

# **Developer Reference for Intel® oneAPI Math Kernel Library for C**

# Contents

## Chapter 1: Developer Reference for Intel® oneAPI Math Kernel Library - C

Getting Help and Support .....	17
What's New .....	18
Notational Conventions .....	18
Overview.....	19
Performance Enhancements.....	22
Parallelism .....	23
C Datatypes Specific to Intel MKL.....	23
OpenMP* Offload.....	24
OpenMP* Offload for Intel® oneAPI Math Kernel Library .....	24
BLAS and Sparse BLAS Routines.....	32
BLAS Routines .....	32
Naming Conventions for BLAS Routines.....	32
C Interface Conventions for BLAS Routines.....	34
Matrix Storage Schemes for BLAS Routines .....	35
BLAS Level 1 Routines and Functions.....	35
BLAS Level 2 Routines .....	52
BLAS Level 3 Routines .....	96
Sparse BLAS Level 1 Routines.....	118
Vector Arguments .....	118
Naming Conventions for Sparse BLAS Routines .....	119
Routines and Data Types.....	119
BLAS Level 1 Routines That Can Work With Sparse Vectors.....	119
cblas_?axpyi .....	120
cblas_?doti .....	121
cblas_?dotci .....	121
cblas_?dotui.....	122
cblas_?gthr .....	123
cblas_?gthrz.....	124
cblas_?roti .....	124
cblas_?sctr.....	125
Sparse BLAS Level 2 and Level 3 Routines.....	126
Naming Conventions in Sparse BLAS Level 2 and Level 3.....	126
Sparse Matrix Storage Formats for Sparse BLAS Routines.....	127
Routines and Supported Operations.....	128
Interface Consideration.....	129
Sparse BLAS Level 2 and Level 3 Routines.....	133
Sparse QR Routines.....	240
mkl_sparse_set_qr_hint .....	240
mkl_sparse_?_qr .....	241
mkl_sparse_qr_reorder.....	243
mkl_sparse_?_qr_factorize.....	244
mkl_sparse_?_qr_solve .....	245
mkl_sparse_?_qr_qmult .....	247
mkl_sparse_?_qr_rsolve .....	249
Compact BLAS and LAPACK Functions .....	250
mkl_?gemm_compact.....	254

mkl_?trsm_compact.....	257
mkl_?potrf_compact.....	259
mkl_?getrfnp_compact .....	260
mkl_?geqrf_compact .....	261
mkl_?getrinp_compact .....	263
Numerical Limitations for Compact BLAS and Compact LAPACK Routines .....	264
mkl_?get_size_compact.....	265
mkl_get_format_compact .....	265
mkl_?gepack_compact .....	266
mkl_?geunpack_compact.....	268
Inspector-executor Sparse BLAS Routines.....	269
Naming Conventions in Inspector-Executor Sparse BLAS Routines	269
Sparse Matrix Storage Formats for Inspector-executor Sparse BLAS Routines .....	271
Supported Inspector-executor Sparse BLAS Operations .....	271
Two-stage Algorithm in Inspector-Executor Sparse BLAS Routines	272
Matrix Manipulation Routines .....	273
Inspector-Executor Sparse BLAS Analysis Routines .....	293
Inspector-Executor Sparse BLAS Execution Routines.....	310
BLAS-like Extensions .....	354
cblas_?axpy_batch.....	356
cblas_?axpy_batch_strided .....	357
cblas_?axpby .....	358
cblas_?gemmt.....	359
cblas_?gemm3m.....	362
cblas_?gemm_batch.....	366
cblas_?gemm_batch_strided .....	369
cblas_?gemm3m_batch_strided .....	372
cblas_?gemm3m_batch .....	376
cblas_?trsm_batch .....	379
cblas_?trsm_batch_strided.....	382
mkl_?imatcopy .....	384
mkl_?imatcopy_batch.....	386
mkl_?imatcopy_batch_strided .....	387
mkl_?omatadd_batch_strided.....	389
mkl_?omatcopy .....	391
mkl_?omatcopy_batch.....	393
mkl_?omatcopy_batch_strided .....	395
mkl_?omatcopy2 .....	397
mkl_?omatadd .....	399
cblas_?gemm_pack_get_size, cblas_gemm_*_pack_get_size .....	401
cblas_?gemm_pack.....	403
cblas_gemm_*_pack.....	406
cblas_?gemm_compute .....	411
cblas_gemm_*_compute .....	414
cblas_gemm_bf16bf16f32_compute .....	420
cblas_gemm_bf16bf16f32.....	424
cblas_gemm_f16f16f32_compute.....	426
cblas_gemm_f16f16f32 .....	430
cblas_?gemm_free.....	433
cblas_gemm_* .....	434
cblas_?gemv_batch_strided .....	438
cblas_?gemv_batch.....	439
cblas_?dggmm_batch_strided .....	441

cblas_?dgemm_batch.....	443
mkl_jit_create_?gemm .....	445
mkl_jit_get_?gemm_ptr .....	447
mkl_jit_destroy .....	450
LAPACK Routines.....	451
Choosing a LAPACK Routine.....	451
C Interface Conventions for LAPACK Routines.....	451
Matrix Layout for LAPACK Routines .....	453
Matrix Storage Schemes for LAPACK Routines .....	455
Mathematical Notation for LAPACK Routines.....	463
Error Analysis .....	464
LAPACK Linear Equation Routines .....	464
LAPACK Linear Equation Computational Routines.....	465
LAPACK Linear Equation Driver Routines .....	675
LAPACK Least Squares and Eigenvalue Problem Routines.....	779
LAPACK Least Squares and Eigenvalue Problem Computational Routines .....	780
LAPACK Least Squares and Eigenvalue Problem Driver Routines ..	1001
LAPACK Auxiliary Routines.....	1171

# Developer Reference for Intel® oneAPI Math Kernel Library - C

1

For more documentation on this and other products, visit the [oneAPI Documentation Library](#).

Intel® Math Kernel Library is now Intel® oneAPI Math Kernel Library (oneMKL).

Documentation for versions of Intel® Math Kernel Library older than 2023.0 is available for download only. See [Downloadable Documentation](#).

[What's New](#)

[Fortran interface: Developer Reference for Intel® oneAPI Math Kernel Library - Fortran](#)

This publication describes the C interface.

Basic Linear Algebra Subprograms (BLAS)	The <a href="#">BLAS</a> routines provide vector, matrix-vector, and matrix-matrix operations.
Sparse BLAS	The <a href="#">Sparse BLAS</a> routines provide basic operations on sparse vectors and matrices.
Sparse QR	The <a href="#">Sparse QR Routines</a> provide a multifrontal sparse QR factorization method for solving a sparse system of linear equations.
LAPACK	The <a href="#">LAPACK</a> routines solve systems of linear equations, least square problems, eigenvalue and singular value problems, and Sylvester's equations.
Statistical Functions	The <a href="#">Statistical Functions</a> provides a set of routines implementing commonly used pseudorandom random number generators (RNG) with continuous distribution.
Direct and Iterative Sparse Solvers	Among several options for solving sparse linear systems of equations, oneMKL offers a direct sparse solver based on PARDISO*, which is referred to here as <a href="#">Intel MKL PARDISO</a> .
Vector Mathematics Functions	The <a href="#">Vector Mathematics (VM) functions</a> compute core mathematical functions on vector arguments.
Vector Statistics Functions	The <a href="#">Vector Statistics (VS) functions</a> generate vectors of pseudorandom numbers with different types of statistical distributions and perform convolution and correlation computations.
Fourier Transform Functions	The <a href="#">Fourier Transform Functions</a> offer several options for computing Fast Fourier Transforms (FFTs).

## Product and Performance Information

Performance varies by use, configuration and other factors. Learn more at [www.intel.com/PerformanceIndex](http://www.intel.com/PerformanceIndex).

Notice revision #20201201

## Getting Help and Support

Intel provides a support web site that contains a rich repository of self help information, including getting started tips, known product issues, product errata, license information, user forums, and more. Visit the Intel® oneAPI Math Kernel Library (oneMKL) support website at <http://www.intel.com/software/products/support/>.

## What's New

This Developer Reference documents Intel® oneAPI Math Kernel Library (oneMKL) release for the C interface.

Intel® Math Kernel Library is now Intel® oneAPI Math Kernel Library (oneMKL). Documentation for older versions of Intel® Math Kernel Library is available for download only. For a list of available documentation downloads by product version, see these pages:

- [Download Documentation for Intel® Parallel Studio XE](#)
- [Download Documentation for Intel® System Studio](#)

The manual has been updated to reflect enhancements to the product, besides improvements and error corrections.

### Product and Performance Information

Performance varies by use, configuration and other factors. Learn more at [www.Intel.com/PerformanceIndex](http://www.Intel.com/PerformanceIndex).

Notice revision #20201201

## Notational Conventions

This manual uses the following terms to refer to operating systems:

Windows* OS	This term refers to information that is valid on all supported Windows* operating systems.
Linux* OS	This term refers to information that is valid on all supported Linux* operating systems.
macOS*	This term refers to information that is valid on Intel®-based systems running the macOS* operating system.

This manual uses the following notational conventions:

- Routine name shorthand (for example, `?ungqr` instead of `cungqr/zungqr`).
- Font conventions used for distinction between the text and the code.

### Routine Name Shorthand

For shorthand, names that contain a question mark "?" represent groups of routines with similar functionality. Each group typically consists of routines used with four basic data types: single-precision real, double-precision real, single-precision complex, and double-precision complex. The question mark is used to indicate any or all possible varieties of a function; for example:

`?swap` Refers to all four data types of the vector-vector `?swap` routine: `sswap`, `dswap`, `cswap`, and `zswap`.

### Font Conventions

The following font conventions are used:

`lowercase courier`

Code examples:

```
a[k+i][j] = matrix[i][j];
```

data types; for example, `const float*`

lowercase courier mixed with UpperCase courier	Function names; for example, <code>vmlSetMode</code>
<i>lowercase courier italic</i>	Variables in arguments and parameters description. For example, <i>incx</i> .
*	Used as a multiplication symbol in code examples and equations and where required by the programming language syntax.

## Overview

### NOTE

This publication, the *Intel® oneAPI Math Kernel Library Developer Reference*, was previously known as the *Intel® oneAPI Math Kernel Library Reference Manual*.

Intel® oneAPI Math Kernel Library (oneMKL) is optimized for performance on Intel processors. oneMKL also runs on non-Intel x86-compatible processors.

### NOTE

oneMKL provides limited input validation to minimize the performance overheads. It is your responsibility when using oneMKL to ensure that input data has the required format and does not contain invalid characters. These can cause unexpected behavior of the library. Examples of the inputs that may result in unexpected behavior:

- Not-a-number (NaN) and other special floating point values
- Large inputs may lead to accumulator overflow

As the oneMKL API accepts raw pointers, it is your application's responsibility to validate the buffer sizes before passing them to the library. The library requires subroutine and function parameters to be valid before being passed. While some oneMKL routines do limited checking of parameter errors, your application should check for NULL pointers, for example.

The Intel® oneAPI Math Kernel Library includes Fortran routines and functions optimized for Intel® processor-based computers running operating systems that support multiprocessing. In addition to the Fortran interface, Intel® oneAPI Math Kernel Library (oneMKL) includes a C-language interface for the Discrete Fourier transform functions, as well as for the Vector Mathematics and Vector Statistics functions. For hardware and software requirements to use Intel® oneAPI Math Kernel Library (oneMKL), see *Intel® oneAPI Math Kernel Library (oneMKL) Release Notes*.

### NOTE

Functions calls at runtime for Intel® oneAPI Math Kernel Library (oneMKL) libraries on the Microsoft Windows\* operating system can utilize the function, `LoadLibrary()`, and related loading functions in static, dynamic, and single dynamic library linking models. These functions attempt to access the loader lock which when used within or at the same time as another `DllMain` function call, can lead to a deadlock. If possible, avoid making your calls to Intel® oneAPI Math Kernel Library (oneMKL) in a `aDllMain` function or at the same time as other calls to `DllMain` even on separate threads. Refer to Microsoft documentation about *DllMain* and *Dynamic-Link Library Best Practices* for more details.

## BLAS Routines

The BLAS routines and functions are divided into the following groups according to the operations they perform:

- **BLAS Level 1 Routines** perform operations of both addition and reduction on vectors of data. Typical operations include scaling and dot products.

- [BLAS Level 2 Routines](#) perform matrix-vector operations, such as matrix-vector multiplication, rank-1 and rank-2 matrix updates, and solution of triangular systems.
- [BLAS Level 3 Routines](#) perform matrix-matrix operations, such as matrix-matrix multiplication, rank-k update, and solution of triangular systems.

Starting from release 8.0, Intel® oneAPI Math Kernel Library (oneMKL) also supports the Fortran 95 interface to the BLAS routines.

Starting from release 10.1, a number of [BLAS-like Extensions](#) are added to enable the user to perform certain data manipulation, including matrix in-place and out-of-place transposition operations combined with simple matrix arithmetic operations.

## Sparse BLAS Routines

The [Sparse BLAS Level 1 Routines and Functions](#) and [Sparse BLAS Level 2 and Level 3 Routines](#) routines and functions operate on sparse vectors and matrices. These routines perform vector operations similar to the BLAS Level 1, 2, and 3 routines. The Sparse BLAS routines take advantage of vector and matrix sparsity: they allow you to store only non-zero elements of vectors and matrices. Intel® oneAPI Math Kernel Library (oneMKL) also supports Fortran 95 interface to Sparse BLAS routines.

## Sparse QR

[Sparse QR](#) in Intel® oneAPI Math Kernel Library (oneMKL) is a set of routines used to solve sparse matrices with real coefficients and general structure. All Sparse QR routines can be divided into three steps: reordering, factorization, and solving. Currently, only CSR format is supported for the input matrix, and Sparse QR operates on the matrix handle used in all SpBLAS IE routines. (For details on how to create a matrix handle, refer to [mkl-sparse-create-csr](#).)

## LAPACK Routines

The Intel® oneAPI Math Kernel Library fully supports the LAPACK 3.7 set of computational, driver, auxiliary and utility routines.

The original versions of LAPACK from which that part of Intel® oneAPI Math Kernel Library (oneMKL) was derived can be obtained from <http://www.netlib.org/lapack/index.html>. The authors of LAPACK are E. Anderson, Z. Bai, C. Bischof, S. Blackford, J. Demmel, J. Dongarra, J. Du Croz, A. Greenbaum, S. Hammarling, A. McKenney, and D. Sorensen.

The [LAPACK routines](#) can be divided into the following groups according to the operations they perform:

- Routines for solving systems of linear equations, factoring and inverting matrices, and estimating condition numbers (see [LAPACK Routines: Linear Equations](#)).
- Routines for solving least squares problems, eigenvalue and singular value problems, and Sylvester's equations (see [LAPACK Routines: Least Squares and Eigenvalue Problems](#)).

Starting from release 8.0, Intel® oneAPI Math Kernel Library (oneMKL) also supports the Fortran 95 interface to LAPACK computational and driver routines. This interface provides an opportunity for simplified calls of LAPACK routines with fewer required arguments.

## Sparse Solver Routines

Direct sparse solver routines in Intel® oneAPI Math Kernel Library (oneMKL) (see [Sparse Solver Routines](#)) solve symmetric and symmetrically-structured sparse matrices with real or complex coefficients. For symmetric matrices, these Intel® oneAPI Math Kernel Library (oneMKL) subroutines can solve both positive-definite and indefinite systems. Intel® oneAPI Math Kernel Library (oneMKL) includes a solver based on the PARDISO\* sparse solver, referred to as Intel® oneAPI Math Kernel Library (oneMKL) PARDISO, as well as an alternative set of user callable direct sparse solver routines.

If you use the Intel® oneAPI Math Kernel Library (oneMKL) PARDISO sparse solver, please cite:

O.Schenk and K.Gartner. Solving unsymmetric sparse systems of linear equations with PARDISO. J. of Future Generation Computer Systems, 20(3):475-487, 2004.

Intel® oneAPI Math Kernel Library (oneMKL) provides also an iterative sparse solver (see [Sparse Solver Routines](#)) that uses Sparse BLAS level 2 and 3 routines and works with different sparse data formats.

## Extended Eigensolver Routines

The [Extended Eigensolver RCI Routines](#) is a set of high-performance numerical routines for solving standard ( $Ax = \lambda x$ ) and generalized ( $Ax = \lambda Bx$ ) eigenvalue problems, where  $A$  and  $B$  are symmetric or Hermitian. It yields all the eigenvalues and eigenvectors within a given search interval. It is based on the Feast algorithm, an innovative fast and stable numerical algorithm presented in [\[Polizzi09\]](#), which deviates fundamentally from the traditional Krylov subspace iteration based techniques (Arnoldi and Lanczos algorithms [\[Bai00\]](#)) or other Davidson-Jacobi techniques [\[Sleijpen96\]](#). The Feast algorithm is inspired by the density-matrix representation and contour integration technique in quantum mechanics.

It is free from orthogonalization procedures. Its main computational tasks consist of solving very few inner independent linear systems with multiple right-hand sides and one reduced eigenvalue problem orders of magnitude smaller than the original one. The Feast algorithm combines simplicity and efficiency and offers many important capabilities for achieving high performance, robustness, accuracy, and scalability on parallel architectures. This algorithm is expected to significantly augment numerical performance in large-scale modern applications.

Some of the characteristics of the Feast algorithm [\[Polizzi09\]](#) are:

- Converges quickly in 2-3 iterations with very high accuracy
- Naturally captures all eigenvalue multiplicities
- No explicit orthogonalization procedure
- Can reuse the basis of pre-computed subspace as suitable initial guess for performing outer-refinement iterations

This capability can also be used for solving a series of eigenvalue problems that are close one another.

- The number of internal iterations is independent of the size of the system and the number of eigenpairs in the search interval
- The inner linear systems can be solved either iteratively (even with modest relative residual error) or directly

## VM Functions

The Vector Mathematics functions (see [Vector Mathematical Functions](#)) include a set of highly optimized implementations of certain computationally expensive core mathematical functions (power, trigonometric, exponential, hyperbolic, etc.) that operate on vectors of real and complex numbers.

Application programs that might significantly improve performance with VM include nonlinear programming software, integrals computation, and many others. VM provides interfaces both for Fortran and C languages.

## Statistical Functions

Vector Statistics (VS) contains three sets of functions (see [Statistical Functions](#)) providing:

- Pseudorandom, quasi-random, and non-deterministic random number generator subroutines implementing basic continuous and discrete distributions. To provide best performance, the VS subroutines use calls to highly optimized Basic Random Number Generators (BRNGs) and a set of vector mathematical functions.
- A wide variety of convolution and correlation operations.
- Initial statistical analysis of raw single and double precision multi-dimensional datasets.

## Fourier Transform Functions

The Intel® oneAPI Math Kernel Library (oneMKL) multidimensional Fast Fourier Transform (FFT) functions with mixed radix support (see [Fourier Transform Functions](#)) provide uniformity of discrete Fourier transform computation and combine functionality with ease of use. Both Fortran and C interface specifications are given. There is also a cluster version of FFT functions, which runs on distributed-memory architectures and is provided only for Intel® 64 architectures.

The FFT functions provide fast computation via the FFT algorithms for arbitrary lengths. See the *Intel® oneAPI Math Kernel Library (oneMKL) Developer Guide* for the specific radices supported.

## Partial Differential Equations Support

Intel® oneAPI Math Kernel Library (oneMKL) provides tools for solving Partial Differential Equations (PDE) (see [Partial Differential Equations Support](#)). These tools are Trigonometric Transform interface routines and Poisson Solver.

The Trigonometric Transform routines may be helpful to users who implement their own solvers similar to the Intel® oneAPI Math Kernel Library (oneMKL) Poisson Solver. The users can improve performance of their solvers by using fast sine, cosine, and staggered cosine transforms implemented in the Trigonometric Transform interface.

The Poisson Solver is designed for fast solving of simple Helmholtz, Poisson, and Laplace problems. The Trigonometric Transform interface, which underlies the solver, is based on the Intel® oneAPI Math Kernel Library (oneMKL) FFT interface (refer to [Fourier Transform Functions](#)), optimized for Intel® processors.

## Support Functions

The Intel® oneAPI Math Kernel Library (oneMKL) support functions (see [Support Functions](#)) are used to support the operation of the Intel® oneAPI Math Kernel Library (oneMKL) software and provide basic information on the library and library operation, such as the current library version, timing, setting and measuring of CPU frequency, error handling, and memory allocation.

Starting from release 10.0, the Intel® oneAPI Math Kernel Library (oneMKL) support functions provide additional threading control.

Starting from release 10.1, Intel® oneAPI Math Kernel Library (oneMKL) selectively supports a *Progress Routine* feature to track progress of a lengthy computation and/or interrupt the computation using a callback function mechanism. The user application can define a function called `mkl_progress` that is regularly called from the Intel® oneAPI Math Kernel Library (oneMKL) routine supporting the progress routine feature. See [Progress Routine](#) in [Support Functions](#) for reference. Refer to a specific LAPACK or DSS/PARDISO function description to see whether the function supports this feature or not.

Product and Performance Information
Performance varies by use, configuration and other factors. Learn more at <a href="http://www.Intel.com/PerformanceIndex">www.Intel.com/PerformanceIndex</a> .
Notice revision #20201201

## Performance Enhancements

The Intel® oneAPI Math Kernel Library has been optimized by exploiting both processor and system features and capabilities. Special care has been given to those routines that most profit from cache-management techniques. These especially include matrix-matrix operation routines such as `asdgemm()`.

In addition, code optimization techniques have been applied to minimize dependencies of scheduling integer and floating-point units on the results within the processor.

The major optimization techniques used throughout the library include:

- Loop unrolling to minimize loop management costs
- Blocking of data to improve data reuse opportunities
- Copying to reduce chances of data eviction from cache
- Data prefetching to help hide memory latency
- Multiple simultaneous operations (for example, dot products in `dgemm`) to eliminate stalls due to arithmetic unit pipelines
- Use of hardware features such as the SIMD arithmetic units, where appropriate

These are techniques from which the arithmetic code benefits the most.

#### Product and Performance Information

Performance varies by use, configuration and other factors. Learn more at [www.Intel.com/PerformanceIndex](http://www.Intel.com/PerformanceIndex).

Notice revision #20201201

## Parallelism

Intel® oneAPI Math Kernel Library (oneMKL) offers performance gains through parallelism provided by the symmetric multiprocessing performance (SMP) feature. You can obtain improvements from SMP in the following ways:

- One way is based on user-managed threads in the program and further distribution of the operations over the threads based on data decomposition, domain decomposition, control decomposition, or some other parallelizing technique. Each thread can use any of the Intel® oneAPI Math Kernel Library (oneMKL) functions (except for the deprecated `?lacon` LAPACK routine) because the library has been designed to be thread-safe.
- Another method is to use the FFT and BLAS level 3 routines. They have been parallelized and require no alterations of your application to gain the performance enhancements of multiprocessing. Performance using multiple processors on the level 3 BLAS shows excellent scaling. Since the threads are called and managed within the library, the application does not need to be recompiled thread-safe.
- Yet another method is to use *tuned LAPACK routines*. Currently these include the single- and double precision flavors of routines for *QR* factorization of general matrices, triangular factorization of general and symmetric positive-definite matrices, solving systems of equations with such matrices, as well as solving symmetric eigenvalue problems.

For instructions on setting the number of available processors for the BLAS level 3 and LAPACK routines, see *Intel® oneAPI Math Kernel Library (oneMKL) Developer Guide*.

Performance varies by use, configuration and other factors. Learn more at [www.Intel.com/PerformanceIndex](http://www.Intel.com/PerformanceIndex).

Notice revision #20201201

## C Datatypes Specific to Intel MKL

The `mk1_types.h` file defines datatypes specific to Intel® oneAPI Math Kernel Library (oneMKL).

C/C++ Type	Fortran Type	LP32 Equivalent (Size in Bytes)	LP64 Equivalent (Size in Bytes)	ILP64 Equivalent (Size in Bytes)
MKL_INT (MKL integer)	INTEGER (default INTEGER)	C/C++: int Fortran: INTEGER*4	C/C++: int Fortran: INTEGER*4 (4 bytes)	C/C++: long long (or define MKL_ILP64 macros Fortran: INTEGER*8

C/C++ Type	Fortran Type	LP32 Equivalent (Size in Bytes)	LP64 Equivalent (Size in Bytes)	ILP64 Equivalent (Size in Bytes)
MKL_UINT (MKL unsigned integer)	N/A	(4 bytes) C/C++: unsigned int	C/C++: unsigned int (4 bytes)	(8 bytes) C/C++: unsigned long long (8 bytes)
MKL_LONG (MKL long integer)	N/A	(4 bytes) C/C++: long	C/C++: long (Windows: 4 bytes) (Linux, Mac: 8 bytes)	C/C++: long (8 bytes)
MKL_Complex8 (Like C99 complex float)	COMPLEX*8	(8 bytes)	(8 bytes)	(8 bytes)
MKL_Complex16 (Like C99 complex double)	COMPLEX*16	(16 bytes)	(16 bytes)	(16 bytes)

You can redefine datatypes specific to Intel® oneAPI Math Kernel Library (oneMKL). One reason to do this is if you have your own types which are binary-compatible with Intel® oneAPI Math Kernel Library (oneMKL) datatypes, with the same representation or memory layout. To redefine a datatype, use one of these methods:

- Insert the `#define` statement redefining the datatype before the `mkl.h` header file `#include` statement. For example,

```
#define MKL_INT size_t
#include "mkl.h"
```

- Use the compiler `-D` option to redefine the datatype. For example,

```
...-DMKL_INT=size_t...
```

## NOTE

As the user, if you redefine Intel® oneAPI Math Kernel Library (oneMKL) datatypes you are responsible for making sure that your definition is compatible with that of Intel® oneAPI Math Kernel Library (oneMKL). If not, it might cause unpredictable results or crash the application.

## OpenMP\* Offload

This section describes how to perform OpenMP offload computations using Intel® oneAPI Math Kernel Library.

### OpenMP\* Offload for Intel® oneAPI Math Kernel Library

You can use Intel® oneAPI Math Kernel Library (oneMKL) and OpenMP\* offload to run standard oneMKL computations on Intel GPUs. You can find the list of oneMKL features that support OpenMP offload in the `mkl_omp_offload.h` header file, which includes:

- All Level 1, 2, and 3 BLAS functions through the CBLAS and BLAS interfaces, supporting both synchronous and asynchronous execution

- **BLAS-like extensions:** `cblas_?axpby`, `cblas_?axpy_batch{_strided}`, `cblas_?copy_batch{_strided}`, `cblas_?gemv_batch{_strided}`, `cblas_?dgmm_batch{_strided}`, `cblas_hgemm`, `cblas_gemm_bf16bf16f32`, `cblas_gemm_s8u8s32`, `cblas_?gemm_batch{_strided}`, `cblas_?trsm_batch{_strided}`, and `cblas_?gemmt` functionality through the CBLAS and BLAS interfaces as well as `mkl_?omatcopy_batch_strided`, `mkl_?imatcopy_batch_strided`, and `mkl_?omatadd_batch_strided`, supporting both synchronous and asynchronous execution
- LAPACK, including LAPACK-like extensions
  - All computations on the Intel GPU (supports both synchronous and asynchronous execution):
    - `?getrf_batch`
    - `?getrf_batch_strided`
    - `?getrfnp_batch`
    - `?getrfnp_batch_strided`
    - `?getri`
    - `?getri_oop_batch`
    - `?getri_oop_batch_strided`
    - `?getrs`
    - `?getrs_batch_strided`
    - `?getrsnp_batch_strided`
    - `?gels_batch_strided`
    - `?potrf`
    - `?potri`
    - `?potrs`
    - `?trtri`
    - `?trtrs`
  - Hybrid; some computations on the Intel GPU (supports synchronous execution):
    - `?geqrf`
    - `?getrf` (all computations on the CPU for  $n \leq 256$ )
    - `mkl_?getrfnp` (all computations on the CPU for  $n \leq 512$ )
    - `?ormqr`, `?unmqr`
  - Interface support only; all computations on the CPU (supports synchronous execution):
    - `?gebrd`
    - `?gesvd`
    - `?orgqr`, `?ungqr`
    - `?steqr`
    - `?syev`, `?heev`
    - `?syevd`, `?heevd`
    - `?syevx`, `?heevx`
    - `?sygvd`, `?hegvd`
    - `?sygvx`, `?hegvx`
    - `?sytrd`, `?hetrd`
- Vector Statistics
  - Random number generators

**NOTE**

All distributions are supported. See <https://www.intel.com/content/www/us/en/docs/onemkl/developer-reference-c/current/distribution-generators.html>

Basic random number generators:

- `VSL_BRNG_MCG31`
- `VSL_BRNG_MCG59`
- `VSL_BRNG_PHILOX4X32X10`
- `VSL_BRNG_MRG32K3A`
- `VSL_BRNG_MT19937`

- VSL\_BRNG\_MT2203
- VSL\_BRNG\_SOBOL

---

**Important** Check the [oneMKL DPC++ developer reference](#) for the BRNG data type used in the distributions in case the offload device doesn't have `sycl::aspect::fp64` support.

---

- Summary statistics

Supports the `vsl?SSCompute` routine for the following estimates:

- VSL\_SS\_MEAN
- VSL\_SS\_SUM
- VSL\_SS\_2R\_MOM
- VSL\_SS\_2R\_SUM
- VSL\_SS\_3R\_MOM
- VSL\_SS\_3R\_SUM
- VSL\_SS\_4R\_MOM
- VSL\_SS\_4R\_SUM
- VSL\_SS\_2C\_MOM
- VSL\_SS\_2C\_SUM
- VSL\_SS\_3C\_MOM
- VSL\_SS\_3C\_SUM
- VSL\_SS\_4C\_MOM
- VSL\_SS\_4C\_SUM
- VSL\_SS\_KURTOSIS
- VSL\_SS\_SKEWNESS
- VSL\_SS\_MIN
- VSL\_SS\_MAX
- VSL\_SS\_VARIATION

Supported methods:

- VSL\_SS\_METHOD\_FAST
- VSL\_SS\_METHOD\_FAST\_USER\_MEAN
- FFTs through both DFTI and FFTW3 interfaces in one, two, and three dimensions.
  - For COMPLEX\_STORAGE, only the DFTI\_COMPLEX\_COMPLEX format is currently supported on CPU and GPU devices.
  - Both synchronous and asynchronous computations are supported.
  - For R2C/C2R transforms on the GPU, only DFTI\_CONJUGATE\_EVEN\_STORAGE=DFTI\_COMPLEX\_COMPLEX is supported (implying DFTI\_PACKED\_FORMAT=DFTI\_CCE\_FORMAT).
  - **NOTE** INCONSISTENT\_CONFIGURATION errors at compute time indicate an invalid descriptor or invalid data pointer. Double check your data mapping if you encounter such errors.
- Arbitrary strides and batch distances are not supported for multi-dimensional R2C transforms offloaded to the GPU. Considering the last dimension of the data, every element must be separated from its two nearest peers (along another dimension and/or in another batch) by a constant distance. For example, to compute a batched, two-dimensional R2C FFT of size  $[N_2, N_1]$  with input strides  $[0, S_2, 1]$  (row-major layout with unit elementary stride and no offset), INPUT\_DISTANCE must be equal to  $N_2 * S_2$  so that every element is separated from its nearest last-dimension counterpart(s) by a distance  $S_2$  (in this example), even across batches.
- Due to the variadic implementation of DftiComputeForward and DftiComputeBackward, out-of-place compute calls using the DFTI API with the OpenMP 5.1 dispatch construct differ from common dispatch construct usage by requiring a "need\_device\_ptr" clause. The oneMKL examples provided on installation demonstrate this usage.
- Transforms on GPU devices may overwrite FFT-irrelevant, padding entries in the output data.
- Sparse BLAS
  - `mkl_sparse_{s, d}_create_csr`
  - `mkl_sparse_{s, d}_export_csr`

- `mkl_sparse_destroy`
- `mkl_sparse_order`
  - Currently supports only CSR matrix format.
- `mkl_sparse_set_mv_hint`
  - Currently supports only `SPARSE_OPERATION_NON_TRANSPOSE` with CSR matrix format for general MV (`SPARSE_MATRIX_TYPE_GENERAL`) and triangular MV (`SPARSE_MATRIX_TYPE_TRIANGULAR` with fill modes `SPARSE_FILL_MODE_LOWER/SPARSE_FILL_MODE_UPPER`).
- `mkl_sparse_set_sv_hint`
- `mkl_sparse_optimize`
  - Supports optimization for `mkl_sparse_{s, d}_mv` functionality based on supported hints added through `mkl_sparse_set_mv_hint` offload.
  - Supports optimization for `mkl_sparse_{s, d}_trsv` functionality based on supported hints added through `mkl_sparse_set_sv_hint` offload.
  - Both synchronous and asynchronous executions are supported.

---

**NOTE** Note that although you can run the `mkl_sparse_optimize` offload function asynchronously, you are responsible for the data dependency between the optimization routine and the execution routines.

---

- `mkl_sparse_{s, d}_mv`:
  - Currently supports only `SPARSE_OPERATION_NON_TRANSPOSE` with the following combinations of matrix types:
    - `SPARSE_MATRIX_TYPE_GENERAL`
    - `SPARSE_MATRIX_TYPE_TRIANGULAR` with fill modes `SPARSE_FILL_MODE_LOWER/SPARSE_FILL_MODE_UPPER` and diagonal types `SPARSE_DIAG_UNIT/SPARSE_DIAG_NON_UNIT`
    - `SPARSE_MATRIX_TYPE_SYMMETRIC` fill modes `SPARSE_FILL_MODE_LOWER/SPARSE_FILL_MODE_UPPER` and diagonal type `SPARSE_DIAG_NON_UNIT` (currently, `SPARSE_DIAG_UNIT` is not supported)
  - Both synchronous and asynchronous computations are supported.
- `mkl_sparse_{s, d}_mm`:
  - Currently supported only with `SPARSE_MATRIX_TYPE_GENERAL` and `SPARSE_OPERATION_NON_TRANSPOSE`.
  - Both `SPARSE_LAYOUT_ROW_MAJOR` and `SPARSE_LAYOUT_COLUMN_MAJOR` are supported.
  - Both synchronous and asynchronous computations are supported.
- `mkl_sparse_{s, d}_trsv`
  - Currently only supported with `SPARSE_MATRIX_TYPE_TRIANGULAR`, `SPARSE_OPERATION_NON_TRANSPOSE`, and `alpha == 1.0`
  - Both synchronous and asynchronous computations are supported
- `mkl_sparse_sp2m`
  - Currently supported only with `SPARSE_MATRIX_TYPE_GENERAL`.
  - Both synchronous and asynchronous computations are supported with Level Zero backend, and currently only synchronous computations are supported with OpenCL backend.
  - Note that you can run the `mkl_sparse_sp2m` offload function asynchronously, but you are responsible for the data dependency between the first stage and the second stage of `mkl_sparse_sp2m`.
  - `mkl_sparse_sp2m` internally creates arrays for the sparse C matrix output. As they may be expected to be used subsequently on both host and device, they are created internally using USM shared memory. The arrays are managed by the library and will be cleaned up when the corresponding C matrix handle is destroyed; however, direct access to the arrays is provided by the `mkl_sparse_{s, d}_export_csr()` OpenMP offload function. Users are recommended to make a copy to their own arrays if they want to have such data beyond the scope of the C matrix handle.

The choice of USM shared memory for C arrays is made for functional support of the OpenMP Offload paradigm and has a performance impact over choosing USM device memory, which would be more performant but not functional in all subsequent use cases.

- The created C matrix in the provided handle is not guaranteed to be sorted, so the `mkl_sparse_order()` OpenMP offload API is provided for user convenience if that property is needed.
- The input matrix handle A is not required to be sorted on input, but the input matrix handle B is required to be sorted on input.
- In Sparse BLAS, the usage model consists of the creation stage, the inspection stage, the execution stage, and the destruction stage. For Sparse BLAS with C OpenMP Offload, all stages can be asynchronously executed, provided any data dependencies are already respected.

The OpenMP offload feature from Intel® oneAPI Math Kernel Library (oneMKL) enables you to run oneMKL computations on Intel GPUs through the standard oneMKL APIs within an `omp target variant dispatch` section. For example, the standard CBLAS API for single precision real data type matrix multiply is:

```
void cblas_sgemm(const CBLAS_LAYOUT Layout, const CBLAS_TRANSPOSE TransA,
               const CBLAS_TRANSPOSE TransB, const MKL_INT M, const MKL_INT N,
               const MKL_INT K, const float alpha, const float *A, const MKL_INT lda,
               const float *B, const MKL_INT ldb, const float beta, float *C,
               const MKL_INT ldc);
```

If the oneMKL function (for example, `cblas_sgemm`) is called outside of an `omp target variant dispatch` section or if offload is disabled, then the CPU implementation is dispatched. If the same function is called within an `omp target variant dispatch` section and offload is possible then the GPU implementation is dispatched. By default the execution of the oneMKL function within a dispatch variant construct is synchronous. OpenMP offload computations may be done asynchronously by adding the `nowait` clause to the `target variant dispatch` construct. This ensures that the host thread encountering the task region generated by this target construct will not be blocked by the oneMKL call. Rather, the host thread is returned to the caller for further use. To finish the asynchronous (`nowait`) computations and ensure memory and execution model consistency (for example, that the results of a computation will be ready in memory to map), the last such `nowait` computation is followed by the stand-alone construct `#pragma omp taskwait`.

From the *OpenMP Application Programming Interface* version 5.0 specification: "The `taskwait` region binds to the current task region [i.e., in this case, the last `nowait` computation]. The current task region is suspended at an implicit task scheduling point associated with the construct. The current task region remains suspended until all child tasks that it generated before the `taskwait` region complete execution [currently, `depend` clause is not supported]."

## Example

Examples for using the OpenMP offload for oneMKL are located in the Intel® oneAPI Math Kernel Library (oneMKL) installation directory, under:

```
examples/c_offload
```

The following code snippet shows how to use OpenMP offload for single-call oneMKL features such as most dense linear algebra functionality.

```
#include <omp.h>
#include "mkl.h"
#include "mkl_omp_offload.h" // MKL header file for OpenMP offload
int dnum = 0;
int main() {
    float *a, *b, *c, alpha = 1.0, beta = 1.0;
    MKL_INT m = 150, n = 200, k = 128, lda = m, ldb = k, ldc = m;
    MKL_INT sizea = lda * k, sizeb = ldb * n, sizec = ldc * n;
    // allocate matrices and check pointers
    a = (float *)mkl_malloc(sizea * sizeof(float), 64);
    ...
    // initialize matrices
    #pragma omp target map(c[0:sizec])
```

```

{
    for (i = 0; i < sizec; i++) {
        c[i] = 42;
    }
    ...
}
// run gemm on host, use standard MKL interface
cblas_sgemm(CblasColMajor, CblasNoTrans, CblasNoTrans, m, n, k, alpha, a,
lda, b, ldb, beta, c, ldc);
// map the a, b, and c matrices on the device memory
#pragma omp target data map(to:a[0:sizea],b[0:sizeb]) map(tofrom:c[0:sizec])
device(dnum)
{
    // run gemm on gpu, use standard MKL interface within a variant dispatch
construct
    // if offload is not possible, default to cpu
    // use the use_device_ptr clause to specify that a, b and c are device
memory
#pragma omp target variant dispatch device(dnum) use_device_ptr(a, b, c)
{
    cblas_sgemm(CblasColMajor, CblasNoTrans, CblasNoTrans, m, n, k,
alpha, a, lda, b, ldb, beta, c, ldc);
}
}
// Free matrices
mkl_free(a);
...
}

```

Some of the oneMKL functionality requires to call a set of functions to perform the corresponding computation. This is the case, for example, for the Discrete Fourier Transform which for a typical computation involves calling the functions.

```

DFTI_EXTERN MKL_LONG DftiCreateDescriptor(DFTI_DESCRIPTOR_HANDLE*,
enum DFTI_CONFIG_VALUE,
enum DFTI_CONFIG_VALUE,
MKL_LONG, ...);
DFTI_EXTERN MKL_LONG DftiCommitDescriptor(DFTI_DESCRIPTOR_HANDLE);
DFTI_EXTERN MKL_LONG DftiComputeForward(DFTI_DESCRIPTOR_HANDLE, void*, ...);
DFTI_EXTERN MKL_LONG DftiComputeBackward(DFTI_DESCRIPTOR_HANDLE, void*, ...);
DFTI_EXTERN MKL_LONG DftiFreeDescriptor(DFTI_DESCRIPTOR_HANDLE*);

```

In that case, only a subset of the calls must be wrapped in an `omp target variant dispatch construct` as shown in the following code snippet for DFTI.

```

#include <omp.h>
#include "mkl.h"
#include "mkl_omp_offload.h"
int main(void)
{
    const int devNum = 0;
    const MKL_LONG N = 64; // Size of 1D transform
    MKL_LONG status = 0;
    MKL_LONG statusGPU = 0;
    DFTI_DESCRIPTOR_HANDLE descHandle = NULL;
    DFTI_DESCRIPTOR_HANDLE descHandleGPU = NULL;
    MKL_Complex8 *x = NULL;
    MKL_Complex8 *xGPU = NULL;
    printf("Create DFTI descriptor\n");
}

```

```

    status = DftiCreateDescriptor(&descHandle, DFTI_SINGLE, DFTI_COMPLEX, 1, N);
    printf("Create GPU DFTI descriptor\n");
    statusGPU = DftiCreateDescriptor(&descHandleGPU, DFTI_SINGLE, DFTI_COMPLEX,
1, N);
    printf("Commit DFTI descriptor\n");
    status = DftiCommitDescriptor(descHandle);
    printf("Commit GPU DFTI descriptor\n");
#pragma omp target variant dispatch device(devNum)
    {
        statusGPU = DftiCommitDescriptor(descHandleGPU);
    }
    printf("Allocate memory for input array\n");
    x = (MKL_Complex8 *)mkl_malloc(N*sizeof(MKL_Complex8), 64);
    printf("Allocate memory for GPU input array\n");
    xGPU = (MKL_Complex8 *)mkl_malloc(N*sizeof(MKL_Complex8), 64);
    printf("Initialize input for forward FFT\n");
    // init x and xGPU ...
    printf("Compute forward FFT in-place\n");
    status = DftiComputeForward(descHandle, x);
    printf("Compute GPU forward FFT in-place\n");
#pragma omp target data map(tofrom:xGPU[0:N]) device(devNum)
    {
#pragma omp target variant dispatch use_device_ptr(xGPU) device(devNum)
        {
            statusGPU = DftiComputeForward(descHandleGPU, xGPU);
        }
    }
    // use results now in x and xGPU ...
cleanup:
    DftiFreeDescriptor(&descHandle);
    DftiFreeDescriptor(&descHandleGPU);
    mkl_free(x);
    mkl_free(xGPU);
}

```

For asynchronous execution of multi-call oneMKL computation, the `nowait` clause needs to be used only on the call to the function performing the actual computation (for example, `DftiCompute{Forward,Backward}`). For instance, the following snippet shows how the DFTI example above could be changed to have two, back-to-back, asynchronous (`nowait`) computations dispatched, with a `taskwait` at the end of the second to ensure the completion of both computations before their results are accessed:

```

printf("Compute Intel GPU forward FFT 1 in-place\n");
#pragma omp target data map(tofrom:x1GPU[0:N1], x2GPU[0:N2]) device(devNum)
    {
#pragma omp target variant dispatch use_device_ptr(x1GPU) device(devNum) nowait
        {
            status1GPU = DftiComputeForward(descHandle1GPU, x1GPU);
        }
        printf("Compute Intel GPU forward FFT 2 in-place\n");
#pragma omp target variant dispatch use_device_ptr(x2GPU) device(devNum) nowait
        {
            status2GPU = DftiComputeForward(descHandle2GPU, x2GPU);
        }
#pragma omp taskwait
    }
    if (status1GPU != DFTI_NO_ERROR) goto failed;
    if (status2GPU != DFTI_NO_ERROR) goto failed;

```

For sparse BLAS computations, the workflow 'create a CSR matrix handle' → 'compute' → 'destroy the CSR matrix handle' must be done so that the offloaded data arrays are alive through the full workflow. For instance, if you are using a target data map, then the workflow must be contained in a single target data region. On the other hand, if the arrays were allocated directly using `omp_target_alloc()` or the Intel Extensions `omp_target_alloc_host/omp_target_alloc_device/omp_target_alloc_shared`, then the workflow must be contained at least in a subset of the scope where those arrays are usable; that is, before the corresponding calls to `omp_target_free`. The following snippet shows how the Sparse BLAS OpenMP Offload example for `mkl_sparse_s_mv()` could be run using a target data map region, where  $N$  is the number of rows,  $M$  is the number of columns, and  $NNZ$  is the number of non-zero entries of the sparse matrix `csrA_gpu`,  $x$  is the input vector, and the output is stored in the  $z$  array:

```
#pragma omp target data map(to:ia[0:N+1],ja[0:NNZ],a[0:NNZ],x[0:M]) map(tofrom:z[0:N])
device(devNum)
{
#pragma omp target variant dispatch device(devNum) use_device_ptr(ia, ja, a)
    {
        status_gpu1 = mkl_sparse_s_create_csr(&csrA_gpu, SPARSE_INDEX_BASE_ZERO, N, M, ia,
ia + 1, ja, a);
    }
#pragma omp target variant dispatch device(devNum) use_device_ptr(x, z)
    {
        status_gpu2 = mkl_sparse_s_mv(SPARSE_OPERATION_NON_TRANSPOSE, alpha, csrA_gpu,
descrA, x, beta, z);
    }
#pragma omp target variant dispatch device(devNum)
    {
        status_gpu3 = mkl_sparse_destroy(csrA_gpu);
    }
}
```

For asynchronous execution of multi-call oneMKL Sparse BLAS computation, the `nowait` clause can be added to the call of the function performing the actual computation (for example, calls to the `mkl_sparse_{s,d}_mv()` function).

As an example, the following snippet shows how the Sparse BLAS example above could be changed to have two asynchronous (`nowait`) computations using the same matrix handle, `csrA_gpu`, but unrelated vector data so there is no read/write dependency between them. Add a `taskwait` at the end of the second execution to ensure the completion of both computations before the `mkl_sparse_destroy()` function is called:

```
#pragma omp target data map(to:ia[0:N+1],ja[0:NNZ],a[0:NNZ],x[0:M],w[0:M])
map(tofrom:y[0:N],z[0:N]) device(devNum)
{
#pragma omp target variant dispatch device(devNum) use_device_ptr(ia, ja, a)
    {
        status_gpu1 = mkl_sparse_s_create_csr(&csrA_gpu, SPARSE_INDEX_BASE_ZERO, N, M, ia,
ia + 1, ja, a);
    }

#pragma omp target variant dispatch device(devNum) use_device_ptr(x, z) nowait
    {
        status_gpu2 = mkl_sparse_s_mv(SPARSE_OPERATION_NON_TRANSPOSE, alpha, csrA_gpu,
descrA, x, beta, z);
    }

#pragma omp target variant dispatch device(devNum) use_device_ptr(w, y) nowait
    {
        status_gpu3 = mkl_sparse_s_mv(SPARSE_OPERATION_NON_TRANSPOSE, alpha, csrA_gpu,
descrA, w, beta, y);
    }
}
```

```

    }
#pragma omp taskwait

#pragma omp target variant dispatch device(devNum)
    {
        status_gpu4 = mkl_sparse_destroy(csrA_gpu);
    }
}

```

## BLAS and Sparse BLAS Routines

Intel® oneAPI Math Kernel Library (oneMKL) implements the BLAS and Sparse BLAS routines, and BLAS-like extensions. The routine descriptions are arranged in several sections:

- [BLAS Level 1 Routines](#) (vector-vector operations)
- [BLAS Level 2 Routines](#) (matrix-vector operations)
- [BLAS Level 3 Routines](#) (matrix-matrix operations)
- [Sparse BLAS Level 1 Routines](#) (vector-vector operations).
- [Sparse BLAS Level 2 and Level 3 Routines](#) (matrix-vector and matrix-matrix operations)
- [BLAS-like Extensions](#)

The question mark in the group name corresponds to different character codes indicating the data type (*s*, *d*, *c*, and *z* or their combination); see [Routine Naming Conventions](#).

When BLAS or Sparse BLAS routines encounter an error, they call the error reporting routine [xerbla](#).

## BLAS Routines

### Naming Conventions for BLAS Routines

BLAS routine names have the following structure:

*<character>* *<name>* *<mod>* [*\_64*]

The *<character>* field indicates the data type:

<i>s</i>	real, single precision
<i>c</i>	complex, single precision
<i>d</i>	real, double precision
<i>z</i>	complex, double precision

Some routines and functions can have combined character codes, such as *sc* or *dz*.

For example, the function *scasum* uses a complex input array and returns a real value.

The *<name>* field, in BLAS level 1, indicates the operation type. For example, the BLAS level 1 routines *?dot*, *?rot*, *?swap* compute a vector dot product, vector rotation, and vector swap, respectively.

In BLAS level 2 and 3, *<name>* reflects the matrix argument type:

<i>ge</i>	general matrix
<i>gb</i>	general band matrix
<i>sy</i>	symmetric matrix
<i>sp</i>	symmetric matrix (packed storage)

sb	symmetric band matrix
he	Hermitian matrix
hp	Hermitian matrix (packed storage)
hb	Hermitian band matrix
tr	triangular matrix
tp	triangular matrix (packed storage)
tb	triangular band matrix.

The `<mod>` field, if present, provides additional details of the operation. BLAS level 1 names can have the following characters in the `<mod>` field:

c	conjugated vector
u	unconjugated vector
g	Givens rotation construction
m	modified Givens rotation
mg	modified Givens rotation construction

BLAS level 2 names can have the following characters in the `<mod>` field:

mv	matrix-vector product
sv	solving a system of linear equations with a single unknown vector
r	rank-1 update of a matrix
r2	rank-2 update of a matrix.

BLAS level 3 names can have the following characters in the `<mod>` field:

mm	matrix-matrix product
sm	solving a system of linear equations with multiple unknown vectors
rk	rank- $k$ update of a matrix
r2k	rank- $2k$ update of a matrix.

On 64-bit platforms, routines with the `_64` suffix support large data arrays in the LP64 interface library and enable you to mix integer types in one application. For example, when an application is linked with the LP64 interface library, `SGEMM` indexes arrays with the 32-bit integer type, while `SGEMM_64` indexes arrays with the 64-bit integer type. For more interface library details, see "Using the ILP64 Interface vs. LP64 Interface" in the developer guide.

The examples below illustrate how to interpret BLAS routine names:

ddot	<code>&lt;d&gt; &lt;dot&gt;</code> : real and double precision, vector-vector dot product
cdotc	<code>&lt;c&gt; &lt;dot&gt; &lt;c&gt;</code> : complex and single precision, vector-vector dot product, conjugated
cdotu	<code>&lt;c&gt; &lt;dot&gt; &lt;u&gt;</code> : complex and single precision, vector-vector dot product, unconjugated
scasum	<code>&lt;sc&gt; &lt;asum&gt;</code> : real and single-precision output, complex and single-precision input, sum of magnitudes of vector elements
sgemv	<code>&lt;s&gt; &lt;ge&gt; &lt;mv&gt;</code> : real and single precision, general matrix, matrix-vector product

`ztrmm`            `<z>` `<tr>` `<mm>` `_64`: complex and double precision, triangular matrix, matrix-matrix product, 64-bit integer type

Sparse BLAS level 1 naming conventions are similar to those of BLAS level 1. For more information, see [Naming Conventions](#).

## C Interface Conventions for BLAS Routines

CBLAS, the C interface to the Basic Linear Algebra Subprograms (BLAS), provides a C language interface to BLAS routines for Intel® oneAPI Math Kernel Library (oneMKL). While you can call the Fortran implementation of BLAS, for coding in C the CBLAS interface has some advantages such as allowing you to specify column-major or row-major ordering with the `layout` parameter.

For more information about calling Fortran routines from C in general, and specifically about calling BLAS and CBLAS routines, see "Mixed-language Programming with the Intel® oneAPI Math Kernel Library" in the *Intel® oneAPI Math Kernel Library Developer Guide*.

---

### NOTE

This reference contains syntax in C for both the CBLAS interface and the Fortran BLAS routines.

---

In CBLAS, the Fortran routine names are prefixed with `cblas_` (for example, `dasum` becomes `cblas_dasum`). Names of all CBLAS functions are in lowercase letters. Like BLAS routines, Intel® oneAPI Math Kernel Library provides CBLAS routines with the `_64` suffix (for example, `cblas_dasum_64`) to support large data arrays in the LP64 interface library on 64-bit platforms. For more interface library details, see "Using the ILP64 Interface vs. LP64 Interface" in the developer guide.

Complex functions `?dotc` and `?dotu` become CBLAS subroutines (void functions); they return the complex result via a void pointer, added as the last parameter. CBLAS names of these functions are suffixed with `_sub`. For example, the BLAS function `cdotc` corresponds to `cblas_cdotc_sub`.

---

### WARNING

Users of the CBLAS interface should be aware that the CBLAS are just a C interface to the BLAS, which is based on the FORTRAN standard and subject to the FORTRAN standard restrictions. In particular, the output parameters should not be referenced through more than one argument.

---

---

### NOTE

This interface is not implemented in the Sparse BLAS Level 2 and Level 3 routines.

---

The arguments of CBLAS functions comply with the following rules:

- Input arguments are declared with the `const` modifier.
- Non-complex scalar input arguments are passed by value.
- Complex scalar input arguments are passed as void pointers.
- Array arguments are passed by address.
- BLAS character arguments are replaced by the appropriate enumerated type.
- Level 2 and Level 3 routines acquire an additional parameter of type `CBLAS_LAYOUT` as their first argument. This parameter specifies whether two-dimensional arrays are row-major (`CblasRowMajor`) or column-major (`CblasColMajor`).

## Enumerated Types

The CBLAS interface uses the following enumerated types:

```
enum CBLAS_LAYOUT {
    CblasRowMajor=101, /* row-major arrays */
    CblasColMajor=102}; /* column-major arrays */
```

```

enum CBLAS_TRANSPOSE {
    CblasNoTrans=111,    /* trans='N' */
    CblasTrans=112,     /* trans='T' */
    CblasConjTrans=113}; /* trans='C' */
enum CBLAS_UPLO {
    CblasUpper=121,     /* uplo ='U' */
    CblasLower=122};   /* uplo ='L' */
enum CBLAS_DIAG {
    CblasNonUnit=131,   /* diag ='N' */
    CblasUnit=132};    /* diag ='U' */
enum CBLAS_SIDE {
    CblasLeft=141,      /* side ='L' */
    CblasRight=142};   /* side ='R' */

```

## Matrix Storage Schemes for BLAS Routines

Matrix arguments of BLAS and CBLAS routines can use the following storage schemes:

- *Full storage*: a matrix  $A$  is stored in a two-dimensional array  $a$ , with the matrix element  $A_{ij}$  stored in the array element  $a[i + j*lda]$  for column-major layout and  $a[j + i*lda]$  for row-major layout, where  $lda$  is the leading dimension for the array.
- *Packed storage* scheme allows you to store symmetric, Hermitian, or triangular matrices more compactly. For column-major layout, the upper or lower triangle of the matrix is packed by columns in a one dimensional array. For row-major layout, the upper or lower triangle of the matrix is packed by rows in a one dimensional array.
- *Band storage*: a band matrix is stored compactly in a two-dimensional array. For column-major layout, columns of the matrix are stored in the corresponding columns of the array, and diagonals of the matrix are stored in a specific row of the array. For row-major layout, rows of the matrix are stored in the corresponding rows of the array, and diagonals of the matrix are stored in a specific column of the array.

For more information on matrix storage schemes, see [Matrix Arguments](#) in the Appendix "Routine and Function Arguments".

## Row-Major and Column-Major Layout

The BLAS routines follow the Fortran convention of storing two-dimensional arrays using column-major layout. When calling BLAS routines from C, remember that they require arrays to be in column-major format, not the row-major format that is the convention for C. Unless otherwise specified, the psuedo-code examples for the BLAS routines illustrate matrices stored using column-major layout.

The CBLAS interface allows you to specify either column-major or row-major layout for BLAS Level 2 and Level 3 routines, by setting the `layout` parameter to `CblasColMajor` or `CblasRowMajor`.

## BLAS Level 1 Routines and Functions

BLAS Level 1 includes routines and functions, which perform vector-vector operations. The following table lists the BLAS Level 1 routine and function groups and the data types associated with them.

### BLAS Level 1 Routine and Function Groups and Their Data Types

Routine or Function Group	Data Types	Description
<code>cblas_?asum</code>	s, d, sc, dz	Sum of vector magnitudes (functions)
<code>cblas_?axpy</code>	s, d, c, z	Scalar-vector product (routines)
<code>cblas_?copy</code>	s, d, c, z	Copy vector (routines)
<code>cblas_?dot</code>	s, d	Dot product (functions)

Routine or Function Group	Data Types	Description
<code>cblas_?sdot</code>	s, d	Dot product with double precision (functions)
<code>cblas_?dotc</code>	c, z	Dot product conjugated (functions)
<code>cblas_?dotu</code>	c, z	Dot product unconjugated (functions)
<code>cblas_?nrm2</code>	s, d, sc, dz	Vector 2-norm (Euclidean norm) (functions)
<code>cblas_?rot</code>	s, d, c, z, cs, zd	Plane rotation of points (routines)
<code>cblas_?rotg</code>	s, d, c, z	Generate Givens rotation of points (routines)
<code>cblas_?rotm</code>	s, d	Modified Givens plane rotation of points (routines)
<code>cblas_?rotmg</code>	s, d	Generate modified Givens plane rotation of points (routines)
<code>cblas_?scal</code>	s, d, c, z, cs, zd	Vector-scalar product (routines)
<code>cblas_?swap</code>	s, d, c, z	Vector-vector swap (routines)
<code>cblas_i?amax</code>	s, d, c, z	Index of the maximum absolute value element of a vector (functions)
<code>cblas_i?amin</code>	s, d, c, z	Index of the minimum absolute value element of a vector (functions)
<code>cblas_?cabs1</code>	s, d	Auxiliary functions, compute the absolute value of a complex number of single or double precision

### **`cblas_?asum`**

*Computes the sum of magnitudes of the vector elements.*

#### **Syntax**

```
float cblas_sasum (const MKL_INT n, const float *x, const MKL_INT incx);
float cblas_scasum (const MKL_INT n, const void *x, const MKL_INT incx);
double cblas_dasum (const MKL_INT n, const double *x, const MKL_INT incx);
double cblas_dzasum (const MKL_INT n, const void *x, const MKL_INT incx);
```

#### **Include Files**

- `mk1.h`

#### **Description**

The `?asum` routine computes the sum of the magnitudes of elements of a real vector, or the sum of magnitudes of the real and imaginary parts of elements of a complex vector:

$$res = |Re x_1| + |Im x_1| + |Re x_2| + |Im x_2| + \dots + |Re x_n| + |Im x_n|,$$

$$result = \sum_{i=1}^n \left( \left| \operatorname{Re}(X_i) \right| + \left| \operatorname{Im}(X_i) \right| \right)$$

where  $x$  is a vector with  $n$  elements.

## Input Parameters

<code>n</code>	Specifies the number of elements in vector <code>x</code> .
<code>x</code>	Array, size at least $(1 + (n-1) * \text{abs}(incx))$ .
<code>incx</code>	Specifies the increment for indexing vector <code>x</code> .

## Output Parameters

<code>res</code>	Contains the sum of magnitudes of real and imaginary parts of all elements of the vector.
------------------	---

## Return Values

Contains the sum of magnitudes of real and imaginary parts of all elements of the vector.

### **`cblas_?axpy`**

*Computes a vector-scalar product and adds the result to a vector.*

## Syntax

```
void cblas_saxpy (const MKL_INT n, const float a, const float *x, const MKL_INT incx,
float *y, const MKL_INT incy);
void cblas_daxpy (const MKL_INT n, const double a, const double *x, const MKL_INT incx,
double *y, const MKL_INT incy);
void cblas_caxpy (const MKL_INT n, const void *a, const void *x, const MKL_INT incx,
void *y, const MKL_INT incy);
void cblas_zaxpy (const MKL_INT n, const void *a, const void *x, const MKL_INT incx,
void *y, const MKL_INT incy);
```

## Include Files

- `mkl.h`

## Description

The `?axpy` routines perform a vector-vector operation defined as

$$y := a*x + y$$

where:

`a` is a scalar

`x` and `y` are vectors each with a number of elements that equals `n`.

## Input Parameters

<code>n</code>	Specifies the number of elements in vectors <code>x</code> and <code>y</code> .
<code>a</code>	Specifies the scalar <code>a</code> .
<code>x</code>	Array, size at least $(1 + (n-1) * \text{abs}(incx))$ .
<code>incx</code>	Specifies the increment for the elements of <code>x</code> .

*y* Array, size at least  $(1 + (n-1) * \text{abs}(incy))$ .  
*incy* Specifies the increment for the elements of *y*.

## Output Parameters

*y* Contains the updated vector *y*.

### **cblas\_?copy**

*Copies a vector to another vector.*

### Syntax

```
void cblas_scopy (const MKL_INT n, const float *x, const MKL_INT incx, float *y, const MKL_INT incy);
```

```
void cblas_dcopy (const MKL_INT n, const double *x, const MKL_INT incx, double *y, const MKL_INT incy);
```

```
void cblas_ccopy (const MKL_INT n, const void *x, const MKL_INT incx, void *y, const MKL_INT incy);
```

```
void cblas_zcopy (const MKL_INT n, const void *x, const MKL_INT incx, void *y, const MKL_INT incy);
```

### Include Files

- mkl.h

### Description

The *?copy* routines perform a vector-vector operation defined as

$$y = x,$$

where *x* and *y* are vectors.

### Input Parameters

*n* Specifies the number of elements in vectors *x* and *y*.  
*x* Array, size at least  $(1 + (n-1) * \text{abs}(incx))$ .  
*incx* Specifies the increment for the elements of *x*.  
*y* Array, size at least  $(1 + (n-1) * \text{abs}(incy))$ .  
*incy* Specifies the increment for the elements of *y*.

### Output Parameters

*y* Contains a copy of the vector *x* if *n* is positive. Otherwise, parameters are unaltered.

### **cblas\_?copy\_batch**

*Computes a group of vector copies.*

## Syntax

```
void cblas_scopy_batch (const MKL_INT *n_array, const float **x_array, const MKL_INT
*incx_array, float **y_array, const MKL_INT *incy_array, const MKL_INT group_count,
const MKL_INT *group_size_array);
```

```
void cblas_dcopy_batch (const MKL_INT *n_array, const double **x_array, const MKL_INT
*incx_array, double **y_array, const MKL_INT *incy_array, const MKL_INT group_count,
const MKL_INT *group_size_array);
```

```
void cblas_ccopy_batch (const MKL_INT *n_array, const void **x_array, const MKL_INT
*incx_array, void **y_array, const MKL_INT *incy_array, const MKL_INT group_count,
const MKL_INT *group_size_array);
```

```
void cblas_zcopy_batch (const MKL_INT *n_array, const void **x_array, const MKL_INT
*incx_array, void **y_array, const MKL_INT *incy_array, const MKL_INT group_count,
const MKL_INT *group_size_array);
```

## Description

The `cblas_?copy_batch` routines perform a series of vector copies. They are similar to their `cblas_?copy` routine counterparts, but the `cblas_?copy_batch` routines perform vector operations with a group of vectors. Each groups contains vectors with the same parameters (size and increment), while those parameters may vary between groups.

The operation is defined as follows:

```
idx = 0
for i = 0 ... group_count - 1
  n, incx, incy and group_size at position i in n_array, alpha_array, incx_array, incy_array
  and group_size_array
  for j = 0 ... group_size - 1
    x and y are vectors of size n at position idx in x_array and y_array
    y := x
    idx := idx + 1
  end for
end for
```

The number of entries in `x_array` and `y_array` is `total_batch_count`, which is the sum of all the `group_size` entries.

## Input Parameters

<code>n_array</code>	Array of size <code>group_count</code> . For the group <code>i</code> , <code>n_i = n_array[i]</code> is the number of elements in the vectors <code>x</code> and <code>y</code> .
<code>x_array</code>	Array of size <code>total_batch_count</code> of pointers used to store <code>x</code> vectors. The array allocated for the <code>x</code> vectors of the group <code>i</code> must be of size at least $(1 + (n_i - 1) * \text{abs}(\text{incx}_i))$ .
<code>incx_array</code>	Array of size <code>group_count</code> . For the group <code>i</code> , <code>incx_i = incx_array[i]</code> is the increment (or <i>stride</i> ) between two consecutive elements of the vector <code>x</code> .
<code>y_array</code>	Array of size <code>total_batch_count</code> of pointers used to store the output vectors <code>y</code> . The array allocated for the <code>y</code> vectors of the group <code>i</code> must be of size at least $(1 + (n_i - 1) * \text{abs}(\text{incy}_i))$ .
<code>incy_array</code>	Array of size <code>group_count</code> . For the group <code>i</code> , <code>incy_i = incy_array[i]</code> is the increment (or <i>stride</i> ) between two consecutive elements of the vector <code>y</code> .

group_count	Number of groups. Must be at least 0.
group_size_array	Array of size group_count. The element group_size_array[i] is the number of vectors in the group i. Each element in group_size_array must be at least 0.

## Output Parameters

y_array	Array of pointers holding the total_batch_count copied vectors y.
---------	---

## cblas\_?copy\_batch\_strided

*Computes a group of vector copies.*

### Syntax

```
void cblas_scopy_batch_strided (const MKL_INT n, const float *x, const MKL_INT incx,
const MKL_INT stridex, float *y, const MKL_INT incy, const MKL_INT stridey, const
MKL_INT batch_size);
```

```
void cblas_dcopy_batch_strided (const MKL_INT n, const double *x, const MKL_INT incx,
const MKL_INT stridex, double *y, const MKL_INT incy, const MKL_INT stridey, const
MKL_INT batch_size);
```

```
void cblas_ccopy_batch_strided (const MKL_INT n, const void *x, const MKL_INT incx,
const MKL_INT stridex, void *y, const MKL_INT incy, const MKL_INT stridey, const
MKL_INT batch_size);
```

```
void cblas_zcopy_batch_strided (const MKL_INT n, const void *x, const MKL_INT incx,
const MKL_INT stridex, void *y, const MKL_INT incy, const MKL_INT stridey, const
MKL_INT batch_size);
```

### Description

The `cblas_?copy_batch_strided` routines perform a series of vector copies. They are similar to their `cblas_?copy` routine counterparts, but the `cblas_?copy_batch_strided` routines perform vector operations with a group of vectors.

All vectors `x` and `y` have the same parameters (size, increments) and are stored at constant distance `stridex` (respectively, `stridey`) from each other. The operation is defined as follows:

```
for i = 0 ... batch_size - 1
    X and Y are vectors at offset i * stridex and i * stridey in x and y
    Y = X
end for
```

### Input Parameters

n	Number of elements in vectors <code>x</code> and <code>y</code> . Must be at least 0.
x	Array containing the input vectors. Must be of size at least $(1 + (n-1)*abs(incx)) + (batch\_size - 1) * stridex$ .
incx	Increment between two consecutive elements of a single vector in <code>x</code> .
stridex	Stride between two consecutive vectors in <code>x</code> . Must be at least $(1 + (n-1)*abs(incx))$ .
y	Array holding the output vectors. Must be of size at least $(1 + (n-1)*abs(incy)) + (batch\_size - 1) * stridey$ .
incy	Increment between two consecutive elements of a single vector in <code>y</code> .

stridey	Stride between two consecutive $y$ vectors. Must be at least $(1 + (n-1) * \text{abs}(\text{incy}))$ .
batch_size	Number of copy computations to perform; also the number of $x$ and $y$ vectors. Must be at least 0.

## Output Parameters

$y$	Array holding the <code>batch_size</code> copied vectors $y$ .
-----	--

## `cblas_?dot`

*Computes a vector-vector dot product.*

---

## Syntax

```
float cblas_sdot (const MKL_INT n, const float *x, const MKL_INT incx, const float *y,
const MKL_INT incy);
```

```
double cblas_ddot (const MKL_INT n, const double *x, const MKL_INT incx, const double
*y, const MKL_INT incy);
```

## Include Files

- `mkl.h`

## Description

The `?dot` routines perform a vector-vector reduction operation defined as

$$res = \sum_{i=1}^n x_i * y_i$$

where  $x_i$  and  $y_i$  are elements of vectors  $x$  and  $y$ .

## Input Parameters

$n$	Specifies the number of elements in vectors $x$ and $y$ .
$x$	Array, size at least $(1 + (n-1) * \text{abs}(\text{incx}))$ .
$incx$	Specifies the increment for the elements of $x$ .
$y$	Array, size at least $(1 + (n-1) * \text{abs}(\text{incy}))$ .
$incy$	Specifies the increment for the elements of $y$ .

## Return Values

The result of the dot product of  $x$  and  $y$ , if  $n$  is positive. Otherwise, returns 0.

## `cblas_?sdot`

*Computes a vector-vector dot product with double precision.*

---

## Syntax

```
float cblas_sdsdot (const MKL_INT n, const float sb, const float *sx, const MKL_INT incx, const float *sy, const MKL_INT incy);
```

```
double cblas_dsdot (const MKL_INT n, const float *sx, const MKL_INT incx, const float *sy, const MKL_INT incy);
```

## Include Files

- mkl.h

## Description

The `?sdot` routines compute the inner product of two vectors with double precision. Both routines use double precision accumulation of the intermediate results, but the `sdsdot` routine outputs the final result in single precision, whereas the `dsdot` routine outputs the double precision result. The function `sdsdot` also adds scalar value `sb` to the inner product.

## Input Parameters

<code>n</code>	Specifies the number of elements in the input vectors <code>sx</code> and <code>sy</code> .
<code>sb</code>	Single precision scalar to be added to inner product (for the function <code>sdsdot</code> only).
<code>sx, sy</code>	Arrays, size at least $(1+(n-1)*abs(incx))$ and $(1+(n-1)*abs(incy))$ , respectively. Contain the input single precision vectors.
<code>incx</code>	Specifies the increment for the elements of <code>sx</code> .
<code>incy</code>	Specifies the increment for the elements of <code>sy</code> .

## Output Parameters

<code>res</code>	Contains the result of the dot product of <code>sx</code> and <code>sy</code> (with <code>sb</code> added for <code>sdsdot</code> ), if <code>n</code> is positive. Otherwise, <code>res</code> contains <code>sb</code> for <code>sdsdot</code> and 0 for <code>dsdot</code> .
------------------	---

## Return Values

The result of the dot product of `sx` and `sy` (with `sb` added for `sdsdot`), if `n` is positive. Otherwise, returns `sb` for `sdsdot` and 0 for `dsdot`.

## **cblas\_?dotc**

*Computes a dot product of a conjugated vector with another vector.*

---

## Syntax

```
void cblas_cdotc_sub (const MKL_INT n, const void *x, const MKL_INT incx, const void *y, const MKL_INT incy, void *dotc);
```

```
void cblas_zdotc_sub (const MKL_INT n, const void *x, const MKL_INT incx, const void *y, const MKL_INT incy, void *dotc);
```

## Include Files

- mkl.h

## Description

The `?dotc` routines perform a vector-vector operation defined as:

$$res = \sum_{i=1}^n \text{conjg}(x_i) * y_i,$$

where  $x_i$  and  $y_i$  are elements of vectors  $x$  and  $y$ .

## Input Parameters

<code>n</code>	Specifies the number of elements in vectors $x$ and $y$ .
<code>x</code>	Array, size at least $(1 + (n - 1) * \text{abs}(incx))$ .
<code>incx</code>	Specifies the increment for the elements of $x$ .
<code>y</code>	Array, size at least $(1 + (n - 1) * \text{abs}(incy))$ .
<code>incy</code>	Specifies the increment for the elements of $y$ .

## Output Parameters

<code>dotc</code>	Contains the result of the dot product of the conjugated $x$ and unconjugated $y$ , if $n$ is positive. Otherwise, it contains 0.
-------------------	---

## `cblas_?dotu`

*Computes a complex vector-vector dot product.*

## Syntax

```
void cblas_cdotu_sub (const MKL_INT n, const void *x, const MKL_INT incx, const void *y, const MKL_INT incy, void *dotu);
```

```
void cblas_zdotu_sub (const MKL_INT n, const void *x, const MKL_INT incx, const void *y, const MKL_INT incy, void *dotu);
```

## Include Files

- mkl.h

## Description

The `?dotu` routines perform a vector-vector reduction operation defined as

$$res = \sum_{i=1}^n x_i * y_i$$

where  $x_i$  and  $y_i$  are elements of complex vectors  $x$  and  $y$ .

---

**NOTE** The `_sub` suffix on `cblas_cdotu_sub` and `cblas_zdotu_sub` is to emphasize that these are subroutines rather than functions (the return value is stored into the `dotu` pointer).

---

### Input Parameters

<code>n</code>	Specifies the number of elements in vectors $x$ and $y$ .
<code>x</code>	Array, size at least $(1 + (n - 1) * \text{abs}(\text{incx}))$ .
<code>incx</code>	Specifies the increment for the elements of $x$ .
<code>y</code>	Array, size at least $(1 + (n - 1) * \text{abs}(\text{incy}))$ .
<code>incy</code>	Specifies the increment for the elements of $y$ .

### Output Parameters

<code>dotu</code>	Contains the result of the dot product of $x$ and $y$ , if $n$ is positive. Otherwise, it contains 0.
-------------------	---

### `cblas_?norm2`

*Computes the Euclidean norm of a vector.*

### Syntax

```
float cblas_snorm2 (const MKL_INT n, const float *x, const MKL_INT incx);
double cblas_dnorm2 (const MKL_INT n, const double *x, const MKL_INT incx);
float cblas_scnorm2 (const MKL_INT n, const void *x, const MKL_INT incx);
double cblas_dznorm2 (const MKL_INT n, const void *x, const MKL_INT incx);
```

### Include Files

- `mkl.h`

### Description

The `?norm2` routines perform a vector reduction operation defined as

```
res = ||x||,
```

where:

$x$  is a vector,

$res$  is a value containing the Euclidean norm of the elements of  $x$ .

## Input Parameters

<i>n</i>	Specifies the number of elements in vector <i>x</i> .
<i>x</i>	Array, size at least $(1 + (n - 1) * \text{abs}(incx))$ .
<i>incx</i>	Specifies the increment for the elements of <i>x</i> .

## Return Values

The Euclidean norm of the vector *x*.

## **cblas\_?rot**

*Performs rotation of points in the plane.*

## Syntax

```
void cblas_srot (const MKL_INT n, float *x, const MKL_INT incx, float *y, const MKL_INT incy,
const float c, const float s);
void cblas_drot (const MKL_INT n, double *x, const MKL_INT incx, double *y, const MKL_INT incy,
const double c, const double s);
void cblas_crot (const MKL_INT n, void *x, const MKL_INT incx, void *y, const MKL_INT incy,
const float c, const void* s);
void cblas_zrot (const MKL_INT n, void *x, const MKL_INT incx, void *y, const MKL_INT incy,
const double c, const void* s);
void cblas_csrot (const MKL_INT n, void *x, const MKL_INT incx, void *y, const MKL_INT incy,
const float c, const float s);
void cblas_zdrot (const MKL_INT n, void *x, const MKL_INT incx, void *y, const MKL_INT incy,
const double c, const double s);
```

## Description

Given two complex vectors *x* and *y*, each vector element of these vectors is replaced as follows:

$$\begin{aligned} x_i &= c * x_i + s * y_i \\ y_i &= c * y_i - s * x_i \end{aligned}$$

If *s* is a complex type, each vector element is replaced as follows:

$$\begin{aligned} x_i &= c * x_i + s * y_i \\ y_i &= c * y_i - \text{conj}(s) * x_i \end{aligned}$$

## Input Parameters

<i>n</i>	Specifies the number of elements in vectors <i>x</i> and <i>y</i> .
<i>x</i>	Array, size at least $(1 + (n - 1) * \text{abs}(incx))$ .
<i>incx</i>	Specifies the increment for the elements of <i>x</i> .
<i>y</i>	Array, size at least $(1 + (n - 1) * \text{abs}(incy))$ .
<i>incy</i>	Specifies the increment for the elements of <i>y</i> .
<i>c</i>	A scalar.
<i>s</i>	A scalar.

## Output Parameters

$x$	Each element is replaced by $c*x + s*y$ .
$y$	Each element is replaced by $c*y - s*x$ , or by $c*y - \text{conj}(s)*x$ if $s$ is a complex type.

## **cblas\_?rotg**

*Computes the parameters for a Givens rotation.*

## Syntax

```
void cblas_srotg (float *a, float *b, float *c, float *s);
void cblas_drotg (double *a, double *b, double *c, double *s);
void cblas_crotg (void *a, const void *b, float *c, void *s);
void cblas_zrotg (void *a, const void *b, double *c, void *s);
```

## Include Files

- mkl.h

## Description

Given the Cartesian coordinates  $(a, b)$  of a point, these routines return the parameters  $c, s, r$ , and  $z$  associated with the Givens rotation. The parameters  $c$  and  $s$  define a unitary matrix such that:

$$\begin{bmatrix} c & s \\ -s & c \end{bmatrix} \cdot \begin{bmatrix} a \\ b \end{bmatrix} = \begin{bmatrix} r \\ 0 \end{bmatrix}$$

The parameter  $z$  is defined such that if  $|a| > |b|$ ,  $z$  is  $s$ ; otherwise if  $c$  is not 0  $z$  is  $1/c$ ; otherwise  $z$  is 1.

## Input Parameters

$a$	Provides the $x$ -coordinate of the point $p$ .
$b$	Provides the $y$ -coordinate of the point $p$ .

## Output Parameters

$a$	Contains the parameter $r$ associated with the Givens rotation.
$b$	Contains the parameter $z$ associated with the Givens rotation.

<i>c</i>	Contains the parameter <i>c</i> associated with the Givens rotation.
<i>s</i>	Contains the parameter <i>s</i> associated with the Givens rotation.

### **cblas\_?rotm**

*Performs modified Givens rotation of points in the plane.*

### **Syntax**

```
void cblas_srotm (const MKL_INT n, float *x, const MKL_INT incx, float *y, const
MKL_INT incy, const float *param);

void cblas_drotm (const MKL_INT n, double *x, const MKL_INT incx, double *y, const
MKL_INT incy, const double *param);
```

### **Include Files**

- mkl.h

### **Description**

Given two vectors *x* and *y*, each vector element of these vectors is replaced as follows:

$$\begin{bmatrix} x_i \\ y_i \end{bmatrix} = H \begin{bmatrix} x_i \\ y_i \end{bmatrix}$$

for  $i=1$  to  $n$ , where *H* is a modified Givens transformation matrix whose values are stored in the *param*[1] through *param*[4] array. See discussion on the *param* argument.

### **Input Parameters**

<i>n</i>	Specifies the number of elements in vectors <i>x</i> and <i>y</i> .
<i>x</i>	Array, size at least $(1 + (n - 1) * \text{abs}(\text{incx}))$ .
<i>incx</i>	Specifies the increment for the elements of <i>x</i> .
<i>y</i>	Array, size at least $(1 + (n - 1) * \text{abs}(\text{incy}))$ .
<i>incy</i>	Specifies the increment for the elements of <i>y</i> .
<i>param</i>	Array, size 5. The elements of the <i>param</i> array are: <i>param</i> [0] contains a switch, <i>flag</i> . <i>param</i> [1-4] contain $h_{11}$ , $h_{21}$ , $h_{12}$ , and $h_{22}$ , respectively, the components of the array <i>H</i> .

Depending on the values of *flag*, the components of *H* are set as follows:

$$\text{flag} = -1.0: H = \begin{bmatrix} h_{11} & h_{12} \\ h_{21} & h_{22} \end{bmatrix}$$

$$\text{flag} = 0.0: H = \begin{bmatrix} 1.0 & h_{12} \\ h_{21} & 1.0 \end{bmatrix}$$

$$flag = 1.0: H = \begin{bmatrix} h_{11} & 1.0 \\ -1.0 & h_{22} \end{bmatrix}$$

$$flag = -2.0: H = \begin{bmatrix} 1.0 & 0.0 \\ 0.0 & 1.0 \end{bmatrix}$$

In the last three cases, the matrix entries of 1.0, -1.0, and 0.0 are assumed based on the value of *flag* and are not required to be set in the *param* vector.

## Output Parameters

*x* Each element  $x[i]$  is replaced by  $h_{11} * x[i] + h_{12} * y[i]$ .

*y* Each element  $y[i]$  is replaced by  $h_{21} * x[i] + h_{22} * y[i]$ .

## cblas\_?rotmg

Computes the parameters for a modified Givens rotation.

## Syntax

```
void cblas_srotmg (float *d1, float *d2, float *x1, const float y1, float *param);
void cblas_drotmg (double *d1, double *d2, double *x1, const double y1, double *param);
```

## Include Files

- mkl.h

## Description

Given Cartesian coordinates (*x1*, *y1*) of an input vector, these routines compute the components of a modified Givens transformation matrix *H* that zeros the *y*-component of the resulting vector:

$$\begin{bmatrix} x1 \\ 0 \end{bmatrix} = H \begin{bmatrix} x1\sqrt{d1} \\ y1\sqrt{d2} \end{bmatrix}$$

## Input Parameters

*d1* Provides the scaling factor for the *x*-coordinate of the input vector.

*d2* Provides the scaling factor for the *y*-coordinate of the input vector.

*x1* Provides the *x*-coordinate of the input vector.

*y1* Provides the *y*-coordinate of the input vector.

## Output Parameters

*d1* Provides the first diagonal element of the updated matrix.

*d2* Provides the second diagonal element of the updated matrix.

*x1* Provides the *x*-coordinate of the rotated vector before scaling.

*param* Array, size 5.

The elements of the *param* array are:

*param*[0] contains a switch, *flag*. the other array elements *param*[1-4] contain the components of the array *H*:  $h_{11}$ ,  $h_{21}$ ,  $h_{12}$ , and  $h_{22}$ , respectively.

Depending on the values of *flag*, the components of *H* are set as follows:

$$flag = -1.0: H = \begin{bmatrix} h_{11} & h_{12} \\ h_{21} & h_{22} \end{bmatrix}$$

$$flag = 0.0: H = \begin{bmatrix} 1.0 & h_{12} \\ h_{21} & 1.0 \end{bmatrix}$$

$$flag = 1.0: H = \begin{bmatrix} h_{11} & 1.0 \\ -1.0 & h_{22} \end{bmatrix}$$

$$flag = -2.0: H = \begin{bmatrix} 1.0 & 0.0 \\ 0.0 & 1.0 \end{bmatrix}$$

In the last three cases, the matrix entries of 1.0, -1.0, and 0.0 are assumed based on the value of *flag* and are not required to be set in the *param* vector.

## cblas\_?scal

*Computes the product of a vector by a scalar.*

### Syntax

```
void cblas_sscal (const MKL_INT n, const float a, float *x, const MKL_INT incx);
void cblas_dscal (const MKL_INT n, const double a, double *x, const MKL_INT incx);
void cblas_cscal (const MKL_INT n, const void *a, void *x, const MKL_INT incx);
void cblas_zscal (const MKL_INT n, const void *a, void *x, const MKL_INT incx);
void cblas_csscal (const MKL_INT n, const float a, void *x, const MKL_INT incx);
void cblas_zdscal (const MKL_INT n, const double a, void *x, const MKL_INT incx);
```

### Include Files

- mkl.h

### Description

The *?scal* routines perform a vector operation defined as

$$x = a * x$$

where:

*a* is a scalar, *x* is an *n*-element vector.

### Input Parameters

- |          |   |
|----------|---|
| <i>n</i> | Specifies the number of elements in vector <i>x</i> . |
| <i>a</i> | Specifies the scalar <i>a</i> .                       |

*x* Array, size at least  $(1 + (n - 1) * \text{abs}(incx))$ .

*incx* Specifies the increment for the elements of *x*.

## Output Parameters

*x* Updated vector *x*.

### **cblas\_?swap**

*Swaps a vector with another vector.*

---

## Syntax

```
void cblas_sswap (const MKL_INT n, float *x, const MKL_INT incx, float *y, const
MKL_INT incy);
```

```
void cblas_dswap (const MKL_INT n, double *x, const MKL_INT incx, double *y, const
MKL_INT incy);
```

```
void cblas_cswap (const MKL_INT n, void *x, const MKL_INT incx, void *y, const MKL_INT
incy);
```

```
void cblas_zswap (const MKL_INT n, void *x, const MKL_INT incx, void *y, const MKL_INT
incy);
```

## Include Files

- mkl.h

## Description

Given two vectors *x* and *y*, the ?swap routines return vectors *y* and *x* swapped, each replacing the other.

## Input Parameters

*n* Specifies the number of elements in vectors *x* and *y*.

*x* Array, size at least  $(1 + (n-1) * \text{abs}(incx))$ .

*incx* Specifies the increment for the elements of *x*.

*y* Array, size at least  $(1 + (n-1) * \text{abs}(incy))$ .

*incy* Specifies the increment for the elements of *y*.

## Output Parameters

*x* Contains the resultant vector *x*, that is, the input vector *y*.

*y* Contains the resultant vector *y*, that is, the input vector *x*.

### **cblas\_i?amax**

*Finds the index of the element with maximum absolute value.*

---

## Syntax

```
CBLAS_INDEX cblas_isamax (const MKL_INT n, const float *x, const MKL_INT incx);
```

```

CBLAS_INDEX cblas_idamax (const MKL_INT n, const double *x, const MKL_INT incx);
CBLAS_INDEX cblas_icamax (const MKL_INT n, const void *x, const MKL_INT incx);
CBLAS_INDEX cblas_izamax (const MKL_INT n, const void *x, const MKL_INT incx);

```

## Include Files

- mkl.h

## Description

Given a vector  $x$ , the  $i?amax$  functions return the position of the vector element  $x[i]$  that has the largest absolute value for real flavors, or the largest sum  $|\operatorname{Re}(x[i])| + |\operatorname{Im}(x[i])|$  for complex flavors.

If either  $n$  or  $incx$  are not positive, the routine returns 0.

If more than one vector element is found with the same largest absolute value, the index of the first one encountered is returned.

If the vector contains NaN values, then the routine returns the index of the first NaN.

## Input Parameters

$n$	Specifies the number of elements in vector $x$ .
$x$	Array, size at least $(1+(n-1)*\operatorname{abs}(incx))$ .
$incx$	Specifies the increment for the elements of $x$ .

## Return Values

Returns the position of vector element that has the largest absolute value such that  $x[index-1]$  has the largest absolute value. The index returned is zero-based.

### **cblas\_i?amin**

*Finds the index of the element with the smallest absolute value.*

## Syntax

```

CBLAS_INDEX cblas_isamin (const MKL_INT n, const float *x, const MKL_INT incx);
CBLAS_INDEX cblas_idamin (const MKL_INT n, const double *x, const MKL_INT incx);
CBLAS_INDEX cblas_icamin (const MKL_INT n, const void *x, const MKL_INT incx);
CBLAS_INDEX cblas_izamin (const MKL_INT n, const void *x, const MKL_INT incx);

```

## Include Files

- mkl.h

## Description

Given a vector  $x$ , the  $i?amin$  functions return the position of the vector element  $x[i]$  that has the smallest absolute value for real flavors, or the smallest sum  $|\operatorname{Re}(x[i])| + |\operatorname{Im}(x[i])|$  for complex flavors.

If either  $n$  or  $incx$  are not positive, the routine returns 0.

If more than one vector element is found with the same smallest absolute value, the index of the first one encountered is returned.

If the vector contains NaN values, then the routine returns the index of the first NaN.

### Input Parameters

$n$	On entry, $n$ specifies the number of elements in vector $x$ .
$x$	Array, size at least $(1+(n-1)*abs(incx))$ .
$incx$	Specifies the increment for the elements of $x$ .

### Return Values

Indicates the position of vector element with the smallest absolute value such that  $x[index-1]$  has the smallest absolute value. The index returned is zero-based.

### **cblas\_?cabs1**

*Computes absolute value of complex number.*

### Syntax

```
float cblas_scabs1 (const void *z);
double cblas_dcabs1 (const void *z);
```

### Include Files

- mkl.h

### Description

The `?cabs1` is an auxiliary routine for a few BLAS Level 1 routines. This routine performs an operation defined as

$$res = |\operatorname{Re}(z)| + |\operatorname{Im}(z)|,$$

where  $z$  is a scalar, and  $res$  is a value containing the absolute value of a complex number  $z$ .

### Input Parameters

$z$	Scalar.
-----	---------

### Return Values

The absolute value of a complex number  $z$ .

## BLAS Level 2 Routines

This section describes BLAS Level 2 routines, which perform matrix-vector operations. The following table lists the BLAS Level 2 routine groups and the data types associated with them.

### BLAS Level 2 Routine Groups and Their Data Types

Routine Groups	Data Types	Description
<code>cblas_?gbmv</code>	s, d, c, z	Matrix-vector product using a general band matrix
<code>cblas?_gemv</code>	s, d, c, z	Matrix-vector product using a general matrix
<code>cblas_?ger</code>	s, d	Rank-1 update of a general matrix

Routine Groups	Data Types	Description
<code>cblas_?gerc</code>	c, z	Rank-1 update of a conjugated general matrix
<code>cblas_?geru</code>	c, z	Rank-1 update of a general matrix, unconjugated
<code>cblas_?hbmV</code>	c, z	Matrix-vector product using a Hermitian band matrix
<code>cblas_?hemv</code>	c, z	Matrix-vector product using a Hermitian matrix
<code>cblas_?her</code>	c, z	Rank-1 update of a Hermitian matrix
<code>cblas_?her2</code>	c, z	Rank-2 update of a Hermitian matrix
<code>cblas_?hpmv</code>	c, z	Matrix-vector product using a Hermitian packed matrix
<code>cblas_?hpr</code>	c, z	Rank-1 update of a Hermitian packed matrix
<code>cblas_?hpr2</code>	c, z	Rank-2 update of a Hermitian packed matrix
<code>cblas_?sbmv</code>	s, d	Matrix-vector product using symmetric band matrix
<code>cblas_?spmv</code>	s, d	Matrix-vector product using a symmetric packed matrix
<code>cblas_?spr</code>	s, d	Rank-1 update of a symmetric packed matrix
<code>cblas_?spr2</code>	s, d	Rank-2 update of a symmetric packed matrix
<code>cblas_?symv</code>	s, d	Matrix-vector product using a symmetric matrix
<code>cblas_?syr</code>	s, d	Rank-1 update of a symmetric matrix
<code>cblas_?syr2</code>	s, d	Rank-2 update of a symmetric matrix
<code>cblas_?tbmv</code>	s, d, c, z	Matrix-vector product using a triangular band matrix
<code>cblas_?tbsv</code>	s, d, c, z	Solution of a linear system of equations with a triangular band matrix
<code>cblas_?tpmv</code>	s, d, c, z	Matrix-vector product using a triangular packed matrix
<code>cblas_?tpsv</code>	s, d, c, z	Solution of a linear system of equations with a triangular packed matrix
<code>cblas_?trmv</code>	s, d, c, z	Matrix-vector product using a triangular matrix
<code>cblas_?trsv</code>	s, d, c, z	Solution of a linear system of equations with a triangular matrix

**`cblas_?gbmv`**

*Computes a matrix-vector product with a general band matrix.*

**Syntax**

```
void cblas_sgbmv (const CBLAS_LAYOUT Layout, const CBLAS_TRANSPOSE trans, const MKL_INT m, const MKL_INT n, const MKL_INT kl, const MKL_INT ku, const float alpha, const float *a, const MKL_INT lda, const float *x, const MKL_INT incx, const float beta, float *y, const MKL_INT incy);
```

```
void cblas_dgbmv (const CBLAS_LAYOUT Layout, const CBLAS_TRANSPOSE trans, const MKL_INT
m, const MKL_INT n, const MKL_INT kl, const MKL_INT ku, const double alpha, const
double *a, const MKL_INT lda, const double *x, const MKL_INT incx, const double beta,
double *y, const MKL_INT incy);
```

```
void cblas_cgbmv (const CBLAS_LAYOUT Layout, const CBLAS_TRANSPOSE trans, const MKL_INT
m, const MKL_INT n, const MKL_INT kl, const MKL_INT ku, const void *alpha, const void
*a, const MKL_INT lda, const void *x, const MKL_INT incx, const void *beta, void *y,
const MKL_INT incy);
```

```
void cblas_zgbmv (const CBLAS_LAYOUT Layout, const CBLAS_TRANSPOSE trans, const MKL_INT
m, const MKL_INT n, const MKL_INT kl, const MKL_INT ku, const void *alpha, const void
*a, const MKL_INT lda, const void *x, const MKL_INT incx, const void *beta, void *y,
const MKL_INT incy);
```

## Include Files

- mkl.h

## Description

The ?gbmv routines perform a matrix-vector operation defined as

$$y := \alpha A x + \beta y,$$

or

$$y := \alpha A' x + \beta y,$$

or

$$y := \alpha \text{conjg}(A') x + \beta y,$$

where:

$\alpha$  and  $\beta$  are scalars,

$x$  and  $y$  are vectors,

$A$  is an  $m$ -by- $n$  band matrix, with  $kl$  sub-diagonals and  $ku$  super-diagonals.

## Input Parameters

<i>Layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>trans</i>	Specifies the operation: If $trans=CblasNoTrans$ , then $y := \alpha A x + \beta y$ If $trans=CblasTrans$ , then $y := \alpha A' x + \beta y$ If $trans=CblasConjTrans$ , then $y := \alpha \text{conjg}(A') x + \beta y$
<i>m</i>	Specifies the number of rows of the matrix $A$ . The value of $m$ must be at least zero.
<i>n</i>	Specifies the number of columns of the matrix $A$ . The value of $n$ must be at least zero.
<i>kl</i>	Specifies the number of sub-diagonals of the matrix $A$ .

The value of  $kl$  must satisfy  $0 \leq kl$ .

$ku$

Specifies the number of super-diagonals of the matrix  $A$ .

The value of  $ku$  must satisfy  $0 \leq ku$ .

$alpha$

Specifies the scalar  $alpha$ .

$a$

Array, size  $lda * n$ .

*Layout = CblasColMajor:* Before entry, the leading  $(kl + ku + 1)$  by  $n$  part of the array  $a$  must contain the matrix of coefficients. This matrix must be supplied column-by-column, with the leading diagonal of the matrix in row  $(ku)$  of the array, the first super-diagonal starting at position 1 in row  $(ku - 1)$ , the first sub-diagonal starting at position 0 in row  $(ku + 1)$ , and so on. Elements in the array  $a$  that do not correspond to elements in the band matrix (such as the top left  $ku$  by  $ku$  triangle) are not referenced.

The following program segment transfers a band matrix from conventional full matrix storage ( $matrix$ , with leading dimension  $ldm$ ) to band storage ( $a$ , with leading dimension  $lda$ ):

```
for (j = 0; j < n; j++) {
    k = ku - j;
    for (i = max(0, j-ku); i < min(m, j+kl+1); i++) {
        a[(k+i) + j*lda] = matrix[i + j*ldm];
    }
}
```

*Layout = CblasRowMajor:* Before entry, the leading  $(kl + ku + 1)$  by  $m$  part of the array  $a$  must contain the matrix of coefficients. This matrix must be supplied row-by-row, with the leading diagonal of the matrix in column  $(kl)$  of the array, the first super-diagonal starting at position 0 in column  $(kl + 1)$ , the first sub-diagonal starting at position 1 in row  $(kl - 1)$ , and so on. Elements in the array  $a$  that do not correspond to elements in the band matrix (such as the top left  $kl$  by  $kl$  triangle) are not referenced.

The following program segment transfers a band matrix from row-major full matrix storage ( $matrix$ , with leading dimension  $ldm$ ) to band storage ( $a$ , with leading dimension  $lda$ ):

```
for (i = 0; i < m; i++) {
    k = kl - i;
    for (j = max(0, i-kl); j < min(n, i+ku+1); j++) {
        a[(k+j) + i*lda] = matrix[j + i*ldm];
    }
}
```

$lda$

Specifies the leading dimension of  $a$  as declared in the calling (sub)program. The value of  $lda$  must be at least  $(kl + ku + 1)$ .

$x$

Array, size at least  $(1 + (n - 1) * \text{abs}(incx))$  when  $trans = \text{CblasNoTrans}$ , and at least  $(1 + (m - 1) * \text{abs}(incx))$  otherwise. Before entry, the array  $x$  must contain the vector  $x$ .

$incx$

Specifies the increment for the elements of  $x$ .  $incx$  must not be zero.

$beta$

Specifies the scalar  $beta$ . When  $beta$  is equal to zero, then  $y$  need not be set on input.

*y* Array, size at least  $(1 + (m - 1) * \text{abs}(incy))$  when *trans*=CblasNoTrans and at least  $(1 + (n - 1) * \text{abs}(incy))$  otherwise. Before entry, the incremented array *y* must contain the vector *y*.

*incy* Specifies the increment for the elements of *y*.  
The value of *incy* must not be zero.

## Output Parameters

*y* Buffer holding the updated vector *y*.

## cblas\_?gemv

Computes a matrix-vector product using a general matrix.

### Syntax

```
void cblas_sgemv (const CBLAS_LAYOUT Layout, const CBLAS_TRANSPOSE trans, const MKL_INT m, const MKL_INT n, const float alpha, const float *a, const MKL_INT lda, const float *x, const MKL_INT incx, const float beta, float *y, const MKL_INT incy);
```

```
void cblas_dgemv (const CBLAS_LAYOUT Layout, const CBLAS_TRANSPOSE trans, const MKL_INT m, const MKL_INT n, const double alpha, const double *a, const MKL_INT lda, const double *x, const MKL_INT incx, const double beta, double *y, const MKL_INT incy);
```

```
void cblas_cgemv (const CBLAS_LAYOUT Layout, const CBLAS_TRANSPOSE trans, const MKL_INT m, const MKL_INT n, const void *alpha, const void *a, const MKL_INT lda, const void *x, const MKL_INT incx, const void *beta, void *y, const MKL_INT incy);
```

```
void cblas_zgemv (const CBLAS_LAYOUT Layout, const CBLAS_TRANSPOSE trans, const MKL_INT m, const MKL_INT n, const void *alpha, const void *a, const MKL_INT lda, const void *x, const MKL_INT incx, const void *beta, void *y, const MKL_INT incy);
```

### Include Files

- mkl.h

### Description

The ?gemv routines perform a matrix-vector operation defined as:

$$y := \alpha * A * x + \beta * y,$$

or

$$y := \alpha * A' * x + \beta * y,$$

or

$$y := \alpha * \text{conjg}(A') * x + \beta * y,$$

where:

*alpha* and *beta* are scalars,

*x* and *y* are vectors,

*A* is an *m*-by-*n* matrix.

## Input Parameters

<i>Layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>trans</i>	Specifies the operation: if $trans=CblasNoTrans$ , then $y := \alpha * A * x + \beta * y$ ; if $trans=CblasTrans$ , then $y := \alpha * A' * x + \beta * y$ ; if $trans=CblasConjTrans$ , then $y := \alpha * \text{conjg}(A') * x + \beta * y$ .
<i>m</i>	Specifies the number of rows of the matrix <i>A</i> . The value of <i>m</i> must be at least zero.
<i>n</i>	Specifies the number of columns of the matrix <i>A</i> . The value of <i>n</i> must be at least zero.
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>a</i>	Array, size $lda * k$ . For $Layout = CblasColMajor$ , <i>k</i> is <i>n</i> . Before entry, the leading <i>m</i> -by- <i>n</i> part of the array <i>a</i> must contain the matrix <i>A</i> . For $Layout = CblasRowMajor$ , <i>k</i> is <i>m</i> . Before entry, the leading <i>n</i> -by- <i>m</i> part of the array <i>a</i> must contain the matrix <i>A</i> .
<i>lda</i>	Specifies the leading dimension of <i>a</i> as declared in the calling (sub)program. For $Layout = CblasColMajor$ , the value of <i>lda</i> must be at least $\max(1, m)$ . For $Layout = CblasRowMajor$ , the value of <i>lda</i> must be at least $\max(1, n)$ .
<i>x</i>	Array, size at least $(1 + (n - 1) * \text{abs}(\text{incx}))$ when $trans=CblasNoTrans$ and at least $(1 + (m - 1) * \text{abs}(\text{incx}))$ otherwise. Before entry, the incremented array <i>x</i> must contain the vector <i>x</i> .
<i>incx</i>	Specifies the increment for the elements of <i>x</i> . The value of <i>incx</i> must not be zero.
<i>beta</i>	Specifies the scalar <i>beta</i> . When <i>beta</i> is set to zero, then <i>y</i> need not be set on input.
<i>y</i>	Array, size at least $(1 + (m - 1) * \text{abs}(\text{incy}))$ when $trans=CblasNoTrans$ and at least $(1 + (n - 1) * \text{abs}(\text{incy}))$ otherwise. Before entry with non-zero <i>beta</i> , the incremented array <i>y</i> must contain the vector <i>y</i> .
<i>incy</i>	Specifies the increment for the elements of <i>y</i> . The value of <i>incy</i> must not be zero.

## Output Parameters

<i>y</i>	Updated vector <i>y</i> .
----------	---------------------------

## cblas\_?ger

Performs a rank-1 update of a general matrix.

### Syntax

```
void cblas_sger (const CBLAS_LAYOUT Layout, const MKL_INT m, const MKL_INT n, const
float alpha, const float *x, const MKL_INT incx, const float *y, const MKL_INT incy,
float *a, const MKL_INT lda);
```

```
void cblas_dger (const CBLAS_LAYOUT Layout, const MKL_INT m, const MKL_INT n, const
double alpha, const double *x, const MKL_INT incx, const double *y, const MKL_INT incy,
double *a, const MKL_INT lda);
```

### Include Files

- mkl.h

### Description

The ?ger routines perform a matrix-vector operation defined as

$$A := \alpha x y^T + A,$$

where:

$\alpha$  is a scalar,

$x$  is an  $m$ -element vector,

$y$  is an  $n$ -element vector,

$A$  is an  $m$ -by- $n$  general matrix.

### Input Parameters

<i>Layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>m</i>	Specifies the number of rows of the matrix $A$ . The value of $m$ must be at least zero.
<i>n</i>	Specifies the number of columns of the matrix $A$ . The value of $n$ must be at least zero.
<i>alpha</i>	Specifies the scalar $\alpha$ .
<i>x</i>	Array, size at least $(1 + (m - 1) * \text{abs}(incx))$ . Before entry, the incremented array $x$ must contain the $m$ -element vector $x$ .
<i>incx</i>	Specifies the increment for the elements of $x$ . The value of $incx$ must not be zero.
<i>y</i>	Array, size at least $(1 + (n - 1) * \text{abs}(incy))$ . Before entry, the incremented array $y$ must contain the $n$ -element vector $y$ .
<i>incy</i>	Specifies the increment for the elements of $y$ . The value of $incy$ must not be zero.
<i>a</i>	Array, size $lda * k$ .

For *Layout* = CblasColMajor, *k* is *n*. Before entry, the leading *m*-by-*n* part of the array *a* must contain the matrix *A*.

For *Layout* = CblasRowMajor, *k* is *m*. Before entry, the leading *n*-by-*m* part of the array *a* must contain the matrix *A*.

*lda*

Specifies the leading dimension of *a* as declared in the calling (sub)program.

For *Layout* = CblasColMajor, the value of *lda* must be at least  $\max(1, m)$ .

For *Layout* = CblasRowMajor, the value of *lda* must be at least  $\max(1, n)$ .

## Output Parameters

*a*

Overwritten by the updated matrix.

## **cblas\_?gerc**

Performs a rank-1 update (conjugated) of a general matrix.

## Syntax

```
void cblas_cgerc (const CBLAS_LAYOUT Layout, const MKL_INT m, const MKL_INT n, const void *alpha, const void *x, const MKL_INT incx, const void *y, const MKL_INT incy, void *a, const MKL_INT lda);
```

```
void cblas_zgerc (const CBLAS_LAYOUT Layout, const MKL_INT m, const MKL_INT n, const void *alpha, const void *x, const MKL_INT incx, const void *y, const MKL_INT incy, void *a, const MKL_INT lda);
```

## Include Files

- mkl.h

## Description

The *?gerc* routines perform a matrix-vector operation defined as

$$A := \alpha * x * \text{conjg}(y') + A,$$

where:

*alpha* is a scalar,

*x* is an *m*-element vector,

*y* is an *n*-element vector,

*A* is an *m*-by-*n* matrix.

## Input Parameters

*Layout*

Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).

*m*

Specifies the number of rows of the matrix *A*.

	The value of $m$ must be at least zero.
$n$	Specifies the number of columns of the matrix $A$ . The value of $n$ must be at least zero.
$alpha$	Specifies the scalar $alpha$ .
$x$	Array, size at least $(1 + (m - 1) * abs(incx))$ . Before entry, the incremented array $x$ must contain the $m$ -element vector $x$ .
$incx$	Specifies the increment for the elements of $x$ . The value of $incx$ must not be zero.
$y$	Array, size at least $(1 + (n - 1) * abs(incy))$ . Before entry, the incremented array $y$ must contain the $n$ -element vector $y$ .
$incy$	Specifies the increment for the elements of $y$ . The value of $incy$ must not be zero.
$a$	Array, size $lda * k$ . For $Layout = CblasColMajor$ , $k$ is $n$ . Before entry, the leading $m$ -by- $n$ part of the array $a$ must contain the matrix $A$ . For $Layout = CblasRowMajor$ , $k$ is $m$ . Before entry, the leading $n$ -by- $m$ part of the array $a$ must contain the matrix $A$ .
$lda$	Specifies the leading dimension of $a$ as declared in the calling (sub)program. For $Layout = CblasColMajor$ , the value of $lda$ must be at least $\max(1, m)$ . For $Layout = CblasRowMajor$ , the value of $lda$ must be at least $\max(1, n)$ .

## Output Parameters

$a$	Overwritten by the updated matrix.
-----	------------------------------------

## cblas\_?geru

Performs a rank-1 update (unconjugated) of a general matrix.

### Syntax

```
void cblas_cgeru (const CBLAS_LAYOUT Layout, const MKL_INT m, const MKL_INT n, const void *alpha, const void *x, const MKL_INT incx, const void *y, const MKL_INT incy, void *a, const MKL_INT lda);
```

```
void cblas_zgeru (const CBLAS_LAYOUT Layout, const MKL_INT m, const MKL_INT n, const void *alpha, const void *x, const MKL_INT incx, const void *y, const MKL_INT incy, void *a, const MKL_INT lda);
```

### Include Files

- mkl.h

## Description

The `?geru` routines perform a matrix-vector operation defined as

$$A := \alpha * x * y^T + A,$$

where:

*alpha* is a scalar,

*x* is an *m*-element vector,

*y* is an *n*-element vector,

*A* is an *m*-by-*n* matrix.

## Input Parameters

<i>Layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>m</i>	Specifies the number of rows of the matrix <i>A</i> . The value of <i>m</i> must be at least zero.
<i>n</i>	Specifies the number of columns of the matrix <i>A</i> . The value of <i>n</i> must be at least zero.
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>x</i>	Array, size at least $(1 + (m - 1) * \text{abs}(\text{incx}))$ . Before entry, the incremented array <i>x</i> must contain the <i>m</i> -element vector <i>x</i> .
<i>incx</i>	Specifies the increment for the elements of <i>x</i> . The value of <i>incx</i> must not be zero.
<i>y</i>	Array, size at least $(1 + (n - 1) * \text{abs}(\text{incy}))$ . Before entry, the incremented array <i>y</i> must contain the <i>n</i> -element vector <i>y</i> .
<i>incy</i>	Specifies the increment for the elements of <i>y</i> . The value of <i>incy</i> must not be zero.
<i>a</i>	Array, size <i>lda</i> * <i>k</i> . For <i>Layout</i> = CblasColMajor, <i>k</i> is <i>n</i> . Before entry, the leading <i>m</i> -by- <i>n</i> part of the array <i>a</i> must contain the matrix <i>A</i> . For <i>Layout</i> = CblasRowMajor, <i>k</i> is <i>m</i> . Before entry, the leading <i>n</i> -by- <i>m</i> part of the array <i>a</i> must contain the matrix <i>A</i> .
<i>lda</i>	Specifies the leading dimension of <i>a</i> as declared in the calling (sub)program. For <i>Layout</i> = CblasColMajor, the value of <i>lda</i> must be at least $\max(1, m)$ . For <i>Layout</i> = CblasRowMajor, the value of <i>lda</i> must be at least $\max(1, n)$ .

## Output Parameters

*a* Overwritten by the updated matrix.

### **cblas\_?hbm**

Computes a matrix-vector product using a Hermitian band matrix.

### Syntax

```
void cblas_chbmv (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const MKL_INT n,
const MKL_INT k, const void *alpha, const void *a, const MKL_INT lda, const void *x,
const MKL_INT incx, const void *beta, void *y, const MKL_INT incy);
```

```
void cblas_zhbmv (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const MKL_INT n,
const MKL_INT k, const void *alpha, const void *a, const MKL_INT lda, const void *x,
const MKL_INT incx, const void *beta, void *y, const MKL_INT incy);
```

### Include Files

- mkl.h

### Description

The ?hbm routines perform a matrix-vector operation defined as  $y := \alpha * A * x + \beta * y$ ,

where:

*alpha* and *beta* are scalars,

*x* and *y* are *n*-element vectors,

*A* is an *n*-by-*n* Hermitian band matrix, with *k* super-diagonals.

### Input Parameters

<i>Layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>uplo</i>	Specifies whether the upper or lower triangular part of the Hermitian band matrix <i>A</i> is used: If <i>uplo</i> = CblasUpper, then the upper triangular part of the matrix <i>A</i> is used. If <i>uplo</i> = CblasLower, then the low triangular part of the matrix <i>A</i> is used.
<i>n</i>	Specifies the order of the matrix <i>A</i> . The value of <i>n</i> must be at least zero.
<i>k</i>	For <i>uplo</i> = CblasUpper: Specifies the number of super-diagonals of the matrix <i>A</i> . For <i>uplo</i> = CblasLower: Specifies the number of sub-diagonals of the matrix <i>A</i> . The value of <i>k</i> must satisfy $0 \leq k$ .
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>a</i>	Array, size $lda * n$ .

Layout = CblasColMajor:

Before entry with `uplo = CblasUpper`, the leading  $(k + 1)$  by  $n$  part of the array  $a$  must contain the upper triangular band part of the Hermitian matrix. The matrix must be supplied column-by-column, with the leading diagonal of the matrix in row  $k$  of the array, the first super-diagonal starting at position 1 in row  $(k - 1)$ , and so on. The top left  $k$  by  $k$  triangle of the array  $a$  is not referenced.

The following program segment transfers the upper triangular part of a Hermitian band matrix from conventional full matrix storage ( $matrix$ , with leading dimension  $ldm$ ) to band storage ( $a$ , with leading dimension  $lda$ ):

```
for (j = 0; j < n; j++) {
    m = k - j;
    for (i = max( 0, j - k); i <= j; i++) {
        a[(m+i) + j*lda] = matrix[i + j*ldm];
    }
}
```

Before entry with `uplo = CblasLower`, the leading  $(k + 1)$  by  $n$  part of the array  $a$  must contain the lower triangular band part of the Hermitian matrix, supplied column-by-column, with the leading diagonal of the matrix in row 0 of the array, the first sub-diagonal starting at position 0 in row 1, and so on. The bottom right  $k$  by  $k$  triangle of the array  $a$  is not referenced.

The following program segment transfers the lower triangular part of a Hermitian band matrix from conventional full matrix storage ( $matrix$ , with leading dimension  $ldm$ ) to band storage ( $a$ , with leading dimension  $lda$ ):

```
for (j = 0; j < n; j++) {
    m = -j;
    for (i = j; i < min(n, j + k + 1); i++) {
        a[(m+i) + j*lda] = matrix[i + j*ldm];
    }
}
```

Layout = CblasRowMajor:

Before entry with `uplo = CblasUpper`, the leading  $(k + 1)$ -by- $n$  part of array  $a$  must contain the upper triangular band part of the Hermitian matrix. The matrix must be supplied row-by-row, with the leading diagonal of the matrix in column 0 of the array, the first super-diagonal starting at position 0 in column 1, and so on. The bottom right  $k$ -by- $k$  triangle of array  $a$  is not referenced.

The following program segment transfers the upper triangular part of a Hermitian band matrix from row-major full matrix storage ( $matrix$  with leading dimension  $ldm$ ) to row-major band storage ( $a$ , with leading dimension  $lda$ ):

```
for (i = 0; i < n; i++) {
    m = -i;
    for (j = i; j < MIN(n, i+k+1); j++) {
        a[(m+j) + i*lda] = matrix[j + i*ldm];
    }
}
```

Before entry with `uplo = CblasLower`, the leading  $(k + 1)$ -by- $n$  part of array `a` must contain the lower triangular band part of the Hermitian matrix, supplied row-by-row, with the leading diagonal of the matrix in column  $k$  of the array, the first sub-diagonal starting at position 1 in column  $k-1$ , and so on. The top left  $k$ -by- $k$  triangle of array `a` is not referenced.

The following program segment transfers the lower triangular part of a Hermitian row-major band matrix from row-major full matrix storage (`matrix`, with leading dimension `ldm`) to row-major band storage (`a`, with leading dimension `lda`):

```
for (i = 0; i < n; i++) {
    m = k - i;
    for (j = max(0, i-k); j <= i; j++) {
        a[(m+j) + i*lda] = matrix[j + i*ldm];
    }
}
```

The imaginary parts of the diagonal elements need not be set and are assumed to be zero.

<code>lda</code>	Specifies the leading dimension of <code>a</code> as declared in the calling (sub)program. The value of <code>lda</code> must be at least $(k + 1)$ .
<code>x</code>	Array, size at least $(1 + (n - 1) * \text{abs}(\text{incx}))$ . Before entry, the incremented array <code>x</code> must contain the vector <code>x</code> .
<code>incx</code>	Specifies the increment for the elements of <code>x</code> . The value of <code>incx</code> must not be zero.
<code>beta</code>	Specifies the scalar <code>beta</code> .
<code>y</code>	Array, size at least $(1 + (n - 1) * \text{abs}(\text{incy}))$ . Before entry, the incremented array <code>y</code> must contain the vector <code>y</code> .
<code>incy</code>	Specifies the increment for the elements of <code>y</code> . The value of <code>incy</code> must not be zero.

## Output Parameters

<code>y</code>	Overwritten by the updated vector <code>y</code> .
----------------	--

## `cblas_?hemv`

Computes a matrix-vector product using a Hermitian matrix.

### Syntax

```
void cblas_chemv (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const MKL_INT n,
const void *alpha, const void *a, const MKL_INT lda, const void *x, const MKL_INT incx,
const void *beta, void *y, const MKL_INT incy);
```

```
void cblas_zhemv (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const MKL_INT n,
const void *alpha, const void *a, const MKL_INT lda, const void *x, const MKL_INT incx,
const void *beta, void *y, const MKL_INT incy);
```

## Include Files

- mkl.h

## Description

The ?hemv routines perform a matrix-vector operation defined as

$$y := \alpha * A * x + \beta * y,$$

where:

*alpha* and *beta* are scalars,

*x* and *y* are *n*-element vectors,

*A* is an *n*-by-*n* Hermitian matrix.

## Input Parameters

<i>layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>uplo</i>	Specifies whether the upper or lower triangular part of the array <i>a</i> is used. If <i>uplo</i> = CblasUpper, then the upper triangular of the array <i>a</i> is used. If <i>uplo</i> = CblasLower, then the low triangular of the array <i>a</i> is used.
<i>n</i>	Specifies the order of the matrix <i>A</i> . The value of <i>n</i> must be at least zero.
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>a</i>	Array, size <i>lda</i> * <i>n</i> .  Before entry with <i>uplo</i> = CblasUpper, the leading <i>n</i> -by- <i>n</i> upper triangular part of the array <i>a</i> must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of <i>a</i> is not referenced. Before entry with <i>uplo</i> = CblasLower, the leading <i>n</i> -by- <i>n</i> lower triangular part of the array <i>a</i> must contain the lower triangular part of the Hermitian matrix and the strictly upper triangular part of <i>a</i> is not referenced.  The imaginary parts of the diagonal elements need not be set and are assumed to be zero.
<i>lda</i>	Specifies the leading dimension of <i>a</i> as declared in the calling (sub)program. The value of <i>lda</i> must be at least $\max(1, n)$ .
<i>x</i>	Array, size at least $(1 + (n - 1) * \text{abs}(\text{incx}))$ . Before entry, the incremented array <i>x</i> must contain the <i>n</i> -element vector <i>x</i> .
<i>incx</i>	Specifies the increment for the elements of <i>x</i> . The value of <i>incx</i> must not be zero.
<i>beta</i>	Specifies the scalar <i>beta</i> . When <i>beta</i> is supplied as zero then <i>y</i> need not be set on input.
<i>y</i>	Array, size at least $(1 + (n - 1) * \text{abs}(\text{incy}))$ . Before entry, the incremented array <i>y</i> must contain the <i>n</i> -element vector <i>y</i> .
<i>incy</i>	Specifies the increment for the elements of <i>y</i> .

The value of *incx* must not be zero.

## Output Parameters

*y* Overwritten by the updated vector *y*.

## `cblas_?her`

Performs a rank-1 update of a Hermitian matrix.

## Syntax

```
void cblas_cher (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const MKL_INT n,
const float alpha, const void *x, const MKL_INT incx, void *a, const MKL_INT lda);
void cblas_zher (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const MKL_INT n,
const double alpha, const void *x, const MKL_INT incx, void *a, const MKL_INT lda);
```

## Include Files

- `mkl.h`

## Description

The `?her` routines perform a matrix-vector operation defined as

$$A := \alpha * x * \text{conjg}(x') + A,$$

where:

*alpha* is a real scalar,

*x* is an *n*-element vector,

*A* is an *n*-by-*n* Hermitian matrix.

## Input Parameters

<i>Layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>uplo</i>	Specifies whether the upper or lower triangular part of the array <i>a</i> is used. If <i>uplo</i> = CblasUpper, then the upper triangular of the array <i>a</i> is used. If <i>uplo</i> = CblasLower, then the low triangular of the array <i>a</i> is used.
<i>n</i>	Specifies the order of the matrix <i>A</i> . The value of <i>n</i> must be at least zero.
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>x</i>	Array, dimension at least $(1 + (n - 1) * \text{abs}(incx))$ . Before entry, the incremented array <i>x</i> must contain the <i>n</i> -element vector <i>x</i> .
<i>incx</i>	Specifies the increment for the elements of <i>x</i> . The value of <i>incx</i> must not be zero.
<i>a</i>	Array, size <i>lda</i> * <i>n</i> .

Before entry with `uplo = CblasUpper`, the leading  $n$ -by- $n$  upper triangular part of the array  $a$  must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of  $a$  is not referenced.

Before entry with `uplo = CblasLower`, the leading  $n$ -by- $n$  lower triangular part of the array  $a$  must contain the lower triangular part of the Hermitian matrix and the strictly upper triangular part of  $a$  is not referenced.

The imaginary parts of the diagonal elements need not be set and are assumed to be zero.

`lda`

Specifies the leading dimension of  $a$  as declared in the calling (sub)program. The value of `lda` must be at least  $\max(1, n)$ .

## Output Parameters

`a`

With `uplo = CblasUpper`, the upper triangular part of the array  $a$  is overwritten by the upper triangular part of the updated matrix.

With `uplo = CblasLower`, the lower triangular part of the array  $a$  is overwritten by the lower triangular part of the updated matrix.

If `alpha` is zero, matrix  $A$  is unchanged; otherwise, the imaginary parts of the diagonal elements are set to zero.

## `cblas_?her2`

*Performs a rank-2 update of a Hermitian matrix.*

### Syntax

```
void cblas_cher2 (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const MKL_INT n,
const void *alpha, const void *x, const MKL_INT incx, const void *y, const MKL_INT
incy, void *a, const MKL_INT lda);
```

```
void cblas_zher2 (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const MKL_INT n,
const void *alpha, const void *x, const MKL_INT incx, const void *y, const MKL_INT
incy, void *a, const MKL_INT lda);
```

### Include Files

- `mkl.h`

### Description

The `?her2` routines perform a matrix-vector operation defined as

$$A := \alpha * x * \text{conjg}(y') + \text{conjg}(\alpha) * y * \text{conjg}(x') + A,$$

where:

$\alpha$  is scalar,

$x$  and  $y$  are  $n$ -element vectors,

$A$  is an  $n$ -by- $n$  Hermitian matrix.

## Input Parameters

<i>layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>uplo</i>	Specifies whether the upper or lower triangular part of the array <i>a</i> is used. If <i>uplo</i> = CblasUpper, then the upper triangular of the array <i>a</i> is used. If <i>uplo</i> = CblasLower, then the low triangular of the array <i>a</i> is used.
<i>n</i>	Specifies the order of the matrix <i>A</i> . The value of <i>n</i> must be at least zero.
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>x</i>	Array, size at least $(1 + (n - 1) * \text{abs}(\text{incx}))$ . Before entry, the incremented array <i>x</i> must contain the <i>n</i> -element vector <i>x</i> .
<i>incx</i>	Specifies the increment for the elements of <i>x</i> . The value of <i>incx</i> must not be zero.
<i>y</i>	Array, size at least $(1 + (n - 1) * \text{abs}(\text{incy}))$ . Before entry, the incremented array <i>y</i> must contain the <i>n</i> -element vector <i>y</i> .
<i>incy</i>	Specifies the increment for the elements of <i>y</i> . The value of <i>incy</i> must not be zero.
<i>a</i>	Array, size <i>lda</i> * <i>n</i> . Before entry with <i>uplo</i> = CblasUpper, the leading <i>n</i> -by- <i>n</i> upper triangular part of the array <i>a</i> must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of <i>a</i> is not referenced. Before entry with <i>uplo</i> = CblasLower, the leading <i>n</i> -by- <i>n</i> lower triangular part of the array <i>a</i> must contain the lower triangular part of the Hermitian matrix and the strictly upper triangular part of <i>a</i> is not referenced. The imaginary parts of the diagonal elements need not be set and are assumed to be zero.
<i>lda</i>	Specifies the leading dimension of <i>a</i> as declared in the calling (sub)program. The value of <i>lda</i> must be at least $\max(1, n)$ .

## Output Parameters

<i>a</i>	With <i>uplo</i> = CblasUpper, the upper triangular part of the array <i>a</i> is overwritten by the upper triangular part of the updated matrix. With <i>uplo</i> = CblasLower, the lower triangular part of the array <i>a</i> is overwritten by the lower triangular part of the updated matrix. If <i>alpha</i> is zero, matrix <i>A</i> is unchanged; otherwise, the imaginary parts of the diagonal elements are set to zero.
----------	---

### **cblas\_?hpmv**

Computes a matrix-vector product using a Hermitian packed matrix.

---

## Syntax

```
void cblas_chpmv (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const MKL_INT n,
const void *alpha, const void *ap, const void *x, const MKL_INT incx, const void *beta,
void *y, const MKL_INT incy);
```

```
void cblas_zhpmv (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const MKL_INT n,
const void *alpha, const void *ap, const void *x, const MKL_INT incx, const void *beta,
void *y, const MKL_INT incy);
```

## Include Files

- mkl.h

## Description

The ?hpmv routines perform a matrix-vector operation defined as

$$y := \alpha * A * x + \beta * y,$$

where:

*alpha* and *beta* are scalars,

*x* and *y* are *n*-element vectors,

*A* is an *n*-by-*n* Hermitian matrix, supplied in packed form.

## Input Parameters

<i>Layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>uplo</i>	Specifies whether the upper or lower triangular part of the matrix <i>A</i> is supplied in the packed array <i>ap</i> .  If <i>uplo</i> = CblasUpper, then the upper triangular part of the matrix <i>A</i> is supplied in the packed array <i>ap</i> .  If <i>uplo</i> = CblasLower, then the low triangular part of the matrix <i>A</i> is supplied in the packed array <i>ap</i> .
<i>n</i>	Specifies the order of the matrix <i>A</i> . The value of <i>n</i> must be at least zero.
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>ap</i>	Array, size at least $((n * (n + 1)) / 2)$ .  For <i>Layout</i> = CblasColMajor:  Before entry with <i>uplo</i> = CblasUpper, the array <i>ap</i> must contain the upper triangular part of the Hermitian matrix packed sequentially, column-by-column, so that <i>ap</i> [0] contains $A_{1,1}$ , <i>ap</i> [1] and <i>ap</i> [2] contain $A_{1,2}$ and $A_{2,2}$ respectively, and so on. Before entry with <i>uplo</i> = CblasLower, the array <i>ap</i> must contain the lower triangular part of the Hermitian matrix packed sequentially, column-by-column, so that <i>ap</i> [0] contains $A_{1,1}$ , <i>ap</i> [1] and <i>ap</i> [2] contain $A_{2,1}$ and $A_{3,1}$ respectively, and so on.  For <i>Layout</i> = CblasRowMajor:

Before entry with `uplo = CblasUpper`, the array `ap` must contain the upper triangular part of the Hermitian matrix packed sequentially, row-by-row, `ap[0]` contains  $A_{1,1}$ , `ap[1]` and `ap[2]` contain  $A_{1,2}$  and  $A_{1,3}$  respectively, and so on. Before entry with `uplo = CblasLower`, the array `ap` must contain the lower triangular part of the Hermitian matrix packed sequentially, row-by-row, so that `ap[0]` contains  $A_{1,1}$ , `ap[1]` and `ap[2]` contain  $A_{2,1}$  and  $A_{2,2}$  respectively, and so on.

The imaginary parts of the diagonal elements need not be set and are assumed to be zero.

<code>x</code>	Array, size at least $(1 + (n - 1) * \text{abs}(\text{incx}))$ . Before entry, the incremented array <code>x</code> must contain the $n$ -element vector <code>x</code> .
<code>incx</code>	Specifies the increment for the elements of <code>x</code> . The value of <code>incx</code> must not be zero.
<code>beta</code>	Specifies the scalar <code>beta</code> . When <code>beta</code> is equal to zero then <code>y</code> need not be set on input.
<code>y</code>	Array, size at least $(1 + (n - 1) * \text{abs}(\text{incy}))$ . Before entry, the incremented array <code>y</code> must contain the $n$ -element vector <code>y</code> .
<code>incy</code>	Specifies the increment for the elements of <code>y</code> . The value of <code>incy</code> must not be zero.

## Output Parameters

<code>y</code>	Overwritten by the updated vector <code>y</code> .
----------------	--

### `cblas_?hpr`

Performs a rank-1 update of a Hermitian packed matrix.

### Syntax

```
void cblas_chpr (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const MKL_INT n,
const float alpha, const void *x, const MKL_INT incx, void *ap);
```

```
void cblas_zhpr (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const MKL_INT n,
const double alpha, const void *x, const MKL_INT incx, void *ap);
```

### Include Files

- `mkl.h`

### Description

The `?hpr` routines perform a matrix-vector operation defined as

$$A := \alpha * x * \text{conjg}(x') + A,$$

where:

`alpha` is a real scalar,

`x` is an  $n$ -element vector,

`A` is an  $n$ -by- $n$  Hermitian matrix, supplied in packed form.

## Input Parameters

<i>Layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>uplo</i>	Specifies whether the upper or lower triangular part of the matrix <i>A</i> is supplied in the packed array <i>ap</i> .  If <i>uplo</i> = CblasUpper, the upper triangular part of the matrix <i>A</i> is supplied in the packed array <i>ap</i> .  If <i>uplo</i> = CblasLower, the low triangular part of the matrix <i>A</i> is supplied in the packed array <i>ap</i> .
<i>n</i>	Specifies the order of the matrix <i>A</i> . The value of <i>n</i> must be at least zero.
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>x</i>	Array, size at least $(1 + (n - 1) * \text{abs}(\text{incx}))$ . Before entry, the incremented array <i>x</i> must contain the <i>n</i> -element vector <i>x</i> .
<i>incx</i>	Specifies the increment for the elements of <i>x</i> . <i>incx</i> must not be zero.
<i>ap</i>	Array, size at least $((n * (n + 1)) / 2)$ .  For <i>Layout</i> = CblasColMajor:  Before entry with <i>uplo</i> = CblasUpper, the array <i>ap</i> must contain the upper triangular part of the Hermitian matrix packed sequentially, column-by-column, so that <i>ap</i> [0] contains $A_{1,1}$ , <i>ap</i> [1] and <i>ap</i> [2] contain $A_{1,2}$ and $A_{2,2}$ respectively, and so on.  Before entry with <i>uplo</i> = CblasLower, the array <i>ap</i> must contain the lower triangular part of the Hermitian matrix packed sequentially, column-by-column, so that <i>ap</i> [0] contains $A_{1,1}$ , <i>ap</i> [1] and <i>ap</i> [2] contain $A_{2,1}$ and $A_{3,1}$ respectively, and so on.  For <i>Layout</i> = CblasRowMajor:  Before entry with <i>uplo</i> = CblasUpper, the array <i>ap</i> must contain the upper triangular part of the Hermitian matrix packed sequentially, row-by-row, <i>ap</i> [0] contains $A_{1,1}$ , <i>ap</i> [1] and <i>ap</i> [2] contain $A_{1,2}$ and $A_{1,3}$ respectively, and so on.  Before entry with <i>uplo</i> = CblasLower, the array <i>ap</i> must contain the lower triangular part of the Hermitian matrix packed sequentially, row-by-row, so that <i>ap</i> [0] contains $A_{1,1}$ , <i>ap</i> [1] and <i>ap</i> [2] contain $A_{2,1}$ and $A_{2,2}$ respectively, and so on.  The imaginary parts of the diagonal elements need not be set and are assumed to be zero.

## Output Parameters

<i>ap</i>	With <i>uplo</i> = CblasUpper, overwritten by the upper triangular part of the updated matrix.  With <i>uplo</i> = CblasLower, overwritten by the lower triangular part of the updated matrix.
-----------	--

If  $\alpha$  is zero, matrix  $A$  is unchanged; otherwise, the imaginary parts of the diagonal elements are set to zero.

## **cblas\_?hpr2**

Performs a rank-2 update of a Hermitian packed matrix.

### **Syntax**

```
void cblas_chpr2 (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const MKL_INT n,
const void *alpha, const void *x, const MKL_INT incx, const void *y, const MKL_INT
incy, void *ap);
```

```
void cblas_zhpr2 (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const MKL_INT n,
const void *alpha, const void *x, const MKL_INT incx, const void *y, const MKL_INT
incy, void *ap);
```

### **Include Files**

- mkl.h

### **Description**

The ?hpr2 routines perform a matrix-vector operation defined as

$$A := \alpha * x * \text{conjg}(y') + \text{conjg}(\alpha) * y * \text{conjg}(x') + A,$$

where:

$\alpha$  is a scalar,

$x$  and  $y$  are  $n$ -element vectors,

$A$  is an  $n$ -by- $n$  Hermitian matrix, supplied in packed form.

### **Input Parameters**

<i>Layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>uplo</i>	Specifies whether the upper or lower triangular part of the matrix $A$ is supplied in the packed array $ap$ . If $uplo = \text{CblasUpper}$ , then the upper triangular part of the matrix $A$ is supplied in the packed array $ap$ . If $uplo = \text{CblasLower}$ , then the low triangular part of the matrix $A$ is supplied in the packed array $ap$ .
<i>n</i>	Specifies the order of the matrix $A$ . The value of $n$ must be at least zero.
<i>alpha</i>	Specifies the scalar $\alpha$ .
<i>x</i>	Array, dimension at least $(1 + (n - 1) * \text{abs}(incx))$ . Before entry, the incremented array $x$ must contain the $n$ -element vector $x$ .
<i>incx</i>	Specifies the increment for the elements of $x$ . The value of $incx$ must not be zero.

<i>y</i>	Array, size at least $(1 + (n - 1) * \text{abs}(\text{incy}))$ . Before entry, the incremented array <i>y</i> must contain the <i>n</i> -element vector <i>y</i> .
<i>incy</i>	Specifies the increment for the elements of <i>y</i> . The value of <i>incy</i> must not be zero.
<i>ap</i>	Array, size at least $((n * (n + 1)) / 2)$ . For <i>Layout</i> = CblasColMajor: Before entry with <i>uplo</i> = CblasUpper, the array <i>ap</i> must contain the upper triangular part of the Hermitian matrix packed sequentially, column-by-column, so that <i>ap</i> [0] contains $A_{1,1}$ , <i>ap</i> [1] and <i>ap</i> [2] contain $A_{1,2}$ and $A_{2,2}$ respectively, and so on. Before entry with <i>uplo</i> = CblasLower, the array <i>ap</i> must contain the lower triangular part of the Hermitian matrix packed sequentially, column-by-column, so that <i>ap</i> [0] contains $A_{1,1}$ , <i>ap</i> [1] and <i>ap</i> [2] contain $A_{2,1}$ and $A_{3,1}$ respectively, and so on. For <i>Layout</i> = CblasRowMajor: Before entry with <i>uplo</i> = CblasUpper, the array <i>ap</i> must contain the upper triangular part of the Hermitian matrix packed sequentially, row-by-row, <i>ap</i> [0] contains $A_{1,1}$ , <i>ap</i> [1] and <i>ap</i> [2] contain $A_{1,2}$ and $A_{1,3}$ respectively, and so on. Before entry with <i>uplo</i> = CblasLower, the array <i>ap</i> must contain the lower triangular part of the Hermitian matrix packed sequentially, row-by-row, so that <i>ap</i> [0] contains $A_{1,1}$ , <i>ap</i> [1] and <i>ap</i> [2] contain $A_{2,1}$ and $A_{2,2}$ respectively, and so on. The imaginary parts of the diagonal elements need not be set and are assumed to be zero.

## Output Parameters

<i>ap</i>	With <i>uplo</i> = CblasUpper, overwritten by the upper triangular part of the updated matrix. With <i>uplo</i> = CblasLower, overwritten by the lower triangular part of the updated matrix. If <i>alpha</i> is zero, matrix <i>A</i> is unchanged; otherwise, the imaginary parts of the diagonal elements need are set to zero.
-----------	--

### **cblas\_?sbmv**

Computes a matrix-vector product with a symmetric band matrix.

#### Syntax

```
void cblas_ssbmv (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const MKL_INT n,
const MKL_INT k, const float alpha, const float *a, const MKL_INT lda, const float *x,
const MKL_INT incx, const float beta, float *y, const MKL_INT incy);
```

```
void cblas_dsbmv (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const MKL_INT n,
const MKL_INT k, const double alpha, const double *a, const MKL_INT lda, const double
*x, const MKL_INT incx, const double beta, double *y, const MKL_INT incy);
```

## Include Files

- mkl.h

## Description

The `?sbmv` routines perform a matrix-vector operation defined as

$$y := \alpha * A * x + \beta * y,$$

where:

*alpha* and *beta* are scalars,

*x* and *y* are *n*-element vectors,

*A* is an *n*-by-*n* symmetric band matrix, with *k* super-diagonals.

## Input Parameters

<i>Layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>uplo</i>	Specifies whether the upper or lower triangular part of the band matrix <i>A</i> is used: if <i>uplo</i> = CblasUpper - upper triangular part; if <i>uplo</i> = CblasLower - low triangular part.
<i>n</i>	Specifies the order of the matrix <i>A</i> . The value of <i>n</i> must be at least zero.
<i>k</i>	Specifies the number of super-diagonals of the matrix <i>A</i> . The value of <i>k</i> must satisfy $0 \leq k$ .
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>a</i>	Array, size <i>lda</i> * <i>n</i> . Before entry with <i>uplo</i> = CblasUpper, the leading ( <i>k</i> + 1) by <i>n</i> part of the array <i>a</i> must contain the upper triangular band part of the symmetric matrix, supplied column-by-column, with the leading diagonal of the matrix in row <i>k</i> of the array, the first super-diagonal starting at position 1 in row ( <i>k</i> - 1), and so on. The top left <i>k</i> by <i>k</i> triangle of the array <i>a</i> is not referenced.

The following program segment transfers the upper triangular part of a symmetric band matrix from conventional full matrix storage (*matrix*, with leading dimension *ldm*) to band storage (*a*, with leading dimension *lda*):

```
for (j = 0; j < n; j++) {
    m = k - j;
    for (i = max( 0, j - k); i <= j; i++) {
        a[(m+i) + j*lda] = matrix[i + j*ldm];
    }
}
```

Before entry with *uplo* = CblasLower, the leading (*k* + 1) by *n* part of the array *a* must contain the lower triangular band part of the symmetric matrix, supplied column-by-column, with the leading diagonal of the matrix in row 0 of the array, the first sub-diagonal starting at position 0 in row 1, and so on. The bottom right *k* by *k* triangle of the array *a* is not referenced.

The following program segment transfers the lower triangular part of a symmetric band matrix from conventional full matrix storage (*matrix*, with leading dimension *ldm*) to band storage (*a*, with leading dimension *lda*):

```
for (j = 0; j < n; j++) {
    m = -j;
    for (i = j; i < min(n, j + k + 1); i++) {
        a[(m+i) + j*lda] = matrix[i + j*ldm];
    }
}
```

Layout = CblasRowMajor:

Before entry with *uplo* = CblasUpper, the leading  $(k + 1)$ -by-*n* part of array *a* must contain the upper triangular band part of the symmetric matrix. The matrix must be supplied row-by-row, with the leading diagonal of the matrix in column 0 of the array, the first super-diagonal starting at position 0 in column 1, and so on. The bottom right  $k$ -by- $k$  triangle of array *a* is not referenced.

The following program segment transfers the upper triangular part of a symmetric band matrix from row-major full matrix storage (*matrix* with leading dimension *ldm*) to row-major band storage (*a*, with leading dimension *lda*):

```
for (i = 0; i < n; i++) {
    m = -i;
    for (j = i; j < MIN(n, i+k+1); j++) {
        a[(m+j) + i*lda] = matrix[j + i*ldm];
    }
}
```

Before entry with *uplo* = CblasLower, the leading  $(k + 1)$ -by-*n* part of array *a* must contain the lower triangular band part of the symmetric matrix, supplied row-by-row, with the leading diagonal of the matrix in column *k* of the array, the first sub-diagonal starting at position 1 in column  $k-1$ , and so on. The top left  $k$ -by- $k$  triangle of array *a* is not referenced.

The following program segment transfers the lower triangular part of a symmetric row-major band matrix from row-major full matrix storage (*matrix*, with leading dimension *ldm*) to row-major band storage (*a*, with leading dimension *lda*):

```
for (i = 0; i < n; i++) {
    m = k - i;
    for (j = max(0, i-k); j <= i; j++) {
        a[(m+j) + i*lda] = matrix[j + i*ldm];
    }
}
```

*lda*

Specifies the leading dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least  $(k + 1)$ .

*x*

Array, size at least  $(1 + (n - 1) * \text{abs}(\text{incx}))$ . Before entry, the incremented array *x* must contain the vector *x*.

*incx*

Specifies the increment for the elements of *x*.  
The value of *incx* must not be zero.

<i>beta</i>	Specifies the scalar <i>beta</i> .
<i>y</i>	Array, size at least $(1 + (n - 1) * \text{abs}(incy))$ . Before entry, the incremented array <i>y</i> must contain the vector <i>y</i> .
<i>incy</i>	Specifies the increment for the elements of <i>y</i> . The value of <i>incy</i> must not be zero.

## Output Parameters

<i>y</i>	Overwritten by the updated vector <i>y</i> .
----------	--

## cblas\_?spmv

Computes a matrix-vector product with a symmetric packed matrix.

### Syntax

```
void cblas_sspmv (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const MKL_INT n,
const float alpha, const float *ap, const float *x, const MKL_INT incx, const float
beta, float *y, const MKL_INT incy);
```

```
void cblas_dspmv (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const MKL_INT n,
const double alpha, const double *ap, const double *x, const MKL_INT incx, const double
beta, double *y, const MKL_INT incy);
```

### Include Files

- mkl.h

### Description

The ?spmv routines perform a matrix-vector operation defined as

$$y := \alpha * A * x + \beta * y,$$

where:

*alpha* and *beta* are scalars,

*x* and *y* are *n*-element vectors,

*A* is an *n*-by-*n* symmetric matrix, supplied in packed form.

### Input Parameters

<i>Layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>uplo</i>	Specifies whether the upper or lower triangular part of the matrix <i>A</i> is supplied in the packed array <i>ap</i> .  If <i>uplo</i> = CblasUpper, then the upper triangular part of the matrix <i>A</i> is supplied in the packed array <i>ap</i> .  If <i>uplo</i> = CblasLower, then the low triangular part of the matrix <i>A</i> is supplied in the packed array <i>ap</i> .

<i>n</i>	Specifies the order of the matrix <i>A</i> . The value of <i>n</i> must be at least zero.
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>ap</i>	<p>Array, size at least <math>((n * (n + 1)) / 2)</math>.</p> <p>For <i>Layout</i> = CblasColMajor:</p> <p>Before entry with <i>uplo</i> = CblasUpper, the array <i>ap</i> must contain the upper triangular part of the symmetric matrix packed sequentially, column-by-column, so that <i>ap</i>[0] contains <math>A_{1,1}</math>, <i>ap</i>[1] and <i>ap</i>[2] contain <math>A_{1,2}</math> and <math>A_{2,2}</math> respectively, and so on. Before entry with <i>uplo</i> = CblasLower, the array <i>ap</i> must contain the lower triangular part of the symmetric matrix packed sequentially, column-by-column, so that <i>ap</i>[0] contains <math>A_{1,1}</math>, <i>ap</i>[1] and <i>ap</i>[2] contain <math>A_{2,1}</math> and <math>A_{3,1}</math> respectively, and so on.</p> <p>For <i>Layout</i> = CblasRowMajor:</p> <p>Before entry with <i>uplo</i> = CblasUpper, the array <i>ap</i> must contain the upper triangular part of the symmetric matrix packed sequentially, row-by-row, <i>ap</i>[0] contains <math>A_{1,1}</math>, <i>ap</i>[1] and <i>ap</i>[2] contain <math>A_{1,2}</math> and <math>A_{1,3}</math> respectively, and so on. Before entry with <i>uplo</i> = CblasLower, the array <i>ap</i> must contain the lower triangular part of the symmetric matrix packed sequentially, row-by-row, so that <i>ap</i>[0] contains <math>A_{1,1}</math>, <i>ap</i>[1] and <i>ap</i>[2] contain <math>A_{2,1}</math> and <math>A_{2,2}</math> respectively, and so on.</p>
<i>x</i>	Array, size at least $(1 + (n - 1) * \text{abs}(\text{incx}))$ . Before entry, the incremented array <i>x</i> must contain the <i>n</i> -element vector <i>x</i> .
<i>incx</i>	<p>Specifies the increment for the elements of <i>x</i>.</p> <p>The value of <i>incx</i> must not be zero.</p>
<i>beta</i>	<p>Specifies the scalar <i>beta</i>.</p> <p>When <i>beta</i> is supplied as zero, then <i>y</i> need not be set on input.</p>
<i>y</i>	Array, size at least $(1 + (n - 1) * \text{abs}(\text{incy}))$ . Before entry, the incremented array <i>y</i> must contain the <i>n</i> -element vector <i>y</i> .
<i>incy</i>	<p>Specifies the increment for the elements of <i>y</i>.</p> <p>The value of <i>incy</i> must not be zero.</p>

## Output Parameters

<i>y</i>	Overwritten by the updated vector <i>y</i> .
----------	--

### **cblas\_?spr**

Performs a rank-1 update of a symmetric packed matrix.

#### Syntax

```
void cblas_sspr (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const MKL_INT n,
const float alpha, const float *x, const MKL_INT incx, float *ap);
```

```
void cblas_dspr (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const MKL_INT n,
const double alpha, const double *x, const MKL_INT incx, double *ap);
```

## Include Files

- `mk1.h`

## Description

The `?spr` routines perform a matrix-vector operation defined as

$$a := \alpha * x * x' + A,$$

where:

*alpha* is a real scalar,

*x* is an *n*-element vector,

*A* is an *n*-by-*n* symmetric matrix, supplied in packed form.

## Input Parameters

<i>Layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>uplo</i>	Specifies whether the upper or lower triangular part of the matrix <i>A</i> is supplied in the packed array <i>ap</i> .  If <i>uplo</i> = CblasUpper, then the upper triangular part of the matrix <i>A</i> is supplied in the packed array <i>ap</i> .  If <i>uplo</i> = CblasLower, then the low triangular part of the matrix <i>A</i> is supplied in the packed array <i>ap</i> .
<i>n</i>	Specifies the order of the matrix <i>A</i> . The value of <i>n</i> must be at least zero.
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>x</i>	Array, size at least $(1 + (n - 1) * \text{abs}(\text{incx}))$ . Before entry, the incremented array <i>x</i> must contain the <i>n</i> -element vector <i>x</i> .
<i>incx</i>	Specifies the increment for the elements of <i>x</i> .  The value of <i>incx</i> must not be zero.
<i>ap</i>	For <i>Layout</i> = CblasColMajor:  Before entry with <i>uplo</i> = CblasUpper, the array <i>ap</i> must contain the upper triangular part of the symmetric matrix packed sequentially, column-by-column, so that <i>ap</i> [0] contains <i>A</i> <sub>1,1</sub> , <i>ap</i> [1] and <i>ap</i> [2] contain <i>A</i> <sub>1,2</sub> and <i>A</i> <sub>2,2</sub> respectively, and so on.  Before entry with <i>uplo</i> = CblasLower, the array <i>ap</i> must contain the lower triangular part of the symmetric matrix packed sequentially, column-by-column, so that <i>ap</i> [0] contains <i>A</i> <sub>1,1</sub> , <i>ap</i> [1] and <i>ap</i> [2] contain <i>A</i> <sub>2,1</sub> and <i>A</i> <sub>3,1</sub> respectively, and so on.  For <i>Layout</i> = CblasRowMajor:  Before entry with <i>uplo</i> = CblasUpper, the array <i>ap</i> must contain the upper triangular part of the symmetric matrix packed sequentially, row-by-row, <i>ap</i> [0] contains <i>A</i> <sub>1,1</sub> , <i>ap</i> [1] and <i>ap</i> [2] contain <i>A</i> <sub>1,2</sub> and <i>A</i> <sub>1,3</sub> respectively, and so on.

Before entry with `uplo = CblasLower`, the array `ap` must contain the lower triangular part of the symmetric matrix packed sequentially, row-by-row, so that `ap[0]` contains  $A_{1,1}$ , `ap[1]` and `ap[2]` contain  $A_{2,1}$  and  $A_{2,2}$  respectively, and so on.

## Output Parameters

`ap` With `uplo = CblasUpper`, overwritten by the upper triangular part of the updated matrix.  
With `uplo = CblasLower`, overwritten by the lower triangular part of the updated matrix.

## `cblas_?spr2`

Computes a rank-2 update of a symmetric packed matrix.

### Syntax

```
void cblas_sspr2 (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const MKL_INT n,
const float alpha, const float *x, const MKL_INT incx, const float *y, const MKL_INT
incy, float *ap);
```

```
void cblas_dspr2 (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const MKL_INT n,
const double alpha, const double *x, const MKL_INT incx, const double *y, const MKL_INT
incy, double *ap);
```

### Include Files

- `mkl.h`

### Description

The `?spr2` routines perform a matrix-vector operation defined as

$$A := \alpha * x * y' + \alpha * y * x' + A,$$

where:

`alpha` is a scalar,

`x` and `y` are  $n$ -element vectors,

`A` is an  $n$ -by- $n$  symmetric matrix, supplied in packed form.

### Input Parameters

`Layout` Specifies whether two-dimensional array storage is row-major (`CblasRowMajor`) or column-major (`CblasColMajor`).

`uplo` Specifies whether the upper or lower triangular part of the matrix `A` is supplied in the packed array `ap`.

If `uplo = CblasUpper`, then the upper triangular part of the matrix `A` is supplied in the packed array `ap`.

If `uplo = CblasLower`, then the low triangular part of the matrix `A` is supplied in the packed array `ap`.

<i>n</i>	Specifies the order of the matrix <i>A</i> . The value of <i>n</i> must be at least zero.
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>x</i>	Array, size at least $(1 + (n - 1) * \text{abs}(incx))$ . Before entry, the incremented array <i>x</i> must contain the <i>n</i> -element vector <i>x</i> .
<i>incx</i>	Specifies the increment for the elements of <i>x</i> . The value of <i>incx</i> must not be zero.
<i>y</i>	Array, size at least $(1 + (n - 1) * \text{abs}(incy))$ . Before entry, the incremented array <i>y</i> must contain the <i>n</i> -element vector <i>y</i> .
<i>incy</i>	Specifies the increment for the elements of <i>y</i> . The value of <i>incy</i> must not be zero.
<i>ap</i>	For <i>Layout</i> = CblasColMajor:  Before entry with <i>uplo</i> = CblasUpper, the array <i>ap</i> must contain the upper triangular part of the symmetric matrix packed sequentially, column-by-column, so that <i>ap</i> [0] contains $A_{1,1}$ , <i>ap</i> [1] and <i>ap</i> [2] contain $A_{1,2}$ and $A_{2,2}$ respectively, and so on.  Before entry with <i>uplo</i> = CblasLower, the array <i>ap</i> must contain the lower triangular part of the symmetric matrix packed sequentially, column-by-column, so that <i>ap</i> [0] contains $A_{1,1}$ , <i>ap</i> [1] and <i>ap</i> [2] contain $A_{2,1}$ and $A_{3,1}$ respectively, and so on.  For <i>Layout</i> = CblasRowMajor:  Before entry with <i>uplo</i> = CblasUpper, the array <i>ap</i> must contain the upper triangular part of the symmetric matrix packed sequentially, row-by-row, <i>ap</i> [0] contains $A_{1,1}$ , <i>ap</i> [1] and <i>ap</i> [2] contain $A_{1,2}$ and $A_{1,3}$ respectively, and so on.  Before entry with <i>uplo</i> = CblasLower, the array <i>ap</i> must contain the lower triangular part of the symmetric matrix packed sequentially, row-by-row, so that <i>ap</i> [0] contains $A_{1,1}$ , <i>ap</i> [1] and <i>ap</i> [2] contain $A_{2,1}$ and $A_{2,2}$ respectively, and so on.

## Output Parameters

<i>ap</i>	With <i>uplo</i> = CblasUpper, overwritten by the upper triangular part of the updated matrix.  With <i>uplo</i> = CblasLower, overwritten by the lower triangular part of the updated matrix.
-----------	--

### **cblas\_?symv**

Computes a matrix-vector product for a symmetric matrix.

### Syntax

```
void cblas_ssymv (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const MKL_INT n,
const float alpha, const float *a, const MKL_INT lda, const float *x, const MKL_INT
incx, const float beta, float *y, const MKL_INT incy);
```

```
void cblas_dsymv (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const MKL_INT n,
const double alpha, const double *a, const MKL_INT lda, const double *x, const MKL_INT
incx, const double beta, double *y, const MKL_INT incy);
```

## Include Files

- `mkl.h`

## Description

The `?symv` routines perform a matrix-vector operation defined as

$$y := \alpha A x + \beta y,$$

where:

*alpha* and *beta* are scalars,

*x* and *y* are *n*-element vectors,

*A* is an *n*-by-*n* symmetric matrix.

## Input Parameters

<i>Layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>uplo</i>	Specifies whether the upper or lower triangular part of the array <i>a</i> is used. If <i>uplo</i> = CblasUpper, then the upper triangular part of the array <i>a</i> is used. If <i>uplo</i> = CblasLower, then the low triangular part of the array <i>a</i> is used.
<i>n</i>	Specifies the order of the matrix <i>A</i> . The value of <i>n</i> must be at least zero.
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>a</i>	Array, size <i>lda</i> * <i>n</i> . Before entry with <i>uplo</i> = CblasUpper, the leading <i>n</i> -by- <i>n</i> upper triangular part of the array <i>a</i> must contain the upper triangular part of the symmetric matrix <i>A</i> and the strictly lower triangular part of <i>a</i> is not referenced. Before entry with <i>uplo</i> = CblasLower, the leading <i>n</i> -by- <i>n</i> lower triangular part of the array <i>a</i> must contain the lower triangular part of the symmetric matrix <i>A</i> and the strictly upper triangular part of <i>a</i> is not referenced.
<i>lda</i>	Specifies the leading dimension of <i>a</i> as declared in the calling (sub)program. The value of <i>lda</i> must be at least $\max(1, n)$ .
<i>x</i>	Array, size at least $(1 + (n - 1) * \text{abs}(\text{incx}))$ . Before entry, the incremented array <i>x</i> must contain the <i>n</i> -element vector <i>x</i> .
<i>incx</i>	Specifies the increment for the elements of <i>x</i> . The value of <i>incx</i> must not be zero.
<i>beta</i>	Specifies the scalar <i>beta</i> . When <i>beta</i> is supplied as zero, then <i>y</i> need not be set on input.

<i>y</i>	Array, size at least $(1 + (n - 1) * \text{abs}(incy))$ . Before entry, the incremented array <i>y</i> must contain the <i>n</i> -element vector <i>y</i> .
<i>incy</i>	Specifies the increment for the elements of <i>y</i> . The value of <i>incy</i> must not be zero.

## Output Parameters

<i>y</i>	Overwritten by the updated vector <i>y</i> .
----------	--

## cblas\_?syr

Performs a rank-1 update of a symmetric matrix.

## Syntax

```
void cblas_ssyrr (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const MKL_INT n,
const float alpha, const float *x, const MKL_INT incx, float *a, const MKL_INT lda);
void cblas_dsyrr (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const MKL_INT n,
const double alpha, const double *x, const MKL_INT incx, double *a, const MKL_INT lda);
```

## Include Files

- mkl.h

## Description

The ?syr routines perform a matrix-vector operation defined as

$$A := \alpha * x * x' + A,$$

where:

*alpha* is a real scalar,

*x* is an *n*-element vector,

*A* is an *n*-by-*n* symmetric matrix.

## Input Parameters

<i>Layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>uplo</i>	Specifies whether the upper or lower triangular part of the array <i>a</i> is used. If <i>uplo</i> = CblasUpper, then the upper triangular part of the array <i>a</i> is used. If <i>uplo</i> = CblasLower, then the low triangular part of the array <i>a</i> is used.
<i>n</i>	Specifies the order of the matrix <i>A</i> . The value of <i>n</i> must be at least zero.
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>x</i>	Array, size at least $(1 + (n-1) * \text{abs}(incx))$ . Before entry, the incremented array <i>x</i> must contain the <i>n</i> -element vector <i>x</i> .
<i>incx</i>	Specifies the increment for the elements of <i>x</i> .

The value of *incx* must not be zero.

*a*

Array, size  $lda*n$ .

Before entry with *uplo* = CblasUpper, the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular part of the symmetric matrix *A* and the strictly lower triangular part of *a* is not referenced.

Before entry with *uplo* = CblasLower, the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular part of the symmetric matrix *A* and the strictly upper triangular part of *a* is not referenced.

*lda*

Specifies the leading dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least  $\max(1, n)$ .

## Output Parameters

*a*

With *uplo* = CblasUpper, the upper triangular part of the array *a* is overwritten by the upper triangular part of the updated matrix.

With *uplo* = CblasLower, the lower triangular part of the array *a* is overwritten by the lower triangular part of the updated matrix.

## **cblas\_?syr2**

Performs a rank-2 update of a symmetric matrix.

### Syntax

```
void cblas_ssy2 (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const MKL_INT n,
const float alpha, const float *x, const MKL_INT incx, const float *y, const MKL_INT
incy, float *a, const MKL_INT lda);
```

```
void cblas_dsyr2 (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const MKL_INT n,
const double alpha, const double *x, const MKL_INT incx, const double *y, const MKL_INT
incy, double *a, const MKL_INT lda);
```

### Include Files

- mkl.h

### Description

The ?syr2 routines perform a matrix-vector operation defined as

$$A := \alpha*x*y' + \alpha*y*x' + A,$$

where:

*alpha* is scalar,

*x* and *y* are *n*-element vectors,

*A* is an *n*-by-*n* symmetric matrix.

### Input Parameters

*Layout*

Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).

<i>uplo</i>	Specifies whether the upper or lower triangular part of the array <i>a</i> is used. If <i>uplo</i> = <code>CblasUpper</code> , then the upper triangular part of the array <i>a</i> is used. If <i>uplo</i> = <code>CblasLower</code> , then the low triangular part of the array <i>a</i> is used.
<i>n</i>	Specifies the order of the matrix <i>A</i> . The value of <i>n</i> must be at least zero.
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>x</i>	Array, size at least $(1 + (n - 1) * \text{abs}(incx))$ . Before entry, the incremented array <i>x</i> must contain the <i>n</i> -element vector <i>x</i> .
<i>incx</i>	Specifies the increment for the elements of <i>x</i> . The value of <i>incx</i> must not be zero.
<i>y</i>	Array, size at least $(1 + (n - 1) * \text{abs}(incy))$ . Before entry, the incremented array <i>y</i> must contain the <i>n</i> -element vector <i>y</i> .
<i>incy</i>	Specifies the increment for the elements of <i>y</i> . The value of <i>incy</i> must not be zero.
<i>a</i>	Array, size <i>lda</i> * <i>n</i> . Before entry with <i>uplo</i> = <code>CblasUpper</code> , the leading <i>n</i> -by- <i>n</i> upper triangular part of the array <i>a</i> must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of <i>a</i> is not referenced. Before entry with <i>uplo</i> = <code>CblasLower</code> , the leading <i>n</i> -by- <i>n</i> lower triangular part of the array <i>a</i> must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of <i>a</i> is not referenced.
<i>lda</i>	Specifies the leading dimension of <i>a</i> as declared in the calling (sub)program. The value of <i>lda</i> must be at least $\max(1, n)$ .

## Output Parameters

<i>a</i>	With <i>uplo</i> = <code>CblasUpper</code> , the upper triangular part of the array <i>a</i> is overwritten by the upper triangular part of the updated matrix. With <i>uplo</i> = <code>CblasLower</code> , the lower triangular part of the array <i>a</i> is overwritten by the lower triangular part of the updated matrix.
----------	--

## **cblas\_?tbmv**

Computes a matrix-vector product using a triangular band matrix.

### Syntax

```
void cblas_stbmv (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const
CBLAS_TRANSPOSE trans, const CBLAS_DIAG diag, const MKL_INT n, const MKL_INT k, const
float *a, const MKL_INT lda, float *x, const MKL_INT incx);
```

```
void cblas_dtbmv (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const
CBLAS_TRANSPOSE trans, const CBLAS_DIAG diag, const MKL_INT n, const MKL_INT k, const
double *a, const MKL_INT lda, double *x, const MKL_INT incx);
```

```
void cblas_ctbmv (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const
CBLAS_TRANSPOSE trans, const CBLAS_DIAG diag, const MKL_INT n, const MKL_INT k, const
void *a, const MKL_INT lda, void *x, const MKL_INT incx);
```

```
void cblas_ztbmv (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const
CBLAS_TRANSPOSE trans, const CBLAS_DIAG diag, const MKL_INT n, const MKL_INT k, const
void *a, const MKL_INT lda, void *x, const MKL_INT incx);
```

## Include Files

- mkl.h

## Description

The `?tbmv` routines perform one of the matrix-vector operations defined as

$x := A*x$ , or  $x := A'*x$ , or  $x := \text{conjg}(A')*x$ ,

where:

$x$  is an  $n$ -element vector,

$A$  is an  $n$ -by- $n$  unit, or non-unit, upper or lower triangular band matrix, with  $(k + 1)$  diagonals.

## Input Parameters

<i>Layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>uplo</i>	Specifies whether the matrix $A$ is an upper or lower triangular matrix: <i>uplo</i> = CblasUpper if <i>uplo</i> = CblasLower, then the matrix is low triangular.
<i>trans</i>	Specifies the operation: if <i>trans</i> =CblasNoTrans, then $x := A*x$ ; if <i>trans</i> =CblasTrans, then $x := A'*x$ ; if <i>trans</i> =CblasConjTrans, then $x := \text{conjg}(A')*x$ .
<i>diag</i>	Specifies whether the matrix $A$ is unit triangular: if <i>diag</i> = CblasUnit then the matrix is unit triangular; if <i>diag</i> = CblasNonUnit , then the matrix is not unit triangular.
<i>n</i>	Specifies the order of the matrix $A$ . The value of $n$ must be at least zero.
<i>k</i>	On entry with <i>uplo</i> = CblasUpper specifies the number of super-diagonals of the matrix $A$ . On entry with <i>uplo</i> = CblasLower, $k$ specifies the number of sub-diagonals of the matrix $a$ .  The value of $k$ must satisfy $0 \leq k$ .
<i>a</i>	Array, size $lda*n$ .  <i>Layout</i> = CblasColMajor:

Before entry with `uplo = CblasUpper`, the leading  $(k + 1)$  by  $n$  part of the array  $a$  must contain the upper triangular band part of the matrix of coefficients, supplied column-by-column, with the leading diagonal of the matrix in row  $k$  of the array, the first super-diagonal starting at position 1 in row  $(k - 1)$ , and so on. The top left  $k$  by  $k$  triangle of the array  $a$  is not referenced. The following program segment transfers an upper triangular band matrix from conventional full matrix storage ( $matrix$ , with leading dimension  $ldm$ ) to band storage ( $a$ , with leading dimension  $lda$ ):

```
for (j = 0; j < n; j++) {
    m = k - j;
    for (i = max( 0, j - k); i <= j; i++) {
        a[(m+i) + j*lda] = matrix[i + j*ldm];
    }
}
```

Before entry with `uplo = CblasLower`, the leading  $(k + 1)$  by  $n$  part of the array  $a$  must contain the lower triangular band part of the matrix of coefficients, supplied column-by-column, with the leading diagonal of the matrix in row 0 of the array, the first sub-diagonal starting at position 0 in row 1, and so on. The bottom right  $k$  by  $k$  triangle of the array  $a$  is not referenced. The following program segment transfers a lower triangular band matrix from conventional full matrix storage ( $matrix$ , with leading dimension  $ldm$ ) to band storage ( $a$ , with leading dimension  $lda$ ):

```
for (j = 0; j < n; j++) {
    m = -j;
    for (i = j; i < min(n, j + k + 1); i++) {
        a[(m+i) + j*lda] = matrix[i + j*ldm];
    }
}
```

Note that when `diag = CblasUnit`, the elements of the array  $a$  corresponding to the diagonal elements of the matrix are not referenced, but are assumed to be unity.

Layout = `CblasRowMajor`:

Before entry with `uplo = CblasUpper`, the leading  $(k + 1)$ -by- $n$  part of array  $a$  must contain the upper triangular band part of the matrix of coefficients. The matrix must be supplied row-by-row, with the leading diagonal of the matrix in column 0 of the array, the first super-diagonal starting at position 0 in column 1, and so on. The bottom right  $k$ -by- $k$  triangle of array  $a$  is not referenced.

The following program segment transfers the upper triangular part of a Hermitian band matrix from row-major full matrix storage ( $matrix$  with leading dimension  $ldm$ ) to row-major band storage ( $a$ , with leading dimension  $lda$ ):

```
for (i = 0; i < n; i++) {
    m = -i;
    for (j = i; j < MIN(n, i+k+1); j++) {
        a[(m+j) + i*lda] = matrix[j + i*ldm];
    }
}
```

Before entry with `uplo = CblasLower`, the leading  $(k + 1)$ -by- $n$  part of array `a` must contain the lower triangular band part of the matrix of coefficients, supplied row-by-row, with the leading diagonal of the matrix in column  $k$  of the array, the first sub-diagonal starting at position 1 in column  $k-1$ , and so on. The top left  $k$ -by- $k$  triangle of array `a` is not referenced.

The following program segment transfers the lower triangular part of a Hermitian row-major band matrix from row-major full matrix storage (`matrix`, with leading dimension `ldm`) to row-major band storage (`a`, with leading dimension `lda`):

```
for (i = 0; i < n; i++) {
    m = k - i;
    for (j = max(0, i-k); j <= i; j++) {
        a[(m+j) + i*lda] = matrix[j + i*ldm];
    }
}
```

<code>lda</code>	Specifies the leading dimension of <code>a</code> as declared in the calling (sub)program. The value of <code>lda</code> must be at least $(k + 1)$ .
<code>x</code>	Array, size at least $(1 + (n - 1) * \text{abs}(\text{incx}))$ . Before entry, the incremented array <code>x</code> must contain the $n$ -element vector <code>x</code> .
<code>incx</code>	Specifies the increment for the elements of <code>x</code> . The value of <code>incx</code> must not be zero.

## Output Parameters

<code>x</code>	Overwritten with the transformed vector <code>x</code> .
----------------	--

## `cblas_?tbsv`

*Solves a system of linear equations whose coefficients are in a triangular band matrix.*

### Syntax

```
void cblas_stbsv (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const
CBLAS_TRANSPOSE trans, const CBLAS_DIAG diag, const MKL_INT n, const MKL_INT k, const
float *a, const MKL_INT lda, float *x, const MKL_INT incx);
```

```
void cblas_dtbsv (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const

void *a, const MKL_INT lda, void *x, const MKL_INT incx);
```

## Include Files

- `mkl.h`

## Description

The `?tbsv` routines solve one of the following systems of equations:

$$A*x = b, \text{ or } A'*x = b, \text{ or } \text{conjg}(A')*x = b,$$

where:

$b$  and  $x$  are  $n$ -element vectors,

$A$  is an  $n$ -by- $n$  unit, or non-unit, upper or lower triangular band matrix, with  $(k + 1)$  diagonals.

The routine does not test for singularity or near-singularity.

Such tests must be performed before calling this routine.

## Input Parameters

<i>layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>uplo</i>	Specifies whether the matrix $A$ is an upper or lower triangular matrix: if <i>uplo</i> = CblasUpper the matrix is upper triangular; if <i>uplo</i> = CblasLower, the matrix is low triangular.
<i>trans</i>	Specifies the system of equations: if <i>trans</i> =CblasNoTrans, then $A*x = b$ ; if <i>trans</i> =CblasTrans, then $A'*x = b$ ; if <i>trans</i> =CblasConjTrans, then $\text{conjg}(A')*x = b$ .
<i>diag</i>	Specifies whether the matrix $A$ is unit triangular: if <i>diag</i> = CblasUnit then the matrix is unit triangular; if <i>diag</i> = CblasNonUnit, then the matrix is not unit triangular.
<i>n</i>	Specifies the order of the matrix $A$ . The value of $n$ must be at least zero.
<i>k</i>	On entry with <i>uplo</i> = CblasUpper, $k$ specifies the number of super-diagonals of the matrix $A$ . On entry with <i>uplo</i> = CblasLower, $k$ specifies the number of sub-diagonals of the matrix $A$ .  The value of $k$ must satisfy $0 \leq k$ .
<i>a</i>	Array, size $lda*n$ .  <i>Layout</i> = CblasColMajor:  Before entry with <i>uplo</i> = CblasUpper, the leading $(k + 1)$ by $n$ part of the array $a$ must contain the upper triangular band part of the matrix of coefficients, supplied column-by-column, with the leading diagonal of the matrix in row $k$ of the array, the first super-diagonal starting at position 1 in row $(k - 1)$ , and so on. The top left $k$ by $k$ triangle of the array $a$ is not referenced.

The following program segment transfers an upper triangular band matrix from conventional full matrix storage (*matrix*, with leading dimension *ldm*) to band storage (*a*, with leading dimension *lda*):

```
for (j = 0; j < n; j++) {
    m = k - j;
    for (i = max( 0, j - k); i <= j; i++) {
        a[(m+i) + j*lda] = matrix[i + j*ldm];
    }
}
```

Before entry with *uplo* = *CblasLower*, the leading  $(k + 1)$  by  $n$  part of the array *a* must contain the lower triangular band part of the matrix of coefficients, supplied column-by-column, with the leading diagonal of the matrix in row 0 of the array, the first sub-diagonal starting at position 0 in row 1, and so on. The bottom right  $k$  by  $k$  triangle of the array *a* is not referenced.

The following program segment transfers a lower triangular band matrix from conventional full matrix storage (*matrix*, with leading dimension *ldm*) to band storage (*a*, with leading dimension *lda*):

```
for (j = 0; j < n; j++) {
    m = -j;
    for (i = j; i < min(n, j + k + 1); i++) {
        a[(m+i) + j*lda] = matrix[i + j*ldm];
    }
}
```

When *diag* = *CblasUnit*, the elements of the array *a* corresponding to the diagonal elements of the matrix are not referenced, but are assumed to be unity.

Layout = *CblasRowMajor*:

Before entry with *uplo* = *CblasUpper*, the leading  $(k + 1)$ -by- $n$  part of array *a* must contain the upper triangular band part of the matrix of coefficients. The matrix must be supplied row-by-row, with the leading diagonal of the matrix in column 0 of the array, the first super-diagonal starting at position 0 in column 1, and so on. The bottom right  $k$ -by- $k$  triangle of array *a* is not referenced.

The following program segment transfers the upper triangular part of a Hermitian band matrix from row-major full matrix storage (*matrix* with leading dimension *ldm*) to row-major band storage (*a*, with leading dimension *lda*):

```
for (i = 0; i < n; i++) {
    m = -i;
    for (j = i; j < MIN(n, i+k+1); j++) {
        a[(m+j) + i*lda] = matrix[j + i*ldm];
    }
}
```

Before entry with *uplo* = *CblasLower*, the leading  $(k + 1)$ -by- $n$  part of array *a* must contain the lower triangular band part of the matrix of coefficients, supplied row-by-row, with the leading diagonal of the matrix in column  $k$  of the array, the first sub-diagonal starting at position 1 in column  $k-1$ , and so on. The top left  $k$ -by- $k$  triangle of array *a* is not referenced.

The following program segment transfers the lower triangular part of a Hermitian row-major band matrix from row-major full matrix storage (*matrix*, with leading dimension *ldm*) to row-major band storage (*a*, with leading dimension *lda*):

```
for (i = 0; i < n; i++) {
    m = k - i;
    for (j = max(0, i-k); j <= i; j++) {
        a[(m+j) + i*lda] = matrix[j + i*ldm];
    }
}
```

*lda*

Specifies the leading dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least  $(k + 1)$ .

*x*

Array, size at least  $(1 + (n - 1) * \text{abs}(\text{incx}))$ . Before entry, the incremented array *x* must contain the *n*-element right-hand side vector *b*.

*incx*

Specifies the increment for the elements of *x*.  
The value of *incx* must not be zero.

## Output Parameters

*x*

Overwritten with the solution vector *x*.

## cblas\_?tpmv

Computes a matrix-vector product using a triangular packed matrix.

## Syntax

```
void cblas_stpmv (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const
CBLAS_TRANSPOSE trans, const CBLAS_DIAG diag, const MKL_INT n, const float *ap, float
*x, const MKL_INT incx);
```

```
void cblas_dtpmv (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const
CBLAS_TRANSPOSE trans, const CBLAS_DIAG diag, const MKL_INT n, const double *ap, double
*x, const MKL_INT incx);
```

```
void cblas_ctpmv (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const

const MKL_INT incx);
```

```
void cblas_ztpmv (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const
CBLAS_TRANSPOSE trans, const CBLAS_DIAG diag, const MKL_INT n, const void *ap, void *x,
const MKL_INT incx);
```

## Include Files

- mkl.h

## Description

The ?tpmv routines perform one of the matrix-vector operations defined as

$x := A*x$ , or  $x := A'*x$ , or  $x := \text{conjg}(A')*x$ ,

where:

$x$  is an  $n$ -element vector,

$A$  is an  $n$ -by- $n$  unit, or non-unit, upper or lower triangular matrix, supplied in packed form.

## Input Parameters

<i>Layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>uplo</i>	Specifies whether the matrix $A$ is upper or lower triangular: <i>uplo</i> = CblasUpper if <i>uplo</i> = CblasLower, then the matrix is low triangular.
<i>trans</i>	Specifies the operation: if <i>trans</i> =CblasNoTrans, then $x := A*x$ ; if <i>trans</i> =CblasTrans, then $x := A'*x$ ; if <i>trans</i> =CblasConjTrans, then $x := \text{conjg}(A')*x$ .
<i>diag</i>	Specifies whether the matrix $A$ is unit triangular: if <i>diag</i> = CblasUnit then the matrix is unit triangular; if <i>diag</i> = CblasNonUnit, then the matrix is not unit triangular.
<i>n</i>	Specifies the order of the matrix $A$ . The value of $n$ must be at least zero.
<i>ap</i>	Array, size at least $((n*(n + 1))/2)$ . For <i>Layout</i> = CblasColMajor: Before entry with <i>uplo</i> = CblasUpper, the array <i>ap</i> must contain the upper triangular matrix packed sequentially, column-by-column, so that respectively, and so on. Before entry with <i>uplo</i> = CblasLower <i>ap</i> [0] contains $A_{1,1}$ , <i>ap</i> [1] and <i>ap</i> [2] contain $A_{1,2}$ and $A_{2,2}$ , the array <i>ap</i> must contain the lower triangular matrix packed sequentially, column-by-column, so that <i>ap</i> [0] contains $A_{1,1}$ , <i>ap</i> [1] and <i>ap</i> [2] contain $A_{2,1}$ and $A_{3,1}$ respectively, and so on. When <i>diag</i> = CblasUnit, the diagonal elements of $a$ are not referenced, but are assumed to be unity. For <i>Layout</i> = CblasRowMajor: Before entry with <i>uplo</i> = CblasUpper, the array <i>ap</i> must contain the upper triangular matrix packed sequentially, row-by-row, <i>ap</i> [0] contains $A_{1,1}$ , <i>ap</i> [1] and <i>ap</i> [2] contain $A_{1,2}$ and $A_{1,3}$ respectively, and so on. Before entry with <i>uplo</i> = CblasLower, the array <i>ap</i> must contain the lower triangular matrix packed sequentially, row-by-row, so that <i>ap</i> [0] contains $A_{1,1}$ , <i>ap</i> [1] and <i>ap</i> [2] contain $A_{2,1}$ and $A_{2,2}$ respectively, and so on.
<i>x</i>	Array, size at least $(1 + (n - 1)*\text{abs}(\text{incx}))$ . Before entry, the incremented array $x$ must contain the $n$ -element vector $x$ .
<i>incx</i>	Specifies the increment for the elements of $x$ . The value of <i>incx</i> must not be zero.

## Output Parameters

*x* Overwritten with the transformed vector *x*.

### **cblas\_?tpsv**

*Solves a system of linear equations whose coefficients are in a triangular packed matrix.*

### Syntax

```
void cblas_stpsv (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const

const MKL_INT incx);
```

### Include Files

- mkl.h

### Description

The ?tpsv routines solve one of the following systems of equations

$A*x = b$ , or  $A'*x = b$ , or  $\text{conjg}(A')*x = b$ ,

where:

*b* and *x* are *n*-element vectors,

*A* is an *n*-by-*n* unit, or non-unit, upper or lower triangular matrix, supplied in packed form.

This routine does not test for singularity or near-singularity.

Such tests must be performed before calling this routine.

### Input Parameters

<i>Layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>uplo</i>	Specifies whether the matrix <i>A</i> is upper or lower triangular: <i>uplo</i> = CblasUpper if <i>uplo</i> = CblasLower, then the matrix is low triangular.
<i>trans</i>	Specifies the system of equations: if <i>trans</i> =CblasNoTrans, then $A*x = b$ ; if <i>trans</i> =CblasTrans, then $A'*x = b$ ;

	if <i>trans</i> =CblasConjTrans, then $\text{conjg}(A') * x = b$ .
<i>diag</i>	Specifies whether the matrix <i>A</i> is unit triangular: if <i>diag</i> = CblasUnit then the matrix is unit triangular; if <i>diag</i> = CblasNonUnit , then the matrix is not unit triangular.
<i>n</i>	Specifies the order of the matrix <i>A</i> . The value of <i>n</i> must be at least zero.
<i>ap</i>	Array, size at least $((n * (n + 1)) / 2)$ . For <i>Layout</i> = CblasColMajor: Before entry with <i>uplo</i> = CblasUpper, the array <i>ap</i> must contain the upper triangular part of the triangular matrix packed sequentially, column-by-column, so that <i>ap</i> [0] contains $A_{1,1}$ , <i>ap</i> [1] and <i>ap</i> [2] contain $A_{1,2}$ and $A_{2,2}$ respectively, and so on. Before entry with <i>uplo</i> = CblasLower, the array <i>ap</i> must contain the lower triangular part of the triangular matrix packed sequentially, column-by-column, so that <i>ap</i> [0] contains $A_{1,1}$ , <i>ap</i> [1] and <i>ap</i> [2] contain $A_{2,1}$ and $A_{3,1}$ respectively, and so on. For <i>Layout</i> = CblasRowMajor: Before entry with <i>uplo</i> = CblasUpper, the array <i>ap</i> must contain the upper triangular part of the triangular matrix packed sequentially, row-by-row, <i>ap</i> [0] contains $A_{1,1}$ , <i>ap</i> [1] and <i>ap</i> [2] contain $A_{1,2}$ and $A_{1,3}$ respectively, and so on. Before entry with <i>uplo</i> = CblasLower, the array <i>ap</i> must contain the lower triangular part of the triangular matrix packed sequentially, row-by-row, so that <i>ap</i> [0] contains $A_{1,1}$ , <i>ap</i> [1] and <i>ap</i> [2] contain $A_{2,1}$ and $A_{2,2}$ respectively, and so on. When <i>diag</i> = CblasUnit, the diagonal elements of <i>a</i> are not referenced, but are assumed to be unity.
<i>x</i>	Array, size at least $(1 + (n - 1) * \text{abs}(\text{incx}))$ . Before entry, the incremented array <i>x</i> must contain the <i>n</i> -element right-hand side vector <i>b</i> .
<i>incx</i>	Specifies the increment for the elements of <i>x</i> . The value of <i>incx</i> must not be zero.

## Output Parameters

<i>x</i>	Overwritten with the solution vector <i>x</i> .
----------	---

### **cblas\_?trmv**

Computes a matrix-vector product using a triangular matrix.

#### Syntax

```
void cblas_strmv (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const
CBLAS_TRANSPOSE trans, const CBLAS_DIAG diag, const MKL_INT n, const float *a, const
MKL_INT lda, float *x, const MKL_INT incx);
```

```
void cblas_dtrmv (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const
CBLAS_TRANSPOSE trans, const CBLAS_DIAG diag, const MKL_INT n, const double *a, const
MKL_INT lda, double *x, const MKL_INT incx);
```

```
void cblas_ctrmv (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const
CBLAS_TRANSPOSE trans, const CBLAS_DIAG diag, const MKL_INT n, const void *a, const
MKL_INT lda, void *x, const MKL_INT incx);
```

```
void cblas_ztrmv (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const
CBLAS_TRANSPOSE trans, const CBLAS_DIAG diag, const MKL_INT n, const void *a, const
MKL_INT lda, void *x, const MKL_INT incx);
```

## Include Files

- mkl.h

## Description

The ?trmv routines perform one of the following matrix-vector operations defined as

$x := A*x$ , or  $x := A'*x$ , or  $x := \text{conjg}(A')*x$ ,

where:

$x$  is an  $n$ -element vector,

$A$  is an  $n$ -by- $n$  unit, or non-unit, upper or lower triangular matrix.

## Input Parameters

<i>Layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>uplo</i>	Specifies whether the matrix $A$ is upper or lower triangular: <i>uplo</i> = CblasUpper if <i>uplo</i> = CblasLower, then the matrix is low triangular.
<i>trans</i>	Specifies the operation: if <i>trans</i> =CblasNoTrans, then $x := A*x$ ; if <i>trans</i> =CblasTrans, then $x := A'*x$ ; if <i>trans</i> =CblasConjTrans, then $x := \text{conjg}(A')*x$ .
<i>diag</i>	Specifies whether the matrix $A$ is unit triangular: if <i>diag</i> = CblasUnit then the matrix is unit triangular; if <i>diag</i> = CblasNonUnit, then the matrix is not unit triangular.
<i>n</i>	Specifies the order of the matrix $A$ . The value of $n$ must be at least zero.
<i>a</i>	Array, size $lda*n$ . Before entry with <i>uplo</i> = CblasUpper, the leading $n$ -by- $n$ upper triangular part of the array $a$ must contain the upper triangular matrix and the strictly lower triangular part of $a$ is not referenced. Before entry with <i>uplo</i> = CblasLower, the leading $n$ -by- $n$ lower triangular part of the array $a$ must contain the lower triangular matrix and the strictly upper triangular part of $a$ is not referenced.  When <i>diag</i> = CblasUnit, the diagonal elements of $a$ are not referenced either, but are assumed to be unity.
<i>lda</i>	Specifies the leading dimension of $a$ as declared in the calling (sub)program. The value of <i>lda</i> must be at least $\max(1, n)$ .

<code>x</code>	Array, size at least $(1 + (n - 1) * \text{abs}(\text{incx}))$ . Before entry, the incremented array <code>x</code> must contain the $n$ -element vector <code>x</code> .
<code>incx</code>	Specifies the increment for the elements of <code>x</code> . The value of <code>incx</code> must not be zero.

## Output Parameters

<code>x</code>	Overwritten with the transformed vector <code>x</code> .
----------------	--

## `cblas_?trsv`

Solves a system of linear equations whose coefficients are in a triangular matrix.

## Syntax

```
void cblas_strsv (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const
CBLAS_TRANSPOSE trans, const CBLAS_DIAG diag, const MKL_INT n, const float *a, const
MKL_INT lda, float *x, const MKL_INT incx);
```

```
void cblas_dtrsv (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const
CBLAS_TRANSPOSE trans, const CBLAS_DIAG diag, const MKL_INT n, const double *a, const
MKL_INT lda, double *x, const MKL_INT incx);
```

```
void cblas_ctrsv (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const
CBLAS_TRANSPOSE trans, const CBLAS_DIAG diag, const MKL_INT n, const void *a, const
MKL_INT lda, void *x, const MKL_INT incx);
```

```
void cblas_ztrsv (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const
CBLAS_TRANSPOSE trans, const CBLAS_DIAG diag, const MKL_INT n, const void *a, const
MKL_INT lda, void *x, const MKL_INT incx);
```

## Include Files

- `mkl.h`

## Description

The `?trsv` routines solve one of the systems of equations:

$A * x = b$ , or  $A' * x = b$ , or  $\text{conjg}(A') * x = b$ ,

where:

$b$  and  $x$  are  $n$ -element vectors,

$A$  is an  $n$ -by- $n$  unit, or non-unit, upper or lower triangular matrix.

The routine does not test for singularity or near-singularity.

Such tests must be performed before calling this routine.

## Input Parameters

<code>Layout</code>	Specifies whether two-dimensional array storage is row-major ( <code>CblasRowMajor</code> ) or column-major ( <code>CblasColMajor</code> ).
<code>uplo</code>	Specifies whether the matrix $A$ is upper or lower triangular:

	<code>uplo = CblasUpper</code> if <code>uplo = CblasLower</code> , then the matrix is low triangular.
<code>trans</code>	Specifies the systems of equations: if <code>trans=CblasNoTrans</code> , then $A*x = b$ ; if <code>trans=CblasTrans</code> , then $A'*x = b$ ; if <code>trans=CblasConjTrans</code> , then $oconjg(A')*x = b$ .
<code>diag</code>	Specifies whether the matrix $A$ is unit triangular: if <code>diag = CblasUnit</code> then the matrix is unit triangular; if <code>diag = CblasNonUnit</code> , then the matrix is not unit triangular.
<code>n</code>	Specifies the order of the matrix $A$ . The value of $n$ must be at least zero.
<code>a</code>	Array, size $lda*n$ . Before entry with <code>uplo = CblasUpper</code> , the leading $n$ -by- $n$ upper triangular part of the array $a$ must contain the upper triangular matrix and the strictly lower triangular part of $a$ is not referenced. Before entry with <code>uplo = CblasLower</code> , the leading $n$ -by- $n$ lower triangular part of the array $a$ must contain the lower triangular matrix and the strictly upper triangular part of $a$ is not referenced.  When <code>diag = CblasUnit</code> , the diagonal elements of $a$ are not referenced either, but are assumed to be unity.
<code>lda</code>	Specifies the leading dimension of $a$ as declared in the calling (sub)program. The value of $lda$ must be at least $\max(1, n)$ .
<code>x</code>	Array, size at least $(1 + (n - 1)*abs(incx))$ . Before entry, the incremented array $x$ must contain the $n$ -element right-hand side vector $b$ .
<code>incx</code>	Specifies the increment for the elements of $x$ . The value of <code>incx</code> must not be zero.

## Output Parameters

<code>x</code>	Overwritten with the solution vector $x$ .
----------------	--

## BLAS Level 3 Routines

BLAS Level 3 routines perform matrix-matrix operations. The following table lists the BLAS Level 3 routine groups and the data types associated with them.

### BLAS Level 3 Routine Groups and Their Data Types

Routine Group	Data Types	Description
<code>cblas_?gemm</code>	s, d, c, z	Computes a matrix-matrix product with general matrices.
<code>cblas_?hemm</code>	c, z	Computes a matrix-matrix product where one input matrix is Hermitian.
<code>cblas_?herk</code>	c, z	Performs a Hermitian rank-k update.
<code>cblas_?her2k</code>	c, z	Performs a Hermitian rank-2k update.

Routine Group	Data Types	Description
<code>cblas_?symm</code>	s, d, c, z	Computes a matrix-matrix product where one input matrix is symmetric.
<code>cblas_?syrk</code>	s, d, c, z	Performs a symmetric rank-k update.
<code>cblas_?syr2k</code>	s, d, c, z	Performs a symmetric rank-2k update.
<code>cblas_?trmm</code>	s, d, c, z	Computes a matrix-matrix product where one input matrix is triangular.
<code>cblas_?trsm</code>	s, d, c, z	Solves a triangular matrix equation.

## Symmetric Multiprocessing Version of Intel® MKL

Many applications spend considerable time executing BLAS routines. This time can be scaled by the number of processors available on the system through using the symmetric multiprocessing (SMP) feature built into the Intel® oneMKL. The performance enhancements based on the parallel use of the processors are available without any programming effort on your part.

To enhance performance, the library uses the following methods:

- The BLAS functions are blocked where possible to restructure the code in a way that increases the localization of data reference, enhances cache memory use, and reduces the dependency on the memory bus.
- The code is distributed across the processors to maximize parallelism.

### Product and Performance Information

Performance varies by use, configuration and other factors. Learn more at [www.Intel.com/PerformanceIndex](http://www.Intel.com/PerformanceIndex).

Notice revision #20201201

## `cblas_?gemm`

*Computes a matrix-matrix product with general matrices.*

### Syntax

```

## Include Files

- `mkl.h`

## Description

The `?gemm` routines compute a scalar-matrix-matrix product and add the result to a scalar-matrix product, with general matrices. The operation is defined as

$$C := \alpha * \text{op}(A) * \text{op}(B) + \beta * C$$

where:

$\text{op}(X)$  is one of  $\text{op}(X) = X$ , or  $\text{op}(X) = X^T$ , or  $\text{op}(X) = X^H$ ,

$\alpha$  and  $\beta$  are scalars,

$A$ ,  $B$  and  $C$  are matrices:

$\text{op}(A)$  is an  $m$ -by- $k$  matrix,

$\text{op}(B)$  is a  $k$ -by- $n$  matrix,

$C$  is an  $m$ -by- $n$  matrix.

See also:

- [?gemm3m](#), BLAS-like extension routines, that use matrix multiplication for similar matrix-matrix operations

## Input Parameters

<i>Layout</i>	Specifies whether two-dimensional array storage is row-major ( <code>CblasRowMajor</code> ) or column-major ( <code>CblasColMajor</code> ).
<i>transa</i>	Specifies the form of $\text{op}(A)$ used in the matrix multiplication: <ul style="list-style-type: none"> <li>• if <math>\text{transa}=\text{CblasNoTrans}</math>, then <math>\text{op}(A) = A</math>;</li> <li>• if <math>\text{transa}=\text{CblasTrans}</math>, then <math>\text{op}(A) = A^T</math>;</li> <li>• if <math>\text{transa}=\text{CblasConjTrans}</math>, then <math>\text{op}(A) = A^H</math>.</li> </ul>
<i>transb</i>	Specifies the form of $\text{op}(B)$ used in the matrix multiplication: <ul style="list-style-type: none"> <li>• if <math>\text{transb}=\text{CblasNoTrans}</math>, then <math>\text{op}(B) = B</math>;</li> <li>• if <math>\text{transb}=\text{CblasTrans}</math>, then <math>\text{op}(B) = B^T</math>;</li> <li>• if <math>\text{transb}=\text{CblasConjTrans}</math>, then <math>\text{op}(B) = B^H</math>.</li> </ul>
<i>m</i>	Specifies the number of rows of the matrix $\text{op}(A)$ and of the matrix $C$ . The value of $m$ must be at least zero.
<i>n</i>	Specifies the number of columns of the matrix $\text{op}(B)$ and the number of columns of the matrix $C$ . The value of $n$ must be at least zero.
<i>k</i>	Specifies the number of columns of the matrix $\text{op}(A)$ and the number of rows of the matrix $\text{op}(B)$ . The value of $k$ must be at least zero.
<i>alpha</i>	Specifies the scalar $\alpha$ .

*a*

	<i>transa</i> =CblasNoTrans	<i>transa</i> =CblasTrans or <i>transa</i> =CblasConjTrans
<i>Layout</i> = CblasColMajor	Array, size <i>lda</i> * <i>k</i> . Before entry, the leading <i>m</i> -by- <i>k</i> part of the array <i>a</i> must contain the matrix <i>A</i> .	Array, size <i>lda</i> * <i>m</i> . Before entry, the leading <i>k</i> -by- <i>m</i> part of the array <i>a</i> must contain the matrix <i>A</i> .
<i>Layout</i> = CblasRowMajor	Array, size <i>lda</i> * <i>m</i> . Before entry, the leading <i>k</i> -by- <i>m</i> part of the array <i>a</i> must contain the matrix <i>A</i> .	Array, size <i>lda</i> * <i>k</i> . Before entry, the leading <i>m</i> -by- <i>k</i> part of the array <i>a</i> must contain the matrix <i>A</i> .

*lda*

Specifies the leading dimension of *a* as declared in the calling (sub)program.

	<i>transa</i> =CblasNoTrans	<i>transa</i> =CblasTrans or <i>transa</i> =CblasConjTrans
<i>Layout</i> = CblasColMajor	<i>lda</i> must be at least $\max(1, m)$ .	<i>lda</i> must be at least $\max(1, k)$
<i>Layout</i> = CblasRowMajor	<i>lda</i> must be at least $\max(1, k)$	<i>lda</i> must be at least $\max(1, m)$ .

*b*

	<i>transb</i> =CblasNoTrans	<i>transb</i> =CblasTrans or <i>transb</i> =CblasConjTrans
<i>Layout</i> = CblasColMajor	Array, size <i>ldb</i> by <i>n</i> . Before entry, the leading <i>k</i> -by- <i>n</i> part of the array <i>b</i> must contain the matrix <i>B</i> .	Array, size <i>ldb</i> by <i>k</i> . Before entry the leading <i>n</i> -by- <i>k</i> part of the array <i>b</i> must contain the matrix <i>B</i> .
<i>Layout</i> = CblasRowMajor	Array, size <i>ldb</i> by <i>k</i> . Before entry the leading <i>n</i> -by- <i>k</i> part of the array <i>b</i> must contain the matrix <i>B</i> .	Array, size <i>ldb</i> by <i>n</i> . Before entry, the leading <i>k</i> -by- <i>n</i> part of the array <i>b</i> must contain the matrix <i>B</i> .

*ldb*

Specifies the leading dimension of *b* as declared in the calling (sub)program.

When *transb*=CblasNoTrans, then *ldb* must be at least  $\max(1, k)$ , otherwise *ldb* must be at least  $\max(1, n)$ .

	<i>transb</i> =CblasNoTrans	<i>transb</i> =CblasTrans or <i>transb</i> =CblasConjTrans
--	-----------------------------	---

<i>Layout</i> = CblasColMajor	<i>ldb</i> must be at least $\max(1, k)$ .	<i>ldb</i> must be at least $\max(1, n)$ .
<i>Layout</i> = CblasRowMajor	<i>ldb</i> must be at least $\max(1, n)$ .	<i>ldb</i> must be at least $\max(1, k)$ .

*beta*

Specifies the scalar *beta*. When *beta* is equal to zero, then *c* need not be set on input.

*c*

<i>Layout</i> = CblasColMajor	Array, size <i>ldc</i> by <i>n</i> . Before entry, the leading <i>m</i> -by- <i>n</i> part of the array <i>c</i> must contain the matrix <i>C</i> , except when <i>beta</i> is equal to zero, in which case <i>c</i> need not be set on entry.
<i>Layout</i> = CblasRowMajor	Array, size <i>ldc</i> by <i>m</i> . Before entry, the leading <i>n</i> -by- <i>m</i> part of the array <i>c</i> must contain the matrix <i>C</i> , except when <i>beta</i> is equal to zero, in which case <i>c</i> need not be set on entry.

*ldc*

Specifies the leading dimension of *c* as declared in the calling (sub)program.

<i>Layout</i> = CblasColMajor	<i>ldc</i> must be at least $\max(1, m)$ .
<i>Layout</i> = CblasRowMajor	<i>ldc</i> must be at least $\max(1, n)$ .

## Output Parameters

*c*

Overwritten by the *m*-by-*n* matrix  $(\alpha * \text{op}(A) * \text{op}(B) + \beta * C)$ .

## Example

For examples of routine usage, see these code examples in the Intel® oneAPI Math Kernel Library (oneMKL) installation directory:

- `cblas_sgemm: examples\cblas\source\cblas_sgemmx.c`
- `cblas_dgemm: examples\cblas\source\cblas_dgemmx.c`
- `cblas_cgemm: examples\cblas\source\cblas_cgemmx.c`
- `cblas_zgemm: examples\cblas\source\cblas_zgemmx.c`

## `cblas_?hemm`

Computes a matrix-matrix product where one input matrix is Hermitian.

## Syntax

```
void cblas_chemm (const CBLAS_LAYOUT Layout, const CBLAS_SIDE side, const CBLAS_UPLO uplo,
const MKL_INT m, const MKL_INT n, const void *alpha, const void *a, const MKL_INT lda,
const void *b, const MKL_INT ldb, const void *beta, void *c, const MKL_INT ldc);
```

```
void cblas_zhemm (const CBLAS_LAYOUT Layout, const CBLAS_SIDE side, const CBLAS_UPLO
uplo, const MKL_INT m, const MKL_INT n, const void *alpha, const void *a, const MKL_INT
lda, const void *b, const MKL_INT ldb, const void *beta, void *c, const MKL_INT ldc);
```

## Include Files

- mkl.h

## Description

The ?hemm routines compute a scalar-matrix-matrix product using a Hermitian matrix  $A$  and a general matrix  $B$  and add the result to a scalar-matrix product using a general matrix  $C$ . The operation is defined as

$$C := \alpha A * B + \beta * C$$

or

$$C := \alpha B * A + \beta * C$$

where:

$\alpha$  and  $\beta$  are scalars,

$A$  is a Hermitian matrix,

$B$  and  $C$  are  $m$ -by- $n$  matrices.

## Input Parameters

<i>Layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>side</i>	Specifies whether the Hermitian matrix $A$ appears on the left or right in the operation as follows: if $side = CblasLeft$ , then $C := \alpha A * B + \beta * C$ ; if $side = CblasRight$ , then $C := \alpha B * A + \beta * C$ .
<i>uplo</i>	Specifies whether the upper or lower triangular part of the Hermitian matrix $A$ is used: If $uplo = CblasUpper$ , then the upper triangular part of the Hermitian matrix $A$ is used. If $uplo = CblasLower$ , then the low triangular part of the Hermitian matrix $A$ is used.
<i>m</i>	Specifies the number of rows of the matrix $C$ . The value of $m$ must be at least zero.
<i>n</i>	Specifies the number of columns of the matrix $C$ . The value of $n$ must be at least zero.
<i>alpha</i>	Specifies the scalar $\alpha$ .
<i>a</i>	Array, size $lda * ka$ , where $ka$ is $m$ when $side = CblasLeft$ and is $n$ otherwise. Before entry with $side = CblasLeft$ , the $m$ -by- $m$ part of the array $a$ must contain the Hermitian matrix, such that when $uplo = CblasUpper$ , the leading $m$ -by- $m$ upper triangular part of the array $a$ must

contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of  $a$  is not referenced, and when  $uplo = CblasLower$ , the leading  $m$ -by- $m$  lower triangular part of the array  $a$  must contain the lower triangular part of the Hermitian matrix, and the strictly upper triangular part of  $a$  is not referenced.

Before entry with  $side = CblasRight$ , the  $n$ -by- $n$  part of the array  $a$  must contain the Hermitian matrix, such that when  $uplo = CblasUpper$ , the leading  $n$ -by- $n$  upper triangular part of the array  $a$  must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of  $a$  is not referenced, and when  $uplo = CblasLower$ , the leading  $n$ -by- $n$  lower triangular part of the array  $a$  must contain the lower triangular part of the Hermitian matrix, and the strictly upper triangular part of  $a$  is not referenced. The imaginary parts of the diagonal elements need not be set, they are assumed to be zero.

<i>lda</i>	Specifies the leading dimension of $a$ as declared in the calling (sub) program. When $side = CblasLeft$ then $lda$ must be at least $\max(1, m)$ , otherwise $lda$ must be at least $\max(1, n)$ .
<i>b</i>	For $Layout = CblasColMajor$ : array, size $ldb*n$ . The leading $m$ -by- $n$ part of the array $b$ must contain the matrix $B$ . For $Layout = CblasRowMajor$ : array, size $ldb*m$ . The leading $n$ -by- $m$ part of the array $b$ must contain the matrix $B$
<i>ldb</i>	Specifies the leading dimension of $b$ as declared in the calling (sub)program. When $Layout = CblasColMajor$ , $ldb$ must be at least $\max(1, m)$ ; otherwise, $ldb$ must be at least $\max(1, n)$ .
<i>beta</i>	Specifies the scalar $beta$ . When $beta$ is supplied as zero, then $c$ need not be set on input.
<i>c</i>	For $Layout = CblasColMajor$ : array, size $ldc*n$ . Before entry, the leading $m$ -by- $n$ part of the array $c$ must contain the matrix $C$ , except when $beta$ is zero, in which case $c$ need not be set on entry. For $Layout = CblasRowMajor$ : array, size $ldc*m$ . Before entry, the leading $n$ -by- $m$ part of the array $c$ must contain the matrix $C$ , except when $beta$ is zero, in which case $c$ need not be set on entry.
<i>ldc</i>	Specifies the leading dimension of $c$ as declared in the calling (sub)program. When $Layout = CblasColMajor$ , $ldc$ must be at least $\max(1, m)$ ; otherwise, $ldc$ must be at least $\max(1, n)$ .

## Output Parameters

<i>c</i>	Overwritten by the $m$ -by- $n$ updated matrix.
----------	---

### **`cblas_?herk`**

*Performs a Hermitian rank- $k$  update.*

### Syntax

```
void cblas_cherk (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const
CBLAS_TRANSPOSE trans, const MKL_INT n, const MKL_INT k, const float alpha, const void
*a, const MKL_INT lda, const float beta, void *c, const MKL_INT ldc);
```

```
void cblas_zherk (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const
CBLAS_TRANSPOSE trans, const MKL_INT n, const MKL_INT k, const double alpha, const void
*a, const MKL_INT lda, const double beta, void *c, const MKL_INT ldc);
```

## Include Files

- mkl.h

## Description

The `zherk` routines perform a rank- $k$  matrix-matrix operation using a general matrix  $A$  and a Hermitian matrix  $C$ . The operation is defined as:

$$C := \alpha A A^H + \beta C,$$

or

$$C := \alpha A^H A + \beta C,$$

where:

$\alpha$  and  $\beta$  are real scalars,

$C$  is an  $n$ -by- $n$  Hermitian matrix,

$A$  is an  $n$ -by- $k$  matrix in the first case and a  $k$ -by- $n$  matrix in the second case.

## Input Parameters

*Layout*

Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).

*uplo*

Specifies whether the upper or lower triangular part of the array  $c$  is used.

If  $uplo = CblasUpper$ , then the upper triangular part of the array  $c$  is used.

If  $uplo = CblasLower$ , then the low triangular part of the array  $c$  is used.

*trans*

Specifies the operation:

if  $trans = CblasNoTrans$ , then  $C := \alpha A A^H + \beta C$ ;

if  $trans = CblasConjTrans$ , then  $C := \alpha A^H A + \beta C$ .

*n*

Specifies the order of the matrix  $C$ . The value of  $n$  must be at least zero.

*k*

With  $trans = CblasNoTrans$ ,  $k$  specifies the number of columns of the matrix  $A$ , and with  $trans = CblasConjTrans$ ,  $k$  specifies the number of rows of the matrix  $A$ .

The value of  $k$  must be at least zero.

*alpha*

Specifies the scalar  $\alpha$ .

*a*

	$trans = CblasNoTrans$	$trans = CblasConjTrans$
$Layout = CblasColMajor$	Array, size $lda * k$ .	Array, size $lda * n$ . Before entry, the leading $k$ -by- $n$ part of the array $a$ must contain the matrix $A$ .

	Before entry, the leading $n$ -by- $k$ part of the array $a$ must contain the matrix $A$ .	
$Layout =$ $CblasRowMajor$	Array, size $lda*n$ . Before entry, the leading $k$ -by- $n$ part of the array $a$ must contain the matrix $A$ .	Array, size $lda*k$ . Before entry, the leading $n$ -by- $k$ part of the array $a$ must contain the matrix $A$ .

 $lda$ 

	$trans=CblasNoTrans$	$trans=CblasConjTrans$
$Layout =$ $CblasColMajor$	$lda$ must be at least $\max(1, n)$ .	$lda$ must be at least $\max(1, k)$
$Layout =$ $CblasRowMajor$	$lda$ must be at least $\max(1, k)$	$lda$ must be at least $\max(1, n)$ .

 $beta$ Specifies the scalar  $beta$ . $c$ Array, size  $ldc$  by  $n$ .

Before entry with  $uplo = CblasUpper$ , the leading  $n$ -by- $n$  upper triangular part of the array  $c$  must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of  $c$  is not referenced.

Before entry with  $uplo = CblasLower$ , the leading  $n$ -by- $n$  lower triangular part of the array  $c$  must contain the lower triangular part of the Hermitian matrix and the strictly upper triangular part of  $c$  is not referenced.

The imaginary parts of the diagonal elements need not be set, they are assumed to be zero.

 $ldc$ 

Specifies the leading dimension of  $c$  as declared in the calling (sub)program. The value of  $ldc$  must be at least  $\max(1, n)$ .

## Output Parameters

 $c$ 

With  $uplo = CblasUpper$ , the upper triangular part of the array  $c$  is overwritten by the upper triangular part of the updated matrix.

With  $uplo = CblasLower$ , the lower triangular part of the array  $c$  is overwritten by the lower triangular part of the updated matrix.

The imaginary parts of the diagonal elements are set to zero.

## `cblas_?her2k`

*Performs a Hermitian rank-2k update.*

---

## Syntax

```
void cblas_cher2k (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const
CBLAS_TRANSPOSE trans, const MKL_INT n, const MKL_INT k, const void *alpha, const void
*a, const MKL_INT lda, const void *b, const MKL_INT ldb, const float beta, void *c,
const MKL_INT ldc);
```

```
void cblas_zher2k (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const
CBLAS_TRANSPOSE trans, const MKL_INT n, const MKL_INT k, const void *alpha, const void
*a, const MKL_INT lda, const void *b, const MKL_INT ldb, const double beta, void *c,
const MKL_INT ldc);
```

## Include Files

- mkl.h

## Description

The `cher2k` routines perform a rank-2k matrix-matrix operation using general matrices  $A$  and  $B$  and a Hermitian matrix  $C$ . The operation is defined as

$$C := \alpha A^H B^H + \text{conjg}(\alpha) B^H A^H + \beta C$$

or

$$C := \alpha A^H B + \text{conjg}(\alpha) B^H A + \beta C$$

where:

$\alpha$  is a scalar and  $\beta$  is a real scalar.

$C$  is an  $n$ -by- $n$  Hermitian matrix.

$A$  and  $B$  are  $n$ -by- $k$  matrices in the first case and  $k$ -by- $n$  matrices in the second case.

## Input Parameters

<i>Layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>uplo</i>	Specifies whether the upper or lower triangular part of the array $c$ is used. If $uplo = \text{CblasUpper}$ , then the upper triangular of the array $c$ is used. If $uplo = \text{CblasLower}$ , then the low triangular of the array $c$ is used.
<i>trans</i>	Specifies the operation: if $trans = \text{CblasNoTrans}$ , then $C := \alpha A^H B^H + \alpha B^H A^H + \beta C$ ; if $trans = \text{CblasConjTrans}$ , then $C := \alpha A^H B + \alpha B^H A + \beta C$ .
<i>n</i>	Specifies the order of the matrix $C$ . The value of $n$ must be at least zero.
<i>k</i>	With $trans = \text{CblasNoTrans}$ specifies the number of columns of the matrix $A$ , and with $trans = \text{CblasConjTrans}$ , $k$ specifies the number of rows of the matrix $A$ .  The value of $k$ must be at least equal to zero.
<i>alpha</i>	Specifies the scalar $\alpha$ .

*a*

	<i>trans</i> =CblasNoTrans	<i>trans</i> =CblasConjTrans
<i>Layout</i> = CblasColMajor	Array, size $lda*k$ . Before entry, the leading $n$ -by- $k$ part of the array <i>a</i> must contain the matrix <i>A</i> .	Array, size $lda*n$ . Before entry, the leading $k$ -by- $n$ part of the array <i>a</i> must contain the matrix <i>A</i> .
<i>Layout</i> = CblasRowMajor	Array, size $lda*n$ . Before entry, the leading $k$ -by- $n$ part of the array <i>a</i> must contain the matrix <i>A</i> .	Array, size $lda*k$ . Before entry, the leading $n$ -by- $k$ part of the array <i>a</i> must contain the matrix <i>A</i> .

*lda*

Specifies the leading dimension of *a* as declared in the calling (sub)program.

	<i>trans</i> =CblasNoTrans	<i>trans</i> =CblasConjTrans
<i>Layout</i> = CblasColMajor	<i>lda</i> must be at least $\max(1, n)$ .	<i>lda</i> must be at least $\max(1, k)$
<i>Layout</i> = CblasRowMajor	<i>lda</i> must be at least $\max(1, k)$	<i>lda</i> must be at least $\max(1, n)$ .

*beta*

Specifies the scalar *beta*.

*b*

	<i>trans</i> =CblasNoTrans	<i>trans</i> =CblasConjTrans
<i>Layout</i> = CblasColMajor	Array, size $ldb*k$ . Before entry, the leading $n$ -by- $k$ part of the array <i>b</i> must contain the matrix <i>B</i> .	Array, size $ldb*n$ . Before entry, the leading $k$ -by- $n$ part of the array <i>b</i> must contain the matrix <i>B</i> .
<i>Layout</i> = CblasRowMajor	Array, size $lda*n$ . Before entry, the leading $k$ -by- $n$ part of the array <i>b</i> must contain the matrix <i>B</i> .	Array, size $lda*k$ . Before entry, the leading $n$ -by- $k$ part of the array <i>b</i> must contain the matrix <i>B</i> .

*ldb*

Specifies the leading dimension of *a* as declared in the calling (sub)program.

	<i>trans</i> =CblasNoTrans	<i>trans</i> =CblasConjTrans
<i>Layout</i> = CblasColMajor	<i>ldb</i> must be at least $\max(1, n)$ .	<i>ldb</i> must be at least $\max(1, k)$

<i>Layout</i> = CblasRowMajor	<i>ldb</i> must be at least $\max(1, k)$	<i>ldb</i> must be at least $\max(1, n)$ .
----------------------------------	---	---

*c*Array, size *ldc* by *n*.

Before entry with *uplo* = CblasUpper, the leading *n*-by-*n* upper triangular part of the array *c* must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of *c* is not referenced.

Before entry with *uplo* = CblasLower, the leading *n*-by-*n* lower triangular part of the array *c* must contain the lower triangular part of the Hermitian matrix and the strictly upper triangular part of *c* is not referenced.

The imaginary parts of the diagonal elements need not be set, they are assumed to be zero.

*ldc*

Specifies the leading dimension of *c* as declared in the calling (sub)program. The value of *ldc* must be at least  $\max(1, n)$ .

## Output Parameters

*c*

With *uplo* = CblasUpper, the upper triangular part of the array *c* is overwritten by the upper triangular part of the updated matrix.

With *uplo* = CblasLower, the lower triangular part of the array *c* is overwritten by the lower triangular part of the updated matrix.

The imaginary parts of the diagonal elements are set to zero.

## **cblas\_?symm**

*Computes a matrix-matrix product where one input matrix is symmetric.*

### Syntax

```

uplo, const MKL_INT m, const MKL_INT n, const void *alpha, const void *a, const MKL_INT
lda, const void *b, const MKL_INT ldb, const void *beta, void *c, const MKL_INT ldc);
```

```
void cblas_zsymm (const CBLAS_LAYOUT Layout, const CBLAS_SIDE side, const CBLAS_UPLO
uplo, const MKL_INT m, const MKL_INT n, const void *alpha, const void *a, const MKL_INT
lda, const void *b, const MKL_INT ldb, const void *beta, void *c, const MKL_INT ldc);
```

### Include Files

- mkl.h

## Description

The `?symm` routines compute a scalar-matrix-matrix product with one symmetric matrix and add the result to a scalar-matrix product. The operation is defined as

```
C := alpha*A*B + beta*C,
```

or

```
C := alpha*B*A + beta*C,
```

where:

*alpha* and *beta* are scalars,

*A* is a symmetric matrix,

*B* and *C* are *m*-by-*n* matrices.

## Input Parameters

<i>Layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>side</i>	Specifies whether the symmetric matrix <i>A</i> appears on the left or right in the operation: if <i>side</i> = CblasLeft, then $C := \alpha * A * B + \beta * C$ ; if <i>side</i> = CblasRight, then $C := \alpha * B * A + \beta * C$ .
<i>uplo</i>	Specifies whether the upper or lower triangular part of the symmetric matrix <i>A</i> is used: if <i>uplo</i> = CblasUpper, then the upper triangular part is used; if <i>uplo</i> = CblasLower, then the lower triangular part is used.
<i>m</i>	Specifies the number of rows of the matrix <i>C</i> . The value of <i>m</i> must be at least zero.
<i>n</i>	Specifies the number of columns of the matrix <i>C</i> . The value of <i>n</i> must be at least zero.
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>a</i>	Array, size <i>lda</i> * <i>ka</i> , where <i>ka</i> is <i>m</i> when <i>side</i> = CblasLeft and is <i>n</i> otherwise.  Before entry with <i>side</i> = CblasLeft, the <i>m</i> -by- <i>m</i> part of the array <i>a</i> must contain the symmetric matrix, such that when <i>uplo</i> = CblasUpper, the leading <i>m</i> -by- <i>m</i> upper triangular part of the array <i>a</i> must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of <i>a</i> is not referenced, and when <i>side</i> = CblasLeft, the leading <i>m</i> -by- <i>m</i> lower triangular part of the array <i>a</i> must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of <i>a</i> is not referenced.

Before entry with `side = CblasRight`, the  $n$ -by- $n$  part of the array `a` must contain the symmetric matrix, such that when `uplo = CblasUpper` array `a` must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of `a` is not referenced, and when `side = CblasLeft`, the leading  $n$ -by- $n$  lower triangular part of the array `a` must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of `a` is not referenced.

<code>lda</code>	Specifies the leading dimension of <code>a</code> as declared in the calling (sub)program. When <code>side = CblasLeft</code> then <code>lda</code> must be at least $\max(1, m)$ , otherwise <code>lda</code> must be at least $\max(1, n)$ .
<code>b</code>	For <code>Layout = CblasColMajor</code> : array, size <code>ldb*n</code> . The leading $m$ -by- $n$ part of the array <code>b</code> must contain the matrix <code>B</code> .  For <code>Layout = CblasRowMajor</code> : array, size <code>ldb*m</code> . The leading $n$ -by- $m$ part of the array <code>b</code> must contain the matrix <code>B</code> .
<code>ldb</code>	Specifies the leading dimension of <code>b</code> as declared in the calling (sub)program. When <code>Layout = CblasColMajor</code> , <code>ldb</code> must be at least $\max(1, m)$ ; otherwise, <code>ldb</code> must be at least $\max(1, n)$ .
<code>beta</code>	Specifies the scalar <code>beta</code> .  When <code>beta</code> is set to zero, then <code>c</code> need not be set on input.
<code>c</code>	For <code>Layout = CblasColMajor</code> : array, size <code>ldc*n</code> . Before entry, the leading $m$ -by- $n$ part of the array <code>c</code> must contain the matrix <code>C</code> , except when <code>beta</code> is zero, in which case <code>c</code> need not be set on entry.  For <code>Layout = CblasRowMajor</code> : array, size <code>ldc*m</code> . Before entry, the leading $n$ -by- $m$ part of the array <code>c</code> must contain the matrix <code>C</code> , except when <code>beta</code> is zero, in which case <code>c</code> need not be set on entry.
<code>ldc</code>	Specifies the leading dimension of <code>c</code> as declared in the calling (sub)program. When <code>Layout = CblasColMajor</code> , <code>ldc</code> must be at least $\max(1, m)$ ; otherwise, <code>ldc</code> must be at least $\max(1, n)$ .

## Output Parameters

<code>c</code>	Overwritten by the $m$ -by- $n$ updated matrix.
----------------	---

### `cblas_?syrk`

*Performs a symmetric rank- $k$  update.*

#### Syntax

```
void cblas_ssyrrk (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const

```

## Include Files

- mkl.h

## Description

The ?syrk routines perform a rank- $k$  matrix-matrix operation for a symmetric matrix  $C$  using a general matrix  $A$ . The operation is defined as:

$$C := \alpha A A' + \beta C,$$

or

$$C := \alpha A' A + \beta C,$$

where:

$\alpha$  and  $\beta$  are scalars,

$C$  is an  $n$ -by- $n$  symmetric matrix,

$A$  is an  $n$ -by- $k$  matrix in the first case and a  $k$ -by- $n$  matrix in the second case.

## Input Parameters

<i>Layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>uplo</i>	Specifies whether the upper or lower triangular part of the array $c$ is used. If $uplo = CblasUpper$ , then the upper triangular part of the array $c$ is used. If $uplo = CblasLower$ , then the low triangular part of the array $c$ is used.
<i>trans</i>	Specifies the operation: if $trans=CblasNoTrans$ , then $C := \alpha A A' + \beta C$ ; if $trans=CblasTrans$ , then $C := \alpha A' A + \beta C$ ; if $trans=CblasConjTrans$ , then $C := \alpha A' A + \beta C$ .
<i>n</i>	Specifies the order of the matrix $C$ . The value of $n$ must be at least zero.
<i>k</i>	On entry with $trans=CblasNoTrans$ , $k$ specifies the number of columns of the matrix $a$ , and on entry with $trans=CblasTrans$ or $trans=CblasConjTrans$ , $k$ specifies the number of rows of the matrix $a$ . The value of $k$ must be at least zero.
<i>alpha</i>	Specifies the scalar $\alpha$ .
<i>a</i>	Array, size $lda * ka$ , where $ka$ is $k$ when $trans=CblasNoTrans$ , and is $n$ otherwise. Before entry with $trans=CblasNoTrans$ , the leading $n$ -by- $k$ part of the array $a$ must contain the matrix $A$ , otherwise the leading $k$ -by- $n$ part of the array $a$ must contain the matrix $A$ .

	<i>trans</i> =CblasNoTrans	<i>trans</i> =CblasConjTrans
<i>Layout</i> = CblasColMajor	Array, size <i>lda</i> * <i>k</i> . Before entry, the leading <i>n</i> -by- <i>k</i> part of the array <i>a</i> must contain the matrix <i>A</i> .	Array, size <i>lda</i> * <i>n</i> . Before entry, the leading <i>k</i> -by- <i>n</i> part of the array <i>a</i> must contain the matrix <i>A</i> .
<i>Layout</i> = CblasRowMajor	Array, size <i>lda</i> * <i>n</i> . Before entry, the leading <i>k</i> -by- <i>n</i> part of the array <i>a</i> must contain the matrix <i>A</i> .	Array, size <i>lda</i> * <i>k</i> . Before entry, the leading <i>n</i> -by- <i>k</i> part of the array <i>a</i> must contain the matrix <i>A</i> .

*lda*

	<i>trans</i> =CblasNoTrans	<i>trans</i> =CblasConjTrans
<i>Layout</i> = CblasColMajor	<i>lda</i> must be at least $\max(1, n)$ .	<i>lda</i> must be at least $\max(1, k)$
<i>Layout</i> = CblasRowMajor	<i>lda</i> must be at least $\max(1, k)$	<i>lda</i> must be at least $\max(1, n)$ .

*beta*Specifies the scalar *beta*.*c*

Array, size *ldc*\* *n*. Before entry with *uplo* = CblasUpper, the leading *n*-by-*n* upper triangular part of the array *c* must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of *c* is not referenced.

Before entry with *uplo* = CblasLower, the leading *n*-by-*n* lower triangular part of the array *c* must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of *c* is not referenced.

*ldc*

Specifies the leading dimension of *c* as declared in the calling (sub)program. The value of *ldc* must be at least  $\max(1, n)$ .

## Output Parameters

*c*

With *uplo* = CblasUpper, the upper triangular part of the array *c* is overwritten by the upper triangular part of the updated matrix.

With *uplo* = CblasLower, the lower triangular part of the array *c* is overwritten by the lower triangular part of the updated matrix.

## Include Files

- mkl.h

## Description

The `?syr2k` routines perform a rank-2k matrix-matrix operation for a symmetric matrix  $C$  using general matrices  $A$  and  $B$ . The operation is defined as:

$$C := \alpha * A * B' + \alpha * B * A' + \beta * C,$$

or

$$C := \alpha * A' * B + \alpha * B' * A + \beta * C,$$

where:

$\alpha$  and  $\beta$  are scalars,

$C$  is an  $n$ -by- $n$  symmetric matrix,

$A$  and  $B$  are  $n$ -by- $k$  matrices in the first case, and  $k$ -by- $n$  matrices in the second case.

## Input Parameters

<i>Layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>uplo</i>	Specifies whether the upper or lower triangular part of the array $c$ is used. If $uplo = CblasUpper$ , then the upper triangular part of the array $c$ is used. If $uplo = CblasLower$ , then the low triangular part of the array $c$ is used.
<i>trans</i>	Specifies the operation: if $trans = CblasNoTrans$ , then $C := \alpha * A * B' + \alpha * B * A' + \beta * C$ ; if $trans = CblasTrans$ , then $C := \alpha * A' * B + \alpha * B' * A + \beta * C$ ; if $trans = CblasConjTrans$ , then $C := \alpha * A' * B + \alpha * B' * A + \beta * C$ .
<i>n</i>	Specifies the order of the matrix $C$ . The value of $n$ must be at least zero.

*k* On entry with *trans*=CblasNoTrans, *k* specifies the number of columns of the matrices *A* and *B*, and on entry with *trans*=CblasTrans or *trans*=CblasConjTrans, *k* specifies the number of rows of the matrices *A* and *B*. The value of *k* must be at least zero.

*alpha* Specifies the scalar *alpha*.

*a*

	<i>trans</i> =CblasNoTrans	<i>trans</i> =CblasConjTrans
<i>Layout</i> = CblasColMajor	Array, size <i>lda</i> * <i>k</i> . Before entry, the leading <i>n</i> -by- <i>k</i> part of the array <i>a</i> must contain the matrix <i>A</i> .	Array, size <i>lda</i> * <i>n</i> . Before entry, the leading <i>k</i> -by- <i>n</i> part of the array <i>a</i> must contain the matrix <i>A</i> .
<i>Layout</i> = CblasRowMajor	Array, size <i>lda</i> * <i>n</i> . Before entry, the leading <i>k</i> -by- <i>n</i> part of the array <i>a</i> must contain the matrix <i>A</i> .	Array, size <i>lda</i> * <i>k</i> . Before entry, the leading <i>n</i> -by- <i>k</i> part of the array <i>a</i> must contain the matrix <i>A</i> .

*lda* Specifies the leading dimension of *a* as declared in the calling (sub)program.

	<i>trans</i> =CblasNoTrans	<i>trans</i> =CblasConjTrans
<i>Layout</i> = CblasColMajor	<i>lda</i> must be at least $\max(1, n)$ .	<i>lda</i> must be at least $\max(1, k)$
<i>Layout</i> = CblasRowMajor	<i>lda</i> must be at least $\max(1, k)$	<i>lda</i> must be at least $\max(1, n)$ .

*b*

	<i>trans</i> =CblasNoTrans	<i>trans</i> =CblasConjTrans
<i>Layout</i> = CblasColMajor	Array, size <i>ldb</i> * <i>k</i> . Before entry, the leading <i>n</i> -by- <i>k</i> part of the array <i>b</i> must contain the matrix <i>B</i> .	Array, size <i>ldb</i> * <i>n</i> . Before entry, the leading <i>k</i> -by- <i>n</i> part of the array <i>b</i> must contain the matrix <i>B</i> .
<i>Layout</i> = CblasRowMajor	Array, size <i>lda</i> * <i>n</i> . Before entry, the leading <i>k</i> -by- <i>n</i> part of the array <i>b</i> must contain the matrix <i>B</i> .	Array, size <i>lda</i> * <i>k</i> . Before entry, the leading <i>n</i> -by- <i>k</i> part of the array <i>b</i> must contain the matrix <i>B</i> .

*ldb* Specifies the leading dimension of *a* as declared in the calling (sub)program.

	<i>trans</i> =CblasNoTrans	<i>trans</i> =CblasConjTrans
<i>Layout</i> = CblasColMajor	<i>ldb</i> must be at least $\max(1, n)$ .	<i>ldb</i> must be at least $\max(1, k)$
<i>Layout</i> = CblasRowMajor	<i>ldb</i> must be at least $\max(1, k)$	<i>ldb</i> must be at least $\max(1, n)$ .

*beta*

Specifies the scalar *beta*.

*c*

Array, size *ldc*\* *n*. Before entry with *uplo* = CblasUpper, the leading *n*-by-*n* upper triangular part of the array *c* must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of *c* is not referenced.

Before entry with *uplo* = CblasLower, the leading *n*-by-*n* lower triangular part of the array *c* must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of *c* is not referenced.

*ldc*

Specifies the leading dimension of *c* as declared in the calling (sub)program. The value of *ldc* must be at least  $\max(1, n)$ .

## Output Parameters

*c*

With *uplo* = CblasUpper, the upper triangular part of the array *c* is overwritten by the upper triangular part of the updated matrix.

With *uplo* = CblasLower, the lower triangular part of the array *c* is overwritten by the lower triangular part of the updated matrix.

## cblas\_?trmm

Computes a matrix-matrix product where one input matrix is triangular.

### Syntax

## Description

The `?trmm` routines compute a scalar-matrix-matrix product with one triangular matrix. The operation is defined as

$$B := \alpha * \text{op}(A) * B$$

or

$$B := \alpha * B * \text{op}(A)$$

where:

$\alpha$  is a scalar,

$B$  is an  $m$ -by- $n$  matrix,

$A$  is a unit, or non-unit, upper or lower triangular matrix

$\text{op}(A)$  is one of  $\text{op}(A) = A$ , or  $\text{op}(A) = A'$ , or  $\text{op}(A) = \text{conjg}(A')$ .

## Input Parameters

<i>Layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>side</i>	Specifies whether $\text{op}(A)$ appears on the left or right of $B$ in the operation: if $side = \text{CblasLeft}$ , then $B := \alpha * \text{op}(A) * B$ ; if $side = \text{CblasRight}$ , then $B := \alpha * B * \text{op}(A)$ .
<i>uplo</i>	Specifies whether the matrix $A$ is upper or lower triangular. $uplo = \text{CblasUpper}$ if $uplo = \text{CblasLower}$ , then the matrix is low triangular.
<i>transa</i>	Specifies the form of $\text{op}(A)$ used in the matrix multiplication: if $transa = \text{CblasNoTrans}$ , then $\text{op}(A) = A$ ; if $transa = \text{CblasTrans}$ , then $\text{op}(A) = A'$ ; if $transa = \text{CblasConjTrans}$ , then $\text{op}(A) = \text{conjg}(A')$ .
<i>diag</i>	Specifies whether the matrix $A$ is unit triangular: if $diag = \text{CblasUnit}$ then the matrix is unit triangular; if $diag = \text{CblasNonUnit}$ , then the matrix is not unit triangular.
<i>m</i>	Specifies the number of rows of $B$ . The value of $m$ must be at least zero.
<i>n</i>	Specifies the number of columns of $B$ . The value of $n$ must be at least zero.
<i>alpha</i>	Specifies the scalar $\alpha$ . When $\alpha$ is zero, then $a$ is not referenced and $b$ need not be set before entry.

<i>a</i>	<p>Array, size <i>lda</i> by <i>k</i>, where <i>k</i> is <i>m</i> when <i>side</i> = CblasLeft and is <i>n</i> when <i>side</i> = CblasRight. Before entry with <i>uplo</i> = CblasUpper, the leading <i>k</i> by <i>k</i> upper triangular part of the array <i>a</i> must contain the upper triangular matrix and the strictly lower triangular part of <i>a</i> is not referenced.</p> <p>Before entry with <i>uplo</i> = CblasLower, the leading <i>k</i> by <i>k</i> lower triangular part of the array <i>a</i> must contain the lower triangular matrix and the strictly upper triangular part of <i>a</i> is not referenced.</p> <p>When <i>diag</i> = CblasUnit, the diagonal elements of <i>a</i> are not referenced either, but are assumed to be unity.</p>
<i>lda</i>	<p>Specifies the leading dimension of <i>a</i> as declared in the calling (sub)program. When <i>side</i> = CblasLeft, then <i>lda</i> must be at least <math>\max(1, m)</math>, when <i>side</i> = CblasRight, then <i>lda</i> must be at least <math>\max(1, n)</math>.</p>
<i>b</i>	<p>For <i>Layout</i> = CblasColMajor: array, size <i>ldb</i>*<i>n</i>. Before entry, the leading <i>m</i>-by-<i>n</i> part of the array <i>b</i> must contain the matrix <i>B</i>.</p> <p>For <i>Layout</i> = CblasRowMajor: array, size <i>ldb</i>*<i>m</i>. Before entry, the leading <i>n</i>-by-<i>m</i> part of the array <i>b</i> must contain the matrix <i>B</i>.</p>
<i>ldb</i>	<p>Specifies the leading dimension of <i>b</i> as declared in the calling (sub)program. When <i>Layout</i> = CblasColMajor, <i>ldb</i> must be at least <math>\max(1, m)</math>; otherwise, <i>ldb</i> must be at least <math>\max(1, n)</math>.</p>

## Output Parameters

<i>b</i>	Overwritten by the transformed matrix.
----------	--

## cblas\_?trsm

Solves a triangular matrix equation.

### Syntax

```
void cblas_strsm (const CBLAS_LAYOUT Layout, const CBLAS_SIDE side, const CBLAS_UPLO
uplo, const CBLAS_TRANSPOSE transa, const CBLAS_DIAG diag, const MKL_INT m, const
MKL_INT n, const float alpha, const float *a, const MKL_INT lda, float *b, const
MKL_INT ldb);
```

```
void cblas_dtrsm (const CBLAS_LAYOUT Layout, const CBLAS_SIDE side, const CBLAS_UPLO
uplo, const CBLAS_TRANSPOSE transa, const CBLAS_DIAG diag, const MKL_INT m, const
MKL_INT n, const double alpha, const double *a, const MKL_INT lda, double *b, const
MKL_INT ldb);
```

```
void cblas_ctrsm (const CBLAS_LAYOUT Layout, const CBLAS_SIDE side, const CBLAS_UPLO
uplo, const CBLAS_TRANSPOSE transa, const CBLAS_DIAG diag, const MKL_INT m, const
MKL_INT n, const void *alpha, const void *a, const MKL_INT lda, void *b, const MKL_INT
ldb);
```

```
void cblas_ztrsm (const CBLAS_LAYOUT Layout, const CBLAS_SIDE side, const CBLAS_UPLO
uplo, const CBLAS_TRANSPOSE transa, const CBLAS_DIAG diag, const MKL_INT m, const
MKL_INT n, const void *alpha, const void *a, const MKL_INT lda, void *b, const MKL_INT
ldb);
```

### Include Files

- mkl.h

## Description

The `?trsm` routines solve one of the following matrix equations:

$$\text{op}(A) * X = \alpha * B,$$

or

$$X * \text{op}(A) = \alpha * B,$$

where:

$\alpha$  is a scalar,

$X$  and  $B$  are  $m$ -by- $n$  matrices,

$A$  is a unit, or non-unit, upper or lower triangular matrix, and

$\text{op}(A)$  is one of  $\text{op}(A) = A$ , or  $\text{op}(A) = A'$ , or  $\text{op}(A) = \text{conjg}(A')$ .

The matrix  $B$  is overwritten by the solution matrix  $X$ .

## Input Parameters

<i>Layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>side</i>	Specifies whether $\text{op}(A)$ appears on the left or right of $X$ in the equation: if $side = \text{CblasLeft}$ , then $\text{op}(A) * X = \alpha * B$ ; if $side = \text{CblasRight}$ , then $X * \text{op}(A) = \alpha * B$ .
<i>uplo</i>	Specifies whether the matrix $A$ is upper or lower triangular. $uplo = \text{CblasUpper}$ if $uplo = \text{CblasLower}$ , then the matrix is low triangular.
<i>transa</i>	Specifies the form of $\text{op}(A)$ used in the matrix multiplication: if $transa = \text{CblasNoTrans}$ , then $\text{op}(A) = A$ ; if $transa = \text{CblasTrans}$ ; if $transa = \text{CblasConjTrans}$ , then $\text{op}(A) = \text{conjg}(A')$ .
<i>diag</i>	Specifies whether the matrix $A$ is unit triangular: if $diag = \text{CblasUnit}$ then the matrix is unit triangular; if $diag = \text{CblasNonUnit}$ , then the matrix is not unit triangular.
<i>m</i>	Specifies the number of rows of $B$ . The value of $m$ must be at least zero.
<i>n</i>	Specifies the number of columns of $B$ . The value of $n$ must be at least zero.
<i>alpha</i>	Specifies the scalar $\alpha$ . When $\alpha$ is zero, then $a$ is not referenced and $b$ need not be set before entry.
<i>a</i>	Array, size $lda * k$ , where $k$ is $m$ when $side = \text{CblasLeft}$ and is $n$ when $side = \text{CblasRight}$ . Before entry with $uplo = \text{CblasUpper}$ , the leading $k$ by $k$ upper triangular part of the array $a$ must contain the upper triangular matrix and the strictly lower triangular part of $a$ is not referenced.

Before entry with `uplo = CblasLower` lower triangular part of the array `a` must contain the lower triangular matrix and the strictly upper triangular part of `a` is not referenced.

When `diag = CblasUnit`, the diagonal elements of `a` are not referenced either, but are assumed to be unity.

<code>lda</code>	Specifies the leading dimension of <code>a</code> as declared in the calling (sub)program. When <code>side = CblasLeft</code> , then <code>lda</code> must be at least $\max(1, m)$ , when <code>side = CblasRight</code> , then <code>lda</code> must be at least $\max(1, n)$ .
<code>b</code>	For <code>Layout = CblasColMajor</code> : array, size <code>ldb*n</code> . Before entry, the leading <code>m</code> -by- <code>n</code> part of the array <code>b</code> must contain the matrix <code>B</code> . For <code>Layout = CblasRowMajor</code> : array, size <code>ldb*m</code> . Before entry, the leading <code>n</code> -by- <code>m</code> part of the array <code>b</code> must contain the matrix <code>B</code> .
<code>ldb</code>	Specifies the leading dimension of <code>b</code> as declared in the calling (sub)program. When <code>Layout = CblasColMajor</code> , <code>ldb</code> must be at least $\max(1, m)$ ; otherwise, <code>ldb</code> must be at least $\max(1, n)$ .

## Output Parameters

<code>b</code>	Overwritten by the solution matrix <code>X</code> .
----------------	---

## Sparse BLAS Level 1 Routines

This section describes Sparse BLAS Level 1, an extension of BLAS Level 1 included in the Intel® oneAPI Math Kernel Library beginning with the Intel® oneAPI Math Kernel Library (oneMKL) release 2.1. Sparse BLAS Level 1 is a group of routines and functions that perform a number of common vector operations on sparse vectors stored in compressed form.

*Sparse vectors* are those in which the majority of elements are zeros. Sparse BLAS routines and functions are specially implemented to take advantage of vector sparsity. This allows you to achieve large savings in computer time and memory. If `nz` is the number of non-zero vector elements, the computer time taken by Sparse BLAS operations will be  $O(nz)$ .

## Vector Arguments

**Compressed sparse vectors.** Let `a` be a vector stored in an array, and assume that the only non-zero elements of `a` are the following:

```
a[k1], a[k2], a[k3] . . . a[knz],
```

where `nz` is the total number of non-zero elements in `a`.

In Sparse BLAS, this vector can be represented in compressed form by two arrays, `x` (values) and `indx` (indices). Each array has `nz` elements:

```
x[0]=a[k1], x[1]=a[k2], . . . x[nz-1]= a[knz],
```

```
indx[0]=k1, indx[1]=k2, . . . indx[nz-1]= knz.
```

Thus, a sparse vector is fully determined by the triple (`nz`, `x`, `indx`). If you pass a negative or zero value of `nz` to Sparse BLAS, the subroutines do not modify any arrays or variables.

**Full-storage vectors.** Sparse BLAS routines can also use a vector argument fully stored in a single array (a full-storage vector). If `y` is a full-storage vector, its elements must be stored contiguously: the first element in `y[0]`, the second in `y[1]`, and so on. This corresponds to an increment `incy = 1` in BLAS Level 1. No increment value for full-storage vectors is passed as an argument to Sparse BLAS routines or functions.

## Naming Conventions for Sparse BLAS Routines

Similar to BLAS, the names of Sparse BLAS subprograms have prefixes that determine the data type involved: *s* and *d* for single- and double-precision real; *c* and *z* for single- and double-precision complex respectively.

If a Sparse BLAS routine is an extension of a "dense" one, the subprogram name is formed by appending the suffix *i* (standing for *indexed*) to the name of the corresponding "dense" subprogram. For example, the Sparse BLAS routine `saxpyi` corresponds to the BLAS routine `saxpy`, and the Sparse BLAS function `cdotci` corresponds to the BLAS function `cdotc`.

## Routines and Data Types

Routines and data types supported in the Intel® oneAPI Math Kernel Library (oneMKL) implementation of Sparse BLAS are listed in Table "Sparse BLAS Routines and Their Data Types".

### Sparse BLAS Routines and Their Data Types

Routine/ Function	Data Types	Description
<code>cblas_?axpyi</code>	s, d, c, z	Scalar-vector product plus vector (routines)
<code>cblas_?doti</code>	s, d	Dot product (functions)
<code>cblas_?dotci</code>	c, z	Complex dot product conjugated (functions)
<code>cblas_?dotui</code>	c, z	Complex dot product unconjugated (functions)
<code>cblas_?gthr</code>	s, d, c, z	Gathering a full-storage sparse vector into compressed form <i>nz</i> , <i>x</i> , <i>indx</i> (routines)
<code>cblas_?gthrz</code>	s, d, c, z	Gathering a full-storage sparse vector into compressed form and assigning zeros to gathered elements in the full-storage vector (routines)
<code>cblas_?roti</code>	s, d	Givens rotation (routines)
<code>cblas_?sctr</code>	s, d, c, z	Scattering a vector from compressed form to full-storage form (routines)

## BLAS Level 1 Routines That Can Work With Sparse Vectors

The following BLAS Level 1 routines will give correct results when you pass to them a compressed-form array *x* (with the increment `incx=1`):

<code>cblas_?asum</code>	sum of absolute values of vector elements
<code>cblas_?copy</code>	copying a vector
<code>cblas_?nrm2</code>	Euclidean norm of a vector
<code>cblas_?scal</code>	scaling a vector
<code>cblas_i?amax</code>	index of the element with the largest absolute value for real flavors, or the largest sum $ \operatorname{Re}(x[i])  +  \operatorname{Im}(x[i]) $ for complex flavors.
<code>cblas_i?amin</code>	index of the element with the smallest absolute value for real flavors, or the smallest sum $ \operatorname{Re}(x[i])  +  \operatorname{Im}(x[i]) $ for complex flavors.

The result *i* returned by `i?amax` and `i?amin` should be interpreted as index in the compressed-form array, so that the largest (smallest) value is `x[i-1]`; the corresponding index in full-storage array is `indx[i-1]`.

You can also call `cblas_?rotg` to compute the parameters of Givens rotation and then pass these parameters to the Sparse BLAS routines `cblas_?roti`.

## **cblas\_?axpyi**

*Adds a scalar multiple of compressed sparse vector to a full-storage vector.*

### **Syntax**

```
void cblas_saxpyi (const MKL_INT nz, const float a, const float *x, const MKL_INT
*indx, float *y);

void cblas_daxpyi (const MKL_INT nz, const double a, const double *x, const MKL_INT
*indx, double *y);

void cblas_caxpyi (const MKL_INT nz, const void *a, const void *x, const MKL_INT *indx,
void *y);

void cblas_zaxpyi (const MKL_INT nz, const void *a, const void *x, const MKL_INT *indx,
void *y);
```

### **Include Files**

- `mkl.h`

### **Description**

The `?axpyi` routines perform a vector-vector operation defined as

$$y := a*x + y$$

where:

*a* is a scalar,

*x* is a sparse vector stored in compressed form,

*y* is a vector in full storage form.

The `?axpyi` routines reference or modify only the elements of *y* whose indices are listed in the array *indx*.

The values in *indx* must be distinct.

### **Input Parameters**

<i>nz</i>	The number of elements in <i>x</i> and <i>indx</i> .
<i>a</i>	Specifies the scalar <i>a</i> .
<i>x</i>	Array, size at least <i>nz</i> .
<i>indx</i>	Specifies the indices for the elements of <i>x</i> . Array, size at least <i>nz</i> .
<i>y</i>	Array, size at least $\max(indx[i])$ .

### **Output Parameters**

<i>y</i>	Contains the updated vector <i>y</i> .
----------	--

## cblas\_?doti

Computes the dot product of a compressed sparse real vector by a full-storage real vector.

### Syntax

```
float cblas_sdoti (const MKL_INT nz, const float *x, const MKL_INT *indx, const float *y);
```

```
double cblas_ddoti (const MKL_INT nz, const double *x, const MKL_INT *indx, const double *y);
```

### Include Files

- mkl.h

### Description

The ?doti routines return the dot product of  $x$  and  $y$  defined as

```
res = x[0]*y[indx[0]] + x[1]*y[indx[1]] + ... + x[nz-1]*y[indx[nz-1]]
```

where the triple  $(nz, x, indx)$  defines a sparse real vector stored in compressed form, and  $y$  is a real vector in full storage form. The functions reference only the elements of  $y$  whose indices are listed in the array  $indx$ . The values in  $indx$  must be distinct.

### Input Parameters

$nz$	The number of elements in $x$ and $indx$ .
$x$	Array, size at least $nz$ .
$indx$	Specifies the indices for the elements of $x$ . Array, size at least $nz$ .
$y$	Array, size at least $\max(indx[i])$ .

### Output Parameters

$res$	Contains the dot product of $x$ and $y$ , if $nz$ is positive. Otherwise, $res$ contains 0.
-------	---

## cblas\_?dotci

Computes the conjugated dot product of a compressed sparse complex vector with a full-storage complex vector.

### Syntax

```
void cblas_cdotci_sub (const MKL_INT nz, const void *x, const MKL_INT *indx, const void *y, void *dotui);
```

```
void cblas_zdotci_sub (const MKL_INT nz, const void *x, const MKL_INT *indx, const void *y, void *dotui);
```

## Include Files

- mkl.h

## Description

The `?dotci` routines return the dot product of  $x$  and  $y$  defined as

```
conjg(x[0])*y[indx[0]] + ... + conjg(x[nz-1])*y[indx[nz-1]]
```

where the triple  $(nz, x, indx)$  defines a sparse complex vector stored in compressed form, and  $y$  is a real vector in full storage form. The functions reference only the elements of  $y$  whose indices are listed in the array  $indx$ . The values in  $indx$  must be distinct.

## Input Parameters

$nz$	The number of elements in $x$ and $indx$ .
$x$	Array, size at least $nz$ .
$indx$	Specifies the indices for the elements of $x$ . Array, size at least $nz$ .
$y$	Array, size at least $\max(indx[i])$ .

## Output Parameters

$dotui$	Contains the conjugated dot product of $x$ and $y$ , if $nz$ is positive. Otherwise, it contains 0.
---------	---

## cblas\_?dotui

*Computes the dot product of a compressed sparse complex vector by a full-storage complex vector.*

## Syntax

```
void cblas_cdotui_sub (const MKL_INT nz, const void *x, const MKL_INT *indx, const void *y, void *dotui);
```

```
void cblas_zdotui_sub (const MKL_INT nz, const void *x, const MKL_INT *indx, const void *y, void *dotui);
```

## Include Files

- mkl.h

## Description

The `?dotui` routines return the dot product of  $x$  and  $y$  defined as

```
res = x[0]*y[indx[0]] + x[1]*y[indx[1]] + ... + x[nz - 1]*y[indx[nz - 1]]
```

where the triple  $(nz, x, indx)$  defines a sparse complex vector stored in compressed form, and  $y$  is a real vector in full storage form. The functions reference only the elements of  $y$  whose indices are listed in the array  $indx$ . The values in  $indx$  must be distinct.

## Input Parameters

<i>nz</i>	The number of elements in <i>x</i> and <i>indx</i> .
<i>x</i>	Array, size at least <i>nz</i> .
<i>indx</i>	Specifies the indices for the elements of <i>x</i> . Array, size at least <i>nz</i> .
<i>y</i>	Array, size at least $\max(\text{indx}[i])$ .

## Output Parameters

<i>dotui</i>	Contains the dot product of <i>x</i> and <i>y</i> , if <i>nz</i> is positive. Otherwise, <i>res</i> contains 0.
--------------	---

## cblas\_?gthr

*Gathers a full-storage sparse vector's elements into compressed form.*

---

### Syntax

```
void cblas_sgthr (const MKL_INT nz, const float *y, float *x, const MKL_INT *indx);
void cblas_dgthr (const MKL_INT nz, const double *y, double *x, const MKL_INT *indx);
void cblas_cgthr (const MKL_INT nz, const void *y, void *x, const MKL_INT *indx);
void cblas_zgthr (const MKL_INT nz, const void *y, void *x, const MKL_INT *indx);
```

### Include Files

- mkl.h

### Description

The `?gthr` routines gather the specified elements of a full-storage sparse vector *y* into compressed form(*nz*, *x*, *indx*). The routines reference only the elements of *y* whose indices are listed in the array *indx*:

$x[i] = y[indx[i]]$ , for  $i=0,1,\dots, nz-1$ .

### Input Parameters

<i>nz</i>	The number of elements of <i>y</i> to be gathered.
<i>indx</i>	Specifies indices of elements to be gathered. Array, size at least <i>nz</i> .
<i>y</i>	Array, size at least $\max(\text{indx}[i])$ .

### Output Parameters

<i>x</i>	Array, size at least <i>nz</i> . Contains the vector converted to the compressed form.
----------	---

## **cblas\_?gthrz**

*Gathers a sparse vector's elements into compressed form, replacing them by zeros.*

---

### **Syntax**

```
void cblas_sgthrz (const MKL_INT nz, float *y, float *x, const MKL_INT *indx);
void cblas_dgthrz (const MKL_INT nz, double *y, double *x, const MKL_INT *indx);
void cblas_cgthrz (const MKL_INT nz, void *y, void *x, const MKL_INT *indx);
void cblas_zgthrz (const MKL_INT nz, void *y, void *x, const MKL_INT *indx);
```

### **Include Files**

- mkl.h

### **Description**

The `?gthrz` routines gather the elements with indices specified by the array `indx` from a full-storage vector `y` into compressed form (`nz`, `x`, `indx`) and overwrite the gathered elements of `y` by zeros. Other elements of `y` are not referenced or modified (see also `?gthr`).

### **Input Parameters**

<code>nz</code>	The number of elements of <code>y</code> to be gathered.
<code>indx</code>	Specifies indices of elements to be gathered. Array, size at least <code>nz</code> .
<code>y</code>	Array, size at least <code>max(indx[i])</code> .

### **Output Parameters**

<code>x</code>	Array, size at least <code>nz</code> . Contains the vector converted to the compressed form.
<code>y</code>	The updated vector <code>y</code> .

## **cblas\_?roti**

*Applies Givens rotation to sparse vectors one of which is in compressed form.*

---

### **Syntax**

```
void cblas_sroti (const MKL_INT nz, float *x, const MKL_INT *indx, float *y, const float c, const float s);
void cblas_droti (const MKL_INT nz, double *x, const MKL_INT *indx, double *y, const double c, const double s);
```

### **Include Files**

- mkl.h

## Description

The `?roti` routines apply the Givens rotation to elements of two real vectors,  $x$  (in compressed form  $nz$ ,  $x$ ,  $indx$ ) and  $y$  (in full storage form):

$$x[i] = c*x[i] + s*y[indx[i]]$$

$$y[indx[i]] = c*y[indx[i]] - s*x[i]$$

The routines reference only the elements of  $y$  whose indices are listed in the array  $indx$ . The values in  $indx$  must be distinct.

## Input Parameters

$nz$	The number of elements in $x$ and $indx$ .
$x$	Array, size at least $nz$ .
$indx$	Specifies the indices for the elements of $x$ . Array, size at least $nz$ .
$y$	Array, size at least $\max(indx[i])$ .
$c$	A scalar.
$s$	A scalar.

## Output Parameters

$x$ and $y$	The updated arrays.
-------------	---------------------

## `cblas_?sctr`

*Converts compressed sparse vectors into full storage form.*

## Syntax

```
void cblas_ssctr (const MKL_INT nz, const float *x, const MKL_INT *indx, float *y);
void cblas_dsctr (const MKL_INT nz, const double *x, const MKL_INT *indx, double *y);
void cblas_csctr (const MKL_INT nz, const void *x, const MKL_INT *indx, void *y);
void cblas_zsctr (const MKL_INT nz, const void *x, const MKL_INT *indx, void *y);
```

## Include Files

- `mkl.h`

## Description

The `?sctr` routines scatter the elements of the compressed sparse vector ( $nz$ ,  $x$ ,  $indx$ ) to a full-storage vector  $y$ . The routines modify only the elements of  $y$  whose indices are listed in the array  $indx$ :

$$y[indx[i]] = x[i], \text{ for } i=0,1,\dots,nz-1.$$

## Input Parameters

<i>nz</i>	The number of elements of <i>x</i> to be scattered.
<i>indx</i>	Specifies indices of elements to be scattered. Array, size at least <i>nz</i> .
<i>x</i>	Array, size at least <i>nz</i> . Contains the vector to be converted to full-storage form.

## Output Parameters

<i>y</i>	Array, size at least $\max(\text{indx}[i])$ . Contains the vector <i>y</i> with updated elements.
----------	--

## Sparse BLAS Level 2 and Level 3 Routines

---

**NOTE** The Intel® oneAPI Math Kernel Library (oneMKL) Sparse BLAS Level 2 and Level 3 routines are deprecated. Use the corresponding routine from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface as indicated in the description for each routine.

---

This section describes Sparse BLAS Level 2 and Level 3 routines included in the Intel® oneAPI Math Kernel Library (oneMKL). Sparse BLAS Level 2 is a group of routines and functions that perform operations between a sparse matrix and dense vectors. Sparse BLAS Level 3 is a group of routines and functions that perform operations between a sparse matrix and dense matrices.

The terms and concepts required to understand the use of the Intel® oneAPI Math Kernel Library (oneMKL) Sparse BLAS Level 2 and Level 3 routines are discussed in the [Linear Solvers Basics](#) appendix.

The Sparse BLAS routines can be useful to implement iterative methods for solving large sparse systems of equations or eigenvalue problems. For example, these routines can be considered as building blocks for [Iterative Sparse Solvers based on Reverse Communication Interface \(RCI ISS\)](#).

Intel® oneAPI Math Kernel Library (oneMKL) provides Sparse BLAS Level 2 and Level 3 routines with typical (or conventional) interface similar to the interface used in the NIST\* Sparse BLAS library [[Rem05](#)].

Some software packages and libraries (the [PARDISO\\* Solver](#) used in Intel® oneAPI Math Kernel Library (oneMKL), *Sparskit 2* [[Saad94](#)], the Compaq\* Extended Math Library (CXML)[[CXML01](#)]) use different (early) variation of the compressed sparse row (CSR) format and support only Level 2 operations with simplified interfaces. Intel® oneAPI Math Kernel Library (oneMKL) provides an additional set of Sparse BLAS Level 2 routines with similar simplified interfaces. Each of these routines operates only on a matrix of the fixed type.

The routines described in this section support both one-based indexing and zero-based indexing of the input data (see details in the section [One-based and Zero-based Indexing](#)).

## Naming Conventions in Sparse BLAS Level 2 and Level 3

Each Sparse BLAS Level 2 and Level 3 routine has a six- or eight-character base name preceded by the prefix `mkl_` or `mkl_cspblas_`.

The routines with typical (conventional) interface have six-character base names in accordance with the template:

```
mkl_<character> <data> <operation>( )
```

The routines with simplified interfaces have eight-character base names in accordance with the templates:

```
mkl_<character> <data> <mtype> <operation>( )
```

for routines with one-based indexing; and

```
mkl_cspblas_<character> <data><mtype><operation>( )
```

for routines with zero-based indexing.

The *<character>* field indicates the data type:

s	real, single precision
c	complex, single precision
d	real, double precision
z	complex, double precision

The *<data>* field indicates the sparse matrix storage format (see section [Sparse Matrix Storage Formats](#)):

coo	coordinate format
csr	compressed sparse row format and its variations
csc	compressed sparse column format and its variations
dia	diagonal format
sky	skyline storage format
bsr	block sparse row format and its variations

The *<operation>* field indicates the type of operation:

mv	matrix-vector product (Level 2)
mm	matrix-matrix product (Level 3)
sv	solving a single triangular system (Level 2)
sm	solving triangular systems with multiple right-hand sides (Level 3)

The field *<mtype>* indicates the matrix type:

ge	sparse representation of a general matrix
sy	sparse representation of the upper or lower triangle of a symmetric matrix
tr	sparse representation of a triangular matrix

## Sparse Matrix Storage Formats for Sparse BLAS Routines

The current version of Intel® oneAPI Math Kernel Library (oneMKL) Sparse BLAS Level 2 and Level 3 routines support the following point entry [\[Duff86\]](#) storage formats for sparse matrices:

- *compressed sparse row* format (CSR) and its variations;
- *compressed sparse column* format (CSC);
- *coordinate* format;
- *diagonal* format;
- *skyline* storage format;

and one block entry storage format:

- *block sparse row* format (BSR) and its variations.

For more information see "[Sparse Matrix Storage Formats](#)" in the Appendix "Linear Solvers Basics".

Intel® oneAPI Math Kernel Library (oneMKL) provides auxiliary routines -[matrix converters](#) - that convert sparse matrix from one storage format to another.

## Routines and Supported Operations

This section describes operations supported by the Intel® oneAPI Math Kernel Library (oneMKL) Sparse BLAS Level 2 and Level 3 routines. The following notations are used here:

$A$  is a sparse matrix;  
 $B$  and  $C$  are dense matrices;  
 $D$  is a diagonal scaling matrix;  
 $x$  and  $y$  are dense vectors;  
 $\alpha$  and  $\beta$  are scalars;

$\text{op}(A)$  is one of the possible operations:

$\text{op}(A) = A$ ;  
 $\text{op}(A) = A^T$  - transpose of  $A$ ;  
 $\text{op}(A) = A^H$  - conjugated transpose of  $A$ .

$\text{inv}(\text{op}(A))$  denotes the inverse of  $\text{op}(A)$ .

The Intel® oneAPI Math Kernel Library (oneMKL) Sparse BLAS Level 2 and Level 3 routines support the following operations:

- computing the vector product between a sparse matrix and a dense vector:

```
y := alpha*op(A)*x + beta*y
```

- solving a single triangular system:

```
y := alpha*inv(op(A))*x
```

- computing a product between sparse matrix and dense matrix:

```
C := alpha*op(A)*B + beta*C
```

- solving a sparse triangular system with multiple right-hand sides:

```
C := alpha*inv(op(A))*B
```

Intel® oneAPI Math Kernel Library (oneMKL) provides an additional set of the Sparse BLAS Level 2 routines with *simplified interfaces*. Each of these routines operates on a matrix of the fixed type. The following operations are supported:

- computing the vector product between a sparse matrix and a dense vector (for general and symmetric matrices):

```
y := op(A)*x
```

- solving a single triangular system (for triangular matrices):

```
y := inv(op(A))*x
```

Matrix type is indicated by the field `<mtype>` in the routine name (see section [Naming Conventions in Sparse BLAS Level 2 and Level 3](#)).

---

### NOTE

The routines with simplified interfaces support only four sparse matrix storage formats, specifically:

CSR format in the 3-array variation accepted in the direct sparse solvers and in the CXML;  
 diagonal format accepted in the CXML;  
 coordinate format;  
 BSR format in the 3-array variation.

---

Note that routines with both typical (conventional) and simplified interfaces use the same computational kernels that work with certain internal data structures.

The Intel® oneAPI Math Kernel Library (oneMKL) Sparse BLAS Level 2 and Level 3 routines do not support in-place operations.

Complete list of all routines is given in the ["Sparse BLAS Level 2 and Level 3 Routines"](#).

## Interface Consideration

### One-Based and Zero-Based Indexing

The Intel® oneAPI Math Kernel Library (oneMKL) Sparse BLAS Level 2 and Level 3 routines support one-based and zero-based indexing of data arrays.

Routines with typical interfaces support zero-based indexing for the following sparse data storage formats: CSR, CSC, BSR, and COO. Routines with simplified interfaces support zero based indexing for the following sparse data storage formats: CSR, BSR, and COO. See the complete list of [Sparse BLAS Level 2 and Level 3 Routines](#).

The one-based indexing uses the convention of starting array indices at 1. The zero-based indexing uses the convention of starting array indices at 0. For example, indices of the 5-element array  $x$  can be presented in case of one-based indexing as follows:

Element index: 1 2 3 4 5

Element value: 1.0 5.0 7.0 8.0 9.0

and in case of zero-based indexing as follows:

Element index: 0 1 2 3 4

Element value: 1.0 5.0 7.0 8.0 9.0

The detailed descriptions of the one-based and zero-based variants of the sparse data storage formats are given in the ["Sparse Matrix Storage Formats"](#) in the Appendix "Linear Solvers Basics".

Most parameters of the routines are identical for both one-based and zero-based indexing, but some of them have certain differences. The following table lists all these differences.

Parameter	One-based Indexing	Zero-based Indexing
<i>val</i>	Array containing non-zero elements of the matrix $A$ , its length is $.pntrb[m] - pntrb[1]$	Array containing non-zero elements of the matrix $A$ , its length is $.pntrb[m-1] - pntrb[0]$
<i>pntrb</i>	Array of length $m$ . This array contains row indices, such that $pntrb[i] - pntrb[1]+1$ is the first index of row $i$ in the arrays <i>val</i> and <i>indx</i>	Array of length $m$ . This array contains row indices, such that $pntrb[i] - pntrb[0]$ is the first index of row $i$ in the arrays <i>val</i> and <i>indx</i> .
<i>pntrb</i>	Array of length $m$ . This array contains row indices, such that $pntrb[i] - pntrb[1]$ is the last index of row $i$ in the arrays <i>val</i> and <i>indx</i> .	Array of length $m$ . This array contains row indices, such that $pntrb[i] - pntrb[0]-1$ is the last index of row $i$ in the arrays <i>val</i> and <i>indx</i> .
<i>ia</i>	Array of length $m + 1$ , containing indices of elements in the array $a$ , such that $ia[i]$ is the index in the array $a$ of the first non-zero element from the row $i$ . The value of the last element $ia[m + 1]$ is equal to the number of non-zeros plus one.	Array of length $m+1$ , containing indices of elements in the array $a$ , such that $ia[i]$ is the index in the array $a$ of the first non-zero element from the row $i$ . The value of the last element $ia[m]$ is equal to the number of non-zeros.

Parameter	One-based Indexing	Zero-based Indexing
<i>ldb</i>	Specifies the leading dimension of <i>b</i> as declared in the calling (sub)program.	Specifies the second dimension of <i>b</i> as declared in the calling (sub)program.
<i>ldc</i>	Specifies the leading dimension of <i>c</i> as declared in the calling (sub)program.	Specifies the second dimension of <i>c</i> as declared in the calling (sub)program.

## Differences Between Intel MKL and NIST\* Interfaces

The Intel® oneAPI Math Kernel Library (oneMKL) Sparse BLAS Level 3 routines have the following conventional interfaces:

`mkl_xyyyymm(transa, m, n, k, alpha, matdescra, arg(A), b, ldb, beta, c, ldc)`, for matrix-matrix product;

`mkl_xyyysm(transa, m, n, alpha, matdescra, arg(A), b, ldb, c, ldc)`, for triangular solvers with multiple right-hand sides.

Here *x* denotes data type, and *yyy* - sparse matrix data structure (storage format).

The analogous NIST\* Sparse BLAS (NSB) library routines have the following interfaces:

`xyyyymm(transa, m, n, k, alpha, descra, arg(A), b, ldb, beta, c, ldc, work, lwork)`, for matrix-matrix product;

`xyyyysm(transa, m, n, unitd, dv, alpha, descra, arg(A), b, ldb, beta, c, ldc, work, lwork)`, for triangular solvers with multiple right-hand sides.

Some similar arguments are used in both libraries. The argument *transa* indicates what operation is performed and is slightly different in the NSB library (see [Table "Parameter transa"](#)). The arguments *m* and *k* are the number of rows and column in the matrix *A*, respectively, *n* is the number of columns in the matrix *C*. The arguments *alpha* and *beta* are scalar *alpha* and *beta* respectively (*beta* is not used in the Intel® oneAPI Math Kernel Library (oneMKL) triangular solvers.) The arguments *b* and *c* are rectangular arrays with the leading dimension *ldb* and *ldc*, respectively. *arg(A)* denotes the list of arguments that describe the sparse representation of *A*.

### Parameter *transa*

	MKL interface	NSB interface	Operation
data type	char *	INTEGER	
value	N or n	0	$\text{op}(A) = A$
	T or t	1	$\text{op}(A) = A^T$
	C or c	2	$\text{op}(A) = A^T$ or $\text{op}(A) = A^H$

### Parameter *matdescra*

The parameter *matdescra* describes the relevant characteristic of the matrix *A*. This manual describes *matdescra* as an array of six elements in line with the NIST\* implementation. However, only the first four elements of the array are used in the current versions of the Intel® oneAPI Math Kernel Library (oneMKL) Sparse BLAS routines. Elements *matdescra*[4] and *matdescra*[5] are reserved for future use. Note that whether *matdescra* is described in your application as an array of length 6 or 4 is of no importance because the array is declared as a pointer in the Intel® oneAPI Math Kernel Library (oneMKL) routines. To learn more about declaration of the *matdescra* array, see the Sparse BLAS examples located in the Intel® oneAPI Math

Kernel Library (oneMKL) installation directory: `examples/spblas/` for C. The table below lists elements of the parameter `matdescra`, their Fortran values, and their meanings. The parameter `matdescra` corresponds to the argument `descra` from NSB library.

### Possible Values of the Parameter `matdescra` [`descra - 1`]

	MKL interface		NSB interface	Matrix characteristics
	one-based indexing	zero-based indexing		
data type	char *	char *	int *	
1st element	<code>matdescra[1]</code>	<code>matdescra[0]</code>	<code>descra[0]</code>	matrix structure
value	G	G	0	general
	S	S	1	symmetric ( $A = A^T$ )
	H	H	2	Hermitian ( $A = (A^H)$ )
	T	T	3	triangular
	A	A	4	skew(anti)-symmetric ( $A = -A^T$ )
	D	D	5	diagonal
2nd element	<code>matdescra[2]</code>	<code>matdescra[1]</code>	<code>descra[1]</code>	upper/lower triangular indicator
value	L	L	1	lower
	U	U	2	upper
3rd element	<code>matdescra[3]</code>	<code>matdescra[2]</code>	<code>descra[2]</code>	main diagonal type
value	N	N	0	non-unit
	U	U	1	unit
4th element	<code>matdescra[4]</code>	<code>matdescra[3]</code>	<code>descra[3]</code>	type of indexing
value	F		1	one-based indexing
		C	0	zero-based indexing

In some cases possible element values of the parameter `matdescra` depend on the values of other elements. The [Table "Possible Combinations of Element Values of the Parameter `matdescra`"](#) lists all possible combinations of element values for both multiplication routines and triangular solvers.

### Possible Combinations of Element Values of the Parameter `matdescra`

Routines	<code>matdescra[0]</code>	<code>matdescra[1]</code>	<code>matdescra[2]</code>	<code>matdescra[3]</code>
Multiplication Routines	G	ignored	ignored	<b>F</b> (default) or C
	S or H	<b>L</b> (default)	<b>N</b> (default)	<b>F</b> (default) or C
	S or H	<b>L</b> (default)	U	<b>F</b> (default) or C
	S or H	U	<b>N</b> (default)	<b>F</b> (default) or C
	S or H	U	U	<b>F</b> (default) or C
	A	<b>L</b> (default)	ignored	<b>F</b> (default) or C

Routines	matdescra[0]	matdescra[1]	matdescra[2]	matdescra[3]
Multiplication Routines and Triangular Solvers	A	U	ignored	<b>F</b> (default) or C
	T	L	U	<b>F</b> (default) or C
	T	L	N	<b>F</b> (default) or C
	T	U	U	<b>F</b> (default) or C
	T	U	N	<b>F</b> (default) or C
	D	ignored	<b>N</b> (default)	<b>F</b> (default) or C
	D	ignored	U	<b>F</b> (default) or C

For a matrix in the skyline format with the main diagonal declared to be a unit, diagonal elements must be stored in the sparse representation even if they are zero. In all other formats, diagonal elements can be stored (if needed) in the sparse representation if they are not zero.

## Operations with Partial Matrices

One of the distinctive feature of the Intel® oneAPI Math Kernel Library (oneMKL) Sparse BLAS routines is a possibility to perform operations only on partial matrices composed of certain parts (triangles and the main diagonal) of the input sparse matrix. It can be done by setting properly first three elements of the parameter *matdescra*.

An arbitrary sparse matrix *A* can be decomposed as

$$A = L + D + U$$

where *L* is the strict lower triangle of *A*, *U* is the strict upper triangle of *A*, *D* is the main diagonal.

Table "Output Matrices for Multiplication Routines" shows correspondence between the output matrices and values of the parameter *matdescra* for the sparse matrix *A* for multiplication routines.

### Output Matrices for Multiplication Routines

matdescra[0]	matdescra[1]	matdescra[2]	Output Matrix
G	ignored	ignored	$\alpha * \text{op}(A) * x + \beta * y$ $\alpha * \text{op}(A) * B + \beta * C$
S or H	L	N	$\alpha * \text{op}(L+D+L') * x + \beta * y$ $\alpha * \text{op}(L+D+L') * B + \beta * C$
S or H	L	U	$\alpha * \text{op}(L+I+L') * x + \beta * y$ $\alpha * \text{op}(L+I+L') * B + \beta * C$
S or H	U	N	$\alpha * \text{op}(U'+D+U) * x + \beta * y$ $\alpha * \text{op}(U'+D+U) * B + \beta * C$
S or H	U	U	$\alpha * \text{op}(U'+I+U) * x + \beta * y$ $\alpha * \text{op}(U'+I+U) * B + \beta * C$
T	L	U	$\alpha * \text{op}(L+I) * x + \beta * y$ $\alpha * \text{op}(L+I) * B + \beta * C$
T	L	N	$\alpha * \text{op}(L+D) * x + \beta * y$ $\alpha * \text{op}(L+D) * B + \beta * C$

matdescra[0]	matdescra[1]	matdescra[2]	Output Matrix
T	U	U	$\alpha * \text{op}(U+I) * x + \beta * y$ $\alpha * \text{op}(U+I) * B + \beta * C$
T	U	N	$\alpha * \text{op}(U+D) * x + \beta * y$ $\alpha * \text{op}(U+D) * B + \beta * C$
A	L	ignored	$\alpha * \text{op}(L-L') * x + \beta * y$ $\alpha * \text{op}(L-L') * B + \beta * C$
A	U	ignored	$\alpha * \text{op}(U-U') * x + \beta * y$ $\alpha * \text{op}(U-U') * B + \beta * C$
D	ignored	N	$\alpha * D * x + \beta * y$ $\alpha * D * B + \beta * C$
D	ignored	U	$\alpha * x + \beta * y$ $\alpha * B + \beta * C$

Table "Output Matrices for Triangular Solvers" shows correspondence between the output matrices and values of the parameter *matdescra* for the sparse matrix *A* for triangular solvers.

#### Output Matrices for Triangular Solvers

matdescra[0]	matdescra[1]	matdescra[2]	Output Matrix
T	L	N	$\alpha * \text{inv}(\text{op}(L)) * x$ $\alpha * \text{inv}(\text{op}(L)) * B$
T	L	U	$\alpha * \text{inv}(\text{op}(L)) * x$ $\alpha * \text{inv}(\text{op}(L)) * B$
T	U	N	$\alpha * \text{inv}(\text{op}(U)) * x$ $\alpha * \text{inv}(\text{op}(U)) * B$
T	U	U	$\alpha * \text{inv}(\text{op}(U)) * x$ $\alpha * \text{inv}(\text{op}(U)) * B$
D	ignored	N	$\alpha * \text{inv}(D) * x$ $\alpha * \text{inv}(D) * B$
D	ignored	U	$\alpha * x$ $\alpha * B$

#### Sparse BLAS Level 2 and Level 3 Routines.

**NOTE** The Intel® oneAPI Math Kernel Library (oneMKL) Sparse BLAS Level 2 and Level 3 routines are deprecated. Use the corresponding routine from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface as indicated in the description for each routine.

Table "Sparse BLAS Level 2 and Level 3 Routines" lists the sparse BLAS Level 2 and Level 3 routines described in more detail later in this section.

## Sparse BLAS Level 2 and Level 3 Routines

Routine/Function	Description
<b>Simplified interface, one-based indexing</b>	
<code>mkl_?csrgev</code>	Computes matrix - vector product of a sparse general matrix in the CSR format (3-array variation)
<code>mkl_?bsrgev</code>	Computes matrix - vector product of a sparse general matrix in the BSR format (3-array variation).
<code>mkl_?coogev</code>	Computes matrix - vector product of a sparse general matrix in the coordinate format.
<code>mkl_?diagev</code>	Computes matrix - vector product of a sparse general matrix in the diagonal format.
<code>mkl_?csrsv</code>	Computes matrix - vector product of a sparse symmetrical matrix in the CSR format (3-array variation)
<code>mkl_?bsrsv</code>	Computes matrix - vector product of a sparse symmetrical matrix in the BSR format (3-array variation).
<code>mkl_?coosv</code>	Computes matrix - vector product of a sparse symmetrical matrix in the coordinate format.
<code>mkl_?diasv</code>	Computes matrix - vector product of a sparse symmetrical matrix in the diagonal format.
<code>mkl_?csrtrsv</code>	Triangular solvers with simplified interface for a sparse matrix in the CSR format (3-array variation).
<code>mkl_?bsrtrsv</code>	Triangular solver with simplified interface for a sparse matrix in the BSR format (3-array variation).
<code>mkl_?cootrsv</code>	Triangular solvers with simplified interface for a sparse matrix in the coordinate format.
<code>mkl_?diatrsv</code>	Triangular solvers with simplified interface for a sparse matrix in the diagonal format.
<b>Simplified interface, zero-based indexing</b>	
<code>mkl_cspblas_?csrgev</code>	Computes matrix - vector product of a sparse general matrix in the CSR format (3-array variation) with zero-based indexing.
<code>mkl_cspblas_?bsrgev</code>	Computes matrix - vector product of a sparse general matrix in the BSR format (3-array variation) with zero-based indexing.
<code>mkl_cspblas_?coogev</code>	Computes matrix - vector product of a sparse general matrix in the coordinate format with zero-based indexing.
<code>mkl_cspblas_?csrsv</code>	Computes matrix - vector product of a sparse symmetrical matrix in the CSR format (3-array variation) with zero-based indexing
<code>mkl_cspblas_?bsrsv</code>	Computes matrix - vector product of a sparse symmetrical matrix in the BSR format (3-array variation) with zero-based indexing.

Routine/Function	Description
<code>mkl_cspblas_?coosymv</code>	Computes matrix - vector product of a sparse symmetrical matrix in the coordinate format with zero-based indexing.
<code>mkl_cspblas_?csrtrsv</code>	Triangular solvers with simplified interface for a sparse matrix in the CSR format (3-array variation) with zero-based indexing.
<code>mkl_cspblas_?bsrtrsv</code>	Triangular solver with simplified interface for a sparse matrix in the BSR format (3-array variation) with zero-based indexing.
<code>mkl_cspblas_?cootrsv</code>	Triangular solver with simplified interface for a sparse matrix in the coordinate format with zero-based indexing.

### Typical (conventional) interface, one-based and zero-based indexing

<code>mkl_?csrsv</code>	Computes matrix - vector product of a sparse matrix in the CSR format.
<code>mkl_?bsrsv</code>	Computes matrix - vector product of a sparse matrix in the BSR format.
<code>mkl_?cscsv</code>	Computes matrix - vector product for a sparse matrix in the CSC format.
<code>mkl_?coomv</code>	Computes matrix - vector product for a sparse matrix in the coordinate format.
<code>mkl_?csrsv</code>	Solves a system of linear equations for a sparse matrix in the CSR format.
<code>mkl_?bsrsv</code>	Solves a system of linear equations for a sparse matrix in the BSR format.
<code>mkl_?cscsv</code>	Solves a system of linear equations for a sparse matrix in the CSC format.
<code>mkl_?coosv</code>	Solves a system of linear equations for a sparse matrix in the coordinate format.
<code>mkl_?csrmm</code>	Computes matrix - matrix product of a sparse matrix in the CSR format
<code>mkl_?bsrmm</code>	Computes matrix - matrix product of a sparse matrix in the BSR format.
<code>mkl_?cscmm</code>	Computes matrix - matrix product of a sparse matrix in the CSC format
<code>mkl_?coomm</code>	Computes matrix - matrix product of a sparse matrix in the coordinate format.
<code>mkl_?csrsm</code>	Solves a system of linear matrix equations for a sparse matrix in the CSR format.
<code>mkl_?bsrsm</code>	Solves a system of linear matrix equations for a sparse matrix in the BSR format.
<code>mkl_?cscsm</code>	Solves a system of linear matrix equations for a sparse matrix in the CSC format.

Routine/Function	Description
<code>mkl_?coosm</code>	Solves a system of linear matrix equations for a sparse matrix in the coordinate format.
<b>Typical (conventional) interface, one-based indexing</b>	
<code>mkl_?diamv</code>	Computes matrix - vector product of a sparse matrix in the diagonal format.
<code>mkl_?skymv</code>	Computes matrix - vector product for a sparse matrix in the skyline storage format.
<code>mkl_?diasv</code>	Solves a system of linear equations for a sparse matrix in the diagonal format.
<code>mkl_?skysv</code>	Solves a system of linear equations for a sparse matrix in the skyline format.
<code>mkl_?diamm</code>	Computes matrix - matrix product of a sparse matrix in the diagonal format.
<code>mkl_?skymm</code>	Computes matrix - matrix product of a sparse matrix in the skyline storage format.
<code>mkl_?diasm</code>	Solves a system of linear matrix equations for a sparse matrix in the diagonal format.
<code>mkl_?skysm</code>	Solves a system of linear matrix equations for a sparse matrix in the skyline storage format.
<b>Auxiliary routines</b>	
Matrix converters	
<code>mkl_?dnscsr</code>	Converts a sparse matrix in uncompressed representation to CSR format (3-array variation) and vice versa.
<code>mkl_?csrcoo</code>	Converts a sparse matrix in CSR format (3-array variation) to coordinate format and vice versa.
<code>mkl_?csrbsr</code>	Converts a sparse matrix in CSR format to BSR format (3-array variations) and vice versa.
<code>mkl_?csrcsc</code>	Converts a sparse matrix in CSR format to CSC format and vice versa (3-array variations).
<code>mkl_?csrdia</code>	Converts a sparse matrix in CSR format (3-array variation) to diagonal format and vice versa.
<code>mkl_?csrsky</code>	Converts a sparse matrix in CSR format (3-array variation) to sky line format and vice versa.
Operations on sparse matrices	
<code>mkl_?csradd</code>	Computes the sum of two sparse matrices stored in the CSR format (3-array variation) with one-based indexing.
<code>mkl_?csrmultcsr</code>	Computes the product of two sparse matrices stored in the CSR format (3-array variation) with one-based indexing.

Routine/Function	Description
<code>mkl_?csrmultd</code>	Computes product of two sparse matrices stored in the CSR format (3-array variation) with one-based indexing. The result is stored in the dense matrix.

### `mkl_?csrgemv`

Computes matrix - vector product of a sparse general matrix stored in the CSR format (3-array variation) with one-based indexing (deprecated).

### Syntax

```
void mkl_scsrgemv (const char *transa , const MKL_INT *m , const float *a , const
MKL_INT *ia , const MKL_INT *ja , const float *x , float *y );
void mkl_dcsrgemv (const char *transa , const MKL_INT *m , const double *a , const
MKL_INT *ia , const MKL_INT *ja , const double *x , double *y );
void mkl_ccsrgemv (const char *transa , const MKL_INT *m , const MKL_Complex8 *a ,
const MKL_INT *ia , const MKL_INT *ja , const MKL_Complex8 *x , MKL_Complex8 *y );
void mkl_zcsrgemv (const char *transa , const MKL_INT *m , const MKL_Complex16 *a ,
const MKL_INT *ia , const MKL_INT *ja , const MKL_Complex16 *x , MKL_Complex16 *y );
```

### Include Files

- `mkl.h`

### Description

This routine is deprecated. Use `mkl_sparse_?_mv` from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?csrgemv` routine performs a matrix-vector operation defined as

$$y := A*x$$

or

$$y := A^T*x,$$

where:

$x$  and  $y$  are vectors,

$A$  is an  $m$ -by- $m$  sparse square matrix in the CSR format (3-array variation),  $A^T$  is the transpose of  $A$ .

#### NOTE

This routine supports only one-based indexing of the input arrays.

### Input Parameters

<code>transa</code>	Specifies the operation. If <code>transa = 'N'</code> or <code>'n'</code> , then as $y := A*x$ If <code>transa = 'T'</code> or <code>'t'</code> or <code>'C'</code> or <code>'c'</code> , then $y := A^T*x$ ,
---------------------	---

<i>m</i>	Number of rows of the matrix <i>A</i> .
<i>a</i>	Array containing non-zero elements of the matrix <i>A</i> . Its length is equal to the number of non-zero elements in the matrix <i>A</i> . Refer to <i>values</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.
<i>ia</i>	Array of length $m + 1$ , containing indices of elements in the array <i>a</i> , such that $ia[i] - ia[0]$ is the index in the array <i>a</i> of the first non-zero element from the row <i>i</i> . The value of the last element $ia[m] - ia[0]$ is equal to the number of non-zeros. Refer to <i>rowIndex</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.
<i>ja</i>	Array containing the column indices plus one for each non-zero element of the matrix <i>A</i> .  Its length is equal to the length of the array <i>a</i> . Refer to <i>columns</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.
<i>x</i>	Array, size is <i>m</i> .  On entry, the array <i>x</i> must contain the vector <i>x</i> .

## Output Parameters

<i>y</i>	Array, size at least <i>m</i> .  On exit, the array <i>y</i> must contain the vector <i>y</i> .
----------	---

### **mkl\_?bsrgemv**

*Computes matrix - vector product of a sparse general matrix stored in the BSR format (3-array variation) with one-based indexing (deprecated).*

### Syntax

```
void mkl_sbsrgemv (const char *transa , const MKL_INT *m , const MKL_INT *lb , const
float *a , const MKL_INT *ia , const MKL_INT *ja , const float *x , float *y );

void mkl_dbsrgemv (const char *transa , const MKL_INT *m , const MKL_INT *lb , const
double *a , const MKL_INT *ia , const MKL_INT *ja , const double *x , double *y );

void mkl_cbsrgemv (const char *transa , const MKL_INT *m , const MKL_INT *lb , const
MKL_Complex8 *a , const MKL_INT *ia , const MKL_INT *ja , const MKL_Complex8 *x ,
MKL_Complex8 *y );

void mkl_zbsrgemv (const char *transa , const MKL_INT *m , const MKL_INT *lb , const
MKL_Complex16 *a , const MKL_INT *ia , const MKL_INT *ja , const MKL_Complex16 *x ,
MKL_Complex16 *y );
```

### Include Files

- mkl.h

### Description

This routine is deprecated. Use [mkl\\_sparse\\_?\\_mv](#) from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?bsrgemv` routine performs a matrix-vector operation defined as

$$y := A*x$$

or

$$y := A^T*x,$$

where:

$x$  and  $y$  are vectors,

$A$  is an  $m$ -by- $m$  block sparse square matrix in the BSR format (3-array variation),  $A^T$  is the transpose of  $A$ .

---

#### NOTE

This routine supports only one-based indexing of the input arrays.

---

## Input Parameters

<i>transa</i>	Specifies the operation. If <i>transa</i> = 'N' or 'n', then the matrix-vector product is computed as $y := A*x$ If <i>transa</i> = 'T' or 't' or 'C' or 'c', then the matrix-vector product is computed as $y := A^T*x$ ,
<i>m</i>	Number of block rows of the matrix $A$ .
<i>lb</i>	Size of the block in the matrix $A$ .
<i>a</i>	Array containing elements of non-zero blocks of the matrix $A$ . Its length is equal to the number of non-zero blocks in the matrix $A$ multiplied by $lb*lb$ . Refer to <i>values</i> array description in <a href="#">BSR Format</a> for more details.
<i>ia</i>	Array of length $(m + 1)$ , containing indices of block in the array <i>a</i> , such that $ia[i] - ia[0]$ is the index in the array <i>a</i> of the first non-zero element from the row $i$ . The value of the last element $ia[m] - ia[0]$ is equal to the number of non-zero blocks. Refer to <i>rowIndex</i> array description in <a href="#">BSR Format</a> for more details.
<i>ja</i>	Array containing the column indices plus one for each non-zero block in the matrix $A$ . Its length is equal to the number of non-zero blocks of the matrix $A$ . Refer to <i>columns</i> array description in <a href="#">BSR Format</a> for more details.
<i>x</i>	Array, size $(m*lb)$ . On entry, the array <i>x</i> must contain the vector $x$ .

## Output Parameters

<i>y</i>	Array, size at least $(m*lb)$ . On exit, the array <i>y</i> must contain the vector $y$ .
----------	--

## mkl\_?coogemv

Computes matrix-vector product of a sparse general matrix stored in the coordinate format with one-based indexing (deprecated).

### Syntax

```
void mkl_scoogemv (const char *transa , const MKL_INT *m , const float *val , const
MKL_INT *rowind , const MKL_INT *colind , const MKL_INT *nnz , const float *x , float
*y );
```

```
void mkl_dcoogemv (const char *transa , const MKL_INT *m , const double *val , const
MKL_INT *rowind , const MKL_INT *colind , const MKL_INT *nnz , const double *x , double
*y );
```

```
void mkl_ccoogemv (const char *transa , const MKL_INT *m , const MKL_Complex8 *val ,
const MKL_INT *rowind , const MKL_INT *colind , const MKL_INT *nnz , const MKL_Complex8
*x , MKL_Complex8 *y );
```

```
void mkl_zcoogemv (const char *transa , const MKL_INT *m , const MKL_Complex16 *val ,
const MKL_INT *rowind , const MKL_INT *colind , const MKL_INT *nnz , const
MKL_Complex16 *x , MKL_Complex16 *y );
```

### Include Files

### Description

This routine is deprecated. Use [mkl\\_sparse\\_?\\_mv](#) from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?coogemv` routine performs a matrix-vector operation defined as

```
y := A*x
```

or

```
y := AT*x,
```

where:

$x$  and  $y$  are vectors,

$A$  is an  $m$ -by- $m$  sparse square matrix in the coordinate format,  $A^T$  is the transpose of  $A$ .

---

**NOTE**

This routine supports only one-based indexing of the input arrays.

---

### Input Parameters

<i>transa</i>	Specifies the operation. If <i>transa</i> = 'N' or 'n', then the matrix-vector product is computed as $y := A*x$ If <i>transa</i> = 'T' or 't' or 'C' or 'c', then the matrix-vector product is computed as $y := A^T*x$ ,
---------------	--

<i>m</i>	Number of rows of the matrix <i>A</i> .
<i>val</i>	Array of length <i>nnz</i> , contains non-zero elements of the matrix <i>A</i> in the arbitrary order. Refer to <i>values</i> array description in <a href="#">Coordinate Format</a> for more details.
<i>rowind</i>	Array of length <i>nnz</i> , contains the row indices plus one for each non-zero element of the matrix <i>A</i> . Refer to <i>rows</i> array description in <a href="#">Coordinate Format</a> for more details.
<i>colind</i>	Array of length <i>nnz</i> , contains the column indices plus one for each non-zero element of the matrix <i>A</i> . Refer to <i>columns</i> array description in <a href="#">Coordinate Format</a> for more details.
<i>nnz</i>	Specifies the number of non-zero element of the matrix <i>A</i> . Refer to <i>nnz</i> description in <a href="#">Coordinate Format</a> for more details.
<i>x</i>	Array, size is <i>m</i> . One entry, the array <i>x</i> must contain the vector <i>x</i> .

## Output Parameters

<i>y</i>	Array, size at least <i>m</i> . On exit, the array <i>y</i> must contain the vector <i>y</i> .
----------	---

## **mkl\_?diagemv**

*Computes matrix - vector product of a sparse general matrix stored in the diagonal format with one-based indexing (deprecated).*

### Syntax

```
void mkl_sdiagemv (const char *transa , const MKL_INT *m , const float *val , const
MKL_INT *lval , const MKL_INT *idiag , const MKL_INT *ndiag , const float *x , float
*y );
```

```

MKL_INT *lval , const MKL_INT *idiag , const MKL_INT *ndiag , const double *x , double
*y );
```

```
void mkl_cdiagemv (const char *transa , const MKL_INT *m , const MKL_Complex8 *val ,
const MKL_INT *lval , const MKL_INT *idiag , const MKL_INT *ndiag , const MKL_Complex8
*x , MKL_Complex8 *y );
```

```
void mkl_zdiagemv (const char *transa , const MKL_INT *m , const MKL_Complex16 *val ,
const MKL_INT *lval , const MKL_INT *idiag , const MKL_INT *ndiag , const MKL_Complex16
*x , MKL_Complex16 *y );
```

## Include Files

- mkl.h

## Description

This routine is deprecated. Use `mkl_sparse_?_mv` from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?diagmv` routine performs a matrix-vector operation defined as

$$y := A*x$$

or

$$y := A^T*x,$$

where:

$x$  and  $y$  are vectors,

$A$  is an  $m$ -by- $m$  sparse square matrix in the diagonal storage format,  $A^T$  is the transpose of  $A$ .

---

#### NOTE

This routine supports only one-based indexing of the input arrays.

---

### Input Parameters

<code>transa</code>	Specifies the operation. If <code>transa = 'N'</code> or <code>'n'</code> , then $y := A*x$ If <code>transa = 'T'</code> or <code>'t'</code> or <code>'C'</code> or <code>'c'</code> , then $y := A^T*x$ ,
<code>m</code>	Number of rows of the matrix $A$ .
<code>val</code>	Two-dimensional array of size <code>lval*ndiag</code> , contains non-zero diagonals of the matrix $A$ . Refer to <code>values</code> array description in <a href="#">Diagonal Storage Scheme</a> for more details.
<code>lval</code>	Leading dimension of <code>val</code> , <code>lval ≥ m</code> . Refer to <code>lval</code> description in <a href="#">Diagonal Storage Scheme</a> for more details.
<code>idiag</code>	Array of length <code>ndiag</code> , contains the distances between main diagonal and each non-zero diagonals in the matrix $A$ . Refer to <code>distance</code> array description in <a href="#">Diagonal Storage Scheme</a> for more details.
<code>ndiag</code>	Specifies the number of non-zero diagonals of the matrix $A$ .
<code>x</code>	Array, size is $m$ . On entry, the array <code>x</code> must contain the vector $x$ .

### Output Parameters

<code>y</code>	Array, size at least $m$ . On exit, the array <code>y</code> must contain the vector $y$ .
----------------	---

#### `mkl_?csrsvmv`

*Computes matrix - vector product of a sparse symmetrical matrix stored in the CSR format (3-array variation) with one-based indexing (deprecated).*

---

## Syntax

```
void mkl_scsrsvmv (const char *uplo , const MKL_INT *m , const float *a , const MKL_INT *ia , const MKL_INT *ja , const float *x , float *y );
```

```
void mkl_dcsrsvmv (const char *uplo , const MKL_INT *m , const double *a , const MKL_INT *ia , const MKL_INT *ja , const double *x , double *y );
```

```
void mkl_ccsrsvmv (const char *uplo , const MKL_INT *m , const MKL_Complex8 *a , const MKL_INT *ia , const MKL_INT *ja , const MKL_Complex8 *x , MKL_Complex8 *y );
```

```
void mkl_zcsrsvmv (const char *uplo , const MKL_INT *m , const MKL_Complex16 *a , const MKL_INT *ia , const MKL_INT *ja , const MKL_Complex16 *x , MKL_Complex16 *y );
```

## Include Files

- mkl.h

## Description

This routine is deprecated. Use [mkl\\_sparse\\_?\\_mv](#) from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?csrsvmv` routine performs a matrix-vector operation defined as

$$y := A*x$$

where:

$x$  and  $y$  are vectors,

$A$  is an upper or lower triangle of the symmetrical sparse matrix in the CSR format (3-array variation).

---

### NOTE

This routine supports only one-based indexing of the input arrays.

---

## Input Parameters

<i>uplo</i>	Specifies whether the upper or low triangle of the matrix $A$ is used. If <i>uplo</i> = 'U' or 'u', then the upper triangle of the matrix $A$ is used. If <i>uplo</i> = 'L' or 'l', then the low triangle of the matrix $A$ is used.
<i>m</i>	Number of rows of the matrix $A$ .
<i>a</i>	Array containing non-zero elements of the matrix $A$ . Its length is equal to the number of non-zero elements in the matrix $A$ . Refer to <i>values</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.
<i>ia</i>	Array of length $m + 1$ , containing indices of elements in the array $a$ , such that $ia[i] - ia[0]$ is the index in the array $a$ of the first non-zero element from the row $i$ . The value of the last element $ia[m] - ia[0]$ is equal to the number of non-zeros. Refer to <i>rowIndex</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.

<i>ja</i>	Array containing the column indices plus one for each non-zero element of the matrix <i>A</i> .  Its length is equal to the length of the array <i>a</i> . Refer to <i>columns</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.
<i>x</i>	Array, size is <i>m</i> .  On entry, the array <i>x</i> must contain the vector <i>x</i> .

## Output Parameters

<i>y</i>	Array, size at least <i>m</i> .  On exit, the array <i>y</i> must contain the vector <i>y</i> .
----------	---

### **mkl\_?bsrsymv**

*Computes matrix-vector product of a sparse symmetrical matrix stored in the BSR format (3-array variation) with one-based indexing (deprecated).*

### Syntax

```
void mkl_sbsrsymv (const char *uplo , const MKL_INT *m , const MKL_INT *lb , const
float *a , const MKL_INT *ia , const MKL_INT *ja , const float *x , float *y );

### Description

This routine is deprecated. Use [mkl\\_sparse\\_?\\_mv](#) from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?diasymv` routine performs a matrix-vector operation defined as

$$y := A*x$$

where:

*x* and *y* are vectors,

*A* is an upper or lower triangle of the symmetrical sparse matrix.

---

#### NOTE

This routine supports only one-based indexing of the input arrays.

---

### Input Parameters

*uplo* Specifies whether the upper or low triangle of the matrix *A* is used.  
If *uplo* = 'U' or 'u', then the upper triangle of the matrix *A* is used.

	If <code>uplo = 'L'</code> or <code>'l'</code> , then the low triangle of the matrix <i>A</i> is used.
<i>m</i>	Number of rows of the matrix <i>A</i> .
<i>val</i>	Two-dimensional array of size <i>lval</i> by <i>ndiag</i> , contains non-zero diagonals of the matrix <i>A</i> . Refer to <i>values</i> array description in <a href="#">Diagonal Storage Scheme</a> for more details.
<i>lval</i>	Leading dimension of <i>val</i> , $lval \geq m$ . Refer to <i>lval</i> description in <a href="#">Diagonal Storage Scheme</a> for more details.
<i>idiag</i>	Array of length <i>ndiag</i> , contains the distances between main diagonal and each non-zero diagonals in the matrix <i>A</i> .  Refer to <i>distance</i> array description in <a href="#">Diagonal Storage Scheme</a> for more details.
<i>ndiag</i>	Specifies the number of non-zero diagonals of the matrix <i>A</i> .
<i>x</i>	Array, size is <i>m</i> .  On entry, the array <i>x</i> must contain the vector <i>x</i> .

## Output Parameters

<i>y</i>	Array, size at least <i>m</i> .  On exit, the array <i>y</i> must contain the vector <i>y</i> .
----------	---

### **mkl\_?csrtrsv**

*Triangular solvers with simplified interface for a sparse matrix in the CSR format (3-array variation) with one-based indexing (deprecated).*

### Syntax

```
void mkl_scsrtrsv (const char *uplo , const char *transa , const char *diag , const
MKL_INT *m , const float *a , const MKL_INT *ia , const MKL_INT *ja , const float *x ,
float *y );
```

```
void mkl_dcsrtrsv (const char *uplo , const char *transa , const char *diag , const
MKL_INT *m , const double *a , const MKL_INT *ia , const MKL_INT *ja , const double
*x , double *y );
```

```
void mkl_ccsrtrsv (const char *uplo , const char *transa , const char *diag , const
MKL_INT *m , const MKL_Complex8 *a , const MKL_INT *ia , const MKL_INT *ja , const
MKL_Complex8 *x , MKL_Complex8 *y );
```

```
void mkl_zcsrtrsv (const char *uplo , const char *transa , const char *diag , const
MKL_INT *m , const MKL_Complex16 *a , const MKL_INT *ia , const MKL_INT *ja , const
MKL_Complex16 *x , MKL_Complex16 *y );
```

### Include Files

- mkl.h

### Description

This routine is deprecated. Use [mkl\\_sparse\\_?\\_trsv](#) from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?csrtrsv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix stored in the CSR format (3 array variation):

$$A*y = x$$

or

$$A^T*y = x,$$

where:

$x$  and  $y$  are vectors,

$A$  is a sparse upper or lower triangular matrix with unit or non-unit main diagonal,  $A^T$  is the transpose of  $A$ .

---

#### NOTE

This routine supports only one-based indexing of the input arrays.

---

### Input Parameters

<i>uplo</i>	Specifies whether the upper or low triangle of the matrix $A$ is used. If <i>uplo</i> = 'U' or 'u', then the upper triangle of the matrix $A$ is used. If <i>uplo</i> = 'L' or 'l', then the low triangle of the matrix $A$ is used.
<i>transa</i>	Specifies the system of linear equations. If <i>transa</i> = 'N' or 'n', then $A*y = x$ If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $A^T*y = x$ ,
<i>diag</i>	Specifies whether $A$ is unit triangular. If <i>diag</i> = 'U' or 'u', then $A$ is a unit triangular. If <i>diag</i> = 'N' or 'n', then $A$ is not unit triangular.
<i>m</i>	Number of rows of the matrix $A$ .
<i>a</i>	Array containing non-zero elements of the matrix $A$ . Its length is equal to the number of non-zero elements in the matrix $A$ . Refer to <i>values</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.

---

#### NOTE

The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right).

No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.

---

<i>ia</i>	Array of length $m + 1$ , containing indices of elements in the array <i>a</i> , such that $ia[i] - ia[0]$ is the index in the array <i>a</i> of the first non-zero element from the row <i>i</i> . The value of the last element $ia[m] - ia[0]$ is equal to the number of non-zeros. Refer to <i>rowIndex</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.
<i>ja</i>	Array containing the column indices plus one for each non-zero element of the matrix <i>A</i> .  Its length is equal to the length of the array <i>a</i> . Refer to <i>columns</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.

**NOTE**

Column indices must be sorted in increasing order for each row.

<i>x</i>	Array, size is <i>m</i> .  On entry, the array <i>x</i> must contain the vector <i>x</i> .
----------	--

**Output Parameters**

<i>y</i>	Array, size at least <i>m</i> .  Contains the vector <i>y</i> .
----------	---

**mkl\_?bsrtrsv**

*Triangular solver with simplified interface for a sparse matrix stored in the BSR format (3-array variation) with one-based indexing (deprecated).*

**Syntax**

```
void mkl_sbsrtrsv (const char *uplo , const char *transa , const char *diag , const
MKL_INT *m , const MKL_INT *lb , const float *a , const MKL_INT *ia , const MKL_INT
*ja , const float *x , float *y );

void mkl_dbsrtrsv (const char *uplo , const char *transa , const char *diag , const
MKL_INT *m , const MKL_INT *lb , const double *a , const MKL_INT *ia , const MKL_INT
*ja , const double *x , double *y );

void mkl_cbsrtrsv (const char *uplo , const char *transa , const char *diag , const
MKL_INT *m , const MKL_INT *lb , const MKL_Complex8 *a , const MKL_INT *ia , const
MKL_INT *ja , const MKL_Complex8 *x , MKL_Complex8 *y );

void mkl_zbsrtrsv (const char *uplo , const char *transa , const char *diag , const
MKL_INT *m , const MKL_INT *lb , const MKL_Complex16 *a , const MKL_INT *ia , const
MKL_INT *ja , const MKL_Complex16 *x , MKL_Complex16 *y );
```

**Include Files**

- mkl.h

**Description**

This routine is deprecated. Use [mkl\\_sparse\\_?\\_trsv](#) from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?bsrtrsv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix stored in the BSR format (3-array variation) :

```
y := A*x
```

or

```
y := AT*x,
```

where:

$x$  and  $y$  are vectors,

$A$  is a sparse upper or lower triangular matrix with unit or non-unit main diagonal,  $A^T$  is the transpose of  $A$ .

---

#### NOTE

This routine supports only one-based indexing of the input arrays.

---

## Input Parameters

<code>uplo</code>	Specifies the upper or low triangle of the matrix $A$ is used. If <code>uplo = 'U' or 'u'</code> , then the upper triangle of the matrix $A$ is used. If <code>uplo = 'L' or 'l'</code> , then the low triangle of the matrix $A$ is used.
<code>transa</code>	Specifies the operation. If <code>transa = 'N' or 'n'</code> , then the matrix-vector product is computed as $y := A*x$ If <code>transa = 'T' or 't' or 'C' or 'c'</code> , then the matrix-vector product is computed as $y := A^T*x$ .
<code>diag</code>	Specifies whether $A$ is a unit triangular matrix. If <code>diag = 'U' or 'u'</code> , then $A$ is a unit triangular. If <code>diag = 'N' or 'n'</code> , then $A$ is not a unit triangular.
<code>m</code>	Number of block rows of the matrix $A$ .
<code>lb</code>	Size of the block in the matrix $A$ .
<code>a</code>	Array containing elements of non-zero blocks of the matrix $A$ . Its length is equal to the number of non-zero blocks in the matrix $A$ multiplied by $lb*lb$ . Refer to <code>values</code> array description in <a href="#">BSR Format</a> for more details.

---

#### NOTE

The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right).

No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.

---

<i>ia</i>	Array of length $(m + 1)$ , containing indices of block in the array <i>a</i> , such that $ia[I] - ia[0]$ is the index in the array <i>a</i> of the first non-zero element from the row <i>I</i> . The value of the last element $ia[m] - ia[0]$ is equal to the number of non-zero blocks. Refer to <i>rowIndex</i> array description in <a href="#">BSR Format</a> for more details.
<i>ja</i>	Array containing the column indices plus one for each non-zero block in the matrix <i>A</i> .  Its length is equal to the number of non-zero blocks of the matrix <i>A</i> . Refer to <i>columns</i> array description in <a href="#">BSR Format</a> for more details.
<i>x</i>	Array, size $(m * lb)$ .  On entry, the array <i>x</i> must contain the vector <i>x</i> .

## Output Parameters

<i>y</i>	Array, size at least $(m * lb)$ .  On exit, the array <i>y</i> must contain the vector <i>y</i> .
----------	---

### **mkl\_?cootrsv**

*Triangular solvers with simplified interface for a sparse matrix in the coordinate format with one-based indexing (deprecated).*

### Syntax

```
void mkl_scootrsv (const char *uplo , const char *transa , const char *diag , const
MKL_INT *m , const float *val , const MKL_INT *rowind , const MKL_INT *colind , const
MKL_INT *nnz , const float *x , float *y );

void mkl_dcootrsv (const char *uplo , const char *transa , const char *diag , const
MKL_INT *m , const double *val , const MKL_INT *rowind , const MKL_INT *colind , const
MKL_INT *nnz , const double *x , double *y );

void mkl_ccootrsv (const char *uplo , const char *transa , const char *diag , const

### Description

This routine is deprecated. Use [mkl\\_sparse\\_?\\_trsv](#) from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?cootrsv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix stored in the coordinate format:

$$A * y = x$$

or

$$A^T * y = x,$$

where:

$x$  and  $y$  are vectors,

$A$  is a sparse upper or lower triangular matrix with unit or non-unit main diagonal,  $A^T$  is the transpose of  $A$ .

---

**NOTE**

This routine supports only one-based indexing of the input arrays.

---

## Input Parameters

<i>uplo</i>	Specifies whether the upper or low triangle of the matrix $A$ is considered. If <i>uplo</i> = 'U' or 'u', then the upper triangle of the matrix $A$ is used. If <i>uplo</i> = 'L' or 'l', then the low triangle of the matrix $A$ is used.
<i>transa</i>	Specifies the system of linear equations. If <i>transa</i> = 'N' or 'n', then $A * y = x$ If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $A^T * y = x$ ,
<i>diag</i>	Specifies whether $A$ is unit triangular. If <i>diag</i> = 'U' or 'u', then $A$ is unit triangular. If <i>diag</i> = 'N' or 'n', then $A$ is not unit triangular.
<i>m</i>	Number of rows of the matrix $A$ .
<i>val</i>	Array of length <i>nnz</i> , contains non-zero elements of the matrix $A$ in the arbitrary order. Refer to <i>values</i> array description in <a href="#">Coordinate Format</a> for more details.
<i>rowind</i>	Array of length <i>nnz</i> , contains the row indices plus one for each non-zero element of the matrix $A$ . Refer to <i>rows</i> array description in <a href="#">Coordinate Format</a> for more details.
<i>colind</i>	Array of length <i>nnz</i> , contains the column indices plus one for each non-zero element of the matrix $A$ . Refer to <i>columns</i> array description in <a href="#">Coordinate Format</a> for more details.
<i>nnz</i>	Specifies the number of non-zero element of the matrix $A$ . Refer to <i>nnz</i> description in <a href="#">Coordinate Format</a> for more details.
<i>x</i>	Array, size is <i>m</i> . On entry, the array <i>x</i> must contain the vector $x$ .

## Output Parameters

<i>y</i>	Array, size at least <i>m</i> . Contains the vector $y$ .
----------	--

## mkl\_?diatrsv

Triangular solvers with simplified interface for a sparse matrix in the diagonal format with one-based indexing (deprecated).

---

### Syntax

```
void mkl_sdiatrsv (const char *uplo , const char *transa , const char *diag , const MKL_INT *m , const float *val , const MKL_INT *lval , const MKL_INT *idiag , const MKL_INT *ndiag , const float *x , float *y );
```

```
void mkl_ddiatrsv (const char *uplo , const char *transa , const char *diag , const MKL_INT *m , const double *val , const MKL_INT *lval , const MKL_INT *idiag , const MKL_INT *ndiag , const double *x , double *y );
```

```
void mkl_cdiatrsv (const char *uplo , const char *transa , const char *diag , const MKL_INT *m , const MKL_Complex8 *val , const MKL_INT *lval , const MKL_INT *idiag , const MKL_INT *ndiag , const MKL_Complex8 *x , MKL_Complex8 *y );
```

```

### Description

This routine is deprecated. Use [mkl\\_sparse\\_?\\_trsv](#) from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?diatrsv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix stored in the diagonal format:

$$A^*y = x$$

or

$$A^T*y = x,$$

where:

$x$  and  $y$  are vectors,

$A$  is a sparse upper or lower triangular matrix with unit or non-unit main diagonal,  $A^T$  is the transpose of  $A$ .

---

#### NOTE

This routine supports only one-based indexing of the input arrays.

---

### Input Parameters

<code>uplo</code>	Specifies whether the upper or low triangle of the matrix $A$ is used. If <code>uplo = 'U'</code> or <code>'u'</code> , then the upper triangle of the matrix $A$ is used. If <code>uplo = 'L'</code> or <code>'l'</code> , then the low triangle of the matrix $A$ is used.
<code>transa</code>	Specifies the system of linear equations.

	If <i>transa</i> = 'N' or 'n', then $A^*y = x$
	If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $A^T*y = x$ ,
<i>diag</i>	Specifies whether <i>A</i> is unit triangular. If <i>diag</i> = 'U' or 'u', then <i>A</i> is unit triangular. If <i>diag</i> = 'N' or 'n', then <i>A</i> is not unit triangular.
<i>m</i>	Number of rows of the matrix <i>A</i> .
<i>val</i>	Two-dimensional array of size <i>lval</i> by <i>ndiag</i> , contains non-zero diagonals of the matrix <i>A</i> . Refer to <i>values</i> array description in <a href="#">Diagonal Storage Scheme</a> for more details.
<i>lval</i>	Leading dimension of <i>val</i> , $lval \geq m$ . Refer to <i>lval</i> description in <a href="#">Diagonal Storage Scheme</a> for more details.
<i>idiag</i>	Array of length <i>ndiag</i> , contains the distances between main diagonal and each non-zero diagonals in the matrix <i>A</i> .

**NOTE**

---

All elements of this array must be sorted in increasing order.

---

Refer to *distance* array description in [Diagonal Storage Scheme](#) for more details.

<i>ndiag</i>	Specifies the number of non-zero diagonals of the matrix <i>A</i> .
<i>x</i>	Array, size is <i>m</i> . On entry, the array <i>x</i> must contain the vector <i>x</i> .

**Output Parameters**

<i>y</i>	Array, size at least <i>m</i> . Contains the vector <i>y</i> .
----------	---

**[mkl\\_cspblas\\_?csrgemv](#)**

*Computes matrix - vector product of a sparse general matrix stored in the CSR format (3-array variation) with zero-based indexing (deprecated).*

---

**Syntax**

```
void mkl_cspblas_scsrgemv (const char *transa , const MKL_INT *m , const float *a ,
const MKL_INT *ia , const MKL_INT *ja , const float *x , float *y );

void mkl_cspblas_dcsrgemv (const char *transa , const MKL_INT *m , const double *a ,
const MKL_INT *ia , const MKL_INT *ja , const double *x , double *y );

void mkl_cspblas_ccsrgemv (const char *transa , const MKL_INT *m , const MKL_Complex8
*a , const MKL_INT *ia , const MKL_INT *ja , const MKL_Complex8 *x , MKL_Complex8 *y );

void mkl_cspblas_zcsrgemv (const char *transa , const MKL_INT *m , const MKL_Complex16

## Input Parameters

<code>uplo</code>	Specifies whether the upper or low triangle of the matrix $A$ is used. If <code>uplo = 'U' or 'u'</code> , then the upper triangle of the matrix $A$ is used. If <code>uplo = 'L' or 'l'</code> , then the low triangle of the matrix $A$ is used.
<code>m</code>	Number of block rows of the matrix $A$ .
<code>lb</code>	Size of the block in the matrix $A$ .
<code>a</code>	Array containing elements of non-zero blocks of the matrix $A$ . Its length is equal to the number of non-zero blocks in the matrix $A$ multiplied by $lb*lb$ . Refer to <code>values</code> array description in <a href="#">BSR Format</a> for more details.
<code>ia</code>	Array of length $(m + 1)$ , containing indices of block in the array $a$ , such that <code>ia[i]</code> is the index in the array $a$ of the first non-zero element from the row $i$ . The value of the last element <code>ia[m]</code> is equal to the number of non-zero blocks. Refer to <code>rowIndex</code> array description in <a href="#">BSR Format</a> for more details.
<code>ja</code>	Array containing the column indices for each non-zero block in the matrix $A$ . Its length is equal to the number of non-zero blocks of the matrix $A$ . Refer to <code>columns</code> array description in <a href="#">BSR Format</a> for more details.
<code>x</code>	Array, size $(m*lb)$ . On entry, the array $x$ must contain the vector $x$ .

## Output Parameters

<code>y</code>	Array, size at least $(m*lb)$ . On exit, the array $y$ must contain the vector $y$ .
----------------	---

### `mkl_cspblas_?coosymv`

Computes matrix - vector product of a sparse symmetrical matrix stored in the coordinate format with zero-based indexing (deprecated).

---

## Syntax

```
void mkl_cspblas_scoosymv (const char *uplo , const MKL_INT *m , const float *val ,
const MKL_INT *rowind , const MKL_INT *colind , const MKL_INT *nnz , const float *x ,
float *y );
```

```
void mkl_cspblas_dcoosymv (const char *uplo , const MKL_INT *m , const double *val ,
const MKL_INT *rowind , const MKL_INT *colind , const MKL_INT *nnz , const double *x ,
double *y );
```

```
void mkl_cspblas_ccoosymv (const char *uplo , const MKL_INT *m , const MKL_Complex8
*val , const MKL_INT *rowind , const MKL_INT *colind , const MKL_INT *nnz , const
MKL_Complex8 *x , MKL_Complex8 *y );
```

```
void mkl_cspblas_zcoosymv (const char *uplo , const MKL_INT *m , const MKL_Complex16
*val , const MKL_INT *rowind , const MKL_INT *colind , const MKL_INT *nnz , const
MKL_Complex16 *x , MKL_Complex16 *y );
```

## Include Files

- mkl.h

## Description

This routine is deprecated. Use [mkl\\_sparse?\\_mv](#) from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_cspblas_?coosymv` routine performs a matrix-vector operation defined as

$$y := A*x$$

where:

$x$  and  $y$  are vectors,

$A$  is an upper or lower triangle of the symmetrical sparse matrix in the coordinate format with zero-based indexing.

---

### NOTE

This routine supports only zero-based indexing of the input arrays.

---

## Input Parameters

<i>uplo</i>	Specifies whether the upper or low triangle of the matrix $A$ is used. If <i>uplo</i> = 'U' or 'u', then the upper triangle of the matrix $A$ is used. If <i>uplo</i> = 'L' or 'l', then the low triangle of the matrix $A$ is used.
<i>m</i>	Number of rows of the matrix $A$ .
<i>val</i>	Array of length <i>nnz</i> , contains non-zero elements of the matrix $A$ in the arbitrary order. Refer to <i>values</i> array description in <a href="#">Coordinate Format</a> for more details.
<i>rowind</i>	Array of length <i>nnz</i> , contains the row indices for each non-zero element of the matrix $A$ .

Refer to `rows` array description in [Coordinate Format](#) for more details.

`colind`

Array of length `nnz`, contains the column indices for each non-zero element of the matrix  $A$ . Refer to `columns` array description in [Coordinate Format](#) for more details.

`nnz`

Specifies the number of non-zero element of the matrix  $A$ .

Refer to `nnz` description in [Coordinate Format](#) for more details.

`x`

Array, size is  $m$ .

On entry, the array `x` must contain the vector  $x$ .

## Output Parameters

`y`

Array, size at least  $m$ .

On exit, the array `y` must contain the vector  $y$ .

### `mkl_cspblas_?csrtrsv`

*Triangular solvers with simplified interface for a sparse matrix in the CSR format (3-array variation) with zero-based indexing (deprecated).*

## Syntax

```
void mkl_cspblas_scsrtrsv (const char *uplo , const char *transa , const char *diag ,
const MKL_INT *m , const float *a , const MKL_INT *ia , const MKL_INT *ja , const float
*x , float *y );
```

```
void mkl_cspblas_dcsrtrsv (const char *uplo , const char *transa , const char *diag ,
const MKL_INT *m , const double *a , const MKL_INT *ia , const MKL_INT *ja , const
double *x , double *y );
```

```
void mkl_cspblas_ccsrtrsv (const char *uplo , const char *transa , const char *diag ,
const MKL_INT *m , const MKL_Complex8 *a , const MKL_INT *ia , const MKL_INT *ja ,
const MKL_Complex8 *x , MKL_Complex8 *y );
```

```
void mkl_cspblas_zcsrtrsv (const char *uplo , const char *transa , const char *diag ,
const MKL_INT *m , const MKL_Complex16 *a , const MKL_INT *ia , const MKL_INT *ja ,
const MKL_Complex16 *x , MKL_Complex16 *y );
```

## Include Files

- `mkl.h`

## Description

This routine is deprecated. Use `mkl_sparse_?_trsv` from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_cspblas_?csrtrsv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix stored in the CSR format (3-array variation) with zero-based indexing:

$$A * y = x$$

or

$$A^T * y = x,$$

where:

$x$  and  $y$  are vectors,

$A$  is a sparse upper or lower triangular matrix with unit or non-unit main diagonal,  $A^T$  is the transpose of  $A$ .

---

**NOTE**

This routine supports only zero-based indexing of the input arrays.

---

## Input Parameters

<i>uplo</i>	Specifies whether the upper or low triangle of the matrix $A$ is used. If <i>uplo</i> = 'U' or 'u', then the upper triangle of the matrix $A$ is used. If <i>uplo</i> = 'L' or 'l', then the low triangle of the matrix $A$ is used.
<i>transa</i>	Specifies the system of linear equations. If <i>transa</i> = 'N' or 'n', then $A*y = x$ If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $A^T*y = x$ ,
<i>diag</i>	Specifies whether matrix $A$ is unit triangular. If <i>diag</i> = 'U' or 'u', then $A$ is unit triangular. If <i>diag</i> = 'N' or 'n', then $A$ is not unit triangular.
<i>m</i>	Number of rows of the matrix $A$ .
<i>a</i>	Array containing non-zero elements of the matrix $A$ . Its length is equal to the number of non-zero elements in the matrix $A$ . Refer to <i>values</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.

---

**NOTE**

The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right).

No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.

---

<i>ia</i>	Array of length $m+1$ , containing indices of elements in the array <i>a</i> , such that <i>ia</i> [ <i>i</i> ] is the index in the array <i>a</i> of the first non-zero element from the row <i>i</i> . The value of the last element <i>ia</i> [ <i>m</i> ] is equal to the number of non-zeros. Refer to <i>rowIndex</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.
<i>ja</i>	Array containing the column indices for each non-zero element of the matrix $A$ .  Its length is equal to the length of the array <i>a</i> . Refer to <i>columns</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.

**NOTE**

Column indices must be sorted in increasing order for each row.

---

$x$  Array, size is  $m$ .  
On entry, the array  $x$  must contain the vector  $x$ .

**Output Parameters**

$y$  Array, size at least  $m$ .  
Contains the vector  $y$ .

**`mkl_cspblas_?bsrtrsv`**

*Triangular solver with simplified interface for a sparse matrix stored in the BSR format (3-array variation) with zero-based indexing (deprecated).*

---

**Syntax**

```
void mkl_cspblas_sbsrtrsv (const char *uplo , const char *transa , const char *diag ,
const MKL_INT *m , const MKL_INT *lb , const float *a , const MKL_INT *ia , const
MKL_INT *ja , const float *x , float *y );
```

```
void mkl_cspblas_dbsrtrsv (const char *uplo , const char *transa , const char *diag ,
const MKL_INT *m , const MKL_INT *lb , const double *a , const MKL_INT *ia , const
MKL_INT *ja , const double *x , double *y );
```

```
void mkl_cspblas_cbsrtrsv (const char *uplo , const char *transa , const char *diag ,
const MKL_INT *m , const MKL_INT *lb , const MKL_Complex8 *a , const MKL_INT *ia ,
const MKL_INT *ja , const MKL_Complex8 *x , MKL_Complex8 *y );
```

```
void mkl_cspblas_zbsrtrsv (const char *uplo , const char *transa , const char *diag ,
const MKL_INT *m , const MKL_INT *lb , const MKL_Complex16 *a , const MKL_INT *ia ,
const MKL_INT *ja , const MKL_Complex16 *x , MKL_Complex16 *y );
```

**Include Files**

### Description

This routine is deprecated. Use [mkl\\_sparse\\_?\\_trsv](#) from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_cspblas_?cootrsv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix stored in the coordinate format with zero-based indexing:

$$\bar{A} * y = x$$

or

$$\bar{A}^T * y = x,$$

where:

$x$  and  $y$  are vectors,

$A$  is a sparse upper or lower triangular matrix with unit or non-unit main diagonal,  $A^T$  is the transpose of  $A$ .

---

#### NOTE

This routine supports only zero-based indexing of the input arrays.

---

### Input Parameters

<code>uplo</code>	Specifies whether the upper or low triangle of the matrix $A$ is considered. If <code>uplo</code> = 'U' or 'u', then the upper triangle of the matrix $A$ is used. If <code>uplo</code> = 'L' or 'l', then the low triangle of the matrix $A$ is used.
<code>transa</code>	Specifies the system of linear equations. If <code>transa</code> = 'N' or 'n', then $A*y = x$ If <code>transa</code> = 'T' or 't' or 'C' or 'c', then $A^T*y = x$ ,
<code>diag</code>	Specifies whether $A$ is unit triangular. If <code>diag</code> = 'U' or 'u', then $A$ is unit triangular. If <code>diag</code> = 'N' or 'n', then $A$ is not unit triangular.
<code>m</code>	Number of rows of the matrix $A$ .
<code>val</code>	Array of length <code>nnz</code> , contains non-zero elements of the matrix $A$ in the arbitrary order. Refer to <code>values</code> array description in <a href="#">Coordinate Format</a> for more details.
<code>rowind</code>	Array of length <code>nnz</code> , contains the row indices for each non-zero element of the matrix $A$ . Refer to <code>rows</code> array description in <a href="#">Coordinate Format</a> for more details.
<code>colind</code>	Array of length <code>nnz</code> , contains the column indices for each non-zero element of the matrix $A$ . Refer to <code>columns</code> array description in <a href="#">Coordinate Format</a> for more details.
<code>nnz</code>	Specifies the number of non-zero element of the matrix $A$ . Refer to <code>nnz</code> description in <a href="#">Coordinate Format</a> for more details.
<code>x</code>	Array, size is <code>m</code> . On entry, the array <code>x</code> must contain the vector $x$ .

## Output Parameters

<code>y</code>	Array, size at least <code>m</code> . Contains the vector $y$ .
----------------	--

### **mkl\_?csrvm**

Computes matrix - vector product of a sparse matrix stored in the CSR format (deprecated).

### Syntax

```
void mkl_scsrvm (const char *transa , const MKL_INT *m , const MKL_INT *k , const float
*alpha , const char *matdescra , const float *val , const MKL_INT *indx , const MKL_INT
*pntrb , const MKL_INT *pntrc , const float *x , const float *beta , float *y );

void mkl_dcsrvm (const char *transa , const MKL_INT *m , const MKL_INT *k , const

## Description

This routine is deprecated. Use [mkl\\_sparse\\_?\\_mv](#) from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?csrmv` routine performs a matrix-vector operation defined as

```
y := alpha*A*x + beta*y
```

or

```
y := alpha*AT*x + beta*y,
```

where:

*alpha* and *beta* are scalars,

*x* and *y* are vectors,

*A* is an *m*-by-*k* sparse matrix in the CSR format, *A*<sup>T</sup> is the transpose of *A*.

---

### NOTE

This routine supports a CSR format both with one-based indexing and zero-based indexing.

---

## Input Parameters

<i>transa</i>	Specifies the operation. If <i>transa</i> = 'N' or 'n', then $y := \alpha * A * x + \beta * y$ If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $y := \alpha * A^T * x + \beta * y$ ,
<i>m</i>	Number of rows of the matrix <i>A</i> .
<i>k</i>	Number of columns of the matrix <i>A</i> .
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>matdescra</i>	Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in <a href="#">Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)"</a> . Possible combinations of element values of this parameter are given in <a href="#">Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>"</a> .
<i>val</i>	Array containing non-zero elements of the matrix <i>A</i> .

	Its length is $pntrb[m-1] - pntrb[0]$ .
	Refer to <i>values</i> array description in <a href="#">CSR Format</a> for more details.
<i>indx</i>	For one-based indexing, array containing the column indices plus one for each non-zero element of the matrix <i>A</i> . For zero-based indexing, array containing the column indices for each non-zero element of the matrix <i>A</i> .  Its length is equal to length of the <i>val</i> array.  Refer to <i>columns</i> array description in <a href="#">CSR Format</a> for more details.
<i>pntrb</i>	Array of length <i>m</i> .  This array contains row indices, such that $pntrb[i] - pntrb[0]$ is the first index of row <i>i</i> in the arrays <i>val</i> and <i>indx</i> .  Refer to <i>pointerb</i> array description in <a href="#">CSR Format</a> for more details.
<i>pntrbE</i>	Array of length <i>m</i> .  This array contains row indices, such that $pntrbE[i] - pntrb[0]-1$ is the last index of row <i>i</i> in the arrays <i>val</i> and <i>indx</i> .  Refer to <i>pointerE</i> array description in <a href="#">CSR Format</a> for more details.
<i>x</i>	Array, size at least <i>k</i> if <i>transa</i> = 'N' or 'n' and at least <i>m</i> otherwise. On entry, the array <i>x</i> must contain the vector <i>x</i> .
<i>beta</i>	Specifies the scalar <i>beta</i> .
<i>y</i>	Array, size at least <i>m</i> if <i>transa</i> = 'N' or 'n' and at least <i>k</i> otherwise. On entry, the array <i>y</i> must contain the vector <i>y</i> .

## Output Parameters

<i>y</i>	Overwritten by the updated vector <i>y</i> .
----------	--

### **mkl\_?bsrmv**

Computes matrix - vector product of a sparse matrix stored in the BSR format (deprecated).

#### Syntax

```
void mkl_sbsrmv (const char *transa , const MKL_INT *m , const MKL_INT *k , const
MKL_INT *lb , const float *alpha , const char *matdescra , const float *val , const

## Description

This routine is deprecated. Use [mkl\\_sparse\\_?\\_mv](#) from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?bsrmv` routine performs a matrix-vector operation defined as

$$y := \alpha A x + \beta y$$

or

$$y := \alpha A^T x + \beta y,$$

where:

*alpha* and *beta* are scalars,

*x* and *y* are vectors,

*A* is an *m*-by-*k* block sparse matrix in the BSR format,  $A^T$  is the transpose of *A*.

---

### NOTE

This routine supports a BSR format both with one-based indexing and zero-based indexing.

---

## Input Parameters

<i>transa</i>	Specifies the operation.  If <i>transa</i> = 'N' or 'n', then the matrix-vector product is computed as $y := \alpha A x + \beta y$  If <i>transa</i> = 'T' or 't' or 'C' or 'c', then the matrix-vector product is computed as $y := \alpha A^T x + \beta y,$
<i>m</i>	Number of block rows of the matrix <i>A</i> .
<i>k</i>	Number of block columns of the matrix <i>A</i> .
<i>lb</i>	Size of the block in the matrix <i>A</i> .
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>matdescra</i>	Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in <a href="#">Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)"</a> . Possible combinations of element values of this parameter are given in <a href="#">Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>"</a> .
<i>val</i>	Array containing elements of non-zero blocks of the matrix <i>A</i> . Its length is equal to the number of non-zero blocks in the matrix <i>A</i> multiplied by $lb * lb$ .

	Refer to <i>values</i> array description in <a href="#">BSR Format</a> for more details.
<i>indx</i>	For one-based indexing, array containing the column indices plus one for each non-zero block of the matrix <i>A</i> . For zero-based indexing, array containing the column indices for each non-zero block of the matrix <i>A</i> . Its length is equal to the number of non-zero blocks in the matrix <i>A</i> . Refer to <i>columns</i> array description in <a href="#">BSR Format</a> for more details.
<i>pntrb</i>	Array of length <i>m</i> . This array contains row indices, such that <i>pntrb</i> [ <i>i</i> ] - <i>pntrb</i> [0] is the first index of block row <i>i</i> in the array <i>indx</i> . Refer to <i>pointerB</i> array description in <a href="#">BSR Format</a> for more details.
<i>pntrE</i>	Array of length <i>m</i> . For zero-based indexing this array contains row indices, such that <i>pntrE</i> [ <i>i</i> ] - <i>pntrb</i> [0] - 1 is the last index of block row <i>i</i> in the array <i>indx</i> . Refer to <i>pointerE</i> array description in <a href="#">BSR Format</a> for more details.
<i>x</i>	Array, size at least ( <i>k*lb</i> ) if <i>transa</i> = 'N' or 'n', and at least ( <i>m*lb</i> ) otherwise. On entry, the array <i>x</i> must contain the vector <i>x</i> .
<i>beta</i>	Specifies the scalar <i>beta</i> .
<i>y</i>	Array, size at least ( <i>m*lb</i> ) if <i>transa</i> = 'N' or 'n', and at least ( <i>k*lb</i> ) otherwise. On entry, the array <i>y</i> must contain the vector <i>y</i> .

## Output Parameters

<i>y</i>	Overwritten by the updated vector <i>y</i> .
----------	--

### **mkl\_?cscmv**

Computes matrix-vector product for a sparse matrix in the CSC format (deprecated).

#### Syntax

```
void mkl_scscmv (const char *transa , const MKL_INT *m , const MKL_INT *k , const float *alpha , const char *matdescra , const float *val , const MKL_INT *indx , const MKL_INT *pntrb , const MKL_INT *pntrE , const float *x , const float *beta , float *y );
```

## Description

This routine is deprecated. Use [mkl\\_sparse\\_?\\_mv](#) from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?cscmv` routine performs a matrix-vector operation defined as

```
y := alpha*A*x + beta*y
```

or

```
y := alpha*AT*x + beta*y,
```

where:

*alpha* and *beta* are scalars,

*x* and *y* are vectors,

*A* is an *m*-by-*k* sparse matrix in compressed sparse column (CSC) format, *A*<sup>T</sup> is the transpose of *A*.

---

### NOTE

This routine supports CSC format both with one-based indexing and zero-based indexing.

---

## Input Parameters

<i>transa</i>	Specifies the operation. If <i>transa</i> = 'N' or 'n', then $y := \alpha * A * x + \beta * y$ If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $y := \alpha * A^T * x + \beta * y$ ,
<i>m</i>	Number of rows of the matrix <i>A</i> .
<i>k</i>	Number of columns of the matrix <i>A</i> .
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>matdescra</i>	Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in <a href="#">Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)"</a> . Possible combinations of element values of this parameter are given in <a href="#">Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>"</a> .
<i>val</i>	Array containing non-zero elements of the matrix <i>A</i> . Its length is <code>pntre[k-1] - pntrb[0]</code> . Refer to <i>values</i> array description in <a href="#">CSC Format</a> for more details.

<i>indx</i>	<p>For one-based indexing, array containing the column indices plus one for each non-zero element of the matrix <i>A</i>. For zero-based indexing, array containing the column indices for each non-zero element of the matrix <i>A</i>. Its length is equal to length of the <i>val</i> array.</p> <p>Refer to <i>rows</i> array description in <a href="#">CSC Format</a> for more details.</p>
<i>pntrb</i>	<p>Array of length <i>k</i>.</p> <p>This array contains column indices, such that <math>pntrb[i] - pntrb[0] + 1</math> is the first index of column <i>i</i> in the arrays <i>val</i> and <i>indx</i>.</p> <p>Refer to <i>pointerb</i> array description in <a href="#">CSC Format</a> for more details.</p>
<i>pntrE</i>	<p>Array of length <i>k</i>.</p> <p>For one-based indexing this array contains column indices, such that <math>pntrE[i] - pntrb[1]</math> is the last index of column <i>i</i> in the arrays <i>val</i> and <i>indx</i>.</p> <p>For zero-based indexing this array contains column indices, such that <math>pntrE[i] - pntrb[1] - 1</math> is the last index of column <i>i</i> in the arrays <i>val</i> and <i>indx</i>.</p> <p>Refer to <i>pointerE</i> array description in <a href="#">CSC Format</a> for more details.</p>
<i>x</i>	<p>Array, size at least <i>k</i> if <i>transa</i> = 'N' or 'n' and at least <i>m</i> otherwise. On entry, the array <i>x</i> must contain the vector <i>x</i>.</p>
<i>beta</i>	<p>Specifies the scalar <i>beta</i>.</p>
<i>y</i>	<p>Array, size at least <i>m</i> if <i>transa</i> = 'N' or 'n' and at least <i>k</i> otherwise. On entry, the array <i>y</i> must contain the vector <i>y</i>.</p>

## Output Parameters

<i>y</i>	Overwritten by the updated vector <i>y</i> .
----------	--

### **mkl\_?coomv**

*Computes matrix - vector product for a sparse matrix in the coordinate format (deprecated).*

#### **Syntax**

```
void mkl_scoomv (const char *transa , const MKL_INT *m , const MKL_INT *k , const float *alpha , const char *matdescra , const float *val , const MKL_INT *rowind , const MKL_INT *colind , const MKL_INT *nnz , const float *x , const float *beta , float *y );
```

```
void mkl_dcoomv (const char *transa , const MKL_INT *m , const MKL_INT *k , const double *alpha , const char *matdescra , const double *val , const MKL_INT *rowind , const MKL_INT *colind , const MKL_INT *nnz , const double *x , const double *beta , double *y );
```

```
void mkl_ccoomv (const char *transa , const MKL_INT *m , const MKL_INT *k , const MKL_Complex8 *alpha , const char *matdescra , const MKL_Complex8 *val , const MKL_INT *rowind , const MKL_INT *colind , const MKL_INT *nnz , const MKL_Complex8 *x , const MKL_Complex8 *beta , MKL_Complex8 *y );
```

```
void mkl_zcoomv (const char *transa , const MKL_INT *m , const MKL_INT *k , const
MKL_Complex16 *alpha , const char *matdescra , const MKL_Complex16 *val , const MKL_INT

## Description

This routine is deprecated. Use [mkl\\_sparse\\_?\\_mv](#) from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?coomv` routine performs a matrix-vector operation defined as

$$y := \alpha * A * x + \beta * y$$

or

$$y := \alpha * A^T * x + \beta * y,$$

where:

*alpha* and *beta* are scalars,

*x* and *y* are vectors,

*A* is an *m*-by-*k* sparse matrix in compressed coordinate format,  $A^T$  is the transpose of *A*.

---

### NOTE

This routine supports a coordinate format both with one-based indexing and zero-based indexing.

---

## Input Parameters

<i>transa</i>	Specifies the operation. If <i>transa</i> = 'N' or 'n', then $y := \alpha * A * x + \beta * y$ If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $y := \alpha * A^T * x + \beta * y,$
<i>m</i>	Number of rows of the matrix <i>A</i> .
<i>k</i>	Number of columns of the matrix <i>A</i> .
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>matdescra</i>	Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in <a href="#">Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)"</a> . Possible combinations of element values of this parameter are given in <a href="#">Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>"</a> .
<i>val</i>	Array of length <i>nnz</i> , contains non-zero elements of the matrix <i>A</i> in the arbitrary order. Refer to <i>values</i> array description in <a href="#">Coordinate Format</a> for more details.
<i>rowind</i>	Array of length <i>nnz</i> .

For one-based indexing, contains the row indices plus one for each non-zero element of the matrix *A*.

For zero-based indexing, contains the row indices for each non-zero element of the matrix *A*.

Refer to *rows* array description in [Coordinate Format](#) for more details.

*colind*

Array of length *nnz*.

For one-based indexing, contains the column indices plus one for each non-zero element of the matrix *A*.

For zero-based indexing, contains the column indices for each non-zero element of the matrix *A*.

Refer to *columns* array description in [Coordinate Format](#) for more details.

*nnz*

Specifies the number of non-zero element of the matrix *A*.

Refer to *nnz* description in [Coordinate Format](#) for more details.

*x*

Array, size at least *k* if *transa* = 'N' or 'n' and at least *m* otherwise. On entry, the array *x* must contain the vector *x*.

*beta*

Specifies the scalar *beta*.

*y*

Array, size at least *m* if *transa* = 'N' or 'n' and at least *k* otherwise. On entry, the array *y* must contain the vector *y*.

## Output Parameters

*y*

Overwritten by the updated vector *y*.

## **mkl\_?csrsv**

*Solves a system of linear equations for a sparse matrix in the CSR format (deprecated).*

### Syntax

```
void mkl_scsrsv (const char *transa , const MKL_INT *m , const float *alpha , const
char *matdescra , const float *val , const MKL_INT *indx , const MKL_INT *pntrb , const
MKL_INT *pntre , const float *x , float *y );
```

```
void mkl_dcsrsv (const char *transa , const MKL_INT *m , const double *alpha , const

## Include Files

- mkl.h

## Description

This routine is deprecated. Use `mkl_sparse_?_trsv` from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?csrsv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix in the CSR format:

$$y := \alpha * \text{inv}(A) * x$$

or

$$y := \alpha * \text{inv}(A^T) * x,$$

where:

$\alpha$  is scalar,  $x$  and  $y$  are vectors,  $A$  is a sparse upper or lower triangular matrix with unit or non-unit main diagonal,  $A^T$  is the transpose of  $A$ .

---

### NOTE

This routine supports a CSR format both with one-based indexing and zero-based indexing.

---

## Input Parameters

<i>transa</i>	Specifies the system of linear equations. If <i>transa</i> = 'N' or 'n', then $y := \alpha * \text{inv}(A) * x$ If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $y := \alpha * \text{inv}(A^T) * x$ ,
<i>m</i>	Number of columns of the matrix $A$ .
<i>alpha</i>	Specifies the scalar $\alpha$ .
<i>matdescra</i>	Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in <a href="#">Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)"</a> . Possible combinations of element values of this parameter are given in <a href="#">Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>"</a> .
<i>val</i>	Array containing non-zero elements of the matrix $A$ . Its length is $\text{pntrc}[m - 1] - \text{pntrb}[0]$ . Refer to <i>values</i> array description in <a href="#">CSR Format</a> for more details.

---

### NOTE

The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right).

No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.

---

<i>indx</i>	For one-based indexing, array containing the column indices plus one for each non-zero element of the matrix $A$ . For zero-based indexing, array containing the column indices for each non-zero element of the matrix $A$ .
-------------	---

Its length is equal to length of the *val* array.

Refer to *columns* array description in [CSR Format](#) for more details.

---

**NOTE**

Column indices must be sorted in increasing order for each row.

---

<i>pntrb</i>	<p>Array of length <i>m</i>.</p> <p>This array contains row indices, such that <i>pntrb</i>[<i>i</i>] - <i>pntrb</i>[0] is the first index of row <i>i</i> in the arrays <i>val</i> and <i>indx</i>.</p> <p>Refer to <i>pointerb</i> array description in <a href="#">CSR Format</a> for more details.</p>
<i>pntrE</i>	<p>Array of length <i>m</i>.</p> <p>This array contains row indices, such that <i>pntrE</i>[<i>i</i>] - <i>pntrb</i>[0] - 1 is the last index of row <i>i</i> in the arrays <i>val</i> and <i>indx</i>.</p> <p>Refer to <i>pointerE</i> array description in <a href="#">CSR Format</a> for more details.</p>
<i>x</i>	<p>Array, size at least <i>m</i>.</p> <p>On entry, the array <i>x</i> must contain the vector <i>x</i>. The elements are accessed with unit increment.</p>
<i>y</i>	<p>Array, size at least <i>m</i>.</p> <p>On entry, the array <i>y</i> must contain the vector <i>y</i>. The elements are accessed with unit increment.</p>

## Output Parameters

<i>y</i>	Contains solution vector <i>x</i> .
----------	-------------------------------------

### **mkl\_?bsrsv**

*Solves a system of linear equations for a sparse matrix in the BSR format (deprecated).*

---

### Syntax

```
void mkl_sbsrsv (const char *transa , const MKL_INT *m , const MKL_INT *lb , const
float *alpha , const char *matdescra , const float *val , const MKL_INT *indx , const
MKL_INT *pntrb , const MKL_INT *pntrE , const float *x , float *y );

void mkl_dbsrsv (const char *transa , const MKL_INT *m , const MKL_INT *lb , const
double *alpha , const char *matdescra , const double *val , const MKL_INT *indx , const
MKL_INT *pntrb , const MKL_INT *pntrE , const double *x , double *y );

void mkl_cbsrsv (const char *transa , const MKL_INT *m , const MKL_INT *lb , const
MKL_Complex8 *alpha , const char *matdescra , const MKL_Complex8 *val , const MKL_INT

MKL_Complex16 *y );
```

## Include Files

- `mkl.h`

## Description

This routine is deprecated. Use `mkl_sparse_?_trsv` from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?bsrsv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix in the BSR format:

```
y := alpha*inv(A)*x
```

or

```
y := alpha*inv(AT)* x,
```

where:

*alpha* is scalar, *x* and *y* are vectors, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A*<sup>T</sup> is the transpose of *A*.

---

### NOTE

This routine supports a BSR format both with one-based indexing and zero-based indexing.

---

## Input Parameters

<i>transa</i>	Specifies the operation. If <i>transa</i> = 'N' or 'n', then $y := \alpha * \text{inv}(A) * x$ If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $y := \alpha * \text{inv}(A^T) * x$ ,
<i>m</i>	Number of block columns of the matrix <i>A</i> .
<i>lb</i>	Size of the block in the matrix <i>A</i> .
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>matdescra</i>	Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in <a href="#">Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)"</a> . Possible combinations of element values of this parameter are given in <a href="#">Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>"</a> .
<i>val</i>	Array containing elements of non-zero blocks of the matrix <i>A</i> . Its length is equal to the number of non-zero blocks in the matrix <i>A</i> multiplied by $lb * lb$ . Refer to the <i>values</i> array description in <a href="#">BSR Format</a> for more details.

**NOTE**

The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right).

No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.

<i>indx</i>	<p>For one-based indexing, array containing the column indices plus one for each non-zero element of the matrix <i>A</i>. ## Description

This routine is deprecated. Use [mkl\\_sparse\\_?\\_trsv](#) from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?cscsv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix in the CSC format:

```
y := alpha*inv(A)*x
```

or

```
y := alpha*inv(AT)* x,
```

where:

*alpha* is scalar, *x* and *y* are vectors, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A<sup>T</sup>* is the transpose of *A*.

---

### NOTE

This routine supports a CSC format both with one-based indexing and zero-based indexing.

---

## Input Parameters

<i>transa</i>	Specifies the operation. If <i>transa</i> = 'N' or 'n', then $y := \alpha * \text{inv}(A) * x$ If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $y := \alpha * \text{inv}(A^T) * x$ ,
<i>m</i>	Number of columns of the matrix <i>A</i> .
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>matdescra</i>	Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in <a href="#">Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)"</a> . Possible combinations of element values of this parameter are given in <a href="#">Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>"</a> .
<i>val</i>	Array containing non-zero elements of the matrix <i>A</i> . Its length is $\text{pntre}[m-1] - \text{pntrb}[0]$ .

Refer to *values* array description in [CSC Format](#) for more details.

---

**NOTE**

The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right).

No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.

---

*indx*

For one-based indexing, array containing the row indices plus one for each non-zero element of the matrix *A*.

For zero-based indexing, array containing the row indices for each non-zero element of the matrix *A*.

Its length is equal to length of the *val* array.

Refer to *columns* array description in [CSC Format](#) for more details.

---

**NOTE**

Row indices must be sorted in increasing order for each column.

---

*pntrb*

Array of length *m*.

This array contains column indices, such that  $pntreb[i] - pntreb[0]$  is the first index of column *i* in the arrays *val* and *indx*.

Refer to *pointerb* array description in [CSC Format](#) for more details.

*pntre*

Array of length *m*.

This array contains column indices, such that  $pntre[i] - pntreb[0] - 1$  is the last index of column *i* in the arrays *val* and *indx*.

Refer to *pointerE* array description in [CSC Format](#) for more details.

*x*

Array, size at least *m*.

On entry, the array *x* must contain the vector *x*. The elements are accessed with unit increment.

*y*

Array, size at least *m*.

On entry, the array *y* must contain the vector *y*. The elements are accessed with unit increment.

## Output Parameters

*y*

Contains the solution vector *x*.

### **mkl\_?coosv**

*Solves a system of linear equations for a sparse matrix in the coordinate format (deprecated).*

## Description

This routine is deprecated. Use [mkl\\_sparse?\\_trsv](#) from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?coosv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix in the coordinate format:

$$y := \alpha \cdot \text{inv}(A) \cdot x$$

or

$$y := \alpha \cdot \text{inv}(A^T) \cdot x,$$

where:

*alpha* is scalar, *x* and *y* are vectors, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal,  $A^T$  is the transpose of *A*.

---

### NOTE

This routine supports a coordinate format both with one-based indexing and zero-based indexing.

---

## Input Parameters

<i>transa</i>	Specifies the system of linear equations. If <i>transa</i> = 'N' or 'n', then $y := \alpha \cdot \text{inv}(A) \cdot x$ If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $y := \alpha \cdot \text{inv}(A^T) \cdot x$ ,
<i>m</i>	Number of rows of the matrix <i>A</i> .
<i>alpha</i>	Specifies the scalar <i>alpha</i> .

<i>matdescra</i>	Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in <a href="#">Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)"</a> . Possible combinations of element values of this parameter are given in <a href="#">Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>"</a> .
<i>val</i>	Array of length <i>nnz</i> , contains non-zero elements of the matrix <i>A</i> in the arbitrary order.  Refer to <i>values</i> array description in <a href="#">Coordinate Format</a> for more details.
<i>rowind</i>	Array of length <i>nnz</i> .  For one-based indexing, contains the row indices plus one for each non-zero element of the matrix <i>A</i> .  For zero-based indexing, contains the row indices for each non-zero element of the matrix <i>A</i> .  Refer to <i>rows</i> array description in <a href="#">Coordinate Format</a> for more details.
<i>colind</i>	Array of length <i>nnz</i> .  For one-based indexing, contains the column indices plus one for each non-zero element of the matrix <i>A</i> .  For zero-based indexing, contains the column indices for each non-zero element of the matrix <i>A</i> .  Refer to <i>columns</i> array description in <a href="#">Coordinate Format</a> for more details.
<i>nnz</i>	Specifies the number of non-zero element of the matrix <i>A</i> .  Refer to <i>nnz</i> description in <a href="#">Coordinate Format</a> for more details.
<i>x</i>	Array, size at least <i>m</i> .  On entry, the array <i>x</i> must contain the vector <i>x</i> . The elements are accessed with unit increment.
<i>y</i>	Array, size at least <i>m</i> .  On entry, the array <i>y</i> must contain the vector <i>y</i> . The elements are accessed with unit increment.

## Output Parameters

<i>y</i>	Contains solution vector <i>x</i> .
----------	-------------------------------------

### **mkl\_?csrmm**

*Computes matrix - matrix product of a sparse matrix stored in the CSR format (deprecated).*

#### Syntax

```

## Include Files

- mkl.h

## Description

This routine is deprecated. Use [Use mkl\\_sparse\\_?\\_mm](#) from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?csrmm` routine performs a matrix-matrix operation defined as

$$C := \alpha * A * B + \beta * C$$

or

$$C := \alpha * A^T * B + \beta * C$$

or

$$C := \alpha * A^H * B + \beta * C,$$

where:

*alpha* and *beta* are scalars,

*B* and *C* are dense matrices, *A* is an *m*-by-*k* sparse matrix in compressed sparse row (CSR) format,  $A^T$  is the transpose of *A*, and  $A^H$  is the conjugate transpose of *A*.

---

### NOTE

This routine supports a CSR format both with one-based indexing and zero-based indexing.

---

## Input Parameters

<i>transa</i>	Specifies the operation. If <i>transa</i> = 'N' or 'n', then $C := \alpha * A * B + \beta * C$ , If <i>transa</i> = 'T' or 't', then $C := \alpha * A^T * B + \beta * C$ , If <i>transa</i> = 'C' or 'c', then $C := \alpha * A^H * B + \beta * C$ .
<i>m</i>	Number of rows of the matrix <i>A</i> .

<i>n</i>	Number of columns of the matrix <i>C</i> .
<i>k</i>	Number of columns of the matrix <i>A</i> .
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>matdescra</i>	Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in <a href="#">Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)"</a> . Possible combinations of element values of this parameter are given in <a href="#">Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>"</a> .
<i>val</i>	Array containing non-zero elements of the matrix <i>A</i> . For zero-based indexing its length is $pntrb[m-1] - pntrb[0]$ . Refer to <i>values</i> array description in <a href="#">CSR Format</a> for more details.
<i>indx</i>	For one-based indexing, array containing the column indices plus one for each non-zero element of the matrix <i>A</i> . For zero-based indexing, array containing the column indices for each non-zero element of the matrix <i>A</i> . Its length is equal to length of the <i>val</i> array. Refer to <i>columns</i> array description in <a href="#">CSR Format</a> for more details.
<i>pntrb</i>	Array of length <i>m</i> . This array contains row indices, such that $pntrb[I] - pntrb[0]$ is the first index of row <i>I</i> in the arrays <i>val</i> and <i>indx</i> . Refer to <i>pointerb</i> array description in <a href="#">CSR Format</a> for more details.
<i>pntrE</i>	Array of length <i>m</i> . This array contains row indices, such that $pntrE[I] - pntrb[0] - 1$ is the last index of row <i>I</i> in the arrays <i>val</i> and <i>indx</i> . Refer to <i>pointerE</i> array description in <a href="#">CSR Format</a> for more details.
<i>b</i>	Array, size <i>ldb</i> by at least <i>n</i> for non-transposed matrix <i>A</i> and at least <i>m</i> for transposed for one-based indexing, and (at least <i>k</i> for non-transposed matrix <i>A</i> and at least <i>m</i> for transposed, <i>ldb</i> ) for zero-based indexing. On entry with <i>transa</i> ='N' or 'n', the leading <i>k</i> -by- <i>n</i> part of the array <i>b</i> must contain the matrix <i>B</i> , otherwise the leading <i>m</i> -by- <i>n</i> part of the array <i>b</i> must contain the matrix <i>B</i> .
<i>ldb</i>	Specifies the leading dimension of <i>b</i> for one-based indexing, and the second dimension of <i>b</i> for zero-based indexing, as declared in the calling (sub)program.
<i>beta</i>	Specifies the scalar <i>beta</i> .
<i>c</i>	Array, size <i>ldc</i> by <i>n</i> for one-based indexing, and ( <i>m</i> , <i>ldc</i> ) for zero-based indexing. On entry, the leading <i>m</i> -by- <i>n</i> part of the array <i>c</i> must contain the matrix <i>C</i> , otherwise the leading <i>k</i> -by- <i>n</i> part of the array <i>c</i> must contain the matrix <i>C</i> .

*ldc* Specifies the leading dimension of *c* for one-based indexing, and the second dimension of *c* for zero-based indexing, as declared in the calling (sub)program.

## Output Parameters

*c* Overwritten by the matrix  $(\alpha * A * B + \beta * C)$ ,  $(\alpha * A^T * B + \beta * C)$ , or  $(\alpha * A^H * B + \beta * C)$ .

## mkl\_?bsrmm

*Computes matrix - matrix product of a sparse matrix stored in the BSR format (deprecated).*

### Syntax

```
void mkl_sbsrmm (const char *transa , const MKL_INT *m , const MKL_INT *n , const

### Description

This routine is deprecated. Use [Use mkl\\_sparse?\\_mm](#) from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?bsrmm` routine performs a matrix-matrix operation defined as

$$C := \alpha * A * B + \beta * C$$

or

$$C := \alpha * A^T * B + \beta * C$$

or

$$C := \alpha * A^H * B + \beta * C,$$

where:

$\alpha$  and  $\beta$  are scalars,

$B$  and  $C$  are dense matrices,  $A$  is an  $m$ -by- $k$  sparse matrix in block sparse row (BSR) format,  $A^T$  is the transpose of  $A$ , and  $A^H$  is the conjugate transpose of  $A$ .

---

**NOTE**

This routine supports a BSR format both with one-based indexing and zero-based indexing.

---

## Input Parameters

<i>transa</i>	Specifies the operation. If <i>transa</i> = 'N' or 'n', then the matrix-matrix product is computed as $C := \alpha * A * B + \beta * C$ If <i>transa</i> = 'T' or 't', then the matrix-vector product is computed as $C := \alpha * A^T * B + \beta * C$ If <i>transa</i> = 'C' or 'c', then the matrix-vector product is computed as $C := \alpha * A^H * B + \beta * C$ ,
<i>m</i>	Number of block rows of the matrix $A$ .
<i>n</i>	Number of columns of the matrix $C$ .
<i>k</i>	Number of block columns of the matrix $A$ .
<i>lb</i>	Size of the block in the matrix $A$ .
<i>alpha</i>	Specifies the scalar $\alpha$ .
<i>matdescra</i>	Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in <a href="#">Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)"</a> . Possible combinations of element values of this parameter are given in <a href="#">Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>"</a> .
<i>val</i>	Array containing elements of non-zero blocks of the matrix $A$ . Its length is equal to the number of non-zero blocks in the matrix $A$ multiplied by $lb * lb$ . Refer to the <i>values</i> array description in <a href="#">BSR Format</a> for more details.
<i>indx</i>	For one-based indexing, array containing the column indices plus one for each non-zero block in the matrix $A$ . For zero-based indexing, array containing the column indices for each non-zero block in the matrix $A$ . Its length is equal to the number of non-zero blocks in the matrix $A$ . Refer to the <i>columns</i> array description in <a href="#">BSR Format</a> for more details.
<i>pntrb</i>	Array of length $m$ . This array contains row indices, such that $pntrb[I] - pntrb[0]$ is the first index of block row $I$ in the array <i>indx</i> . Refer to <i>pointerB</i> array description in <a href="#">BSR Format</a> for more details.
<i>pntrc</i>	Array of length $m$ .

This array contains row indices, such that  $pntre[I] - pntrb[0] - 1$  is the last index of block row  $I$  in the array  $indx$ .

Refer to *pointerE* array description in [BSR Format](#) for more details.

<i>b</i>	Array, size $ldb$ by at least $n$ for non-transposed matrix $A$ and at least $m$ for transposed for one-based indexing, and (at least $k$ for non-transposed matrix $A$ and at least $m$ for transposed, $ldb$ ) for zero-based indexing.  On entry with $transa='N'$ or $'n'$ , the leading $n$ -by- $k$ block part of the array $b$ must contain the matrix $B$ , otherwise the leading $m$ -by- $n$ block part of the array $b$ must contain the matrix $B$ .
<i>ldb</i>	Specifies the leading dimension (in blocks) of $b$ as declared in the calling (sub)program.
<i>beta</i>	Specifies the scalar $beta$ .
<i>c</i>	Array, size $ldc * n$ for one-based indexing, size $k * ldc$ for zero-based indexing.  On entry, the leading $m$ -by- $n$ block part of the array $c$ must contain the matrix $C$ , otherwise the leading $n$ -by- $k$ block part of the array $c$ must contain the matrix $C$ .
<i>ldc</i>	Specifies the leading dimension (in blocks) of $c$ as declared in the calling (sub)program.

## Output Parameters

<i>c</i>	Overwritten by the matrix $(alpha * A * B + beta * C)$ or $(alpha * A^T * B + beta * C)$ or $(alpha * A^H * B + beta * C)$ .
----------	--

## `mkl_?cscmm`

Computes matrix-matrix product of a sparse matrix stored in the CSC format (deprecated).

### Syntax

```
void mkl_scscmm (const char *transa , const MKL_INT *m , const MKL_INT *n , const
MKL_INT *k , const float *alpha , const char *matdescra , const float *val , const

<i>ldb</i>	Specifies the leading dimension of <i>b</i> for one-based indexing, and the second dimension of <i>b</i> for zero-based indexing, as declared in the calling (sub)program.
<i>beta</i>	Specifies the scalar <i>beta</i> .
<i>c</i>	Array, size <i>ldc</i> by <i>n</i> for one-based indexing, and ( <i>m</i> , <i>ldc</i> ) for zero-based indexing.  On entry, the leading <i>m</i> -by- <i>n</i> part of the array <i>c</i> must contain the matrix <i>C</i> , otherwise the leading <i>k</i> -by- <i>n</i> part of the array <i>c</i> must contain the matrix <i>C</i> .
<i>ldc</i>	Specifies the leading dimension of <i>c</i> for one-based indexing, and the second dimension of <i>c</i> for zero-based indexing, as declared in the calling (sub)program.

## Output Parameters

<i>c</i>	Overwritten by the matrix $(\alpha * A * B + \beta * C)$ , $(\alpha * A^T * B + \beta * C)$ , or $(\alpha * A^H * B + \beta * C)$ .
----------	---

## mkl\_?csrsm

*Solves a system of linear matrix equations for a sparse matrix in the CSR format (deprecated).*

### Syntax

```
void mkl_scsrsm (const char *transa , const MKL_INT *m , const MKL_INT *n , const float
*alpha , const char *matdescra , const float *val , const MKL_INT *indx , const MKL_INT
*pntrb , const MKL_INT *pntre , const float *b , const MKL_INT *ldb , float *c , const
MKL_INT *ldc );
```

```
void mkl_dcsrsm (const char *transa , const MKL_INT *m , const MKL_INT *n , const
double *alpha , const char *matdescra , const double *val , const MKL_INT *indx , const
MKL_INT *pntrb , const MKL_INT *pntre , const double *b , const MKL_INT *ldb , double
*c , const MKL_INT *ldc );
```

```

## Description

This routine is deprecated. Use [mkl\\_sparse\\_?\\_trsm](#) from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?csrsm` routine solves a system of linear equations with matrix-matrix operations for a sparse matrix in the CSR format:

$$C := \alpha * \text{inv}(A) * B$$

or

$$C := \alpha * \text{inv}(A^T) * B,$$

where:

$\alpha$  is scalar,  $B$  and  $C$  are dense matrices,  $A$  is a sparse upper or lower triangular matrix with unit or non-unit main diagonal,  $A^T$  is the transpose of  $A$ .

---

#### NOTE

This routine supports a CSR format both with one-based indexing and zero-based indexing.

---

### Input Parameters

<code>transa</code>	Specifies the system of linear equations. If <code>transa = 'N' or 'n'</code> , then $C := \alpha * \text{inv}(A) * B$ If <code>transa = 'T' or 't' or 'C' or 'c'</code> , then $C := \alpha * \text{inv}(A^T) * B$ ,
<code>m</code>	Number of columns of the matrix $A$ .
<code>n</code>	Number of columns of the matrix $C$ .
<code>alpha</code>	Specifies the scalar $\alpha$ .
<code>matdescra</code>	Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in <a href="#">Table "Possible Values of the Parameter <code>matdescra (descra)</code>"</a> . Possible combinations of element values of this parameter are given in <a href="#">Table "Possible Combinations of Element Values of the Parameter <code>matdescra</code>"</a> .
<code>val</code>	Array containing non-zero elements of the matrix $A$ . For zero-based indexing its length is <code>pntrb[m-1] - pntrb[0]</code> . Refer to <code>values</code> array description in <a href="#">CSR Format</a> for more details.

---

#### NOTE

The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right).

No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.

---

<code>indx</code>	For one-based indexing, array containing the column indices plus one for each non-zero element of the matrix $A$ . For zero-based indexing, array containing the column indices for each non-zero element of the matrix $A$ . Its length is equal to length of the <code>val</code> array. Refer to <code>columns</code> array description in <a href="#">CSR Format</a> for more details.
-------------------	---

**NOTE**

Column indices must be sorted in increasing order for each row.

<i>pntrb</i>	<p>Array of length <math>m</math>.</p> <p>This array contains row indices, such that <math>pntrb[i] - pntrb[0]</math> is the first index of row <math>i</math> in the arrays <i>val</i> and <i>indx</i>.</p> <p>Refer to <i>pointerb</i> array description in <a href="#">CSR Format</a> for more details.</p>
<i>pntrE</i>	<p>Array of length <math>m</math>.</p> <p>For zero-based indexing this array contains row indices, such that <math>pntrE[i] - pntrb[0] - 1</math> is the last index of row <math>i</math> in the arrays <i>val</i> and <i>indx</i>.</p> <p>Refer to <i>pointerE</i> array description in <a href="#">CSR Format</a> for more details.</p>
<i>b</i>	<p>Array, size <math>ldb * n</math> for one-based indexing, and <math>(m, ldb)</math> for zero-based indexing.</p> <p>On entry the leading <math>m</math>-by-<math>n</math> part of the array <i>b</i> must contain the matrix <i>B</i>.</p>
<i>ldb</i>	<p>Specifies the leading dimension of <i>b</i> for one-based indexing, and the second dimension of <i>b</i> for zero-based indexing, as declared in the calling (sub)program.</p>
<i>ldc</i>	<p>Specifies the leading dimension of <i>c</i> for one-based indexing, and the second dimension of <i>c</i> for zero-based indexing, as declared in the calling (sub)program.</p>

**Output Parameters**

<i>c</i>	<p>Array, size <math>ldc</math> by <math>n</math> for one-based indexing, and <math>(m, ldc)</math> for zero-based indexing.</p> <p>The leading <math>m</math>-by-<math>n</math> part of the array <i>c</i> contains the output matrix <i>C</i>.</p>

## Description

This routine is deprecated. Use [mkl\\_sparse\\_?\\_trsm](#) from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?cscsm` routine solves a system of linear equations with matrix-matrix operations for a sparse matrix in the CSC format:

```
C := alpha*inv(A)*B
```

or

```
C := alpha*inv(AT)*B,
```

where:

*alpha* is scalar, *B* and *C* are dense matrices, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A*<sup>T</sup> is the transpose of *A*.

---

### NOTE

This routine supports a CSC format both with one-based indexing and zero-based indexing.

---

## Input Parameters

<i>transa</i>	Specifies the system of equations. If <i>transa</i> = 'N' or 'n', then $C := \alpha \cdot \text{inv}(A) \cdot B$ If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $C := \alpha \cdot \text{inv}(A^T) \cdot B$ ,
<i>m</i>	Number of columns of the matrix <i>A</i> .
<i>n</i>	Number of columns of the matrix <i>C</i> .
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>matdescra</i>	Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in <a href="#">Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)"</a> . Possible combinations of element values of this parameter are given in <a href="#">Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>"</a> .
<i>val</i>	Array containing non-zero elements of the matrix <i>A</i> . For zero-based indexing its length is $\text{pntre}[m] - \text{pntrb}[0]$ .

Refer to *values* array description in [CSC Format](#) for more details.

---

**NOTE**

The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right).

No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.

---

*indx*

For one-based indexing, array containing the row indices plus one for each non-zero element of the matrix *A*. For zero-based indexing, array containing the row indices for each non-zero element of the matrix *A*.

Refer to *rows* array description in [CSC Format](#) for more details.

---

**NOTE**

Row indices must be sorted in increasing order for each column.

---

*pntrb*

Array of length *m*.

This array contains column indices, such that  $pntrb[I] - pntrb[0]$  is the first index of column *I* in the arrays *val* and *indx*.

Refer to *pointerb* array description in [CSC Format](#) for more details.

*pntrE*

Array of length *m*.

This array contains column indices, such that  $pntrE[I] - pntrb[1]-1$  is the last index of column *I* in the arrays *val* and *indx*.

Refer to *pointerE* array description in [CSC Format](#) for more details.

*b*

Array, size *ldb* by *n* for one-based indexing, and (*m*, *ldb*) for zero-based indexing.

On entry the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.

*ldb*

Specifies the leading dimension of *b* for one-based indexing, and the second dimension of *b* for zero-based indexing, as declared in the calling (sub)program.

*ldc*

Specifies the leading dimension of *c* for one-based indexing, and the second dimension of *c* for zero-based indexing, as declared in the calling (sub)program.

## Output Parameters

*c*

Array, size *ldc* by *n* for one-based indexing, and (*m*, *ldc*) for zero-based indexing.

The leading *m*-by-*n* part of the array *c* contains the output matrix *C*.

## mkl\_?coosm

Solves a system of linear matrix equations for a sparse matrix in the coordinate format (deprecated).

### Syntax

```
void mkl_scoosm (const char *transa , const MKL_INT *m , const MKL_INT *n , const float
*alpha , const char *matdescra , const float *val , const MKL_INT *rowind , const
MKL_INT *colind , const MKL_INT *nnz , const float *b , const MKL_INT *ldb , float *c ,
const MKL_INT *ldc );
```

```
void mkl_dcoosm (const char *transa , const MKL_INT *m , const MKL_INT *n , const
double *alpha , const char *matdescra , const double *val , const MKL_INT *rowind ,
const MKL_INT *colind , const MKL_INT *nnz , const double *b , const MKL_INT *ldb ,
double *c , const MKL_INT *ldc );
```

```
void mkl_ccoosm (const char *transa , const MKL_INT *m , const MKL_INT *n , const
MKL_Complex8 *alpha , const char *matdescra , const MKL_Complex8 *val , const MKL_INT
*rowind , const MKL_INT *colind , const MKL_INT *nnz , const MKL_Complex8 *b , const
MKL_INT *ldb , MKL_Complex8 *c , const MKL_INT *ldc );
```

```
void mkl_zcoosm (const char *transa , const MKL_INT *m , const MKL_INT *n , const
MKL_Complex16 *alpha , const char *matdescra , const MKL_Complex16 *val , const MKL_INT
*rowind , const MKL_INT *colind , const MKL_INT *nnz , const MKL_Complex16 *b , const
MKL_INT *ldb , MKL_Complex16 *c , const MKL_INT *ldc );
```

### Include Files

- mkl.h

### Description

This routine is deprecated. Use [mkl\\_sparse\\_?\\_trsm](#) from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?coosm` routine solves a system of linear equations with matrix-matrix operations for a sparse matrix in the coordinate format:

$$C := \alpha * \text{inv}(A) * B$$

or

$$C := \alpha * \text{inv}(A^T) * B,$$

where:

*alpha* is scalar, *B* and *C* are dense matrices, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal,  $A^T$  is the transpose of *A*.

#### NOTE

This routine supports a coordinate format both with one-based indexing and zero-based indexing.

### Input Parameters

*transa*

Specifies the system of linear equations.

If *transa* = 'N' or 'n', then the matrix-matrix product is computed as

$$C := \alpha * \text{inv}(A) * B$$

If  $transa = 'T'$  or  $'t'$  or  $'C'$  or  $'c'$ , then the matrix-vector product is computed as  $C := \alpha * \text{inv}(A^T) * B$ ,

<i>m</i>	Number of rows of the matrix <i>A</i> .
<i>n</i>	Number of columns of the matrix <i>C</i> .
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>matdescra</i>	Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in <a href="#">Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)"</a> . Possible combinations of element values of this parameter are given in <a href="#">Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>"</a> .
<i>val</i>	Array of length <i>nnz</i> , contains non-zero elements of the matrix <i>A</i> in the arbitrary order.  Refer to <i>values</i> array description in <a href="#">Coordinate Format</a> for more details.
<i>rowind</i>	Array of length <i>nnz</i> .  For one-based indexing, contains the row indices plus one for each non-zero element of the matrix <i>A</i> .  For zero-based indexing, contains the row indices for each non-zero element of the matrix <i>A</i> .  Refer to <i>rows</i> array description in <a href="#">Coordinate Format</a> for more details.
<i>colind</i>	Array of length <i>nnz</i> .  For one-based indexing, contains the column indices plus one for each non-zero element of the matrix <i>A</i>  For zero-based indexing, contains the row indices for each non-zero element of the matrix <i>A</i>  Refer to <i>columns</i> array description in <a href="#">Coordinate Format</a> for more details.
<i>nnz</i>	Specifies the number of non-zero element of the matrix <i>A</i> .  Refer to <i>nnz</i> description in <a href="#">Coordinate Format</a> for more details.
<i>b</i>	Array, size <i>ldb</i> by <i>n</i> for one-based indexing, and ( <i>m</i> , <i>ldb</i> ) for zero-based indexing.  Before entry the leading <i>m</i> -by- <i>n</i> part of the array <i>b</i> must contain the matrix <i>B</i> .
<i>ldb</i>	Specifies the leading dimension of <i>b</i> for one-based indexing, and the second dimension of <i>b</i> for zero-based indexing, as declared in the calling (sub)program.
<i>ldc</i>	Specifies the leading dimension of <i>c</i> for one-based indexing, and the second dimension of <i>c</i> for zero-based indexing, as declared in the calling (sub)program.

## Output Parameters

<i>c</i>	Array, size <i>ldc</i> by <i>n</i> for one-based indexing, and ( <i>m</i> , <i>ldc</i> ) for zero-based indexing.
----------	---

The leading  $m$ -by- $n$  part of the array  $c$  contains the output matrix  $C$ .

## **mkl\_?bsrsm**

*Solves a system of linear matrix equations for a sparse matrix in the BSR format (deprecated).*

### **Syntax**

```
void mkl_sbsrsm (const char *transa , const MKL_INT *m , const MKL_INT *n , const
MKL_INT *lb , const float *alpha , const char *matdescra , const float *val , const
MKL_INT *indx , const MKL_INT *pntrb , const MKL_INT *pntre , const float *b , const
MKL_INT *ldb , float *c , const MKL_INT *ldc );
```

```
void mkl_dbsrsm (const char *transa , const MKL_INT *m , const MKL_INT *n , const
MKL_INT *lb , const double *alpha , const char *matdescra , const double *val , const
MKL_INT *indx , const MKL_INT *pntrb , const MKL_INT *pntre , const double *b , const
MKL_INT *ldb , double *c , const MKL_INT *ldc );
```

```
void mkl_cbsrsm (const char *transa , const MKL_INT *m , const MKL_INT *n , const

*val , const MKL_INT *indx , const MKL_INT *pntrb , const MKL_INT *pntre , const
MKL_Complex8 *b , const MKL_INT *ldb , MKL_Complex8 *c , const MKL_INT *ldc );
```

```
void mkl_zbsrsm (const char *transa , const MKL_INT *m , const MKL_INT *n , const
MKL_INT *lb , const MKL_Complex16 *alpha , const char *matdescra , const MKL_Complex16
*val , const MKL_INT *indx , const MKL_INT *pntrb , const MKL_INT *pntre , const
MKL_Complex16 *b , const MKL_INT *ldb , MKL_Complex16 *c , const MKL_INT *ldc );
```

### **Include Files**

- mkl.h

### **Description**

This routine is deprecated. Use [mkl\\_sparse\\_?\\_trsm](#) from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?bsrsm` routine solves a system of linear equations with matrix-matrix operations for a sparse matrix in the BSR format:

$$C := \alpha * \text{inv}(A) * B$$

or

$$C := \alpha * \text{inv}(A^T) * B,$$

where:

$\alpha$  is scalar,  $B$  and  $C$  are dense matrices,  $A$  is a sparse upper or lower triangular matrix with unit or non-unit main diagonal,  $A^T$  is the transpose of  $A$ .

---

#### **NOTE**

This routine supports a BSR format both with one-based indexing and zero-based indexing.

---

### **Input Parameters**

---

<i>transa</i>	Specifies the operation. If <i>transa</i> = 'N' or 'n', then the matrix-matrix product is computed as $C := \alpha * \text{inv}(A) * B$ . If <i>transa</i> = 'T' or 't' or 'C' or 'c', then the matrix-vector product is computed as $C := \alpha * \text{inv}(A^T) * B$ .
<i>m</i>	Number of block columns of the matrix <i>A</i> .
<i>n</i>	Number of columns of the matrix <i>C</i> .
<i>lb</i>	Size of the block in the matrix <i>A</i> .
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>matdescra</i>	Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in <a href="#">Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)"</a> . Possible combinations of element values of this parameter are given in <a href="#">Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>"</a> .
<i>val</i>	Array containing elements of non-zero blocks of the matrix <i>A</i> . Its length is equal to the number of non-zero blocks in the matrix <i>A</i> multiplied by $lb * lb$ . Refer to the <i>values</i> array description in <a href="#">BSR Format</a> for more details.

**NOTE**

The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right).

No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.

---

<i>indx</i>	For one-based indexing, array containing the column indices plus one for each non-zero element of the matrix <i>A</i> . For zero-based indexing, array containing the column indices for each non-zero element of the matrix <i>A</i> . Its length is equal to the number of non-zero blocks in the matrix <i>A</i> . Refer to the <i>columns</i> array description in <a href="#">BSR Format</a> for more details.
<i>pntrb</i>	Array of length <i>m</i> . This array contains row indices, such that $pntrb[i] - pntrb[0]$ is the first index of block row <i>i</i> in the array <i>indx</i> . Refer to <i>pointerB</i> array description in <a href="#">BSR Format</a> for more details.
<i>pntre</i>	Array of length <i>m</i> . This array contains row indices, such that $pntre[i] - pntre[0] - 1$ is the last index of block row <i>i</i> in the arrays <i>val</i> and <i>indx</i> . Refer to <i>pointerE</i> array description in <a href="#">BSR Format</a> for more details.
<i>b</i>	Array, size $ldb * n$ for one-based indexing, size $m * ldb$ for zero-based indexing. On entry the leading <i>m</i> -by- <i>n</i> part of the array <i>b</i> must contain the matrix <i>B</i> .

<code>ldb</code>	Specifies the leading dimension (in blocks) of $b$ as declared in the calling (sub)program.
<code>ldc</code>	Specifies the leading dimension (in blocks) of $c$ as declared in the calling (sub)program.

## Output Parameters

<code>c</code>	Array, size $ldc * n$ for one-based indexing, size $m * ldc$ for zero-based indexing. The leading $m$ -by- $n$ part of the array $c$ contains the output matrix $C$ .
----------------	--

### `mkl_?diamv`

Computes matrix - vector product for a sparse matrix in the diagonal format with one-based indexing (deprecated).

### Syntax

```
void mkl_sdiamv (const char *transa , const MKL_INT *m , const MKL_INT *k , const float *alpha , const char *matdescra , const float *val , const MKL_INT *lval , const MKL_INT *idiag , const MKL_INT *ndiag , const float *x , const float *beta , float *y );
```

```
void mkl_ddiamv (const char *transa , const MKL_INT *m , const MKL_INT *k , const double *alpha , const char *matdescra , const double *val , const MKL_INT *lval , const MKL_INT *idiag , const MKL_INT *ndiag , const double *x , const double *beta , double *y );
```

```
void mkl_cdiamv (const char *transa , const MKL_INT *m , const MKL_INT *k , const MKL_Complex8 *alpha , const char *matdescra , const MKL_Complex8 *val , const MKL_INT *lval , const MKL_INT *idiag , const MKL_INT *ndiag , const MKL_Complex8 *x , const MKL_Complex8 *beta , MKL_Complex8 *y );
```

```
void mkl_zdiamv (const char *transa , const MKL_INT *m , const MKL_INT *k , const MKL_Complex16 *alpha , const char *matdescra , const MKL_Complex16 *val , const MKL_INT *lval , const MKL_INT *idiag , const MKL_INT *ndiag , const MKL_Complex16 *x , const MKL_Complex16 *beta , MKL_Complex16 *y );
```

### Include Files

- `mkl.h`

### Description

This routine is deprecated. Use `mkl_sparse_?_mv` from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?diamv` routine performs a matrix-vector operation defined as

$$y := \alpha * A * x + \beta * y$$

or

$$y := \alpha * A^T * x + \beta * y,$$

where:

$\alpha$  and  $\beta$  are scalars,

$x$  and  $y$  are vectors,

$A$  is an  $m$ -by- $k$  sparse matrix stored in the diagonal format,  $A^T$  is the transpose of  $A$ .

---

**NOTE**

This routine supports only one-based indexing of the input arrays.

---

## Input Parameters

<i>transa</i>	Specifies the operation. If <i>transa</i> = 'N' or 'n', then $y := \alpha * A * x + \beta * y$ , If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $y := \alpha * A^T * x + \beta * y$ .
<i>m</i>	Number of rows of the matrix $A$ .
<i>k</i>	Number of columns of the matrix $A$ .
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>matdescra</i>	Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in <a href="#">Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)"</a> . Possible combinations of element values of this parameter are given in <a href="#">Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>"</a> .
<i>val</i>	Two-dimensional array of size <i>lval</i> by <i>ndiag</i> , contains non-zero diagonals of the matrix $A$ . Refer to <i>values</i> array description in <a href="#">Diagonal Storage Scheme</a> for more details.
<i>lval</i>	Leading dimension of <i>val</i> , $lval \geq m$ . Refer to <i>lval</i> description in <a href="#">Diagonal Storage Scheme</a> for more details.
<i>idiag</i>	Array of length <i>ndiag</i> , contains the distances between main diagonal and each non-zero diagonals in the matrix $A$ . Refer to <i>distance</i> array description in <a href="#">Diagonal Storage Scheme</a> for more details.
<i>ndiag</i>	Specifies the number of non-zero diagonals of the matrix $A$ .
<i>x</i>	Array, size at least $k$ if <i>transa</i> = 'N' or 'n', and at least $m$ otherwise. On entry, the array <i>x</i> must contain the vector $x$ .
<i>beta</i>	Specifies the scalar <i>beta</i> .
<i>y</i>	Array, size at least $m$ if <i>transa</i> = 'N' or 'n', and at least $k$ otherwise. On entry, the array <i>y</i> must contain the vector $y$ .

## Output Parameters

<i>y</i>	Overwritten by the updated vector $y$ .
----------	---

## mkl\_?skymv

Computes matrix - vector product for a sparse matrix in the skyline storage format with one-based indexing (deprecated).

### Syntax

```
void mkl_sskymv (const char *transa , const MKL_INT *m , const MKL_INT *k , const float *alpha , const char *matdescra , const float *val , const MKL_INT *pntr , const float *x , const float *beta , float *y );
```

```

### Description

This routine is deprecated. Use [mkl\\_sparse\\_?\\_mv](#) from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?skymv` routine performs a matrix-vector operation defined as

```
 $y := \alpha * A * x + \beta * y$ 
```

or

```
 $y := \alpha * A^T * x + \beta * y,$ 
```

where:

*alpha* and *beta* are scalars,

*x* and *y* are vectors,

*A* is an *m*-by-*k* sparse matrix stored using the skyline storage scheme,  $A^T$  is the transpose of *A*.

---

#### NOTE

This routine supports only one-based indexing of the input arrays.

---

### Input Parameters

<i>transa</i>	Specifies the operation. If <i>transa</i> = 'N' or 'n', then $y := \alpha * A * x + \beta * y$ If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $y := \alpha * A^T * x + \beta * y,$
<i>m</i>	Number of rows of the matrix <i>A</i> .

<i>k</i>	Number of columns of the matrix <i>A</i> .
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>matdescra</i>	Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in <a href="#">Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)"</a> . Possible combinations of element values of this parameter are given in <a href="#">Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>"</a> .

**NOTE**

General matrices (*matdescra*[0]='G') is not supported.

<i>val</i>	<p>Array containing the set of elements of the matrix <i>A</i> in the skyline profile form.</p> <p>If <i>matdescrsa</i>[1]= 'L', then <i>val</i> contains elements from the low triangle of the matrix <i>A</i>.</p> <p>If <i>matdescrsa</i>[1]= 'U', then <i>val</i> contains elements from the upper triangle of the matrix <i>A</i>.</p> <p>Refer to <i>values</i> array description in <a href="#">Skyline Storage Scheme</a> for more details.</p>
<i>pntr</i>	<p>Array of length (<i>m</i> + 1) for lower triangle, and (<i>k</i> + 1) for upper triangle.</p> <p>It contains the indices specifying in the <i>val</i> the positions of the first element in each row (column) of the matrix <i>A</i>. Refer to <i>pointers</i> array description in <a href="#">Skyline Storage Scheme</a> for more details.</p>
<i>x</i>	Array, size at least <i>k</i> if <i>transa</i> = 'N' or 'n' and at least <i>m</i> otherwise. On entry, the array <i>x</i> must contain the vector <i>x</i> .
<i>beta</i>	Specifies the scalar <i>beta</i> .
<i>y</i>	Array, size at least <i>m</i> if <i>transa</i> = 'N' or 'n' and at least <i>k</i> otherwise. On entry, the array <i>y</i> must contain the vector <i>y</i> .

**Output Parameters**

<i>y</i>	Overwritten by the updated vector <i>y</i> .
----------	--

## Description

This routine is deprecated. Use [mkl\\_sparse\\_?\\_trsv](#) from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?diasv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix stored in the diagonal format:

```
y := alpha*inv(A)*x
```

or

```
y := alpha*inv(AT)* x,
```

where:

*alpha* is scalar, *x* and *y* are vectors, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A<sup>T</sup>* is the transpose of *A*.

---

### NOTE

This routine supports only one-based indexing of the input arrays.

---

## Input Parameters

<i>transa</i>	Specifies the system of linear equations. If <i>transa</i> = 'N' or 'n', then $y := \alpha \cdot \text{inv}(A) \cdot x$ If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $y := \alpha \cdot \text{inv}(A^T) \cdot x$ ,
<i>m</i>	Number of rows of the matrix <i>A</i> .
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>matdescra</i>	Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in <a href="#">Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)"</a> . Possible combinations of element values of this parameter are given in <a href="#">Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>"</a> .
<i>val</i>	Two-dimensional array of size <i>lval</i> by <i>ndiag</i> , contains non-zero diagonals of the matrix <i>A</i> . Refer to <i>values</i> array description in <a href="#">Diagonal Storage Scheme</a> for more details.
<i>lval</i>	Leading dimension of <i>val</i> , $lval \geq m$ . Refer to <i>lval</i> description in <a href="#">Diagonal Storage Scheme</a> for more details.

*idiag* Array of length *ndiag*, contains the distances between main diagonal and each non-zero diagonals in the matrix *A*.

**NOTE**

All elements of this array must be sorted in increasing order.

Refer to *distance* array description in [Diagonal Storage Scheme](#) for more details.

*ndiag* Specifies the number of non-zero diagonals of the matrix *A*.

*x* Array, size at least *m*.

On entry, the array *x* must contain the vector *x*. The elements are accessed with unit increment.

*y* Array, size at least *m*.

On entry, the array *y* must contain the vector *y*. The elements are accessed with unit increment.

**Output Parameters**

*y* Contains solution vector *x*.

**mkl\_?skysv**

*Solves a system of linear equations for a sparse matrix in the skyline format with one-based indexing (deprecated).*

**Syntax**

```
void mkl_sskysv (const char *transa , const MKL_INT *m , const float *alpha , const char *matdescra , const float *val , const MKL_INT *pntr , const float *x , float *y );
```

```
void mkl_dskysv (const char *transa , const MKL_INT *m , const double *alpha , const char *matdescra , const double *val , const MKL_INT *pntr , const double *x , double *y );
```

```
void mkl_cskysv (const char *transa , const MKL_INT *m , const MKL_Complex8 *alpha , const char *matdescra , const MKL_Complex8 *val , const MKL_INT *pntr , const MKL_Complex8 *x , MKL_Complex8 *y );
```

```
void mkl_zskysv (const char *transa , const MKL_INT *m , const MKL_Complex16 *alpha , const char *matdescra , const MKL_Complex16 *val , const MKL_INT *pntr , const MKL_Complex16 *x , MKL_Complex16 *y );
```

**Description**

This routine is deprecated. Use [mkl\\_sparse\\_?\\_trsv](#) from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?skysv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix in the skyline storage format:

```
y := alpha*inv(A)*x
```

or

```
y := alpha*inv(AT)*x,
```

where:

*alpha* is scalar, *x* and *y* are vectors, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A<sup>T</sup>* is the transpose of *A*.

---

#### NOTE

This routine supports only one-based indexing of the input arrays.

---

### Input Parameters

<i>transa</i>	Specifies the system of linear equations. If <i>transa</i> = 'N' or 'n', then $y := \alpha * \text{inv}(A) * x$ If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $y := \alpha * \text{inv}(A^T) * x$ ,
<i>m</i>	Number of rows of the matrix <i>A</i> .
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>matdescra</i>	Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in <a href="#">Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)"</a> . Possible combinations of element values of this parameter are given in <a href="#">Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>"</a> .

---

#### NOTE

General matrices (*matdescra*[0]='G') is not supported.

---

<i>val</i>	Array containing the set of elements of the matrix <i>A</i> in the skyline profile form. If <i>matdescra</i> [2]= 'L', then <i>val</i> contains elements from the low triangle of the matrix <i>A</i> . If <i>matdescra</i> [2]= 'U', then <i>val</i> contains elements from the upper triangle of the matrix <i>A</i> . Refer to <i>values</i> array description in <a href="#">Skyline Storage Scheme</a> for more details.
<i>pntr</i>	Array of length ( <i>m</i> + 1) for lower triangle, and ( <i>k</i> + 1) for upper triangle. It contains the indices specifying in the <i>val</i> the positions of the first element in each row (column) of the matrix <i>A</i> . Refer to <i>pointers</i> array description in <a href="#">Skyline Storage Scheme</a> for more details.
<i>x</i>	Array, size at least <i>m</i> .

On entry, the array  $x$  must contain the vector  $x$ . The elements are accessed with unit increment.

$y$

Array, size at least  $m$ .

On entry, the array  $y$  must contain the vector  $y$ . The elements are accessed with unit increment.

## Output Parameters

$y$

Contains solution vector  $x$ .

### `mkl_?diamm`

Computes matrix-matrix product of a sparse matrix stored in the diagonal format with one-based indexing (deprecated).

### Description

This routine is deprecated. Use [Use `mkl\_sparse\_?\_m`](#) from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?diamm` routine performs a matrix-matrix operation defined as

```
 $C := \alpha * A * B + \beta * C$ 
```

or

```
 $C := \alpha * A^T * B + \beta * C,$ 
```

or

$$C := \alpha * A^H * B + \beta * C,$$

where:

$\alpha$  and  $\beta$  are scalars,

$B$  and  $C$  are dense matrices,  $A$  is an  $m$ -by- $k$  sparse matrix in the diagonal format,  $A^T$  is the transpose of  $A$ , and  $A^H$  is the conjugate transpose of  $A$ .

---

**NOTE**

This routine supports only one-based indexing of the input arrays.

---

## Input Parameters

<i>transa</i>	Specifies the operation. If <i>transa</i> = 'N' or 'n', then $C := \alpha * A * B + \beta * C$ , If <i>transa</i> = 'T' or 't', then $C := \alpha * A^T * B + \beta * C$ , If <i>transa</i> = 'C' or 'c', then $C := \alpha * A^H * B + \beta * C$ .
<i>m</i>	Number of rows of the matrix $A$ .
<i>n</i>	Number of columns of the matrix $C$ .
<i>k</i>	Number of columns of the matrix $A$ .
<i>alpha</i>	Specifies the scalar $\alpha$ .
<i>matdescra</i>	Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in <a href="#">Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)"</a> . Possible combinations of element values of this parameter are given in <a href="#">Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>"</a> .
<i>val</i>	Two-dimensional array of size <i>lval</i> by <i>ndiag</i> , contains non-zero diagonals of the matrix $A$ . Refer to <i>values</i> array description in <a href="#">Diagonal Storage Scheme</a> for more details.
<i>lval</i>	Leading dimension of <i>val</i> , $lval \geq m$ . Refer to <i>lval</i> description in <a href="#">Diagonal Storage Scheme</a> for more details.
<i>idiag</i>	Array of length <i>ndiag</i> , contains the distances between main diagonal and each non-zero diagonals in the matrix $A$ . Refer to <i>distance</i> array description in <a href="#">Diagonal Storage Scheme</a> for more details.
<i>ndiag</i>	Specifies the number of non-zero diagonals of the matrix $A$ .
<i>b</i>	Array, size $ldb * n$ . On entry with <i>transa</i> = 'N' or 'n', the leading $k$ -by- $n$ part of the array <i>b</i> must contain the matrix $B$ , otherwise the leading $m$ -by- $n$ part of the array <i>b</i> must contain the matrix $B$ .

<code>ldb</code>	Specifies the leading dimension of $b$ as declared in the calling (sub)program.
<code>beta</code>	Specifies the scalar $\beta$ .
<code>c</code>	Array, size $ldc$ by $n$ . On entry, the leading $m$ -by- $n$ part of the array $c$ must contain the matrix $C$ , otherwise the leading $k$ -by- $n$ part of the array $c$ must contain the matrix $C$ .
<code>ldc</code>	Specifies the leading dimension of $c$ as declared in the calling (sub)program.

## Output Parameters

<code>c</code>	Overwritten by the matrix $(\alpha * A * B + \beta * C)$ , $(\alpha * A^T * B + \beta * C)$ , or $(\alpha * A^H * B + \beta * C)$ .
----------------	---

## mkl\_?skymm

Computes matrix-matrix product of a sparse matrix stored using the skyline storage scheme with one-based indexing (deprecated).

### Syntax

```
void mkl_sskymm (const char *transa , const MKL_INT *m , const MKL_INT *n , const
MKL_INT *k , const float *alpha , const char *matdescra , const float *val , const

```

## Include Files

- `mkl.h`

## Description

This routine is deprecated. Use `mkl_sparse_?_trsm` from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?diasm` routine solves a system of linear equations with matrix-matrix operations for a sparse matrix in the diagonal format:

$$C := \alpha * \text{inv}(A) * B$$

or

$$C := \alpha * \text{inv}(A^T) * B,$$

where:

$\alpha$  is scalar,  $B$  and  $C$  are dense matrices,  $A$  is a sparse upper or lower triangular matrix with unit or non-unit main diagonal,  $A^T$  is the transpose of  $A$ .

---

### NOTE

This routine supports only one-based indexing of the input arrays.

---

## Input Parameters

<i>transa</i>	Specifies the system of linear equations. If <i>transa</i> = 'N' or 'n', then $C := \alpha * \text{inv}(A) * B$ , If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $C := \alpha * \text{inv}(A^T) * B$ .
<i>m</i>	Number of rows of the matrix $A$ .
<i>n</i>	Number of columns of the matrix $C$ .
<i>alpha</i>	Specifies the scalar $\alpha$ .
<i>matdescra</i>	Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in <a href="#">Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)"</a> . Possible combinations of element values of this parameter are given in <a href="#">Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>"</a> .
<i>val</i>	Two-dimensional array of size <i>lval</i> by <i>ndiag</i> , contains non-zero diagonals of the matrix $A$ . Refer to <i>values</i> array description in <a href="#">Diagonal Storage Scheme</a> for more details.
<i>lval</i>	Leading dimension of <i>val</i> , $lval \geq m$ . Refer to <i>lval</i> description in <a href="#">Diagonal Storage Scheme</a> for more details.
<i>idiag</i>	Array of length <i>ndiag</i> , contains the distances between main diagonal and each non-zero diagonals in the matrix $A$ .

**NOTE**

All elements of this array must be sorted in increasing order.

Refer to *distance* array description in [Diagonal Storage Scheme](#) for more details.

*ndiag*

Specifies the number of non-zero diagonals of the matrix *A*.

*b*

Array, size  $ldb * n$ .

On entry the leading  $m$ -by- $n$  part of the array *b* must contain the matrix *B*.

*ldb*

Specifies the leading dimension of *b* as declared in the calling (sub)program.

*ldc*

Specifies the leading dimension of *c* as declared in the calling (sub)program.

**Output Parameters**

*c*

Array, size  $ldc$  by  $n$ .

The leading  $m$ -by- $n$  part of the array *c* contains the matrix *C*.

**mkl\_?skysm**

*Solves a system of linear matrix equations for a sparse matrix stored using the skyline storage scheme with one-based indexing (deprecated).*

**Syntax**

```
void mkl_sskysm (const char *transa , const MKL_INT *m , const MKL_INT *n , const float
*alpha , const char *matdescra , const float *val , const MKL_INT *pntr , const float
*b , const MKL_INT *ldb , float *c , const MKL_INT *ldc );
```

```

**Include Files**

- mkl.h

**Description**

This routine is deprecated. Use `mkl_sparse_?_trsm` from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?skysm` routine solves a system of linear equations with matrix-matrix operations for a sparse matrix in the skyline storage format:

$$C := \alpha * \text{inv}(A) * B$$

or

$$C := \alpha * \text{inv}(A^T) * B,$$

where:

$\alpha$  is scalar,  $B$  and  $C$  are dense matrices,  $A$  is a sparse upper or lower triangular matrix with unit or non-unit main diagonal,  $A^T$  is the transpose of  $A$ .

---

#### NOTE

This routine supports only one-based indexing of the input arrays.

---

### Input Parameters

<i>transa</i>	Specifies the system of linear equations. If <i>transa</i> = 'N' or 'n', then $C := \alpha * \text{inv}(A) * B$ , If <i>transa</i> = 'T' or 't' or 'C' or 'c', then $C := \alpha * \text{inv}(A^T) * B$ ,
<i>m</i>	Number of rows of the matrix $A$ .
<i>n</i>	Number of columns of the matrix $C$ .
<i>alpha</i>	Specifies the scalar $\alpha$ .
<i>matdescra</i>	Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in <a href="#">Table "Possible Values of the Parameter <i>matdescra</i> (<i>descra</i>)"</a> . Possible combinations of element values of this parameter are given in <a href="#">Table "Possible Combinations of Element Values of the Parameter <i>matdescra</i>"</a> .

---

#### NOTE

General matrices (*matdescra*[0]='G') is not supported.

---

<i>val</i>	Array containing the set of elements of the matrix $A$ in the skyline profile form. If <i>matdescrsa</i> [2]= 'L', then <i>val</i> contains elements from the low triangle of the matrix $A$ . If <i>matdescrsa</i> [2]= 'U', then <i>val</i> contains elements from the upper triangle of the matrix $A$ . Refer to <i>values</i> array description in <a href="#">Skyline Storage Scheme</a> for more details.
<i>pntr</i>	Array of length $(m + 1)$ for lower triangle, and $(n + 1)$ for upper triangle.

It contains the indices specifying the positions of the first element of the matrix  $A$  in each row (for the lower triangle) or column (for upper triangle) in the  $val$  array such that  $val[pntr[i] - 1]$  is the first element in row or column  $i + 1$ . Refer to *pointers* array description in [Skyline Storage Scheme](#) for more details.

$b$	Array, size $ldb * n$ . On entry the leading $m$ -by- $n$ part of the array $b$ must contain the matrix $B$ .
$ldb$	Specifies the leading dimension of $b$ as declared in the calling (sub)program.
$ldc$	Specifies the leading dimension of $c$ as declared in the calling (sub)program.

## Output Parameters

$c$	Array, size $ldc$ by $n$ . The leading $m$ -by- $n$ part of the array $c$ contains the matrix $C$ .
-----	--

## `mkl_?dnscsr`

Convert a sparse matrix in uncompressed representation to the CSR format and vice versa (deprecated).

## Syntax

```
void mkl_ddnscsr (const MKL_INT *job , const MKL_INT *m , const MKL_INT *n , double
*adns , const MKL_INT *lda , double *acsr , MKL_INT *ja , MKL_INT *ia , MKL_INT *info );
void mkl_sdnscsr (const MKL_INT *job , const MKL_INT *m , const MKL_INT *n , float
*adns , const MKL_INT *lda , float *acsr , MKL_INT *ja , MKL_INT *ia , MKL_INT *info );
void mkl_cdnscsr (const MKL_INT *job , const MKL_INT *m , const MKL_INT *n ,
MKL_Complex8 *adns , const MKL_INT *lda , MKL_Complex8 *acsr , MKL_INT *ja , MKL_INT
*ia , MKL_INT *info );
void mkl_zdnscsr (const MKL_INT *job , const MKL_INT *m , const MKL_INT *n ,
MKL_Complex16 *adns , const MKL_INT *lda , MKL_Complex16 *acsr , MKL_INT *ja , MKL_INT
*ia , MKL_INT *info );
```

## Include Files

- `mkl.h`

## Description

This routine is deprecated. Use the [matrix manipulation routines](#) from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

This routine converts a sparse matrix  $A$  between formats: stored as a rectangular array (dense representation) and stored using compressed sparse row (CSR) format (3-array variation).

## Input Parameters

<i>job</i>	<p>Array, contains the following conversion parameters:</p> <ul style="list-style-type: none"> <li>• <i>job</i>[0]: Conversion type. <ul style="list-style-type: none"> <li>• If <i>job</i>[0]=0, the rectangular matrix <i>A</i> is converted to the CSR format;</li> <li>• if <i>job</i>[0]=1, the rectangular matrix <i>A</i> is restored from the CSR format.</li> </ul> </li> <li>• <i>job</i>[1]: index base for the rectangular matrix <i>A</i>. <ul style="list-style-type: none"> <li>• If <i>job</i>[1]=0, zero-based indexing for the rectangular matrix <i>A</i> is used;</li> <li>• if <i>job</i>[1]=1, one-based indexing for the rectangular matrix <i>A</i> is used.</li> </ul> </li> <li>• <i>job</i>[2]: Index base for the matrix in CSR format. <ul style="list-style-type: none"> <li>• If <i>job</i>[2]=0, zero-based indexing for the matrix in CSR format is used;</li> <li>• if <i>job</i>[2]=1, one-based indexing for the matrix in CSR format is used.</li> </ul> </li> <li>• <i>job</i>[3]: Portion of matrix. <ul style="list-style-type: none"> <li>• If <i>job</i>[3]=0, <i>adns</i> is a lower triangular part of matrix <i>A</i>;</li> <li>• If <i>job</i>[3]=1, <i>adns</i> is an upper triangular part of matrix <i>A</i>;</li> <li>• If <i>job</i>[3]=2, <i>adns</i> is a whole matrix <i>A</i>.</li> </ul> </li> <li>• <i>job</i>[4]=<i>nzmax</i>: maximum number of the non-zero elements allowed if <i>job</i>[0]=0.</li> <li>• <i>job</i>[5]: job indicator for conversion to CSR format. <ul style="list-style-type: none"> <li>• If <i>job</i>[5]=0, only array <i>ia</i> is generated for the output storage.</li> <li>• If <i>job</i>[5]&gt;0, arrays <i>acsr</i>, <i>ia</i>, <i>ja</i> are generated for the output storage.</li> </ul> </li> </ul>
<i>m</i>	Number of rows of the matrix <i>A</i> .
<i>n</i>	Number of columns of the matrix <i>A</i> .
<i>adns</i>	<p>(input/output)</p> <p>If the conversion type is from uncompressed to CSR, on input <i>adns</i> contains an uncompressed (dense) representation of matrix <i>A</i>.</p>
<i>lda</i>	<p>Specifies the leading dimension of <i>adns</i> as declared in the calling (sub)program.</p> <p>For zero-based indexing of <i>A</i>, <i>lda</i> must be at least <math>\max(1, n)</math>.</p> <p>For one-based indexing of <i>A</i>, <i>lda</i> must be at least <math>\max(1, m)</math>.</p>
<i>acsr</i>	<p>(input/output)</p> <p>If conversion type is from CSR to uncompressed, on input <i>acsr</i> contains the non-zero elements of the matrix <i>A</i>. Its length is equal to the number of non-zero elements in the matrix <i>A</i>. Refer to <i>values</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.</p>
<i>ja</i>	<p>(input/output). If conversion type is from CSR to uncompressed, on input for zero-based indexing of <i>A</i> <i>ja</i> contains the column indices plus one for each non-zero element of the matrix <i>A</i>. For one-based indexing of <i>A</i> <i>ja</i> contains the column indices for each non-zero element of the matrix <i>A</i>.</p>

Its length is equal to the length of the array *acsr*. Refer to *columns* array description in [Sparse Matrix Storage Formats](#) for more details.

*ia*

(input/output). Array of length  $m + 1$ .

If conversion type is from CSR to uncompressed, on input for zero-based indexing of *A* *ia* contains indices of elements in the array *acsr*, such that  $ia[i] - 1$  is the index in the array *acsr* of the first non-zero element from the row *i*. For one-based indexing of *A* *ia* contains indices of elements in the array *acsr*, such that  $ia[i]$  is the index in the array *acsr* of the first non-zero element from the row *i*.

The value of  $ia[m] - ia[0]$  is equal to the number of non-zeros. Refer to *rowIndex* array description in [Sparse Matrix Storage Formats](#) for more details.

## Output Parameters

*adns*

If conversion type is from CSR to uncompressed, on output *adns* contains the uncompressed (dense) representation of matrix *A*.

*acsr, ja, ia*

If conversion type is from uncompressed to CSR, on output *acsr*, *ja*, and *ia* contain the compressed sparse row (CSR) format (3-array variation) of matrix *A* (see [Sparse Matrix Storage Formats](#) for a description of the storage format).

*info*

Integer *info* indicator only for restoring the matrix *A* from the CSR format.

If  $info=0$ , the execution is successful.

If  $info=i$ , the routine is interrupted processing the *i*-th row because there is no space in the arrays *acsr* and *ja* according to the value *nzmax*.

## `mkl_?csrcoo`

*Converts a sparse matrix in the CSR format to the coordinate format and vice versa (deprecated).*

### Syntax

```
void mkl_scsrcoo (const MKL_INT *job , const MKL_INT *n , float *acsr , MKL_INT *ja ,
MKL_INT *ia , MKL_INT *nnz , float *acoo , MKL_INT *rowind , MKL_INT *colind , MKL_INT
*info );
```

```
void mkl_dcsrcoo (const MKL_INT *job , const MKL_INT *n , double *acsr , MKL_INT *ja ,
MKL_INT *ia , MKL_INT *nnz , double *acoo , MKL_INT *rowind , MKL_INT *colind , MKL_INT
*info );
```

```
void mkl_ccsrcoo (const MKL_INT *job , const MKL_INT *n , MKL_Complex8 *acsr , MKL_INT
*ja , MKL_INT *ia , MKL_INT *nnz , MKL_Complex8 *acoo , MKL_INT *rowind , MKL_INT
*colind , MKL_INT *info );
```

```
void mkl_zcsrcoo (const MKL_INT *job , const MKL_INT *n , MKL_Complex16 *acsr , MKL_INT
*ja , MKL_INT *ia , MKL_INT *nnz , MKL_Complex16 *acoo , MKL_INT *rowind , MKL_INT
*colind , MKL_INT *info );
```

### Include Files

- `mkl.h`

## Description

This routine is deprecated. Use the [matrix manipulation routines](#) from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

This routine converts a sparse matrix *A* stored in the compressed sparse row (CSR) format (3-array variation) to coordinate format and vice versa.

## Input Parameters

*job*

Array, contains the following conversion parameters:

*job*[0]

If *job*[0]=0, the matrix in the CSR format is converted to the coordinate format;

if *job*[0]=1, the matrix in the coordinate format is converted to the CSR format.

if *job*[0]=2, the matrix in the coordinate format is converted to the CSR format, and the column indices in CSR representation are sorted in the increasing order within each row.

*job*[1]

If *job*[1]=0, zero-based indexing for the matrix in CSR format is used;

if *job*[1]=1, one-based indexing for the matrix in CSR format is used.

*job*[2]

If *job*[2]=0, zero-based indexing for the matrix in coordinate format is used;

if *job*[2]=1, one-based indexing for the matrix in coordinate format is used.

*job*[4]

*job*[4]=*nzmax* - maximum number of the non-zero elements allowed if *job*[0]=0.

*job*[5] - job indicator.

For conversion to the coordinate format:

If *job*[5]=1, only array *rowind* is filled in for the output storage.

If *job*[5]=2, arrays *rowind*, *colind* are filled in for the output storage.

If *job*[5]=3, all arrays *rowind*, *colind*, *acoo* are filled in for the output storage.

For conversion to the CSR format:

If *job*[5]=0, all arrays *acsr*, *ja*, *ia* are filled in for the output storage.

If *job*[5]=1, only array *ia* is filled in for the output storage.

If *job*[5]=2, then it is assumed that the routine already has been called with the *job*[5]=1, and the user allocated the required space for storing the output arrays *acsr* and *ja*.

<i>n</i>	Dimension of the matrix <i>A</i> .
<i>nnz</i>	Specifies the number of non-zero elements of the matrix <i>A</i> for <i>job</i> [0]≠0. Refer to <i>nnz</i> description in <a href="#">Coordinate Format</a> for more details.
<i>acsr</i>	(input/output) Array containing non-zero elements of the matrix <i>A</i> . Its length is equal to the number of non-zero elements in the matrix <i>A</i> . Refer to <i>values</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.
<i>ja</i>	(input/output). For <i>job</i> [1] = 1 (one-based indexing for the matrix in CSR format), array containing the column indices plus one for each non-zero element of the matrix <i>A</i> . For <i>job</i> [1] = 0 (zero-based indexing for the matrix in CSR format), array containing the column indices for each non-zero element of the matrix <i>A</i> . Its length is equal to the length of the array <i>acsr</i> . Refer to <i>columns</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.
<i>ia</i>	(input/output). Array of length $n + 1$ , containing indices of elements in the array <i>acsr</i> , such that $ia[i] - ia[0]$ is the index in the array <i>acsr</i> of the first non-zero element from the row <i>i</i> . The value of the last element $ia[n] - ia[0]$ is equal to the number of non-zeros plus one. Refer to <i>rowIndex</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.
<i>acoo</i>	(input/output) Array containing non-zero elements of the matrix <i>A</i> . Its length is equal to the number of non-zero elements in the matrix <i>A</i> . Refer to <i>values</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.
<i>rowind</i>	(input/output). Array of length <i>nnz</i> , contains the row indices for each non-zero element of the matrix <i>A</i> . Refer to <i>rows</i> array description in <a href="#">Coordinate Format</a> for more details.
<i>colind</i>	(input/output). Array of length <i>nnz</i> , contains the column indices for each non-zero element of the matrix <i>A</i> . Refer to <i>columns</i> array description in <a href="#">Coordinate Format</a> for more details.

## Output Parameters

<i>nnz</i>	Returns the number of converted elements of the matrix <i>A</i> for <i>job</i> [0]=0.
<i>info</i>	Integer info indicator only for converting the matrix <i>A</i> from the CSR format. If <i>info</i> =0, the execution is successful. If <i>info</i> =1, the routine is interrupted because there is no space in the arrays <i>acoo</i> , <i>rowind</i> , <i>colind</i> according to the value <i>nzmax</i> .

### **mkl\_?csrbsr**

*Converts a square sparse matrix in the CSR format to the BSR format and vice versa (deprecated).*

---

## Syntax

```
void mkl_scsrbsr (const MKL_INT *job , const MKL_INT *m , const MKL_INT *mblk , const
MKL_INT *ldabsr , float *acsr , MKL_INT *ja , MKL_INT *ia , float *absr , MKL_INT *jab ,
MKL_INT *iab , MKL_INT *info );
```

```
void mkl_dcsrbsr (const MKL_INT *job , const MKL_INT *m , const MKL_INT *mblk , const
MKL_INT *ldabsr , double *acsr , MKL_INT *ja , MKL_INT *ia , double *absr , MKL_INT
*jab , MKL_INT *iab , MKL_INT *info );
```

```
void mkl_ccsrbsr (const MKL_INT *job , const MKL_INT *m , const MKL_INT *mblk , const
MKL_INT *ldabsr , MKL_Complex8 *acsr , MKL_INT *ja , MKL_INT *ia , MKL_Complex8 *absr ,
MKL_INT *jab , MKL_INT *iab , MKL_INT *info );
```

```
void mkl_zcsrbsr (const MKL_INT *job , const MKL_INT *m , const MKL_INT *mblk , const
MKL_INT *ldabsr , MKL_Complex16 *acsr , MKL_INT *ja , MKL_INT *ia , MKL_Complex16
*absr , MKL_INT *jab , MKL_INT *iab , MKL_INT *info );
```

## Include Files

- mkl.h

## Description

This routine is deprecated. Use the [matrix manipulation routines](#) from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

This routine converts a square sparse matrix *A* stored in the compressed sparse row (CSR) format (3-array variation) to the block sparse row (BSR) format and vice versa.

## Input Parameters

*job*

Array, contains the following conversion parameters:

*job*[0]

If *job*[0]=0, the matrix in the CSR format is converted to the BSR format;

if *job*[0]=1, the matrix in the BSR format is converted to the CSR format.

*job*[1]

If *job*[1]=0, zero-based indexing for the matrix in CSR format is used;

if *job*[1]=1, one-based indexing for the matrix in CSR format is used.

*job*[2]

If *job*[2]=0, zero-based indexing for the matrix in the BSR format is used;

if *job*[2]=1, one-based indexing for the matrix in the BSR format is used.

*job*[3] is only used for conversion to CSR format. By default, the converter saves the blocks without checking whether an element is zero or not. If *job*[3]=1, then the converter only saves non-zero elements in blocks.

*job*[5] - job indicator.

For conversion to the BSR format:

If *job*[5]=0, only arrays *jab*, *iab* are generated for the output storage.

If  $job[5] > 0$ , all output arrays  $absr$ ,  $jab$ , and  $iab$  are filled in for the output storage.

If  $job[5] = -1$ ,  $iab[m] - iab[0]$  returns the number of non-zero blocks.

For conversion to the CSR format:

If  $job[5] = 0$ , only arrays  $ja$ ,  $ia$  are generated for the output storage.

$m$	Actual row dimension of the matrix $A$ for convert to the BSR format; block row dimension of the matrix $A$ for convert to the CSR format.
$mblk$	Size of the block in the matrix $A$ .
$ldabsr$	Leading dimension of the array $absr$ as declared in the calling program. $ldabsr$ must be greater than or equal to $mblk * mblk$ .
$acsr$	(input/output) Array containing non-zero elements of the matrix $A$ . Its length is equal to the number of non-zero elements in the matrix $A$ . Refer to <i>values</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.
$ja$	(input/output). Array containing the column indices for each non-zero element of the matrix $A$ . Its length is equal to the length of the array $acsr$ . Refer to <i>columns</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.
$ia$	(input/output). Array of length $m + 1$ , containing indices of elements in the array $acsr$ , such that $ia[I] - iab[0]$ is the index in the array $acsr$ of the first non-zero element from the row $I$ . The value of $ia[m] - iab[0]$ is equal to the number of non-zeros. Refer to <i>rowIndex</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.
$absr$	(input/output) Array containing elements of non-zero blocks of the matrix $A$ . Its length is equal to the number of non-zero blocks in the matrix $A$ multiplied by $mblk * mblk$ . Refer to <i>values</i> array description in <a href="#">BSR Format</a> for more details.
$jab$	(input/output). Array containing the column indices for each non-zero block of the matrix $A$ . Its length is equal to the number of non-zero blocks of the matrix $A$ . Refer to <i>columns</i> array description in <a href="#">BSR Format</a> for more details.
$iab$	(input/output). Array of length $(m + 1)$ , containing indices of blocks in the array $absr$ , such that $iab[i] - iab[0]$ is the index in the array $absr$ of the first non-zero element from the $i$ -th row. The value of $iab[m]$ is equal to the number of non-zero blocks. Refer to <i>rowIndex</i> array description in <a href="#">BSR Format</a> for more details.

## Output Parameters

$info$	Integer info indicator only for converting the matrix $A$ from the CSR format. If $info = 0$ , the execution is successful. If $info = 1$ , it means that $mblk$ is equal to 0.
--------	---

If  $info=2$ , it means that  $ldabsr$  is less than  $mblk*mblk$  and there is no space for all blocks.

## mkl\_?csrsc

*Converts a square sparse matrix in the CSR format to the CSC format and vice versa (deprecated).*

### Syntax

```
void mkl_dcsrsc (const MKL_INT *job , const MKL_INT *n , double *acsr , MKL_INT *ja ,
MKL_INT *ia , double *acsc , MKL_INT *jal , MKL_INT *ial , MKL_INT *info );
void mkl_scsrsc (const MKL_INT *job , const MKL_INT *n , float *acsr , MKL_INT *ja ,
MKL_INT *ia , float *acsc , MKL_INT *jal , MKL_INT *ial , MKL_INT *info );
void mkl_ccsrsc (const MKL_INT *job , const MKL_INT *n , MKL_Complex8 *acsr , MKL_INT
*ja , MKL_INT *ia , MKL_Complex8 *acsc , MKL_INT *jal , MKL_INT *ial , MKL_INT *info );
void mkl_zcsrsc (const MKL_INT *job , const MKL_INT *n , MKL_Complex16 *acsr , MKL_INT
*ja , MKL_INT *ia , MKL_Complex16 *acsc , MKL_INT *jal , MKL_INT *ial , MKL_INT *info );
```

### Include Files

- mkl.h

### Description

This routine is deprecated. Use the [matrix manipulation routines](#) from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

This routine converts a square sparse matrix  $A$  stored in the compressed sparse row (CSR) format (3-array variation) to the compressed sparse column (CSC) format and vice versa.

### Input Parameters

*job*

Array, contains the following conversion parameters:

*job*[0]

If *job*[0]=0, the matrix in the CSR format is converted to the CSC format;

if *job*[0]=1, the matrix in the CSC format is converted to the CSR format.

*job*[1]

If *job*[1]=0, zero-based indexing for the matrix in CSR format is used;

if *job*[1]=1, one-based indexing for the matrix in CSR format is used.

*job*[2]

If *job*[2]=0, zero-based indexing for the matrix in the CSC format is used;

if *job*[2]=1, one-based indexing for the matrix in the CSC format is used.

*job*[5] - job indicator.

For conversion to the CSC format:

If *job*[5]=0, only arrays *jal*, *ial* are filled in for the output storage.

If  $job[5] \neq 0$ , all output arrays  $acsc$ ,  $jal$ , and  $ial$  are filled in for the output storage.

For conversion to the CSR format:

If  $job[5] = 0$ , only arrays  $ja$ ,  $ia$  are filled in for the output storage.

If  $job[5] \neq 0$ , all output arrays  $acsr$ ,  $ja$ , and  $ia$  are filled in for the output storage.

$m$	Dimension of the square matrix $A$ .
$acsr$	(input/output) Array containing non-zero elements of the square matrix $A$ . Its length is equal to the number of non-zero elements in the matrix $A$ . Refer to <i>values</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.
$ja$	(input/output). Array containing the column indices for each non-zero element of the matrix $A$ . Its length is equal to the length of the array $acsr$ . Refer to <i>columns</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.
$ia$	(input/output). Array of length $m + 1$ , containing indices of elements in the array $acsr$ , such that $ia[i] - ia[0]$ is the index in the array $acsr$ of the first non-zero element from the row $i$ . The value of $ia[m] - ia[0]$ is equal to the number of non-zeros. Refer to <i>rowIndex</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.
$acsc$	(input/output) Array containing non-zero elements of the square matrix $A$ . Its length is equal to the number of non-zero elements in the matrix $A$ . Refer to <i>values</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.
$jal$	(input/output). Array containing the row indices for each non-zero element of the matrix $A$ . Its length is equal to the length of the array $acsc$ . Refer to <i>columns</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.
$ial$	(input/output). Array of length $m + 1$ , containing indices of elements in the array $acsc$ , such that $ial[i] - ial[0]$ is the index in the array $acsc$ of the first non-zero element from the column $i$ . The value of $ial[m] - ial[0]$ is equal to the number of non-zeros. Refer to <i>rowIndex</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.

## Output Parameters

*info* This parameter is not used now.

### **`mkl_?csrdia`**

*Converts a sparse matrix in the CSR format to the diagonal format and vice versa (deprecated).*

## Syntax

```
void mkl_dcsrddia (const MKL_INT *job , const MKL_INT *n , double *acsr , MKL_INT *ja ,
MKL_INT *ia , double *adia , const MKL_INT *ndiag , MKL_INT *distance , MKL_INT
*idiag , double *acsr_rem , MKL_INT *ja_rem , MKL_INT *ia_rem , MKL_INT *info );

void mkl_scscrddia (const MKL_INT *job , const MKL_INT *n , float *acsr , MKL_INT *ja ,
MKL_INT *ia , float *adia , const MKL_INT *ndiag , MKL_INT *distance , MKL_INT *idiag ,
float *acsr_rem , MKL_INT *ja_rem , MKL_INT *ia_rem , MKL_INT *info );

void mkl_ccscrddia (const MKL_INT *job , const MKL_INT *n , MKL_Complex8 *acsr , MKL_INT

## Include Files

- mkl.h

## Description

This routine is deprecated. Use the [matrix manipulation routines](#) from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

This routine converts a sparse matrix *A* stored in the compressed sparse row (CSR) format (3-array variation) to the diagonal format and vice versa.

## Input Parameters

*job*

Array, contains the following conversion parameters:

*job*[0]

If *job*[0]=0, the matrix in the CSR format is converted to the diagonal format;

if *job*[0]=1, the matrix in the diagonal format is converted to the CSR format.

*job*[1]

If *job*[1]=0, zero-based indexing for the matrix in CSR format is used;

if *job*[1]=1, one-based indexing for the matrix in CSR format is used.

*job*[2]

If *job*[2]=0, zero-based indexing for the matrix in the diagonal format is used;

if *job*[2]=1, one-based indexing for the matrix in the diagonal format is used.

*job*[5] - job indicator.

For conversion to the diagonal format:

If  $job[5]=0$ , diagonals are not selected internally, and  $acsr\_rem$ ,  $ja\_rem$ ,  $ia\_rem$  are not filled in for the output storage.

If  $job[5]=1$ , diagonals are not selected internally, and  $acsr\_rem$ ,  $ja\_rem$ ,  $ia\_rem$  are filled in for the output storage.

If  $job[5]=10$ , diagonals are selected internally, and  $acsr\_rem$ ,  $ja\_rem$ ,  $ia\_rem$  are not filled in for the output storage.

If  $job[5]=11$ , diagonals are selected internally, and  $csr\_rem$ ,  $ja\_rem$ ,  $ia\_rem$  are filled in for the output storage.

For conversion to the CSR format:

If  $job[5]=0$ , each entry in the array  $adia$  is checked whether it is zero. Zero entries are not included in the array  $acsr$ .

If  $job[5] \neq 0$ , each entry in the array  $adia$  is not checked whether it is zero.

$m$	Dimension of the matrix $A$ .
$acsr$	(input/output) Array containing non-zero elements of the matrix $A$ . Its length is equal to the number of non-zero elements in the matrix $A$ . Refer to <i>values</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.
$ja$	(input/output). Array containing the column indices for each non-zero element of the matrix $A$ .  Its length is equal to the length of the array $acsr$ . Refer to <i>columns</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.
$ia$	(input/output). Array of length $m + 1$ , containing indices of elements in the array $acsr$ , such that $ia[i] - ia[0]$ is the index in the array $acsr$ of the first non-zero element from the row $i$ . The value of $ia[m] - ia[0]$ is equal to the number of non-zeros. Refer to <i>rowIndex</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.
$adia$	(input/output) Array of size $(ndiag * idiag)$ containing diagonals of the matrix $A$ .  The key point of the storage is that each element in the array $adia$ retains the row number of the original matrix. To achieve this diagonals in the lower triangular part of the matrix are padded from the top, and those in the upper triangular part are padded from the bottom.
$ndiag$	Specifies the leading dimension of the array $adia$ as declared in the calling (sub)program, must be at least $\max(1, m)$ .
$distance$	Array of length $idiag$ , containing the distances between the main diagonal and each non-zero diagonal to be extracted. The distance is positive if the diagonal is above the main diagonal, and negative if the diagonal is below the main diagonal. The main diagonal has a distance equal to zero.
$idiag$	Number of diagonals to be extracted. For conversion to diagonal format on return this parameter may be modified.
$acsr\_rem, ja\_rem, ia\_rem$	Remainder of the matrix in the CSR format if it is needed for conversion to the diagonal format.

## Output Parameters

*info* This parameter is not used now.

### **mkl\_?csrsky**

Converts a sparse matrix in CSR format to the skyline format and vice versa (deprecated).

### Syntax

```
void mkl_dcsrsky (const MKL_INT *job , const MKL_INT *m , double *acsr , MKL_INT *ja ,
MKL_INT *ia , double *asky , MKL_INT *pointers , MKL_INT *info );

void mkl_scsrsky (const MKL_INT *job , const MKL_INT *m , float *acsr , MKL_INT *ja ,
MKL_INT *ia , float *asky , MKL_INT *pointers , MKL_INT *info );

void mkl_ccsrsky (const MKL_INT *job , const MKL_INT *m , MKL_Complex8 *acsr , MKL_INT
*ja , MKL_INT *ia , MKL_Complex8 *asky , MKL_INT *pointers , MKL_INT *info );

void mkl_zcsrsky (const MKL_INT *job , const MKL_INT *m , MKL_Complex16 *acsr , MKL_INT
*ja , MKL_INT *ia , MKL_Complex16 *asky , MKL_INT *pointers , MKL_INT *info );
```

### Include Files

- mkl.h

### Description

This routine is deprecated. Use the [matrix manipulation routines](#) from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

This routine converts a sparse matrix *A* stored in the compressed sparse row (CSR) format (3-array variation) to the skyline format and vice versa.

### Input Parameters

*job* Array, contains the following conversion parameters:

*job*[0]  
If *job*[0]=0, the matrix in the CSR format is converted to the skyline format;  
if *job*[0]=1, the matrix in the skyline format is converted to the CSR format.

*job*[1]  
If *job*[1]=0, zero-based indexing for the matrix in CSR format is used;  
if *job*[1]=1, one-based indexing for the matrix in CSR format is used.

*job*[2]  
If *job*[2]=0, zero-based indexing for the matrix in the skyline format is used;  
if *job*[2]=1, one-based indexing for the matrix in the skyline format is used.

*job*[3]

For conversion to the skyline format:

If  $job[3]=0$ , the upper part of the matrix  $A$  in the CSR format is converted.

If  $job[3]=1$ , the lower part of the matrix  $A$  in the CSR format is converted.

For conversion to the CSR format:

If  $job[3]=0$ , the matrix is converted to the upper part of the matrix  $A$  in the CSR format.

If  $job[3]=1$ , the matrix is converted to the lower part of the matrix  $A$  in the CSR format.

$job[4]$

$job[4]=nzmax$  - maximum number of the non-zero elements of the matrix  $A$  if  $job[0]=0$ .

$job[5]$  - job indicator.

Only for conversion to the skyline format:

If  $job[5]=0$ , only arrays *pointers* is filled in for the output storage.

If  $job[5]=1$ , all output arrays *asky* and *pointers* are filled in for the output storage.

$m$

Dimension of the matrix  $A$ .

*acsr*

(input/output)

Array containing non-zero elements of the matrix  $A$ . Its length is equal to the number of non-zero elements in the matrix  $A$ . Refer to *values* array description in [Sparse Matrix Storage Formats](#) for more details.

*ja*

(input/output). Array containing the column indices for each non-zero element of the matrix  $A$ .

Its length is equal to the length of the array *acsr*. Refer to *columns* array description in [Sparse Matrix Storage Formats](#) for more details.

*ia*

(input/output). Array of length  $m + 1$ , containing indices of elements in the array *acsr*, such that  $ia[i] - ia[0]$  is the index in the array *acsr* of the first non-zero element from the row  $i$ . The value of  $ia[m] - ia[0]$  is equal to the number of non-zeros. Refer to *rowIndex* array description in [Sparse Matrix Storage Formats](#) for more details.

*asky*

(input/output)

Array, for a lower triangular part of  $A$  it contains the set of elements from each row starting from the first non-zero element to and including the diagonal element. For an upper triangular matrix it contains the set of elements from each column of the matrix starting with the first non-zero element down to and including the diagonal element. Encountered zero elements are included in the sets. Refer to *values* array description in [Skyline Storage Format](#) for more details.

*pointers*

(input/output).

Array with dimension  $(m+1)$ , where  $m$  is number of rows for lower triangle (columns for upper triangle),  $pointers[i-1] - pointers[0]$  gives the index of element in the array *asky* that is first non-zero element in row

(column) $i$ . The value of `pointers[m]` is set to `nnz + pointers[0]`, where `nnz` is the number of elements in the array `asky`. Refer to `pointers` array description in [Skyline Storage Format](#) for more details

## Output Parameters

`info`

Integer info indicator only for converting the matrix  $A$  from the CSR format.

If `info=0`, the execution is successful.

If `info=1`, the routine is interrupted because there is no space in the array `asky` according to the value `nzmax`.

## `mkl_?csradd`

Computes the sum of two matrices stored in the CSR format (3-array variation) with one-based indexing (deprecated).

## Syntax

```
void mkl_dcsradd (const char *trans , const MKL_INT *request , const MKL_INT *sort ,
const MKL_INT *m , const MKL_INT *n , double *a , MKL_INT *ja , MKL_INT *ia , const
double *beta , double *b , MKL_INT *jb , MKL_INT *ib , double *c , MKL_INT *jc , MKL_INT
*ic , const MKL_INT *nzmax , MKL_INT *info );
```

```
void mkl_scsradd (const char *trans , const MKL_INT *request , const MKL_INT *sort ,
const MKL_INT *m , const MKL_INT *n , float *a , MKL_INT *ja , MKL_INT *ia , const
float *beta , float *b , MKL_INT *jb , MKL_INT *ib , float *c , MKL_INT *jc , MKL_INT
*ic , const MKL_INT *nzmax , MKL_INT *info );
```

```
void mkl_ccsradd (const char *trans , const MKL_INT *request , const MKL_INT *sort ,
const MKL_INT *m , const MKL_INT *n , MKL_Complex8 *a , MKL_INT *ja , MKL_INT *ia ,
const MKL_Complex8 *beta , MKL_Complex8 *b , MKL_INT *jb , MKL_INT *ib , MKL_Complex8
*c , MKL_INT *jc , MKL_INT *ic , const MKL_INT *nzmax , MKL_INT *info );
```

```
void mkl_zcsradd (const char *trans , const MKL_INT *request , const MKL_INT *sort ,
const MKL_INT *m , const MKL_INT *n , MKL_Complex16 *a , MKL_INT *ja , MKL_INT *ia ,
const MKL_Complex16 *beta , MKL_Complex16 *b , MKL_INT *jb , MKL_INT *ib ,
MKL_Complex16 *c , MKL_INT *jc , MKL_INT *ic , const MKL_INT *nzmax , MKL_INT *info );
```

## Include Files

- `mkl.h`

## Description

This routine is deprecated. Use `mkl_sparse_?_add` from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?csradd` routine performs a matrix-matrix operation defined as

$$C := A + \text{beta} * \text{op}(B)$$

where:

$A$ ,  $B$ ,  $C$  are the sparse matrices in the CSR format (3-array variation).

`op(B)` is one of `op(B) = B`, or `op(B) = BT`, or `op(B) = BH`

`beta` is a scalar.

The routine works correctly if and only if the column indices in sparse matrix representations of matrices  $A$  and  $B$  are arranged in the increasing order for each row. If not, use the parameter `sort` (see below) to reorder column indices and the corresponding elements of the input matrices.

**NOTE**

This routine supports only one-based indexing of the input arrays.

**Input Parameters**

<code>trans</code>	<p>Specifies the operation.</p> <p>If <code>trans = 'N'</code> or <code>'n'</code>, then <math>C := A + \text{beta} * B</math></p> <p>If <code>trans = 'T'</code> or <code>'t'</code>, then <math>C := A + \text{beta} * B^T</math></p> <p>If <code>trans = 'C'</code> or <code>'c'</code>, then <math>C := A + \text{beta} * B^H</math>.</p>
<code>request</code>	<p>If <code>request=0</code>, the routine performs addition. The memory for the output arrays <code>ic</code>, <code>jc</code>, <code>c</code> must be allocated beforehand.</p> <p>If <code>request=1</code>, the routine only computes the values of the array <code>ic</code> of length <math>m + 1</math>. The memory for the <code>ic</code> array must be allocated beforehand. On exit the value <code>ic[m] - 1</code> is the actual number of the elements in the arrays <code>c</code> and <code>jc</code>.</p> <p>If <code>request=2</code>, after the routine is called previously with the parameter <code>request=1</code> and after the output arrays <code>jc</code> and <code>c</code> are allocated in the calling program with length at least <code>ic[m] - 1</code>, the routine performs addition.</p>
<code>sort</code>	<p>Specifies the type of reordering. If this parameter is not set (default), the routine does not perform reordering.</p> <p>If <code>sort=1</code>, the routine arranges the column indices <code>ja</code> for each row in the increasing order and reorders the corresponding values of the matrix <math>A</math> in the array <code>a</code>.</p> <p>If <code>sort=2</code>, the routine arranges the column indices <code>jb</code> for each row in the increasing order and reorders the corresponding values of the matrix <math>B</math> in the array <code>b</code>.</p> <p>If <code>sort=3</code>, the routine performs reordering for both input matrices <math>A</math> and <math>B</math>.</p>
<code>m</code>	Number of rows of the matrix $A$ .
<code>n</code>	Number of columns of the matrix $A$ .
<code>a</code>	Array containing non-zero elements of the matrix $A$ . Its length is equal to the number of non-zero elements in the matrix $A$ . Refer to <code>values</code> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.
<code>ja</code>	<p>Array containing the column indices plus one for each non-zero element of the matrix <math>A</math>. For each row the column indices must be arranged in the increasing order.</p> <p>The length of this array is equal to the length of the array <code>a</code>. Refer to <code>columns</code> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.</p>

<i>ia</i>	Array of length $m + 1$ , containing indices of elements in the array <i>a</i> , such that $ia[i] - ia[0]$ is the index in the array <i>a</i> of the first non-zero element from the row <i>i</i> . The value of the last element $ia[m]$ is equal to the number of non-zero elements of the matrix <i>A</i> plus one. Refer to <i>rowIndex</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.
<i>beta</i>	Specifies the scalar <i>beta</i> .
<i>b</i>	Array containing non-zero elements of the matrix <i>B</i> . Its length is equal to the number of non-zero elements in the matrix <i>B</i> . Refer to <i>values</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.
<i>jb</i>	Array containing the column indices plus one for each non-zero element of the matrix <i>B</i> . For each row the column indices must be arranged in the increasing order.  The length of this array is equal to the length of the array <i>b</i> . Refer to <i>columns</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.
<i>ib</i>	Array of length $m + 1$ when <i>trans</i> = 'N' or 'n', or $n + 1$ otherwise.  This array contains indices of elements in the array <i>b</i> , such that $ib[i] - ib[0]$ is the index in the array <i>b</i> of the first non-zero element from the row <i>i</i> . The value of the last element $ib[m]$ or $ib[n]$ is equal to the number of non-zero elements of the matrix <i>B</i> plus one. Refer to <i>rowIndex</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.
<i>nzmax</i>	The length of the arrays <i>c</i> and <i>jc</i> .  This parameter is used only if <i>request</i> =0. The routine stops calculation if the number of elements in the result matrix <i>C</i> exceeds the specified value of <i>nzmax</i> .

## Output Parameters

<i>c</i>	Array containing non-zero elements of the result matrix <i>C</i> . Its length is equal to the number of non-zero elements in the matrix <i>C</i> . Refer to <i>values</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.
<i>jc</i>	Array containing the column indices plus one for each non-zero element of the matrix <i>C</i> .  The length of this array is equal to the length of the array <i>c</i> . Refer to <i>columns</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.
<i>ic</i>	Array of length $m + 1$ , containing indices of elements in the array <i>c</i> , such that $ic[i] - ic[0]$ is the index in the array <i>c</i> of the first non-zero element from the row <i>i</i> . The value of the last element $ic[m]$ is equal to the number of non-zero elements of the matrix <i>C</i> plus one. Refer to <i>rowIndex</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.
<i>info</i>	If <i>info</i> =0, the execution is successful.  If <i>info</i> = <i>I</i> >0, the routine stops calculation in the <i>I</i> -th row of the matrix <i>C</i> because number of elements in <i>C</i> exceeds <i>nzmax</i> .

If  $info=-1$ , the routine calculates only the size of the arrays  $c$  and  $jc$  and returns this value plus 1 as the last element of the array  $ic$ .

### **mkl\_?csrmultcsr**

*Computes product of two sparse matrices stored in the CSR format (3-array variation) with one-based indexing (deprecated).*

#### **Syntax**

```
void mkl_dcsmultcsr (const char *trans , const MKL_INT *request , const MKL_INT
*sort , const MKL_INT *m , const MKL_INT *n , const MKL_INT *k , double *a , MKL_INT
*ja , MKL_INT *ia , double *b , MKL_INT *jb , MKL_INT *ib , double *c , MKL_INT *jc ,
MKL_INT *ic , const MKL_INT *nzmax , MKL_INT *info );

void mkl_scsmultcsr (const char *trans , const MKL_INT *request , const MKL_INT
*sort , const MKL_INT *m , const MKL_INT *n , const MKL_INT *k , float *a , MKL_INT
*ja , MKL_INT *ia , float *b , MKL_INT *jb , MKL_INT *ib , float *c , MKL_INT *jc ,
MKL_INT *ic , const MKL_INT *nzmax , MKL_INT *info );

void mkl_ccsmultcsr (const char *trans , const MKL_INT *request , const MKL_INT
*sort , const MKL_INT *m , const MKL_INT *n , const MKL_INT *k , MKL_Complex8 *a ,
MKL_INT *ja , MKL_INT *ia , MKL_Complex8 *b , MKL_INT *jb , MKL_INT *ib , MKL_Complex8
*c , MKL_INT *jc , MKL_INT *ic , const MKL_INT *nzmax , MKL_INT *info );

void mkl_zcsmultcsr (const char *trans , const MKL_INT *request , const MKL_INT
*sort , const MKL_INT *m , const MKL_INT *n , const MKL_INT *k , MKL_Complex16 *a ,
MKL_INT *ja , MKL_INT *ia , MKL_Complex16 *b , MKL_INT *jb , MKL_INT *ib ,
MKL_Complex16 *c , MKL_INT *jc , MKL_INT *ic , const MKL_INT *nzmax , MKL_INT *info );
```

#### **Include Files**

- mkl.h

#### **Description**

This routine is deprecated. Use [mkl\\_sparse\\_spmv](#) from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?csrmultcsr` routine performs a matrix-matrix operation defined as

$$C := \text{op}(A) * B$$

where:

$A$ ,  $B$ ,  $C$  are the sparse matrices in the CSR format (3-array variation);

$\text{op}(A)$  is one of  $\text{op}(A) = A$ , or  $\text{op}(A) = A^T$ , or  $\text{op}(A) = A^H$ .

You can use the parameter `sort` to perform or not perform reordering of non-zero entries in input and output sparse matrices. The purpose of reordering is to rearrange non-zero entries in compressed sparse row matrix so that column indices in compressed sparse representation are sorted in the increasing order for each row.

The following table shows correspondence between the value of the parameter `sort` and the type of reordering performed by this routine for each sparse matrix involved:

Value of the parameter <i>sort</i>	Reordering of <i>A</i> (arrays <i>a, ja, ia</i> )	Reordering of <i>B</i> (arrays <i>b, ja, ib</i> )	Reordering of <i>C</i> (arrays <i>c, jc, ic</i> )
1	yes	no	yes
2	no	yes	yes
3	yes	yes	yes
4	yes	no	no
5	no	yes	no
6	yes	yes	no
7	no	no	no
arbitrary value not equal to 1, 2, ..., 7	no	no	yes

**NOTE**

This routine supports only one-based indexing of the input arrays.

## Input Parameters

<i>trans</i>	<p>Specifies the operation.</p> <p>If <i>trans</i> = 'N' or 'n', then <math>C := A*B</math></p> <p>If <i>trans</i> = 'T' or 't' or 'C' or 'c', then <math>C := A^T*B</math>.</p>
<i>request</i>	<p>If <i>request</i>=0, the routine performs multiplication, the memory for the output arrays <i>ic</i>, <i>jc</i>, <i>c</i> must be allocated beforehand.</p> <p>If <i>request</i>=1, the routine computes only values of the array <i>ic</i> of length <math>m + 1</math>, the memory for this array must be allocated beforehand. On exit the value <math>ic[m] - 1</math> is the actual number of the elements in the arrays <i>c</i> and <i>jc</i>.</p> <p>If <i>request</i>=2, the routine has been called previously with the parameter <i>request</i>=1, the output arrays <i>jc</i> and <i>c</i> are allocated in the calling program and they are of the length <math>ic[m] - 1</math> at least.</p>
<i>sort</i>	<p>Specifies whether the routine performs reordering of non-zeros entries in input and/or output sparse matrices (see table above).</p>
<i>m</i>	Number of rows of the matrix <i>A</i> .
<i>n</i>	Number of columns of the matrix <i>A</i> .
<i>k</i>	Number of columns of the matrix <i>B</i> .
<i>a</i>	Array containing non-zero elements of the matrix <i>A</i> . Its length is equal to the number of non-zero elements in the matrix <i>A</i> . Refer to <i>values</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.
<i>ja</i>	<p>Array containing the column indices plus one for each non-zero element of the matrix <i>A</i>. For each row the column indices must be arranged in the increasing order.</p> <p>The length of this array is equal to the length of the array <i>a</i>. Refer to <i>columns</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.</p>

<i>ia</i>	<p>Array of length <math>m + 1</math>.</p> <p>This array contains indices of elements in the array <i>a</i>, such that <math>ia[i] - ia[0]</math> is the index in the array <i>a</i> of the first non-zero element from the row <i>i</i>. The value of the last element <math>ia[m]</math> is equal to the number of non-zero elements of the matrix <i>A</i> plus one. Refer to <i>rowIndex</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.</p>
<i>b</i>	<p>Array containing non-zero elements of the matrix <i>B</i>. Its length is equal to the number of non-zero elements in the matrix <i>B</i>. Refer to <i>values</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.</p>
<i>jb</i>	<p>Array containing the column indices plus one for each non-zero element of the matrix <i>B</i>. For each row the column indices must be arranged in the increasing order.</p> <p>The length of this array is equal to the length of the array <i>b</i>. Refer to <i>columns</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.</p>
<i>ib</i>	<p>Array of length <math>n + 1</math> when <i>trans</i> = 'N' or 'n', or <math>m + 1</math> otherwise.</p> <p>This array contains indices of elements in the array <i>b</i>, such that <math>ib[i] - ib[0]</math> is the index in the array <i>b</i> of the first non-zero element from the row <i>i</i>. The value of the last element <math>ib[n]</math> or <math>ib[m]</math> is equal to the number of non-zero elements of the matrix <i>B</i> plus one. Refer to <i>rowIndex</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.</p>
<i>nzmax</i>	<p>The length of the arrays <i>c</i> and <i>jc</i>.</p> <p>This parameter is used only if <i>request</i>=0. The routine stops calculation if the number of elements in the result matrix <i>C</i> exceeds the specified value of <i>nzmax</i>.</p>

## Output Parameters

<i>c</i>	<p>Array containing non-zero elements of the result matrix <i>C</i>. Its length is equal to the number of non-zero elements in the matrix <i>C</i>. Refer to <i>values</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.</p>
<i>jc</i>	<p>Array containing the column indices plus one for each non-zero element of the matrix <i>C</i>.</p> <p>The length of this array is equal to the length of the array <i>c</i>. Refer to <i>columns</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.</p>
<i>ic</i>	<p>Array of length <math>m + 1</math> when <i>trans</i> = 'N' or 'n', or <math>n + 1</math> otherwise.</p> <p>This array contains indices of elements in the array <i>c</i>, such that <math>ic[i] - ic[0]</math> is the index in the array <i>c</i> of the first non-zero element from the row <i>i</i>. The value of the last element <math>ic[m]</math> or <math>ic[n]</math> is equal to the number of non-zero elements of the matrix <i>C</i> plus one. Refer to <i>rowIndex</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.</p>
<i>info</i>	<p>If <i>info</i>=0, the execution is successful.</p> <p>If <i>info</i>=<i>I</i>&gt;0, the routine stops calculation in the <i>I</i>-th row of the matrix <i>C</i> because number of elements in <i>C</i> exceeds <i>nzmax</i>.</p>

If  $info=-1$ , the routine calculates only the size of the arrays  $c$  and  $jc$  and returns this value plus 1 as the last element of the array  $ic$ .

## mkl\_?csrmultd

Computes product of two sparse matrices stored in the CSR format (3-array variation) with one-based indexing. The result is stored in the dense matrix (deprecated).

### Syntax

```
void mkl_dcsmultd (const char *trans , const MKL_INT *m , const MKL_INT *n , const MKL_INT *k , double *a , MKL_INT *ja , MKL_INT *ia , double *b , MKL_INT *jb , MKL_INT *ib , double *c , MKL_INT *ldc );
```

```
void mkl_scsmultd (const char *trans , const MKL_INT *m , const MKL_INT *n , const MKL_INT *k , float *a , MKL_INT *ja , MKL_INT *ia , float *b , MKL_INT *jb , MKL_INT *ib , float *c , MKL_INT *ldc );
```

### Description

This routine is deprecated. Use [mkl\\_sparse\\_?\\_spmmd](#) from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?csrmultd` routine performs a matrix-matrix operation defined as

$$C := \text{op}(A) * B$$

where:

$A$ ,  $B$  are the sparse matrices in the CSR format (3-array variation),  $C$  is dense matrix;

$\text{op}(A)$  is one of  $\text{op}(A) = A$ , or  $\text{op}(A) = A^T$ , or  $\text{op}(A) = A^H$ .

The routine works correctly if and only if the column indices in sparse matrix representations of matrices  $A$  and  $B$  are arranged in the increasing order for each row.

---

#### NOTE

This routine supports only one-based indexing of the input arrays.

---

### Input Parameters

<code>trans</code>	Specifies the operation. If <code>trans = 'N' or 'n'</code> , then $C := A * B$
--------------------	--

If  $trans = 'T'$  or  $'t'$  or  $'C'$  or  $'c'$ , then  $C := A^T * B$ .

$m$	Number of rows of the matrix $A$ .
$n$	Number of columns of the matrix $A$ .
$k$	Number of columns of the matrix $B$ .
$a$	Array containing non-zero elements of the matrix $A$ . Its length is equal to the number of non-zero elements in the matrix $A$ . Refer to <i>values</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.
$ja$	<p>Array containing the column indices plus one for each non-zero element of the matrix <math>A</math>. For each row the column indices must be arranged in the increasing order.</p> <p>The length of this array is equal to the length of the array <math>a</math>. Refer to <i>columns</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.</p>
$ia$	<p>Array of length <math>m + 1</math> when <math>trans = 'N'</math> or <math>'n'</math>, or <math>n + 1</math> otherwise.</p> <p>This array contains indices of elements in the array <math>a</math>, such that <math>ia[i] - ia[0]</math> is the index in the array <math>a</math> of the first non-zero element from the row <math>i</math>. The value of the last element <math>ia[m]</math> or <math>ia[n]</math> is equal to the number of non-zero elements of the matrix <math>A</math> plus one. Refer to <i>rowIndex</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.</p>
$b$	Array containing non-zero elements of the matrix $B$ . Its length is equal to the number of non-zero elements in the matrix $B$ . Refer to <i>values</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.
$jb$	<p>Array containing the column indices plus one for each non-zero element of the matrix <math>B</math>. For each row the column indices must be arranged in the increasing order.</p> <p>The length of this array is equal to the length of the array <math>b</math>. Refer to <i>columns</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.</p>
$ib$	<p>Array of length <math>m + 1</math>.</p> <p>This array contains indices of elements in the array <math>b</math>, such that <math>ib[i] - ib[0]</math> is the index in the array <math>b</math> of the first non-zero element from the row <math>i</math>. The value of the last element <math>ib[m]</math> is equal to the number of non-zero elements of the matrix <math>B</math> plus one. Refer to <i>rowIndex</i> array description in <a href="#">Sparse Matrix Storage Formats</a> for more details.</p>

## Output Parameters

$c$	Array containing non-zero elements of the result matrix $C$ .
$ldc$	Specifies the leading dimension of the dense matrix $C$ as declared in the calling (sub)program. Must be at least $\max(m, 1)$ when $trans = 'N'$ or $'n'$ , or $\max(1, n)$ otherwise.

## Sparse QR Routines

*Sparse QR routines and their data types*

Routine or function group	Data types	Description
<a href="#">mkl_sparse_set_qr_hint</a>		Enables a pivot strategy for an ill-conditioned matrix.
<a href="#">mkl_sparse_?_qr</a>	s,d	Calculates the solution of a sparse system of linear equations using QR factorization.
<a href="#">mkl_sparse_qr_reorder</a>		Performs reordering and symbolic analysis of the matrix $A$ .
<a href="#">mkl_sparse_?_qr_factorize</a>	s,d	Performs numerical factorization of the matrix $A$ .
<a href="#">mkl_sparse_?_qr_solve</a>	s,d	Solves the system $A*x = b$ using QR factorization of the matrix $A$ .
<a href="#">mkl_sparse_?_qr_qmult</a>	s,d	Performs $x := Q^{(-1)} * b$ .
<a href="#">mkl_sparse_?_qr_rsolve</a>	s,d	Performs $x := R^{(-1)} * b$ .

**NOTE** The underdetermined systems of equations are not supported. The number of columns should be less or equal to the number or rows.

For more information about the workflow of sparse QR functionality, refer to [oneMKL Sparse QR solver: Multifrontal Sparse QR Factorization Method for Solving a Sparse System of Linear Equations](#).

### [mkl\\_sparse\\_set\\_qr\\_hint](#)

Define the pivot strategy for further calls of [mkl\\_sparse\\_?\\_qr](#).

#### Syntax

```
sparse_status_t mkl_sparse_set_qr_hint (sparse_matrix_t A, sparse_qr_hint_t hint);
```

#### Include Files

- `mkl_sparse_qr.h`

#### Description

You can use this routine to enable a pivot strategy in the case of an ill-conditioned matrix.

#### Input Parameters

`A` Handle containing a sparse matrix in an internal data structure.

`hint` Value specifying whether to use pivoting.

**NOTE** The only value currently supported is `SPARSE_QR_WITH_PIVOTS`, which enables the use of a pivot strategy for an ill-conditioned matrix.

#### Return Values

`SPARSE_STATUS_SUCCESS` The operation was successful.

`SPARSE_STATUS_NOT_INITIALIZED` The routine encountered an empty handle or matrix array.

SPARSE\_STATUS\_ALLOC\_FAILED Internal memory allocation failed.

SPARSE\_STATUS\_INVALID\_VALUE The input parameters contain an invalid value.

SPARSE\_STATUS\_EXECUTION\_FAILED Execution failed.

SPARSE\_STATUS\_INTERNAL\_ERROR An error in algorithm implementation occurred.

SPARSE\_STATUS\_NOT\_SUPPORTED The requested operation is not supported.

## mkl\_sparse\_?\_qr

*Computes the QR decomposition for the matrix of a sparse linear system and calculates the solution.*

### Syntax

```
sparse_status_t mkl_sparse_d_qr ( sparse_operation_t operation, sparse_matrix_t A,
struct matrix_descr descr, sparse_layout_t layout, MKL_INT columns, double *x, MKL_INT
ldx, const double *b, MKL_INT ldb );
```

```
sparse_status_t mkl_sparse_s_qr ( sparse_operation_t operation, sparse_matrix_t A,
struct matrix_descr descr, sparse_layout_t layout, MKL_INT columns, float *x, MKL_INT
ldx, const float *b, MKL_INT ldb );
```

### Include Files

- mkl\_sparse\_qr.h

### Description

The `mkl_sparse_?_qr` routine computes the QR decomposition for the matrix of a sparse linear system  $A*x = b$ , so that  $A = Q*R$  where  $Q$  is the orthogonal matrix and  $R$  is upper triangular, and calculates the solution.

---

#### NOTE

Currently, `mkl_sparse_?_qr` supports only square and overdetermined systems. For underdetermined systems you can manually transpose the system matrix and use QR decomposition for  $A^T$  to get the minimum-norm solution for the original underdetermined system.

---

---

**NOTE** Currently, `mkl_sparse_?_qr` supports only CSR format for the input matrix, non-transpose operation, and single right-hand side.

---

### Input Parameters

`operation` Specifies the operation to perform.

---

**NOTE** Currently, the only supported value is `SPARSE_OPERATION_NON_TRANSPOSE` (non-transpose case; that is,  $A*x = b$  is solved).

---

*A* Handle containing a sparse matrix in an internal data structure.

*descr* Structure specifying sparse matrix properties. Only the parameters listed here are currently supported.

*type* Specifies the type of sparse matrix.

---

**NOTE** Currently, the only supported value is `SPARSE_MATRIX_TYPE_GENERAL` (the matrix is processed as-is).

---

*layout* Describes the storage scheme for the dense matrix:

<code>SPARSE_LAYOUT_COLUMN_MAJOR</code>	Storage of elements uses column-major layout.
<code>SPARSE_LAYOUT_ROW_MAJOR</code>	Storage of elements uses row-major layout.

*x* Array with a size of at least  $rows*cols$ :

	<i>layout</i> = <code>SPARSE_LAYOUT_COLUMN_MAJOR</code>	<i>layout</i> = <code>SPARSE_LAYOUT_ROW_MAJOR</code>
<i>rows</i> (number of rows in <i>x</i> )	<i>ldx</i>	Number of columns in <i>A</i>
<i>cols</i> (number of columns in <i>x</i> )	<i>columns</i>	<i>ldx</i>

*columns* Number of columns in matrix *b*.

*ldx* Specifies the leading dimension of matrix *x*.

*b* Array with a size of at least  $rows*cols$ :

	<i>layout</i> = <code>SPARSE_LAYOUT_COLUMN_MAJOR</code>	<i>layout</i> = <code>SPARSE_LAYOUT_ROW_MAJOR</code>
<i>rows</i> (number of rows in <i>b</i> )	<i>ldb</i>	Number of columns in <i>A</i>
<i>cols</i> (number of columns in <i>b</i> )	<i>columns</i>	<i>ldb</i>

*ldb* Specifies the leading dimension of matrix *b*.

## Output Parameters

`x` Overwritten by the updated matrix `y`.

## Return Values

`SPARSE_STATUS_SUCCESS` The operation was successful.

`SPARSE_STATUS_NOT_INITIALIZED` The routine encountered an empty handle or matrix array.

`SPARSE_STATUS_ALLOC_FAILED` Internal memory allocation failed.

`SPARSE_STATUS_INVALID_VALUE` The input parameters contain an invalid value.

`SPARSE_STATUS_EXECUTION_FAILED` Execution failed.

`SPARSE_STATUS_INTERNAL_ERROR` An error in algorithm implementation occurred.

`SPARSE_STATUS_NOT_SUPPORTED` The requested operation is not supported.

## `mkl_sparse_qr_reorder`

*Reordering step of SPARSE QR solver.*

---

### Syntax

```
sparse_status_t mkl_sparse_qr_reorder (sparse_matrix_t A, struct matrix_descr descr);
```

### Include Files

- `mkl_sparse_qr.h`

### Description

The `mkl_sparse_qr_reorder` routine performs ordering and symbolic analysis of matrix `A`.

---

**NOTE** Currently, `mkl_sparse_qr_reorder` supports only general structure and CSR format for the input matrix.

---

## Input Parameters

`A` Handle containing a sparse matrix in an internal data structure.

`descr` Structure specifying sparse matrix properties. Only the parameters listed here are currently supported.

## Return Values

`SPARSE_STATUS_SUCCESS` The operation was successful.

<code>SPARSE_STATUS_NOT_INITIALIZED</code>	The routine encountered an empty handle or matrix array.
<code>SPARSE_STATUS_ALLOC_FAILED</code>	Internal memory allocation failed.
<code>SPARSE_STATUS_INVALID_VALUE</code>	The input parameters contain an invalid value.
<code>SPARSE_STATUS_EXECUTION_FAILED</code>	Execution failed.
<code>SPARSE_STATUS_INTERNAL_ERROR</code>	An error in algorithm implementation occurred.
<code>SPARSE_STATUS_NOT_SUPPORTED</code>	The requested operation is not supported.

## **mkl\_sparse\_?\_qr\_factorize**

*Factorization step of the SPARSE QR solver.*

### **Syntax**

```
sparse_status_t mkl_sparse_d_qr_factorize (sparse_matrix_t A, double *alt_values);
sparse_status_t mkl_sparse_s_qr_factorize (sparse_matrix_t A, float *alt_values);
```

### **Include Files**

- `mkl_sparse_qr.h`

### **Description**

The `mkl_sparse_?_qr_factorize` routine performs numerical factorization of matrix *A*. Prior to calling this routine, the `mkl_sparse_?_qr_reorder` routine must be called for the matrix handle *A*. For more information about the workflow of sparse QR functionality, refer to [oneMKL Sparse QR solver. Multifrontal Sparse QR Factorization Method for Solving a Sparse System of Linear Equations](#).

---

**NOTE** Currently, `mkl_sparse_?_qr_factorize` supports only CSR format for the input matrix.

---

### **Input Parameters**

<i>A</i>	Handle containing a sparse matrix in an internal data structure.
<i>alt_values</i>	Array with alternative values. Must be the size of the non-zeroes in the initial input matrix. When passed to the routine, these values will be used during the factorization step instead of the values stored in handle <i>A</i> .

### **Return Values**

<code>SPARSE_STATUS_SUCCESS</code>	The operation was successful.
<code>SPARSE_STATUS_NOT_INITIALIZED</code>	The routine encountered an empty handle or matrix array.

`SPARSE_STATUS_ALLOC_FAILED` Internal memory allocation failed.

`SPARSE_STATUS_INVALID_VALUE` The input parameters contain an invalid value.

`SPARSE_STATUS_EXECUTION_FAILED` Execution failed.

`SPARSE_STATUS_INTERNAL_ERROR` An error in algorithm implementation occurred.

`SPARSE_STATUS_NOT_SUPPORTED` The requested operation is not supported.

## `mkl_sparse_?_qr_solve`

*Solving step of the SPARSE QR solver.*

---

### Syntax

```
sparse_status_t mkl_sparse_d_qr_solve ( sparse_operation_t operation, sparse_matrix_t
A, double *alt_values, sparse_layout_t layout, MKL_INT columns, double *x, MKL_INT ldx,
const double *b, MKL_INT ldb );

sparse_status_t mkl_sparse_s_qr_solve ( sparse_operation_t operation, sparse_matrix_t
A, float *alt_values, sparse_layout_t layout, MKL_INT columns, float *x, MKL_INT ldx,
const float *b, MKL_INT ldb );
```

### Include Files

- `mkl_sparse_qr.h`

### Description

The `mkl_sparse_?_qr_solve` routine computes the solution of sparse systems of linear equations  $A*x = b$ . Prior to calling this routine, the `mkl_sparse_?_qr_factorize` routine must be called for the matrix handle  $A$ . For more information about the workflow of sparse QR functionality, refer to [oneMKL Sparse QR solver: Multifrontal Sparse QR Factorization Method for Solving a Sparse System of Linear Equations](#).

---

#### NOTE

Currently, `mkl_sparse_?_qr_solve` supports only CSR format for the input matrix, non-transpose operation, and single right-hand side.

Alternative values are not supported and must be set to NULL.

---

### Input Parameters

*operation* Specifies the operation to perform.

---

**NOTE** Currently, the only supported value is `SPARSE_OPERATION_NON_TRANSPOSE` (non-transpose case; that is,  $A*x = b$  is solved).

---

*A* Handle containing a sparse matrix in an internal data structure.

*alt\_values* Reserved for future use.

*layout* Describes the storage scheme for the dense matrix:

SPARSE_LAYOUT_COLUMN_MAJOR	Storage of elements uses column-major layout.
SPARSE_LAYOUT_ROW_MAJOR	Storage of elements uses row-major layout.

*x* Array with a size of at least  $rows * cols$ :

	<i>layout</i> = SPARSE_LAYOUT_COLUMN_MAJOR	<i>layout</i> = SPARSE_LAYOUT_ROW_MAJOR
<i>rows</i> (number of rows in <i>x</i> )	<i>ldx</i>	Number of columns in <i>A</i>
<i>cols</i> (number of columns in <i>x</i> )	<i>columns</i>	<i>ldx</i>

*columns* Number of columns in matrix *b*.

*ldx* Specifies the leading dimension of matrix *x*.

*b* Array with a size of at least  $rows * cols$ :

	<i>layout</i> = SPARSE_LAYOUT_COLUMN_MAJOR	<i>layout</i> = SPARSE_LAYOUT_ROW_MAJOR
<i>rows</i> (number of rows in <i>b</i> )	<i>ldb</i>	Number of columns in <i>A</i>
<i>cols</i> (number of columns in <i>b</i> )	<i>columns</i>	<i>ldb</i>

*ldb* Specifies the leading dimension of matrix *b*.

## Output Parameters

*x* Contains the solution of system  $A * x = b$ .

## Return Values

SPARSE\_STATUS\_SUCCESS The operation was successful.

SPARSE\_STATUS\_NOT\_INITIALIZED The routine encountered an empty handle or matrix array.

SPARSE\_STATUS\_ALLOC\_FAILED Internal memory allocation failed.

SPARSE\_STATUS\_INVALID\_VALUE The input parameters contain an invalid value.

`SPARSE_STATUS_EXECUTION_FAILED` Execution failed.

`ON_FAILED`

`SPARSE_STATUS_INTERNAL_ERROR` An error in algorithm implementation occurred.

`L_ERROR`

`SPARSE_STATUS_NOT_SUPPORTED` The requested operation is not supported.

`PORTED`

## mkl\_sparse\_?\_qr\_qmult

First stage of the solving step of the SPARSE QR solver.

### Syntax

```
sparse_status_t mkl_sparse_d_qr_qmult ( sparse_operation_t operation, sparse_matrix_t
A, sparse_layout_t layout, MKL_INT columns, double *x, MKL_INT ldx, const double *b,
MKL_INT ldb );
```

```
sparse_status_t mkl_sparse_s_qr_qmult ( sparse_operation_t operation, sparse_matrix_t
A, sparse_layout_t layout, MKL_INT columns, float *x, MKL_INT ldx, const float *b,
MKL_INT ldb );
```

### Include Files

- `mkl_sparse_qr.h`

### Description

The `mkl_sparse_?_qr_qmult` routine computes multiplication of inversed matrix  $Q$  and right-hand side matrix  $b$ . This routine can be used to perform the solving step in two separate calls as an alternative to a single call of `mkl_sparse_?_qr_solve`.

---

**NOTE** Currently, `mkl_sparse_?_qr_qmult` supports only CSR format for the input matrix, non-transpose operation, and single right-hand side.

---

### Input Parameters

*operation* Specifies the operation to perform.

---

**NOTE** Currently, the only supported value is `SPARSE_OPERATION_NON_TRANSPOSE` (non-transpose case; that is,  $A^*x = b$  is solved).

---

*A* Handle containing a sparse matrix in an internal data structure.

*layout* Describes the storage scheme for the dense matrix:

<code>SPARSE_LAYOUT_COLUMN_MAJOR</code>	Storage of elements uses column-major layout.
<code>SPARSE_LAYOUT_ROW_MAJOR</code>	Storage of elements uses row-major layout.

*x* Array with a size of at least `rows*cols`:

	<i>layout =</i> SPARSE_LAYOUT_COLUMN_MAJOR	<i>layout =</i> SPARSE_LAYOUT_ROW_MAJOR
<i>rows</i> (number of rows in <i>x</i> )	<i>ldx</i>	Number of columns in <i>A</i>
<i>cols</i> (number of columns in <i>x</i> )	<i>columns</i>	<i>ldx</i>

*columns*

Number of columns in matrix *b*.

*ldx*

Specifies the leading dimension of matrix *x*.

*b*

Array with a size of at least  $rows * cols$ :

	<i>layout =</i> SPARSE_LAYOUT_COLUMN_MAJOR	<i>layout =</i> SPARSE_LAYOUT_ROW_MAJOR
<i>rows</i> (number of rows in <i>b</i> )	<i>ldb</i>	Number of columns in <i>A</i>
<i>cols</i> (number of columns in <i>b</i> )	<i>columns</i>	<i>ldb</i>

*ldb*

Specifies the leading dimension of matrix *b*.

## Output Parameters

*x*

Overwritten by the updated matrix  $x = Q^{-1} * b$ .

## Return Values

- SPARSE\_STATUS\_SUCCESS The operation was successful.
- SPARSE\_STATUS\_NOT\_INITIALIZED The routine encountered an empty handle or matrix array.
- SPARSE\_STATUS\_ALLOC\_FAILED Internal memory allocation failed.
- SPARSE\_STATUS\_INVALID\_VALUE The input parameters contain an invalid value.
- SPARSE\_STATUS\_EXECUTION\_FAILED Execution failed.
- SPARSE\_STATUS\_INTERNAL\_ERROR An error in algorithm implementation occurred.
- SPARSE\_STATUS\_NOT\_SUPPORTED The requested operation is not supported.

## mkl\_sparse\_?\_qr\_solve

Second stage of the solving step of the SPARSE QR solver.

### Syntax

```
sparse_status_t mkl_sparse_d_qr_solve ( sparse_operation_t operation, sparse_matrix_t
A, sparse_layout_t layout, MKL_INT columns, double *x, MKL_INT ldx, const double *b,
MKL_INT ldb );
```

```
sparse_status_t mkl_sparse_s_qr_solve ( sparse_operation_t operation, sparse_matrix_t
A, sparse_layout_t layout, MKL_INT columns, float *x, MKL_INT ldx, const float *b,
MKL_INT ldb );
```

### Include Files

- mkl\_sparse\_qr.h

### Description

The `mkl_sparse_?_qr_solve` routine computes the solution of  $A*x = b$ .

---

**NOTE** Currently, `mkl_sparse_?_qr_solve` supports only CSR format for the input matrix, non-transpose operation, and single right-hand side.

---

### Input Parameters

*operation* Specifies the operation to perform.

---

**NOTE** Currently, the only supported value is `SPARSE_OPERATION_NON_TRANSPOSE` (non-transpose case; that is,  $A*x = b$  is solved).

---

*A* Handle containing a sparse matrix in an internal data structure.

*layout* Describes the storage scheme for the dense matrix:

<code>SPARSE_LAYOUT_COLUMN_MAJOR</code>	Storage of elements uses column-major layout.
<code>SPARSE_LAYOUT_ROW_MAJOR</code>	Storage of elements uses row-major layout.

*x* Array with a size of at least  $rows*cols$ :

	<i>layout</i> = <code>SPARSE_LAYOUT_COLUMN_MAJOR</code>	<i>layout</i> = <code>SPARSE_LAYOUT_ROW_MAJOR</code>
<i>rows</i> (number of rows in <i>x</i> )	<i>ldx</i>	Number of columns in <i>A</i>
<i>cols</i> (number of columns in <i>x</i> )	<i>columns</i>	<i>ldx</i>

*columns* Number of columns in matrix *b*.

*ldx* Specifies the leading dimension of matrix *x*.

*b* Array with a size of at least  $rows * cols$ :

	<i>layout</i> = SPARSE_LAYOUT_COLUMN_MAJOR	<i>layout</i> = SPARSE_LAYOUT_ROW_MAJOR
<i>rows</i> (number of rows in <i>b</i> )	<i>ldb</i>	Number of columns in <i>A</i>
<i>cols</i> (number of columns in <i>b</i> )	<i>columns</i>	<i>ldb</i>

*ldb* Specifies the leading dimension of matrix *b*.

## Output Parameters

*x* Contains the solution of the triangular system  $R*x = b$ .

## Return Values

SPARSE\_STATUS\_SUCCESS The operation was successful.

SPARSE\_STATUS\_NOT\_INITIALIZED The routine encountered an empty handle or matrix array.

SPARSE\_STATUS\_ALLOC\_FAILED Internal memory allocation failed.

SPARSE\_STATUS\_INVALID\_VALUE The input parameters contain an invalid value.

SPARSE\_STATUS\_EXECUTION\_FAILED Execution failed.

SPARSE\_STATUS\_INTERNAL\_ERROR An error in algorithm implementation occurred.

SPARSE\_STATUS\_NOT\_SUPPORTED The requested operation is not supported.

## Compact BLAS and LAPACK Functions

### Overview

Many HPC applications rely on the application of BLAS and LAPACK operations on groups of very small matrices. While existing batch Intel® oneAPI Math Kernel Library (oneMKL) BLAS routines already provide meaningful speedup over OpenMP\* loops around BLAS operations for these sizes, another customization offers potential speedup by allocating matrices in a [SIMD-friendly format](#), thus allowing for cross-matrix vectorization in the BLAS and LAPACK routines of the Intel® oneAPI Math Kernel Library (oneMKL) called *Compact BLAS and LAPACK*.

The main idea behind these compact methods is to create true SIMD computations in which subgroups of matrices are operated on with kernels that abstractly appear as scalar kernels, while registers are filled by cross-matrix vectorization.

These are the BLAS/LAPACK compact functions:

- [mkl\\_?gemm\\_compact](#)
- [mkl\\_?trsm\\_compact](#)
- [mkl\\_?potrf\\_compact](#)
- [mkl\\_?getrfnp\\_compact](#)
- [mkl\\_?geqrf\\_compact](#)
- [mkl\\_?getrinp\\_compact](#)

The compact API provides additional service functions to refactor data. Because this capability is not specific to any particular BLAS or LAPACK operation, this data manipulation can be executed once for an application's data, allowing the entire program -- consisting of any number of BLAS and LAPACK operations for which compact kernels have been written -- to be performed on the compact data without any refactoring. For applications working on data in compact format, the packing function need not be used.

See "About the Compact Format" below for more details.

Along with this new data format, the API consists of two components:

- **BLAS and LAPACK Compact Kernels:** The first component of the API is a compact kernel that works on matrices stored in compact format.
- **Service Functions for the Compact Format:** The second component of the API is a compact service function allowing for data to be factored into and out of compact format. These are:
  - [mkl\\_?gepack\\_compact](#)
  - [mkl\\_?geunpack\\_compact](#)
  - [mkl\\_get\\_format\\_compact](#)
  - [mkl\\_?get\\_size\\_compact](#)

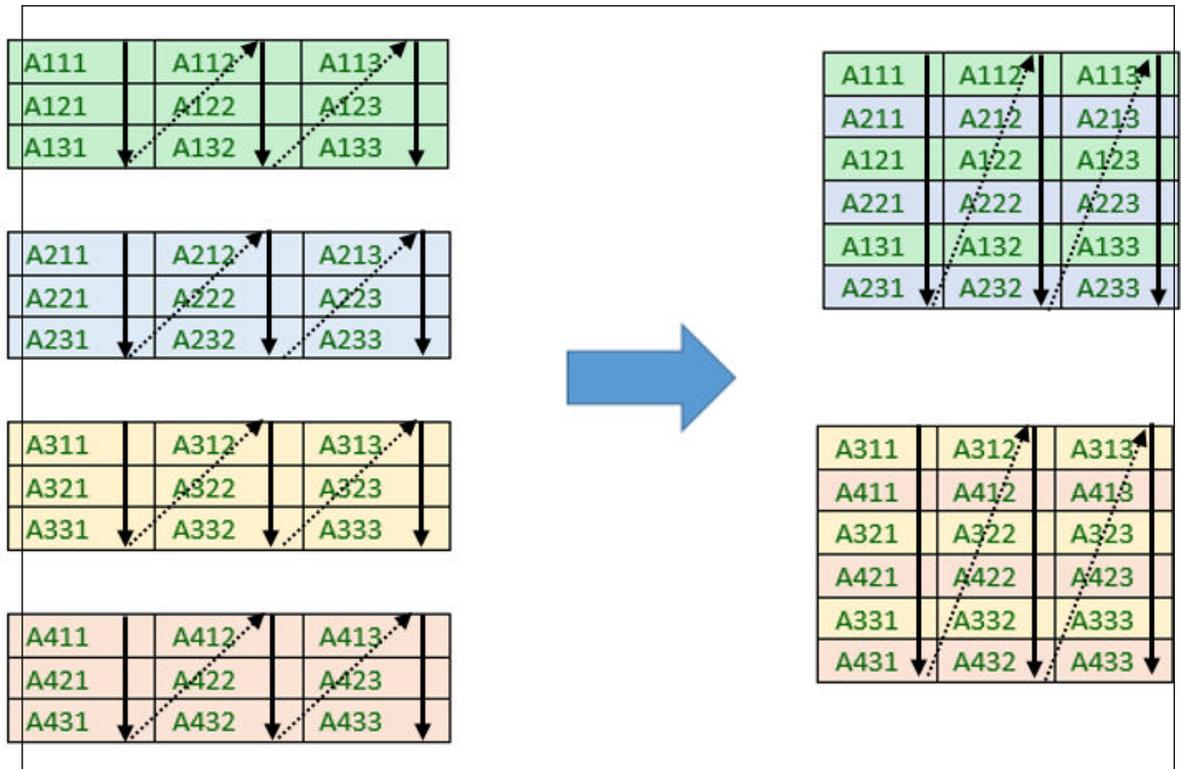

Note that there are some [Numerical Limitations](#) for the routines mentioned above.

## About the Compact Format

In compact format, for calculations involving *real* precision, matrices are organized in packs of size  $V$ , where  $V$  is the SIMD vector length of the underlying architecture. Each pack is a 3D-tensor with the matrix index incrementing the fastest. These packs are then loaded into registers and operated on using SIMD instructions.

The figure below demonstrates the packing of a set of four 3 x 3 real-precision matrices into compact format. The pack length for this example is  $V = 2$ , resulting in 2 compact packs.

**Interleaved Data for Compact BLAS and LAPACK**

For calculations involving *complex* precision, the real and imaginary parts of each matrix are packed separately. In the figure below, the group of four 3 x 3 complex matrices is packed into compact format with pack length  $V = 2$ . The first pack consists of the real parts of the first two matrices, and the second pack consists of the imaginary parts of the first two matrices. Real and imaginary packs alternate in memory. This storage format means that *all* compact arrays can be handled as a real type.

### Compact Format for Complex Precision

The particular specifications (size and number) of the compact packs for the architecture and problem-precision definition are specified by an **MKL\_COMPACT\_PACK** enum type. For example: given a double-precision problem involving a group of 128 matrices working on an architecture with a 256-bit SIMD vector length, the optimal pack length is  $V = 4$ , and the number of packs is 32.

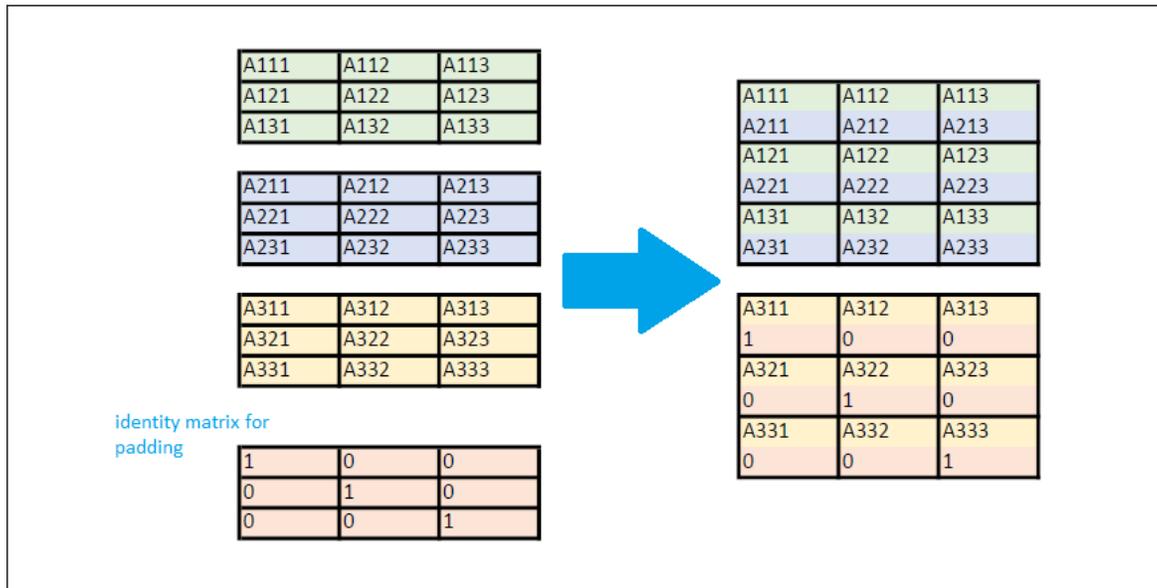

The initially-permitted values for the enum are:

- **MKL\_COMPACT\_SSE** - pack length 2 for double precision, pack length 4 for single precision.
- **MKL\_COMPACT\_AVX** - pack length 4 for double precision, pack length 8 for single precision.
- **MKL\_COMPACT\_AVX512** - pack length 8 for double precision, pack length 16 for single precision.

For calculations involving *complex* precision, the pack length is the same; however, half of the packs store the real parts of matrices, and half store the imaginary parts. This means that it takes **double** the number of packs to store the same number of matrices.

The above examples illustrate the case when the number of matrices is evenly-divisible by the pack length. When this is not the case, there will be partially-unfilled packs at the end of the memory segment, and the compact-packing routine will pad these partially unfilled packs with *identity matrices*, so that compact routines use only the completely-filled registers in their calculations. The next figure illustrates this padding for a group of three 3 x 3 real-precision matrices with a pack length of 2.

### Compact Format with Padding

Before calling a BLAS or LAPACK compact function, the input data must be packed in compact format. After execution, the output data should be unpacked from this compact format, unless another compact routine will be called immediately following the first. Two service functions, [mkl\\_?gepack\\_compact](#), and [mkl\\_?geunpack\\_compact](#), facilitate the process of storing matrices in compact format. It is recommended that the user call the function [mkl\\_get\\_format\\_compact](#) before calling the [mkl\\_?gepack\\_compact](#) routine to obtain the optimal format for performance. Advanced users can pack and unpack the matrices themselves and still use Intel® oneAPI Math Kernel Library (oneMKL) compact functions on the packed set.

Compact routines can only be called for groups of matrices that have the same dimensions, leading dimension, and storage format. For example, the routine [mkl\\_?getrfnp\\_compact](#), which calculates the LU factorization of a group of  $m \times n$  matrices without pivoting, can only be called for a group of matrices with the same number of rows ( $m$ ) and the same number of columns ( $n$ ). All of the matrices must also be stored in arrays with the same leading dimension, and all must be stored in the same storage format (column-major or row-major).

### [mkl\\_?gemm\\_compact](#)

*Computes a matrix-matrix product of a set of compact format general matrices.*

#### Syntax

```
void mkl_sgemm_compact (MKL_LAYOUT layout, MKL_TRANSPOSE transa, MKL_TRANSPOSE transb,
MKL_INT m, MKL_INT n, MKL_INT k, float alpha, const float *ap, MKL_INT ldap, const float
*bp, MKL_INT ldbp, float beta, float *cp, MKL_INT ldcp, MKL_COMPACT_PACK format, MKL_INT
nm);
```

```
void mkl_dgemm_compact (MKL_LAYOUT layout, MKL_TRANSPOSE transa, MKL_TRANSPOSE transb,
MKL_INT m, MKL_INT n, MKL_INT k, double alpha, const double *ap, MKL_INT ldap, const
double *bp, MKL_INT ldbp, double beta, double *cp, MKL_INT ldcp, MKL_COMPACT_PACK
format, MKL_INT nm);
```

```
void mkl_cgemm_compact (MKL_LAYOUT layout, MKL_TRANSPOSE transa, MKL_TRANSPOSE transb,
MKL_INT m, MKL_INT n, MKL_INT k, mkl_compact_complex_float *alpha, const float *ap,
MKL_INT ldap, const float *bp, MKL_INT ldbp, mkl_compact_complex_float *beta, float
*cp, MKL_INT ldcp, MKL_COMPACT_PACK format, MKL_INT nm);
```

```
void mkl_zgemm_compact (MKL_LAYOUT layout, MKL_TRANSPOSE transa, MKL_TRANSPOSE transb,
MKL_INT m, MKL_INT n, MKL_INT k, mkl_compact_complex_double *alpha, const double *ap,
MKL_INT ldap, const double *bp, MKL_INT ldbp, mkl_compact_complex_double *beta, double
*cp, MKL_INT ldcp, MKL_COMPACT_PACK format, MKL_INT nm);
```

## Description

The `mkl_?gemm_compact` routine computes a scalar-matrix-matrix product and adds the result to a scalar-matrix product for a group of `nm` general matrices  $A_c$  that have been stored in compact format. The operation is defined for each matrix as:

$$C_c := \alpha * \text{op}(A_c) * \text{op}(B_c) + \beta * C_c$$

Where

- $\text{op}(X_c)$  is one of  $\text{op}(X_c) = X_c$ , or  $\text{op}(X_c) = X_c^T$ , or  $\text{op}(X_c) = X_c^H$ ,
- $\alpha$  and  $\beta$  are scalars,
- $A_c$ ,  $B_c$ , and  $C_c$  are matrices that have been stored in compact format,
- $\text{op}(A_c)$  is an  $m$ -by- $k$  matrix for each matrix in the group,
- $\text{op}(B_c)$  is a  $k$ -by- $n$  matrix for each matrix in the group,
- and  $C_c$  is an  $m$ -by- $n$  matrix.

## Input Parameters

<i>layout</i>	Specifies whether two-dimensional array storage is row-major (MKL_ROW_MAJOR) or column-major (MKL_COL_MAJOR).
<i>transa</i>	Specifies the operation: If <i>transa</i> =MKL_NOTRANS, then $\text{op}(A_c) := A_c$ . If <i>transa</i> =MKL_TRANS, then $\text{op}(A_c) := A_c^T$ . If <i>transa</i> =MKL_CONJTRANS, then $\text{op}(A_c) := A_c^H$ .
<i>transb</i>	Specifies the operation: If <i>transb</i> =MKL_NOTRANS, then $\text{op}(B_c) := B_c$ . If <i>transb</i> =MKL_TRANS, then $\text{op}(B_c) := B_c^T$ . If <i>transb</i> =MKL_CONJTRANS, then $\text{op}(B_c) := B_c^H$ .
<i>m</i>	The number of rows of the matrices $\text{op}(A_c)$ , $m \geq 0$ .
<i>n</i>	The number of columns of matrices $\text{op}(B_c)$ and $C_c$ . $n \geq 0$ .
<i>k</i>	The number of columns of matrices $\text{op}(A_c)$ and the number of rows of matrices $\text{op}(B_c)$ . $k \geq 0$ .
<i>alpha</i>	Specifies the scalar <i>alpha</i> .

*ap*

Points to the beginning of the array that stores the  $nmA_c$  matrices. See [Compact Format](#) for more details.

	<i>transa</i> =MKL_NOTRANS	<i>transa</i> =MKL_TRANS or <i>transa</i> =MKL_CONJTRANS
<i>layout</i> = MKL_COL_MAJOR	<i>ap</i> has size $ldap*k*nm$ .	<i>ap</i> has size $ldap*m*nm$ .
<i>layout</i> = MKL_ROW_MAJOR	<i>ap</i> has size $ldap*m*nm$ .	<i>ap</i> has size $ldap*k*nm$ .

*ldap*

Specifies the leading dimension of  $A_c$ .

*bp*

Points to the beginning of the array that stores the  $nmB_c$  matrices. See [Compact Format](#) for more details.

	<i>transb</i> =MKL_NOTRANS	<i>transb</i> =MKL_TRANS or <i>transb</i> =MKL_CONJTRANS
<i>layout</i> = MKL_COL_MAJOR	<i>bp</i> has size $ldb p*n*nm$ .	<i>bp</i> has size $ldb p*k*nm$ .
<i>layout</i> = MKL_ROW_MAJOR	<i>bp</i> has size $ldb p*k*nm$ .	<i>bp</i> has size $ldb p*n*nm$ .

*ldb p*

Specifies the leading dimension of  $B_c$ .

*beta*

Specifies the scalar *beta*.

*cp*

Before entry, *cp* points to the beginning of the array that stores the  $nmC_c$  matrices, except when *beta* is equal to zero, in which case *cp* need not be set on entry.

<i>layout</i> = MKL_COL_MAJOR	<i>cp</i> has size $ldap*n*nm$ .
<i>layout</i> = MKL_ROW_MAJOR	<i>cp</i> has size $ldap*m*nm$ .

*ldcp*

Specifies the leading dimension of  $C_c$ .

<i>layout</i> = MKL_COL_MAJOR	<i>ldcp</i> must be at least $\max(1,m)$ .
<i>layout</i> = MKL_ROW_MAJOR	<i>ldcp</i> must be at least $\max(1,n)$ .

*format*

Specifies the format of the compact matrices. See [Compact Format](#) or `mkl_get_format_compact` for details.

*nm*

Total number of matrices stored in compact format in the group of matrices.

**NOTE**

The values of *ldap*, *ldbp*, and *ldcp* used in `mkl_?gemm_compact` must be consistent with the values used in `mkl_?get_size_compact`, `mkl_?gepack_compact`, and `mkl_?geunpack_compact`.

**Output Parameters**

*cp* Each matrix  $C_c$  is overwritten by the  $m$ -by- $n$  matrix ( $\alpha * \text{op}(A_c) * \text{op}(B_c) + \beta * C_c$ ).

**mkl\_?trsm\_compact**

Solves a triangular matrix equation for a set of general,  $m \times n$  matrices that have been stored in Compact format.

**Syntax**

```
mkl_strsm_compact (MKL_LAYOUT layout, MKL_SIDE side, MKL_UPLO uplo, MKL_TRANSPOSE
transa, MKL_DIAG diag, MKL_INT m, MKL_INT n, float alpha, const float *ap, MKL_INT
a_stride, float *bp, MKL_INT b_stride, MKL_COMPACT_PACK format, MKL_INT nm);
```

```
mkl_dtrsm_compact (MKL_LAYOUT layout, MKL_SIDE side, MKL_UPLO uplo, MKL_TRANSPOSE
transa, MKL_DIAG diag, MKL_INT m, MKL_INT n, double alpha, const double*ap, MKL_INT
a_stride, double *bp, MKL_INT b_stride, MKL_COMPACT_PACK format, MKL_INT nm);
```

```
mkl_ctrsm_compact (MKL_LAYOUT layout, MKL_SIDE side, MKL_UPLO uplo, MKL_TRANSPOSE
transa, MKL_DIAG diag, MKL_INT m, MKL_INT n, mkl_compact_complex_float *alpha, const
float *ap, MKL_INT a_stride, float *bp, MKL_INT b_stride, MKL_COMPACT_PACK format,
MKL_INT nm);
```

```
mkl_ztrsm_compact (MKL_LAYOUT layout, MKL_SIDE side, MKL_UPLO uplo, MKL_TRANSPOSE
transa, MKL_DIAG diag, MKL_INT m, MKL_INT n, mkl_compact_complex_double *alpha, const
double *ap, MKL_INT a_stride, double *bp, MKL_INT b_stride, MKL_COMPACT_PACK format,
MKL_INT nm);
```

**Description**

The routine solves one of the following matrix equations for a group of *nm* matrices:

$$\text{op}(A_c) * X_c = \alpha * B_c,$$

or

$$X_c * \text{op}(A_c) = \alpha * B_c$$

where:

$\alpha$  is a scalar,  $X_c$  and  $B_c$  are  $m$ -by- $n$  matrices that have been stored in compact format, and  $A_c$  is a  $m$ -by- $m$  unit, or non-unit, upper or lower triangular matrix that has been stored in compact format.

$\text{op}(A_c)$  is one of  $\text{op}(A_c) = A_c$ , or  $\text{op}(A_c) = A_c^T$ , or  $\text{op}(A_c) = A_c^H$ ,

$B_c$  is overwritten by the solution matrix  $X_c$ .

**Input Parameters**

*layout* Specifies whether two-dimensional array storage is row-major (MKL\_ROW\_MAJOR) or column-major (MKL\_COL\_MAJOR).

*side* Specifies whether  $\text{op}(A_c)$  appears on the left or right of  $X_c$  in the equation:

	if <code>side = MKL_LEFT</code> , then $\text{op}(A_c) * X_c = \text{alpha} * B_c$ , if <code>side = MKL_RIGHT</code> , then $X_c * \text{op}(A_c) = \text{alpha} * B_c$						
<code>uplo</code>	Specifies whether matrix $A_c$ is upper or lower triangular. If <code>uplo = MKL_UPPER</code> , $A_c$ is upper triangular. If <code>uplo = MKL_LOWER</code> , $A_c$ is lower triangular.						
<code>transa</code>	Specifies the operation: If <code>transa=MKL_NOTRANS</code> , then $\text{op}(A_c) = A_c$ ; If <code>transa=MKL_TRANS</code> , then $\text{op}(A_c) = A_c^T$ ; If <code>transa=MKL_CONJTRANS</code> , then $\text{op}(A_c) = A_c^H$ ;						
<code>diag</code>	Specifies whether the matrix $A_c$ is unit triangular: If <code>diag=MKL_UNIT</code> , then the matrix is unit triangular; if <code>diag=MKL_NONUNIT</code> , then the matrix is not unit triangular.						
<code>m</code>	The number of rows of $B_c$ and the number of rows and columns of $A_c$ when <code>side=MKL_LEFT</code> ; $m \geq 0$ .						
<code>n</code>	The number of columns of $B_c$ and the number of rows and columns of $A_c$ when <code>side=MKL_RIGHT</code> ; $n \geq 0$ .						
<code>alpha</code>	Specifies the scalar <i>alpha</i> . When alpha is zero, then <code>ap</code> is not referenced and <code>bp</code> need not be set before entry.						
<code>ap</code>	Array, size <code>ldap*k*nm</code> , where <code>k</code> is <code>m</code> when <code>side= MKL_LEFT</code> and <code>n</code> when <code>side = MKL_RIGHT</code> . <code>ap</code> points to the beginning of <code>nm</code> $A_c$ matrices stored in compact format. When <code>uplo = MKL_UPPER</code> , $A_c$ is assumed to be an upper triangular matrix and the lower triangular part of $A_c$ is not referenced. With <code>uplo = MKL_LOWER</code> , $A_c$ is assumed to be a lower triangular matrix and the upper triangular part of $A_c$ is not referenced. With <code>diag = MKL_UNIT</code> , the diagonal elements of $A_c$ are not referenced either, but are assumed to be unity.						
<code>ldap</code>	Column stride (column-major layout) or row stride (row-major layout) of $A_c$ . When <code>side=MKL_LEFT</code> , <code>ldap</code> must be at least $\max(1,m)$ . When <code>side=MKL_RIGHT</code> , <code>ldap</code> must be at least $\max(1,n)$ .						
<code>bp</code>	Array, size <code>ldbp*n*nm</code> when <code>layout = MKL_COL_MAJOR</code> ; size <code>ldbp*m*nm</code> when <code>layout = MKL_ROW_MAJOR</code> . Before entry, <code>bp</code> points to the beginning of <code>nm</code> $B_c$ matrices stored in compact format.						
<code>ldbp</code>	Column stride (column-major layout) or row stride (row-major layout) of $B_c$ .						
	<table border="1"> <tr> <td></td> <td></td> </tr> <tr> <td><code>layout = MKL_COL_MAJOR</code></td> <td><code>ldbp</code> must be at least <math>\max(1,m)</math>.</td> </tr> <tr> <td><code>layout = MKL_ROW_MAJOR</code></td> <td>*<code>ldbp</code> must be at least <math>\max(1,n)</math>.</td> </tr> </table>			<code>layout = MKL_COL_MAJOR</code>	<code>ldbp</code> must be at least $\max(1,m)$ .	<code>layout = MKL_ROW_MAJOR</code>	* <code>ldbp</code> must be at least $\max(1,n)$ .
<code>layout = MKL_COL_MAJOR</code>	<code>ldbp</code> must be at least $\max(1,m)$ .						
<code>layout = MKL_ROW_MAJOR</code>	* <code>ldbp</code> must be at least $\max(1,n)$ .						
<code>format</code>	Specifies the format of the compact matrices. See <Compact Format> or <code>mk1_get_format_compact</code> for details.						
<code>nm</code>	Total number of matrices stored in Compact format; $nm \geq 0$ .						

**NOTE**

The values of `ldap` and `ldbp` used in `mkl_?trsm_compact` must be consistent with the values used in `mkl_?get_size_compact`, `mkl_?gepack_compact`, and `mkl_?geunpack_compact`.

**Output Parameters**

`bp` On exit,  $B_c$  is overwritten by the solution matrix  $X_c$ . `bp` points to the beginning of `nm` such  $X_c$  matrices.

**mkl\_?potrf\_compact**

Computes the Cholesky factorization of a set of symmetric (Hermitian), positive-definite matrices, stored in Compact format (see [Compact Format](#) for details).

**Syntax**

```
void mkl_spotrf_compact (MKL_LAYOUT layout, MKL_UPLO uplo, MKL_INT n, float * ap,
MKL_INT ldap, MKL_INT * info, MKL_COMPACT_PACK format, MKL_INT nm);
```

```
void mkl_cpotrf_compact (MKL_LAYOUT layout, MKL_UPLO uplo, MKL_INT n, float * ap,
MKL_INT ldap, MKL_INT * info, MKL_COMPACT_PACK format, MKL_INT nm);
```

```
void mkl_dpotrf_compact (MKL_LAYOUT layout, MKL_UPLO uplo, MKL_INT n, double * ap,
MKL_INT ldap, MKL_INT * info, MKL_COMPACT_PACK format, MKL_INT nm);
```

```
void mkl_zpotrf_compact (MKL_LAYOUT layout, MKL_UPLO uplo, MKL_INT n, double * ap,
MKL_INT ldap, MKL_INT * info, MKL_COMPACT_PACK format, MKL_INT nm);
```

**Description**

The routine forms the Cholesky factorization of a set of symmetric, positive definite (or, for complex data, Hermitian, positive-definite),  $n \times n$  matrices  $A_c$ , stored in Compact format, as:

- $A_c = U_c^T * U_c$  (for real data),  $A_c = U_c^H * U_c$  (for complex data), if `uplo = MKL_UPPER`
- $A_c = L_c * L_c^T$  (for real data),  $A_c = L_c * L_c^H$  (for complex data), if `uplo = MKL_LOWER`

where  $L_c$  is a lower triangular matrix, and  $U_c$  is upper triangular. The factorization (output) data will also be stored in Compact format.

Before calling this routine, call `mkl_?gepack_compact` to store the matrices in the Compact format.

**NOTE**

Compact routines have some limitations; see [Numerical Limitations](#).

**Input Parameters**

`layout` Specifies whether two-dimensional array storage is row-major (`MKL_ROW_MAJOR`) or column-major (`MKL_COL_MAJOR`).

`uplo` Must be `MKL_UPPER` or `MKL_LOWER`

Indicates whether the upper or lower triangular part of  $A_c$  has been stored and will be factored.

If `uplo = MKL_UPPER`, the upper triangular part of  $A_c$  is stored, and the strictly lower triangular part of  $A_c$  is not referenced.

	If <code>uplo = MKL_LOWER</code> , the lower triangular part of $A_c$ is stored, and the strictly upper triangular part of $A_c$ is not referenced.
<code>n</code>	The order of $A_c$ ; $n \geq 0$ .
<code>ldap</code>	Column stride (column-major layout) or row stride (row-major layout) of $A_c$ .
<code>ap</code>	Points to the beginning of the $nm$ $A_c$ matrices. On entry, <code>ap</code> contains either the upper or the lower triangular part of $A_c$ (see <code>uplo</code> ).
<code>format</code>	Specifies the format of the compact matrices. See <a href="#">Compact Format</a> or <a href="#">mkl_get_format_compact</a> for details.
<code>nm</code>	Total number of matrices stored in Compact format; $nm \geq 0$ .

### Application Notes:

Before calling this routine, `mkl_?gepack_compact` must be called. After calling this routine, `mkl_?geunpack_compact` should be called, unless another compact routine will be called for the Compact format matrices.

The total number of floating-point operations is approximately  $nm * (1/3) n^3$  for real flavors and  $nm * (4/3) n^3$  for complex flavors.

### Output Parameters

<code>ap</code>	The upper or lower triangular part of $A_c$ , stored in Compact format in <code>ap</code> , is overwritten by its Cholesky factor $U_c$ or $L_c$ (as specified by <code>uplo</code> ). <code>ap</code> now points to the beginning of this set of factors, stored in Compact format.
<code>info</code>	The parameter is not currently used in this routine. It is reserved for the future use.

### `mkl_?getrfnp_compact`

*The routine computes the LU factorization, without pivoting, of a set of general,  $m \times n$  matrices that have been stored in Compact format (see [Compact Format](#)).*

### Syntax

```
void mkl_sgetrfnp_compact (MKL_LAYOUT layout, MKL_INT m, MKL_INT n, float * ap, MKL_INT ldap, MKL_INT * info, MKL_COMPACT_PACK format, MKL_INT nm);

void mkl_dgetrfnp_compact (MKL_LAYOUT layout, MKL_INT m, MKL_INT n, double * ap, MKL_INT ldap, MKL_INT * info, MKL_COMPACT_PACK format, MKL_INT nm);

void mkl_cgetrfnp_compact (MKL_LAYOUT layout, MKL_INT m, MKL_INT n, float * ap, MKL_INT ldap, MKL_INT * info, MKL_COMPACT_PACK format, MKL_INT nm);

void mkl_zgetrfnp_compact (MKL_LAYOUT layout, MKL_INT m, MKL_INT n, double * ap, MKL_INT ldap, MKL_INT * info, MKL_COMPACT_PACK format, MKL_INT nm);
```

### Description

The `mkl_?getrfnp_compact` routine calculates the LU factorizations of a set of  $nm$  general ( $m \times n$ ) matrices  $A$ , stored in Compact format, as  $A_c = L_c * U_c$ . The factorization (output) data will also be stored in Compact format.

**NOTE**

Compact routines have some limitations; see [Numerical Limitations](#).

**Input Parameters**

<i>layout</i>	Specifies whether two-dimensional array storage is row-major (MKL_ROW_MAJOR) or column-major (MKL_COL_MAJOR).
<i>m</i>	The number of rows of A; $m \geq 0$ .
<i>n</i>	The number of columns of A; $n \geq 0$ .
<i>ap</i>	Points to the beginning of the the array which stores nm $A_c$ matrices. See <a href="#">Compact Format</a> for more details.
<i>ldap</i>	Leading dimension of $A_c$ .
<i>format</i>	Specifies the format of the compact matrices. See <a href="#">Compact Format</a> or <code>mkl_get_format_compact</code> for details.
<i>nm</i>	Total number of matrices stored in Compact format.

**Application Notes:**

Before calling this routine, [mkl\\_?gepack\\_compact](#) must be called. After calling this routine, [mkl\\_?geunpack\\_compact](#) should be called, unless another compact routine will be subsequently called for the Compact format matrices.

The approximate number of floating-point operations for real flavors is:

$nm \cdot (2/3)n^3$ , if  $m = n$ ,

$nm \cdot (1/3)n^2(3m-n)$ , if  $m > n$ ,

$nm \cdot (1/3)m^2(3n-m)$ , if  $m < n$ .

The number of operations for complex flavors is four times greater. Directly after calling this routine, you can call the following:

[mkl\\_?getrinp\\_compact](#), for computing the inverse of the *nm* input matrices in Compact format

**Output Parameters**

<i>ap</i>	On exit, $A_c$ is overwritten by its factorization data. <i>ap</i> points to the beginning of <i>nm</i> $L_c$ and $U_c$ factors of $A_c$ . The unit diagonal elements of $L_c$ are not stored.
<i>info</i>	The parameter is not currently used in this routine. It is reserved for the future use.

**[mkl\\_?geqrf\\_compact](#)**

Computes the QR factorization of a set of general  $m \times n$ , matrices, stored in Compact format (see [Compact Format](#) for details).

**Syntax**

```
void mkl_sgeqrf_compact (MKL_LAYOUT layout, MKL_INT m, MKL_INT n, float * ap, MKL_INT ldap, float * taup, float * work, MKL_INT lwork, MKL_INT * info, MKL_COMPACT_PACK format, MKL_INT nm);
```

```
void mkl_cgeqrf_compact (MKL_LAYOUT layout, MKL_INT m, MKL_INT n, float * ap, MKL_INT ldap, float * taup, float * work, MKL_INT lwork, MKL_INT * info, MKL_COMPACT_PACK format, MKL_INT nm);
```

```
void mkl_dgeqrf_compact (MKL_LAYOUT layout, MKL_INT m, MKL_INT n, double * ap, MKL_INT ldap, double * taup, double * work, MKL_INT lwork, MKL_INT * info, MKL_COMPACT_PACK format, MKL_INT nm);
```

```
void mkl_zgeqrf_compact (MKL_LAYOUT layout, MKL_INT m, MKL_INT n, double * ap, MKL_INT ldap, double * taup, double * work, MKL_INT lwork, MKL_INT * info, MKL_COMPACT_PACK format, MKL_INT nm);
```

## Description

The routine forms the QR factorization of a set of general,  $m \times n$  matrices  $A$ , stored in Compact format. The routine does not form the  $Q$  factors explicitly. Instead,  $Q$  is represented as a product of  $\min(m,n)$  elementary reflectors. The factorization (output) data will also be stored in Compact format.

---

### NOTE

Compact routines have some limitations; see [Numerical Limitations](#).

---

## Input Parameters

<i>layout</i>	Specifies whether two-dimensional array storage is row-major (MKL_ROW_MAJOR) or column-major (MKL_COL_MAJOR).
<i>m</i>	The number of rows of $A_C$ ; $m \geq 0$ .
<i>n</i>	The number of columns of $A_C$ ; $n \geq 0$ .
<i>ap</i>	Points to the beginning of the $nm$ $A_C$ matrices. On entry, <i>ap</i> contains either the upper or the lower triangular part of $A_C$ (see <a href="#">uplo</a> ).
<i>ldap</i>	Column stride (column-major layout) or row stride (row-major layout) of $A_C$ .
<i>work</i>	Points to the beginning of the workspace array.
<i>lwork</i>	The size of the work array. If <i>lwork</i> = -1, a workspace query is assumed; the routine only calculates the optimal size of the work array and returns this value as the first entry of the work array.
<i>format</i>	Specifies the format of the compact matrices. See <a href="#">Compact Format</a> or <a href="#">mkl_get_format_compact</a> for details.
<i>nm</i>	Total number of matrices stored in Compact format.

### Application Notes:

The compact array that will store the elementary reflectors needs to be allocated before the routine is called and unpacked after. First, the routine [mkl\\_?get\\_size\\_compact](#) should be called, to determine the size of *taup*, and memory for *taup* should be allocated. After calling [mkl\\_?geqrf\\_compact](#), *taup* stores the elementary reflectors in compact form, so should be unpacked using [mkl\\_?geunpack\\_compact](#). See [Compact Format](#) for more details, or reference the example below. (Note: the following example is meant to demonstrate the calling sequence to allocate memory and unpack *taup*. All other parameters are assumed to be already set up before the sequence below is executed.)

```
MKL_R_TYPE *tau_array[nm];  
// ...  
tau_buffer_size = mkl_?get_size_compact(min(m, n), 1, format, nm);
```

```
MKL_R_TYPE *tau_compact = (MKL_R_TYPE *)mkl_malloc(tau_buffer_size, 128);
mkl_?geqrf_compact(layout, m, n, a_compact, ldap, tau_compact, work, lwork, &info, format, nm);
// Note that here MKL_COL_MAJOR is used because tau is a 1-d array
mkl_?geunpack_compact(MKL_COL_MAJOR, min(m, n), 1, tau_array, min(m, n), tau_compact, min(m, n),
format, nm);
```

## Output Parameters

<i>ap</i>	On exit, $A_c$ is overwritten by its factorization data. <i>ap</i> points to the beginning of $nm$ factorizations of $A_c$ , stored in Compact format. The factorization data is stored as follows: The elements on and above the diagonal contain the $\min(m, n)$ -by- $n$ upper trapezoidal matrix $R_c$ ( $R_c$ is upper triangular if $m \geq n$ ); the elements below the diagonal, with $\tau$ , present the orthogonal matrix $Q_c$ as a product of $\min(m, n)$ elementary reflectors (see <a href="#">Orthogonal Factorizations: LAPACK Computational Routines</a> ). See <a href="#">Compact Format</a> for more details.
<i>taup</i>	Points to the beginning of a set of the $\tau_c$ arrays, each of which has size $\min(m, n)$ , stored in Compact format. $\tau_c$ contains scalars that define elementary reflectors for $Q_c$ in its decomposition in a product of elementary reflectors. <i>taup</i> needs to be allocated by the user before calling this routine. See the application notes (below the description) for more details.
<i>work[0]</i>	On exit contains the minimum value of <i>lwork</i> required for optimum performance. Use this <i>lwork</i> for subsequent runs.
<i>info</i>	The parameter is not currently used in this routine. It is reserved for the future use.

## mkl\_?getrinp\_compact

*Computes the inverse of a set of LU-factorized general matrices, without pivoting, stored in the compact format (see [Compact Format](#) for details).*

### Syntax

```
void mkl_sgetrinp_compact (MKL_LAYOUT layout, MKL_INT n, float * ap, MKL_INT ldap,
float * work, MKL_INT lwork, MKL_INT * info, MKL_COMPACT_PACK format, MKL_INT nm);
void mkl_dgetrinp_compact (MKL_LAYOUT layout, MKL_INT n, double * ap, MKL_INT ldap,
double * work, MKL_INT lwork, MKL_INT * info, MKL_COMPACT_PACK format, MKL_INT nm);
void mkl_cgetrinp_compact (MKL_LAYOUT layout, MKL_INT n, float * ap, MKL_INT ldap,
float * work, MKL_INT lwork, MKL_INT * info, MKL_COMPACT_PACK format, MKL_INT nm);
void mkl_zgetrinp_compact (MKL_LAYOUT layout, MKL_INT n, double * ap, MKL_INT ldap,
double * work, MKL_INT lwork, MKL_INT * info, MKL_COMPACT_PACK format, MKL_INT nm);
```

### Description

This routine computes the inverse  $\text{inv}(A_c)$  of a set of general,  $n \times n$  matrices  $A_c$ , that have been stored in Compact format. The factorization (output) data will also be stored in Compact format.

---

#### NOTE

Compact routines have some limitations; see [Numerical Limitations](#).

---

## Input Parameters

<i>layout</i>	Specifies whether two-dimensional array storage is row-major (MKL_ROW_MAJOR) or column-major (MKL_COL_MAJOR).
<i>n</i>	The order of $A_c$ ; $n \geq 0$ .
<i>ap</i>	Points to the beginning of the $nm$ $A_c$ matrices. On entry, <i>ap</i> contains the LU factorizations of $A_c$ , stored in Compact format, as returned by <a href="#">mkl_?getrfnp_compact</a> : $A_c = L_c * U_c$ . See <a href="#">Compact Format</a> for more details.
<i>ldap</i>	Column stride (column-major layout) or row stride (row-major layout) of $A_c$ .
<i>work</i>	Points to the beginning of the <i>work</i> array.
<i>lwork</i>	The size of the work array. If <i>lwork</i> = -1, a workspace query is assumed; the routine calculates only the optimal size of the work array and returns this value as the first entry of the work array.
<i>format</i>	Specifies the format of the compact matrices. See <a href="#">Compact Format</a> or <a href="#">mkl_get_format_compact</a> for details.
<i>nm</i>	Total number of matrices stored in Compact format.

### Application Notes:

Before calling this routine, [mkl\\_?gepack\\_compact](#) must be called. After calling this routine, [mkl\\_?geunpack\\_compact](#) should be called, unless another compact routine will be subsequently called on the Compact format matrices.

The total number of floating-point operations is approximately  $nm * (4/3) n^3$  for real flavors and  $nm * (16/3) n^3$  for complex flavors.

## Output Parameters

<i>ap</i>	On exit, $A_c$ is overwritten by $\text{inv}(A_c)$ . <i>ap</i> points to the beginning of $nm$ $\text{inv}(A_c)$ matrices stored in Compact format.
<i>work[0]</i>	On exit, <i>work[0]</i> contains the minimum value of <i>lwork</i> required for optimum performance. Use this <i>lwork</i> for subsequent runs.
<i>info</i>	The parameter is not currently used in this routine. It is reserved for the future use.

## Numerical Limitations for Compact BLAS and Compact LAPACK Routines

Compact routines are subject to a set of numerical limitations. They also skip most of the checks presented in regular BLAS and LAPACK routines in order to provide effective vectorization. The following limitations apply to at least one compact routine.

**Complex division:** BLAS and LAPACK compact routines rely on a naïve method for complex division that does not protect the solution against overflow, underflow, or loss of precision.

**Error checking :** the LAPACK compact routines skip error checking for performance reasons ; therefore, the user is responsible for passing correct parameters. There are no checks for incorrect matrices (such as singular for LU, non-positive-definite for Cholesky) - it is always assumed that the algorithm for the input matrix can be completed without error.

**No pivoting:** the generic LU factorization routine, [?getrf](#) , calculates the factorization using partial pivoting. However, because pivoting includes comparisons which cannot be effectively vectorized, only non-pivoting versions of LU [mkl\\_?getrfnp\\_compact](#) and Inverse from LU ([mkl\\_?getrinp\\_compact](#)) are provided as compact routines.

*Matrices scaled near underflow/overflow:* the LAPACK compact routines do not provide safe handling for values near underflow/overflow. This means that Compact routines may return incorrect results for such matrices. This limitation is related to compact routine for QR: `mkl_?geqrf_compact`.

It is the responsibility of the user to ensure that the input matrices can be factorized, inverted, and/or solved given these numerical limitations.

## `mkl_?get_size_compact`

Returns the buffer size, in bytes, needed to pack data in Compact format.

### Syntax

```
MKL_INT mkl_sget_size_compact (MKL_INT ld, MKL_INT sd, MKL_COMPACT_PACK format, MKL_INT nm);
```

```
MKL_INT mkl_dget_size_compact (MKL_INT ld, MKL_INT sd, MKL_COMPACT_PACK format, MKL_INT nm);
```

```
MKL_INT mkl_cget_size_compact (MKL_INT ld, MKL_INT sd, MKL_COMPACT_PACK format, MKL_INT nm);
```

```
MKL_INT mkl_zget_size_compact (MKL_INT ld, MKL_INT sd, MKL_COMPACT_PACK format, MKL_INT nm);
```

### Description

The routine returns the buffer size, in bytes, required for `mkl_?gepack_compact`.

### Input Parameters

<i>ld</i>	Leading dimension of the matrices in Compact format.
<i>sd</i>	Second dimension of the matrices in Compact format.
<i>format</i>	Describes the compact packing format according to the <b>MKL_COMPACT_PACK</b> enum type.
<i>nm</i>	Total number of matrices to be packed in Compact format.

### Application Notes:

Before calling this routine, `mkl_?get_format_compact` can be called to determine the optimal *format*.

After calling this routine and allocating the amount of memory indicated by *size*, the user can call `mkl_?gepack_compact` to pack the *nm* input matrices in Compact format.

### Return Values

This function returns a value *size*.

<i>size</i>	The buffer size, in bytes, required by the packing function <code>mkl_?gepack_compact</code> .
-------------	--

## `mkl_get_format_compact`

Returns the optimal compact packing format for the architecture, needed for all compact routines.

### Syntax

```
MKL_COMPACT_PACK mkl_get_format_compact ();
```

## Description

The routine returns the optimal compact packing *format*, which is an `MKL_COMPACT_PACK` type, for the current architecture. The optimal value of *format* is determined by the architecture's vector-register length. *format* is a required parameter for any packing, unpacking, or BLAS/LAPACK compact routine. See [Compact Format](#) for details.

## Return Values

The function returns a value *format*.

*format*

*format* can be returned as any of the following three values. **MKL\_COMPACT\_AVX512** is the optimal *format* value for:

- Intel® Advanced Vector Extensions 512 (Intel® AVX-512)-enabled processors.
- Intel® Advanced Vector Extensions 512 (Intel® AVX-512) for Intel® Many Integrated Core Architecture (Intel® MIC Architecture)-enabled processors.
- Intel® Advanced Vector Extensions 512 (Intel® AVX-512) for Intel® Many Integrated Core Architecture (Intel® MIC Architecture) with support of AVX512\_4FMAPS and AVX512\_4VNNIW instruction groups processors.

**MKL\_COMPACT\_AVX** is the optimal *format* value for:

- Intel® Advanced Vector Extensions (Intel® AVX)-enabled processors.
- Intel® Advanced Vector Extensions 2 (Intel® AVX2)-enabled processors.

**MKL\_COMPACT\_SSE** is the optimal *format* value for all other processors.

## Application Notes:

After calling this routine, `mkl_?get_size_compact` can be called to calculate the buffer size needed for `mkl_?gepack_compact`.

## `mkl_?gepack_compact`

*Packs matrices from standard (row or column-major) format to Compact format.*

## Syntax

```
mkl_sgepack_compact(MKL_LAYOUT layout, MKL_INT rows, MKL_INT columns, const float *
const *a, MKL_INT lda, float *ap, MKL_INT ldap, MKL_COMPACT_PACK format, MKL_INT nm);
mkl_dgepack_compact(MKL_LAYOUT layout, MKL_INT rows, MKL_INT columns, const double *
const *a, MKL_INT lda, double *ap, MKL_INT ldap, MKL_COMPACT_PACK format, MKL_INT nm);
mkl_cgepack_compact (MKL_LAYOUT layout, MKL_INT rows, MKL_INT columns, const
mkl_compact_complex_float * const *a, MKL_INT lda, float *ap, MKL_INT ldap,
MKL_COMPACT_PACK format, const MKL_INT nm);
```

```
mkl_zgepack_compact (MKL_LAYOUT layout, MKL_INT rows, MKL_INT columns, const
mkl_compact_complex_double * const *a, MKL_INT lda, double *ap, MKL_INT ldap,
MKL_COMPACT_PACK format, MKL_INT nm);
```

## Description

The routine packs  $nm$  matrices  $A$  from standard format (row or column-major, pointer to pointer) in  $a$  into Compact format, storing the new compact format matrices  $A_c$  in array  $ap$ .

## Input Parameters

*layout* Specifies whether two-dimensional array storage is row-major (MKL\_ROW\_MAJOR) or column-major (MKL\_COL\_MAJOR).

*rows* The number of rows of  $A$ ;  $rows \geq 0$ .

*columns* The number of columns of  $A$ ;  $columns \geq 0$ .

*a* A standard format (row or column-major, pointer-to-pointer) array, storing  $nm$  input  $A$  matrices.

*lda* Leading dimension of  $A$ .

<i>layout</i> = MKL_COL_MAJOR	<i>lda</i> must be at least $\max(1, rows)$ .
<i>layout</i> = MKL_ROW_MAJOR	<i>lda</i> must be at least $\max(1, columns)$ .

*ldap* Leading dimension of  $A_c$ .

<i>layout</i> = MKL_COL_MAJOR	<i>ldap</i> must be at least $\max(1, rows)$ .
<i>layout</i> = MKL_ROW_MAJOR	<i>ldap</i> must be at least $\max(1, columns)$ .

### NOTE

The values of *ldap* used in `mkl_?gepack_compact` must be consistent with the values used in `mkl_?get_size_compact` and `mkl_?geunpack_compact`.

*format* Specifies the format of the compact matrices. See [Compact Format](#) or `mkl_get_format_compact` for details.

*nm* Total number of matrices that will be stored in Compact format.

## Application Notes:

Directly after calling this routine, any BLAS or LAPACK compact routine can be called. Unpacking matrices from Compact format can be done by calling `mkl_?geunpack_compact`.

## Output Parameters

*ap* Array storing the compact format input matrices  $A_c$ . *ap* must have size at least  $size = mkl\_?get\_size\_compact$ .

## mkl\_?geunpack\_compact

Unpacks matrices from Compact format to standard (row- or column-major, pointer-to-pointer) format.

### Syntax

```

mkl_sgeunpack_compact (MKL_LAYOUT layout, MKL_INT rows, MKL_INT columns, float * const
*a, MKL_INT lda, const float *ap, MKL_INT ldap, MKL_COMPACT_PACK format, MKL_INT nm);
mkl_dgeunpack_compact (MKL_LAYOUT layout, MKL_INT rows, MKL_INT columns, double * const
*a, MKL_INT lda, const double *ap, MKL_INT ldap, MKL_COMPACT_PACK format, MKL_INT nm);
mkl_cgeunpack_compact (MKL_LAYOUT layout, MKL_INT rows, MKL_INT columns,
mkl_compact_complex_float * const *a, MKL_INT lda, const float *ap, MKL_INT ldap,
MKL_COMPACT_PACK format, MKL_INT nm);
mkl_zgeunpack_compact (MKL_LAYOUT layout, MKL_INT rows, MKL_INT columns,
mkl_compact_complex_double * const *a, MKL_INT lda, const double *ap, MKL_INT ldap,
MKL_COMPACT_PACK format, MKL_INT nm);
    
```

### Description

The routine unpacks *nm* Compact format matrices  $A_c$  from array *ap* into standard (row- or column-major, pointer-to-pointer) format in array *A*.

### Input Parameters

*layout* Specifies whether two-dimensional array storage is row-major (MKL\_ROW\_MAJOR) or column-major (MKL\_COL\_MAJOR).

*rows* The number of rows of *A*;  $rows \geq 0$ .

*columns* The number of columns of *A*;  $columns \geq 0$ .

*lda* Leading dimension of *A*.

<i>layout</i> = MKL_COL_MAJOR	<i>lda</i> must be at least $\max(1, rows)$ .
<i>layout</i> = MKL_ROW_MAJOR	<i>lda</i> must be at least $\max(1, columns)$ .

*ap* Array storing the compact format of input matrices  $A_c$ . See [Compact Formator mkl\\_get\\_format\\_compact](#) for details.

<i>layout</i> = MKL_COL_MAJOR	<i>ap</i> has size $ldap * columns * nm$ .
<i>layout</i> = MKL_ROW_MAJOR	<i>ap</i> has size $ldap * rows * nm$ .

*ldap* Leading dimension of  $A_c$ .

<i>layout</i> = MKL_COL_MAJOR	<i>ldap</i> must be at least $\max(1, rows)$ .
<i>layout</i> = MKL_ROW_MAJOR	<i>ldap</i> must be at least $\max(1, columns)$ .

**NOTE**

The values of *ldap* used in `mkl_?geunpack_compact` must be consistent with the values used in `mkl_?get_size_compact` and `mkl_?gepack_compact`.

*format*

Specifies the format of the compact matrices. See [Compact Format](#) or `mkl_get_format_compact` for details.

*nm*

Total number of matrices that will be stored in Compact format.

**Output Parameters**

*a*

A standard format (row- or column-major, pointer-to-pointer) array, storing *nm* output *A* matrices.

<code>layout = MKL_COL_MAJOR</code>	<i>a</i> has size <code>lda*columns*nm</code> .
<code>layout = MKL_ROW_MAJOR</code>	<i>a</i> has size <code>lda*rows*nm</code> .

**Inspector-executor Sparse BLAS Routines**

The inspector-executor API for Sparse BLAS divides operations into two stages: analysis and execution. During the initial analysis stage, the API inspects the matrix sparsity pattern and applies matrix structure changes. In the execution stage, subsequent routine calls reuse this information in order to improve performance.

The inspector-executor API supports key Sparse BLAS operations for iterative sparse solvers:

- Sparse matrix-vector multiplication
- Sparse matrix-matrix multiplication with a sparse or dense result
- Solution of triangular systems
- Sparse matrix addition

**Product and Performance Information**

Performance varies by use, configuration and other factors. Learn more at [www.Intel.com/PerformanceIndex](http://www.Intel.com/PerformanceIndex).

Notice revision #20201201

**Naming Conventions in Inspector-Executor Sparse BLAS Routines**

The Inspector-Executor Sparse BLAS API routine names use the following convention:

```
mkl_sparse_ [<character>_ ] <operation> [ _ <format> ]
```

The *<character>* field indicates the data type:

s	real, single precision
c	complex, single precision
d	real, double precision
z	complex, double precision

The data type is included in the name only if the function accepts dense matrix or scalar floating point parameters.

The *<operation>* field indicates the type of operation:

<code>create</code>	create matrix handle
<code>copy</code>	create a copy of matrix handle
<code>convert</code>	convert matrix between sparse formats
<code>export</code>	export matrix from internal representation to CSR or BSR format
<code>destroy</code>	frees memory allocated for matrix handle
<code>set_&lt;op&gt;_hint</code>	provide information about number of upcoming compute operations and operation type for optimization purposes, where <i>&lt;op&gt;</i> is <code>mv</code> , <code>sv</code> , <code>mm</code> , <code>sm</code> , <code>dotmv</code> , <code>symgs</code> , or <code>memory</code>
<code>optimize</code>	analyze the matrix using hints and store optimization information in matrix handle
<code>mv</code>	compute sparse matrix-vector product
<code>mm</code>	compute sparse matrix by dense matrix product (batch mv)
<code>set_value</code>	change a value in a matrix
<code>sppm/sppmd</code>	compute sparse matrix by sparse matrix product and store the result as a sparse/dense matrix
<code>trsv</code>	solve a triangular system
<code>trsm</code>	solve a triangular system with multiple right-hand sides
<code>add</code>	compute sum of two sparse matrices
<code>symgs</code>	compute a symmetric Gauss-Zeidel preconditioner
<code>symgs_mv</code>	compute a symmetric Gauss-Zeidel preconditioner with a final matrix-vector multiplication
<code>sorv</code>	computes forward, backward sweeps or symmetric successive over-relaxation preconditioner
<code>sypr</code>	compute the symmetric or Hermitian product of sparse matrices and store the result as a sparse matrix
<code>syprd</code>	compute the symmetric or Hermitian product of sparse and dense matrices and store the result as a dense matrix
<code>syrk</code>	compute the product of sparse matrix with its transposed matrix and store the result as a sparse matrix
<code>syrkd</code>	compute the product of sparse matrix with its transposed matrix and store the result as a dense matrix
<code>order</code>	perform ordering of column indexes of the matrix in CSR format
<code>dotmv</code>	compute a sparse matrix-vector product with dot product

The *<format>* field indicates the sparse matrix storage format:

<code>coo</code>	coordinate format
<code>bsr</code>	block sparse row format plus variations. Fill out either <code>rows_start</code> and <code>rows_end</code> (for 4-arrays representation) or <code>rowIndex</code> array (for 3-array BSR/CSR).

<code>csr</code>	compressed sparse row format plus variations. Fill out either <code>rows_start</code> and <code>rows_end</code> (for 4-arrays representation) or <code>rowIndex</code> array (for 3-array BSR/CSR).
<code>csc</code>	compressed sparse column format plus variations. Fill out either <code>cols_start</code> and <code>cols_end</code> (for 4-arrays representation) or <code>colIndex</code> array (for 3 array CSC).

The format is included in the function name only if the function parameters include an explicit sparse matrix in one of the conventional sparse matrix formats.

## Sparse Matrix Storage Formats for Inspector-executor Sparse BLAS Routines

Inspector-executor Sparse BLAS routines support four conventional sparse matrix storage formats:

- compressed sparse row format (CSR) plus variations
- compressed sparse column format (CSC) plus variations
- coordinate format (COO)
- block sparse row format (BSR) plus variations

Computational routines operate on a matrix handle that stores a matrix in CSR or BSR formats. Other formats should be converted to CSR or BSR format before calling any computational routines. For more information see [Sparse Matrix Storage Formats](#).

## Supported Inspector-executor Sparse BLAS Operations

The Inspector-executor Sparse BLAS API can perform several operations involving sparse matrices. These notations are used in the description of the operations:

- $A, G, V$  are sparse matrices
- $B$  and  $C$  are dense matrices
- $x$  and  $y$  are dense vectors
- $\alpha$  and  $\beta$  are scalars

$\text{op}(A)$  represents a possible transposition of matrix  $A$

$$\begin{aligned}\text{op}(A) &= A \\ \text{op}(A) &= A^T - \text{transpose of } A \\ \text{op}(A) &= A^H - \text{conjugate transpose of } A\end{aligned}$$

$\text{op}(A)^{-1}$  denotes the inverse of  $\text{op}(A)$ .

The Inspector-executor Sparse BLAS routines support the following operations:

- computing the vector product between a sparse matrix and a dense vector:

$$y := \alpha * \text{op}(A) * x + \beta * y$$

- solving a single triangular system:

$$y := \alpha * \text{inv}(\text{op}(A)) * x$$

- computing a product between a sparse matrix and a dense matrix:

$$C := \alpha * \text{op}(A) * B + \beta * C$$

- computing a product between sparse matrices with a sparse result:

$$V := \alpha * \text{op}(A) * \text{op}(G)$$

- computing a product between sparse matrices with a dense result:

$$C := \alpha * \text{op}(A) * \text{op}(G)$$

- computing a sum of sparse matrices with a sparse result:

$$V := \alpha * \text{op}(A) + G$$

- solving a sparse triangular system with multiple right-hand sides:

$$C := \alpha * \text{inv}(\text{op}(A)) * B$$

## Two-stage Algorithm in Inspector-Executor Sparse BLAS Routines

You can use a two-stage algorithm in Inspector-executor Sparse BLAS routines which produce a sparse matrix. The applicable routines are:

- `mkl_sparse_sp2m` (BSR/CSR/CSC formats)
- `mkl_sparse_sypr` (CSR format)

The two-stage algorithm allows you to split computations into stages. The main purpose of the splitting is to provide an estimate for the memory required for the output prior to allocating the largest part of the memory (for the indices and values of the non-zero elements). Additionally, the two-stage approach extends the functionality and allows more complex usage models.

---

**NOTE** The multistage approach currently does not allow you to allocate memory for the output matrix outside oneMKL.

---

In the two-stage algorithm:

1. The first stage allocates data which is necessary for the memory estimation (arrays `rows_start/rows_end` or `cols_start/cols_end` depending on the format, (see [Sparse Matrix Storage Formats](#)) and computes the number of entries or the full structure of the matrix.

---

**NOTE** The format of the output is decided internally but can be checked using the export functionality `mkl_sparse_?_export_<format>`.

---

2. The second stage allocates data and computes column or row indices (depending on the format) of non-zero elements and/or values of the output matrix.

Specifying the stage for execution is supported through the `sparse_request_t` parameter in the API with the following options:

### Values for `sparse_request_t` parameter

Value	Description
<code>SPARSE_STAGE_NNZ_COUNT</code>	Allocates and computes only the <code>rows_start/rows_end</code> (CSR/BSR format) or <code>cols_start/cols_end</code> (CSC format) arrays for the output matrix. After this stage, by calling <code>mkl_sparse_?_export_&lt;format&gt;</code> , you can obtain the number of non-zeros in the output matrix and calculate the amount of memory required for the output matrix.
<code>SPARSE_STAGE_FINALIZE_MULT_NO_VAL</code>	Allocates and computes row/column indices provided that <code>rows_start/rows_end</code> or <code>cols_start/cols_end</code> have already been computed in a prior call with the request <code>SPARSE_STAGE_NNZ_COUNT</code> . The values of the output matrix are not computed.
<code>SPARSE_STAGE_FINALIZE_MULT</code>	Depending on the state of the output matrix <code>C</code> on entry to the routine, this stage does one of the following: <ul style="list-style-type: none"> <li>• Allocates and computes row/column indices and values of nonzero elements, if only <code>rows_start/rows_end</code> or <code>cols_start/cols_end</code> are present</li> <li>• allocates and computes values of nonzero elements, if <code>rows_start/rows_end</code> or <code>cols_start/cols_end</code> and row/column indices of non-zero elements are present</li> </ul>
<code>SPARSE_STAGE_FULL_MULT_NO_VAL</code>	Allocates and computes the output matrix structure in a single step. The values of the output matrix are not computed.
<code>SPARSE_STAGE_FULL_MULT</code>	Allocates and computes the entire output matrix (structure and values) in a single step.

The example below shows how you can use the two-stage approach for estimating the memory requirements for the output matrix in CSR format:

### First stage (`sparse_request_t = SPARSE_STAGE_NNZ_COUNT`)

1. The routine `mkl_sparse_sp2m` is called with the request parameter `SPARSE_STAGE_NNZ_COUNT`.
2. The arrays `rows_start` and `rows_end` are exported using the `mkl_sparse_x_export_csr` routine.
3. These arrays are used to calculate the number of non-zeros (nnz) of the resulting output matrix.

Note that by the end of the first stage, the arrays associated with column indices and values of the output matrix have not been allocated or computed yet.

```
sparse_matrix_t csrC = NULL;
status = mkl_sparse_sp2m (opA, descrA, csrA, opB, descrB, csrB, SPARSE_STAGE_NNZ_COUNT, &csrC);

/* optional calculation of nnz in the output matrix for getting a memory estimate */

status = mkl_sparse_?_export_csr (csrC, &indexing, &nrows, &ncols, &rows_start, &rows_end,
&col_indx, &values);

MKL_INT nnz = rows_end[nrows-1] - rows_start[0];
```

### Second stage (`sparse_request_t = SPARSE_STAGE_FINALIZE_MULT`)

This stage allocates and computes the remaining output arrays (associated with column indices and values of output matrix entries) and completes the matrix-matrix multiplication.

```
status = mkl_sparse_sp2m (opA, descrA, csrA, opB, descrB, csrB, SPARSE_STAGE_FINALIZE_MULT,
&csrC);
```

When the two-stage approach is not needed, you can perform both stages in a single call:

### Single stage operation (`sparse_request_t = SPARSE_STAGE_FULL_MULT`)

```
status = mkl_sparse_sp2m (opA, descrA, csrA, opB, descrB, csrB, SPARSE_STAGE_FULL_MULT, &csrC);
```

## Matrix Manipulation Routines

The [Matrix Manipulation Routines](#) table lists the matrix manipulation routines and the data types associated with them.

### Matrix Manipulation Routines and Their Data Types

Routine or Function Group	Data Types	Description
<a href="#">mkl_sparse_?_create_csr</a>	s, d, c, z	Creates a handle for a CSR-format matrix.
<a href="#">mkl_sparse_?_create_csc</a>	s, d, c, z	Creates a handle for a CSC format matrix.
<a href="#">mkl_sparse_?_create_coo</a>	s, d, c, z	Creates a handle for a matrix in COO format.
<a href="#">mkl_sparse_?_create_bsr</a>	s, d, c, z	Creates a handle for a matrix in BSR format.
<a href="#">mkl_sparse_copy</a>	NA	Creates a copy of a matrix handle.
<a href="#">mkl_sparse_destroy</a>	NA	Frees memory allocated for matrix handle.
<a href="#">mkl_sparse_convert_csr</a>	NA	Converts internal matrix representation to CSR format.

Routine or Function Group	Data Types	Description
<a href="#">mkl_sparse_convert_bsr</a>	NA	Converts internal matrix representation to BSR format or changes BSR block size.
<a href="#">mkl_sparse_?_export_csr</a>	s, d, c, z	Exports CSR matrix from internal representation.
<a href="#">mkl_sparse_?_export_csc</a>	s, d, c, z	Exports CSC matrix from internal representation.
<a href="#">mkl_sparse_?_export_bsr</a>	s, d, c, z	Exports BSR matrix from internal representation.
<a href="#">mkl_sparse_?_set_value</a>	s, d, c, z	Changes a single value of matrix in internal representation.
<a href="#">mkl_sparse_?_update_values</a>	s, d, c, z	Changes all or selected matrix values in internal representation.
<a href="#">mkl_sparse_order</a>	NA	Performs ordering of column indexes of the matrix in CSR format.

### [mkl\\_sparse\\_?\\_create\\_csr](#)

*Creates a handle for a CSR-format matrix.*

#### Syntax

```
sparse_status_t mkl_sparse_s_create_csr (sparse_matrix_t *A, const sparse_index_base_t indexing, const MKL_INT rows, const MKL_INT cols, MKL_INT *rows_start, MKL_INT *rows_end, MKL_INT *col_indx, float *values);
```

```
sparse_status_t mkl_sparse_d_create_csr (sparse_matrix_t *A, const sparse_index_base_t indexing, const MKL_INT rows, const MKL_INT cols, MKL_INT *rows_start, MKL_INT *rows_end, MKL_INT *col_indx, double *values);
```

```
sparse_status_t mkl_sparse_c_create_csr (sparse_matrix_t *A, const sparse_index_base_t indexing, const MKL_INT rows, const MKL_INT cols, MKL_INT *rows_start, MKL_INT *rows_end, MKL_INT *col_indx, MKL_Complex8 *values);
```

```
sparse_status_t mkl_sparse_z_create_csr (sparse_matrix_t *A, const sparse_index_base_t indexing, const MKL_INT rows, const MKL_INT cols, MKL_INT *rows_start, MKL_INT *rows_end, MKL_INT *col_indx, MKL_Complex16 *values);
```

#### Include Files

- `mkl_spblas.h`

#### Description

The `mkl_sparse_?_create_csr` routine creates a handle for an  $m$ -by- $k$  matrix  $A$  in CSR format.

#### NOTE

The input arrays provided are left unchanged except for the call to [mkl\\_sparse\\_order](#), which performs ordering of column indexes of the matrix. To avoid any changes to the input data, use [mkl\\_sparse\\_copy](#).

## Input Parameters

<i>indexing</i>	Indicates how input arrays are indexed.				
	<table> <tr> <td>SPARSE_INDEX_BASE_ZERO</td> <td>Zero-based (C-style) indexing: indices start at 0.</td> </tr> <tr> <td>SPARSE_INDEX_BASE_ONE</td> <td>One-based (Fortran-style) indexing: indices start at 1.</td> </tr> </table>	SPARSE_INDEX_BASE_ZERO	Zero-based (C-style) indexing: indices start at 0.	SPARSE_INDEX_BASE_ONE	One-based (Fortran-style) indexing: indices start at 1.
SPARSE_INDEX_BASE_ZERO	Zero-based (C-style) indexing: indices start at 0.				
SPARSE_INDEX_BASE_ONE	One-based (Fortran-style) indexing: indices start at 1.				
<i>rows</i>	Number of rows of matrix <i>A</i> .				
<i>cols</i>	Number of columns of matrix <i>A</i> .				
<i>rows_start</i>	<p>Array of length at least <i>rows</i>. This array contains row indices, such that <math>rows\_start[i] - indexing</math> is the first index of row <i>i</i> in the arrays <i>values</i> and <i>col_indx</i>. The value of <i>indexing</i> is 0 for zero-based indexing and 1 for one-based indexing.</p> <p>Refer to <i>pointerB</i> array description in <a href="#">CSR Format</a> for more details.</p>				
<i>rows_end</i>	<p>Array of at least length <i>rows</i>. This array contains row indices, such that <math>rows\_end[i] - indexing - 1</math> is the last index of row <i>i</i> in the arrays <i>values</i> and <i>col_indx</i>. The value of <i>indexing</i> is 0 for zero-based indexing and 1 for one-based indexing.</p> <p>Refer to <i>pointerE</i> array description in <a href="#">CSR Format</a> for more details.</p>				
<i>col_indx</i>	<p>For one-based indexing, array containing the column indices plus one for each non-zero element of the matrix <i>A</i>. For zero-based indexing, array containing the column indices for each non-zero element of the matrix <i>A</i>. Its length is at least <math>rows\_end[rows - 1] - indexing</math>.</p> <p>The value of <i>indexing</i> is 0 for zero-based indexing and 1 for one-based indexing.</p>				
<i>values</i>	<p>Array containing non-zero elements of the matrix <i>A</i>. Its length is equal to length of the <i>col_indx</i> array.</p> <p>Refer to <i>values</i> array description in <a href="#">CSR Format</a> for more details.</p>				

## Output Parameters

<i>A</i>	Handle containing internal data for subsequent Inspector-executor Sparse BLAS operations.
----------	---

## Return Values

The function returns a value indicating whether the operation was successful or not, and why.

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.

<code>SPARSE_STATUS_INTERNAL_ERROR</code>	An error in algorithm implementation occurred.
<code>SPARSE_STATUS_NOT_SUPPORTED</code>	The requested operation is not supported.

## `mkl_sparse_?_create_csc`

Creates a handle for a CSC format matrix.

### Syntax

```
sparse_status_t mkl_sparse_s_create_csc (sparse_matrix_t *A, const sparse_index_base_t indexing, const MKL_INT rows, const MKL_INT cols, MKL_INT *cols_start, MKL_INT *cols_end, MKL_INT *row_indx, float *values);
```

```
sparse_status_t mkl_sparse_d_create_csc (sparse_matrix_t *A, const sparse_index_base_t indexing, const MKL_INT rows, const MKL_INT cols, MKL_INT *cols_start, MKL_INT *cols_end, MKL_INT *row_indx, double *values);
```

```
sparse_status_t mkl_sparse_c_create_csc (sparse_matrix_t *A, const sparse_index_base_t indexing, const MKL_INT rows, const MKL_INT cols, MKL_INT *cols_start, MKL_INT *cols_end, MKL_INT *row_indx, MKL_Complex8 *values);
```

```
sparse_status_t mkl_sparse_z_create_csc (sparse_matrix_t *A, const sparse_index_base_t indexing, const MKL_INT rows, const MKL_INT cols, MKL_INT *cols_start, MKL_INT *cols_end, MKL_INT *row_indx, MKL_Complex16 *values);
```

### Include Files

- `mkl_spblas.h`

### Description

The `mkl_sparse_?_create_csc` routine creates a handle for an  $m$ -by- $k$  matrix  $A$  in CSC format.

#### NOTE

The input arrays provided are left unchanged except for the call to `mkl_sparse_order`, which performs ordering of column indexes of the matrix. To avoid any changes to the input data, use `mkl_sparse_copy`.

### Input Parameters

<code>indexing</code>	Indicates how input arrays are indexed.
<code>SPARSE_INDEX_BASE_ZER</code>	Zero-based (C-style) indexing: indices start at 0.
<code>SPARSE_INDEX_BASE_ONE</code>	One-based (Fortran-style) indexing: indices start at 1.
<code>rows</code>	Number of rows of the matrix $A$ .
<code>cols</code>	Number of columns of the matrix $A$ .
<code>cols_start</code>	Array of length at least $m$ . This array contains col indices, such that <code>cols_start[i] - ind</code> is the first index of col $i$ in the arrays <code>values</code> and <code>row_indx</code> . <code>ind</code> takes 0 for zero-based indexing and 1 for one-based indexing.

	Refer to <i>pointerB</i> array description in <a href="#">CSC Format</a> for more details.
<i>cols_end</i>	Array of at least length <i>m</i> . This array contains col indices, such that <i>cols_end</i> [ <i>i</i> ] - <i>ind</i> - 1 is the last index of col <i>i</i> in the arrays <i>values</i> and <i>row_indx</i> . <i>ind</i> takes 0 for zero-based indexing and 1 for one-based indexing.
	Refer to <i>pointerE</i> array description in <a href="#">CSC Format</a> for more details.
<i>row_indx</i>	For one-based indexing, array containing the row indices plus one for each non-zero element of the matrix <i>A</i> . For zero-based indexing, array containing the row indices for each non-zero element of the matrix <i>A</i> . Its length is at least <i>cols_end</i> [ <i>cols</i> - 1] - <i>ind</i> . <i>ind</i> takes 0 for zero-based indexing and 1 for one-based indexing.
<i>values</i>	Array containing non-zero elements of the matrix <i>A</i> . Its length is equal to length of the <i>row_indx</i> array.
	Refer to <i>values</i> array description in <a href="#">CSC Format</a> for more details.

## Output Parameters

<i>A</i>	Handle containing internal data.
----------	----------------------------------

## Return Values

The function returns a value indicating whether the operation was successful or not, and why.

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

## **mkl\_sparse\_?\_create\_coo**

*Creates a handle for a matrix in COO format.*

### Syntax

```
sparse_status_t mkl_sparse_s_create_coo (sparse_matrix_t *A, const sparse_index_base_t indexing, const MKL_INT rows, const MKL_INT cols, const MKL_INT nnz, MKL_INT *row_indx, MKL_INT * col_indx, float *values);
```

```
sparse_status_t mkl_sparse_d_create_coo (sparse_matrix_t *A, const sparse_index_base_t indexing, const MKL_INT rows, const MKL_INT cols, const MKL_INT nnz, MKL_INT *row_indx, MKL_INT * col_indx, double *values);
```

```
sparse_status_t mkl_sparse_c_create_coo (sparse_matrix_t *A, const sparse_index_base_t indexing, const MKL_INT rows, const MKL_INT cols, const MKL_INT nnz, MKL_INT *row_indx, MKL_INT * col_indx, MKL_Complex8 *values);
```

```
sparse_status_t mkl_sparse_z_create_coo (sparse_matrix_t *A, const sparse_index_base_t
indexing, const MKL_INT rows, const MKL_INT cols, const MKL_INT nnz, MKL_INT *row_indx,
MKL_INT * col_indx, MKL_Complex16 *values);
```

## Include Files

- `mkl_spblas.h`

## Description

The `mkl_sparse_?_create_coo` routine creates a handle for an  $m$ -by- $k$  matrix  $A$  in COO format.

### NOTE

The input arrays provided are left unchanged except for the call to `mkl_sparse_order`, which performs ordering of column indexes of the matrix. To avoid any changes to the input data, use `mkl_sparse_copy`.

## Input Parameters

<i>indexing</i>	Indicates how input arrays are indexed.				
	<table> <tbody> <tr> <td><code>SPARSE_INDEX_BASE_ZER</code> 0</td> <td>Zero-based (C-style) indexing: indices start at 0.</td> </tr> <tr> <td><code>SPARSE_INDEX_BASE_ONE</code></td> <td>One-based (Fortran-style) indexing: indices start at 1.</td> </tr> </tbody> </table>	<code>SPARSE_INDEX_BASE_ZER</code> 0	Zero-based (C-style) indexing: indices start at 0.	<code>SPARSE_INDEX_BASE_ONE</code>	One-based (Fortran-style) indexing: indices start at 1.
<code>SPARSE_INDEX_BASE_ZER</code> 0	Zero-based (C-style) indexing: indices start at 0.				
<code>SPARSE_INDEX_BASE_ONE</code>	One-based (Fortran-style) indexing: indices start at 1.				
<i>rows</i>	Number of rows of matrix $A$ .				
<i>cols</i>	Number of columns of matrix $A$ .				
<i>nnz</i>	Specifies the number of non-zero elements of the matrix $A$ . Refer to <i>nnz</i> description in <a href="#">Coordinate Format</a> for more details.				
<i>row_indx</i>	Array of length <i>nnz</i> , containing the row indices for each non-zero element of matrix $A$ . Refer to <i>rows</i> array description in <a href="#">Coordinate Format</a> for more details.				
<i>col_indx</i>	Array of length <i>nnz</i> , containing the column indices for each non-zero element of matrix $A$ . Refer to <i>columns</i> array description in <a href="#">Coordinate Format</a> for more details.				
<i>values</i>	Array of length <i>nnz</i> , containing the non-zero elements of matrix $A$ in arbitrary order. Refer to <i>values</i> array description in <a href="#">Coordinate Format</a> for more details.				

## Output Parameters

<i>A</i>	Handle containing internal data.
----------	----------------------------------

## Return Values

The function returns a value indicating whether the operation was successful or not, and why.

<code>SPARSE_STATUS_SUCCESS</code>	The operation was successful.
------------------------------------	-------------------------------

<code>SPARSE_STATUS_NOT_INITIALIZED</code>	The routine encountered an empty handle or matrix array.
<code>SPARSE_STATUS_ALLOC_FAILED</code>	Internal memory allocation failed.
<code>SPARSE_STATUS_INVALID_VALUE</code>	The input parameters contain an invalid value.
<code>SPARSE_STATUS_EXECUTION_FAILED</code>	Execution failed.
<code>SPARSE_STATUS_INTERNAL_ERROR</code>	An error in algorithm implementation occurred.
<code>SPARSE_STATUS_NOT_SUPPORTED</code>	The requested operation is not supported.

### [mkl\\_sparse\\_create\\_bsr](#)

*Creates a handle for a matrix in BSR format.*

#### Syntax

```
sparse_status_t mkl_sparse_s_create_bsr (sparse_matrix_t *A, const sparse_index_base_t
indexing, const sparse_layout_t block_layout, const MKL_INT rows, const MKL_INT cols,
const MKL_INT block_size, MKL_INT *rows_start, MKL_INT *rows_end, MKL_INT *col_indx,
float *values);
```

```
sparse_status_t mkl_sparse_d_create_bsr (sparse_matrix_t *A, const sparse_index_base_t
indexing, const sparse_layout_t block_layout, const MKL_INT rows, const MKL_INT cols,
const MKL_INT block_size, MKL_INT *rows_start, MKL_INT *rows_end, MKL_INT *col_indx,
double *values);
```

```
sparse_status_t mkl_sparse_c_create_bsr (sparse_matrix_t *A, const sparse_index_base_t
indexing, const sparse_layout_t block_layout, const MKL_INT rows, const MKL_INT cols,
const MKL_INT block_size, MKL_INT *rows_start, MKL_INT *rows_end, MKL_INT *col_indx,
MKL_Complex8 *values);
```

```
sparse_status_t mkl_sparse_z_create_bsr (sparse_matrix_t *A, const sparse_index_base_t
indexing, const sparse_layout_t block_layout, const MKL_INT rows, const MKL_INT cols,
const MKL_INT block_size, MKL_INT *rows_start, MKL_INT *rows_end, MKL_INT *col_indx,
MKL_Complex16 *values);
```

#### Include Files

- `mkl_spblas.h`

#### Description

The `mkl_sparse_create_bsr` routine creates a handle for an  $m$ -by- $k$  matrix  $A$  in BSR format.

---

#### NOTE

The input arrays provided are left unchanged except for the call to [mkl\\_sparse\\_order](#), which performs ordering of column indexes of the matrix. To avoid any changes to the input data, use [mkl\\_sparse\\_copy](#).

---

#### Input Parameters

<i>indexing</i>	Indicates how input arrays are indexed.
<code>SPARSE_INDEX_BASE_ZERO</code>	Zero-based (C-style) indexing: indices start at 0.

	SPARSE_INDEX_BASE_ONE	One-based (Fortran-style) indexing: indices start at 1.
<i>block_layout</i>	Specifies layout of blocks:	
	SPARSE_LAYOUT_ROW_MAJOR OR SPARSE_LAYOUT_COLUMN_MAJOR	Storage of elements of blocks uses row major layout. Storage of elements of blocks uses column major layout.
<i>rows</i>	Number of block rows of matrix <i>A</i> .	
<i>cols</i>	Number of block columns of matrix <i>A</i> .	
<i>block_size</i>	Size of blocks in matrix <i>A</i> .	
<i>rows_start</i>	Array of length <i>m</i> . This array contains row indices, such that <i>rows_start</i> [ <i>i</i> ] - <i>ind</i> is the first index of block row <i>i</i> in the arrays <i>values</i> and <i>col_indx</i> . <i>ind</i> takes 0 for zero-based indexing and 1 for one-based indexing.	
	Refer to <i>pointerB</i> array description in <a href="#">CSR Format</a> for more details.	
<i>rows_end</i>	Array of length <i>m</i> . This array contains row indices, such that <i>rows_end</i> [ <i>i</i> ] - <i>ind</i> - 1 is the last index of block row <i>i</i> in the arrays <i>values</i> and <i>col_indx</i> . <i>ind</i> takes 0 for zero-based indexing and 1 for one-based indexing.	
	Refer to <i>pointerE</i> array description in <a href="#">CSR Format</a> for more details.	
<i>col_indx</i>	For one-based indexing, array containing the column indices plus one for each non-zero block of the matrix <i>A</i> . For zero-based indexing, array containing the column indices for each non-zero block of the matrix <i>A</i> . Its length is <i>rows_end</i> [ <i>rows</i> - 1] - <i>ind</i> . <i>ind</i> takes 0 for zero-based indexing and 1 for one-based indexing.	
<i>values</i>	Array containing non-zero elements of the matrix <i>A</i> . Its length is equal to length of the <i>col_indx</i> array multiplied by <i>block_size</i> * <i>block_size</i> . Refer to the <i>values</i> array description in <a href="#">BSR Format</a> for more details.	

## Output Parameters

<i>A</i>	Handle containing internal data.
----------	----------------------------------

## Return Values

The function returns a value indicating whether the operation was successful or not, and why.

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.

<code>SPARSE_STATUS_INTERNAL_ERROR</code>	An error in algorithm implementation occurred.
<code>SPARSE_STATUS_NOT_SUPPORTED</code>	The requested operation is not supported.

## **mkl\_sparse\_copy**

*Creates a copy of a matrix handle.*

---

### **Syntax**

```
sparse_status_t mkl_sparse_copy (const sparse_matrix_t source, const struct
matrix_descr descr, sparse_matrix_t *dest);
```

### **Include Files**

- `mkl_spblas.h`

### **Description**

The `mkl_sparse_copy` routine creates a copy of a matrix handle.

---

#### **NOTE**

Currently, the `mkl_sparse_copy` routine does not support the descriptor argument and creates an exact (deep) copy of the input matrix.

---

### **Input Parameters**

<i>source</i>	Specifies handle containing internal data.
<i>descr</i>	Structure specifying sparse matrix properties.
<code>sparse_matrix_type_t</code> <i>type</i>	- Specifies the type of a sparse matrix:
<code>SPARSE_MATRIX_TYPE_GENERAL</code>	The matrix is processed as is.
<code>SPARSE_MATRIX_TYPE_SYMMETRIC</code>	The matrix is symmetric (only the requested triangle is processed).
<code>SPARSE_MATRIX_TYPE_HERMITIAN</code>	The matrix is Hermitian (only the requested triangle is processed).
<code>SPARSE_MATRIX_TYPE_TRIANGULAR</code>	The matrix is triangular (only the requested triangle is processed).
<code>SPARSE_MATRIX_TYPE_DIAGONAL</code>	The matrix is diagonal (only diagonal elements are processed).
<code>SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR</code>	The matrix is block-triangular (only requested triangle is processed). Applies to BSR format only.
<code>SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL</code>	The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only.
<code>sparse_fill_mode_t</code> <i>mode</i>	- Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:

SPARSE_FILL_MODE_LOWE	The lower triangular matrix part is processed.
R	
SPARSE_FILL_MODE_UPPE	The upper triangular matrix part is processed.
R	
sparse_diag_type_t <i>diag</i>	- Specifies diagonal type for non-general matrices:
SPARSE_DIAG_NON_UNIT	Diagonal elements might not be equal to one.
SPARSE_DIAG_UNIT	Diagonal elements are equal to one.

## Output Parameters

*dest* Handle containing internal data.

## Return Values

The function returns a value indicating whether the operation was successful or not, and why.

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

## **mkl\_sparse\_destroy**

*Frees memory allocated for matrix handle.*

## Syntax

```
sparse_status_t mkl_sparse_destroy (sparse_matrix_t A);
```

## Include Files

- `mkl_spblas.h`

## Description

The `mkl_sparse_destroy` routine frees memory allocated for matrix handle.

---

### NOTE

You must free memory allocated for matrices after completing use of them. The `mkl_sparse_destroy` routine provides a utility to do so.

---

## Input Parameters

*A* Handle containing internal data.

## Return Values

The function returns a value indicating whether the operation was successful or not, and why.

<code>SPARSE_STATUS_SUCCESS</code>	The operation was successful.
<code>SPARSE_STATUS_NOT_INITIALIZED</code>	The routine encountered an empty handle or matrix array.
<code>SPARSE_STATUS_ALLOC_FAILED</code>	Internal memory allocation failed.
<code>SPARSE_STATUS_INVALID_VALUE</code>	The input parameters contain an invalid value.
<code>SPARSE_STATUS_EXECUTION_FAILED</code>	Execution failed.
<code>SPARSE_STATUS_INTERNAL_ERROR</code>	An error in algorithm implementation occurred.
<code>SPARSE_STATUS_NOT_SUPPORTED</code>	The requested operation is not supported.

## `mkl_sparse_convert_csr`

*Converts internal matrix representation to CSR format.*

### Syntax

```
sparse_status_t mkl_sparse_convert_csr (const sparse_matrix_t source, const
sparse_operation_t operation, sparse_matrix_t *dest);
```

### Include Files

- `mkl_spblas.h`

### Description

The `mkl_sparse_convert_csr` routine converts internal matrix representation to CSR format. When the source matrix is in COO format, the routine performs a sum reduction on duplicate elements.

### Input Parameters

<i>source</i>	Handle containing internal data.
<i>operation</i>	Specifies operation <code>op()</code> on input matrix.
<code>SPARSE_OPERATION_NON_TRANSPOSE</code>	Non-transpose, $op(A) = A$ .
<code>SPARSE_OPERATION_TRANSPOSE</code>	Transpose, $op(A) = A^T$ .
<code>SPARSE_OPERATION_CONJUGATE_TRANSPOSE</code>	Conjugate transpose, $op(A) = A^H$ .

### Output Parameters

<i>dest</i>	Handle containing internal data.
-------------	----------------------------------

## Return Values

The function returns a value indicating whether the operation was successful or not, and why.

<code>SPARSE_STATUS_SUCCESS</code>	The operation was successful.
------------------------------------	-------------------------------

<code>SPARSE_STATUS_NOT_INITIALIZED</code>	The routine encountered an empty handle or matrix array.
<code>SPARSE_STATUS_ALLOC_FAILED</code>	Internal memory allocation failed.
<code>SPARSE_STATUS_INVALID_VALUE</code>	The input parameters contain an invalid value.
<code>SPARSE_STATUS_EXECUTION_FAILED</code>	Execution failed.
<code>SPARSE_STATUS_INTERNAL_ERROR</code>	An error in algorithm implementation occurred.
<code>SPARSE_STATUS_NOT_SUPPORTED</code>	The requested operation is not supported.

### **mkl\_sparse\_convert\_bsr**

*Converts internal matrix representation to BSR format or changes BSR block size.*

#### **Syntax**

```
sparse_status_t mkl_sparse_convert_bsr (const sparse_matrix_t source, const MKL_INT
block_size, const sparse_layout_t block_layout, const sparse_operation_t operation,
sparse_matrix_t *dest);
```

#### **Include Files**

- `mkl_spblas.h`

#### **Description**

The `mkl_sparse_convert_bsr` routine converts internal matrix representation to BSR format or changes BSR block size.

When the source matrix is in COO format, the routine performs a sum reduction on duplicate elements.

#### **Input Parameters**

<i>source</i>	Handle containing internal data.						
<i>block_size</i>	Size of the block in the output structure.						
<i>block_layout</i>	Specifies layout of blocks: <table> <tr> <td><code>SPARSE_LAYOUT_ROW_MAJOR</code></td> <td>Storage of elements of blocks uses row major layout.</td> </tr> <tr> <td>OR</td> <td></td> </tr> <tr> <td><code>SPARSE_LAYOUT_COLUMN_MAJOR</code></td> <td>Storage of elements of blocks uses column major layout.</td> </tr> </table>	<code>SPARSE_LAYOUT_ROW_MAJOR</code>	Storage of elements of blocks uses row major layout.	OR		<code>SPARSE_LAYOUT_COLUMN_MAJOR</code>	Storage of elements of blocks uses column major layout.
<code>SPARSE_LAYOUT_ROW_MAJOR</code>	Storage of elements of blocks uses row major layout.						
OR							
<code>SPARSE_LAYOUT_COLUMN_MAJOR</code>	Storage of elements of blocks uses column major layout.						
<i>operation</i>	Specifies operation <code>op()</code> on input matrix. <table> <tr> <td><code>SPARSE_OPERATION_NON_TRANSPOSE</code></td> <td>Non-transpose, <math>op(A) = A</math>.</td> </tr> <tr> <td><code>SPARSE_OPERATION_TRANSPOSE</code></td> <td>Transpose, <math>op(A) = A^T</math>.</td> </tr> <tr> <td><code>SPARSE_OPERATION_CONJUGATE_TRANSPOSE</code></td> <td>Conjugate transpose, <math>op(A) = A^H</math>.</td> </tr> </table>	<code>SPARSE_OPERATION_NON_TRANSPOSE</code>	Non-transpose, $op(A) = A$ .	<code>SPARSE_OPERATION_TRANSPOSE</code>	Transpose, $op(A) = A^T$ .	<code>SPARSE_OPERATION_CONJUGATE_TRANSPOSE</code>	Conjugate transpose, $op(A) = A^H$ .
<code>SPARSE_OPERATION_NON_TRANSPOSE</code>	Non-transpose, $op(A) = A$ .						
<code>SPARSE_OPERATION_TRANSPOSE</code>	Transpose, $op(A) = A^T$ .						
<code>SPARSE_OPERATION_CONJUGATE_TRANSPOSE</code>	Conjugate transpose, $op(A) = A^H$ .						

## Output Parameters

*dest* Handle containing internal data.

## Return Values

The function returns a value indicating whether the operation was successful or not, and why.

<code>SPARSE_STATUS_SUCCESS</code>	The operation was successful.
<code>SPARSE_STATUS_NOT_INITIALIZED</code>	The routine encountered an empty handle or matrix array.
<code>SPARSE_STATUS_ALLOC_FAILED</code>	Internal memory allocation failed.
<code>SPARSE_STATUS_INVALID_VALUE</code>	The input parameters contain an invalid value.
<code>SPARSE_STATUS_EXECUTION_FAILED</code>	Execution failed.
<code>SPARSE_STATUS_INTERNAL_ERROR</code>	An error in algorithm implementation occurred.
<code>SPARSE_STATUS_NOT_SUPPORTED</code>	The requested operation is not supported.

## `mkl_sparse_?_export_csr`

*Exports CSR matrix from internal representation.*

### Syntax

```
sparse_status_t mkl_sparse_s_export_csr (const sparse_matrix_t source,
sparse_index_base_t *indexing, MKL_INT *rows, MKL_INT *cols, MKL_INT **rows_start,
MKL_INT **rows_end, MKL_INT **col_indx, float **values);
```

```
sparse_status_t mkl_sparse_d_export_csr (const sparse_matrix_t source,
sparse_index_base_t *indexing, MKL_INT *rows, MKL_INT *cols, MKL_INT **rows_start,
MKL_INT **rows_end, MKL_INT **col_indx, double **values);
```

```
sparse_status_t mkl_sparse_c_export_csr (const sparse_matrix_t source,
sparse_index_base_t *indexing, MKL_INT *rows, MKL_INT *cols, MKL_INT **rows_start,
MKL_INT **rows_end, MKL_INT **col_indx, MKL_Complex8 **values);
```

```
sparse_status_t mkl_sparse_z_export_csr (const sparse_matrix_t source,
sparse_index_base_t *indexing, MKL_INT *rows, MKL_INT *cols, MKL_INT **rows_start,
MKL_INT **rows_end, MKL_INT **col_indx, MKL_Complex16 **values);
```

### Include Files

- `mkl_spblas.h`

### Description

If the matrix specified by the *source* handle is in CSR format, the `mkl_sparse_?_export_csr` routine exports an  $m$ -by- $k$  matrix  $A$  in CSR format matrix from the internal representation. The routine returns pointers to the internal representation and does not allocate additional memory.

If the matrix is not already in CSR format, the routine returns `SPARSE_STATUS_INVALID_VALUE`.

### Input Parameters

*source* Handle containing internal data.

## Output Parameters

<i>indexing</i>	Indicates how input arrays are indexed.				
	<table> <tr> <td>SPARSE_INDEX_BASE_ZERO</td> <td>Zero-based (C-style) indexing: indices start at 0.</td> </tr> <tr> <td>SPARSE_INDEX_BASE_ONE</td> <td>One-based (Fortran-style) indexing: indices start at 1.</td> </tr> </table>	SPARSE_INDEX_BASE_ZERO	Zero-based (C-style) indexing: indices start at 0.	SPARSE_INDEX_BASE_ONE	One-based (Fortran-style) indexing: indices start at 1.
SPARSE_INDEX_BASE_ZERO	Zero-based (C-style) indexing: indices start at 0.				
SPARSE_INDEX_BASE_ONE	One-based (Fortran-style) indexing: indices start at 1.				
<i>rows</i>	Number of rows of the matrix <i>source</i> .				
<i>cols</i>	Number of columns of the matrix <i>source</i> .				
<i>rows_start</i>	<p>Pointer to array of length <i>m</i>. This array contains row indices, such that <math>rows\_start[i] - ind</math> is the first index of row <i>i</i> in the arrays <i>values</i> and <i>col_indx</i>. <i>ind</i> takes 0 for zero-based indexing and 1 for one-based indexing.</p> <p>Refer to <i>pointerB</i> array description in <a href="#">CSR Format</a> for more details.</p>				
<i>rows_end</i>	<p>Pointer to array of length <i>m</i>. This array contains row indices, such that <math>rows\_end[i] - ind - 1</math> is the last index of row <i>i</i> in the arrays <i>values</i> and <i>col_indx</i>. <i>ind</i> takes 0 for zero-based indexing and 1 for one-based indexing.</p> <p>Refer to <i>pointerE</i> array description in <a href="#">CSR Format</a> for more details.</p>				
<i>col_indx</i>	For one-based indexing, pointer to array containing the column indices plus one for each non-zero element of the matrix <i>source</i> . For zero-based indexing, pointer to array containing the column indices for each non-zero element of the matrix <i>source</i> . Its length is $rows\_end[rows - 1] - ind$ . <i>ind</i> takes 0 for zero-based indexing and 1 for one-based indexing.				
<i>values</i>	<p>Pointer to array containing non-zero elements of the matrix <i>A</i>. Its length is equal to length of the <i>col_indx</i> array.</p> <p>Refer to <i>values</i> array description in <a href="#">CSR Format</a> for more details.</p>				

## Return Values

The function returns a value indicating whether the operation was successful or not, and why.

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

### [mkl\\_sparse\\_?\\_export\\_csc](#)

*Exports CSC matrix from internal representation.*

## Syntax

```
sparse_status_t mkl_sparse_s_export_csc (const sparse_matrix_t source,
sparse_index_base_t *indexing, MKL_INT *rows, MKL_INT *cols, MKL_INT **cols_start,
MKL_INT **cols_end, MKL_INT **row_indx, float **values);
```

```
sparse_status_t mkl_sparse_d_export_csc (const sparse_matrix_t source,
sparse_index_base_t *indexing, MKL_INT *rows, MKL_INT *cols, MKL_INT **cols_start,
MKL_INT **cols_end, MKL_INT **row_indx, double **values);
```

```
sparse_status_t mkl_sparse_c_export_csc (const sparse_matrix_t source,
sparse_index_base_t *indexing, MKL_INT *rows, MKL_INT *cols, MKL_INT **cols_start,
MKL_INT **cols_end, MKL_INT **row_indx, MKL_Complex8 **values);
```

```
sparse_status_t mkl_sparse_z_export_csc (const sparse_matrix_t source,
sparse_index_base_t *indexing, MKL_INT *rows, MKL_INT *cols, MKL_INT **cols_start,
MKL_INT **cols_end, MKL_INT **row_indx, MKL_Complex16 **values);
```

## Include Files

- mkl\_spblas.h

## Description

If the matrix specified by the *source* handle is in CSC format, the `mkl_sparse_?_export_csc` routine exports an  $m$ -by- $k$  matrix  $A$  in CSC format matrix from the internal representation. The routine returns pointers to the internal representation and does not allocate additional memory.

If the matrix is not already in CSC format, the routine returns `SPARSE_STATUS_INVALID_VALUE`.

## Input Parameters

*source* Handle containing internal data.

## Output Parameters

*indexing* Indicates how input arrays are indexed.

<code>SPARSE_INDEX_BASE_ZER</code>	Zero-based (C-style) indexing: indices start at 0.
<code>SPARSE_INDEX_BASE_ONE</code>	One-based (Fortran-style) indexing: indices start at 1.

*rows* Number of rows of the matrix *source*.

*cols* Number of columns of the matrix *source*.

*cols\_start* Array of length  $m$ . This array contains column indices, such that  $cols\_start[i] - cols\_start[0]$  is the first index of column  $i$  in the arrays *values* and *row\_indx*.  
Refer to *pointerb* array description in [csc Format](#) for more details.

*cols\_end* Pointer to array of length  $m$ . This array contains row indices, such that  $cols\_end[i] - cols\_start[0] - 1$  is the last index of column  $i$  in the arrays *values* and *row\_indx*.  
Refer to *pointerE* array description in [csc Format](#) for more details.

*row\_indx* For one-based indexing, pointer to array containing the row indices plus one for each non-zero element of the matrix *source*. For zero-based indexing, pointer to array containing the row indices for each non-zero element of the matrix *source*. Its length is `cols_end[cols - 1] - cols_start[0]`.

*values* Pointer to array containing non-zero elements of the matrix A. Its length is equal to length of the *row\_indx* array.

Refer to *values* array description in [csc Format](#) for more details.

## Return Values

The function returns a value indicating whether the operation was successful or not, and why.

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

## **`mkl_sparse_?_export_bsr`**

*Exports BSR matrix from internal representation.*

### Syntax

```
sparse_status_t mkl_sparse_s_export_bsr (const sparse_matrix_t source,
sparse_index_base_t *indexing, sparse_layout_t *block_layout, MKL_INT *rows, MKL_INT
*cols, MKL_INT *block_size, MKL_INT **rows_start, MKL_INT **rows_end, MKL_INT
**col_indx, float **values);
```

```
sparse_status_t mkl_sparse_d_export_bsr (const sparse_matrix_t source,
sparse_index_base_t *indexing, sparse_layout_t *block_layout, MKL_INT *rows, MKL_INT
*cols, MKL_INT *block_size, MKL_INT **rows_start, MKL_INT **rows_end, MKL_INT
**col_indx, double **values);
```

```
sparse_status_t mkl_sparse_c_export_bsr (const sparse_matrix_t source,
sparse_index_base_t *indexing, sparse_layout_t *block_layout, MKL_INT *rows, MKL_INT
*cols, MKL_INT *block_size, MKL_INT **rows_start, MKL_INT **rows_end, MKL_INT
**col_indx, MKL_Complex8 **values);
```

```
sparse_status_t mkl_sparse_z_export_bsr (const sparse_matrix_t source,
sparse_index_base_t *indexing, sparse_layout_t *block_layout, MKL_INT *rows, MKL_INT
*cols, MKL_INT *block_size, MKL_INT **rows_start, MKL_INT **rows_end, MKL_INT
**col_indx, MKL_Complex16 **values);
```

### Include Files

- `mkl_splblas.h`

## Description

If the matrix specified by the *source* handle is in BSR format, the `mkl_sparse?_export_bsr` routine exports an  $(block\_size * rows)$ -by- $(block\_size * cols)$  matrix *A* in BSR format from the internal representation. The routine returns pointers to the internal representation and does not allocate additional memory.

If the matrix is not already in BSR format, the routine returns `SPARSE_STATUS_INVALID_VALUE`.

## Input Parameters

*source* Handle containing internal data.

## Output Parameters

*indexing* Indicates how input arrays are indexed.

`SPARSE_INDEX_BASE_ZERO` Zero-based (C-style) indexing: indices start at 0.

`SPARSE_INDEX_BASE_ONE` One-based (Fortran-style) indexing: indices start at 1.

*block\_layout* Specifies layout of blocks:

`SPARSE_LAYOUT_ROW_MAJOR` OR Storage of elements of blocks uses row major layout.

`SPARSE_LAYOUT_COLUMN_MAJOR` Storage of elements of blocks uses column major layout.

*rows* Number of block rows of the matrix *source*.

*cols* Number of block columns of matrix *source*.

*block\_size* Size of the square block in matrix *source*.

*rows\_start* Pointer to array of length *rows*. This array contains row indices, such that  $rows\_start[i] - ind$  is the first index of block row *i* in the arrays *values* and *col\_indx*. *ind* takes 0 for zero-based indexing and 1 for one-based indexing.

Refer to *pointerB* array description in [BSR Format](#) for more details.

*rows\_end* Pointer to array of length *rows*. This array contains row indices, such that  $rows\_end[i] - ind - 1$  is the last index of block row *i* in the arrays *values* and *col\_indx*. *ind* takes 0 for zero-based indexing and 1 for one-based indexing.

Refer to *pointerE* array description in [BSR Format](#) for more details.

*col\_indx* For one-based indexing, pointer to array containing the column indices plus one for each non-zero blocks of the matrix *source*. For zero-based indexing, pointer to array containing the column indices for each non-zero blocks of the matrix *source*. Its length is  $rows\_end[rows - 1] - ind[0]$ . *ind* takes 0 for zero-based indexing and 1 for one-based indexing.

*values* Pointer to array containing non-zero elements of matrix *source*. Its length is equal to length of the *col\_indx* array multiplied by *block\_size\*block\_size*.

Refer to the *values* array description in [BSR Format](#) for more details.

## Return Values

The function returns a value indicating whether the operation was successful or not, and why.

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

## [mkl\\_sparse\\_?\\_set\\_value](#)

*Changes a single value of matrix in internal representation.*

---

### Syntax

```
sparse_status_t mkl_sparse_s_set_value (const sparse_matrix_t A, const MKL_INT row,
const MKL_INT col, const float value);

sparse_status_t mkl_sparse_d_set_value (const sparse_matrix_t A, const MKL_INT row,
const MKL_INT col, const double value);

sparse_status_t mkl_sparse_c_set_value (const sparse_matrix_t A, const MKL_INT row,
const MKL_INT col, const MKL_Complex8 value);

sparse_status_t mkl_sparse_z_set_value (const sparse_matrix_t A, const MKL_INT row,
const MKL_INT col, const MKL_Complex16 value);
```

### Include Files

- `mkl_spblas.h`

### Description

Use the `mkl_sparse_?_set_value` routine to change a single value of a matrix in the internal Inspector-executor Sparse BLAS format. The value should already be presented in a matrix structure.

### Input Parameters

<i>A</i>	Specifies handle containing internal data.
<i>row</i>	Indicates row of matrix in which to set value.
<i>col</i>	Indicates column of matrix in which to set value.
<i>value</i>	Indicates value

## Output Parameters

A Handle containing modified internal data.

## Return Values

The function returns a value indicating whether the operation was successful or not, and why.

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.

### **mkl\_sparse\_?\_update\_values**

*Changes all or selected matrix values in internal representation.*

## Syntax

### **NOTE**

This routine is supported for sparse matrices in BSR format only.

```

sparse_status_t mkl_sparse_s_update_values (sparse_matrix_t A, MKL_INT nvalues, MKL_INT
*indx, MKL_INT *indy, float *values);

sparse_status_t mkl_sparse_d_update_values (sparse_matrix_t A, MKL_INT nvalues, MKL_INT
*indx, MKL_INT *indy, double *values);

sparse_status_t mkl_sparse_c_update_values (sparse_matrix_t A, MKL_INT nvalues, MKL_INT
*indx, MKL_INT *indy, MKL_Complex8 *values);

sparse_status_t mkl_sparse_z_update_values (sparse_matrix_t A, MKL_INT nvalues, MKL_INT
*indx, MKL_INT *indy, MKL_Complex16 *values);

```

## Include Files

- mkl\_spblas.h

## Description

Use the `mkl_sparse_?_update_values` routine to change all or selected values of a matrix in the internal Inspector-Executor Sparse BLAS format.

The values to be updated should already be present in the matrix structure.

- To change selected values, you must provide an array `values` (with new values) and also the corresponding row and column indices for each value via `indx` and `indy` arrays as well as the overall number of changed elements `nvalues`.

So that, for example, to change  $A(0, 0)$  to 1 and  $A(0, 1)$  to 2, pass the following input parameters: `nvalues = 2`, `indx = {0, 0}`, `indy = {0, 1}` and `values = {1, 2}`.

- To change all the values in the matrix, provide the `values` array and explicitly set `nvalues` to 0 or the actual number of non zero elements. There is no need to supply `indx` and `indy` arrays.

## Input Parameters

<i>A</i>	Specifies handle containing internal data.
<i>nvalues</i>	Total number of elements changed.
<i>indx</i>	Row indices for the new values.

---

### NOTE

Currently, only updating the full matrix is supported. Set *indx* and *indy* as NULL.

---

<i>indy</i>	Column indices for the new values.
-------------	------------------------------------

---

### NOTE

Currently, only updating the full matrix is supported. Set *indx* and *indy* as NULL.

---

<i>values</i>	New values.
---------------	-------------

## Output Parameters

<i>A</i>	Handle containing modified internal data.
----------	---

## Return Values

The function returns a value indicating whether the operation was successful or not, and why.

<code>SPARSE_STATUS_SUCCESS</code>	The operation was successful.
<code>SPARSE_STATUS_NOT_INITIALIZED</code>	The routine encountered an empty handle or matrix array.
<code>SPARSE_STATUS_ALLOC_FAILED</code>	Internal memory allocation failed.
<code>SPARSE_STATUS_INVALID_VALUE</code>	The input parameters contain an invalid value.
<code>SPARSE_STATUS_EXECUTION_FAILED</code>	Execution failed.
<code>SPARSE_STATUS_INTERNAL_ERROR</code>	An error in algorithm implementation occurred.
<code>SPARSE_STATUS_NOT_SUPPORTED</code>	The requested operation is not supported.

## `mkl_sparse_order`

*Performs ordering of column indexes of the matrix in CSR format*

---

### Syntax

```
sparse_status_t mkl_sparse_order (const sparse_matrix_t csrA);
```

### Include Files

- `mkl_spblas.h`

### Description

Use the `mkl_sparse_order` routine to perform ordering of column indexes of the matrix in CSR format.

## Input Parameters

`csrA` CSR data

## Output Parameters

`csrA` Handle containing modified internal data.

## Return Values

The function returns a value indicating whether the operation was successful or not, and why.

<code>SPARSE_STATUS_SUCCESS</code>	The operation was successful.
<code>SPARSE_STATUS_NOT_INITIALIZED</code>	The routine encountered an empty handle or matrix array.
<code>SPARSE_STATUS_INVALID_VALUE</code>	The input parameters contain an invalid value.
<code>SPARSE_STATUS_INTERNAL_ERROR</code>	An error in algorithm implementation occurred.

## Inspector-Executor Sparse BLAS Analysis Routines

### Analysis Routines and Their Data Types

Routine or Function Group	Description
<a href="#">mkl_sparse_set_lu_smoother_hint</a>	Provides and estimate of the number and type of upcoming calls to LU smoother functionality.
<a href="#">mkl_sparse_set_mv_hint</a>	Provides estimate of number and type of upcoming matrix-vector operations.
<a href="#">mkl_sparse_set_sv_hint</a>	Provides estimate of number and type of upcoming triangular system solver operations.
<a href="#">mkl_sparse_set_mm_hint</a>	Provides estimate of number and type of upcoming matrix-matrix multiplication operations.
<a href="#">mkl_sparse_set_sm_hint</a>	Provides estimate of number and type of upcoming triangular matrix solve with multiple right hand sides operations.
<a href="#">mkl_sparse_set_dotmv_hint</a>	Sets estimate of the number and type of upcoming matrix-vector operations.
<a href="#">mkl_sparse_set_symgs_hint</a>	Sets estimate of number and type of upcoming <code>mkl_sparse?_symgs</code> operations.
<a href="#">mkl_sparse_set_sorv_hint</a>	Sets estimate of number and type of upcoming <code>mkl_sparse?_symgs</code> operations.
<a href="#">mkl_sparse_set_memory_hint</a>	Provides memory requirements for performance optimization purposes.
<a href="#">mkl_sparse_optimize</a>	Analyzes matrix structure and performs optimizations using the hints provided in the handle.

### Product and Performance Information

Performance varies by use, configuration and other factors. Learn more at [www.Intel.com/PerformanceIndex](http://www.Intel.com/PerformanceIndex).

Notice revision #20201201

## mkl\_sparse\_set\_lu\_smoother\_hint

Provides an estimate of the number and type of upcoming calls to LU smoother functionality.

### Syntax

```
sparse_status_t mkl_sparse_set_lu_smoother_hint (sparse_matrix_t A, const
sparse_operation_t operation, struct matrix_descr descr, MKL_INT expected_calls);
```

### Include Files

- mkl\_splblas.h

### Description

The `mkl_sparse_set_lu_smoother_hint` function provides subsequent Inspector-Executor Sparse BLAS calls an estimate of the number of upcoming calls to the `lu_smoother` routine that ultimately may influence the optimizations applied and specifies whether or not to perform an operation on the matrix.

#### Product and Performance Information

Performance varies by use, configuration and other factors. Learn more at [www.Intel.com/PerformanceIndex](http://www.Intel.com/PerformanceIndex).

Notice revision #20201201

### Input Parameters

<i>operation</i>	Specifies the operation <i>op()</i> on input matrix.
	<p>SPARSE_OPERATION_NON_TRANSPOSE Non-transpose, <math>op(A) = A</math>.</p> <p>SPARSE_OPERATION_TRANSPOSE Transpose, <math>op(A) = A^T</math>.</p> <p>SPARSE_OPERATION_CONJUGATE_TRANSPOSE Conjugate transpose, <math>op(A) = A^H</math>.</p>
<i>descr</i>	Structure specifying sparse matrix properties.
	<p><i>sparse_matrix_type_t</i> <i>type</i> - Specifies the type of a sparse matrix:</p> <p>SPARSE_MATRIX_TYPE_GENERAL The matrix is processed as is.</p> <p>SPARSE_MATRIX_TYPE_SYMMETRIC The matrix is symmetric (only the requested triangle is processed).</p> <p>SPARSE_MATRIX_TYPE_HERMITIAN The matrix is Hermitian (only the requested triangle is processed).</p> <p>SPARSE_MATRIX_TYPE_TRIANGULAR The matrix is triangular (only the requested triangle is processed).</p> <p>SPARSE_MATRIX_TYPE_DIAGONAL The matrix is diagonal (only diagonal elements are processed).</p> <p>SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR The matrix is block-triangular (only the requested triangle is processed). Applies to BSR format only.</p>

`SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL` The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only.

`sparse_fill_mode_t`*mode* - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:

`SPARSE_FILL_MODE_LOWER` The lower triangular matrix part is processed.

`SPARSE_FILL_MODE_UPPER` The upper triangular matrix part is processed.

`sparse_diag_type_t`*diag* - Specifies the diagonal type for non-general matrices:

`SPARSE_DIAG_NON_UNIT` Diagonal elements might not be equal to one.

`SPARSE_DIAG_UNIT` Diagonal elements are equal to one.

`expected_calls`

Number of expected calls to execution routine.

`A`

Handle containing internal data.

## Return Values

The function returns a value indicating whether the operation was successful or not, and why.

<code>SPARSE_STATUS_SUCCESS</code>	The operation was successful.
<code>SPARSE_STATUS_NOT_INITIALIZED</code>	The routine encountered an empty handle or matrix array.
<code>SPARSE_STATUS_ALLOC_FAILED</code>	Internal memory allocation failed.
<code>SPARSE_STATUS_INVALID_VALUE</code>	The input parameters contain an invalid value.
<code>SPARSE_STATUS_EXECUTION_FAILED</code>	Execution failed.
<code>SPARSE_STATUS_INTERNAL_ERROR</code>	An error in algorithm implementation occurred.
<code>SPARSE_STATUS_NOT_SUPPORTED</code>	The requested operation is not supported.

## `mkl_sparse_set_mv_hint`

*Provides estimate of number and type of upcoming matrix-vector operations.*

### Syntax

```
sparse_status_t mkl_sparse_set_mv_hint (const sparse_matrix_t A, const
sparse_operation_t operation, const struct matrix_descr descr, const MKL_INT
expected_calls);
```

### Include Files

- `mkl_spblas.h`

### Description

Use the `mkl_sparse_set_mv_hint` routine to provide the Inspector-executor Sparse BLAS API an estimate of the number of upcoming matrix-vector multiplication operations for performance optimization, and specify whether or not to perform an operation on the matrix.

**Product and Performance Information**

Performance varies by use, configuration and other factors. Learn more at [www.Intel.com/PerformanceIndex](http://www.Intel.com/PerformanceIndex).

Notice revision #20201201

**Input Parameters**

*operation*

Specifies operation `op()` on input matrix.

`SPARSE_OPERATION_NON_TRANSPOSE` Non-transpose,  $\text{op}(A) = A$ .

`SPARSE_OPERATION_TRANSPOSE` Transpose,  $\text{op}(A) = A^T$ .

`SPARSE_OPERATION_CONJUGATE_TRANSPOSE` Conjugate transpose,  $\text{op}(A) = A^H$ .

*descr*

Structure specifying sparse matrix properties.

`sparse_matrix_type_t` *type* - Specifies the type of a sparse matrix:

`SPARSE_MATRIX_TYPE_GENERAL` The matrix is processed as is.

`SPARSE_MATRIX_TYPE_SYMMETRIC` The matrix is symmetric (only the requested triangle is processed).

`SPARSE_MATRIX_TYPE_HERMITIAN` The matrix is Hermitian (only the requested triangle is processed).

`SPARSE_MATRIX_TYPE_TRIANGULAR` The matrix is triangular (only the requested triangle is processed).

`SPARSE_MATRIX_TYPE_DIAGONAL` The matrix is diagonal (only diagonal elements are processed).

`SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR` The matrix is block-triangular (only requested triangle is processed). Applies to BSR format only.

`SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL` The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only.

`sparse_fill_mode_t` *mode* - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:

`SPARSE_FILL_MODE_LOWER` The lower triangular matrix part is processed.

`SPARSE_FILL_MODE_UPPER` The upper triangular matrix part is processed.

`sparse_diag_type_t` *diag* - Specifies diagonal type for non-general matrices:

`SPARSE_DIAG_NON_UNIT` Diagonal elements might not be equal to one.

`SPARSE_DIAG_UNIT` Diagonal elements are equal to one.  
`expected_calls` Number of expected calls to execution routine.

## Output Parameters

`A` Handle containing internal data.

## Return Values

The function returns a value indicating whether the operation was successful or not, and why.

`SPARSE_STATUS_SUCCESS` The operation was successful.  
`SPARSE_STATUS_NOT_INITIALIZED` The routine encountered an empty handle or matrix array.  
`SPARSE_STATUS_ALLOC_FAILED` Internal memory allocation failed.  
`SPARSE_STATUS_INVALID_VALUE` The input parameters contain an invalid value.  
`SPARSE_STATUS_EXECUTION_FAILED` Execution failed.  
`SPARSE_STATUS_INTERNAL_ERROR` An error in algorithm implementation occurred.  
`SPARSE_STATUS_NOT_SUPPORTED` The requested operation is not supported.

## `mkl_sparse_set_sv_hint`

*Provides estimate of number and type of upcoming triangular system solver operations.*

## Syntax

```
sparse_status_t mkl_sparse_set_sv_hint (const sparse_matrix_t A, const
sparse_operation_t operation, const struct matrix_descr descr, const MKL_INT
expected_calls);
```

## Include Files

- `mkl_spblas.h`

## Description

The `mkl_sparse_set_sv_hint` routine provides an estimate of the number of upcoming triangular system solver operations and type of these operations for performance optimization.

### Product and Performance Information

Performance varies by use, configuration and other factors. Learn more at [www.Intel.com/PerformanceIndex](http://www.Intel.com/PerformanceIndex).

Notice revision #20201201

## Input Parameters

`operation` Specifies operation `op()` on input matrix.  
`SPARSE_OPERATION_NON_TRANSPOSE` Non-transpose,  $op(A) = A$ .

SPARSE\_OPERATION\_TRANSPOSE Transpose,  $\text{op}(A) = A^T$ .  
SPOSE

SPARSE\_OPERATION\_CONJUGATE\_TRANSPOSE Conjugate transpose,  $\text{op}(A) = A^H$ .  
UGATE\_TRANSPOSE

*descr*

Structure specifying sparse matrix properties.

`sparse_matrix_type_t` *type* - Specifies the type of a sparse matrix:

SPARSE\_MATRIX\_TYPE\_GENERAL The matrix is processed as is.  
NERAL

SPARSE\_MATRIX\_TYPE\_SYMMETRIC The matrix is symmetric (only the requested triangle is processed).  
MMETRIC

SPARSE\_MATRIX\_TYPE\_HERMITIAN The matrix is Hermitian (only the requested triangle is processed).  
RMITIAN

SPARSE\_MATRIX\_TYPE\_TRIANGULAR The matrix is triangular (only the requested triangle is processed).  
IANGULAR

SPARSE\_MATRIX\_TYPE\_DIAGONAL The matrix is diagonal (only diagonal elements are processed).  
AGONAL

SPARSE\_MATRIX\_TYPE\_BLOCK\_TRIANGULAR The matrix is block-triangular (only requested triangle is processed). Applies to BSR format only.  
OCK\_TRIANGULAR

SPARSE\_MATRIX\_TYPE\_BLOCK\_DIAGONAL The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only.  
OCK\_DIAGONAL

`sparse_fill_mode_t` *mode* - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:

SPARSE\_FILL\_MODE\_LOWER The lower triangular matrix part is processed.  
R

SPARSE\_FILL\_MODE\_UPPER The upper triangular matrix part is processed.  
R

`sparse_diag_type_t` *diag* - Specifies diagonal type for non-general matrices:

SPARSE\_DIAG\_NON\_UNIT Diagonal elements might not be equal to one.

SPARSE\_DIAG\_UNIT Diagonal elements are equal to one.

*expected\_calls*

Number of expected calls to execution routine.

## Output Parameters

*A*

Handle containing internal data.

## Return Values

The function returns a value indicating whether the operation was successful or not, and why.

SPARSE\_STATUS\_SUCCESS The operation was successful.

<code>SPARSE_STATUS_NOT_INITIALIZED</code>	The routine encountered an empty handle or matrix array.
<code>SPARSE_STATUS_ALLOC_FAILED</code>	Internal memory allocation failed.
<code>SPARSE_STATUS_INVALID_VALUE</code>	The input parameters contain an invalid value.
<code>SPARSE_STATUS_EXECUTION_FAILED</code>	Execution failed.
<code>SPARSE_STATUS_INTERNAL_ERROR</code>	An error in algorithm implementation occurred.
<code>SPARSE_STATUS_NOT_SUPPORTED</code>	The requested operation is not supported.

### **mkl\_sparse\_set\_mm\_hint**

*Provides estimate of number and type of upcoming matrix-matrix multiplication operations.*

#### **Syntax**

```
sparse_status_t mkl_sparse_set_mm_hint (const sparse_matrix_t A, const
sparse_operation_t operation, const struct matrix_descr descr, const sparse_layout_t
layout, const MKL_INT dense_matrix_size, const MKL_INT expected_calls);
```

#### **Include Files**

- `mkl_spblas.h`

#### **Description**

The `mkl_sparse_set_mm_hint` routine provides an estimate of the number of upcoming matrix-matrix multiplication operations and type of these operations for performance optimization purposes.

#### **Product and Performance Information**

Performance varies by use, configuration and other factors. Learn more at [www.Intel.com/PerformanceIndex](http://www.Intel.com/PerformanceIndex).

Notice revision #20201201

#### **Input Parameters**

<i>operation</i>	Specifies operation <code>op()</code> on input matrix.
<code>SPARSE_OPERATION_NON_TRANSPOSE</code>	Non-transpose, $op(A) = A$ .
<code>SPARSE_OPERATION_TRANSPOSE</code>	Transpose, $op(A) = A^T$ .
<code>SPARSE_OPERATION_CONJUGATE_TRANSPOSE</code>	Conjugate transpose, $op(A) = A^H$ .
<i>descr</i>	Structure specifying sparse matrix properties.
<code>sparse_matrix_type_t</code>	<i>type</i> - Specifies the type of a sparse matrix:
<code>SPARSE_MATRIX_TYPE_GENERAL</code>	The matrix is processed as is.
<code>SPARSE_MATRIX_TYPE_SYMMETRIC</code>	The matrix is symmetric (only the requested triangle is processed).

<code>SPARSE_MATRIX_TYPE_HERMITIAN</code>	The matrix is Hermitian (only the requested triangle is processed).
<code>SPARSE_MATRIX_TYPE_TRIANGULAR</code>	The matrix is triangular (only the requested triangle is processed).
<code>SPARSE_MATRIX_TYPE_DIAGONAL</code>	The matrix is diagonal (only diagonal elements are processed).
<code>SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR</code>	The matrix is block-triangular (only requested triangle is processed). Applies to BSR format only.
<code>SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL</code>	The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only.

`sparse_fill_mode_t` *mode* - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:

<code>SPARSE_FILL_MODE_LOWER</code>	The lower triangular matrix part is processed.
<code>SPARSE_FILL_MODE_UPPER</code>	The upper triangular matrix part is processed.

`sparse_diag_type_t` *diag* - Specifies diagonal type for non-general matrices:

<code>SPARSE_DIAG_NON_UNIT</code>	Diagonal elements might not be equal to one.
<code>SPARSE_DIAG_UNIT</code>	Diagonal elements are equal to one.

*layout*

Specifies layout of elements:

<code>SPARSE_LAYOUT_COLUMN_MAJOR</code>	Storage of elements uses column major layout.
<code>SPARSE_LAYOUT_ROW_MAJOR</code>	Storage of elements uses row major layout.

*dense\_matrix\_size*

Number of columns in dense matrix.

*expected\_calls*

Number of expected calls to execution routine.

## Output Parameters

*A*

Handle containing internal data.

## Return Values

The function returns a value indicating whether the operation was successful or not, and why.

<code>SPARSE_STATUS_SUCCESS</code>	The operation was successful.
<code>SPARSE_STATUS_NOT_INITIALIZED</code>	The routine encountered an empty handle or matrix array.
<code>SPARSE_STATUS_ALLOC_FAILED</code>	Internal memory allocation failed.
<code>SPARSE_STATUS_INVALID_VALUE</code>	The input parameters contain an invalid value.

<code>SPARSE_STATUS_EXECUTION_FAILED</code>	Execution failed.
<code>SPARSE_STATUS_INTERNAL_ERROR</code>	An error in algorithm implementation occurred.
<code>SPARSE_STATUS_NOT_SUPPORTED</code>	The requested operation is not supported.

### **mkl\_sparse\_set\_sm\_hint**

Provides estimate of number and type of upcoming triangular matrix solve with multiple right hand sides operations.

#### **Syntax**

```
sparse_status_t mkl_sparse_set_sm_hint (const sparse_matrix_t A, const
sparse_operation_t operation, const struct matrix_descr descr, const sparse_layout_t
layout, const MKL_INT dense_matrix_size, const MKL_INT expected_calls);
```

#### **Include Files**

- `mkl_spblas.h`

#### **Description**

The `mkl_sparse_set_sm_hint` routine provides an estimate of the number of upcoming triangular matrix solve with multiple right hand sides operations and type of these operations for performance optimization purposes.

#### **Product and Performance Information**

Performance varies by use, configuration and other factors. Learn more at [www.Intel.com/PerformanceIndex](http://www.Intel.com/PerformanceIndex).

Notice revision #20201201

#### **Input Parameters**

<i>operation</i>	Specifies operation <code>op()</code> on input matrix.
	<code>SPARSE_OPERATION_NON_TRANSPOSE</code> Non-transpose, $op(A) = A$ .
	<code>SPARSE_OPERATION_TRANSPOSE</code> Transpose, $op(A) = A^T$ .
	<code>SPARSE_OPERATION_CONJUGATE_TRANSPOSE</code> Conjugate transpose, $op(A) = A^H$ .
<i>descr</i>	Structure specifying sparse matrix properties.
	<code>sparse_matrix_type_t type</code> - Specifies the type of a sparse matrix:
	<code>SPARSE_MATRIX_TYPE_GENERAL</code> The matrix is processed as is.
	<code>SPARSE_MATRIX_TYPE_SYMMETRIC</code> The matrix is symmetric (only the requested triangle is processed).
	<code>SPARSE_MATRIX_TYPE_HERMITIAN</code> The matrix is Hermitian (only the requested triangle is processed).

<code>SPARSE_MATRIX_TYPE_TRIANGULAR</code>	The matrix is triangular (only the requested triangle is processed).
<code>SPARSE_MATRIX_TYPE_DIAGONAL</code>	The matrix is diagonal (only diagonal elements are processed).
<code>SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR</code>	The matrix is block-triangular (only requested triangle is processed). Applies to BSR format only.
<code>SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL</code>	The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only.

`sparse_fill_mode_t mode` - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:

<code>SPARSE_FILL_MODE_LOWER</code>	The lower triangular matrix part is processed.
<code>SPARSE_FILL_MODE_UPPER</code>	The upper triangular matrix part is processed.

`sparse_diag_type_t diag` - Specifies diagonal type for non-general matrices:

<code>SPARSE_DIAG_NON_UNIT</code>	Diagonal elements might not be equal to one.
<code>SPARSE_DIAG_UNIT</code>	Diagonal elements are equal to one.

*layout*

Specifies layout of elements:

<code>SPARSE_LAYOUT_COLUMN_MAJOR</code>	Storage of elements uses column major layout.
<code>SPARSE_LAYOUT_ROW_MAJOR</code>	Storage of elements uses row major layout.

*dense\_matrix\_size*

Number of right-hand-side.

*expected\_calls*

Number of expected calls to execution routine.

## Output Parameters

A

Handle containing internal data.

## Return Values

The function returns a value indicating whether the operation was successful or not, and why.

<code>SPARSE_STATUS_SUCCESS</code>	The operation was successful.
<code>SPARSE_STATUS_NOT_INITIALIZED</code>	The routine encountered an empty handle or matrix array.
<code>SPARSE_STATUS_ALLOC_FAILED</code>	Internal memory allocation failed.
<code>SPARSE_STATUS_INVALID_VALUE</code>	The input parameters contain an invalid value.
<code>SPARSE_STATUS_EXECUTION_FAILED</code>	Execution failed.
<code>SPARSE_STATUS_INTERNAL_ERROR</code>	An error in algorithm implementation occurred.

SPARSE\_STATUS\_NOT\_SUPPORTED      The requested operation is not supported.

### **mkl\_sparse\_set\_dotmv\_hint**

*Sets estimate of the number and type of upcoming matrix-vector operations.*

#### **Syntax**

```
sparse_status_t mkl_sparse_set_dotmv_hint (const sparse_matrix_t A, const
sparse_operation_t operation, const struct matrix_descr descr, const MKL_INT
expected_calls);
```

#### **Include Files**

- mkl\_splblas.h

#### **Description**

Use the `mkl_sparse_set_dotmv_hint` routine to provide the Inspector-executor Sparse BLAS API an estimate of the number of upcoming matrix-vector multiplication operations for performance optimization, and specify whether or not to perform an operation on the matrix.

#### **Input Parameters**

<i>operation</i>	Specifies the operation performed on matrix <i>A</i> . If <i>operation</i> = SPARSE_OPERATION_NON_TRANSPOSE, $op(A) = A$ . If <i>operation</i> = SPARSE_OPERATION_TRANSPOSE, $op(A) = A^T$ . If <i>operation</i> = SPARSE_OPERATION_CONJUGATE_TRANSPOSE, $op(A) = A^H$ .
<i>descr</i>	Structure specifying sparse matrix properties. sparse_matrix_type_t <i>type</i> - Specifies the type of a sparse matrix:  SPARSE_MATRIX_TYPE_GENERAL      The matrix is processed as is. SPARSE_MATRIX_TYPE_SYMMETRIC      The matrix is symmetric (only the requested triangle is processed). SPARSE_MATRIX_TYPE_HERMITIAN      The matrix is Hermitian (only the requested triangle is processed). SPARSE_MATRIX_TYPE_TRIANGULAR      The matrix is triangular (only the requested triangle is processed). SPARSE_MATRIX_TYPE_DIAGONAL      The matrix is diagonal (only diagonal elements are processed). SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR      The matrix is block-triangular (only requested triangle is processed). Applies to BSR format only. SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL      The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only.

`sparse_fill_mode_t mode` - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:

`SPARSE_FILL_MODE_LOWER` The lower triangular matrix part is processed.  
R

`SPARSE_FILL_MODE_UPPER` The upper triangular matrix part is processed.  
R

`sparse_diag_type_t diag` - Specifies diagonal type for non-general matrices:

`SPARSE_DIAG_NON_UNIT` Diagonal elements might not be equal to one.

`SPARSE_DIAG_UNIT` Diagonal elements are equal to one.

`expected_calls`

Expected number of calls to the execution routine.

## Output Parameters

A

Handle containing internal data.

## Return Values

The function returns a value indicating whether the operation was successful or not, and why.

<code>SPARSE_STATUS_SUCCESS</code>	The operation was successful.
<code>SPARSE_STATUS_NOT_INITIALIZED</code>	The routine encountered an empty handle or matrix array.
<code>SPARSE_STATUS_ALLOC_FAILED</code>	Internal memory allocation failed.
<code>SPARSE_STATUS_INVALID_VALUE</code>	The input parameters contain an invalid value.
<code>SPARSE_STATUS_EXECUTION_FAILED</code>	Execution failed.
<code>SPARSE_STATUS_INTERNAL_ERROR</code>	An error in algorithm implementation occurred.
<code>SPARSE_STATUS_NOT_SUPPORTED</code>	The requested operation is not supported.

## `mkl_sparse_set_symgs_hint`

### Syntax

Sets estimate of number and type of upcoming `mkl_sparse_?_symgs` operations.

```
sparse_status_t mkl_sparse_set_symgs_hint (const sparse_matrix_t A, const
sparse_operation_t operation, const struct matrix_descr descr, const MKL_INT
expected_calls);
```

### Include Files

- `mkl_splblas.h`

### Description

Use the `mkl_sparse_set_symgs_hint` routine to provide the Inspector-executor Sparse BLAS API an estimate of the number of upcoming symmetric Gauss-Zeidel preconditioner operations for performance optimization, and specify whether or not to perform an operation on the matrix.

## Input Parameters

<i>operation</i>	Specifies the operation performed on matrix <i>A</i> . If <i>operation</i> = SPARSE_OPERATION_NON_TRANSPOSE, $\text{op}(A) = A$ . If <i>operation</i> = SPARSE_OPERATION_TRANSPOSE, $\text{op}(A) = A^T$ . If <i>operation</i> = SPARSE_OPERATION_CONJUGATE_TRANSPOSE, $\text{op}(A) = A^H$ .																						
<i>descr</i>	Structure specifying sparse matrix properties. <i>sparse_matrix_type_t type</i> - Specifies the type of a sparse matrix:  <table> <tr> <td>SPARSE_MATRIX_TYPE_GENERAL</td> <td>The matrix is processed as is.</td> </tr> <tr> <td>SPARSE_MATRIX_TYPE_SYMMETRIC</td> <td>The matrix is symmetric (only the requested triangle is processed).</td> </tr> <tr> <td>SPARSE_MATRIX_TYPE_HERMITIAN</td> <td>The matrix is Hermitian (only the requested triangle is processed).</td> </tr> <tr> <td>SPARSE_MATRIX_TYPE_TRIANGULAR</td> <td>The matrix is triangular (only the requested triangle is processed).</td> </tr> <tr> <td>SPARSE_MATRIX_TYPE_DIAGONAL</td> <td>The matrix is diagonal (only diagonal elements are processed).</td> </tr> <tr> <td>SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR</td> <td>The matrix is block-triangular (only requested triangle is processed). <i>mode</i>	Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices.																						
<i>type</i>	Specifies the type of a sparse matrix.																						
<i>expected_calls</i>	Estimate of the number to the execution routine.																						

## Output Parameters

A Handle containing internal data.

## Return Values

The function returns a value indicating whether the operation was successful or not, and why.

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

## **mkl\_sparse\_set\_sorv\_hint**

*Sets an estimate of the number and type of upcoming mkl\_sparse\_?\_sorv operations.*

---

## Syntax

```
sparse_status_t mkl_sparse_set_sorv_hint(
    const sparse_sor_type_t type,
    const sparse_matrix_t A,
    const struct matrix_descr descr,
    const MKL_INT expected_calls
);
```

## Include Files

- mkl\_splblas.h

## Description

Use the `mkl_sparse_set_sorv_hint` routine to provide the Inspector-Executor Sparse BLAS API an estimate of the number of upcoming forward/backward sweeps or symmetric SOR preconditioner operations for performance optimization.

### Product and Performance Information

Performance varies by use, configuration and other factors. Learn more at [www.Intel.com/PerformanceIndex](http://www.Intel.com/PerformanceIndex).

Notice revision #20201201

## Input Parameters

`type` Specifies the operation performed by the SORV preconditioner.

SPARSE\_SOR\_FORWARD Performs forward sweep as defined by:

$$(\omega * L + D) * x^1 = (D - \omega * D - \omega * U) * x^0 + \omega * b$$

SPARSE\_SOR\_BACKWARD

Performs backward sweep as defined by:

$$(\omega * U + D) * x^1 = (D - \omega * D - \omega * L) * x^0 + \omega * b$$

SPARSE\_SOR\_SYMMETRIC

Preconditioner matrix could be expressed as:

$$\frac{\omega}{2 - \omega} \left( \frac{1}{\omega} D + L \right) D^{-1} \left( \frac{1}{\omega} D + L \right)^T$$

*descr*

Structure specifying sparse matrix properties.

sparse\_matrix\_type\_t  
type

Specifies the type of a sparse matrix:

- SPARSE\_MATRIX\_TYPE\_GENERAL

The matrix is processed as-is.

- SPARSE\_MATRIX\_TYPE\_SYMMETRIC

The matrix is symmetric (only the requested triangle is processed).

- SPARSE\_MATRIX\_TYPE\_HERMITIAN

The matrix is Hermitian (only the requested triangle is processed).

- SPARSE\_MATRIX\_TYPE\_TRIANGULAR

The matrix is triangular (only the requested triangle is processed).

- SPARSE\_MATRIX\_TYPE\_DIAGONAL

The matrix is diagonal (only diagonal elements are processed).

- SPARSE\_MATRIX\_TYPE\_BLOCK\_TRIANGULAR

The matrix is block-triangular (only requested triangle is processed). Applies to BSR format only.

- SPARSE\_MATRIX\_TYPE\_BLOCK\_DIAGONAL

The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only.

sparse\_fill\_mode\_t  
mode

Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:

- SPARSE\_FILL\_MODE\_LOWER

The lower triangular matrix part is processed.

- SPARSE\_FILL\_MODE\_UPPER

The upper triangular matrix part is processed.

sparse\_diag\_type\_t  
diag

Specifies diagonal type for non-general matrices:

- SPARSE\_DIAG\_NON\_UNIT

Diagonal elements might not be equal to one.

- SPARSE\_DIAG\_UNIT

Diagonal elements are equal to one.

*A* Handle containing internal data.

*expected\_calls* Estimate of the number of calls to the execution routine.

## Output Parameters

*A* Handle containing internal data.

## Return Values

The function returns a value indicating whether the operation was successful or not, and why.

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

## **mkl\_sparse\_set\_memory\_hint**

*Provides memory requirements for performance optimization purposes.*

## Syntax

```
sparse_status_t mkl_sparse_set_memory_hint (const sparse_matrix_t A, const
sparse_memory_usage_t policy);
```

## Include Files

- mkl\_spblas.h

## Description

The `mkl_sparse_set_memory_hint` routine allocates additional memory for further performance optimization purposes.

### Product and Performance Information

Performance varies by use, configuration and other factors. Learn more at [www.Intel.com/PerformanceIndex](http://www.Intel.com/PerformanceIndex).

Notice revision #20201201

## Input Parameters

<i>policy</i>	Specify memory utilization policy for optimization routine using these types:
<code>SPARSE_MEMORY_NONE</code>	Routine can allocate memory only for auxiliary structures (such as for workload balancing); the amount of memory is proportional to vector size.
<code>SPARSE_MEMORY_AGGRESSIVE</code>	Default. Routine can allocate memory up to the size of matrix <i>A</i> for converting into the appropriate sparse format.

## Output Parameters

*A* Handle containing internal data.

## Return Values

The function returns a value indicating whether the operation was successful or not, and why.

<code>SPARSE_STATUS_SUCCESS</code>	The operation was successful.
<code>SPARSE_STATUS_NOT_INITIALIZED</code>	The routine encountered an empty handle or matrix array.
<code>SPARSE_STATUS_ALLOC_FAILED</code>	Internal memory allocation failed.
<code>SPARSE_STATUS_INVALID_VALUE</code>	The input parameters contain an invalid value.
<code>SPARSE_STATUS_EXECUTION_FAILED</code>	Execution failed.
<code>SPARSE_STATUS_INTERNAL_ERROR</code>	An error in algorithm implementation occurred.
<code>SPARSE_STATUS_NOT_SUPPORTED</code>	The requested operation is not supported.

## `mkl_sparse_optimize`

*Analyzes matrix structure and performs optimizations using the hints provided in the handle.*

## Syntax

```
sparse_status_t mkl_sparse_optimize (sparse_matrix_t A);
```

## Include Files

- `mkl_spblas.h`

## Description

The `mkl_sparse_optimize` routine analyzes matrix structure and performs optimizations using the hints provided in the handle. Generally, specifying a higher number of expected operations allows for more aggressive and time consuming optimizations.

### Product and Performance Information

Performance varies by use, configuration and other factors. Learn more at [www.Intel.com/PerformanceIndex](http://www.Intel.com/PerformanceIndex).

## Inspector-Executor Sparse BLAS Execution Routines

### Execution Routines and Their Data Types

Routine or Function Group	Data Types	Description
<a href="#">mkl_sparse?_lu_smoother</a>	s, d, c, z	Computes an action of a preconditioner which corresponds to the approximate matrix decomposition $A \approx (L+D)*E*(U+D)$ for the system $Ax = b$
<a href="#">mkl_sparse?_mv</a>	s, d, c, z	Computes a sparse matrix-vector product.
<a href="#">mkl_sparse?_trsv</a>	s, d, c, z	Solves a system of linear equations for a square sparse matrix.
<a href="#">mkl_sparse?_mm</a>	s, d, c, z	Computes the product of a sparse matrix and a dense matrix and stores the result as a dense matrix.
<a href="#">mkl_sparse?_trsm</a>	s, d, c, z	Solves a system of linear equations with multiple right-hand sides for a square sparse matrix.
<a href="#">mkl_sparse?_add</a>	s, d, c, z	Computes the sum of two sparse matrices. The result is stored in a newly allocated sparse matrix.
<a href="#">mkl_sparse_spm</a>	s, d, c, z	Computes the product of two sparse matrices and stores the result in a newly allocated sparse matrix.
<a href="#">mkl_sparse?_spmmd</a>	s, d, c, z	Computes the product of two sparse matrices and stores the result as a dense matrix.
<a href="#">mkl_sparse_sp2m</a>	s, d, c, z	Computes the product of two sparse matrices (support operations on both matrices) and stores the result in a newly allocated sparse matrix.

Routine or Function Group	Data Types	Description
<a href="#">mkl_sparse?_sp2md</a>	s, d, c, z	Computes the product of two sparse matrices (support operations on both matrices) and stores the result as a dense matrix.
<a href="#">mkl_sparse_sypr</a>	s, d, c, z	Computes the symmetric product of three sparse matrices and stores the result in a newly allocated sparse matrix.
<a href="#">mkl_sparse?_syprd</a>	s, d, c, z	Computes the symmetric triple product of a sparse matrix and a dense matrix and stores the result as a dense matrix.
<a href="#">mkl_sparse?_symgs</a>	s, d, c, z	Computes an action of a symmetric Gauss-Seidel preconditioner.
<a href="#">mkl_sparse?_symgs_mv</a>	s, d, c, z	Computes an action of a symmetric Gauss-Seidel preconditioner followed by a matrix-vector multiplication at the end.
<a href="#">mkl_sparse?_syrgd</a>	s, d, c, z	Computes the product of sparse matrix with its transpose (or conjugate transpose) and stores the result as a dense matrix.
<a href="#">mkl_sparse_syrgk</a>	s, d, c, z	Computes the product of a sparse matrix with its transpose (or conjugate transpose) and stores the result in a newly allocated sparse matrix.
<a href="#">mkl_sparse?_dotmv</a>	s, d, c, z	Computes a sparse matrix-vector product followed by a dot product.

### [mkl\\_sparse?\\_lu\\_smoother](#)

Computes an action of a preconditioner which corresponds to the approximate matrix decomposition

$A \approx (L + D) \times E \times (U + D)$  for the system  $Ax = b$  (see description below).

#### Syntax

```
sparse_status_t mkl_sparse_s_lu_smoother (const sparse_operation_t op, const
sparse_matrix_t A, const struct matrix_descr descr, const float *diag, const float
*approx_diag_inverse, float *x, const float *b);
```

```
sparse_status_t mkl_sparse_d_lu_smoother (const sparse_operation_t op, const
sparse_matrix_t A, const struct matrix_descr descr, const double *diag, const double
*approx_diag_inverse, double *x, const double *b);
```

```
sparse_status_t mkl_sparse_c_lu_smoother (const sparse_operation_t op, const
sparse_matrix_t A, const struct matrix_descr descr, const MKL_COMPLEX8 *diag, const
MKL_COMPLEX8 *approx_diag_inverse, MKL_COMPLEX8 *x, const MKL_COMPLEX8 *b);
```

```
sparse_status_t mkl_sparse_z_lu_smoother (const sparse_operation_t op, const
sparse_matrix_t A, const struct matrix_descr descr, const MKL_COMPLEX16 *diag, const
MKL_COMPLEX16 *approx_diag_inverse, MKL_COMPLEX16 *x, const MKL_COMPLEX16 *b);
```

#### Include Files

- `mkl_spblas.h`

## Description

This routine computes an update for an iterative solution  $x$  of the system  $Ax=b$  by means of applying one iteration of an approximate preconditioner which is based on the following approximation:

$A \sim (L + D) * E * (U + D)$ , where  $E$  is an approximate inverse of the diagonal (using exact inverse will result in Gauss-Seidel preconditioner),  $L$  and  $U$  are lower/upper triangular parts of  $A$ ,  $D$  is the diagonal (block diagonal in case of BSR format) of  $A$ .

The `mk1_sparse_?_lu_smoother` routine performs these operations:

```
r = b - A*x /* 1. Computes the residual */
(L + D)*E*(U + D)*dx = r /* 2. Finds the update dx by solving the system */
y = x + dx /* 3. Performs an update */
```

This is also equal to the Symmetric Gauss-Seidel operation in the case of a CSR format and 1x1 diagonal blocks:

```
(L + D)*x^1 = b - U*x /* Lower solve for intermediate x^1 */
(U + D)*x = b - L*x^1 /* Upper solve */
```

### NOTE

This routine is supported only for non-transpose operation, real data types, and CSR/BSR sparse formats. In a BSR format, both diagonal values and approximate diagonal inverse arrays should be passed explicitly. For CSR format, diagonal values should be passed explicitly.

## Input Parameters

<i>operation</i>	Specifies the operation performed on matrix $A$ .
	<pre>SPARSE_OPERATION_NON_TRANSPOSE, op(A) := A</pre>
	<hr/> <p><b>NOTE</b> Transpose and conjugate transpose (<code>SPARSE_OPERATION_TRANSPOSE</code> and <code>SPARSE_OPERATION_CONJUGATE_TRANSPOSE</code>) are not supported.</p> <hr/>
	Non-transpose, $op(A) = A$ .
$A$	Handle which contains the sparse matrix $A$ .
<i>descr</i>	Structure specifying sparse matrix properties.
	<i>sparse_matrix_type_ttype</i> - Specifies the type of a sparse matrix:
	<pre>SPARSE_MATRIX_TYPE_GENERAL</pre> <p>The matrix is processed as is.</p>
	<pre>SPARSE_MATRIX_TYPE_SYMMETRIC</pre> <p>The matrix is symmetric (only the requested triangle is processed).</p>
	<pre>SPARSE_MATRIX_TYPE_HERMITIAN</pre> <p>The matrix is Hermitian (only the requested triangle is processed).</p>
	<pre>SPARSE_MATRIX_TYPE_TRIANGULAR</pre> <p>The matrix is triangular (only the requested triangle is processed).</p>

<code>SPARSE_MATRIX_TYPE_DIAGONAL</code>	The matrix is diagonal (only diagonal elements are processed).
<code>SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR</code>	The matrix is block-triangular (only the requested triangle is processed). Applies to BSR format only.
<code>SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL</code>	The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only.
<code>sparse_fill_mode_tmode</code> - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:	
<code>SPARSE_FILL_MODE_LOWER</code>	The lower triangular matrix part is processed.
<code>SPARSE_FILL_MODE_UPPER</code>	The upper triangular matrix part is processed.
<code>sparse_diag_type_tdiag</code> - Specifies the diagonal type for non-general matrices:	
<code>SPARSE_DIAG_NON_UNIT</code>	Diagonal elements might not be equal to one.
<code>SPARSE_DIAG_UNIT</code>	Diagonal elements are equal to one.

**NOTE**

Only `SPARSE_MATRIX_TYPE_GENERAL` is supported.

<code>diag</code>	Array of size at least $m$ , where $m$ is the number of rows (or $nrows * block\_size * block\_size$ in case of BSR format) of matrix $A$ . The array <code>diag</code> must contain the diagonal values of matrix $A$ .
<code>approx_diag_inverse</code>	Array of size at least $m$ , where $m$ is the number of rows (or the number of $rows * block\_size * block\_size$ in case of BSR format) of matrix $A$ . The array <code>approx_diag_inverse</code> will be used as $E$ , approximate inverse of the diagonal of the matrix $A$ .
<code>x</code>	Array of size at least $k$ , where $k$ is the number of columns (or $columns * block\_size$ in case of BSR format) of matrix $A$ . On entry, the array <code>x</code> must contain the input vector.
<code>b</code>	Array of size at least $m$ , where $m$ is the number of rows ( or $rows * block\_size$ in case of BSR format ) of matrix $A$ . The array <code>b</code> must contain the values of the right-hand side of the system.

**Output Parameters**

<code>x</code>	Overwritten by the computed vector $y$ .
----------------	--

**Return Values**

The function returns a value indicating whether the operation was successful or not, and why.

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

## **mkl\_sparse?\_mv**

*Computes a sparse matrix- vector product.*

---

### **Syntax**

```
sparse_status_t mkl_sparse_s_mv (const sparse_operation_t operation, const float alpha,
const sparse_matrix_t A, const struct matrix_descr descr, const float *x, const float
beta, float *y);
```

```
sparse_status_t mkl_sparse_d_mv (const sparse_operation_t operation, const double
alpha, const sparse_matrix_t A, const struct matrix_descr descr, const double *x, const
double beta, double *y);
```

```
sparse_status_t mkl_sparse_c_mv (const sparse_operation_t operation, const MKL_Complex8
alpha, const sparse_matrix_t A, const struct matrix_descr descr, const MKL_Complex8 *x,
const MKL_Complex8 beta, MKL_Complex8 *y);
```

```
sparse_status_t mkl_sparse_z_mv (const sparse_operation_t operation, const
MKL_Complex16 alpha, const sparse_matrix_t A, const struct matrix_descr descr, const
MKL_Complex16 *x, const MKL_Complex16 beta, MKL_Complex16 *y);
```

### **Include Files**

- mkl\_splblas.h

### **Description**

The `mkl_sparse?_mv` routine computes a sparse matrix-dense vector product defined as

$$y := \alpha * \text{op}(A) * x + \beta * y$$

where:

*alpha* and *beta* are scalars, *x* and *y* are vectors, and *A* is a sparse matrix handle of a matrix with *m* rows and *k* columns, and `op` is a matrix modifier for matrix *A*.

### **Input Parameters**

<i>operation</i>	Specifies operation <code>op()</code> on input matrix.
SPARSE_OPERATION_NON_TRANSPOSE	Non-transpose, $\text{op}(A) = A$ .
SPARSE_OPERATION_TRANSPOSE	Transpose, $\text{op}(A) = A^T$ .

	SPARSE_OPERATION_CONJUGATE_TRANSPOSE	Conjugate transpose, $op(A) = A^H$ .
<i>alpha</i>		Specifies the scalar <i>alpha</i> .
<i>A</i>		Handle which contains the input matrix <i>A</i> .
<i>descr</i>		Structure specifying sparse matrix properties.
	<code>sparse_matrix_type_t</code>	<i>type</i> - Specifies the type of a sparse matrix:
	SPARSE_MATRIX_TYPE_GENERAL	The matrix is processed as is.
	SPARSE_MATRIX_TYPE_SYMMETRIC	The matrix is symmetric (only the requested triangle is processed).
	SPARSE_MATRIX_TYPE_HERMITIAN	The matrix is Hermitian (only the requested triangle is processed).
	SPARSE_MATRIX_TYPE_TRIANGULAR	The matrix is triangular (only the requested triangle is processed).
	SPARSE_MATRIX_TYPE_DIAGONAL	The matrix is diagonal (only diagonal elements are processed).
	SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR	The matrix is block-triangular (only requested triangle is processed). Applies to BSR format only.
	SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL	The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only.
	<code>sparse_fill_mode_t</code>	<i>mode</i> - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:
	SPARSE_FILL_MODE_LOWER	The lower triangular matrix part is processed.
	SPARSE_FILL_MODE_UPPER	The upper triangular matrix part is processed.
	<code>sparse_diag_type_t</code>	<i>diag</i> - Specifies diagonal type for non-general matrices:
	SPARSE_DIAG_NON_UNIT	Diagonal elements might not be equal to one.
	SPARSE_DIAG_UNIT	Diagonal elements are equal to one.
<i>x</i>		Array of size equal to the number of columns, <i>k</i> of <i>A</i> if <i>operation</i> = SPARSE_OPERATION_NON_TRANSPOSE and at least the number of rows, <i>m</i> , of <i>A</i> otherwise. On entry, the array must contain the vector <i>x</i> .
<i>beta</i>		Specifies the scalar <i>beta</i> .
<i>y</i>		Array with size at least <i>m</i> if <i>operation</i> =SPARSE_OPERATION_NON_TRANSPOSE and at least <i>k</i> otherwise. On entry, the array <i>y</i> must contain the vector <i>y</i> . Array of size equal to the

number of rows,  $m$  of  $A$  if  $operation = SPARSE\_OPERATION\_NON\_TRANSPOSE$  and at least the number of columns,  $k$ , of  $A$  otherwise. On entry, the array  $y$  must contain the vector  $y$ .

## Output Parameters

$y$  Overwritten by the updated vector  $y$ .

## Return Values

The function returns a value indicating whether the operation was successful or not, and why.

<code>SPARSE_STATUS_SUCCESS</code>	The operation was successful.
<code>SPARSE_STATUS_NOT_INITIALIZED</code>	The routine encountered an empty handle or matrix array.
<code>SPARSE_STATUS_ALLOC_FAILED</code>	Internal memory allocation failed.
<code>SPARSE_STATUS_INVALID_VALUE</code>	The input parameters contain an invalid value.
<code>SPARSE_STATUS_EXECUTION_FAILED</code>	Execution failed.
<code>SPARSE_STATUS_INTERNAL_ERROR</code>	An error in algorithm implementation occurred.
<code>SPARSE_STATUS_NOT_SUPPORTED</code>	The requested operation is not supported.

## `mkl_sparse_?_trsv`

*Solves a system of linear equations for a triangular sparse matrix.*

---

## Syntax

```
sparse_status_t mkl_sparse_s_trsv (const sparse_operation_t operation, const float
alpha, const sparse_matrix_t A, const struct matrix_descr descr, const float *x, float
*y);
```

```
sparse_status_t mkl_sparse_d_trsv (const sparse_operation_t operation, const double
alpha, const sparse_matrix_t A, const struct matrix_descr descr, const double *x,
double *y);
```

```
sparse_status_t mkl_sparse_c_trsv (const sparse_operation_t operation, const
MKL_Complex8 alpha, const sparse_matrix_t A, const struct matrix_descr descr, const
MKL_Complex8 *x, MKL_Complex8 *y);
```

```
sparse_status_t mkl_sparse_z_trsv (const sparse_operation_t operation, const
MKL_Complex16 alpha, const sparse_matrix_t A, const struct matrix_descr descr, const
MKL_Complex16 *x, MKL_Complex16 *y);
```

## Include Files

- `mkl_spblas.h`

## Description

The `mkl_sparse_?_trsv` routine solves a system of linear equations for a matrix:

$$op(A) * y = alpha * x$$

where  $A$  is a triangular sparse matrix,  $op$  is a matrix modifier for matrix  $A$ ,  $alpha$  is a scalar, and  $x$  and  $y$  are vectors.

**NOTE**

For sparse matrices in the BSR format, the supported combinations of (*indexing,block\_layout*) are:

- (SPARSE\_INDEX\_BASE\_ZERO, SPARSE\_LAYOUT\_ROW\_MAJOR)
- (SPARSE\_INDEX\_BASE\_ONE, SPARSE\_LAYOUT\_COLUMN\_MAJOR)

**Input Parameters**

<i>operation</i>	Specifies operation <code>op()</code> on input matrix.
	<p>SPARSE_OPERATION_NON_TRANSPOSE Non-transpose, <math>op(A) = A</math>.</p> <p>SPARSE_OPERATION_TRANSPOSE Transpose, <math>op(A) = A^T</math>.</p> <p>SPARSE_OPERATION_CONJUGATE_TRANSPOSE Conjugate transpose, <math>op(A) = A^H</math>.</p>
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>A</i>	Handle which contains the input matrix <i>A</i> .
<i>descr</i>	Structure specifying sparse matrix properties.
	<p><code>sparse_matrix_type_t</code> <i>type</i> - Specifies the type of a sparse matrix:</p> <p>SPARSE_MATRIX_TYPE_GENERAL The matrix is processed as is.</p> <p>SPARSE_MATRIX_TYPE_SYMMETRIC The matrix is symmetric (only the requested triangle is processed).</p> <p>SPARSE_MATRIX_TYPE_HERMITIAN The matrix is Hermitian (only the requested triangle is processed).</p> <p>SPARSE_MATRIX_TYPE_TRIANGULAR The matrix is triangular (only the requested triangle is processed).</p> <p>SPARSE_MATRIX_TYPE_DIAGONAL The matrix is diagonal (only diagonal elements are processed).</p> <p>SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR The matrix is block-triangular (only requested triangle is processed). Applies to BSR format only.</p> <p>SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only.</p> <p><code>sparse_fill_mode_t</code> <i>mode</i> - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:</p> <p>SPARSE_FILL_MODE_LOWER The lower triangular matrix part is processed.</p> <p>SPARSE_FILL_MODE_UPPER The upper triangular matrix part is processed.</p>

`sparse_diag_type_t` *diag* - Specifies diagonal type for non-general matrices:

`SPARSE_DIAG_NON_UNIT` Diagonal elements might not be equal to one.

`SPARSE_DIAG_UNIT` Diagonal elements are equal to one.

`x` Array of size at least  $m$ , where  $m$  is the number of rows of matrix  $A$ . On entry, the array must contain the vector  $x$ .

## Output Parameters

`y` Array of size at least  $m$  containing the solution to the system of linear equations.

## Return Values

The function returns a value indicating whether the operation was successful or not, and why.

<code>SPARSE_STATUS_SUCCESS</code>	The operation was successful.
<code>SPARSE_STATUS_NOT_INITIALIZED</code>	The routine encountered an empty handle or matrix array.
<code>SPARSE_STATUS_ALLOC_FAILED</code>	Internal memory allocation failed.
<code>SPARSE_STATUS_INVALID_VALUE</code>	The input parameters contain an invalid value.
<code>SPARSE_STATUS_EXECUTION_FAILED</code>	Execution failed.
<code>SPARSE_STATUS_INTERNAL_ERROR</code>	An error in algorithm implementation occurred.
<code>SPARSE_STATUS_NOT_SUPPORTED</code>	The requested operation is not supported.

## `mkl_sparse_?_mm`

*Computes the product of a sparse matrix and a dense matrix and stores the result as a dense matrix.*

## Syntax

```
sparse_status_t mkl_sparse_s_mm (const sparse_operation_t operation, const float alpha,
const sparse_matrix_t A, const struct matrix_descr descr, const sparse_layout_t layout,
const float *B, const MKL_INT columns, const MKL_INT ldb, const float beta, float *C,
const MKL_INT ldc);
```

```
sparse_status_t mkl_sparse_d_mm (const sparse_operation_t operation, const double
alpha, const sparse_matrix_t A, const struct matrix_descr descr, const sparse_layout_t
layout, const double *B, const MKL_INT columns, const MKL_INT ldb, const double beta,
double *C, const MKL_INT ldc);
```

```
sparse_status_t mkl_sparse_c_mm (const sparse_operation_t operation, const MKL_Complex8
alpha, const sparse_matrix_t A, const struct matrix_descr descr, const sparse_layout_t
layout, const MKL_Complex8 *B, const MKL_INT columns, const MKL_INT ldb, const
MKL_Complex8 beta, MKL_Complex8 *C, const MKL_INT ldc);
```

```
sparse_status_t mkl_sparse_z_mm (const sparse_operation_t operation, const
MKL_Complex16 alpha, const sparse_matrix_t A, const struct matrix_descr descr, const
sparse_layout_t layout, const MKL_Complex16 *B, const MKL_INT columns, const MKL_INT
ldb, const MKL_Complex16 beta, MKL_Complex16 *C, const MKL_INT ldc);
```

## Include Files

- `mkl_spblas.h`

## Description

The `mkl_sparse_?_mm` routine performs a matrix-matrix operation:

$$C := \alpha * \text{op}(A) * B + \beta * C$$

where  $\alpha$  and  $\beta$  are scalars,  $A$  is a sparse matrix, `op` is a matrix modifier for matrix  $A$ , and  $B$  and  $C$  are dense matrices.

The `mkl_sparse_?_mm` and `mkl_sparse_?_trsm` routines support these configurations:

	Column-major dense matrix: <code>layout =</code> <code>SPARSE_LAYOUT_COLUMN_MAJOR</code>	Row-major dense matrix: <code>layout</code> <code>= SPARSE_LAYOUT_ROW_MAJOR</code>
0-based sparse matrix: <code>SPARSE_INDEX_BASE_ZERO</code>	CSR BSR: general non-transposed matrix multiplication only	All formats
1-based sparse matrix: <code>SPARSE_INDEX_BASE_ONE</code>	All formats	CSR BSR: general non-transposed matrix multiplication only

### NOTE

For sparse matrices in the BSR format, the supported combinations of (`indexing`, `block_layout`) are:

- (`SPARSE_INDEX_BASE_ZERO`, `SPARSE_LAYOUT_ROW_MAJOR`)
- (`SPARSE_INDEX_BASE_ONE`, `SPARSE_LAYOUT_COLUMN_MAJOR`)

## Input Parameters

`operation`

Specifies operation `op()` on input matrix.

`SPARSE_OPERATION_NON_TRANSPOSE` Non-transpose,  $\text{op}(A) = A$ .

`SPARSE_OPERATION_TRANSPOSE` Transpose,  $\text{op}(A) = A^T$ .

`SPARSE_OPERATION_CONJUGATE_TRANSPOSE` Conjugate transpose,  $\text{op}(A) = A^H$ .

`alpha`

Specifies the scalar  $\alpha$ .

`A`

Handle which contains the sparse matrix  $A$ .

`descr`

Structure specifying sparse matrix properties.

`sparse_matrix_type_t type` - Specifies the type of a sparse matrix:

`SPARSE_MATRIX_TYPE_GENERAL` The matrix is processed as is.

SPARSE_MATRIX_TYPE_SYMMETRIC	The matrix is symmetric (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_HERMITIAN	The matrix is Hermitian (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_TRIANGULAR	The matrix is triangular (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_DIAGONAL	The matrix is diagonal (only diagonal elements are processed).
SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR	The matrix is block-triangular (only requested triangle is processed). Applies to BSR format only.
SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL	The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only.

`sparse_fill_mode_t mode` - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:

SPARSE_FILL_MODE_LOWER	The lower triangular matrix part is processed.
SPARSE_FILL_MODE_UPPER	The upper triangular matrix part is processed.

`sparse_diag_type_t diag` - Specifies diagonal type for non-general matrices:

SPARSE_DIAG_NON_UNIT	Diagonal elements might not be equal to one.
SPARSE_DIAG_UNIT	Diagonal elements are equal to one.

*layout*

Describes the storage scheme for the dense matrix:

SPARSE_LAYOUT_COLUMN_MAJOR	Storage of elements uses column major layout.
SPARSE_LAYOUT_ROW_MAJOR	Storage of elements uses row major layout.

*B*

Array of size at least *rows\*cols*.

	<code>layout = SPARSE_LAYOUT_COLUMN_MAJOR</code>	<code>layout = SPARSE_LAYOUT_ROW_MAJOR</code>
<i>rows</i> (number of rows in <i>B</i> )	<code>ldb</code>	If $op(A) = A$ , number of columns in A If $op(A) = A^T$ , number of rows in A
<i>cols</i> (number of columns in <i>B</i> )	<code>columns</code>	<code>ldb</code>

*columns*

Number of columns of matrix *C*.

*ldb* Specifies the leading dimension of matrix *B*.

*beta* Specifies the scalar *beta*

*C* Array of size at least *rows\*cols*, where

	<i>layout</i> = SPARSE_LAYOUT_COLU MN_MAJOR	<i>layout</i> = SPARSE_LAYOUT_ROW_MA JOR
<i>rows</i> (number of rows in <i>C</i> )	<i>ldc</i>	If $op(A) = A$ , number of rows in <i>A</i>  If $op(A) = A^T$ , number of columns in <i>A</i>
<i>cols</i> (number of columns in <i>C</i> )	<i>columns</i>	<i>ldc</i>

*ldc* Specifies the leading dimension of matrix *C*.

## Output Parameters

*C* Overwritten by the updated matrix *C*.

## Return Values

The function returns a value indicating whether the operation was successful or not, and why.

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

## **mkl\_sparse\_?\_trsm**

*Solves a system of linear equations with multiple right hand sides for a triangular sparse matrix.*

### Syntax

```
sparse_status_t mkl_sparse_s_trsm (const sparse_operation_t operation, const float
alpha, const sparse_matrix_t A, const struct matrix_descr descr, const sparse_layout_t
layout, const float *x, const MKL_INT columns, const MKL_INT ldx, float *y, const
MKL_INT ldy);
```

```
sparse_status_t mkl_sparse_d_trsm (const sparse_operation_t operation, const double
alpha, const sparse_matrix_t A, const struct matrix_descr descr, const sparse_layout_t
layout, const double *x, const MKL_INT columns, const MKL_INT ldx, double *y, const
MKL_INT ldy);
```

```
sparse_status_t mkl_sparse_c_trsm (const sparse_operation_t operation, const
MKL_Complex8 alpha, const sparse_matrix_t A, const struct matrix_descr descr, const
sparse_layout_t layout, const MKL_Complex8 *x, const MKL_INT columns, const MKL_INT
ldx, MKL_Complex8 *y, const MKL_INT ldy);
```

```
sparse_status_t mkl_sparse_z_trsm (const sparse_operation_t operation, const
MKL_Complex16 alpha, const sparse_matrix_t A, const struct matrix_descr descr, const
sparse_layout_t layout, const MKL_Complex16 *x, const MKL_INT columns, const MKL_INT
ldx, MKL_Complex16 *y, const MKL_INT ldy);
```

## Include Files

- mkl\_spblas.h

## Description

The `mkl_sparse_?_trsm` routine solves a system of linear equations with multiple right hand sides for a triangular sparse matrix:

```
Y := alpha*inv(op(A))*X
```

where:

*alpha* is a scalar, *X* and *Y* are dense matrices, *A* is a sparse matrix, and `op` is a matrix modifier for matrix *A*.

The `mkl_sparse_?_mm` and `mkl_sparse_?_trsm` routines support these configurations:

	Column-major dense matrix: <i>layout</i> = SPARSE_LAYOUT_COLUMN_MAJOR	Row-major dense matrix: <i>layout</i> = SPARSE_LAYOUT_ROW_MAJOR
0-based sparse matrix: SPARSE_INDEX_BASE_ZERO	CSR BSR: general non-transposed matrix multiplication only	All formats
1-based sparse matrix: SPARSE_INDEX_BASE_ONE	All formats	CSR BSR: general non-transposed matrix multiplication only

### NOTE

For sparse matrices in the BSR format, the supported combinations of (*indexing,block\_layout*) are:

- (SPARSE\_INDEX\_BASE\_ZERO, SPARSE\_LAYOUT\_ROW\_MAJOR )
- (SPARSE\_INDEX\_BASE\_ONE, SPARSE\_LAYOUT\_COLUMN\_MAJOR )

## Input Parameters

<i>operation</i>	Specifies operation <code>op()</code> on input matrix.
SPARSE_OPERATION_NON_TRANSPOSE	Non-transpose, $op(A) = A$ .
SPARSE_OPERATION_TRANSPOSE	Transpose, $op(A) = A^T$ .
SPARSE_OPERATION_CONJUGATE_TRANSPOSE	Conjugate transpose, $op(A) = A^H$ .

<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>A</i>	Handle which contains the sparse matrix <i>A</i> .
<i>descr</i>	Structure specifying sparse matrix properties.
	<code>sparse_matrix_type_t</code> <i>type</i> - Specifies the type of a sparse matrix:
	<code>SPARSE_MATRIX_TYPE_GENERAL</code> The matrix is processed as is.
	<code>SPARSE_MATRIX_TYPE_SYMMETRIC</code> The matrix is symmetric (only the requested triangle is processed).
	<code>SPARSE_MATRIX_TYPE_HERMITIAN</code> The matrix is Hermitian (only the requested triangle is processed).
	<code>SPARSE_MATRIX_TYPE_TRIANGULAR</code> The matrix is triangular (only the requested triangle is processed).
	<code>SPARSE_MATRIX_TYPE_DIAGONAL</code> The matrix is diagonal (only diagonal elements are processed).
	<code>SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR</code> The matrix is block-triangular (only requested triangle is processed). Applies to BSR format only.
	<code>SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL</code> The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only.
	<code>sparse_fill_mode_t</code> <i>mode</i> - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:
	<code>SPARSE_FILL_MODE_LOWER</code> The lower triangular matrix part is processed.
	<code>SPARSE_FILL_MODE_UPPER</code> The upper triangular matrix part is processed.
	<code>sparse_diag_type_t</code> <i>diag</i> - Specifies diagonal type for non-general matrices:
	<code>SPARSE_DIAG_NON_UNIT</code> Diagonal elements might not be equal to one.
	<code>SPARSE_DIAG_UNIT</code> Diagonal elements are equal to one.
<i>layout</i>	Describes the storage scheme for the dense matrix:
	<code>SPARSE_LAYOUT_COLUMN_MAJOR</code> Storage of elements uses column major layout.
	<code>SPARSE_LAYOUT_ROW_MAJOR</code> Storage of elements uses row major layout.
<i>x</i>	Array of size at least <i>rows*cols</i> .

<i>layout</i> =	<i>layout</i> =
<code>SPARSE_LAYOUT_COLUMN_MAJOR</code>	<code>SPARSE_LAYOUT_ROW_MAJOR</code>

<i>rows</i> (number of rows in <i>x</i> )	<i>ldx</i>	number of rows in A
<i>cols</i> (number of columns in <i>x</i> )	<i>columns</i>	<i>ldx</i>

On entry, the array *x* must contain the matrix *X*.

*columns*

Number of columns in matrix *Y*.

*ldx*

Specifies the leading dimension of matrix *X*.

*y*

Array of size at least *rows*\**cols*, where

	<i>layout</i> = SPARSE_LAYOUT_COLU MN_MAJOR	<i>layout</i> = SPARSE_LAYOUT_ROW_MA JOR
<i>rows</i> (number of rows in <i>y</i> )	<i>ldy</i>	number of rows in A
<i>cols</i> (number of columns in <i>y</i> )	<i>columns</i>	<i>ldy</i>

## Output Parameters

*y*

Overwritten by the updated matrix *Y*.

## Return Values

The function returns a value indicating whether the operation was successful or not, and why.

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

## **mkl\_sparse\_?\_add**

*Computes the sum of two sparse matrices. The result is stored in a newly allocated sparse matrix.*

## Syntax

```
sparse_status_t mkl_sparse_s_add (const sparse_operation_t operation, const
sparse_matrix_t A, const float alpha, const sparse_matrix_t B, sparse_matrix_t *C);
sparse_status_t mkl_sparse_d_add (const sparse_operation_t operation, const
sparse_matrix_t A, const double alpha, const sparse_matrix_t B, sparse_matrix_t *C);
```

```
sparse_status_t mkl_sparse_c_add (const sparse_operation_t operation, const
sparse_matrix_t A, const MKL_Complex8 alpha, const sparse_matrix_t B, sparse_matrix_t
*C);
```

```
sparse_status_t mkl_sparse_z_add (const sparse_operation_t operation, const
sparse_matrix_t A, const MKL_Complex16 alpha, const sparse_matrix_t B, sparse_matrix_t
*C);
```

## Include Files

- mkl\_spblas.h

## Description

The `mkl_sparse_?_add` routine performs a matrix-matrix operation:

```
C := alpha*op(A) + B
```

where *alpha* is a scalar, *op* is a matrix modifier, and *A*, *B*, and *C* are sparse matrices.

---

### NOTE

This routine is only supported for sparse matrices in CSR and BSR formats. It is not supported for COO or CSC formats.

---

## Input Parameters

<i>A</i>	Handle which contains the sparse matrix <i>A</i> .
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>operation</i>	Specifies operation <code>op()</code> on input matrix. <ul style="list-style-type: none"> <li><code>SPARSE_OPERATION_NON_TRANSPOSE</code> Non-transpose, <math>op(A) = A</math>.</li> <li><code>SPARSE_OPERATION_TRANSPOSE</code> Transpose, <math>op(A) = A^T</math>.</li> <li><code>SPARSE_OPERATION_CONJUGATE_TRANSPOSE</code> Conjugate transpose, <math>op(A) = A^H</math>.</li> </ul>
<i>B</i>	Handle which contains the sparse matrix <i>B</i> .

## Output Parameters

<i>C</i>	Handle which contains the resulting sparse matrix.
----------	--

## Return Values

The function returns a value indicating whether the operation was successful or not, and why.

<code>SPARSE_STATUS_SUCCESS</code>	The operation was successful.
<code>SPARSE_STATUS_NOT_INITIALIZED</code>	The routine encountered an empty handle or matrix array.
<code>SPARSE_STATUS_ALLOC_FAILED</code>	Internal memory allocation failed.
<code>SPARSE_STATUS_INVALID_VALUE</code>	The input parameters contain an invalid value.
<code>SPARSE_STATUS_EXECUTION_FAILED</code>	Execution failed.

<code>SPARSE_STATUS_INTERNAL_ERROR</code>	An error in algorithm implementation occurred.
<code>SPARSE_STATUS_NOT_SUPPORTED</code>	The requested operation is not supported.

## **mkl\_sparse\_spm**

Computes the product of two sparse matrices. The result is stored in a newly allocated sparse matrix.

### Syntax

```
sparse_status_t mkl_sparse_spm (const sparse_operation_t operation, const
sparse_matrix_t A, const sparse_matrix_t B, sparse_matrix_t *C);
```

### Include Files

- `mkl_splblas.h`

### Description

The `mkl_sparse_spm` routine performs a matrix-matrix operation:

$$C := op(A) * B$$

where  $A$ ,  $B$ , and  $C$  are sparse matrices and  $op$  is a matrix modifier for matrix  $A$ .

### Notes

- This routine is supported only for sparse matrices in CSC, CSR, and BSR formats. It is not supported for sparse matrices in COO format.
- The column indices of the output matrix (if in CSR format) can appear unsorted due to the algorithm chosen internally. To ensure sorted column indices (if that is important), call `mkl_sparse_order()`.

### Input Parameters

<code>operation</code>	Specifies operation <code>op()</code> on input matrix.
	<code>SPARSE_OPERATION_NON_TRANSPOSE</code> Non-transpose, $op(A) = A$ .
	<code>SPARSE_OPERATION_TRANSPOSE</code> Transpose, $op(A) = A^T$ .
	<code>SPARSE_OPERATION_CONJUGATE_TRANSPOSE</code> Conjugate transpose, $op(A) = A^H$ .
<code>A</code>	Handle which contains the sparse matrix $A$ .
<code>B</code>	Handle which contains the sparse matrix $B$ .

### Output Parameters

<code>C</code>	Handle which contains the resulting sparse matrix.
----------------	--

### Return Values

The function returns a value indicating whether the operation was successful or not, and why.

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

### **mkl\_sparse\_?\_spmmd**

*Computes the product of two sparse matrices and stores the result as a dense matrix.*

#### **Syntax**

```
sparse_status_t mkl_sparse_s_spmmd (const sparse_operation_t operation, const
sparse_matrix_t A, const sparse_matrix_t B, const sparse_layout_t layout, float *C,
const MKL_INT ldc);
```

```
sparse_status_t mkl_sparse_d_spmmd (const sparse_operation_t operation, const

```

#### **Include Files**

- mkl\_spblas.h

#### **Description**

The `mkl_sparse_?_spmmd` routine performs a matrix-matrix operation:

$$C := op(A) * B$$

where  $A$  and  $B$  are sparse matrices,  $op$  is a matrix modifier for matrix  $A$ , and  $C$  is a dense matrix.

---

#### **NOTE**

This routine is not supported for sparse matrices in the COO format. For sparse matrices in BSR format, these combinations of (*indexing*, *block\_layout*) are supported:

- (SPARSE\_INDEX\_BASE\_ZERO, SPARSE\_LAYOUT\_ROW\_MAJOR)
  - (SPARSE\_INDEX\_BASE\_ONE, SPARSE\_LAYOUT\_COLUMN\_MAJOR)
- 

#### **Input Parameters**

*operation* Specifies operation `op()` on input matrix.

	SPARSE_OPERATION_NON_TRANSPOSE	Non-transpose, $op(A) = A$ .
	SPARSE_OPERATION_TRANSPOSE	Transpose, $op(A) = A^T$ .
	SPARSE_OPERATION_CONJUGATE_TRANSPOSE	Conjugate transpose, $op(A) = A^H$ .
<i>A</i>		Handle which contains the sparse matrix <i>A</i> .
<i>B</i>		Handle which contains the sparse matrix <i>B</i> .
<i>layout</i>		Describes the storage scheme for the dense matrix:
	SPARSE_LAYOUT_COLUMN_MAJOR	Storage of elements uses column major layout.
	SPARSE_LAYOUT_ROW_MAJOR	Storage of elements uses row major layout.
<i>ldC</i>		Leading dimension of matrix <i>C</i> .

## Output Parameters

<i>C</i>	Resulting dense matrix.
----------	-------------------------

## Return Values

The function returns a value indicating whether the operation was successful or not, and why.

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

## **mkl\_sparse\_sp2m**

*Computes the product of two sparse matrices. The result is stored in a newly allocated sparse matrix.*

### Syntax

```
sparse_status_t mkl_sparse_sp2m (const sparse_operation_t transA, const struct
matrix_descr descrA, const sparse_matrix_t A, const sparse_operation_t transB, const
struct matrix_descr descrB, const sparse_matrix_t B, const sparse_request_t request,
sparse_matrix_t *C);
```

### Include Files

- mkl\_splblas.h

## Description

The `mk1_sparse_sp2m` routine performs a matrix-matrix operation:

$$C := opA(A) * opB(B)$$

where  $A, B$ , and  $C$  are sparse matrices,  $opA$  and  $opB$  are matrix modifiers for matrices  $A$  and  $B$ , respectively.

### NOTE

The column indices of the output matrix (if in CSR format) can appear unsorted due to the algorithm chosen internally. To ensure sorted column indices (if that is important), call `mk1_sparse_order()`.

## Input Parameters

*opA*

Specifies operation on input matrix.

SPARSE_OPERATION_NON_TRANSPOSE	Non-transpose, $op(A)=A$
SPARSE_OPERATION_TRANSPOSE	Transpose, $op(A)=A^T$
SPARSE_OPERATION_CONJUGATE_TRANSPOSE	Conjugate transpose, $op(A)=A^H$

*opB*

Specifies operation on input matrix.

SPARSE_OPERATION_NON_TRANSPOSE	Non-transpose, $op(B)=B$
SPARSE_OPERATION_TRANSPOSE	Transpose, $op(B)=B^T$
SPARSE_OPERATION_CONJUGATE_TRANSPOSE	Conjugate transpose, $op(B)=B^H$

*descrA*

Structure that specifies sparse matrix properties.

**NOTE** Currently, only `SPARSE_MATRIX_TYPE_GENERAL` is supported.

`sparse_matrix_type_ttype` specifies the type of sparse matrix.

SPARSE_MATRIX_TYPE_GENERAL	The matrix is processed as is.
SPARSE_MATRIX_TYPE_SYMMETRIC	The matrix is symmetric (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_HERMITIAN	The matrix is Hermitian (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_TRIANGULAR	The matrix is triangular (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_DIAGONAL	The matrix is diagonal (only diagonal elements are processed).

SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR	The matrix is block-triangular (only the requested triangle is processed). This applies to BSR format only.
SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL	The matrix is block-diagonal (only the requested triangle is processed). This applies to BSR format only.

`sparse_fill_mode_t` *mode* specifies the triangular matrix portion for symmetric, Hermitian, triangular, and block-triangular matrices.

SPARSE_FILL_MODE_LOWER	The lower triangular matrix is processed.
SPARSE_FILL_MODE_UPPER	The upper triangular matrix is processed.

`sparse_diag_type_t` *diag* specifies the type of diagonal for non-general matrices.

SPARSE_DIAG_NON_UNIT	Diagonal elements must not be equal to 1.
SPARSE_DIAG_UNIT	Diagonal elements are equal to 1.

*descrB*

Structure that specifies sparse matrix properties.

---

**NOTE** Currently, only SPARSE\_MATRIX\_TYPE\_GENERAL is supported.

---

`sparse_matrix_type_t` *type* specifies the type of sparse matrix.

SPARSE_MATRIX_TYPE_GENERAL	The matrix is processed as is.
SPARSE_MATRIX_TYPE_SYMMETRIC	The matrix is symmetric (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_HERMITIAN	The matrix is Hermitian (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_TRIANGULAR	The matrix is triangular (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_DIAGONAL	The matrix is diagonal (only diagonal elements are processed).
SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR	The matrix is block-triangular (only the requested triangle is processed). This applies to BSR format only.

SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL	The matrix is block-diagonal (only the requested triangle is processed). This applies to BSR format only.
-----------------------------------	---

`sparse_fill_mode_t` *mode* specifies the triangular matrix portion for symmetric, Hermitian, triangular, and block-triangular matrices.

SPARSE_FILL_MODE_LOWER	The lower triangular matrix is processed.
SPARSE_FILL_MODE_UPPER	The upper triangular matrix is processed.

`sparse_diag_type_t` *diag* specifies the type of diagonal for non-general matrices.

SPARSE_DIAG_NON_UNIT	Diagonal elements must not be equal to 1.
SPARSE_DIAG_UNIT	Diagonal elements are equal to 1.

*A*

Handle which contains the sparse matrix *A*.

*B*

Handle which contains the sparse matrix *B*.

*request*

Specifies whether the full computations are performed at once or using the two-stage algorithm. See [Two-stage Algorithm for Inspector-executor Sparse BLAS Routines](#).

SPARSE_STAGE_NNZ_COUNT	Only <code>rowIndex</code> (BSR/CSR format) or <code>colIndex</code> (CSC format) array of the matrix is computed internally. The computation can be extracted to measure the memory required for full operation.
SPARSE_STAGE_FINALIZE_MULT_NO_VAL	Finalize computations of the matrix structure (values will not be computed). Use only after the call with <code>SPARSE_STAGE_NNZ_COUNT</code> parameter.
SPARSE_STAGE_FINALIZE_MULT	Finalize computation. Can also be used when the matrix structure remains unchanged and only values of the resulting matrix <i>C</i> need to be recomputed.
SPARSE_STAGE_FULL_MULT_NO_VAL	Perform computations of the matrix structure.
SPARSE_STAGE_FULL_MULT	Perform the entire computation in a single step.

## Output Parameters

*C*

Handle which contains the resulting sparse matrix.

## Return Values

The function returns a value indicating whether the operation was successful, or the reason why it failed.

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	The internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	The execution failed.
D	
SPARSE_STATUS_INTERNAL_ERROR	An error occurred in the implementation of the algorithm.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

## mkl\_sparse\_?\_sp2md

*Computes the product of two sparse matrices (support operations on both matrices) and stores the result as a dense matrix.*

---

## Syntax

```

sparse_status_t mkl_sparse_s_sp2md ( const sparse_operation_t transA, const struct
matrix_descr descrA, const sparse_matrix_t A, const sparse_operation_t transB, const
struct matrix_descr descrB, const sparse_matrix_t B, const float alpha, const float
beta, float *C, const sparse_layout_t layout, const MKL_INT ldc );

sparse_status_t mkl_sparse_d_sp2md ( const sparse_operation_t transA, const struct
matrix_descr descrA, const sparse_matrix_t A, const sparse_operation_t transB, const
struct matrix_descr descrB, const sparse_matrix_t B, const double alpha, const double
beta, double *C, const sparse_layout_t layout, const MKL_INT ldc );

sparse_status_t mkl_sparse_c_sp2md ( const sparse_operation_t transA, const struct
matrix_descr descrA, const sparse_matrix_t A, const sparse_operation_t transB, const
struct matrix_descr descrB, const sparse_matrix_t B, const MKL_Complex8 alpha, const
MKL_Complex8 beta, MKL_Complex8 *C, const sparse_layout_t layout, const MKL_INT ldc );

sparse_status_t mkl_sparse_z_sp2md ( const sparse_operation_t transA, const struct
matrix_descr descrA, const sparse_matrix_t A, const sparse_operation_t transB, const
struct matrix_descr descrB, const sparse_matrix_t B, const MKL_Complex16 alpha, const
MKL_Complex16 beta, MKL_Complex16 *C, const sparse_layout_t layout, const MKL_INT
ldc );

```

## Include Files

- mkl\_spblas.h

## Description

The `mkl_sparse_?_sp2md` routine performs a matrix-matrix operation:

$$C = \alpha * opA(A) * opB(B) + \beta * C$$

where  $A$  and  $B$  are sparse matrices,  $opA$  is a matrix modifier for matrix  $A$ ,  $opB$  is a matrix modifier for matrix  $B$ , and  $C$  is a dense matrix,  $\alpha$  and  $\beta$  are scalars.

**NOTE**

This routine is not supported for sparse matrices in the COO format. For sparse matrices in BSR format, these combinations of (indexing, block\_layout) are supported:

- (SPARSE\_INDEX\_BASE\_ZERO, SPARSE\_LAYOUT\_ROW\_MAJOR)
- (SPARSE\_INDEX\_BASE\_ONE, SPARSE\_LAYOUT\_COLUMN\_MAJOR)

**Input Parameters***transA*

Specifies operation op() on the input matrix.

SPARSE_OPERATION_NON_TRANSPOSE	Non-transpose, $op(A)=A$
SPARSE_OPERATION_TRANSPOSE	Transpose, $op(A)=A^T$
SPARSE_OPERATION_CONJUGATE_TRANSPOSE	Conjugate transpose, $op(A)=A^H$

*descrA*

Structure that specifies the sparse matrix properties.

**NOTE** Currently, only SPARSE\_MATRIX\_TYPE\_GENERAL is supported.

*sparse\_matrix\_type\_ttype* specifies the type of sparse matrix.

SPARSE_MATRIX_TYPE_GENERAL	The matrix is processed as is.
SPARSE_MATRIX_TYPE_SYMMETRIC	The matrix is symmetric (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_HERMITIAN	The matrix is Hermitian (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_TRIANGULAR	The matrix is triangular (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_DIAGONAL	The matrix is diagonal (only diagonal elements are processed).
SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR	The matrix is block-triangular (only the requested triangle is processed). This applies to BSR format only.
SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL	The matrix is block-diagonal (only the requested triangle is processed). This applies to BSR format only.

*sparse\_fill\_mode\_tmode* specifies the triangular matrix portion for symmetric, Hermitian, triangular, and block-triangular matrices.

SPARSE_FILL_MODE_LOWER	The lower triangular matrix is processed.
------------------------	---

SPARSE_FILL_MODE_UPPER	The upper triangular matrix is processed.
------------------------	---

`sparse_diag_type_t` *diag* specifies the type of diagonal for non-general matrices.

SPARSE_DIAG_NON_UNIT	Diagonal elements must not be equal to 1.
SPARSE_DIAG_UNIT	Diagonal elements are equal to 1.

*A*

Handle which contains the sparse matrix *A*.

*transB*

Specifies operation `opB()` on the input matrix.

SPARSE_OPERATION_NON_TRANSPOSE	Non-transpose, $opB(B) = B$ .
SPARSE_OPERATION_TRANSPOSE	Transpose, $opB(B) = B^T$ .
SPARSE_OPERATION_CONJUGATE_TRANSPOSE	Conjugate transpose, $opB(B) = B^H$ .

*descrB*

Structure that specifies the sparse matrix properties.

#### NOTE

Currently, only `SPARSE_MATRIX_TYPE_GENERAL` is supported.

`sparse_matrix_type_t` *type* specifies the type of sparse matrix.

SPARSE_MATRIX_TYPE_GENERAL	The matrix is processed as is.
SPARSE_MATRIX_TYPE_SYMMETRIC	The matrix is symmetric (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_HERMITIAN	The matrix is Hermitian (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_TRIANGULAR	The matrix is triangular (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_DIAGONAL	The matrix is diagonal (only diagonal elements are processed).
SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR	The matrix is block-triangular (only the requested triangle is processed). This applies to BSR format only.
SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL	The matrix is block-diagonal (only the requested triangle is processed). This applies to BSR format only.

`sparse_fill_mode_t` *mode* specifies the triangular matrix portion for symmetric, Hermitian, triangular, and block-triangular matrices.

SPARSE_FILL_MODE_LOWER	The lower triangular matrix is processed.
SPARSE_FILL_MODE_UPPER	The upper triangular matrix is processed.

`sparse_diag_type_t` *diag* specifies the type of diagonal for non-general matrices.

SPARSE_DIAG_NON_UNIT	Diagonal elements must not be equal to 1.
SPARSE_DIAG_UNIT	Diagonal elements are equal to 1.

*B* Handle which contains the sparse matrix *B*.

*alpha* Specifies the scalar alpha.

*beta* Specifies the scalar beta.

*layout* Describes the storage scheme for the dense matrix:

SPARSE_LAYOUT_COLUMN_MAJOR	Storage of elements uses column major layout.
SPARSE_LAYOUT_ROW_MAJOR	Storage of elements uses row major layout.

*ldc* Leading dimension of matrix *C*.

## Output Parameters

*C* The resulting dense matrix.

## Return Values

The function returns a value indicating whether the operation was successful, or the reason why it failed.

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	The internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	The execution failed.
D	
SPARSE_STATUS_INTERNAL_ERROR	An error occurred in the implementation of the algorithm.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

## **mkl\_sparse\_sypr**

*Computes the symmetric product of three sparse matrices and stores the result in a newly allocated sparse matrix.*

## Syntax

```
sparse_status_t mkl_sparse_sypr (const sparse_operation_t operation , const
sparse_matrix_t A, const sparse_matrix_t B, const struct matrix_descr B,
sparse_matrix_t *C, const sparse_request_t request);
```

## Include Files

- mkl\_splblas.h

## Description

The `mkl_sparse_sypr` routine performs a multiplication of three sparse matrices that results in a symmetric or Hermitian matrix, *C*.

```
C:=A*B*opA(A)
```

or

```
C:=opA(A) *B*A
```

depending on the matrix modifier *operation*.

Here, *A*, *B*, and *C* are sparse matrices, where *A* has a general structure while *B* and *C* are symmetric (for real data types) or Hermitian (for complex data types) matrices. `opA` is the transpose (real data types) or conjugate transpose (complex data types) operator.

### NOTE

This routine is not supported for sparse matrices in COO or CSC formats. This routine supports only CSR and BSR formats. In addition, it supports only the sorted CSR and sorted BSR formats for the input matrix. If the data is unsorted, call the `mkl_sparse_order` routine before either `mkl_sparse_sypr` or `mkl_sparse_?_syprd`.

## Input Parameters

operation

Specifies operation on the input sparse matrices.

SPARSE_OPERATION_NON_TRANSPOSE	Non-transpose case. $C:=A*B*(A^T)$ for real precision $C:=A*B*(A^H)$ for complex precision.
SPARSE_OPERATION_TRANSPOSE	Transpose case. This is not supported for complex matrices. $C:=(A^T)*B*A$
SPARSE_OPERATION_CONJUGATE_TRANSPOSE	Conjugate transpose case. This is not supported for real matrices. $C:=(A^H)*B*A$

A

Handle which contains the sparse matrix *A*.

B

Handle which contains the sparse matrix *B*.

descrB

Structure specifying properties of the sparse matrix.

`sparse_matrix_type_t` *type* specifies the type of a sparse matrix

SPARSE_MATRIX_TYPE_SYMMETRIC	The matrix is symmetric (only the specified triangle is processed).
SPARSE_MATRIX_TYPE_HERMITIAN	The matrix is Hermitian (only the specified triangle is processed).

`sparse_fill_mode_t` *mode* specifies the triangular matrix part.

SPARSE_FILL_MODE_LOWER	The lower triangular matrix part is processed.
SPARSE_FILL_MODE_UPPER	The upper triangular matrix part is processed.

`sparse_diag_type_t` *diag* specifies the type of diagonal.

SPARSE_DIAG_NON_UNIT	Diagonal elements cannot be equal to one.
----------------------	---

**NOTE**This routine also supports  $C=AA^{T,H}$  with these parameters:`descrB.type=SPARSE_MATRIX_TYPE_DIAGONAL``descrB.diag=SPARSE_DIAG_UNIT`In this case, you do not need to allocate structure B. Use the routine as a 2-stage version of [mkl\\_sparse\\_syrk](#).

request

Use this routine to specify if the computations should be performed in a single step or using the two-stage algorithm. See [Two-stage Algorithm for Inspector-executor Sparse BLAS Routines](#) for more information.

SPARSE_STAGE_NNZ_COUNT	Only <code>rowIndex</code> (BSR/CSR format) or <code>colIndex</code> (CSC format) array of the matrix is computed internally. The computation can be extracted to measure the memory required for full operation.
SPARSE_STAGE_FINALIZE_MULT_N O_VAL	Finalize computations of the matrix structure (values will not be computed). Use only after the call with <code>SPARSE_STAGE_NNZ_COUNT</code> parameter.
SPARSE_STAGE_FINALIZE_MULT	Finalize computation. Can be used after the call with the <code>SPARSE_STAGE_NNZ_COUNT</code> or

	SPARSE_STAGE_FINALIZE_MULT_NO_VAL. Can also be used when the matrix structure remains unchanged and only values of the resulting matrix <i>C</i> need to be recomputed.
SPARSE_STAGE_FULL_MULT_NO_VAL	Perform computations of the matrix structure.
SPARSE_STAGE_FULL_MULT	Perform the entire computation in a single step.

## Output Parameters

**C** Handle which contains the resulting sparse matrix. Only the upper-triangular part of the matrix is computed.

## Return Values

The function returns a value indicating whether the operation was successful, or the reason why it failed.

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

## **mkl\_sparse\_?\_syprd**

*Computes the symmetric triple product of a sparse matrix and a dense matrix and stores the result as a dense matrix.*

### Syntax

```

sparse_status_t mkl_sparse_s_syprd (const sparse_operation_t op, const sparse_matrix_t
A, const float *B, const sparse_layout_t layoutB, const MKL_INT ldb, const float alpha,
const float beta, float *C, const sparse_layout_t layoutC, const MKL_INT ldc);

sparse_status_t mkl_sparse_d_syprd (const sparse_operation_t op, const sparse_matrix_t
A, const double *B, const sparse_layout_t layoutB, const MKL_INT ldb, const double
alpha, const double beta, double *C, const sparse_layout_t layoutC, const MKL_INT ldc);

sparse_status_t mkl_sparse_c_syprd (const sparse_operation_t op, const sparse_matrix_t
A, const MKL_Complex8 *B, const sparse_layout_t layoutB, const MKL_INT ldb, const
MKL_Complex8 alpha, const MKL_Complex8 beta, MKL_Complex8 *C, const sparse_layout_t
layoutC, const MKL_INT ldc);

sparse_status_t mkl_sparse_z_syprd (const sparse_operation_t op, const sparse_matrix_t
A, const MKL_Complex16 *B, const sparse_layout_t layoutB, const MKL_INT ldb, const
MKL_Complex16 alpha, const MKL_Complex16 beta, MKL_Complex16 *C, const sparse_layout_t
layoutC, const MKL_INT ldc);

```

## Include Files

- `mkl_spblas.h`

## Description

The `mkl_sparse_?_syprd` routine performs a multiplication of three sparse matrices that results in a symmetric or Hermitian matrix,  $C$ .

$$C := \alpha * A * B * \text{op}(A) + \beta * C$$

or

$$C := \alpha * \text{op}(A) * B * A + \beta * C$$

depending on the matrix modifier `operation`. Here  $A$  is a sparse matrix,  $B$  and  $C$  are dense and symmetric (or Hermitian) matrices.

`op` is the transpose (real precision) or conjugate transpose (complex precision) operator.

### NOTE

This routine is not supported for sparse matrices in COO or CSC formats. It supports only CSR and BSR formats. In addition, this routine supports only the sorted CSR and sorted BSR formats for the input matrix. If the data is unsorted, call the `mkl_sparse_order` routine before either `mkl_sparse_sypr` or `mkl_sparse_?_syprd`.

## Input Parameters

`operation`

Specifies operation on the input sparse matrix.

<code>SPARSE_OPERATION_NON_TRANSPOSE</code>	<p>Non-transpose case.</p> <p><math>C := \alpha * A * B * (A^T) + \beta * C</math> for real precision.</p> <p><math>C := \alpha * A * B * (A^H) + \beta * C</math> for complex precision.</p>
<code>SPARSE_OPERATION_TRANSPOSE</code>	<p>Transpose case. This is not supported for complex matrices.</p> <p><math>C := \alpha * (A^T) * B * A + \beta * C</math></p>
<code>SPARSE_OPERATION_CONJUGATE_TRANSPOSE</code>	<p>Conjugate transpose case. This is not supported for real matrices.</p> <p><math>C := \alpha * (A^H) * B * A + \beta * C</math></p>

`A`

Handle which contains the sparse matrix  $A$ .

`B`

Input dense matrix. Only the upper triangular part of the matrix is used for computation.

`denselayoutB` Structure that describes the storage scheme for the dense matrix.

<code>SPARSE_LAYOUT_COLUMN_MAJOR</code>	Store elements in a column-major layout.
<code>SPARSE_LAYOUT_ROW_MAJOR</code>	Store elements in a row-major layout.

`ldb` Leading dimension of matrix B.

`alpha` Scalar parameter.

`beta` Scalar parameter.

---

#### NOTE

Since the upper triangular part of matrix C is the only portion that is processed, set real values of `alpha` and `beta` in the complex case to obtain the Hermitian matrix.

---

`denselayoutC` Structure that describes the storage scheme for the dense matrix.

<code>SPARSE_LAYOUT_COLUMN_MAJOR</code>	Store elements in a column-major layout.
<code>SPARSE_LAYOUT_ROW_MAJOR</code>	Store elements in a row-major layout.

`ldc` Leading dimension of matrix C.

### Output Parameters

`C` Handle which contains the resulting dense matrix. Only the upper-triangular part of the matrix is computed.

### Return Values

The function returns a value indicating whether the operation was successful, or the reason why it failed.

<code>SPARSE_STATUS_SUCCESS</code>	The operation was successful.
<code>SPARSE_STATUS_NOT_INITIALIZED</code>	The routine encountered an empty handle or matrix array.
<code>SPARSE_STATUS_ALLOC_FAILED</code>	The internal memory allocation failed.
<code>SPARSE_STATUS_INVALID_VALUE</code>	The input parameters contain an invalid value.
<code>SPARSE_STATUS_EXECUTION_FAILED</code>	The execution failed.
<code>D</code>	
<code>SPARSE_STATUS_INTERNAL_ERROR</code>	An error occurred in the implementation of the algorithm.
<code>SPARSE_STATUS_NOT_SUPPORTED</code>	The requested operation is not supported.

### `mkl_sparse?_symgs`

*Computes a symmetric Gauss-Seidel preconditioner.*

---

## Syntax

```
sparse_status_t mkl_sparse_s_symgs (const sparse_operation_t operation, const
sparse_matrix_t A, const struct matrix_descr descr, const float alpha, const float *b,
float *x);
```

```
sparse_status_t mkl_sparse_d_symgs (const sparse_operation_t operation, const
sparse_matrix_t A, const struct matrix_descr descr, const double alpha, const double
*b, double *x);
```

```
sparse_status_t mkl_sparse_c_symgs (const sparse_operation_t operation, const
sparse_matrix_t A, const struct matrix_descr descr, const MKL_Complex8 alpha, const
MKL_Complex8 *b, MKL_Complex8 *x);
```

```
sparse_status_t mkl_sparse_z_symgs (const sparse_operation_t operation, const
sparse_matrix_t A, const struct matrix_descr descr, const MKL_Complex16 alpha, const
MKL_Complex16 *b, MKL_Complex16 *x);
```

## Include Files

- mkl\_spblas.h

## Description

The `mkl_sparse_?_symgs` routine performs this operation:

```
x0 := x*alpha;
(L + D)*x1 = b - U*x0;
(U + D)*x = b - L*x1;
```

where  $A = L + D + U$ .

---

### NOTE

This routine is not supported for sparse matrices in BSR, COO, or CSC formats. It supports only the CSR format. Additionally, only symmetric matrices are supported, so the `desc.type` must be `SPARSE_MATRIX_TYPE_SYMMETRIC`.

---

## Input Parameters

*operation* Specifies the operation performed on matrix *A*.  
`SPARSE_OPERATION_NON_TRANSPOSE`, `op(A) := A`.

---

### NOTE

Transpose (`SPARSE_OPERATION_TRANSPOSE`) and conjugate transpose (`SPARSE_OPERATION_CONJUGATE_TRANSPOSE`) are not supported.

---

*A* Handle which contains the sparse matrix *A*.

*alpha* Specifies the scalar *alpha*.

*descr* Structure specifying sparse matrix properties.

`sparse_matrix_type_t type` - Specifies the type of a sparse matrix:

<code>SPARSE_MATRIX_TYPE_GENERAL</code>	The matrix is processed as is.
<code>SPARSE_MATRIX_TYPE_SYMMETRIC</code>	The matrix is symmetric (only the requested triangle is processed).
<code>SPARSE_MATRIX_TYPE_HERMITIAN</code>	The matrix is Hermitian (only the requested triangle is processed).
<code>SPARSE_MATRIX_TYPE_TRIANGULAR</code>	The matrix is triangular (only the requested triangle is processed).
<code>SPARSE_MATRIX_TYPE_DIAGONAL</code>	The matrix is diagonal (only diagonal elements are processed).
<code>SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR</code>	The matrix is block-triangular (only requested triangle is processed). Applies to BSR format only.
<code>SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL</code>	The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only.

`sparse_fill_mode_t mode` - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:

<code>SPARSE_FILL_MODE_LOWER</code>	The lower triangular matrix part is processed.
<code>SPARSE_FILL_MODE_UPPER</code>	The upper triangular matrix part is processed.

`sparse_diag_type_t diag` - Specifies diagonal type for non-general matrices:

<code>SPARSE_DIAG_NON_UNIT</code>	Diagonal elements might not be equal to one.
<code>SPARSE_DIAG_UNIT</code>	Diagonal elements are equal to one.

<code>x</code>	Array of size at least $m$ , where $m$ is the number of rows of matrix $A$ . On entry, the array <code>x</code> must contain the vector $x$ .
<code>b</code>	Array of size at least $m$ , where $m$ is the number of rows of matrix $A$ . On entry, the array <code>b</code> must contain the vector $b$ .

## Output Parameters

<code>x</code>	Overwritten by the computed vector $x$ .
----------------	--

## Return Values

The function returns a value indicating whether the operation was successful or not, and why.

<code>SPARSE_STATUS_SUCCESS</code>	The operation was successful.
<code>SPARSE_STATUS_NOT_INITIALIZED</code>	The routine encountered an empty handle or matrix array.
<code>SPARSE_STATUS_ALLOC_FAILED</code>	Internal memory allocation failed.

<code>SPARSE_STATUS_INVALID_VALUE</code>	The input parameters contain an invalid value.
<code>SPARSE_STATUS_EXECUTION_FAILED</code>	Execution failed.
<code>SPARSE_STATUS_INTERNAL_ERROR</code>	An error in algorithm implementation occurred.
<code>SPARSE_STATUS_NOT_SUPPORTED</code>	The requested operation is not supported.

### **mkl\_sparse\_?\_symgs\_mv**

*Computes a symmetric Gauss-Seidel preconditioner followed by a matrix-vector multiplication.*

#### **Syntax**

```
sparse_status_t mkl_sparse_s_symgs_mv (const sparse_operation_t operation, const
sparse_matrix_t A, const struct matrix_descr descr, const float alpha, const float *b,
float *x, float *y);
```

```
sparse_status_t mkl_sparse_d_symgs_mv (const sparse_operation_t operation, const
sparse_matrix_t A, const struct matrix_descr descr, const double alpha, const double
*b, double *x, double *y);
```

```
sparse_status_t mkl_sparse_c_symgs_mv (const sparse_operation_t operation, const
sparse_matrix_t A, const struct matrix_descr descr, const MKL_Complex8 alpha, const
MKL_Complex8 *b, MKL_Complex8 *x, MKL_Complex8 *y);
```

```
sparse_status_t mkl_sparse_z_symgs_mv (const sparse_operation_t operation, const
sparse_matrix_t A, const struct matrix_descr descr, const MKL_Complex16 alpha, const
MKL_Complex16 *b, MKL_Complex16 *x, MKL_Complex16 *y);
```

#### **Include Files**

- `mkl_spblas.h`

#### **Description**

The `mkl_sparse_?_symgs_mv` routine performs this operation:

```
x0 := x*alpha;
(L + D)*x1 = b - U*x0;
(U + D)*x = b - L*x1;
y := A*x
```

where  $A = L + D + U$

---

#### **NOTE**

This routine is not supported for sparse matrices in BSR, COO, or CSC formats. It supports only the CSR format. Additionally, only symmetric matrices are supported, so the `desc.type` must be `SPARSE_MATRIX_TYPE_SYMMETRIC`.

---

#### **Input Parameters**

`operation` Specifies the operation performed on input matrix.  
`SPARSE_OPERATION_NON_TRANSPOSE`,  $\text{op}(A) = A$ .

**NOTE**

Transpose (`SPARSE_OPERATION_TRANSPOSE`) and conjugate transpose (`SPARSE_OPERATION_CONJUGATE_TRANSPOSE`) are not supported.

<i>A</i>	Handle which contains the sparse matrix <i>A</i> .
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>descr</i>	Structure specifying sparse matrix properties.
	<code>sparse_matrix_type_t</code> <i>type</i> - Specifies the type of a sparse matrix:
	<code>SPARSE_MATRIX_TYPE_GENERAL</code> The matrix is processed as is.
	<code>SPARSE_MATRIX_TYPE_SYMMETRIC</code> The matrix is symmetric (only the requested triangle is processed).
	<code>SPARSE_MATRIX_TYPE_HERMITIAN</code> The matrix is Hermitian (only the requested triangle is processed).
	<code>SPARSE_MATRIX_TYPE_TRIANGULAR</code> The matrix is triangular (only the requested triangle is processed).
	<code>SPARSE_MATRIX_TYPE_DIAGONAL</code> The matrix is diagonal (only diagonal elements are processed).
	<code>SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR</code> The matrix is block-triangular (only requested triangle is processed). Applies to BSR format only.
	<code>SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL</code> The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only.
	<code>sparse_fill_mode_t</code> <i>mode</i> - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:
	<code>SPARSE_FILL_MODE_LOWER</code> The lower triangular matrix part is processed.
	<code>SPARSE_FILL_MODE_UPPER</code> The upper triangular matrix part is processed.
	<code>sparse_diag_type_t</code> <i>diag</i> - Specifies diagonal type for non-general matrices:
	<code>SPARSE_DIAG_NON_UNIT</code> Diagonal elements might not be equal to one.
	<code>SPARSE_DIAG_UNIT</code> Diagonal elements are equal to one.
<i>x</i>	Array of size at least <i>m</i> , where <i>m</i> is the number of rows of matrix <i>A</i> . On entry, the array <i>x</i> must contain the vector <i>x</i> .
<i>b</i>	Array of size at least <i>m</i> , where <i>m</i> is the number of rows of matrix <i>A</i> . On entry, the array <i>b</i> must contain the vector <i>b</i> .

## Output Parameters

$x$	Overwritten by the computed vector $x$ .
$y$	Array of size at least $m$ , where $m$ is the number of rows of matrix $A$ . Overwritten by the computed vector $y$ .

## Return Values

The function returns a value indicating whether the operation was successful or not, and why.

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

## mkl\_sparse\_syrk

*Computes the product of sparse matrix with its transpose (or conjugate transpose) and stores the result in a newly allocated sparse matrix.*

## Syntax

```
sparse_status_t mkl_sparse_syrk (const sparse_operation_t operation, const
sparse_matrix_t A, sparse_matrix_t *C);
```

## Include Files

- mkl\_spblas.h

## Description

The `mkl_sparse_syrk` routine performs a sparse matrix-matrix operation which results in a sparse matrix  $C$  that is either Symmetric (real) or Hermitian (complex):

$$C := A * \text{op}(A)$$

where `op(*)` is the transpose for real matrices and conjugate transpose for complex matrices OR

$$C := \text{op}(A) * A$$

depending on the matrix modifier `op` which can be the transpose for real matrices or conjugate transpose for complex matrices.

Here,  $A$  and  $C$  are sparse matrices.

---

**NOTE** This routine is not supported for sparse matrices in COO or CSC formats. It supports only CSR and BSR formats. Additionally, this routine supports only the sorted CSR and sorted BSR formats for the input matrix. If data is unsorted, call the `mkl_sparse_order` routine before either `mkl_sparse_syrk` or `mkl_sparse_?_syrkd`.

---

## Input Parameters

<i>operation</i>	Specifies the operation $op()$ on input matrix .  SPARSE_OPERATION_NON_TRANSPOSE, Non-transpose, $C := A * op(A)$ where $op(*)$ is the transpose for real matrices and conjugate transpose for complex matrices  SPARSE_OPERATION_TRANSPOSE, Transpose, $C := (A^T) * A$ for real matrix A  SPARSE_OPERATION_CONJUGATE_TRANSPOSE, Conjugate transpose, $C := (A^H) * A$ for complex matrix A.
<i>A</i>	Handle which contains the sparse matrix A.

## Output Parameters

<i>C</i>	Handle which contains the resulting sparse matrix. Only the upper-triangular part of the matrix is computed.
----------	--

## Return Values

The function returns a value indicating whether the operation was successful or not, and why.

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

## **mkl\_sparse\_?\_syrkd**

*Computes the product of sparse matrix with its transpose (or conjugate transpose) and stores the result as a dense matrix.*

---

## Syntax

```
sparse_status_t mkl_sparse_s_syrkd (sparse_operation_t operation, const sparse_matrix_t
A, float alpha, float beta, float *C, sparse_layout_t layout, MKL_INT ldc);

sparse_status_t mkl_sparse_d_syrkd (sparse_operation_t operation, const sparse_matrix_t
A, double alpha, double beta, double *C, sparse_layout_t layout, MKL_INT ldc);

sparse_status_t mkl_sparse_c_syrkd (sparse_operation_t operation, const sparse_matrix_t
A, const MKL_Complex8 alpha, MKL_Complex8 beta, MKL_Complex8 *C, sparse_layout_t
layout, MKL_INT ldc);

sparse_status_t mkl_sparse_z_syrkd (sparse_operation_t operation, const sparse_matrix_t
A, MKL_Complex16 alpha, MKL_Complex16 beta, MKL_Complex16 *C, sparse_layout_t layout,
const MKL_INT ldc);
```

## Include Files

- `mkl_spblas.h`

## Description

The `mkl_sparse_?_syrkd` routine performs a sparse matrix-matrix operation which results in a dense matrix `C` that is either symmetric (real case) or Hermitian (complex case):

$$C := \text{beta} * C + \text{alpha} * A * \text{op}(A)$$

or

$$C := \text{beta} * C + \text{alpha} * \text{op}(A) * A$$

depending on the matrix modifier `op` which can be the transpose for real matrices or conjugate transpose for complex matrices. Here, `A` is a sparse matrix and `C` is a dense matrix.

---

**NOTE** This routine is not supported for sparse matrices in COO or CSC formats. It supports only CSR and BSR formats. Additionally, this routine supports only the sorted CSR and sorted BSR formats for the input matrix. If data is unsorted, call the `mkl_sparse_order` routine before either `mkl_sparse_syrk` or `mkl_sparse_?_syrkd`.

---

## Input Parameters

<code>operation</code>	Specifies the operation <code>op()</code> performed on the input matrix.  SPARSE_OPERATION_NON_TRANSPOSE, Non-transpose, $C := \text{beta} * C + \text{alpha} * A * \text{op}(A)$ where <code>op(*)</code> is the transpose (real matrices) or conjugate transpose (complex matrices).  SPARSE_OPERATION_TRANSPOSE, Transpose, $C := \text{beta} * C + \text{alpha} * A^T * A$ for real matrix <code>A</code> .  SPARSE_OPERATION_CONJUGATE_TRANSPOSE Conjugate transpose, $C := \text{beta} * C + \text{alpha} * A^H * A$ for complex matrix <code>A</code> .				
<code>A</code>	Handle which contains the sparse matrix <code>A</code> .				
<code>alpha</code>	Scalar parameter <code>alpha</code> .				
<code>beta</code>	Scalar parameter <code>beta</code> .				
<code>layout</code>	Describes the storage scheme for the dense matrix.  <table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="padding: 5px;"><code>layout = SPARSE_LAYOUT_COLUMN_MAJOR</code></td> <td style="padding: 5px;">Storage of elements uses column-major layout.</td> </tr> <tr> <td style="padding: 5px;"><code>layout = SPARSE_LAYOUT_ROW_MAJOR</code></td> <td style="padding: 5px;">Storage of elements uses row-major layout.</td> </tr> </table>	<code>layout = SPARSE_LAYOUT_COLUMN_MAJOR</code>	Storage of elements uses column-major layout.	<code>layout = SPARSE_LAYOUT_ROW_MAJOR</code>	Storage of elements uses row-major layout.
<code>layout = SPARSE_LAYOUT_COLUMN_MAJOR</code>	Storage of elements uses column-major layout.				
<code>layout = SPARSE_LAYOUT_ROW_MAJOR</code>	Storage of elements uses row-major layout.				
<code>ldc</code>	Leading dimension of matrix <code>C</code> .				

## NOTE

Only the upper triangular part of matrix `C` is processed. Therefore, you must set real values of `alpha` and `beta` for complex matrices in order to obtain a Hermitian matrix.

---

## Output Parameters

*C* Resulting dense matrix. Only the upper triangular part of the matrix is computed.

## Return Values

The function returns a value indicating whether the operation was successful or not, and why.

<code>SPARSE_STATUS_SUCCESS</code>	The operation was successful.
<code>SPARSE_STATUS_NOT_INITIALIZED</code>	The routine encountered an empty handle or matrix array.
<code>SPARSE_STATUS_ALLOC_FAILED</code>	Internal memory allocation failed.
<code>SPARSE_STATUS_INVALID_VALUE</code>	The input parameters contain an invalid value.
<code>SPARSE_STATUS_EXECUTION_FAILED</code>	Execution failed.
<code>SPARSE_STATUS_INTERNAL_ERROR</code>	An error in algorithm implementation occurred.
<code>SPARSE_STATUS_NOT_SUPPORTED</code>	The requested operation is not supported.

## `mkl_sparse_?_dotmv`

*Computes a sparse matrix-vector product followed by a dot product.*

---

## Syntax

```
sparse_status_t mkl_sparse_s_dotmv (const sparse_operation_t operation, const float alpha, const sparse_matrix_t A, const struct matrix_descr descr, const float *x, const float beta, float *y, float *d);
```

```
sparse_status_t mkl_sparse_d_dotmv (const sparse_operation_t operation, const double alpha, const sparse_matrix_t A, const struct matrix_descr descr, const double *x, const double beta, double *y, double *d);
```

```
sparse_status_t mkl_sparse_c_dotmv (const sparse_operation_t operation, const MKL_Complex8 alpha, const sparse_matrix_t A, const struct matrix_descr descr, const MKL_Complex8 *x, const MKL_Complex8 beta, MKL_Complex8 *y, MKL_Complex8 *d);
```

```
sparse_status_t mkl_sparse_z_dotmv (const sparse_operation_t operation, const MKL_Complex16 alpha, const sparse_matrix_t A, const struct matrix_descr descr, const MKL_Complex16 *x, const MKL_Complex16 beta, MKL_Complex16 *y, MKL_Complex16 *d);
```

## Include Files

- `mkl_spblas.h`

## Description

The `mkl_sparse_?_dotmv` routine computes a sparse matrix-vector product and dot product:

$$y := \alpha * \text{op}(A) * x + \beta * y \quad d := \sum_i x_i * y_i \quad (\text{real case})$$

$$d := \sum_i \text{conj}(x_i) * y_i \quad (\text{complex case})$$

where

- *alpha* and *beta* are scalars.
- *x* and *y* are vectors.
- *A* is an *m*-by-*k* matrix.

- *conj* represents complex conjugation.
- $\text{op}(A)$  is a matrix modifier.

Available options for  $\text{op}(A)$  are  $A$ ,  $A^T$ , or  $A^H$ .

---

#### NOTE

For sparse matrices in the BSR format, the supported combinations of (*indexing,block\_layout*) are:

- (SPARSE\_INDEX\_BASE\_ZERO, SPARSE\_LAYOUT\_ROW\_MAJOR )
  - (SPARSE\_INDEX\_BASE\_ONE, SPARSE\_LAYOUT\_COLUMN\_MAJOR )
- 

## Input Parameters

<i>operation</i>	Specifies the operation performed on matrix $A$ . If <i>operation</i> = SPARSE_OPERATION_NON_TRANSPOSE, $\text{op}(A) = A$ . If <i>operation</i> = SPARSE_OPERATION_TRANSPOSE, $\text{op}(A) = A^T$ . If <i>operation</i> = SPARSE_OPERATION_CONJUGATE_TRANSPOSE, $\text{op}(A) = A^H$ .																
<i>alpha</i>	Specifies the scalar <i>alpha</i> .																
<i>A</i>	Handle which contains the sparse matrix $A$ .																
<i>descr</i>	Structure specifying sparse matrix properties. <i>sparse_matrix_type_t type</i> - Specifies the type of a sparse matrix:  <table> <tr> <td>SPARSE_MATRIX_TYPE_GENERAL</td> <td>The matrix is processed as is.</td> </tr> <tr> <td>SPARSE_MATRIX_TYPE_SYMMETRIC</td> <td>The matrix is symmetric (only the requested triangle is processed).</td> </tr> <tr> <td>SPARSE_MATRIX_TYPE_HERMITIAN</td> <td>The matrix is Hermitian (only the requested triangle is processed).</td> </tr> <tr> <td>SPARSE_MATRIX_TYPE_TRIANGULAR</td> <td>The matrix is triangular (only the requested triangle is processed).</td> </tr> <tr> <td>SPARSE_MATRIX_TYPE_DIAGONAL</td> <td>The matrix is diagonal (only diagonal elements are processed).</td> </tr> <tr> <td>SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR</td> <td>The matrix is block-triangular (only requested triangle is processed). Applies to BSR format only.</td> </tr> <tr> <td>SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL</td> <td>The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only.</td> </tr> </table> <i>sparse_fill_mode_t mode</i> - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:  <table> <tr> <td>SPARSE_FILL_MODE_LOWER</td> <td>The lower triangular matrix part is processed.</td> </tr> </table>	SPARSE_MATRIX_TYPE_GENERAL	The matrix is processed as is.	SPARSE_MATRIX_TYPE_SYMMETRIC	The matrix is symmetric (only the requested triangle is processed).	SPARSE_MATRIX_TYPE_HERMITIAN	The matrix is Hermitian (only the requested triangle is processed).	SPARSE_MATRIX_TYPE_TRIANGULAR	The matrix is triangular (only the requested triangle is processed).	SPARSE_MATRIX_TYPE_DIAGONAL	The matrix is diagonal (only diagonal elements are processed).	SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR	The matrix is block-triangular (only requested triangle is processed). Applies to BSR format only.	SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL	The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only.	SPARSE_FILL_MODE_LOWER	The lower triangular matrix part is processed.
SPARSE_MATRIX_TYPE_GENERAL	The matrix is processed as is.																
SPARSE_MATRIX_TYPE_SYMMETRIC	The matrix is symmetric (only the requested triangle is processed).																
SPARSE_MATRIX_TYPE_HERMITIAN	The matrix is Hermitian (only the requested triangle is processed).																
SPARSE_MATRIX_TYPE_TRIANGULAR	The matrix is triangular (only the requested triangle is processed).																
SPARSE_MATRIX_TYPE_DIAGONAL	The matrix is diagonal (only diagonal elements are processed).																
SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR	The matrix is block-triangular (only requested triangle is processed). Applies to BSR format only.																
SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL	The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only.																
SPARSE_FILL_MODE_LOWER	The lower triangular matrix part is processed.																

SPARSE\_FILL\_MODE\_UPPER The upper triangular matrix part is processed.  
R

sparse\_diag\_type\_t *diag* - Specifies diagonal type for non-general matrices:

SPARSE\_DIAG\_NON\_UNIT Diagonal elements might not be equal to one.

SPARSE\_DIAG\_UNIT Diagonal elements are equal to one.

*x* If *operation* = SPARSE\_OPERATION\_NON\_TRANSPOSE, array of size at least *k*, where *k* is the number of columns of matrix *A*.

Otherwise, array of size at least *m*, where *m* is the number of rows of matrix *A*.

On entry, the array *x* must contain the vector *x*.

*beta* Specifies the scalar *beta*.

*y* If *operation* = SPARSE\_OPERATION\_NON\_TRANSPOSE, array of size at least *m*, where *k* is the number of rows of matrix *A*.

Otherwise, array of size at least *k*, where *k* is the number of columns of matrix *A*.

On entry, the array *y* must contain the vector *y*.

## Output Parameters

*y* Overwritten by the updated vector *y*.

*d* Overwritten by the dot product of *x* and *y*.

## Return Values

The function returns a value indicating whether the operation was successful or not, and why.

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

## **mkl\_sparse\_?\_sorv**

*Computes forward, backward sweeps or a symmetric successive over-relaxation preconditioner operation.*

## Syntax

```
sparse_status_t mkl_sparse_s_sorv(
    const sparse_sor_type_t type,
    const struct matrix_descr descrA,
```

```

const sparse_matrix_t A,
float omega,
float alpha,
float* x,
float* b
);

```

```

sparse_status_t mkl_sparse_d_sorv(
const sparse_sor_type_t type,
const struct matrix_descr descrA,
const sparse_matrix_t A,
double omega,
double alpha,
double* x,
double* b
);

```

### Include Files

- mkl\_spblas.h

### Description

The mkl\_sparse\_?\_sorv routine performs one of the following operations:

SPARSE\_SOR\_FORWARD:

$$(\omega * L + D) * x^1 = (D - \omega * D - \omega * U) * x^0 + \omega * b$$

SPARSE\_SOR\_BACKWARD:

$$(\omega * U + D) * x^1 = (D - \omega * D - \omega * L) * x^0 + \omega * b$$

SPARSE\_SOR\_SYMMETRIC: Performs application of a

$$\frac{\omega}{2 - \omega} \left( \frac{1}{\omega} D + L \right) D^{-1} \left( \frac{1}{\omega} D + L \right)^T$$

preconditioner.

where  $A = L + D + U$  and  $x^0$  is an input vector  $x$  scaled by input parameter  $\alpha$  vector and  $x^1$  is an output stored in vector  $x$ .

**NOTE**

Currently this routine only supports the following configuration:

- CSR format of the input matrix
- SPARSE\_SOR\_FORWARD operation
- General matrix (`descr.type` is `SPARSE_MATRIX_TYPE_GENERAL`) or symmetric matrix with full portrait and unit diagonal (`descr.type` is `SPARSE_MATRIX_TYPE_SYMMETRIC`, `descr.mode` is `SPARSE_FILL_MODE_FULL`, and `descr.diag` is `SPARSE_DIAG_UNIT`)

**NOTE**

Currently, this routine is optimized only for sequential threading execution mode.

**Warning** It is currently not allowed to place a `sorv` call in a parallel section (e.g., under `#pragma omp parallel`), because it is not thread-safe in this scenario. This limitation will be addressed in one of the upcoming releases.

**Product and Performance Information**

Performance varies by use, configuration and other factors. Learn more at [www.Intel.com/PerformanceIndex](http://www.Intel.com/PerformanceIndex).

Notice revision #20201201

**Input Parameters**

<code>type</code>	Specifies the operation performed by the SORV preconditioner.
<code>SPARSE_SOR_FORWARD</code>	Performs forward sweep as defined by: $(\omega * L + D) * x^1 = (D - \omega * D - \omega * U) * x^0 + \omega * b$
<code>SPARSE_SOR_BACKWARD</code>	Performs backward sweep as defined by: $(\omega * U + D) * x^1 = (D - \omega * D - \omega * L) * x^0 + \omega * b$
<code>SPARSE_SOR_SYMMETRIC</code>	Preconditioner matrix could be expressed as: $\frac{\omega}{2 - \omega} \left( \frac{1}{\omega} D + L \right) D^{-1} \left( \frac{1}{\omega} D + L \right)^T$
<code>descr</code>	Structure specifying sparse matrix properties.
<code>sparse_matrix_type_t</code> <code>type</code>	Specifies the type of a sparse matrix: <ul style="list-style-type: none"> <li>• <code>SPARSE_MATRIX_TYPE_GENERAL</code> The matrix is processed as-is.</li> <li>• <code>SPARSE_MATRIX_TYPE_SYMMETRIC</code> The matrix is symmetric (only the requested triangle is processed).</li> <li>• <code>SPARSE_MATRIX_TYPE_HERMITIAN</code></li> </ul>

The matrix is Hermitian (only the requested triangle is processed).

- `SPARSE_MATRIX_TYPE_TRIANGULAR`

The matrix is triangular (only the requested triangle is processed).

- `SPARSE_MATRIX_TYPE_DIAGONAL`

The matrix is diagonal (only diagonal elements are processed).

- `SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR`

The matrix is block-triangular (only requested triangle is processed). Applies to BSR format only.

- `SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL`

The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only.

`sparse_fill_mode_t`  
`mode`

Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:

- `SPARSE_FILL_MODE_LOWER`

The lower triangular matrix part is processed.

- `SPARSE_FILL_MODE_UPPER`

The upper triangular matrix part is processed.

`sparse_diag_type_t`  
`diag`

Specifies diagonal type for non-general matrices:

- `SPARSE_DIAG_NON_UNIT`

Diagonal elements might not be equal to one.

- `SPARSE_DIAG_UNIT`

Diagonal elements are equal to one.

*A*

Handle containing internal data.

*omega*

Relaxation factor.

*alpha*

Parameter that could be used to normalize or set to zero the vector *x* that holds the initial guess.

*x*

Initial guess on input.

*b*

Right-hand side.

## Output Parameters

*x*

Solution vector on output.

## Return Values

The function returns a value indicating whether the operation was successful or not, and why.

<code>SPARSE_STATUS_SUCCESS</code>	The operation was successful.
<code>SPARSE_STATUS_NOT_INITIALIZED</code>	The routine encountered an empty handle or matrix array.
<code>SPARSE_STATUS_ALLOC_FAILED</code>	Internal memory allocation failed.
<code>SPARSE_STATUS_INVALID_VALUE</code>	The input parameters contain an invalid value.
<code>SPARSE_STATUS_EXECUTION_FAILED</code>	Execution failed.
<code>SPARSE_STATUS_INTERNAL_ERROR</code>	An error in algorithm implementation occurred.
<code>SPARSE_STATUS_NOT_SUPPORTED</code>	The requested operation is not supported.

## BLAS-like Extensions

Intel® oneAPI Math Kernel Library provides C and Fortran routines to extend the functionality of the BLAS routines. These include routines to compute vector products, matrix-vector products, and matrix-matrix products.

Intel® oneAPI Math Kernel Library also provides routines to perform certain data manipulation, including matrix in-place and out-of-place transposition operations combined with simple matrix arithmetic operations. Transposition operations are Copy As Is, Conjugate transpose, Transpose, and Conjugate. Each routine adds the possibility of scaling during the transposition operation by giving some *alpha* and/or *beta* parameters. Each routine supports both row-major orderings and column-major orderings.

Table “BLAS-like Extensions” lists these routines.

The `<?>` symbol in the routine short names is a precision prefix that indicates the data type:

<code>s</code>	float
<code>d</code>	double
<code>c</code>	MKL_Complex8
<code>z</code>	MKL_Complex16

## BLAS-like Extensions

Routine	Data Types	Description
<code>cblas_?axpby</code>	<code>s, d, c, z</code>	Scales two vectors, adds them to one another and stores result in the vector (routines).
<code>cblas_?axpy_batch</code> <code>cblas_?axpy_batch_strided</code>	<code>s, d, c, z</code>	Computes groups of vector-scalar products added to a vector.
<code>cblas_?dggm_batch_strided</code> <code>cblas_?dggm_batch</code>	<code>s, d, c, z</code>	Computes groups of diagonal matrix-general matrix product
<code>cblas_?gemm_batch</code> <code>cblas_?gemm_batch_strided</code>	<code>s, d, c, z</code>	Computes scalar-matrix-matrix products and adds the results to scalar matrix products for groups of general matrices.
<code>cblas_gemm_bf16bf16f3bf16</code>	<code>bfloat16</code>	Computes a matrix-matrix product with general matrices of <code>bfloat16</code> data type.

Routine	Data Types	Description
<code>cblas_gemm_bf16bf16f32bf16f32</code>	bfloat16	Computes a matrix-matrix product with general matrices of bfloat16 data type where one or both input matrices are stored in a packed data structure, and adds the result to a scalar-matrix product.
<code>cblas_gemm_f16f16f32</code>	half precision	Computes a matrix-matrix product with general matrices of half precision data type.
<code>cblas_gemm_f16f16f32_halfprecision</code>	half precision	Computes a matrix-matrix product with general matrices of half precision data type where one or both input matrices are stored in a packed data structure, and adds the result to a scalar-matrix product.
<code>cblas_gemm_*</code>	Integer	Computes a matrix-matrix product with general integer matrices.
<code>cblas_?gemm_compute</code>	h, s, d	Computes a matrix-matrix product with general matrices where one or both input matrices are stored in a packed data structure and adds the result to a scalar-matrix product.
<code>cblas_gemm_*_compute</code>	Integer	Computes a matrix-matrix product with general integer matrices where one or both input matrices are stored in a packed data structure and adds the result to a scalar-matrix product.
<code>cblas_?gemm_pack</code>	h, s, d	Performs scaling and packing of the matrix into the previously allocated buffer.
<code>cblas_gemm_*_pack</code>	Integer, bfloat16	Pack the matrix into the buffer allocated previously.
<code>cblas_?gemm_pack_get_h, s, d</code>	h, s, d	Returns the number of bytes required to store the packed matrix.
<code>cblas_gemm_*_pack_get_h, s, d</code>	Integer, bfloat16	Returns the number of bytes required to store the packed matrix.
<code>cblas_?gemm3m</code>	c, z	Computes a scalar-matrix-matrix product using matrix multiplications and adds the result to a scalar-matrix product.
<code>cblas_?gemm3m_batch</code>	c, z	Computes a scalar-matrix-matrix product using matrix multiplications and adds the result to a scalar-matrix product.
<code>cblas_?gemm3m_batch_strided</code>		
<code>cblas_?gemmt</code>	s, d, c, z	Computes a matrix-matrix product with general matrices but updates only the upper or lower triangular part of the result matrix.
<code>cblas_?gemv_batch_strided</code>	s, d, c, z	Computes groups of matrix-vector product using general matrices.
<code>cblas_?gemv_batch</code>		
<code>cblas_?trsm_batch</code>	s, d, c, z	Solves a triangular matrix equation for a group of matrices.
<code>?cblas_?trsm_batch_strided</code>		
<code>mkl_?imatcopy</code>	s, d, c, z	Performs scaling and in-place transposition/copying of matrices.
<code>mkl_?imatcopy_batch_strided</code>	s, d, c, z	Computes groups of in-place matrix copy/transposition with scaling using general matrices.
<code>mkl_?imatcopy_batch</code>		

Routine	Data Types	Description
<code>mkl_?omatadd</code>	s, d, c, z	Performs scaling and sum of two matrices including their out-of-place transposition/copying.
<code>mkl_?omatcopy</code>	s, d, c, z	Performs scaling and out-of-place transposition/copying of matrices.
<code>mkl_? omatcopy_batch_stride d</code>	s, d, c, z	Computes groups of out of place matrix copy/transposition with scaling using general matrices.
<code>mkl_?omatcopy_batch</code>		
<code>mkl_?omatcopy2</code>	s, d, c, z	Performs two-strided scaling and out-of-place transposition/copying of matrices.
<code>mkl_jit_create_?gemm</code>	s, d, c, z	Creates a handle on a jitter and generates a GEMM kernel that computes a scalar-matrix-matrix product and adds the result to a scalar-matrix product, with general matrices.
<code>mkl_jit_destroy</code>		Deletes the previously created jitter and the generated GEMM kernel.
<code>mkl_jit_get_?gemm_ptr</code>	s, d, c, z	Returns the GEMM kernel previously generated.

## **cblas\_?axpy\_batch**

*Computes a group of vector-scalar products added to a vector.*

### **Syntax**

```
void cblas_saxpy_batch (const MKL_INT *n_array, const float *alpha_array, const float
**x_array, const MKL_INT *incx_array, float **y_array, const MKL_INT *incy_array, const
MKL_INT group_count, const MKL_INT *group_size_array);
```

```
void cblas_daxpy_batch (const MKL_INT *n_array, const double *alpha_array, const double
**x_array, const MKL_INT *incx_array, double **y_array, const MKL_INT *incy_array,
const MKL_INT group_count, const MKL_INT *group_size_array);
```

```
void cblas_caxpy_batch (const MKL_INT *n_array, const void *alpha_array, const void
**x_array, const MKL_INT *incx_array, void **y_array, const MKL_INT *incy_array, const
MKL_INT group_count, const MKL_INT *group_size_array);
```

```
void cblas_zaxpy_batch (const MKL_INT *n_array, const void *alpha_array, const void
**x_array, const MKL_INT *incx_array, void **y_array, const MKL_INT *incy_array, const
MKL_INT group_count, const MKL_INT *group_size_array);
```

### **Description**

The `cblas_?axpy_batch` routines perform a series of scalar-vector product added to a vector. They are similar to the `cblas_?axpy` routine counterparts, but the `cblas_?axpy_batch` routines perform vector operations with a group of vectors. The groups contain vectors with the same parameters.

The operation is defined as

```
idx = 0
for i = 0 ... group_count - 1
    n, alpha, incx, incy and group_size at position i in n_array, alpha_array, incx_array,
    incy_array and group_size_array
    for j = 0 ... group_size - 1
```

```

        x and y are vectors of size n at position idx in x_array and y_array
        y := alpha * x + y
        idx := idx + 1
    end for
end for

```

The number of entries in *x\_array*, and *y\_array* is *total\_batch\_count* = the sum of all of the *group\_size* entries.

## Input Parameters

<i>n_array</i>	Array of size <i>group_count</i> . For the group <i>i</i> , $n_i = n\_array[i]$ is the number of elements in vectors <i>x</i> and <i>y</i> .
<i>alpha_array</i>	Array of size <i>group_count</i> . For the group <i>i</i> , $\alpha_i = alpha\_array[i]$ is the scalar <i>alpha</i> .
<i>x_array</i>	Array of size <i>total_batch_count</i> of pointers used to store <i>x</i> vectors. The array allocated for the <i>x</i> vectors of the group <i>i</i> must be of size at least $(1 + (n_i - 1) * \text{abs}(\text{incx}_i))$ .
<i>incx_array</i>	Array of size <i>group_count</i> . For the group <i>i</i> , $\text{incx}_i = \text{incx\_array}[i]$ is the stride of vector <i>x</i> .
<i>y_array</i>	Array of size <i>total_batch_count</i> of pointers used to store <i>y</i> vectors. The array allocated for the <i>y</i> vectors of the group <i>i</i> must be of size at least $(1 + (n_i - 1) * \text{abs}(\text{incy}_i))$ .
<i>incy_array</i>	Array of size <i>group_count</i> . For the group <i>i</i> , $\text{incy}_i = \text{incy\_array}[i]$ is the stride of vector <i>y</i> .
<i>group_count</i>	Number of groups. Must be at least 0.
<i>group_size_array</i>	Array of size <i>group_count</i> . The element <i>group_size_array</i> [ <i>i</i> ] is the number of vector in the group <i>i</i> . Each element in <i>group_size_array</i> must be at least 0.

## Output Parameters

<i>y_array</i>	Array of pointers holding the <i>total_batch_count</i> updated vector <i>y</i> .
----------------	--

## cblas\_?axpy\_batch\_strided

Computes a group of vector-scalar products added to a vector.

### Syntax

```
void cblas_saxpy_batch_strided (const MKL_INT n, const float alpha, const float *x,
const MKL_INT incx, const MKL_INT stridex, float *y, const MKL_INT incy, const MKL_INT
stridey, const MKL_INT batch_size);
```

```
void cblas_daxpy_batch_strided (const MKL_INT n, const double alpha, const double *x,
const MKL_INT incx, const MKL_INT stridex, double *y, const MKL_INT incy, const MKL_INT
stridey, const MKL_INT batch_size);
```

```
void cblas_caxpy_batch_strided (const MKL_INT n, const void alpha, const void *x, const
MKL_INT incx, const MKL_INT stridex, void *y, const MKL_INT incy, const MKL_INT
stridey, const MKL_INT batch_size);
```

```
void cblas_zaxpy_batch_strided (const MKL_INT n, const void alpha, const void *x, const
MKL_INT incx, const MKL_INT stridex, void *y, const MKL_INT incy, const MKL_INT
stridey, const MKL_INT batch_size);
```

## Include Files

- mkl.h

## Description

The `cblas_?axpy_batch_strided` routines perform a series of scalar-vector product added to a vector. They are similar to the `cblas_?axpy` routine counterparts, but the `cblas_?axpy_batch_strided` routines perform vector operations with a group of vectors.

All vector  $x$  (respectively,  $y$ ) have the same parameters (size, increments) and are stored at constant *stridex* (respectively, *stridey*) from each other. The operation is defined as

```
For i = 0 ... batch_size - 1
  X and Y are vectors at offset i * stridex and i * stridey in x and y
  Y = alpha * X + Y
end for
```

## Input Parameters

<i>n</i>	Number of elements in vectors $x$ and $y$ .
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>x</i>	Array of size at least <i>stridex</i> * <i>batch_size</i> holding the $x$ vectors.
<i>incx</i>	Specifies the increment for the elements of $x$ .
<i>stridex</i>	Stride between two consecutive $x$ vectors; must be at least zero.
<i>y</i>	Array of size at least <i>stridey</i> * <i>batch_size</i> holding the $y$ vectors.
<i>incy</i>	Specifies the increment for the elements of $y$ .
<i>stridey</i>	Stride between two consecutive $y$ vectors; must be at least $(1 + (n-1)*abs(incy))$ .
<i>batch_size</i>	Number of <code>axpy</code> computations to perform and $x$ and $y$ vectors. Must be at least 0.

## Output Parameters

<i>y</i>	Array holding the <i>batch_size</i> updated vector $y$ .
----------	--

## cblas\_?axpby

*Scales two vectors, adds them to one another and stores result in the vector.*

## Syntax

```
void cblas_saxpby (const MKL_INT n, const float a, const float *x, const MKL_INT incx,
const float b, float *y, const MKL_INT incy);
```

```
void cblas_daxpby (const MKL_INT n, const double a, const double *x, const MKL_INT
incx, const double b, double *y, const MKL_INT incy);
```

```
void cblas_caxpby (const MKL_INT n, const void *a, const void *x, const MKL_INT incx,
const void *b, void *y, const MKL_INT incy);
```

```
void cblas_zaxpby (const MKL_INT n, const void *a, const void *x, const MKL_INT incx,
const void *b, void *y, const MKL_INT incy);
```

## Include Files

- mkl.h

## Description

The ?axpby routines perform a vector-vector operation defined as

$$y := a*x + b*y$$

where:

$a$  and  $b$  are scalars

$x$  and  $y$  are vectors each with  $n$  elements.

## Input Parameters

$n$	Specifies the number of elements in vectors $x$ and $y$ .
$a$	Specifies the scalar $a$ .
$x$	Array, size at least $(1 + (n-1)*abs(incx))$ .
$incx$	Specifies the increment for the elements of $x$ .
$b$	Specifies the scalar $b$ .
$y$	Array, size at least $(1 + (n-1)*abs(incy))$ .
$incy$	Specifies the increment for the elements of $y$ .

## Output Parameters

$y$	Contains the updated vector $y$ .
-----	-----------------------------------

## Example

For examples of routine usage, see these code examples in the Intel® oneAPI Math Kernel Library (oneMKL) installation directory:

- cblas\_daxpby: examples\cblas\source\cblas\_daxpbyx.c
- cblas\_caxpby: examples\cblas\source\cblas\_caxpbyx.c
- cblas\_zaxpby: examples\cblas\source\cblas\_zaxpbyx.c

## cblas\_?gemmt

*Computes a matrix-matrix product with general matrices but updates only the upper or lower triangular part of the result matrix.*

---

## Syntax

```
void cblas_sgemmt (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const
CBLAS_TRANSPOSE transa, const CBLAS_TRANSPOSE transb, const MKL_INT n, const MKL_INT k,
const float alpha, const float *a, const MKL_INT lda, const float *b, const MKL_INT
ldb, const float beta, float *c, const MKL_INT ldc);
```

```
void cblas_dgemmt (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const
CBLAS_TRANSPOSE transa, const CBLAS_TRANSPOSE transb, const MKL_INT n, const MKL_INT k,
const double alpha, const double *a, const MKL_INT lda, const double *b, const MKL_INT
ldb, const double beta, double *c, const MKL_INT ldc);
```

```
void cblas_cgemmt (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const
CBLAS_TRANSPOSE transa, const CBLAS_TRANSPOSE transb, const MKL_INT n, const MKL_INT k,
const void *alpha, const void *a, const MKL_INT lda, const void *b, const MKL_INT ldb,
const void *beta, void *c, const MKL_INT ldc);
```

```
void cblas_zgemmt (const CBLAS_LAYOUT Layout, const CBLAS_UPLO uplo, const
CBLAS_TRANSPOSE transa, const CBLAS_TRANSPOSE transb, const MKL_INT n, const MKL_INT k,
const void *alpha, const void *a, const MKL_INT lda, const void *b, const MKL_INT ldb,
const void *beta, void *c, const MKL_INT ldc);
```

## Include Files

- mkl.h

## Description

The `?gemmt` routines compute a scalar-matrix-matrix product with general matrices and add the result to the upper or lower part of a scalar-matrix product. These routines are similar to the `?gemm` routines, but they only access and update a triangular part of the square result matrix (see Application Notes below).

The operation is defined as

$$C := \alpha * \text{op}(A) * \text{op}(B) + \beta * C,$$

where:

$\text{op}(X)$  is one of  $\text{op}(X) = X$ , or  $\text{op}(X) = X^T$ , or  $\text{op}(X) = X^H$ ,

$\alpha$  and  $\beta$  are scalars,

$A$ ,  $B$  and  $C$  are matrices:

$\text{op}(A)$  is an  $n$ -by- $k$  matrix,

$\text{op}(B)$  is a  $k$ -by- $n$  matrix,

$C$  is an  $n$ -by- $n$  upper or lower triangular matrix.

## Input Parameters

<i>Layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>uplo</i>	Specifies whether the upper or lower triangular part of the array <i>c</i> is used. If <i>uplo</i> = 'CblasUpper', then the upper triangular part of the array <i>c</i> is used. If <i>uplo</i> = 'CblasLower', then the lower triangular part of the array <i>c</i> is used.
<i>transa</i>	Specifies the form of $\text{op}(A)$ used in the matrix multiplication: if <i>transa</i> = 'CblasNoTrans', then $\text{op}(A) = A$ ;

if *transa* = 'CblasTrans', then  $op(A) = A^T$ ;  
 if *transa* = 'CblasConjTrans', then  $op(A) = A^H$ .

*transb*

Specifies the form of  $op(B)$  used in the matrix multiplication:

if *transb* = 'CblasNoTrans', then  $op(B) = B$ ;  
 if *transb* = 'CblasTrans', then  $op(B) = B^T$ ;  
 if *transb* = 'CblasConjTrans', then  $op(B) = B^H$ .

*n*

Specifies the order of the matrix *C*. The value of *n* must be at least zero.

*k*

Specifies the number of columns of the matrix  $op(A)$  and the number of rows of the matrix  $op(B)$ . The value of *k* must be at least zero.

*alpha*

Specifies the scalar *alpha*.

*a*

	<i>transa</i> ='CblasNoTrans'	<i>transa</i> ='CblasTrans' or 'CblasConjTrans'
<i>Layout</i> ='CblasColMajor' or'	Array, size <i>lda</i> * <i>k</i> . Before entry, the leading <i>n</i> -by- <i>k</i> part of the array <i>a</i> must contain the matrix <i>A</i> .	Array, size <i>lda</i> * <i>n</i> . Before entry, the leading <i>k</i> -by- <i>n</i> part of the array <i>a</i> must contain the matrix <i>A</i> .
<i>Layout</i> ='CblasRowMajor' or'	Array, size <i>lda</i> * <i>n</i> . Before entry, the leading <i>k</i> -by- <i>n</i> part of the array <i>a</i> must contain the matrix <i>A</i> .	Array, size <i>lda</i> * <i>k</i> . Before entry, the leading <i>n</i> -by- <i>k</i> part of the array <i>a</i> must contain the matrix <i>A</i> .

*lda*

Specifies the leading dimension of *a* as declared in the calling (sub)program.

	<i>transa</i> ='CblasNoTrans'	<i>transa</i> ='CblasTrans' or 'CblasConjTrans'
<i>Layout</i> ='CblasColMajor' or'	<i>lda</i> must be at least $\max(1, n)$ .	<i>lda</i> must be at least $\max(1, k)$ .
<i>Layout</i> ='CblasRowMajor' or'	<i>lda</i> must be at least $\max(1, k)$ .	<i>lda</i> must be at least $\max(1, n)$ .

*b*

	<i>transb</i> ='CblasNoTrans'	<i>transb</i> ='CblasTrans' or 'CblasConjTrans'
<i>Layout</i> ='CblasColMajor' or'	Array, size <i>ldb</i> * <i>n</i> . Before entry, the leading <i>k</i> -by- <i>n</i> part of the array <i>b</i> must contain the matrix <i>B</i> .	Array, size <i>ldb</i> * <i>k</i> . Before entry, the leading <i>n</i> -by- <i>k</i> part of the array <i>b</i> must contain the matrix <i>B</i> .

<i>Layout</i> = 'CblasRowMaj or'	Array, size $ldb * k$ . Before entry, the leading $n$ -by- $k$ part of the array $b$ must contain the matrix $B$ .	Array, size $ldb * n$ . Before entry, the leading $k$ -by- $n$ part of the array $b$ must contain the matrix $B$ .
-------------------------------------	--	--

*ldb*

Specifies the leading dimension of  $b$  as declared in the calling (sub)program.

	<i>transb</i> = 'CblasNoTr ans'	<i>transb</i> = 'CblasTran s' or 'CblasConjTrans'
<i>Layout</i> = 'CblasColMaj or'	<i>ldb</i> must be at least $\max(1, k)$ .	<i>ldb</i> must be at least $\max(1, n)$ .
<i>Layout</i> = 'CblasRowMaj or'	<i>ldb</i> must be at least $\max(1, n)$ .	<i>ldb</i> must be at least $\max(1, k)$ .

*beta*

Specifies the scalar  $\beta$ . When  $\beta$  is equal to zero, then  $c$  need not be set on input.

*c*

Array, size  $ldc$  by  $n$ .

When  $\beta$  is equal to zero,  $c$  need not be set on input.

<i>uplo</i> = 'CblasUpper'	<i>uplo</i> = 'CblasLower'
The leading $n$ -by- $n$ upper triangular part of the array $c$ must contain the upper triangular part of the matrix $C$ and the strictly lower triangular part of $c$ is not referenced.	The leading $n$ -by- $n$ lower triangular part of the array $c$ must contain the lower triangular part of the matrix $C$ and the strictly upper triangular part of $c$ is not referenced.

*ldc*

Specifies the leading dimension of  $c$  as declared in the calling (sub)program. The value of  $ldc$  must be at least  $\max(1, n)$ .

## Output Parameters

*c*

When *uplo* = 'CblasUpper', the upper triangular part of the array  $c$  is overwritten by the upper triangular part of the updated matrix.

When *uplo* = 'CblasLower', the lower triangular part of the array  $c$  is overwritten by the lower triangular part of the updated matrix.

## Application Notes

These routines only access and update the upper or lower triangular part of the result matrix. This can be useful when the result is known to be symmetric; for example, when computing a product of the form  $C := \alpha * B * S * B^T + \beta * C$ , where  $S$  and  $C$  are symmetric matrices and  $B$  is a general matrix. In this case, first compute  $A := B * S$  (which can be done using the corresponding ?*symm* routine), then compute  $C := \alpha * A * B^T + \beta * C$  using the ?*gemmt* routine.

## cblas\_?gemm3m

Computes a scalar-matrix-matrix product using matrix multiplications and adds the result to a scalar-matrix product.

## Syntax

```
void cblas_cgemm3m (const CBLAS_LAYOUT Layout, const CBLAS_TRANSPOSE transa, const
CBLAS_TRANSPOSE transb, const MKL_INT m, const MKL_INT n, const MKL_INT k, const void
*alpha, const void *a, const MKL_INT lda, const void *b, const MKL_INT ldb, const void
*beta, void *c, const MKL_INT ldc);
```

```
void cblas_zgemm3m (const CBLAS_LAYOUT Layout, const CBLAS_TRANSPOSE transa, const
CBLAS_TRANSPOSE transb, const MKL_INT m, const MKL_INT n, const MKL_INT k, const void
*alpha, const void *a, const MKL_INT lda, const void *b, const MKL_INT ldb, const void
*beta, void *c, const MKL_INT ldc);
```

## Include Files

- mkl.h

## Description

The `?gemm3m` routines perform a matrix-matrix operation with general complex matrices. These routines are similar to the `?gemm` routines, but they use fewer matrix multiplication operations (see *Application Notes* below).

The operation is defined as

$$C := \alpha * \text{op}(A) * \text{op}(B) + \beta * C,$$

where:

$\text{op}(x)$  is one of  $\text{op}(x) = x$ , or  $\text{op}(x) = x'$ , or  $\text{op}(x) = \text{conjg}(x')$ ,

$\alpha$  and  $\beta$  are scalars,

$A$ ,  $B$  and  $C$  are matrices:

$\text{op}(A)$  is an  $m$ -by- $k$  matrix,

$\text{op}(B)$  is a  $k$ -by- $n$  matrix,

$C$  is an  $m$ -by- $n$  matrix.

## Input Parameters

<i>Layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>transa</i>	Specifies the form of $\text{op}(A)$ used in the matrix multiplication: if $\text{transa}=\text{CblasNoTrans}$ , then $\text{op}(A) = A$ ; if $\text{transa}=\text{CblasTrans}$ , then $\text{op}(A) = A'$ ; if $\text{transa}=\text{CblasConjTrans}$ , then $\text{op}(A) = \text{conjg}(A')$ .
<i>transb</i>	Specifies the form of $\text{op}(B)$ used in the matrix multiplication: if $\text{transb}=\text{CblasNoTrans}$ , then $\text{op}(B) = B$ ; if $\text{transb}=\text{CblasTrans}$ , then $\text{op}(B) = B'$ ; if $\text{transb}=\text{CblasConjTrans}$ , then $\text{op}(B) = \text{conjg}(B')$ .
<i>m</i>	Specifies the number of rows of the matrix $\text{op}(A)$ and of the matrix $C$ . The value of $m$ must be at least zero.

*n* Specifies the number of columns of the matrix  $op(B)$  and the number of columns of the matrix *C*.

The value of *n* must be at least zero.

*k* Specifies the number of columns of the matrix  $op(A)$  and the number of rows of the matrix  $op(B)$ .

The value of *k* must be at least zero.

*alpha* Specifies the scalar *alpha*.

*a*

	<i>transa</i> =CblasNoTrans	<i>transa</i> =CblasTrans or <i>transa</i> =CblasConjTrans
<i>Layout</i> = CblasColMajor	Array, size <i>lda</i> * <i>k</i> . Before entry, the leading <i>m</i> -by- <i>k</i> part of the array <i>a</i> must contain the matrix <i>A</i> .	Array, size <i>lda</i> * <i>m</i> . Before entry, the leading <i>k</i> -by- <i>m</i> part of the array <i>a</i> must contain the matrix <i>A</i> .
<i>Layout</i> = CblasRowMajor	Array, size <i>lda</i> * <i>m</i> . Before entry, the leading <i>k</i> -by- <i>m</i> part of the array <i>a</i> must contain the matrix <i>A</i> .	Array, size <i>lda</i> * <i>k</i> . Before entry, the leading <i>m</i> -by- <i>k</i> part of the array <i>a</i> must contain the matrix <i>A</i> .

*lda*

Specifies the leading dimension of *a* as declared in the calling (sub)program.

	<i>transa</i> =CblasNoTrans	<i>transa</i> =CblasTrans or <i>transa</i> =CblasConjTrans
<i>Layout</i> = CblasColMajor	<i>lda</i> must be at least $\max(1, m)$ .	<i>lda</i> must be at least $\max(1, k)$
<i>Layout</i> = CblasRowMajor	<i>lda</i> must be at least $\max(1, k)$	<i>lda</i> must be at least $\max(1, m)$ .

*b*

	<i>transb</i> =CblasNoTrans	<i>transb</i> =CblasTrans or <i>transb</i> =CblasConjTrans
<i>Layout</i> = CblasColMajor	Array, size <i>ldb</i> by <i>n</i> . Before entry, the leading <i>k</i> -by- <i>n</i> part of the array <i>b</i> must contain the matrix <i>B</i> .	Array, size <i>ldb</i> by <i>k</i> . Before entry the leading <i>n</i> -by- <i>k</i> part of the array <i>b</i> must contain the matrix <i>B</i> .

<i>Layout</i> = CblasRowMajor	Array, size <i>ldb</i> by <i>k</i> . Before entry the leading <i>n</i> -by- <i>k</i> part of the array <i>b</i> must contain the matrix <i>B</i> .	Array, size <i>ldb</i> by <i>n</i> . Before entry, the leading <i>k</i> -by- <i>n</i> part of the array <i>b</i> must contain the matrix <i>B</i> .
----------------------------------	---	---

*ldb*

Specifies the leading dimension of *b* as declared in the calling (sub)program.

	<i>transb</i> =CblasNoTrans	<i>transb</i> =CblasTrans or <i>transb</i> =CblasConjTrans
<i>Layout</i> = CblasColMajor	<i>ldb</i> must be at least $\max(1, k)$ .	<i>ldb</i> must be at least $\max(1, n)$ .
<i>Layout</i> = CblasRowMajor	<i>ldb</i> must be at least $\max(1, n)$ .	<i>ldb</i> must be at least $\max(1, k)$ .

*beta*

Specifies the scalar *beta*.

When *beta* is equal to zero, then *c* need not be set on input.

*c*

<i>Layout</i> = CblasColMajor	Array, size <i>ldc</i> by <i>n</i> . Before entry, the leading <i>m</i> -by- <i>n</i> part of the array <i>c</i> must contain the matrix <i>C</i> , except when <i>beta</i> is equal to zero, in which case <i>c</i> need not be set on entry.
<i>Layout</i> = CblasRowMajor	Array, size <i>ldc</i> by <i>m</i> . Before entry, the leading <i>n</i> -by- <i>m</i> part of the array <i>c</i> must contain the matrix <i>C</i> , except when <i>beta</i> is equal to zero, in which case <i>c</i> need not be set on entry.

*ldc*

Specifies the leading dimension of *c* as declared in the calling (sub)program.

<i>Layout</i> = CblasColMajor	<i>ldc</i> must be at least $\max(1, m)$ .
<i>Layout</i> = CblasRowMajor	<i>ldc</i> must be at least $\max(1, n)$ .

## Output Parameters

*c*

Overwritten by the *m*-by-*n* matrix  $(\alpha * \text{op}(A) * \text{op}(B) + \beta * C)$ .

## Application Notes

These routines perform a complex matrix multiplication by forming the real and imaginary parts of the input matrices. This uses three real matrix multiplications and five real matrix additions instead of the conventional four real matrix multiplications and two real matrix additions. The use of three real matrix multiplications reduces the time spent in matrix operations by 25%, resulting in significant savings in compute time for large matrices.

If the errors in the floating point calculations satisfy the following conditions:

$fl(x \text{ op } y) = (x \text{ op } y)(1 + \delta)$ ,  $|\delta| \leq u$ ,  $\text{op} = *, /$ ,  $fl(x \pm y) = x(1 + \alpha) \pm y(1 + \beta)$ ,  $|\alpha|, |\beta| \leq u$

then for an  $n$ -by- $n$  matrix  $\hat{C} = fl(C_1 + iC_2) = fl((A_1 + iA_2)(B_1 + iB_2)) = \hat{C}_1 + i\hat{C}_2$ , the following bounds are satisfied:

$$\|\hat{C}_1 - C_1\| \leq 2(n+1)u\|A\|_\infty\|B\|_\infty + O(u^2),$$

$$\|\hat{C}_2 - C_2\| \leq 4(n+4)u\|A\|_\infty\|B\|_\infty + O(u^2),$$

where  $\|A\|_\infty = \max(\|A_1\|_\infty, \|A_2\|_\infty)$ , and  $\|B\|_\infty = \max(\|B_1\|_\infty, \|B_2\|_\infty)$ .

Thus the corresponding matrix multiplications are stable.

## cblas\_?gemm\_batch

*Computes scalar-matrix-matrix products and adds the results to scalar matrix products for groups of general matrices.*

### Syntax

```
void cblas_sgemm_batch (const CBLAS_LAYOUT Layout, const CBLAS_TRANSPOSE* transa_array,

### Description

The ?gemm\_batch routines perform a series of matrix-matrix operations with general matrices. They are similar to the ?gemm routine counterparts, but the ?gemm\_batch routines perform matrix-matrix operations with groups of matrices, processing a number of groups at once. The groups contain matrices with the same parameters.

The operation is defined as

```

idx = 0
for i = 0..group_count - 1
  alpha and beta in alpha_array[i] and beta_array[i]
  for j = 0..group_size[i] - 1
    A, B, and C matrix in a_array[idx], b_array[idx], and c_array[idx]
    C := alpha*op(A)*op(B) + beta*C,
    idx = idx + 1
  end for
end for

```

where:

$\text{op}(X)$  is one of  $\text{op}(X) = X$ , or  $\text{op}(X) = X^T$ , or  $\text{op}(X) = X^H$ ,

*alpha* and *beta* are scalar elements of *alpha\_array* and *beta\_array*,

*A*, *B* and *C* are matrices such that for *m*, *n*, and *k* which are elements of *m\_array*, *n\_array*, and *k\_array*:

$\text{op}(A)$  is an *m*-by-*k* matrix,

$\text{op}(B)$  is a *k*-by-*n* matrix,

*C* is an *m*-by-*n* matrix.

*A*, *B*, and *C* represent matrices stored at addresses pointed to by *a\_array*, *b\_array*, and *c\_array*, respectively. The number of entries in *a\_array*, *b\_array*, and *c\_array* is *total\_batch\_count* = the sum of all of the *group\_size* entries.

See also [gemm](#) for a detailed description of multiplication for general matrices and [?gemm3m\\_batch](#), BLAS-like extension routines for similar matrix-matrix operations.

---

#### NOTE

Error checking is not performed for oneMKL Windows\* single dynamic libraries for the `?gemm_batch` routines.

---

## Input Parameters

<i>Layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>transa_array</i>	Array of size <i>group_count</i> . For the group <i>i</i> , <i>transa<sub>i</sub></i> = <i>transa_array</i> [ <i>i</i> ] specifies the form of $\text{op}(A)$ used in the matrix multiplication: if <i>transa<sub>i</sub></i> = CblasNoTrans, then $\text{op}(A) = A$ ; if <i>transa<sub>i</sub></i> = CblasTrans, then $\text{op}(A) = A^T$ ; if <i>transa<sub>i</sub></i> = CblasConjTrans, then $\text{op}(A) = A^H$ .
<i>transb_array</i>	Array of size <i>group_count</i> . For the group <i>i</i> , <i>transb<sub>i</sub></i> = <i>transb_array</i> [ <i>i</i> ] specifies the form of $\text{op}(B_i)$ used in the matrix multiplication: if <i>transb<sub>i</sub></i> = CblasNoTrans, then $\text{op}(B) = B$ ; if <i>transb<sub>i</sub></i> = CblasTrans, then $\text{op}(B) = B^T$ ; if <i>transb<sub>i</sub></i> = CblasConjTrans, then $\text{op}(B) = B^H$ .
<i>m_array</i>	Array of size <i>group_count</i> . For the group <i>i</i> , <i>m<sub>i</sub></i> = <i>m_array</i> [ <i>i</i> ] specifies the number of rows of the matrix $\text{op}(A)$ and of the matrix <i>C</i> .

The value of each element of  $m\_array$  must be at least zero.

$n\_array$

Array of size  $group\_count$ . For the group  $i$ ,  $n_i = n\_array[i]$  specifies the number of columns of the matrix  $op(B)$  and the number of columns of the matrix  $C$ .

The value of each element of  $n\_array$  must be at least zero.

$k\_array$

Array of size  $group\_count$ . For the group  $i$ ,  $k_i = k\_array[i]$  specifies the number of columns of the matrix  $op(A)$  and the number of rows of the matrix  $op(B)$ .

The value of each element of  $k\_array$  must be at least zero.

$alpha\_array$

Array of size  $group\_count$ . For the group  $i$ ,  $alpha\_array[i]$  specifies the scalar  $alpha_i$ .

$a\_array$

Array, size  $total\_batch\_count$ , of pointers to arrays used to store  $A$  matrices.

$lda\_array$

Array of size  $group\_count$ . For the group  $i$ ,  $lda_i = lda\_array[i]$  specifies the leading dimension of the array storing matrix  $A$  as declared in the calling (sub)program.

	$transa_i = \text{CblasNoTrans}$	$transa_i = \text{CblasTrans}$ or $transa_i = \text{CblasConjTrans}$
$Layout = \text{CblasColMajor}$	$lda_i$ must be at least $\max(1, m_i)$ .	$lda_i$ must be at least $\max(1, k_i)$
$Layout = \text{CblasRowMajor}$	$lda_i$ must be at least $\max(1, k_i)$	$lda_i$ must be at least $\max(1, m_i)$ .

$b\_array$

Array, size  $total\_batch\_count$ , of pointers to arrays used to store  $B$  matrices.

$ldb\_array$

Array of size  $group\_count$ . For the group  $i$ ,  $ldb_i = ldb\_array[i]$  specifies the leading dimension of the array storing matrix  $B$  as declared in the calling (sub)program.

	$transb_i = \text{CblasNoTrans}$	$transb_i = \text{CblasTrans}$ or $transb_i = \text{CblasConjTrans}$
$Layout = \text{CblasColMajor}$	$ldb_i$ must be at least $\max(1, k_i)$ .	$ldb_i$ must be at least $\max(1, n_i)$ .
$Layout = \text{CblasRowMajor}$	$ldb_i$ must be at least $\max(1, n_i)$ .	$ldb_i$ must be at least $\max(1, k_i)$ .

$beta\_array$

Array of size  $group\_count$ . For the group  $i$ ,  $beta\_array[i]$  specifies the scalar  $beta_i$ .

When  $beta_i$  is equal to zero, then  $C$  matrices in group  $i$  need not be set on input.

<code>c_array</code>	Array, size <code>total_batch_count</code> , of pointers to arrays used to store <code>C</code> matrices.
<code>ldc_array</code>	Array of size <code>group_count</code> . For the group <code>i</code> , <code>ldc<sub>i</sub> = ldc_array[i]</code> specifies the leading dimension of all arrays storing matrix <code>C</code> in group <code>i</code> as declared in the calling (sub)program.  When <code>Layout = CblasColMajor</code> / <code>ldc<sub>i</sub></code> must be at least $\max(1, m_i)$ . When <code>Layout = CblasRowMajor</code> / <code>ldc<sub>i</sub></code> must be at least $\max(1, n_i)$ .
<code>group_count</code>	Specifies the number of groups. Must be at least 0.
<code>group_size</code>	Array of size <code>group_count</code> . The element <code>group_size[i]</code> specifies the number of matrices in group <code>i</code> . Each element in <code>group_size</code> must be at least 0.

## Output Parameters

<code>c_array</code>	Output buffer, overwritten by <code>total_batch_count</code> matrix multiply operations of the form $\alpha * \text{op}(A) * \text{op}(B) + \beta * C$ .
----------------------	--

## `cblas_?gemm_batch_strided`

Computes groups of matrix-matrix product with general matrices.

## Description

The `cblas_?gemm_batch_strided` routines perform a series of matrix-matrix operations with general matrices. They are similar to the `cblas_?gemm` routine counterparts, but the `cblas_?gemm_batch_strided` routines perform matrix-matrix operations with groups of matrices. The groups contain matrices with the same parameters.

All matrix  $a$  (respectively,  $b$  or  $c$ ) have the same parameters (size, leading dimension, transpose operation, alpha, beta scaling) and are stored at constant  $stride_a$  (respectively,  $stride_b$  or  $stride_c$ ) from each other. The operation is defined as

```
For i = 0 ... batch_size - 1
  Ai, Bi and Ci are matrices at offset i * stridea, i * strideb and i * stridec in a, b and c
  Ci = alpha * Ai * Bi + beta * Ci
end for
```

## Input Parameters

<i>layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>transa</i>	Specifies $op(A)$ the transposition operation applied to the matrices $A$ . if <i>transa</i> = CblasNoTrans, then $op(A) = A$ ; if <i>transa</i> = CblasTrans, then $op(A) = A^T$ ; if <i>transa</i> = CblasConjTrans, then $op(A) = A^H$ .
<i>transb</i>	Specifies $op(B)$ the transposition operation applied to the matrices $B$ . if <i>transb</i> = CblasNoTrans, then $op(B) = B$ ; if <i>transb</i> = CblasTrans, then $op(B) = B^T$ ; if <i>transb</i> = CblasConjTrans, then $op(B) = B^H$ .
<i>m</i>	Number of rows of the $op(A)$ and $C$ matrices. Must be at least 0.
<i>n</i>	Number of columns of the $op(B)$ and $C$ matrices. Must be at least 0.
<i>k</i>	Number of columns of the $op(A)$ matrix and number of rows of the $op(B)$ matrix. Must be at least 0.
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>a</i>	Array of size at least $stride_a * batch\_size$ holding the $a$ matrices.

	<i>transa</i> =CblasNoTrans	<i>transa</i> =CblasTrans or CblasConjTrans
<i>layout</i> = CblasColMajor	Before entry, the leading $m$ -by- $k$ part of the array $a + i * stride_a$ must contain the matrix $A_i$ .	Before entry, the leading $k$ -by- $m$ part of the array $a + i * stride_a$ must contain the matrix $A_i$ .
<i>layout</i> = CblasRowMajor	Before entry, the leading $k$ -by- $m$ part of the array $a + i * stride_a$ must contain the matrix $A_i$ .	Before entry, the leading $m$ -by- $k$ part of the array $a + i * stride_a$ must contain the matrix $A_i$ .

*lda*Specifies the leading dimension of the *a* matrices.

	<i>transa</i> =CblasNoTrans	<i>transa</i> =CblasTrans or CblasConjTrans
<i>layout</i> = CblasColMajor	<i>lda</i> must be at least $\max(1,m)$	<i>lda</i> must be at least $\max(1,k)$ .
<i>layout</i> = CblasRowMajor	<i>lda</i> must be at least $\max(1,k)$ .	<i>lda</i> must be at least $\max(1,m)$

*stridea*Stride between two consecutive *a* matrices.

	<i>transa</i> =CblasNoTrans	<i>transa</i> =CblasTrans or CblasConjTrans
<i>layout</i> = CblasColMajor	Must be at least $lda*k$	Must be at least $lda*m$
<i>layout</i> = CblasRowMajor	Must be at least $lda*m$	Must be at least $lda*k$

*b*Array of size at least *strideb*\**batch\_size* holding the *b* matrices.

	<i>transb</i> =CblasNoTrans	<i>transb</i> =CblasTrans or CblasConjTrans
<i>layout</i> = CblasColMajor	Before entry, the leading <i>k</i> -by- <i>n</i> part of the array <i>b</i> + <i>i</i> * <i>strideb</i> must contain the matrix <i>B<sub>i</sub></i> .	Before entry, the leading <i>n</i> -by- <i>k</i> part of the array <i>b</i> + <i>i</i> * <i>strideb</i> must contain the matrix <i>B<sub>i</sub></i> .
<i>layout</i> = CblasRowMajor	Before entry, the leading <i>n</i> -by- <i>k</i> part of the array <i>b</i> + <i>i</i> * <i>strideb</i> must contain the matrix <i>B<sub>i</sub></i> .	Before entry, the leading <i>k</i> -by- <i>n</i> part of the array <i>b</i> + <i>i</i> * <i>strideb</i> must contain the matrix <i>B<sub>i</sub></i> .

*ldb*Specifies the leading dimension of the *b* matrices.

	<i>transab</i> =CblasNoTrans	<i>transb</i> =CblasTrans or CblasConjTrans
<i>layout</i> = CblasColMajor	<i>ldb</i> must be at least $\max(1,k)$	<i>ldb</i> must be at least $\max(1,n)$ .
<i>layout</i> = CblasRowMajor	<i>ldb</i> must be at least $\max(1,n)$ .	<i>ldb</i> must be at least $\max(1,k)$

*strideb*Stride between two consecutive *b* matrices.

	<i>transa</i> =CblasNoTrans	<i>transa</i> =CblasTrans or CblasConjTrans
--	-----------------------------	---

<code>layout = CblasColMajor</code>	Must be at least $ldb*n$	Must be at least $ldb*k$
<code>layout = CblasRowMajor</code>	Must be at least $ldb*k$	Must be at least $ldb*n$

<code>beta</code>	Specifies the scalar <i>beta</i> .
<code>c</code>	<p>Array of size at least <math>stridec*batch\_size</math> holding the <i>c</i> matrices.</p> <p>If <code>layout=CblasColMajor</code>, before entry, the leading <i>m</i>-by-<i>n</i> part of the array <math>c + i * stridec</math> must contain the matrix <math>C_i</math>.</p> <p>If <code>layout=CblasRowMajor</code>, before entry, the leading <i>n</i>-by-<i>m</i> part of the array <math>c + i * stridec</math> must contain the matrix <math>C_i</math>.</p>
<code>ldc</code>	<p>Specifies the leading dimension of the <i>c</i> matrices.</p> <p>Must be at least <math>\max(1,m)</math> if <code>layout=CblasColMajor</code> or <math>\max(1,n)</math> if <code>layout=CblasRowMajor</code>.</p>
<code>stridec</code>	<p>Specifies the stride between two consecutive <i>c</i> matrices.</p> <p>Must be at least <math>ldc*n</math> if <code>layout=CblasColMajor</code> or <math>ldc*m</math> if <code>layout=CblasRowMajor</code>.</p>
<code>batch_size</code>	Number of <code>gemm</code> computations to perform and <i>a</i> , <i>b</i> and <i>c</i> matrices. Must be at least 0.

## Output Parameters

<code>c</code>	Array holding the <code>batch_size</code> updated <i>c</i> matrices.
----------------	--

## `cblas_?gemm3m_batch_strided`

Computes groups of matrix-matrix product with general matrices.

### Syntax

## Description

The `cblas_?gemm3m_batch_strided` routines perform a series of matrix-matrix operations with general matrices. They are similar to the `cblas_?gemm` routine counterparts, but the `cblas_?gemm3m_batch_strided` routines perform matrix-matrix operations with groups of matrices. The groups contain matrices with the same parameters.

All matrix  $a$  (respectively,  $b$  or  $c$ ) have the same parameters (size, leading dimension, transpose operation, alpha, beta scaling) and are stored at constant  $stride_a$  (respectively,  $stride_b$  or  $stride_c$ ) from each other. The operation is defined as

```
For i = 0 ... batch_size - 1
  Ai, Bi and Ci are matrices at offset i * stridea, i * strideb and i * stridec in a, b and c
  Ci = alpha * Ai * Bi + beta * Ci
end for
```

The `cblas_?gemm3m_batch_strided` routines use fewer matrix multiplications than the `cblas_?gemm` routines, as described in the *Application Notes* below.

## Input Parameters

<code>layout</code>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<code>transa</code>	Specifies $op(A)$ the transposition operation applied to the matrices $A$ . if <code>transa</code> = CblasNoTrans, then $op(A) = A$ ; if <code>transa</code> = CblasTrans, then $op(A) = A^T$ ; if <code>transa</code> = CblasConjTrans, then $op(A) = A^H$ .
<code>transb</code>	Specifies $op(B)$ the transposition operation applied to the matrices $B$ . if <code>transb</code> = CblasNoTrans, then $op(B) = B$ ; if <code>transb</code> = CblasTrans, then $op(B) = B^T$ ; if <code>transb</code> = CblasConjTrans, then $op(B) = B^H$ .
<code>m</code>	Number of rows of the $op(A)$ and $C$ matrices. Must be at least 0.
<code>n</code>	Number of columns of the $op(B)$ and $C$ matrices. Must be at least 0.
<code>k</code>	Number of columns of the $op(A)$ matrix and number of rows of the $op(B)$ matrix. Must be at least 0.
<code>alpha</code>	Specifies the scalar $alpha$ .
<code>a</code>	Array of size at least $stride_a * batch\_size$ holding the $a$ matrices.

	<code>transa=CblasNoTrans</code>	<code>transa=CblasTrans</code> or <code>CblasConjTrans</code>
<code>layout =</code> <code>CblasColMajor</code>	Before entry, the leading $m$ -by- $k$ part of the array $a + i * stride_a$ must contain the matrix $A_i$ .	Before entry, the leading $k$ -by- $m$ part of the array $a + i * stride_a$ must contain the matrix $A_i$ .

<code>layout = CblasRowMajor</code>	Before entry, the leading $k$ -by- $m$ part of the array $a + i * stride_a$ must contain the matrix $A_i$ .	Before entry, the leading $m$ -by- $k$ part of the array $a + i * stride_a$ must contain the matrix $A_i$ .
-------------------------------------	---	---

*lda*Specifies the leading dimension of the  $a$  matrices.

	<code>transa=CblasNoTrans</code>	<code>transa=CblasTrans</code> or <code>CblasConjTrans</code>
<code>layout = CblasColMajor</code>	<i>lda</i> must be at least $\max(1,m)$ .	<i>lda</i> must be at least $\max(1,k)$ .
<code>layout = CblasRowMajor</code>	<i>lda</i> must be at least $\max(1,k)$ .	<i>lda</i> must be at least $\max(1,m)$ .

*stridea*Stride between two consecutive  $a$  matrices.

	<code>transa=CblasNoTrans</code>	<code>transa=CblasTrans</code> or <code>CblasConjTrans</code>
<code>layout = CblasColMajor</code>	Must be at least $lda*k$ .	Must be at least $lda*m$ .
<code>layout = CblasRowMajor</code>	Must be at least $lda*m$ .	Must be at least $lda*k$ .

*b*Array of size at least  $stride_b*batch\_size$  holding the  $b$  matrices.

	<code>transb=CblasNoTrans</code>	<code>transb=CblasTrans</code> or <code>CblasConjTrans</code>
<code>layout = CblasColMajor</code>	Before entry, the leading $k$ -by- $n$ part of the array $b + i * stride_b$ must contain the matrix $B_i$ .	Before entry, the leading $n$ -by- $k$ part of the array $b + i * stride_b$ must contain the matrix $B_i$ .
<code>layout = CblasRowMajor</code>	Before entry, the leading $n$ -by- $k$ part of the array $b + i * stride_b$ must contain the matrix $B_i$ .	Before entry, the leading $k$ -by- $n$ part of the array $b + i * stride_b$ must contain the matrix $B_i$ .

*ldb*Specifies the leading dimension of the  $b$  matrices.

	<code>transab=CblasNoTrans</code>	<code>transb=CblasTrans</code> or <code>CblasConjTrans</code>
<code>layout = CblasColMajor</code>	<i>ldb</i> must be at least $\max(1,k)$ .	<i>ldb</i> must be at least $\max(1,n)$ .

<i>layout</i> = CblasRowMajor	<i>ldb</i> must be at least $\max(1,n)$ .	<i>ldb</i> must be at least $\max(1,k)$ .
----------------------------------	--	--

*strideb*Stride between two consecutive *b* matrices.

	<i>transa</i> =CblasNoTrans	<i>transa</i> =CblasTrans or CblasConjTrans
<i>layout</i> = CblasColMajor	Must be at least <i>ldb</i> * <i>n</i> .	Must be at least <i>ldb</i> * <i>k</i> .
<i>layout</i> = CblasRowMajor	Must be at least <i>ldb</i> * <i>k</i> .	Must be at least <i>ldb</i> * <i>n</i> .

*beta*Specifies the scalar *beta*.*c*Array of size at least *stridec*\**batch\_size* holding the *c* matrices.If *layout*=CblasColMajor, before entry, the leading *m*-by-*n* part of the array *c* + *i* \* *stridec* must contain the matrix *C<sub>i</sub>*.If *layout*=CblasRowMajor, before entry, the leading *n*-by-*m* part of the array *c* + *i* \* *stridec* must contain the matrix *C<sub>i</sub>*.*ldc*Specifies the leading dimension of the *c* matrices.Must be at least  $\max(1,m)$  if *layout*=CblasColMajor or  $\max(1,n)$  if *layout*=CblasRowMajor.*stridec*Specifies the stride between two consecutive *c* matrices.Must be at least *ldc*\**n* if *layout*=CblasColMajor or *ldc*\**m* if *layout*=CblasRowMajor.*batch\_size*Number of `gemm` computations to perform and *a*, *b* and *c* matrices. Must be at least 0.

## Output Parameters

*c*Array holding the *batch\_size* updated *c* matrices.

## Application Notes

These routines perform a complex matrix multiplication by forming the real and imaginary parts of the input matrices. This uses three real matrix multiplications and five real matrix additions instead of the conventional four real matrix multiplications and two real matrix additions. The use of three real matrix multiplications reduces the time spent in matrix operations by 25%, resulting in significant savings in compute time for large matrices.

If the errors in the floating point calculations satisfy the following conditions:

$$fl(x \text{ op } y) = (x \text{ op } y) (1 + \delta), |\delta| \leq u, \text{ op} = *, /, fl(x \pm y) = x(1 + \alpha) \pm y(1 + \beta), |\alpha|, |\beta| \leq u$$

then for an *n*-by-*n* matrix  $\hat{C} = fl(C1 + iC2) = fl((A1 + iA2)(B1 + iB2)) = \hat{C}1 + i\hat{C}2$ , the following bounds are satisfied:

$$\begin{aligned} \|\hat{C}1 - C1\| &\leq 2(n+1)u \|A\|_{\infty} \|B\|_{\infty} + O(u^2), \\ \|\hat{C}2 - C2\| &\leq 4(n+4)u \|A\|_{\infty} \|B\|_{\infty} + O(u^2), \end{aligned}$$

where  $\|A\|_{\infty} = \max(\|A1\|_{\infty}, \|A2\|_{\infty})$ , and  $\|B\|_{\infty} = \max(\|B1\|_{\infty}, \|B2\|_{\infty})$ .

Thus the corresponding matrix multiplications are stable.

## cblas\_?gemm3m\_batch

*Computes scalar-matrix-matrix products and adds the results to scalar matrix products for groups of general matrices.*

### Syntax

```
void cblas_cgemm3m_batch (const CBLAS_LAYOUT Layout, const CBLAS_TRANSPOSE*
    transa_array, const CBLAS_TRANSPOSE* transb_array, const MKL_INT* m_array, const
    MKL_INT* n_array, const MKL_INT* k_array, const void *alpha_array, const void
    **a_array, const MKL_INT* lda_array, const void **b_array, const MKL_INT* ldb_array,
    const void *beta_array, void **c_array, const MKL_INT* ldc_array, const MKL_INT
    group_count, const MKL_INT* group_size);
```

```
void cblas_zgemm3m_batch (const CBLAS_LAYOUT Layout, const CBLAS_TRANSPOSE*

```

### Include Files

- mkl.h

### Description

The ?gemm3m\_batch routines perform a series of matrix-matrix operations with general matrices. They are similar to the ?gemm3m routine counterparts, but the ?gemm3m\_batch routines perform matrix-matrix operations with groups of matrices, processing a number of groups at once. The groups contain matrices with the same parameters. The ?gemm3m\_batch routines use fewer matrix multiplications than the ?gemm\_batch routines, as described in the *Application Notes*.

The operation is defined as

```
idx = 0
for i = 0..group_count - 1
    alpha and beta in alpha_array[i] and beta_array[i]
    for j = 0..group_size[i] - 1
        A, B, and C matrix in a_array[idx], b_array[idx], and c_array[idx]
        C := alpha*op(A)*op(B) + beta*C,
        idx = idx + 1
    end for
end for
```

where:

op(X) is one of  $op(X) = X$ , or  $op(X) = X^T$ , or  $op(X) = X^H$ ,

alpha and beta are scalar elements of alpha\_array and beta\_array,

A, B and C are matrices such that for m, n, and k which are elements of m\_array, n\_array, and k\_array:

op(A) is an m-by-k matrix,

op(B) is a k-by-n matrix,

$C$  is an  $m$ -by- $n$  matrix.

$A$ ,  $B$ , and  $C$  represent matrices stored at addresses pointed to by  $a\_array$ ,  $b\_array$ , and  $c\_array$ , respectively. The number of entries in  $a\_array$ ,  $b\_array$ , and  $c\_array$  is  $total\_batch\_count$  = the sum of all the  $group\_size$  entries.

See also [gemm](#) for a detailed description of multiplication for general matrices and [gemm\\_batch](#), BLAS-like extension routines for similar matrix-matrix operations.

---

#### NOTE

Error checking is not performed for Intel® oneAPI Math Kernel Library (oneMKL) Windows\* single dynamic libraries for the `?gemm3m_batch` routines.

---

### Input Parameters

<i>Layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>transa_array</i>	Array of size <i>group_count</i> . For the group $i$ , $transa_i = transa\_array[i]$ specifies the form of $op(A)$ used in the matrix multiplication: if $transa_i = CblasNoTrans$ , then $op(A) = A$ ; if $transa_i = CblasTrans$ , then $op(A) = A^T$ ; if $transa_i = CblasConjTrans$ , then $op(A) = A^H$ .
<i>transb_array</i>	Array of size <i>group_count</i> . For the group $i$ , $transb_i = transb\_array[i]$ specifies the form of $op(B_i)$ used in the matrix multiplication: if $transb_i = CblasNoTrans$ , then $op(B) = B$ ; if $transb_i = CblasTrans$ , then $op(B) = B^T$ ; if $transb_i = CblasConjTrans$ , then $op(B) = B^H$ .
<i>m_array</i>	Array of size <i>group_count</i> . For the group $i$ , $m_i = m\_array[i]$ specifies the number of rows of the matrix $op(A)$ and of the matrix $C$ .  The value of each element of <i>m_array</i> must be at least zero.
<i>n_array</i>	Array of size <i>group_count</i> . For the group $i$ , $n_i = n\_array[i]$ specifies the number of columns of the matrix $op(B)$ and the number of columns of the matrix $C$ .  The value of each element of <i>n_array</i> must be at least zero.
<i>k_array</i>	Array of size <i>group_count</i> . For the group $i$ , $k_i = k\_array[i]$ specifies the number of columns of the matrix $op(A)$ and the number of rows of the matrix $op(B)$ .  The value of each element of <i>k_array</i> must be at least zero.
<i>alpha_array</i>	Array of size <i>group_count</i> . For the group $i$ , $alpha\_array[i]$ specifies the scalar $alpha_i$ .
<i>a_array</i>	Array, size <i>total_batch_count</i> , of pointers to arrays used to store $A$ matrices.

*lda\_array*

Array of size *group\_count*. For the group *i*,  $lda_i = lda\_array[i]$  specifies the leading dimension of the array storing matrix *A* as declared in the calling (sub)program.

	<i>transa<sub>i</sub></i> =CblasNoTrans	<i>transa<sub>i</sub></i> =CblasTrans or <i>transa<sub>i</sub></i> =CblasConjTrans
<i>Layout</i> = CblasColMajor	<i>lda<sub>i</sub></i> must be at least $\max(1, m_i)$ .	<i>lda<sub>i</sub></i> must be at least $\max(1, k_i)$
<i>Layout</i> = CblasRowMajor	<i>lda<sub>i</sub></i> must be at least $\max(1, k_i)$	<i>lda<sub>i</sub></i> must be at least $\max(1, m_i)$ .

*b\_array*

Array, size *total\_batch\_count*, of pointers to arrays used to store *B* matrices.

*ldb\_array*

Array of size *group\_count*. For the group *i*,  $ldb_i = ldb\_array[i]$  specifies the leading dimension of the array storing matrix *B* as declared in the calling (sub)program.

	<i>transb<sub>i</sub></i> =CblasNoTrans	<i>transb<sub>i</sub></i> =CblasTrans or <i>transb<sub>i</sub></i> =CblasConjTrans
<i>Layout</i> = CblasColMajor	<i>ldb<sub>i</sub></i> must be at least $\max(1, k_i)$ .	<i>ldb<sub>i</sub></i> must be at least $\max(1, n_i)$ .
<i>Layout</i> = CblasRowMajor	<i>ldb<sub>i</sub></i> must be at least $\max(1, n_i)$ .	<i>ldb<sub>i</sub></i> must be at least $\max(1, k_i)$ .

*beta\_array*

For the group *i*, *beta\_array*[*i*] specifies the scalar *beta<sub>i</sub>*.

When *beta<sub>i</sub>* is equal to zero, then *C* matrices in group *i* need not be set on input.

*c\_array*

Array, size *total\_batch\_count*, of pointers to arrays used to store *C* matrices.

*ldc\_array*

Array of size *group\_count*. For the group *i*,  $ldc_i = ldc\_array[i]$  specifies the leading dimension of all arrays storing matrix *C* in group *i* as declared in the calling (sub)program.

When *Layout* = CblasColMajor/*ldc<sub>i</sub>* must be at least  $\max(1, m_i)$ .

When *Layout* = CblasRowMajor/*ldc<sub>i</sub>* must be at least  $\max(1, n_i)$ .

*group\_count*

Specifies the number of groups. Must be at least 0.

*group\_size*

Array of size *group\_count*. The element *group\_size*[*i*] specifies the number of matrices in group *i*. Each element in *group\_size* must be at least 0.

## Output Parameters

*c\_array*

Overwritten by the  $m_i$ -by- $n_i$  matrix  $(\alpha_i * op(A) * op(B) + \beta_i * C)$  for group *i*.

## Application Notes

These routines perform a complex matrix multiplication by forming the real and imaginary parts of the input matrices. This uses three real matrix multiplications and five real matrix additions instead of the conventional four real matrix multiplications and two real matrix additions. The use of three real matrix multiplications reduces the time spent in matrix operations by 25%, resulting in significant savings in compute time for large matrices.

If the errors in the floating point calculations satisfy the following conditions:

$$fl(x \text{ op } y) = (x \text{ op } y)(1 + \delta), |\delta| \leq u, \text{ op} = *, /, fl(x \pm y) = (x \pm y)(1 + \alpha) \pm y(1 + \beta), |\alpha|, |\beta| \leq u$$

then for an  $n$ -by- $n$  matrix  $\hat{C} = fl(C_1 + iC_2) = fl((A_1 + iA_2)(B_1 + iB_2)) = \hat{C}_1 + i\hat{C}_2$ , the following bounds are satisfied:

$$\|\hat{C}_1 - C_1\| \leq 2(n+1)u\|A\|_\infty\|B\|_\infty + O(u^2),$$

$$\|\hat{C}_2 - C_2\| \leq 4(n+4)u\|A\|_\infty\|B\|_\infty + O(u^2),$$

where  $\|A\|_\infty = \max(\|A_1\|_\infty, \|A_2\|_\infty)$ , and  $\|B\|_\infty = \max(\|B_1\|_\infty, \|B_2\|_\infty)$ .

Thus the corresponding matrix multiplications are stable.

## cblas\_?trsm\_batch

Solves a triangular matrix equation for a group of matrices.

### Syntax

```
void cblas_strsm_batch (const CBLAS_LAYOUT Layout, const CBLAS_SIDE *Side_Array, const

### Description

The `?trsm_batch` routines solve a series of matrix equations. They are similar to the `?trsm` routines except that they operate on groups of matrices which have the same parameters. The `?trsm_batch` routines process a number of groups at once.

```

idx = 0
for i = 0..group_count - 1
  alpha in alpha_array[i]
  for j = 0..group_size[i] - 1
    A and B matrix in a_array[idx] and b_array[idx]
    Solve op(A)*X = alpha*B
    or
    Solve X*op(A) = alpha*B
    idx = idx + 1
  end for
end for

```

where:

$\alpha$  is a scalar element of `alpha_array`,

$X$  and  $B$  are  $m$ -by- $n$  matrices for  $m$  and  $n$  which are elements of `m_array` and `n_array`, respectively,

$A$  is a unit, or non-unit, upper or lower triangular matrix,

and  $\text{op}(A)$  is one of  $\text{op}(A) = A$ , or  $\text{op}(A) = A^T$ , or  $\text{op}(A) = \text{conjg}(A^T)$ .

$A$  and  $B$  represent matrices stored at addresses pointed to by `a_array` and `b_array`, respectively. There are `total_batch_count` entries in each of `a_array` and `b_array`, where `total_batch_count` is the sum of all the `group_size` entries.

## Input Parameters

<code>Layout</code>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<code>side_array</code>	<p>Array of size <code>group_count</code>. For group <math>i</math>, <math>0 \leq i &lt; \text{group\_count} - 1</math>, <code>side<sub>i</sub> = side_array[i]</code> specifies whether <math>\text{op}(A)</math> appears on the left or right of <math>X</math> in the equation:</p> <p>if <code>side<sub>i</sub> = CblasLeft</code>, then <math>\text{op}(A) * X = \alpha * B</math>;</p> <p>if <code>side<sub>i</sub> = CblasRight</code>, then <math>X * \text{op}(A) = \alpha * B</math>.</p>
<code>uplo_array</code>	<p>Array of size <code>group_count</code>. For group <math>i</math>, <math>0 \leq i &lt; \text{group\_count} - 1</math>, <code>uplo<sub>i</sub> = uplo_array[i]</code> specifies whether the matrix <math>A</math> is upper or lower triangular:</p> <p><code>uplo<sub>i</sub> = CblasUpper</code></p> <p>if <code>uplo<sub>i</sub> = CblasLower</code>, then the matrix is low triangular.</p>
<code>transa_array</code>	<p>Array of size <code>group_count</code>. For group <math>i</math>, <math>0 \leq i &lt; \text{group\_count} - 1</math>, <code>transa<sub>i</sub> = transa_array[i]</code> specifies the form of <math>\text{op}(A)</math> used in the matrix multiplication:</p> <p>if <code>transa<sub>i</sub> = CblasNoTrans</code>, then <math>\text{op}(A) = A</math>;</p> <p>if <code>transa<sub>i</sub> = CblasTrans</code>;</p> <p>if <code>transa<sub>i</sub> = CblasConjTrans</code>, then <math>\text{op}(A) = \text{conjg}(A')</math>.</p>
<code>diag_array</code>	<p>Array of size <code>group_count</code>. For group <math>i</math>, <math>0 \leq i &lt; \text{group\_count} - 1</math>, <code>diag<sub>i</sub> = diag_array[i]</code> specifies whether the matrix <math>A</math> is unit triangular:</p> <p>if <code>diag<sub>i</sub> = CblasUnit</code> then the matrix is unit triangular;</p>

	if $diag_i = \text{CblasNonUnit}$ , then the matrix is not unit triangular.
<code>m_array</code>	Array of size <code>group_count</code> . For group $i$ , $0 \leq i < \text{group\_count} - 1$ , $m_i = m\_array[i]$ specifies the number of rows of $B$ . The value of $m_i$ must be at least zero.
<code>n_array</code>	Array of size <code>group_count</code> . For group $i$ , $0 \leq i < \text{group\_count} - 1$ , $n_i = n\_array[i]$ specifies the number of columns of $B$ . The value of $n_i$ must be at least zero.
<code>alpha_array</code>	Array of size <code>group_count</code> . For group $i$ , $0 \leq i < \text{group\_count} - 1$ , $alpha\_array[i]$ specifies the scalar $alpha_i$ .
<code>a_array</code>	<p>Array, size <code>total_batch_count</code>, of pointers to arrays used to store <math>A</math> matrices.</p> <p>For group <math>i</math>, <math>0 \leq i &lt; \text{group\_count} - 1</math>, <math>k</math> is <math>m_i</math> when <math>side_i = \text{CblasLeft}</math> and is <math>n_i</math> when <math>side_i = \text{CblasRight}</math> and <math>a</math> is any of the <code>group_size[i]</code> arrays starting with <code>a_array[group_size[0] + group_size[1] + ... + group_size(i - 1)]</code>:</p> <p>Before entry with <math>uplo_i = \text{CblasUpper}</math>, the leading <math>k</math> by <math>k</math> upper triangular part of the array <math>a</math> must contain the upper triangular matrix and the strictly lower triangular part of <math>a</math> is not referenced.</p> <p>Before entry with <math>uplo_i = \text{CblasLower}</math> lower triangular part of the array <math>a</math> must contain the lower triangular matrix and the strictly upper triangular part of <math>a</math> is not referenced.</p> <p>When <math>diag_i = \text{CblasUnit}</math>, the diagonal elements of <math>a</math> are not referenced either, but are assumed to be unity.</p>
<code>lda_array</code>	Array of size <code>group_count</code> . For group $i$ , $0 \leq i < \text{group\_count} - 1$ , $lda_i = lda\_array[i]$ specifies the leading dimension of $a$ as declared in the calling (sub)program. When $side_i = \text{CblasLeft}$ , then $lda_i$ must be at least $\max(1, m_i)$ , when $side_i = \text{CblasRight}$ , then $lda_i$ must be at least $\max(1, n_i)$ .
<code>b_array</code>	<p>Array, size <code>total_batch_count</code>, of pointers to arrays used to store <math>B</math> matrices.</p> <p>For group <math>i</math>, <math>0 \leq i &lt; \text{group\_count} - 1</math>, <math>b</math> is any of the <code>group_size[i]</code> arrays starting with <code>b_array[group_size[0] + group_size[1] + ... + group_size(i - 1)]</code>:</p> <p>For <math>Layout = \text{CblasColMajor}</math>: before entry, the leading <math>m_i</math>-by-<math>n_i</math> part of the array <math>b</math> must contain the matrix <math>B</math>.</p> <p>For <math>Layout = \text{CblasRowMajor}</math>: before entry, the leading <math>n_i</math>-by-<math>m_i</math> part of the array <math>b</math> must contain the matrix <math>B</math>.</p>
<code>ldb_array</code>	<p>Array of size <code>group_count</code>. Specifies the leading dimension of <math>b</math> as declared in the calling (sub)program. When <math>Layout = \text{CblasColMajor}</math>, <math>ldb</math> must be at least <math>\max(1, m)</math>; otherwise, <math>ldb</math> must be at least <math>\max(1, n)</math>.</p> <p>Array of size <code>group_count</code>. For group <math>i</math>, <math>0 \leq i &lt; \text{group\_count} - 1</math>, <math>ldb_i = ldb\_array[i]</math> specifies the leading dimension of <math>b</math> as declared in the calling (sub)program. When <math>Layout = \text{CblasColMajor}</math>, <math>ldb_i</math> must be at least <math>\max(1, m_i)</math>; otherwise, <math>ldb_i</math> must be at least <math>\max(1, n_i)</math>.</p>

<code>group_count</code>	Specifies the number of groups. Must be at least 0.
<code>group_size</code>	Array of size <code>group_count</code> . The element <code>group_size[i]</code> specifies the number of matrices in group <i>i</i> . Each element in <code>group_size</code> must be at least 0.

## Output Parameters

<code>b_array</code>	Overwritten by the solution matrix <i>X</i> .
----------------------	---

## `cblas_?trsm_batch_strided`

Solves groups of triangular matrix equations.

### Syntax

```
void cblas_strsm_batch_strided(const CBLAS_LAYOUT layout, const CBLAS_SIDE side, const
CBLAS_UPLO uplo, const CBLAS_TRANSPOSE transa, const CBLAS_DIAG diag, const MKL_INT m,

### Description

The `cblas_?trsm_batch_strided` routines solve a series of triangular matrix equations. They are similar to the `cblas_?trsm` routine counterparts, but the `cblas_?trsm_batch_strided` routines solve triangular matrix equations with groups of matrices. All matrix *a* have the same parameters (*size*, *leading dimension*, *side*, *uplo*, *diag*, *transpose operation*) and are stored at constant *stridea* from each other. Similarly, all matrix *b* have the same parameters (*size*, *leading dimension*, *alpha scaling*) and are stored at constant *strideb* from each other.

The operation is defined as

### Input Parameters

<code>Layout</code>	Specifies whether two-dimensional array storage is row-major ( <code>CblasRowMajor</code> ) or column-major ( <code>CblasColMajor</code> ).
---------------------	---

<code>side</code>	Specifies whether $op(A)$ appears on the left or right of <i>X</i> in the equation.
-------------------	---

	<p>if <i>side</i> = CblasLeft, then <math>\text{op}(A) * X = \alpha * B</math>;</p> <p>if <i>side</i> = CblasRight, then <math>X * \text{op}(A) = \alpha * B</math>.</p>
<i>uplo</i>	<p>Specifies whether the matrices <i>A</i> are upper or lower triangular.</p> <p>if <i>uplo</i> = CblasUpper, then <i>A</i> are upper triangular;</p> <p>if <i>uplo</i> = CblasLower, then <i>A</i> are lower triangular.</p>
<i>transa</i>	<p>Specifies <math>\text{op}(A)</math> the transposition operation applied to the matrices <i>A</i>.</p> <p>if <i>transa</i> = CblasNoTrans, then <math>\text{op}(A) = A</math>;</p> <p>if <i>transa</i> = CblasTrans, then <math>\text{op}(A) = A^T</math>;</p> <p>if <i>transa</i> = CblasConjTrans, then <math>\text{op}(A) = A^H</math>;</p>
<i>diag</i>	<p>Specifies whether the matrices <i>A</i> are unit triangular.</p> <p>if <i>diag</i> = CblasUnit, then <i>A</i> are unit triangular;</p> <p>if <i>diag</i> = CblasLower, then <i>A</i> are non-unit triangular.</p>
<i>m</i>	Number of rows of <i>B</i> matrices. Must be at least 0
<i>n</i>	Number of columns of <i>B</i> matrices. Must be at least 0
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>a</i>	<p>Array of size at least <i>stridea</i>*<i>batch_size</i> holding the <i>A</i> matrices. Each <i>A</i> matrix is stored at constant <i>stridea</i> from each other.</p> <p>Each <i>A</i> matrix has size <i>lda</i>* <i>k</i>, where <i>k</i> is <i>m</i> when <i>side</i> = CblasLeft and is <i>n</i> when <i>side</i> = CblasRight.</p> <p>Before entry with <i>uplo</i> = CblasUpper, the leading <i>k</i>-by-<i>k</i> upper triangular part of the array <i>A</i> must contain the upper triangular matrix and the strictly lower triangular part of <i>A</i> is not referenced.</p> <p>Before entry with <i>uplo</i> = CblasLower lower triangular part of the array <i>A</i> must contain the lower triangular matrix and the strictly upper triangular part of <i>A</i> is not referenced.</p> <p>When <i>diag</i> = CblasUnit, the diagonal elements of <i>A</i> are not referenced either, but are assumed to be unity.</p>
<i>lda</i>	<p>Specifies the leading dimension of the <i>A</i> matrices. When <i>side</i> = CblasLeft, then <i>lda</i> must be at least <math>\max(1, m)</math>, when <i>side</i> = <i>side</i> = CblasRight, then <i>lda</i> must be at least <math>\max(1, n)</math>.</p>
<i>stridea</i>	<p>Stride between two consecutive <i>A</i> matrices.</p> <p>When <i>side</i> = CblasLeft, then <i>stridea</i> must be at least <i>lda</i>*<i>m</i>.</p> <p>When <i>side</i> = <i>side</i> = CblasRight, then <i>stridea</i> must be at least <i>lda</i>*<i>n</i>.</p>
<i>b</i>	<p>Array of size at least <i>strideb</i>*<i>batch_size</i> holding the <i>B</i> matrices. Each <i>B</i> matrix is stored at constant <i>strideb</i> from each other.</p> <p>When <i>layout</i>= CblasColMajor, each <i>B</i> matrix has size <i>ldb</i>* <i>n</i>. Before entry, the leading <i>m</i>-by-<i>n</i> part of the array <i>B</i> must contain the matrix <i>B</i>.</p>

When *layout*= CblasRowMajor, each *B* matrix has size  $ldb * m$ . Before entry, the leading *n*-by-*m* part of the array *B* must contain the matrix *B*.

*ldb*

Specifies the leading dimension of the *B* matrices.

When *layout*= CblasColMajor, *strideb* must be at least  $\max(1, m)$ .

Otherwise, *strideb* must be at least  $\max(1, n)$ .

*strideb*

Stride between two consecutive *B* matrices.

When *layout*= CblasColMajor, *strideb* must be at least  $ldb * n$ . Otherwise, *strideb* must be at least  $ldb * m$ .

*batch\_size*

Number of `trsm` computations to perform. Must be at least 0.

## Output Parameters

*b*

Overwritten by the solution *batch\_size* *X* matrices.

## mkl\_?imatcopy

Performs scaling and in-place transposition/copying of matrices.

### Syntax

```
void mkl_simatcopy (const char ordering, const char trans, size_t rows, size_t cols,
const float alpha, float * AB, size_t lda, size_t ldb);
```

```
void mkl_dimatcopy (const char ordering, const char trans, size_t rows, size_t cols,
const double alpha, double * AB, size_t lda, size_t ldb);
```

```
void mkl_cimatcopy (const char ordering, const char trans, size_t rows, size_t cols,
const MKL_Complex8 alpha, MKL_Complex8 * AB, size_t lda, size_t ldb);
```

```
void mkl_zimatcopy (const char ordering, const char trans, size_t rows, size_t cols,
const MKL_Complex16 alpha, MKL_Complex16 * AB, size_t lda, size_t ldb);
```

### Include Files

- `mkl.h`

### Description

The `mkl_?imatcopy` routine performs scaling and in-place transposition/copying of matrices. A transposition operation can be a normal matrix copy, a transposition, a conjugate transposition, or just a conjugation. The operation is defined as follows:

$$AB := \alpha * \text{op}(AB).$$

---

#### NOTE

Different arrays must not overlap.

---

### Input Parameters

*ordering*

Ordering of the matrix storage.

	If <i>ordering</i> = 'R' or 'r', the ordering is row-major.
	If <i>ordering</i> = 'C' or 'c', the ordering is column-major.
<i>trans</i>	Parameter that specifies the operation type. If <i>trans</i> = 'N' or 'n', $op(AB) = AB$ and the matrix <i>AB</i> is assumed unchanged on input. If <i>trans</i> = 'T' or 't', it is assumed that <i>AB</i> should be transposed. If <i>trans</i> = 'C' or 'c', it is assumed that <i>AB</i> should be conjugate transposed. If <i>trans</i> = 'R' or 'r', it is assumed that <i>AB</i> should be only conjugated. If the data is real, then <i>trans</i> = 'R' is the same as <i>trans</i> = 'N', and <i>trans</i> = 'C' is the same as <i>trans</i> = 'T'.
<i>rows</i>	The number of rows in matrix <i>AB</i> before the transpose operation.
<i>cols</i>	The number of columns in matrix <i>AB</i> before the transpose operation.
<i>ab</i>	Array.
<i>alpha</i>	This parameter scales the input matrix by <i>alpha</i> .
<i>lda</i>	Distance between the first elements in adjacent columns (in the case of the column-major order) or rows (in the case of the row-major order) in the source matrix; measured in the number of elements. This parameter must be at least <i>rows</i> if <i>ordering</i> = 'C' or 'c', and $\max(1, cols)$ otherwise.
<i>ldb</i>	Distance between the first elements in adjacent columns (in the case of the column-major order) or rows (in the case of the row-major order) in the destination matrix; measured in the number of elements. To determine the minimum value of <i>ldb</i> on output, consider the following guideline: If <i>ordering</i> = 'C' or 'c', then <ul style="list-style-type: none"> <li>• If <i>trans</i> = 'T' or 't' or 'C' or 'c', this parameter must be at least <math>\max(1, cols)</math></li> <li>• If <i>trans</i> = 'N' or 'n' or 'R' or 'r', this parameter must be at least <math>\max(1, rows)</math></li> </ul> If <i>ordering</i> = 'R' or 'r', then <ul style="list-style-type: none"> <li>• If <i>trans</i> = 'T' or 't' or 'C' or 'c', this parameter must be at least <math>\max(1, rows)</math></li> <li>• If <i>trans</i> = 'N' or 'n' or 'R' or 'r', this parameter must be at least <math>\max(1, cols)</math></li> </ul>

## Output Parameters

<i>ab</i>	Array. Contains the matrix <i>AB</i> .
-----------	---

## Application Notes

For threading to be active in `mkl_?imatcopy`, the pointer *AB* must be aligned on the 64-byte boundary. This requirement can be met by allocating *AB* with `mkl_malloc`.

## Interfaces

### `mkl_?imatcopy_batch`

*Computes a group of in-place scaled matrix copy or transposition operations on general matrices.*

#### Syntax

```
void mkl_simatcopy_batch (char layout, const char * trans_array, const size_t *
rows_array, const size_t * cols_array, const float * alpha_array, float ** ab_array,
const size_t * lda_array, const size_t * ldb_array, size_t group_count, const size_t *
group_size);
```

```
void mkl_dimatcopy_batch (char layout, const char * trans_array, const size_t *
rows_array, const size_t * cols_array, const double * alpha_array, double ** ab_array,
const size_t * lda_array, const size_t * ldb_array, size_t group_count, const size_t *
group_size);
```

```
void mkl_cimatcopy_batch (char layout, const char * trans_array, const size_t *
rows_array, const size_t * cols_array, const MKL_Complex8 * alpha_array, MKL_Complex8 **
ab_array, const size_t * lda_array, const size_t * ldb_array, size_t group_count, const
size_t * group_size);
```

```
void mkl_zimatcopy_batch (char layout, const char * trans_array, const size_t *
rows_array, const size_t * cols_array, const MKL_Complex16 * alpha_array, MKL_Complex16
** ab_array, const size_t * lda_array, const size_t * ldb_array, size_t group_count,
const size_t * group_size);
```

#### Description

The `mkl_?imatcopy_batch` routine performs a series of in-place scaled matrix copies or transpositions. They are similar to the `mkl_?imatcopy` routine counterparts, but the `mkl_?imatcopy_batch` routine performs matrix operations with groups of matrices. Each group has the same parameters (matrix size, leading dimension, and scaling parameter), but a single call to `mkl_?imatcopy_batch` operates on multiple groups, and each group can have different parameters, unlike the related `mkl_?imatcopy_batch_strided` routines.

The operation is defined as

```
idx = 0
for i = 0..group_count - 1
  m in rows_array[i], n in cols_array[i], and alpha in alpha_array[i]
  for j = 0..group_size[i] - 1
    AB matrices in AB_array[idx]
    AB := alpha*op(AB)
    idx = idx + 1
  end for
end for
```

Where `op(X)` is one of `op(X)=X`, `op(X)=X'`, `op(X)=conjg(X')`, or `op(X)=conjg(X)`. On entry, *AB* is a *m*-by-*n* matrix such that *m* and *n* are elements of `rows_array` and `cols_array`.

*AB* represents a matrix stored at addresses pointed to by `AB_array`. The number of entries in `AB_array` is `total_batch_count` = the sum of all of the `group_size` entries.

## Input Parameters

<i>layout</i>	Specifies whether two-dimensional array storage is row-major (R) or column-major (C).
<i>trans_array</i>	<p>Array of size <i>group_count</i>. For the group <i>i</i>, <math>trans = trans\_array[i]</math> specifies the form of <math>op(AB)</math>, the transposition operation applied to the <i>AB</i> matrix:</p> <p>If <math>trans = 'N'</math> or <math>'n'</math>, <math>op(AB) = AB</math>.</p> <p>If <math>trans = 'T'</math> or <math>'t'</math>, <math>op(AB) = AB'</math></p> <p>If <math>trans = 'C'</math> or <math>'c'</math>, <math>op(AB) = conjg(AB')</math></p> <p>If <math>trans = 'R'</math> or <math>'r'</math>, <math>op(AB) = conjg(AB)</math></p>
<i>rows_array</i>	Array of size <i>group_count</i> . Specifies the number of rows of the input matrix <i>AB</i> . The value of each element must be at least zero.
<i>cols_array</i>	Array of size <i>group_count</i> . Specifies the number of columns of the input matrix <i>AB</i> . The value of each element must be at least zero.
<i>alpha_array</i>	Array of size <i>group_count</i> . Specifies the scalar <i>alpha</i> .
<i>AB_array</i>	Array of size <i>total_batch_count</i> , holding pointers to arrays used to store <i>AB</i> matrices.
<i>lda_array</i>	Array of size <i>group_count</i> . The leading dimension of the matrix input <i>AB</i> . It must be positive and at least <i>m</i> if column major layout is used or at least <i>n</i> if row major layout is used.
<i>ldb_array</i>	<p>Array of size <i>group_count</i>. The leading dimension of the matrix input <i>AB</i>. It must be positive and at least</p> <p><i>m</i> if column major layout is used and <math>op(AB) = AB</math> or <math>conjg(AB)</math></p> <p><i>n</i> if row major layout is used and <math>op(AB) = AB'</math> or <math>conjg(AB')</math></p> <p><i>n</i> otherwise</p>
<i>group_count</i>	Specifies the number of groups. Must be at least 0
<i>group_size</i>	Array of size <i>group_count</i> . The element $group\_size[i]$ specifies the number of matrices in group <i>i</i> . Each element in <i>group_size</i> must be at least 0.

## Output Parameters

<i>AB_array</i>	Output array of size <i>total_batch_count</i> , holding pointers to arrays used to store the updated <i>AB</i> matrices.
-----------------	--

### **`mkl_?imatcopy_batch_strided`**

Computes a group of in-place scaled matrix copy or transposition using general matrices.

---

## Syntax

```
void mkl_simatcopy_batch_strided (const char layout, const char trans, size_t row,
size_t col, const float alpha, float * ab, size_t lda, size_t ldb, size_t stride, size_t
batch_size);
```

```
void mkl_dimatcopy_batch_strided (const char layout, const char trans, size_t row,
size_t col, const double alpha, double * ab, size_t lda, size_t ldb, size_t stride,
size_t batch_size);
```

```
void mkl_cimatcopy_batch_strided (const char layout, const char trans, size_t row,
size_t col, MKL_complex8 alpha, MKL_complex8 * ab, size_t lda, size_t ldb, size_t
stride, size_t batch_size);
```

```
void mkl_zimatcopy_batch_strided (const char layout, const char trans, size_t row,
size_t col, MKL_complex16 alpha, MKL_complex16 * ab, size_t lda, size_t ldb, size_t
stride, size_t batch_size);
```

## Description

The `mkl_?imatcopy_batch_strided` routine performs a series of scaled matrix copy or transposition. They are similar to the `mkl_?imatcopy` routine counterparts, but the `mkl_?imatcopy_batch_strided` routine performs matrix operations with a group of matrices.

All matrices `ab` have the same parameters (size, transposition operation...) and are stored at constant stride from each other. The operation is defined as

```
for i = 0 ... batch_size - 1
  AB is a matrix at offset i * stride in ab
  AB = alpha * op(AB)
end for
```

## Input Parameters

<i>layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor)
<i>trans</i>	Specifies <code>op(AB)</code> , the transposition operation applied to the <code>AB</code> matrices. If <code>trans = 'N' or 'n'</code> , <code>op(AB) = AB</code> . If <code>trans = 'T' or 't'</code> , <code>op(AB) = AB'</code> If <code>trans = 'C' or 'c'</code> , <code>op(AB) = conjg(AB')</code> If <code>trans = 'R' or 'r'</code> , <code>op(AB) = conjg(AB)</code>
<i>row</i>	Specifies the number of rows of the matrices <code>AB</code> . The value of <code>row</code> must be at least zero.
<i>col</i>	Specifies the number of columns of the matrices <code>AB</code> . The value of <code>col</code> must be at least zero.
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>ab</i>	Array holding all the input matrix <code>AB</code> . Must be of size at least <code>batch_size * stride</code> .
<i>lda</i>	The leading dimension of the matrix input <code>AB</code> . It must be positive and at least <code>row</code> if column major layout is used or at least <code>col</code> if row major layout is used.

<i>ldb</i>	The leading dimension of the matrix input AB. It must be positive and at least <i>row</i> if column major layout is used and $\text{op}(AB) = AB$ or $\text{conjg}(AB)$ <i>row</i> if row major layout is used and $\text{op}(AB) = AB'$ or $\text{conjg}(AB')$ <i>col</i> otherwise
<i>stride</i>	Stride between two consecutive AB matrices, must be at least $\max(ldb, lda) * \max(ka, kb)$ where <ul style="list-style-type: none"> <li>• <i>ka</i> is <i>row</i> if column major layout is used or <i>col</i> if row major layout is used</li> <li>• <i>kb</i> is <i>col</i> if column major layout is used and <math>\text{op}(AB) = AB</math> or <math>\text{conjg}(AB)</math> or row major layout is used and <math>\text{op}(AB) = AB'</math> or <math>\text{conjg}(AB')</math>; <i>kb</i> is <i>row</i> otherwise.</li> </ul>
<i>batch_size</i>	Number of <i>imatcopy</i> computations to perform and AB matrices. Must be at least 0.

## Output Parameters

<i>ab</i>	Array holding the <i>batch_size</i> updated matrices AB.
-----------	--

## **mkl\_?omatadd\_batch\_strided**

*Computes a group of out-of-place scaled matrix additions using general matrices.*

### Syntax

```
void mkl_somatadd_batch_strided(char ordering, char transa, char transb, size_t rows,
size_t cols, float alpha, const float * A, size_t lda, size_t stridea, float beta,
const float * B, size_t ldb, size_t strideb, float * C, size_t ldc, size_t stridec,
size_t batch_size);
```

```
void mkl_domatadd_batch_strided(char ordering, char transa, char transb, size_t rows,
size_t cols, double alpha, const double * A, size_t lda, size_t stridea, double beta,
const double * B, size_t ldb, size_t strideb, double * C, size_t ldc, size_t stridec,
size_t batch_size);
```

```
void mkl_comatadd_batch_strided(char ordering, char transa, char transb, size_t rows,
size_t cols, MKL_Complex8 alpha, const MKL_Complex8 * A, size_t lda, size_t stridea,
MKL_Complex8 beta, const MKL_Complex8 * B, size_t ldb, size_t strideb, MKL_Complex8 *
C, size_t ldc, size_t stridec, size_t batch_size);
```

```
void mkl_zomatadd_batch_strided(char ordering, char transa, char transb, size_t rows,
size_t cols, MKL_Complex16 alpha, const MKL_Complex16 * A, size_t lda, size_t stridea,
MKL_Complex16 beta, const MKL_Complex16 * B, size_t ldb, size_t strideb, MKL_Complex16
* C, size_t ldc, size_t stridec, size_t batch_size);
```

### Description

The `mkl_omatadd_batch_strided` routines perform a series of scaled matrix additions. They are similar to the `mkl_omatadd` routines, but the `mkl_omatadd_batch_strided` routines perform matrix operations with a group of matrices.

The matrices A, B, and C are stored at a constant stride from each other in memory, given by the parameters `stridea`, `strideb`, and `stridec`. The operation is defined as:

```
for i = 0 ... batch_size - 1
  A is a matrix at offset i * stridea in the array a
  B is a matrix at offset i * strideb in the array b
  C is a matrix at offset i * stridec in the array c
  C = alpha * op(A) + beta * op(B)
end for
```

where:

- `op(X)` is one of `op(X) = X`, `op(X) = X'`, `op(X) = conjg(X)` or `op(X) = conjg(X')`.
- `alpha` and `beta` are scalars.
- A, B, and C are matrices.

The input arrays `a` and `b` contain all the input matrices, and the single output array `c` contains all the output matrices. The locations of the individual matrices within the array are given by stride lengths, while the number of matrices is given by the `batch_size` parameter.

## Input Parameters

<code>layout</code>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<code>transa</code>	Specifies <code>op(A)</code> , the transposition operation applied to the matrices A. 'N' or 'n' indicates no operation, 'T' or 't' is transposition, 'R' or 'r' is complex conjugation without transposition, and 'C' or 'c' is conjugate transposition.
<code>transb</code>	Specifies <code>op(B)</code> , the transposition operation applied to the matrices B.
<code>rows</code>	Number of rows for the result matrix C. Must be at least zero.
<code>cols</code>	Number of columns for the result matrix C. Must be at least zero.
<code>alpha</code>	Scaling factor for the matrices A.
<code>a</code>	Array holding the input matrices A. Must have size at least <code>stride_a*batch_size</code> .
<code>lda</code>	Leading dimension of the A matrices. If matrices are stored using column major layout, <code>lda</code> must be at least <code>rows</code> if A is not transposed or <code>cols</code> if A is transposed. If matrices are stored using row major layout, <code>lda</code> must be at least <code>cols</code> if A is not transposed or at least <code>rows</code> if A is transposed. Must be positive.
<code>stride_a</code>	Stride between the different A matrices. If matrices are stored using column major layout, <code>stride_a</code> must be at least <code>lda*rows</code> if A is not transposed or at least <code>lda*cols</code> if A is transposed. If matrices are stored using row major layout, <code>stride_a</code> must be at least <code>lda*rows</code> if B is not transposed or at least <code>lda*cols</code> if A is transposed.
<code>beta</code>	Scaling factor for the matrices B.
<code>b</code>	Array holding the input matrices B. Must have size at least <code>stride_b*batch_size</code> .

<code>ldb</code>	Leading dimension of the B matrices. If matrices are stored using column major layout, <code>ldb</code> must be at least <code>rows</code> if B is not transposed or <code>cols</code> if B is transposed. If matrices are stored using row major layout, <code>ldb</code> must be at least <code>cols</code> if B is not transposed or at least <code>rows</code> if B is transposed. Must be positive.
<code>stride_b</code>	Stride between the different B matrices. If matrices are stored using column major layout, <code>stride_b</code> must be at least <code>ldb*cols</code> if B is not transposed or at least <code>ldb*rows</code> if B is transposed. If matrices are stored using row major layout, <code>stride_b</code> must be at least <code>ldb*rows</code> if B is not transposed or at least <code>ldb*cols</code> if B is transposed.
<code>c</code>	Output array, overwritten by <code>batch_size</code> matrix addition operations of the form $\alpha * \text{op}(A) + \beta * \text{op}(B)$ . Must have size at least <code>stride_c*batch_size</code> .
<code>lda</code>	Leading dimension of the A matrices. If matrices are stored using column major layout, <code>lda</code> must be at least <code>rows</code> . If matrices are stored using row major layout, <code>lda</code> must be at least <code>cols</code> . Must be positive.
<code>stride_c</code>	Stride between the different C matrices. If matrices are stored using column major layout, <code>stride_c</code> must be at least <code>ldc*cols</code> . If matrices are stored using row major layout, <code>stride_c</code> must be at least <code>ldc*rows</code> .
<code>batch_size</code>	Specifies the number of input and output matrices to add.

## Output Parameters

<code>c</code>	Array holding the updated matrices <code>c</code> .
----------------	---

## `mkl_?omatcopy`

*Performs scaling and out-place transposition/copying of matrices.*

### Syntax

```
void mkl_somatcopy (char ordering, char trans, size_t rows, size_t cols, const float alpha, const float * A, size_t lda, float * B, size_t ldb);
```

```
void mkl_domatcopy (char ordering, char trans, size_t rows, size_t cols, const double alpha, const double * A, size_t lda, double * B, size_t ldb);
```

```
void mkl_comatcopy (char ordering, char trans, size_t rows, size_t cols, const MKL_Complex8 alpha, const MKL_Complex8 * A, size_t lda, MKL_Complex8 * B, size_t ldb);
```

```
void mkl_zomatcopy (char ordering, char trans, size_t rows, size_t cols, const MKL_Complex16 alpha, const MKL_Complex16 * A, size_t lda, MKL_Complex16 * B, size_t ldb);
```

### Include Files

- `mkl.h`

### Description

The `mkl_omatcopy` routine performs scaling and out-of-place transposition/copying of matrices. A transposition operation can be a normal matrix copy, a transposition, a conjugate transposition, or just a conjugation. The operation is defined as follows:

$$B := \alpha * op(A)$$

---

**NOTE**

Different arrays must not overlap.

---

## Input Parameters

<i>ordering</i>	Ordering of the matrix storage. If <i>ordering</i> = 'R' or 'r', the ordering is row-major. If <i>ordering</i> = 'C' or 'c', the ordering is column-major.
<i>trans</i>	Parameter that specifies the operation type. If <i>trans</i> = 'N' or 'n', $op(A) = A$ and the matrix <i>A</i> is assumed unchanged on input. If <i>trans</i> = 'T' or 't', it is assumed that <i>A</i> should be transposed. If <i>trans</i> = 'C' or 'c', it is assumed that <i>A</i> should be conjugate transposed. If <i>trans</i> = 'R' or 'r', it is assumed that <i>A</i> should be only conjugated. If the data is real, then <i>trans</i> = 'R' is the same as <i>trans</i> = 'N', and <i>trans</i> = 'C' is the same as <i>trans</i> = 'T'.
<i>rows</i>	The number of rows in matrix <i>A</i> (the input matrix).
<i>cols</i>	The number of columns in matrix <i>A</i> (the input matrix).
<i>alpha</i>	This parameter scales the input matrix by <i>alpha</i> .
<i>a</i>	Input array. If <i>ordering</i> = 'R' or 'r', the size of <i>a</i> is <i>lda</i> * <i>rows</i> . If <i>ordering</i> = 'C' or 'c', the size of <i>a</i> is <i>lda</i> * <i>cols</i> .
<i>lda</i>	If <i>ordering</i> = 'R' or 'r', <i>lda</i> represents the number of elements in array <i>a</i> between adjacent rows of matrix <i>A</i> ; <i>lda</i> must be at least equal to the number of columns of matrix <i>A</i> . If <i>ordering</i> = 'C' or 'c', <i>lda</i> represents the number of elements in array <i>a</i> between adjacent columns of matrix <i>A</i> ; <i>lda</i> must be at least equal to the number of row in matrix <i>A</i> .
<i>b</i>	Output array. If <i>ordering</i> = 'R' or 'r'; <ul style="list-style-type: none"> <li>• If <i>trans</i> = 'T' or 't' or 'C' or 'c', the size of <i>b</i> is <i>ldb</i> * <i>cols</i>.</li> <li>• If <i>trans</i> = 'N' or 'n' or 'R' or 'r', the size of <i>b</i> is <i>ldb</i> * <i>rows</i>.</li> </ul> If <i>ordering</i> = 'C' or 'c';

- If *trans* = 'T' or 't' or 'C' or 'c', the size of *b* is *ldb* \* *rows*.
- If *trans* = 'N' or 'n' or 'R' or 'r', the size of *b* is *ldb* \* *cols*.

*ldb*

If *ordering* = 'R' or 'r', *ldb* represents the number of elements in array *b* between adjacent rows of matrix *B*.

- If *trans* = 'T' or 't' or 'C' or 'c', *ldb* must be at least equal to *rows*.
- If *trans* = 'N' or 'n' or 'R' or 'r', *ldb* must be at least equal to *cols*.

If *ordering* = 'C' or 'c', *ldb* represents the number of elements in array *b* between adjacent columns of matrix *B*.

- If *trans* = 'T' or 't' or 'C' or 'c', *ldb* must be at least equal to *cols*.
- If *trans* = 'N' or 'n' or 'R' or 'r', *ldb* must be at least equal to *rows*.

## Output Parameters

*b*

Output array.

Contains the destination matrix.

## Interfaces

### **mkl\_?omatcopy\_batch**

*Computes a group of out of place scaled matrix copy or transposition operations on general matrices.*

#### Syntax

```
void mkl_somatcopy_batch (char layout, const char * trans_array, const size_t *
rows_array, const size_t * cols_array, const float * alpha_array, float ** A_array,
const size_t * lda_array, float ** B_array, const size_t * ldb_array, size_t
group_count, const size_t * group_size);
```

```
void mkl_domatcopy_batch (char layout, const char * trans_array, const size_t *
rows_array, const size_t * cols_array, const double * alpha_array, float ** A_array,
const size_t * lda_array, double ** B_array, const size_t * ldb_array, size_t
group_count, const size_t * group_size);
```

```
void mkl_comatcopy_batch (char layout, const char * trans_array, const size_t *
rows_array, const size_t * cols_array, const MKL_Complex8 * alpha_array, MKL_Complex8 **
A_array, const size_t * lda_array, MKL_Complex8 ** B_array, const size_t * ldb_array,
size_t group_count, const size_t * group_size);
```

```
void mkl_zomatcopy_batch (char layout, const char * trans_array, const size_t *
rows_array, const size_t * cols_array, const MKL_Complex16 * alpha_array, MKL_Complex16
** A_array, const size_t * lda_array, MKL_Complex16 ** B_array, const size_t *
ldb_array, size_t group_count, const size_t * group_size);
```

## Description

The `mkl_?omatcopy_batch` routine performs a series of out-of-place scaled matrix copies or transpositions. They are similar to the `mkl_?omatcopy` routine counterparts, but the `mkl_?omatcopy_batch` routine performs matrix operations with groups of matrices. Each group has the same parameters (matrix size, leading dimension, and scaling parameter), but a single call to `mkl_?omatcopy_batch` operates on multiple groups, and each group can have different parameters, unlike the related `mkl_?omatcopy_batch_strided` routines.

The operation is defined as

```

idx = 0
for i = 0..group_count - 1
  m in rows_array[i], n in cols_array[i], and alpha in alpha_array[i]
  for j = 0..group_size[i] - 1
    A and B matrices in a_array[idx] and b_array[idx], respectively
    B := alpha*op(A)
    idx = idx + 1
  end for
end for
end for

```

Where  $\text{op}(X)$  is one of  $\text{op}(X)=X$ ,  $\text{op}(X)=X'$ ,  $\text{op}(X)=\text{conjg}(X')$ , or  $\text{op}(X)=\text{conjg}(X)$ .  $A$  is a  $m$ -by- $n$  matrix such that  $m$  and  $n$  are elements of `rows_array` and `cols_array`.

$A$  and  $B$  represent matrices stored at addresses pointed to by `A_array` and `B_array`. The number of entries in `A_array` and `B_array` is `total_batch_count` = the sum of all of the `group_size` entries.

## Input Parameters

<code>layout</code>	Specifies whether two-dimensional array storage is row-major (R) or column-major (C).
<code>trans_array</code>	<p>Array of size <code>group_count</code>. For the group <math>i</math>, <code>trans = trans_array[i]</code> specifies the form of <math>\text{op}(A)</math>, the transposition operation applied to the <math>A</math> matrix:</p> <p>If <code>trans = 'N' or 'n'</code>, <math>\text{op}(A)=A</math>.</p> <p>If <code>trans = 'T' or 't'</code>, <math>\text{op}(A)=A'</math></p> <p>If <code>trans = 'C' or 'c'</code>, <math>\text{op}(A)=\text{conjg}(A')</math></p> <p>If <code>trans = 'R' or 'r'</code>, <math>\text{op}(A)=\text{conjg}(A)</math></p>
<code>rows_array</code>	Array of size <code>group_count</code> . Specifies the number of rows of the matrix $A$ . The value of each element must be at least zero.
<code>cols_array</code>	Array of size <code>group_count</code> . Specifies the number of columns of the matrix $A$ . The value of each element must be at least zero.
<code>alpha_array</code>	Array of size <code>group_count</code> . Specifies the scalar $\alpha$ .
<code>A_array</code>	Array of size <code>total_batch_count</code> , holding pointers to arrays used to store $A$ input matrices.
<code>lda_array</code>	Array of size <code>group_count</code> . The leading dimension of the input matrix $A$ . It must be positive and at least $m$ if column major layout is used or at least $n$ if row major layout is used.

<code>ldb_array</code>	Array of size <code>group_count</code> . The leading dimension of the output matrix <code>B</code> . It must be positive and at least <code>m</code> if column major layout is used and <code>op(A) = A</code> or <code>conjg(A)</code> <code>n</code> if row major layout is used and <code>op(A) = A'</code> or <code>conjg(A')</code> <code>n</code> otherwise
<code>group_count</code>	Specifies the number of groups. Must be at least 0
<code>group_size</code>	Array of size <code>group_count</code> . The element <code>group_size[i]</code> specifies the number of matrices in group <code>i</code> . Each element in <code>group_size</code> must be at least 0.

## Output Parameters

<code>B_array</code>	Output array of size <code>total_batch_count</code> , holding pointers to arrays used to store the <code>B</code> output matrices, the contents of which are overwritten by the operation of the form <code>alpha*op(A)</code> .
----------------------	--

## `mkl_?omatcopy_batch_strided`

Computes a group of out of place scaled matrix copy or transposition using general matrices.

### Syntax

```
void mkl_somatcopy_batch_strided (const char layout, const char trans, size_t row,
size_t col, const float alpha, const float * a, size_t lda, size_t stridea, float * b,
size_t ldb, size_t strideb, size_t batch_size);
```

```
void mkl_domatcopy_batch_strided (const char layout, const char trans, size_t row,
size_t col, const double alpha, const double * a, size_t lda, size_t stridea, double *
b, size_t ldb, size_t strideb, size_t batch_size);
```

```
void mkl_comatcopy_batch_strided (const char layout, const char trans, size_t row,
size_t col, const MKL_complex8 alpha, const MKL_complex8 * a, size_t lda, size_t
stridea, MKL_complex8 * b, size_t ldb, size_t strideb, size_t batch_size);
```

```
void mkl_zomatcopy_batch_strided (const char layout, const char trans, size_t row,
size_t col, const MKL_complex16 alpha, const MKL_complex16 * a, size_t lda, size_t
stridea, MKL_complex16 * b, size_t ldb, size_t strideb, size_t batch_size);
```

### Description

The `mkl_?omatcopy_batch_strided` routine performs a series of out-of-place scaled matrix copy or transposition. They are similar to the `mkl_?omatcopy` routine counterparts, but the `mkl_?omatcopy_batch_strided` routine performs matrix operations with group of matrices.

All matrices `a` and `b` have the same parameters (size, transposition operation...) and are stored at constant stride from each other respectively given by `stridea` and `strideb`. The operation is defined as

```
for i = 0 ... batch_size - 1
  A and B are matrices at offset i * stridea in a and I * strideb in b
  B = alpha * op(A)
end for
```

## Input Parameters

<i>layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>trans</i>	Specifies $op(A)$ , the transposition operation applied to the $AB$ matrices. If <i>trans</i> = 'N' or 'n', $op(A)=A$ . If <i>trans</i> = 'T' or 't', $op(A)=A'$ If <i>trans</i> = 'C' or 'c', $op(A)=conjg(A')$ If <i>trans</i> = 'R' or 'r', $op(A)=conjg(A)$
<i>row</i>	Specifies the number of rows of the matrices $A$ and $B$ . The value of <i>row</i> must be at least zero.
<i>col</i>	Specifies the number of columns of the matrices $A$ and $B$ . The value of <i>col</i> must be at least zero.
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>a</i>	Array holding all the input matrices $A$ . Must be of size at least $lda * k + stride_a * (batch\_size - 1) * stride_a$ where $k$ is <i>col</i> if column major is used and <i>row</i> otherwise.
<i>lda</i>	The leading dimension of the matrix input $A$ . It must be positive and at least <i>row</i> if column major layout is used or at least <i>col</i> if row major layout is used.
<i>stride_a</i>	Stride between two consecutive $A$ matrices, must be at least 0.
<i>b</i>	Array holding all the output matrices $B$ . Must be of size at least $batch\_size * stride_b$ . The <i>b</i> array must be independent from the <i>a</i> array.
<i>ldb</i>	The leading dimension of the output matrix $B$ . It must be positive and at least: <ul style="list-style-type: none"> <li>• <i>row</i> if column major layout is used and <math>op(A) = A</math> or <math>conjg(A)</math></li> <li>• <i>row</i> if row major layout is used and <math>op(A) = A'</math> or <math>conjg(A')</math></li> <li>• <i>col</i> otherwise</li> </ul>
<i>stride_b</i>	Stride between two consecutive $B$ matrices. It must be positive and at least: <ul style="list-style-type: none"> <li>• <math>ldb * col</math> if column major layout is used and <math>op(A) = A</math> or <math>conjg(A)</math></li> <li>• <math>ldb * col</math> if row major layout is used and <math>op(A) = A'</math> or <math>conjg(A')</math></li> <li>• <math>ldb * row</math> otherwise</li> </ul>
<i>batch_size</i>	

## Output Parameters

<i>b</i>	Array holding the <i>batch_size</i> updated matrices $B$ .
----------	--

## mkl\_?omatcopy2

Performs two-strided scaling and out-of-place transposition/copying of matrices.

### Syntax

```
void mkl_somatcopy2 (char ordering, char trans, size_t rows, size_t cols, const float
alpha, const float * A, size_t lda, size_t stridea, float * B, size_t ldb, size_t
strideb);
```

```
void mkl_domatcopy2 (char ordering, char trans, size_t rows, size_t cols, const double
alpha, const double * A, size_t lda, size_t stridea, double * B, size_t ldb, size_t
strideb);
```

```
void mkl_comatcopy2 (char ordering, char trans, size_t rows, size_t cols, const
MKL_Complex8 alpha, const MKL_Complex8 * A, size_t lda, size_t stridea, MKL_Complex8 *
B, size_t ldb, size_t strideb);
```

```
void mkl_zomatcopy2 (char ordering, char trans, size_t rows, size_t cols, const
MKL_Complex16 alpha, const MKL_Complex16 * A, size_t lda, size_t stridea, MKL_Complex16
* B, size_t ldb, size_t strideb);
```

### Include Files

- mkl.h

### Description

The `mkl_?omatcopy2` routine performs two-strided scaling and out-of-place transposition/copying of matrices. A transposition operation can be a normal matrix copy, a transposition, a conjugate transposition, or just a conjugation. The operation is defined as follows:

$$B := \alpha * \text{op}(A)$$

Normally, matrices in the BLAS or LAPACK are specified by a single stride index. For instance, in the column-major order,  $A(2,1)$  is stored in memory one element away from  $A(1,1)$ , but  $A(1,2)$  is a leading dimension away. The leading dimension in this case is at least the number of rows of the source matrix. If a matrix has two strides, then both  $A(2,1)$  and  $A(1,2)$  may be an arbitrary distance from  $A(1,1)$ .

---

#### NOTE

Different arrays must not overlap.

---

### Input Parameters

<i>ordering</i>	Ordering of the matrix storage. If <i>ordering</i> = 'R' or 'r', the ordering is row-major. If <i>ordering</i> = 'C' or 'c', the ordering is column-major.
<i>trans</i>	Parameter that specifies the operation type. If <i>trans</i> = 'N' or 'n', $\text{op}(A)=A$ and the matrix <i>A</i> is assumed unchanged on input. If <i>trans</i> = 'T' or 't', it is assumed that <i>A</i> should be transposed.

If  $trans = 'C'$  or  $'c'$ , it is assumed that  $A$  should be conjugate transposed.

If  $trans = 'R'$  or  $'r'$ , it is assumed that  $A$  should be only conjugated.

If the data is real, then  $trans = 'R'$  is the same as  $trans = 'N'$ , and  $trans = 'C'$  is the same as  $trans = 'T'$ .

*rows*

number of rows for the input matrix  $A$ . Must be at least zero.

*cols*

Number of columns for the input matrix  $A$ . Must be at least zero.

*alpha*

Scaling factor for the matrix transposition or copy.

*a*

Array holding the input matrix  $A$ . Must have size at least  $lda * n$  for column major ordering and at least  $lda * m$  for row major ordering.

*lda*

Leading dimension of the matrix  $A$ . If matrices are stored using column major layout,  $lda$  is the number of elements in the array between adjacent columns of the matrix and must be at least  $stridea * (m-1) + 1$ . If using row major layout,  $lda$  is the number of elements between adjacent rows of the matrix and must be at least  $stridea * (n-1) + 1$ .

*stridea*

The second stride of the matrix  $A$ . For column major layout,  $stridea$  is the number of elements in the array between adjacent rows of the matrix. For row major layout  $stridea$  is the number of elements between adjacent columns of the matrix. In both cases  $stridea$  must be at least 1.

*b*

Array holding the output matrix  $B$ .

	<b><i>trans = transpose::nontrans</i></b>	<b><i>trans = transpose::trans, or trans = transpose::conjtrans</i></b>
Column major	$B$ is $m \times n$ matrix. Size of array $b$ must be at least $ldb * n$ .	$B$ is $n \times m$ matrix. Size of array $b$ must be at least $ldb * m$ .
Row major	$B$ is $m \times n$ matrix. Size of array $b$ must be at least $ldb * m$ .	$B$ is $n \times m$ matrix. Size of array $b$ must be at least $ldb * n$ .

*ldb*

The leading dimension of the matrix  $B$ . Must be positive.

	<b><i>trans = transpose::nontrans</i></b>	<b><i>trans = transpose::trans, or trans = transpose::conjtrans</i></b>
Column major	$ldb$ must be at least $strideb * (m-1) + 1$ .	$ldb$ must be at least $strideb * (n-1) + 1$ .
Row major	$ldb$ must be at least $strideb * (n-1) + 1$ .	$ldb$ must be at least $strideb * (m-1) + 1$ .

*strideb*

The second stride of the matrix  $B$ . For column major layout,  $strideb$  is the number of elements in the array between adjacent rows of the matrix. For row major layout,  $strideb$  is the number of elements between adjacent columns of the matrix. In both cases  $strideb$  must be at least 1.

## Output Parameters

$b$  Array, size at least  $m$ .  
Contains the destination matrix.

## Interfaces

### **mkl\_?omatadd**

Scales and sums two matrices including in addition to performing out-of-place transposition operations.

#### Syntax

```
void mkl_somatadd (char ordering, char transa, char transb, size_t m, size_t n, const float alpha, const float * A, size_t lda, const float beta, const float * B, size_t ldb, float * C, size_t ldc);
```

```
void mkl_domatadd (char ordering, char transa, char transb, size_t m, size_t n, const double alpha, const double * A, size_t lda, const double beta, const double * B, size_t ldb, double * C, size_t ldc);
```

```
void mkl_comatadd (char ordering, char transa, char transb, size_t m, size_t n, const MKL_Complex8 alpha, const MKL_Complex8 * A, size_t lda, const MKL_Complex8 beta, const MKL_Complex8 * B, size_t ldb, MKL_Complex8 * C, size_t ldc);
```

```
void mkl_zomatadd (char ordering, char transa, char transb, size_t m, size_t n, const MKL_Complex16 alpha, const MKL_Complex16 * A, size_t lda, const MKL_Complex16 beta, const MKL_Complex16 * B, size_t ldb, MKL_Complex16 * C, size_t ldc);
```

#### Include Files

- mkl.h

#### Description

The `mkl_?omatadd` routine scales and adds two matrices, as well as performing out-of-place transposition operations. A transposition operation can be no operation, a transposition, a conjugate transposition, or a conjugation (without transposition). The following out-of-place memory movement is done:

$$C := \alpha * \text{op}(A) + \beta * \text{op}(B)$$

where the  $\text{op}(A)$  and  $\text{op}(B)$  operations are transpose, conjugate-transpose, conjugate (no transpose), or no transpose, depending on the values of  $transa$  and  $transb$ . If no transposition of the source matrices is required,  $m$  is the number of rows and  $n$  is the number of columns in the source matrices  $A$  and  $B$ . In this case, the output matrix  $C$  is  $m$ -by- $n$ .

---

#### NOTE

Note that different arrays must not overlap.

---

## Input Parameters

<i>ordering</i>	Ordering of the matrix storage. If <i>ordering</i> = 'R' or 'r', the ordering is row-major. If <i>ordering</i> = 'C' or 'c', the ordering is column-major.
<i>transa</i>	Parameter that specifies the operation type on matrix <i>A</i> . If <i>transa</i> = 'N' or 'n', $op(A)=A$ and the matrix <i>A</i> is assumed unchanged on input. If <i>transa</i> = 'T' or 't', it is assumed that <i>A</i> should be transposed. If <i>transa</i> = 'C' or 'c', it is assumed that <i>A</i> should be conjugate transposed. If <i>transa</i> = 'R' or 'r', it is assumed that <i>A</i> should be conjugated (and not transposed). If the data is real, then <i>transa</i> = 'R' is the same as <i>transa</i> = 'N', and <i>transa</i> = 'C' is the same as <i>transa</i> = 'T'.
<i>transb</i>	Parameter that specifies the operation type on matrix <i>B</i> . If <i>transb</i> = 'N' or 'n', $op(B)=B$ and the matrix <i>B</i> is assumed unchanged on input. If <i>transb</i> = 'T' or 't', it is assumed that <i>B</i> should be transposed. If <i>transb</i> = 'C' or 'c', it is assumed that <i>B</i> should be conjugate transposed. If <i>transb</i> = 'R' or 'r', it is assumed that <i>B</i> should be conjugated (and not transposed). If the data is real, then <i>transb</i> = 'R' is the same as <i>transb</i> = 'N', and <i>transb</i> = 'C' is the same as <i>transb</i> = 'T'.
<i>m</i>	The number of matrix rows in $op(A)$ , $op(B)$ , and <i>C</i> .
<i>n</i>	The number of matrix columns in $op(A)$ , $op(B)$ , and <i>C</i> .
<i>alpha</i>	This parameter scales the input matrix by <i>alpha</i> .
<i>a</i>	Array.
<i>lda</i>	Distance between the first elements in adjacent columns (in the case of the column-major order) or rows (in the case of the row-major order) in the source matrix <i>A</i> ; measured in the number of elements. For <i>ordering</i> = 'C' or 'c': when <i>transa</i> = 'N', 'n', 'R', or 'r', <i>lda</i> must be at least $\max(1, m)$ ; otherwise <i>lda</i> must be $\max(1, n)$ . For <i>ordering</i> = 'R' or 'r': when <i>transa</i> = 'N', 'n', 'R', or 'r', <i>lda</i> must be at least $\max(1, n)$ ; otherwise <i>lda</i> must be $\max(1, m)$ .
<i>beta</i>	This parameter scales the input matrix by <i>beta</i> .
<i>b</i>	Array.

<i>ldb</i>	<p>Distance between the first elements in adjacent columns (in the case of the column-major order) or rows (in the case of the row-major order) in the source matrix <i>B</i>; measured in the number of elements.</p> <p>For <i>ordering</i> = 'C' or 'c': when <i>transa</i> = 'N', 'n', 'R', or 'r', <i>ldb</i> must be at least <math>\max(1, m)</math>; otherwise <i>ldb</i> must be <math>\max(1, n)</math>.</p> <p>For <i>ordering</i> = 'R' or 'r': when <i>transa</i> = 'N', 'n', 'R', or 'r', <i>ldb</i> must be at least <math>\max(1, n)</math>; otherwise <i>ldb</i> must be <math>\max(1, m)</math>.</p>
<i>ldc</i>	<p>Distance between the first elements in adjacent columns (in the case of the column-major order) or rows (in the case of the row-major order) in the destination matrix <i>C</i>; measured in the number of elements.</p> <p>If <i>ordering</i> = 'C' or 'c', then <i>ldc</i> must be at least <math>\max(1, m)</math>, otherwise <i>ldc</i> must be at least <math>\max(1, n)</math>.</p>

## Output Parameters

*c* Array.

## Interfaces

### **cblas\_?gemm\_pack\_get\_size, cblas\_gemm\_\*\_pack\_get\_size**

Returns the number of bytes required to store the packed matrix.

#### Syntax

```
size_t cblas_hgemm_pack_get_size (const CBLAS_IDENTIFIER identifier, const MKL_INT m,
const MKL_INT n, const MKL_INT k)
```

```
size_t cblas_sgemm_pack_get_size (const CBLAS_IDENTIFIER identifier, const MKL_INT m,
const MKL_INT n, const MKL_INT k)
```

```
size_t cblas_dgemm_pack_get_size (const CBLAS_IDENTIFIER identifier, const MKL_INT m,
const MKL_INT n, const MKL_INT k)
```

```
size_t cblas_gemm_s8u8s32_pack_get_size (const CBLAS_IDENTIFIER identifier, const
MKL_INT m, const MKL_INT n, const MKL_INT k)
```

```
size_t cblas_gemm_s16s16s32_pack_get_size (const CBLAS_IDENTIFIER identifier, const
MKL_INT m, const MKL_INT n, const MKL_INT k)
```

```
size_t cblas_gemm_bf16bf16f32_pack_get_size (const CBLAS_IDENTIFIER identifier, const
MKL_INT m, const MKL_INT n, const MKL_INT k)
```

```
size_t cblas_gemm_f16f16f32_pack_get_size (const CBLAS_IDENTIFIER identifier, const
MKL_INT m, const MKL_INT n, const MKL_INT k)
```

#### Include Files

- mkl.h

#### Description

The `cblas_?gemm_pack_get_size` and `cblas_gemm_*_pack_get_size` routines belong to a set of related routines that enable the use of an internal packed storage. Call the `cblas_?gemm_pack_get_size` and `cblas_gemm_*_pack_get_size` routines first to query the size of storage required for a packed matrix structure to be used in subsequent calls. Ultimately, the packed matrix structure is used to compute

$C := \alpha * \text{op}(A) * \text{op}(B) + \beta * C$  for bfloat16, half, single and double precision or

$C := \alpha * (\text{op}(A) + A\_offset) * (\text{op}(B) + B\_offset) + \beta * C + C\_offset$  for integer type.

where:

$\text{op}(X)$  is one of the operations  $\text{op}(X) = X$  or  $\text{op}(X) = X^T$

$\alpha$  and  $\beta$  are scalars,

$A$ ,  $A\_offset$ ,  $B$ ,  $B\_offset$ ,  $C$ , and  $C\_offset$  are matrices

$\text{op}(A)$  is an  $m$ -by- $k$  matrix,

$\text{op}(B)$  is a  $k$ -by- $n$  matrix,

$C$  is an  $m$ -by- $n$  matrix.

$A\_offset$  is an  $m$ -by- $k$  matrix.

$B\_offset$  is an  $k$ -by- $n$  matrix.

$C\_offset$  is an  $m$ -by- $n$  matrix.

## Input Parameters

Parameter	Type	Description
<i>identifier</i>	CBLAS_IDENTIFIER	Specifies which matrix is to be packed: If <i>identifier</i> = CblasAMatrix, the size returned is the size required to store matrix <i>A</i> in an internal format. If <i>identifier</i> = CblasBMatrix, the size returned is the size required to store matrix <i>B</i> in an internal format.
<i>m</i>	MKL_INT	Specifies the number of rows of matrix $\text{op}(A)$ and of the matrix <i>C</i> . The value of <i>m</i> must be at least zero.
<i>n</i>	MKL_INT	Specifies the number of columns of matrix $\text{op}(B)$ and the number of columns of matrix <i>C</i> . The value of <i>n</i> must be at least zero.
<i>k</i>	MKL_INT	Specifies the number of columns of matrix $\text{op}(A)$ and the number of rows of matrix $\text{op}(B)$ . The value of <i>k</i> must be at least zero.

## Return Values

Parameter	Type	Description
<i>size</i>	size_t	Returns the size (in bytes) required to store the matrix when packed into the internal format of Intel® oneAPI Math Kernel Library (oneMKL).

## Example

See the following examples in the MKL installation directory to understand the use of these routines:

float alpha, const float *src, const MKL_INT ld, float *dest);
```

```
void cblas_dgemm_pack (const CBLAS_LAYOUT Layout, const CBLAS_IDENTIFIER identifier,
const CBLAS_TRANSPOSE trans, const MKL_INT m, const MKL_INT n, const MKL_INT k, const
double alpha, const double *src, const MKL_INT ld, double *dest);
```

### Include Files

- `mkl.h`

### Description

The `cblas_?gemm_pack` routine is one of a set of related routines that enable use of an internal packed storage. Call `cblas_?gemm_pack` after you allocate a buffer whose size is given by `cblas_?gemm_pack_getsize`. The `cblas_?gemm_pack` routine scales the identified matrix by `alpha` and packs it into the buffer allocated previously.

---

#### NOTE

Do not copy the packed matrix to a different address because the internal implementation depends on the alignment of internally-stored metadata.

---

The `cblas_?gemm_pack` routine performs this operation:

$$dest := alpha * op(src) \text{ as part of the computation } C := alpha * op(A) * op(B) + beta * C$$

where:

$op(X)$  is one of the operations  $op(X) = X$ ,  $op(X) = X^T$ , or  $op(X) = X^H$ ,

$alpha$  and  $beta$  are scalars,

$src$  is a matrix,

$A$ ,  $B$ , and  $C$  are matrices

$op(src)$  is an  $m$ -by- $k$  matrix if  $identifier = CblasAMatrix$ ,  
 $op(src)$  is a  $k$ -by- $n$  matrix if  $identifier = CblasBMatrix$ ,  
 $dest$  is an internal packed storage buffer.

---

**NOTE**

You must use the same value of the *Layout* parameter for the entire sequence of related `cblas_?gemm_pack` and `cblas_?gemm_compute` calls.

For best performance, use the same number of threads for packing and for computing.

If packing for both *A* and *B* matrices, you must use the same number of threads for packing *A* as for packing *B*.

---

## Input Parameters

<i>Layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>identifier</i>	Specifies which matrix is to be packed: If <i>identifier</i> = CblasAMatrix, the routine allocates storage to pack matrix <i>A</i> . If <i>identifier</i> = CblasBMatrix, the routine allocates storage to pack matrix <i>B</i> .
<i>trans</i>	Specifies the form of $op(src)$ used in the packing: If <i>trans</i> = CblasNoTrans $op(src) = src$ . If <i>trans</i> = CblasTrans $op(src) = src^T$ . If <i>trans</i> = CblasConjTrans $op(src) = src^H$ .
<i>m</i>	Specifies the number of rows of the matrix $op(A)$ and of the matrix <i>C</i> . The value of <i>m</i> must be at least zero.
<i>n</i>	Specifies the number of columns of the matrix $op(B)$ and the number of columns of the matrix <i>C</i> . The value of <i>n</i> must be at least zero.
<i>k</i>	Specifies the number of columns of the matrix $op(A)$ and the number of rows of the matrix $op(B)$ . The value of <i>k</i> must be at least zero.
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>src</i>	Array:

	<i>identifier</i> = <b>CblasAMatrix</b>		<i>identifier</i> = <b>CblasBMatrix</b>	
	<i>trans</i> = <b>CblasNoTrans</b>	<i>trans</i> = <b>CblasTrans</b> <b>OR</b> <i>trans</i> = <b>CblasConjTrans</b>	<i>trans</i> = <b>CblasNoTrans</b>	<i>trans</i> = <b>CblasTrans</b> <b>OR</b> <i>trans</i> = <b>CblasConjTrans</b>
<i>Layout</i> = <b>CblasColMajor</b>	Size $ld*k$ . Before entry, the leading $m$ -by- $k$ part of the array <i>src</i> must contain the matrix <i>A</i> .	Size $ld*m$ . Before entry, the leading $k$ -by- $m$ part of the array <i>src</i> must contain the matrix <i>A</i> .	Size $ld*n$ . Before entry, the leading $k$ -by- $n$ part of the array <i>src</i> must contain the matrix <i>B</i> .	Size $ld*k$ . Before entry, the leading $n$ -by- $k$ part of the array <i>src</i> must contain the matrix <i>B</i> .
<i>Layout</i> = <b>CblasRowMajor</b>	Size $ld*m$ . Before entry, the leading $k$ -by- $m$ part of the array <i>src</i> must contain the matrix <i>A</i> .	Size $ld*k$ . Before entry, the leading $m$ -by- $k$ part of the array <i>src</i> must contain the matrix <i>A</i> .	Size $ld*k$ . Before entry, the leading $n$ -by- $k$ part of the array <i>src</i> must contain the matrix <i>B</i> .	Size $ld*n$ . Before entry, the leading $k$ -by- $n$ part of the array <i>src</i> must contain the matrix <i>B</i> .

*ld*

Specifies the leading dimension of *src* as declared in the calling (sub)program.

	<i>identifier</i> = <b>CblasAMatrix</b>		<i>identifier</i> = <b>CblasBMatrix</b>	
	<i>trans</i> = <b>CblasNoTrans</b>	<i>trans</i> = <b>CblasTrans</b> <b>OR</b> <i>trans</i> = <b>CblasConjTrans</b>	<i>trans</i> = <b>CblasNoTrans</b>	<i>trans</i> = <b>CblasTrans</b> <b>OR</b> <i>trans</i> = <b>CblasConjTrans</b>
<i>Layout</i> = CblasCol Major	<i>ld</i> must be at least $\max(1, m)$ .	<i>ld</i> must be at least $\max(1, k)$ .	<i>ld</i> must be at least $\max(1, k)$ .	<i>ld</i> must be at least $\max(1, n)$ .
<i>Layout</i> = CblasRow Major	<i>ld</i> must be at least $\max(1, k)$ .	<i>ld</i> must be at least $\max(1, m)$ .	<i>ld</i> must be at least $\max(1, n)$ .	<i>ld</i> must be at least $\max(1, k)$ .

*dest*

Scaled and packed internal storage buffer.

## Output Parameters

*dest*Overwritten by the matrix  $\alpha * op(src)$ .

## Description

The `cblas_gemm*_pack` routine is one of a set of related routines that enable the use of an internal packed storage. Call `cblas_gemm*_pack` after you allocate a buffer whose size is given by `cblas_gemm*_pack_get_size`. The `cblas_gemm*_pack` routine packs the identified matrix into the buffer allocated previously.

The `cblas_gemm*_pack` routine performs this operation:

$dest := op(src)$  as part of the computation  $C := alpha * (op(A) + A\_offset) * (op(B) + B\_offset) + beta * C + C\_offset$  for integer types.

$C := alpha * op(A) * op(B) + beta * C$  for bfloat16 type.

where:

$op(X)$  is one of the operations  $op(X) = X$  or  $op(X) = X^T$

$alpha$  and  $beta$  are scalars,

$src$  is a matrix,

$A$ ,  $A\_offset$ ,  $B$ ,  $B\_offset$ ,  $c$ , and  $C\_offset$  are matrices

$op(src)$  is an  $m$ -by- $k$  matrix if  $identifier = CblasAMatrix$ ,

$op(src)$  is a  $k$ -by- $n$  matrix if  $identifier = CblasBMatrix$ ,

$dest$  is the buffer previously allocated to store the matrix packed into an internal format

$A\_offset$  is an  $m$ -by- $k$  matrix.

$B\_offset$  is an  $k$ -by- $n$  matrix.

$C\_offset$  is an  $m$ -by- $n$  matrix.

---

### NOTE

You must use the same value of the `Layout` parameter for the entire sequence of related `cblas_gemm*_pack` and `cblas_gemm*_compute` calls.

For best performance, use the same number of threads for packing and for computing.

If packing for both  $A$  and  $B$  matrices, you must use the same number of threads for packing  $A$  as for packing  $B$ .

---

## Input Parameters

<code>Layout</code>	<b>CBLAS_LAYOUT</b> Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<code>identifier</code>	<b>CBLAS_IDENTIFIER</b> Specifies which matrix is to be packed: If <code>identifier = CblasAMatrix</code> , the $A$ matrix is packed. If <code>identifier = CblasBMatrix</code> , the $B$ matrix is packed.

*trans***CBLAS\_TRANSPOSE**Specifies the form of  $op(src)$  used in the packing:If  $trans = \text{CblasNoTrans}$   $op(src) = src$ .If  $trans = \text{CblasTrans}$   $op(src) = src^T$ .*m***MKL\_INT**Specifies the number of rows of matrix  $op(A)$  and of the matrix  $C$ . The value of  $m$  must be at least zero.*n***MKL\_INT**Specifies the number of columns of matrix  $op(B)$  and the number of columns of matrix  $C$ . The value of  $n$  must be at least zero.*k***MKL\_INT**Specifies the number of columns of matrix  $op(A)$  and the number of rows of matrix  $op(B)$ . The value of  $k$  must be at least zero.*src*MKL\_BF16\* for `cblas_gemm_bf16bf16f32_pack`, MKL\_F16\* for `cblas_gemm_f16f16f32_pack`, void\* for `cblas_gemm_s8u8s32_pack` and MKL\_INT16\* for `cblas_gemm_s16s16s32_pack`

	<i>identifier = CblasAMatrix</i>		<i>identifier = CblasBMatrix</i>	
	<i>trans = CblasNoTrans</i>	<i>trans = CblasTrans</i>	<i>trans = CblasNoTrans</i>	<i>trans = CblasTrans</i>
<i>Layout = CblasColMajor</i>	Size $ld*k$ . Before entry, the leading $m$ -by- $k$ part of the array <i>src</i> must contain the matrix $A$ . *dest*

MKL\_BF16\* for `cblas_gemm_bf16bf16f32_pack`, MKL\_F16\* for `cblas_gemm_f16f16f32_pack`, `void*` for `cblas_gemm_s8u8s32_pack` or MKL\_INT16\* for `cblas_gemm_s16s16s32_pack`  
Buffer for the packed matrix.

## Output Parameters

*dest*

MKL\_BF16\* for `cblas_gemm_bf16bf16f32_pack`, MKL\_F16\* for `cblas_gemm_f16f16f32_pack`, `void*` for `cblas_gemm_s8u8s32_pack` or MKL\_INT16\* for `cblas_gemm_s16s16s32_pack`

Overwritten by the matrix `op(src)` stored in a format internal to Intel® oneAPI Math Kernel Library (oneMKL).

## Example

See the following examples in the MKL installation directory to understand the use of these routines:

`cblas_gemm_s8u8s32_pack`: `examples\cblas\source\cblas_gemm_s8u8s32_computex.c`

`cblas_gemm_s16s16s32_pack`: `examples\cblas\source\cblas_gemm_s16s16s32_computex.c`

`cblas_gemm_bf16bf16f32_pack`: `examples\cblas\source\cblas_gemm_bf16bf16f32_computex.c`

`cblas_gemm_f16f16f32_pack`: `examples\cblas\source\cblas_gemm_f16f16f32_computex.c`

## Application Notes

When using `cblas_gemm_s8u8s32_pack` with row-major layout, the data types of *A* and *B* must be swapped. That is, you must provide an 8-bit unsigned integer array for matrix *A* and an 8-bit signed integer array for matrix *B*.

## See Also

`cblas_gemm*_pack_get_size`

to return the number of bytes needed to store the packed matrix.

`cblas_gemm*_compute`

to compute a matrix-matrix product with general integer matrices (where one or both input matrices are stored in a packed data structure) and add the result to a scalar-matrix product.

## cblas\_?gemm\_compute

Computes a matrix-matrix product with general matrices where one or both input matrices are stored in a packed data structure and adds the result to a scalar-matrix product.

### Description

The `cblas_?gemm_compute` routine is one of a set of related routines that enable use of an internal packed storage. After calling `cblas_?gemm_pack` call `cblas_?gemm_compute` to compute

$$C := \text{op}(A) * \text{op}(B) + \text{beta} * C,$$

where:

$\text{op}(X)$  is one of the operations  $\text{op}(X) = X$ ,  $\text{op}(X) = X^T$ , or  $\text{op}(X) = X^H$ ,

$\text{beta}$  is a scalar,

$A$ ,  $B$ , and  $C$  are matrices:

$\text{op}(A)$  is an  $m$ -by- $k$  matrix,

$\text{op}(B)$  is a  $k$ -by- $n$  matrix,

$C$  is an  $m$ -by- $n$  matrix.

#### NOTE

You must use the same value of the `Layout` parameter for the entire sequence of related `cblas_?gemm_pack` and `cblas_?gemm_compute` calls.

For best performance, use the same number of threads for packing and for computing.

If packing for both  $A$  and  $B$  matrices, you must use the same number of threads for packing  $A$  as for packing  $B$ .

### Input Parameters

<code>Layout</code>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
---------------------	---

*transa*

Specifies the form of  $\text{op}(A)$  used in the matrix multiplication, one of the CBLAS\_TRANSPOSE or CBLAS\_STORAGE enumerated types:

If *transa* = CblasNoTrans  $\text{op}(A) = A$ .

If *transa* = CblasTrans  $\text{op}(A) = A^T$ .

If *transa* = CblasConjTrans  $\text{op}(A) = A^H$ .

If *transa* = CblasPacked the matrix in array *a* is packed and *lda* is ignored.

*transb*

Specifies the form of  $\text{op}(B)$  used in the matrix multiplication, one of the CBLAS\_TRANSPOSE or CBLAS\_STORAGE enumerated types:

If *transb* = CblasNoTrans  $\text{op}(B) = B$ .

If *transb* = CblasTrans  $\text{op}(B) = B^T$ .

If *transb* = CblasConjTrans  $\text{op}(B) = B^H$ .

If *transb* = CblasPacked the matrix in array *b* is packed and *ldb* is ignored.

*m*

Specifies the number of rows of the matrix  $\text{op}(A)$  and of the matrix *C*. The value of *m* must be at least zero.

*n*

Specifies the number of columns of the matrix  $\text{op}(B)$  and the number of columns of the matrix *C*. The value of *n* must be at least zero.

*k*

Specifies the number of columns of the matrix  $\text{op}(A)$  and the number of rows of the matrix  $\text{op}(B)$ . The value of *k* must be at least zero.

*a*

Array:

	<i>transa</i> = CblasNoTrans	<i>transa</i> = CblasTrans or <i>transa</i> = CblasConjTrans	<i>transa</i> = CblasPacked
<i>Layout</i> = CblasColMajor	Size $lda \cdot k$ . Before entry, the leading <i>m</i> -by- <i>k</i> part of the array <i>a</i> must contain the matrix <i>A</i> .	Size $lda \cdot m$ . Before entry, the leading <i>k</i> -by- <i>m</i> part of the array <i>a</i> must contain the matrix <i>A</i> .	Stored in internal packed format.
<i>Layout</i> = CblasRowMajor	Size $lda \cdot m$ . Before entry, the leading <i>k</i> -by- <i>m</i> part of the array <i>a</i> must contain the matrix <i>A</i> .	Size $lda \cdot k$ . Before entry, the leading <i>m</i> -by- <i>k</i> part of the array <i>a</i> must contain the matrix <i>A</i> .	Stored in internal packed format.

*lda*

Specifies the leading dimension of *a* as declared in the calling (sub)program.

	<i>transa</i> = CblasNoTrans	<i>transa</i> = CblasTrans or <i>transa</i> = CblasConjTrans	<i>transa</i> = CblasPacked
<i>Layout</i> = CblasColMajor	<i>lda</i> must be at least $\max(1, m)$ .	<i>lda</i> must be at least $\max(1, k)$ .	<i>lda</i> is ignored.
<i>Layout</i> = CblasRowMajor	<i>lda</i> must be at least $\max(1, k)$ .	<i>lda</i> must be at least $\max(1, m)$ .	<i>lda</i> is ignored.

*b*

Array:

	<i>transb</i> = CblasNoTrans	<i>transb</i> = CblasTrans or <i>transb</i> = CblasConjTrans	<i>transb</i> = CblasPacked
<i>Layout</i> = CblasColMajor	Size $ldb*n$ . Before entry, the leading <i>k</i> -by- <i>n</i> part of the array <i>b</i> must contain the matrix <i>B</i> .	Size $ldb*k$ . Before entry, the leading <i>n</i> -by- <i>k</i> part of the array <i>b</i> must contain the matrix <i>B</i> .	Stored in internal packed format.
<i>Layout</i> = CblasRowMajor	Size $ldb*k$ . Before entry, the leading <i>n</i> -by- <i>k</i> part of the array <i>b</i> must contain the matrix <i>B</i> .	Size $ldb*n$ . Before entry, the leading <i>k</i> -by- <i>n</i> part of the array <i>b</i> must contain the matrix <i>B</i> .	Stored in internal packed format.

*ldb*Specifies the leading dimension of *b* as declared in the calling (sub)program.

	<i>transb</i> = CblasNoTrans	<i>transb</i> = CblasTrans or <i>transb</i> = CblasConjTrans	<i>transb</i> = CblasPacked
<i>Layout</i> = CblasColMajor	<i>ldb</i> must be at least $\max(1, k)$ .	<i>ldb</i> must be at least $\max(1, n)$ .	<i>ldb</i> is ignored.
<i>Layout</i> = CblasRowMajor	<i>ldb</i> must be at least $\max(1, n)$ .	<i>ldb</i> must be at least $\max(1, k)$ .	<i>ldb</i> is ignored.

*beta* Specifies the scalar *beta*. When *beta* is equal to zero, then *c* need not be set on input.

*c* Array:

<i>Layout</i> = CblasColMajor	Size <i>ldc</i> * <i>n</i> . Before entry, the leading <i>m</i> -by- <i>n</i> part of the array <i>c</i> must contain the matrix <i>C</i> , except when <i>beta</i> is equal to zero, in which case <i>c</i> need not be set on entry.
<i>Layout</i> = CblasRowMajor	Size <i>ldc</i> * <i>m</i> . Before entry, the leading <i>n</i> -by- <i>m</i> part of the array <i>c</i> must contain the matrix <i>C</i> , except when <i>beta</i> is equal to zero, in which case <i>c</i> need not be set on entry.

*ldc* Specifies the leading dimension of *c* as declared in the calling (sub)program.

<i>Layout</i> = CblasColMajor	<i>ldc</i> must be at least $\max(1, m)$ .
<i>Layout</i> = CblasRowMajor	<i>ldc</i> must be at least $\max(1, n)$ .

## Output Parameters

*c* Overwritten by the *m*-by-*n* matrix  $\text{op}(A) * \text{op}(B) + \text{beta} * C$ .

## Description

The `cblas_gemm*_compute` routine is one of a set of related routines that enable use of an internal packed storage. After calling `cblas_gemm*_pack` call `cblas_gemm*_compute` to compute

$$C := \alpha * (\text{op}(A) + A\_offset) * (\text{op}(B) + B\_offset) + \beta * C + C\_offset,$$

where:

$\text{op}(X)$  is either  $\text{op}(X) = X$  or  $\text{op}(X) = X^T$

$\alpha$  and  $\beta$  are scalars

$A$ ,  $B$ , and  $C$  are matrices:

$\text{op}(A)$  is an  $m$ -by- $k$  matrix,

$\text{op}(B)$  is a  $k$ -by- $n$  matrix,

$C$  is an  $m$ -by- $n$  matrix.

$A\_offset$  is an  $m$ -by- $k$  matrix with every element equal to the value  $oa$ .

$B\_offset$  is an  $k$ -by- $n$  matrix with every element equal to the value  $ob$ .

$C\_offset$  is an  $m$ -by- $n$  matrix defined by the `oc` array as described in the description of the `offsetc` parameter.

---

### NOTE

You must use the same value of the `Layout` parameter for the entire sequence of related `cblas_?gemm_pack` and `cblas_?gemm_compute` calls.

For best performance, use the same number of threads for packing and for computing.

If you are packing for both  $A$  and  $B$  matrices, you must use the same number of threads for packing  $A$  as for packing  $B$ .

---

## Input Parameters

<code>Layout</code>	<code>CBLAS_LAYOUT</code> Specifies whether two-dimensional array storage is row-major ( <code>CblasRowMajor</code> ) or column-major ( <code>CblasColMajor</code> ).
<code>transa</code>	<code>MKL_INT</code> Specifies the form of $\text{op}(A)$ used in the packing: If <code>transa = CblasNoTrans</code> $\text{op}(A) = A$ . If <code>transa = CblasTrans</code> $\text{op}(A) = A^T$ . If <code>transa = CblasPacked</code> the matrix in array <code>ais</code> is packed into a format internal to Intel® oneAPI Math Kernel Library (oneMKL) and <code>lda</code> is ignored.
<code>transb</code>	<code>MKL_INT</code> Specifies the form of $\text{op}(B)$ used in the packing: If <code>transb = CblasNoTrans</code> $\text{op}(B) = B$ . If <code>transb = CblasTrans</code> $\text{op}(B) = B^T$ . If <code>transb = CblasPacked</code> the matrix in array <code>bis</code> is packed into a format internal to Intel® oneAPI Math Kernel Library (oneMKL) and <code>ldb</code> is ignored.
<code>offsetc</code>	<code>CBLAS_OFFSET</code> Specifies the form of $C\_offset$ used in the matrix multiplication.

If `offsetc=CblasFixOffset` :`oc` has a single element and every element of `C_offset` is equal to this element.

If `offsetc=CblasColOffset` :`oc` has a size of  $m$  and every element of `C_offset` is equal to `oc`.

If `offsetc=CblasRowOffset` :`oc` has a size of  $n$  and every element of `C_offset` is equal to `oc`.

$m$  MKL\_INT Specifies the number of rows of the matrix  $op(A)$  and of the matrix  $C$ . The value of  $m$  must be at least zero.

$n$  MKL\_INT Specifies the number of columns of the matrix  $op(B)$  and the number of columns of the matrix  $C$ . The value of  $n$  must be at least zero.

$k$  MKL\_INT Specifies the number of columns of the matrix  $op(A)$  and the number of rows of the matrix  $op(B)$ . The value of  $k$  must be at least zero.

`alpha` float Specifies the scalar `alpha`.

float

Specifies the scalar  $\beta$ .*c*

MKL\_INT32\*

Array:

<i>Layout</i> = CblasColMajor	<p>Array, size <math>ldc*n</math>.</p> <p>Before entry, the leading <math>m</math>-by-<math>n</math> part of the array <math>c</math> must contain the matrix <math>C</math>, except when <math>\beta</math> is equal to zero, in which case <math>c</math> need not be set on entry.</p>
<i>Layout</i> = CblasRowMajor	Array, size $ldc*m$ .

	Before entry, the leading $n$ -by- $m$ part of the array $c$ must contain the matrix $C$ , except when $beta$ is equal to zero, in which case $c$ need not be set on entry.
--	---

*ldc* MKL\_INT Specifies the leading dimension of  $c$  as declared in the calling (sub)program.

<i>Layout</i> = CblasColMajor	<i>ldc</i> must be at least $\max(1, m)$
<i>Layout</i> = CblasRowMajor	<i>ldc</i> must be at least $\max(1, n)$

*oc* MKL\_INT32\*

Array, size *len*. Specifies the scalar offset value for the matrix  $C$ .

If *offsetc* = CblasFixOffset, *len* must be at least 1.

If *offsetc* = CblasColOffset, *len* must be at least  $\max(1, m)$ .

If *offsetc* = CblasRowOffset, *len* must be at least  $\max(1, n)$ .

## Output Parameters

*c* MKL\_INT32\*  
Overwritten by the matrix  $alpha*(op(A) + A\_offset)*(op(B) + B\_offset) + beta*C + C\_offset$ .

## Example

See the following examples in the MKL installation directory to understand the use of these routines:

`cblas_gemm_s8u8s32_compute: examples\cblas\source\cblas_gemm_s8u8s32_computex.c`

`cblas_gemm_s16s16s32_compute: examples\cblas\source\cblas_gemm_s16s16s32_computex.c`

## Application Notes

You can expand the matrix-matrix product in this manner:

$$(op(A) + A\_offset)*(op(B) + B\_offset) = op(A)*op(B) + op(A)*B\_offset + A\_offset*op(B) + A\_offset*B\_offset$$

After computing these four multiplication terms separately, they are summed from left to right. The results from the matrix-matrix product and the  $C$  matrix are scaled with  $alpha$  and  $beta$  floating-point values respectively using double-precision arithmetic. Before storing the results to the output  $c$  array, the floating-point values are rounded to the nearest integers.

In the event of overflow or underflow, the results depend on the architecture. The results are either unsaturated (wrapped) or saturated to maximum or minimum representable integer values for the data type of the output matrix.

When using `cblas_gemm_s8u8s32_compute` with row-major layout, the data types of  $A$  and  $B$  must be swapped. That is, you must provide an 8-bit unsigned integer array for matrix  $A$  and an 8-bit signed integer array for matrix  $B$ .

## See Also

`cblas_gemm_*_pack_get_size`

to return the number of bytes needed to store the packed matrix.

`cblas_gemm_*_pack`

to pack the matrix into the buffer allocated previously.

### **cblas\_gemm\_bf16bf16f32\_compute**

Computes a matrix-matrix product with general bfloat16 matrices (where one or both input matrices are stored in a packed data structure) and adds the result to a scalar-matrix product.

#### **Syntax**

##### **C:**

```
void cblas_gemm_bf16bf16f32_compute (const CBLAS_LAYOUT Layout, const MKL_INT transa,
const MKL_INT transb, const MKL_INT m, const MKL_INT n, const MKL_INT k, const float
alpha, const MKL_BF16 *a, const MKL_INT lda, const MKL_BF16 *b, const MKL_INT ldb,
const float beta, float *c, const MKL_INT ldc);
```

#### **Include Files**

- mkl.h

#### **Description**

The `cblas_gemm_bf16bf16f32_compute` routine is one of a set of related routines that enable use of an internal packed storage. After calling `cblas_gemm_bf16bf16f32_pack` call `cblas_gemm_bf16bf16f32_compute` to compute

$$C := \alpha * \text{op}(A) * \text{op}(B) + \beta * C,$$

where:

- $\text{op}(X)$  is either  $\text{op}(X) = X$  or  $\text{op}(X) = X^T$ ,
- $\alpha$  and  $\beta$  are scalars,
- $A$ ,  $B$ , and  $C$  are matrices:
- $\text{op}(A)$  is an  $m$ -by- $k$  matrix,
- $\text{op}(B)$  is a  $k$ -by- $n$  matrix,
- $C$  is an  $m$ -by- $n$  matrix.

---

#### **NOTE**

You must use the same value of the `Layout` parameter for the entire sequence of related `cblas_gemm_bf16bf16f32_pack` and `cblas_gemm_bf16bf16f32_compute` calls.

For best performance, use the same number of threads for packing and for computing.

If packing for both  $A$  and  $B$  matrices, you must use the same number of threads for packing  $A$  as for packing  $B$ .

---

#### **Input Parameters**

<code>Layout</code>	CBLAS_LAYOUT Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<code>transa</code>	MKL_INT Specifies the form of $\text{op}(A)$ used in the packing: If <code>transa = CblasNoTrans</code> $\text{op}(A) = A$ .

If  $transa = \text{CblasTrans}$   $op(A) = A^T$ .

If  $transa = \text{CblasPacked}$  the matrix in array  $a$  is packed into a format internal to Intel® oneAPI Math Kernel Library (oneMKL) and  $lda$  is ignored.

$transb$

MKL\_INT

Specifies the form of  $op(B)$  used in the packing:

If  $transb = \text{CblasNoTrans}$   $op(B) = B$ .

If  $transb = \text{CblasTrans}$   $op(B) = B^T$ .

If  $transb = \text{CblasPacked}$  the matrix in array  $b$  is packed into a format internal to Intel® oneAPI Math Kernel Library (oneMKL) and  $ldb$  is ignored.

$m$

MKL\_INT

Specifies the number of rows of the matrix  $op(A)$  and of the matrix  $C$ . The value of  $m$  must be at least zero.

$n$

MKL\_INT

Specifies the number of columns of the matrix  $op(B)$  and the number of columns of the matrix  $C$ . The value of  $n$  must be at least zero.

$k$

MKL\_INT

Specifies the number of columns of the matrix  $op(A)$  and the number of rows of the matrix  $op(B)$ . The value of  $k$  must be at least zero.

$alpha$

float

Specifies the scalar  $alpha$ .

```

## Application Notes

On architectures without native `bfloat16` hardware instructions, matrix  $A$  and  $B$  are upconverted to single precision and `SGEMM` is called to compute matrix multiplication operation.

### `cblas_gemm_bf16bf16f32`

Computes a matrix-matrix product with general `bfloat16` matrices.

#### Syntax

```
void cblas_gemm_bf16bf16f32 (const CBLAS_LAYOUT Layout, const CBLAS_TRANSPOSE transa,
const CBLAS_TRANSPOSE transb, const MKL_INT m, const MKL_INT n, const MKL_INT k, const
float alpha, const MKL_BF16 *a, const MKL_INT lda, const MKL_BF16 *b, const MKL_INT
ldb, const float beta, float *c, const MKL_INT ldc);
```

#### Include Files

- `mkl.h`

#### Description

The `cblas_gemm_bf16bf16f32` routines compute a scalar-matrix-matrix product and adds the result to a scalar-matrix product. The operation is defined as:

$$C := \alpha * \text{op}(A) * \text{op}(B) + \beta * C$$

where :

- $\text{op}(X)$  is one of  $\text{op}(X) = X$  or  $\text{op}(X) = X^T$ ,
- $\alpha$  and  $\beta$  are scalars,
- $A$ ,  $B$ , and  $C$  are matrices
- $\text{op}(A)$  is  $m$ -by- $k$  matrix,
- $\text{op}(B)$  is  $k$ -by- $n$  matrix,
- $C$  is an  $m$ -by- $n$  matrix.

#### Input Parameters

<code>Layout</code>	Specifies whether two-dimensional array storage is row-major ( <code>CblasRowMajor</code> ) or column-major ( <code>CblasColMajor</code> ).
<code>transa</code>	Specifies the form of $\text{op}(A)$ used in the matrix multiplication: if <code>transa=CblasNoTrans</code> , then $\text{op}(A) = A$ ; if <code>transa=CblasTrans</code> , then $\text{op}(A) = A^T$ .
<code>transb</code>	Specifies the form of $\text{op}(B)$ used in the matrix multiplication: if <code>transb=CblasNoTrans</code> , then $\text{op}(B) = B$ ; if <code>transb=CblasTrans</code> , then $\text{op}(B) = B^T$ .
<code>m</code>	Specifies the number of rows of the matrix $\text{op}(A)$ and of the matrix $C$ . The value of $m$ must be at least zero.
<code>n</code>	Specifies the number of columns of the matrix $\text{op}(B)$ and the number of columns of the matrix $C$ . The value of $n$ must be at least zero.

*k* Specifies the number of columns of the matrix  $op(A)$  and the number of rows of the matrix  $op(B)$ . The value of *k* must be at least zero.

*alpha* Specifies the scalar *alpha*.

*a*

	<i>transa</i> =CblasNoTrans	<i>transa</i> =CblasTrans
<i>Layout</i> = CblasColMajor	Array, size $lda*k$ Before entry, the leading $m$ -by- $k$ part of the array <i>a</i> must contain the matrix <i>A</i> .	Array, size $lda*m$ Before entry, the leading $k$ -by- $m$ part of the array <i>a</i> must contain the matrix <i>A</i> .
<i>Layout</i> = CblasRowMajor	Array, size $lda*m$ Before entry, the leading $k$ -by- $m$ part of the array <i>a</i> must contain the matrix.	Array, size $lda*k$ Before entry, the leading $m$ -by- $k$ part of the array <i>a</i> must contain the matrix.

*lda* Specifies the leading dimension of *a* as declared in the calling (sub)program.

	<i>transa</i> =CblasNoTrans	<i>transa</i> =CblasTrans
<i>Layout</i> = CblasColMajor	<i>lda</i> must be at least $\max(1, m)$ .	<i>lda</i> must be at least $\max(1, k)$ .
<i>Layout</i> = CblasRowMajor	<i>lda</i> must be at least $\max(1, k)$ .	<i>lda</i> must be at least $\max(1, m)$ .

*b*

	<i>transb</i> =CblasNoTrans	<i>transb</i> =CblasTrans
<i>Layout</i> = CblasColMajor	Array, size $ldb$ by $n$ Before entry, the leading $k$ -by- $n$ part of the array <i>b</i> must contain the matrix <i>B</i> .	Array, size $ldb$ by $k$ Before entry the leading $n$ -by- $k$ part of the array <i>b</i> must contain the matrix <i>B</i> .
<i>Layout</i> = CblasRowMajor	Array, size $ldb$ by $k$ Before entry the leading $n$ -by- $k$ part of the array <i>b</i> must contain the matrix <i>B</i> .	Array, size $ldb$ by $n$ Before entry, the leading $k$ -by- $n$ part of the array <i>b</i> must contain the matrix <i>B</i> .

*ldb* Specifies the leading dimension of *b* as declared in the calling (sub)program.

	<i>transb</i> =CblasNoTrans	<i>transb</i> =CblasTrans

<i>Layout</i> = CblasColMajor	<i>ldb</i> must be at least $\max(1, k)$ .	<i>ldb</i> must be at least $\max(1, n)$ .
<i>Layout</i> = CblasRowMajor	<i>ldb</i> must be at least $\max(1, n)$ .	<i>ldb</i> must be at least $\max(1, k)$ .

*beta*

Specifies the scalar *beta*. When *beta* is equal to zero, then *c* need not be set on input.

*c*

<i>Layout</i> = CblasColMajor	Array, size <i>ldc</i> by <i>n</i> . Before entry, the leading <i>m</i> -by- <i>n</i> part of the array <i>c</i> must contain the matrix <i>C</i> , except when <i>beta</i> is equal to zero, in which case <i>c</i> need not be set on entry.
<i>Layout</i> = CblasRowMajor	Array, size <i>ldc</i> by <i>m</i> . Before entry, the leading <i>n</i> -by- <i>m</i> part of the array <i>c</i> must contain the matrix <i>C</i> , except when <i>beta</i> is equal to zero, in which case <i>c</i> need not be set on entry.

*ldc*

Specifies the leading dimension of *c* as declared in the calling (sub)program.

<i>Layout</i> = CblasColMajor	<i>ldc</i> must be at least $\max(1, m)$ .
<i>Layout</i> = CblasRowMajor	<i>ldc</i> must be at least $\max(1, n)$ .

## Output Parameters

*c*

Overwritten by  $\alpha * \text{op}(A) * \text{op}(B) + \text{beta} * C$ .

## Example

For examples of routine usage, see these code examples in the Intel® oneAPI Math Kernel Library (oneMKL) installation directory:

- `cblas_gemm_bf16bf16f32: examples\cblas\source\cblas_gemm_bf16bf16f32x.c`

## Application Notes

On architectures without native bfloat16 hardware instructions, matrix *A* and *B* are upconverted to single precision and `SGEMM` is called to compute matrix multiplication operation.

### `cblas_gemm_f16f16f32_compute`

Computes a matrix-matrix product with general matrices of half-precision data type (where one or both input matrices are stored in a packed data structure) and adds the result to a scalar-matrix product.

## Syntax

**C:**

```
void cblas_gemm_f16f16f32_compute (const CBLAS_LAYOUT Layout, const MKL_INT transa,
const MKL_INT transb, const MKL_INT m, const MKL_INT n, const MKL_INT k, const float
alpha, const MKL_F16 *a, const MKL_INT lda, const MKL_F16 *b, const MKL_INT ldb, const
float beta, float *c, const MKL_INT ldc);
```

## Include Files

- mkl.h

## Description

The `cblas_gemm_f16f16f32_compute` routine is one of a set of related routines that enable use of an internal packed storage. After calling `cblas_gemm_f16f16f32_pack` call `cblas_gemm_f16f16f32_compute` to compute

$$C := \alpha * \text{op}(A) * \text{op}(B) + \beta * C,$$

where:

- $\text{op}(X)$  is either  $\text{op}(X) = X$  or  $\text{op}(X) = X^T$ ,
- $\alpha$  and  $\beta$  are scalars,
- $A$ ,  $B$ , and  $C$  are matrices:
- $\text{op}(A)$  is an  $m$ -by- $k$  matrix,
- $\text{op}(B)$  is a  $k$ -by- $n$  matrix,
- $C$  is an  $m$ -by- $n$  matrix.

---

### NOTE

You must use the same value of the `Layout` parameter for the entire sequence of related `cblas_gemm_f16f16f32_pack` and `cblas_gemm_f16f16f32_compute` calls.

For best performance, use the same number of threads for packing and for computing.

If packing for both  $A$  and  $B$  matrices, you must use the same number of threads for packing  $A$  as for packing  $B$ .

---

## Input Parameters

<code>Layout</code>	CBLAS_LAYOUT Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<code>transa</code>	MKL_INT Specifies the form of $\text{op}(A)$ used in the packing: If <code>transa = CblasNoTrans</code> $\text{op}(A) = A$ . If <code>transa = CblasTrans</code> $\text{op}(A) = A^T$ . If <code>transa = CblasPacked</code> the matrix in array <code>a</code> is packed into a format internal to Intel® oneAPI Math Kernel Library (oneMKL) and <code>lda</code> is ignored.
<code>transb</code>	MKL_INT Specifies the form of $\text{op}(B)$ used in the packing: If <code>transb = CblasNoTrans</code> $\text{op}(B) = B$ .

If  $transb = \text{CblasTrans}$   $op(B) = B^T$ .

If  $transb = \text{CblasPacked}$  the matrix in array  $b$  is packed into a format internal to Intel® oneAPI Math Kernel Library (oneMKL) and  $ldb$  is ignored.

$m$

MKL\_INT

Specifies the number of rows of the matrix  $op(A)$  and of the matrix  $C$ . The value of  $m$  must be at least zero.

$n$

MKL\_INT

Specifies the number of columns of the matrix  $op(B)$  and the number of columns of the matrix  $C$ . The value of  $n$  must be at least zero.

$k$

MKL\_INT

Specifies the number of columns of the matrix  $op(A)$  and the number of rows of the matrix  $op(B)$ . The value of  $k$  must be at least zero.

$alpha$

float

Specifies the scalar  $alpha$ .

$a$

MKL\_F16\*

	$transa = \text{CblasNoTrans}$	$transa = \text{CblasTrans}$	$transa = \text{CblasPacked}$
$Layout = \text{CblasColMajor}$	Array, size $lda*k$ . Before entry, the leading $m$ -by- $k$ part of the array $a$ must contain the matrix $A$ .	Array, size $lda*m$ . Array size returned by <code>cblas_gemm_f16f16f32_pack</code> and initialized using <code>cblas_gemm_f16f16f32_pack</code> .

*ldb*

MKL\_INT

Specifies the leading dimension of  $b$  as declared in the calling (sub)program.

	<i>transb</i> = CblasNoTrans	<i>transb</i> = CblasTrans
<i>Layout</i> = CblasColMajor	<i>ldb</i> must be at least $\max(1, k)$ .	<i>ldb</i> must be at least $\max(1, n)$ .
<i>Layout</i> = CblasRowMajor	<i>ldb</i> must be at least $\max(1, n)$ .	<i>ldb</i> must be at least $\max(1, k)$ .

*beta*

float

Specifies the scalar *beta*.

*c*

float\*

<i>Layout</i> = CblasColMajor	Array, size <i>ldc</i> * <i>n</i> . Before entry, the leading <i>m</i> -by- <i>n</i> part of the array <i>c</i> must contain the matrix <i>C</i> , except when <i>beta</i> is equal to zero, in which case <i>c</i> need not be set on entry.
<i>Layout</i> = CblasRowMajor	Array, size <i>ldc</i> * <i>m</i> . Before entry, the leading <i>n</i> -by- <i>m</i> part of the array <i>c</i> must contain the matrix <i>C</i> , except when <i>beta</i> is equal to zero, in which case <i>c</i> need not be set on entry.

*ldc*

MKL\_INT

Specifies the leading dimension of *c* as declared in the calling (sub)program.

<i>Layout</i> = CblasColMajor	<i>ldc</i> must be at least $\max(1, m)$ .
<i>Layout</i> = CblasRowMajor	<i>ldc</i> must be at least $\max(1, n)$ .

## Output Parameters

*c*

float\*

Overwritten by the matrix  $\alpha * \text{op}(A) * \text{op}(B) + \beta * C$ .

## Example

See the following examples in the Intel® oneAPI Math Kernel Library (oneMKL) installation directory to understand the use of these routines:

```
cblas_gemm_f16f16f32_compute:
examples\cblas\source\cblas_gemm_f16f16f32_computex.c
```

## Application Notes

On architectures without native half precision hardware instructions, matrix *A* and *B* are upconverted to single precision and `SGEMM` is called to compute matrix multiplication operation.

## cblas\_gemm\_f16f16f32

*Computes a matrix-matrix product with general matrices of half precision data type.*

### Syntax

```
void cblas_gemm_f16f16f32 (const CBLAS_LAYOUT Layout, const CBLAS_TRANSPOSE transa,
const CBLAS_TRANSPOSE transb, const MKL_INT m, const MKL_INT n, const MKL_INT k, const
float alpha, const MKL_F16 *a, const MKL_INT lda, const MKL_F16 *b, const MKL_INT ldb,
const float beta, float *c, const MKL_INT ldc);
```

## Include Files

- mkl.h

## Description

The `cblas_gemm_f16f16f32` routines compute a scalar-matrix-matrix product and adds the result to a scalar-matrix product. The operation is defined as:

$$C := \alpha * \text{op}(A) * \text{op}(B) + \beta * C$$

where :

$\text{op}(X)$  is one of  $\text{op}(X) = X$  or  $\text{op}(X) = X^T$ ,

$\alpha$  and  $\beta$  are scalars,

$A$ ,  $B$ , and  $C$  are matrices

$\text{op}(A)$  is  $m$ -by- $k$  matrix,

$\text{op}(B)$  is  $k$ -by- $n$  matrix,

$C$  is an  $m$ -by- $n$  matrix.

## Input Parameters

<i>Layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>transa</i>	Specifies the form of $\text{op}(A)$ used in the matrix multiplication: if $transa=CblasNoTrans$ , then $\text{op}(A) = A$ ; if $transa=CblasTrans$ , then $\text{op}(A) = A^T$ .
<i>transb</i>	Specifies the form of $\text{op}(B)$ used in the matrix multiplication: if $transb=CblasNoTrans$ , then $\text{op}(B) = B$ ; if $transb=CblasTrans$ , then $\text{op}(B) = B^T$ .
<i>m</i>	Specifies the number of rows of the matrix $\text{op}(A)$ and of the matrix $C$ . The value of $m$ must be at least zero.
<i>n</i>	Specifies the number of columns of the matrix $\text{op}(B)$ and the number of columns of the matrix $C$ . The value of $n$ must be at least zero.
<i>k</i>	Specifies the number of columns of the matrix $\text{op}(A)$ and the number of rows of the matrix $\text{op}(B)$ . The value of $k$ must be at least zero.
<i>alpha</i>	Specifies the scalar $\alpha$ .

*a*

	<i>transa</i> =CblasNoTrans	<i>transa</i> =CblasTrans
<i>Layout</i> = CblasColMajor	Array, size $lda*k$ Before entry, the leading $m$ -by- $k$ part of the array <i>a</i> must contain the matrix <i>A</i> .	Array, size $lda*m$ Before entry, the leading $k$ -by- $m$ part of the array <i>a</i> must contain the matrix <i>A</i> .
<i>Layout</i> = CblasRowMajor	Array, size $lda*m$	Array, size $lda*k$

	Before entry, the leading $k$ -by- $m$ part of the array $a$ must contain the matrix.	Before entry, the leading $m$ -by- $k$ part of the array $a$ must contain the matrix.
--	---	---

*lda*

Specifies the leading dimension of  $a$  as declared in the calling (sub)program.

	<i>transa</i> =CblasNoTrans	<i>transa</i> =CblasTrans
<i>Layout</i> = CblasColMajor	<i>lda</i> must be at least $\max(1, m)$ .	<i>lda</i> must be at least $\max(1, k)$ .
<i>Layout</i> = CblasRowMajor	<i>lda</i> must be at least $\max(1, k)$ .	<i>lda</i> must be at least $\max(1, m)$ .

*b*

	<i>transb</i> =CblasNoTrans	<i>transb</i> =CblasTrans
<i>Layout</i> = CblasColMajor	Array, size <i>ldb</i> by $n$ Before entry, the leading $k$ -by- $n$ part of the array $b$ must contain the matrix $B$ .	Array, size <i>ldb</i> by $k$ Before entry the leading $n$ -by- $k$ part of the array $b$ must contain the matrix $B$ .
<i>Layout</i> = CblasRowMajor	Array, size <i>ldb</i> by $k$ Before entry the leading $n$ -by- $k$ part of the array $b$ must contain the matrix $B$ .	Array, size <i>ldb</i> by $n$ Before entry, the leading $k$ -by- $n$ part of the array $b$ must contain the matrix $B$ .

*ldb*

Specifies the leading dimension of  $b$  as declared in the calling (sub)program.

	<i>transb</i> =CblasNoTrans	<i>transb</i> =CblasTrans
<i>Layout</i> = CblasColMajor	<i>ldb</i> must be at least $\max(1, k)$ .	<i>ldb</i> must be at least $\max(1, n)$ .
<i>Layout</i> = CblasRowMajor	<i>ldb</i> must be at least $\max(1, n)$ .	<i>ldb</i> must be at least $\max(1, k)$ .

*beta*

Specifies the scalar *beta*. When *beta* is equal to zero, then  $c$  need not be set on input.

*c*

<i>Layout</i> = CblasColMajor	Array, size <i>ldc</i> by $n$ . Before entry, the leading $m$ -by- $n$ part of the array $c$ must contain the matrix $C$ , except when <i>beta</i> is equal to zero, in which case $c$ need not be set on entry.
-------------------------------	--

<i>Layout</i> = CblasRowMajor	Array, size <i>ldc</i> by <i>m</i> . Before entry, the leading <i>n</i> -by- <i>m</i> part of the array <i>c</i> must contain the matrix <i>C</i> , except when <i>beta</i> is equal to zero, in which case <i>c</i> need not be set on entry.
----------------------------------	--

*ldc*

Specifies the leading dimension of *c* as declared in the calling (sub)program.

<i>Layout</i> = CblasColMajor	<i>ldc</i> must be at least $\max(1, m)$ .
<i>Layout</i> = CblasRowMajor	<i>ldc</i> must be at least $\max(1, n)$ .

## Output Parameters

*c*

Overwritten by  $\alpha * \text{op}(A) * \text{op}(B) + \beta * C$ .

## Example

For examples of routine usage, see these code examples in the Intel® oneAPI Math Kernel Library (oneMKL) installation directory:

- `cblas_gemm_f16f16f32: examples\cblas\source\cblas_gemm_f16f16f32x.c`

## Application Notes

On architectures without native half precision hardware instructions, matrix *A* and *B* are upconverted to single precision and `SGEMM` is called to compute matrix multiplication operation.

## `cblas_?gemm_free`

*Frees the storage previously allocated for the packed matrix (deprecated).*

## Syntax

```
void cblas_sgemm_free (float *dest);
void cblas_dgemm_free (double *dest);
```

## Include Files

- `mkl.h`

## Description

The `cblas_?gemm_free` routine is one of a set of related routines that enable use of an internal packed storage. Call the `cblas_?gemm_free` routine last to release storage for the packed matrix structure allocated with `cblas_?gemm_alloc` (deprecated).

## Input Parameters

*dest*

Previously allocated storage.

## Output Parameters

*dest*

The freed buffer.

## See Also

[cblas\\_?gemm\\_pack](#) Performs scaling and packing of the matrix into the previously allocated buffer.  
[cblas\\_?gemm\\_compute](#) Computes a matrix-matrix product with general matrices where one or both input matrices are stored in a packed data structure and adds the result to a scalar-matrix product.

```

## Include Files

- mkl.h

## Description

The `cblas_gemm_*` routines compute a scalar-matrix-matrix product and adds the result to a scalar-matrix product. To get the final result, a vector is added to each row or column of the output matrix. The operation is defined as:

$$C := \alpha * (\text{op}(A) + A\_offset) * (\text{op}(B) + B\_offset) + \beta * C + C\_offset$$

where :

$\text{op}(X)$  is either  $\text{op}(X) = X$  or  $\text{op}(X) = X^T$ ,

$A\_offset$  is an  $m$ -by- $k$  matrix with every element equal to the value  $oa$ ,

$B\_offset$  is a  $k$ -by- $n$  matrix with every element equal to the value  $ob$ ,

$C\_offset$  is an  $m$ -by- $n$  matrix defined by the  $oc$  array as described in the description of the  $offsetc$  parameter,

$\alpha$  and  $\beta$  are scalars,

$A$  is a matrix such that  $\text{op}(A)$  is  $m$ -by- $k$ ,

$B$  is a matrix such that  $\text{op}(B)$  is  $k$ -by- $n$ ,

and  $C$  is an  $m$ -by- $n$  matrix.

## Input Parameters

<i>Layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>transa</i>	Specifies the form of $\text{op}(A)$ used in the matrix multiplication:

if *transa*=CblasNoTrans, then  $op(A) = A$ ;  
 if *transa*=CblasTrans, then  $op(A) = A^T$ .

*transb*

Specifies the form of  $op(B)$  used in the matrix multiplication:

if *transb*=CblasNoTrans, then  $op(B) = B$ ;  
 if *transb*=CblasTrans, then  $op(B) = B^T$ .

*offsetc*

Specifies the form of *C\_offset* used in the matrix multiplication.

*offsetc* = CblasFixOffset: *oc* has a single element and every element of *C\_offset* is equal to this element.  
*offsetc* = CblasColOffset: *oc* has a size of *m* and every column of *C\_offset* is equal to *oc*.  
*offsetc* = CblasRowOffset: *oc* has a size of *n* and every row of *C\_offset* is equal to *oc*.

*m*

Specifies the number of rows of the matrix  $op(A)$  and of the matrix *C*. The value of *m* must be at least zero.

*n*

Specifies the number of columns of the matrix  $op(B)$  and the number of columns of the matrix *C*. The value of *n* must be at least zero.

*k*

Specifies the number of columns of the matrix  $op(A)$  and the number of rows of the matrix  $op(B)$ . The value of *k* must be at least zero.

*alpha*

. Specifies the scalar *alpha*.

*a*

	<i>transa</i> =CblasNoTrans	<i>transa</i> =CblasTrans
<i>Layout</i> = CblasColMajor	Array, size <i>lda</i> * <i>k</i> Before entry, the leading <i>m</i> -by- <i>k</i> part of the array <i>a</i> must contain the matrix <i>A</i> of 8-bit signed integers for <code>cblas_gemm_s8u8s32</code> or 16-bit signed integers for <code>cblas_gemm_s16s16s32</code> .	Array, size <i>lda</i> * <i>m</i> Before entry, the leading <i>k</i> -by- <i>m</i> part of the array <i>a</i> must contain the matrix <i>A</i> of 8-bit signed integers for <code>cblas_gemm_s8u8s32</code> or 16-bit signed integers for <code>cblas_gemm_s16s16s32</code> .
<i>Layout</i> = CblasRowMajor	Array, size <i>lda</i> * <i>m</i> Before entry, the leading <i>k</i> -by- <i>m</i> part of the array <i>a</i> must contain the matrix <i>A</i> of 8-bit unsigned integers for <code>cblas_gemm_s8u8s32</code> or 16-bit signed integers for <code>cblas_gemm_s16s16s32</code> .	Array, size <i>lda</i> * <i>k</i> Before entry, the leading <i>m</i> -by- <i>k</i> part of the array <i>a</i> must contain the matrix <i>A</i> of 8-bit unsigned integers for <code>cblas_gemm_s8u8s32</code> or 16-bit signed integers for <code>cblas_gemm_s16s16s32</code> .

*lda*

Specifies the leading dimension of *a* as declared in the calling (sub)program.

	<i>transa</i> =CblasNoTrans	<i>transa</i> =CblasTrans

<i>Layout</i> = CblasColMajor	<i>lda</i> must be at least $\max(1, m)$ .	<i>lda</i> must be at least $\max(1, k)$ .
<i>Layout</i> = CblasRowMajor	<i>lda</i> must be at least $\max(1, k)$ .	<i>lda</i> must be at least $\max(1, m)$ .

*oa*Specifies the scalar offset value for matrix *A*.*b*

	<i>transb</i> =CblasNoTrans	<i>transb</i> =CblasTrans
<i>Layout</i> = CblasColMajor	Array, size <i>ldb</i> by <i>n</i> Before entry, the leading <i>k</i> -by- <i>n</i> part of the array <i>b</i> must contain the matrix <i>B</i> of 8-bit unsigned integers for <code>cblas_gemm_s8u8s32</code> or 16-bit signed integers for <code>cblas_gemm_s16s16s32</code> .	Array, size <i>ldb</i> by <i>k</i> Before entry the leading <i>n</i> -by- <i>k</i> part of the array <i>b</i> must contain the matrix <i>B</i> of 8-bit unsigned integers for <code>cblas_gemm_s8u8s32</code> or 16-bit signed integers for <code>cblas_gemm_s16s16s32</code> .
<i>Layout</i> = CblasRowMajor	Array, size <i>ldb</i> by <i>k</i> Before entry the leading <i>n</i> -by- <i>k</i> part of the array <i>b</i> must contain the matrix <i>B</i> of 8-bit signed integers for <code>cblas_gemm_s8u8s32</code> or 16-bit signed integers for <code>cblas_gemm_s16s16s32</code> .	Array, size <i>ldb</i> by <i>n</i> Before entry, the leading <i>k</i> -by- <i>n</i> part of the array <i>b</i> must contain the matrix <i>B</i> of 8-bit signed integers for <code>cblas_gemm_s8u8s32</code> or 16-bit signed integers for <code>cblas_gemm_s16s16s32</code> .

*ldb*Specifies the leading dimension of *b* as declared in the calling (sub)program.

	<i>transb</i> =CblasNoTrans	<i>transb</i> =CblasTrans
<i>Layout</i> = CblasColMajor	<i>ldb</i> must be at least $\max(1, k)$ .	<i>ldb</i> must be at least $\max(1, n)$ .
<i>Layout</i> = CblasRowMajor	<i>ldb</i> must be at least $\max(1, n)$ .	<i>ldb</i> must be at least $\max(1, k)$ .

*ob*Specifies the scalar offset value for matrix *B*.*beta*Specifies the scalar *beta*. When *beta* is equal to zero, then *c* need not be set on input.*c*

<i>Layout</i> = CblasColMajor	Array, size <i>ldc</i> by <i>n</i> . Before entry, the leading <i>m</i> -by- <i>n</i> part of the array <i>c</i> must contain the matrix <i>C</i> , except when <i>beta</i> is equal to zero, in which case <i>c</i> need not be set on entry.
----------------------------------	--

<i>Layout</i> = CblasRowMajor	Array, size <i>ldc</i> by <i>m</i> . Before entry, the leading <i>n</i> -by- <i>m</i> part of the array <i>c</i> must contain the matrix <i>C</i> , except when <i>beta</i> is equal to zero, in which case <i>c</i> need not be set on entry.
----------------------------------	--

*ldc*

Specifies the leading dimension of *c* as declared in the calling (sub)program.

<i>Layout</i> = CblasColMajor	<i>ldc</i> must be at least $\max(1, m)$ .
<i>Layout</i> = CblasRowMajor	<i>ldc</i> must be at least $\max(1, n)$ .

*oc*

Array, size *len*. Specifies the offset values for matrix *C*.

If *offsetc* = CblasFixOffset: *len* must be at least 1.

If *offsetc* = CblasColOffset: *len* must be at least  $\max(1, m)$ .

If *offsetc* = CblasRowOffset: *oc* must be at least  $\max(1, n)$ .

## Output Parameters

*c*

Overwritten by  $\alpha * (\text{op}(A) + A\_offset) * (\text{op}(B) + B\_offset) + \beta * C + C\_offset$ .

## Example

For examples of routine usage, see the code in in the following links and in the Intel® oneAPI Math Kernel Library (oneMKL) installation directory:

- `cblas_gemm_s8u8s32: examples\cblas\source\cblas_gemm_s8u8s32x.c`
- `cblas_gemm_s16s16s32: examples\cblas\source\cblas_gemm_s16s16s32x.c`

## Application Notes

The matrix-matrix product can be expanded:

$$(\text{op}(A) + A\_offset) * (\text{op}(B) + B\_offset)$$

$$= \text{op}(A) * \text{op}(B) + \text{op}(A) * B\_offset + A\_offset * \text{op}(B) + A\_offset * B\_offset$$

After computing these four multiplication terms separately, they are summed from left to right. The results from the matrix-matrix product and the *C* matrix are scaled with *alpha* and *beta* floating-point values respectively using double-precision arithmetic. Before storing the results to the output *c* array, the floating-point values are rounded to the nearest integers. In the event of overflow or underflow, the results depend on the architecture. The results are either unsaturated (wrapped) or saturated to maximum or minimum representable integer values for the data type of the output matrix.

When using `cblas_gemm_s8u8s32` with row-major layout, the data types of *A* and *B* must be swapped. That is, you must provide an 8-bit unsigned integer array for matrix *A* and an 8-bit signed integer array for matrix *B*.

Intermediate integer computations in `cblas_gemm_s8u8s32` on 64-bit Intel® Advanced Vector Extensions 2 (Intel® AVX2) and Intel® Advanced Vector Extensions 512 (Intel® AVX-512) architectures without Vector Neural Network Instructions (VNNI) extensions can saturate. This is because only 16-bits are available for the accumulation of intermediate results. You can avoid integer saturation by maintaining all integer elements of *A* or *B* matrices under 8 bits.

## cblas\_?gemv\_batch\_strided

Computes groups of matrix-vector product with general matrices.

### Syntax

```
void cblas_sgemv_batch_strided (const CBLAS_LAYOUT layout, const CBLAS_TRANSPOSE trans,

```
void cblas_zgemv_batch_strided (const CBLAS_LAYOUT layout, const CBLAS_TRANSPOSE trans,
const MKL_INT m, const MKL_INT n, const void alpha, const void *a, const MKL_INT lda,
const MKL_INT stridea, const void *x, const MKL_INT incx, const MKL_INT stridex, const
void beta, void *y, const MKL_INT incy, const MKL_INT stridey, const MKL_INT
batch_size);
```

### Include Files

- mkl.h

### Description

The `cblas_?gemv_batch_strided` routines perform a series of matrix-vector product added to a scaled vector. They are similar to the `cblas_?gemv` routine counterparts, but the `cblas_?gemv_batch_strided` routines perform matrix-vector operations with groups of matrices and vectors.

All matrices  $a$  and vectors  $x$  and  $y$  have the same parameters (size, increments) and are stored at constant *stridea*, *stridex*, and *stridey* from each other. The operation is defined as

```
for i = 0 ... batch_size - 1
  A is a matrix at offset i * stridea in a
  X and Y are vectors at offset i * stridex and i * stridey in x and y
  Y = alpha * op(A) * X + beta * Y
end for
```

### Input Parameters

<i>layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>trans</i>	Specifies $\text{op}(A)$ the transposition operation applied to the $A$ matrices. if <i>trans</i> = CblasNoTrans, then $\text{op}(A) = A$ ; if <i>trans</i> = CblasTrans, then $\text{op}(A) = A'$ ;

	if <i>trans</i> = CblasConjTrans, then $\text{op}(A) = \text{conjg}(A')$ .
<i>m</i>	Number of rows of the matrices <i>A</i> . The value of <i>m</i> must be at least 0.
<i>n</i>	Number of columns of the matrices <i>A</i> . The value of <i>n</i> must be at least 0.
<i>alpha</i>	Specifies the scalar <i>alpha</i> .
<i>a</i>	Array holding all the input matrix <i>A</i> . Must be of size at least $\text{lda} * k + \text{stridea} * (\text{batch\_size} - 1)$ where <i>k</i> is <i>n</i> if column major layout is used or <i>m</i> if row major layout is used.
<i>lda</i>	Specifies the leading dimension of the matrix <i>A</i> . It must be positive and at least <i>m</i> if column major layout is used or at least <i>n</i> if row major layout is used.
<i>stridea</i>	Stride between two consecutive <i>A</i> matrices. Must be at least 0.
<i>x</i>	Array holding all the input vector <i>x</i> . Must be of size at least $(1 + (\text{len} - 1) * \text{abs}(\text{incx})) + \text{stridex} * (\text{batch\_size} - 1)$ where <i>len</i> is <i>n</i> if the <i>A</i> matrix is not transposed or <i>m</i> otherwise.
<i>incx</i>	Stride between two consecutive elements of the <i>x</i> vectors. Must not be zero.
<i>stridex</i>	Stride between two consecutive <i>x</i> vectors, must be at least 0.
<i>beta</i>	Specifies the scalar <i>beta</i> .
<i>y</i>	Array holding all the input vectors <i>y</i> . Must be of size at least $\text{batch\_size} * \text{stridey}$ .
<i>incy</i>	Stride between two consecutive elements of the <i>y</i> vectors. Must not be zero.
<i>stridey</i>	Stride between two consecutive <i>y</i> vectors, must be at least $(1 + (\text{len} - 1) * \text{abs}(\text{incy}))$ where <i>len</i> is <i>m</i> if the matrix <i>A</i> is non transpose or <i>n</i> otherwise.
<i>batch_size</i>	Number of <code>gemv</code> computations to perform and <i>a</i> matrices, <i>x</i> and <i>y</i> vectors. Must be at least 0.

## Output Parameters

<i>y</i>	Array holding the <i>batch_size</i> updated vector <i>y</i> .
----------	---

## `cblas_?gemv_batch`

Computes groups of matrix-vector product with general matrices.

### Syntax

```
void cblas_sgemv_batch (const CBLAS_LAYOUT layout, const CBLAS_TRANSPOSE *trans_array,
const MKL_INT *m_array, const MKL_INT *n_array, const float *alpha_array, const float
**a_array, const MKL_INT *lda_array, const float **x_array, const MKL_INT *incx_array,
const float *beta_array, float **y_array, const MKL_INT *incy_array, const MKL_INT
group_count, const MKL_INT *group_size);
```

```
void cblas_dgemv_batch (const CBLAS_LAYOUT layout, const CBLAS_TRANSPOSE *trans_array,
const MKL_INT *m_array, const MKL_INT *n_array, const double *alpha_array, const double
**a_array, const MKL_INT *lda_array, const double **x_array, const MKL_INT *incx_array,
const double *beta_array, double **y_array, const MKL_INT *incy_array, const MKL_INT
group_count, const MKL_INT *group_size);
```

```
void cblas_cgemv_batch (const CBLAS_LAYOUT layout, const CBLAS_TRANSPOSE *trans_array,
const MKL_INT *m_array, const MKL_INT *n_array, const void *alpha_array, const void
**a_array, const MKL_INT *lda_array, const void **x_array, const MKL_INT *incx_array,
const void *beta_array, void **y_array, const MKL_INT *incy_array, const MKL_INT
group_count, const MKL_INT *group_size);
```

```
void cblas_zgemv_batch (const CBLAS_LAYOUT layout, const CBLAS_TRANSPOSE *trans_array,
const MKL_INT *m_array, const MKL_INT *n_array, const void *alpha_array, const void
**a_array, const MKL_INT *lda_array, const void **x_array, const MKL_INT *incx_array,
const void *beta_array, void **y_array, const MKL_INT *incy_array, const MKL_INT

## Description

The `cblas_?gemv_batch` routines perform a series of matrix-vector product added to a scaled vector. They are similar to the `cblas_?gemv` routine counterparts, but the `cblas_?gemv_batch` routines perform matrix-vector operations with groups of matrices and vectors.

Each group contains matrices and vectors with the same parameters (size, increments). The operation is defined as:

```
idx = 0
For i = 0 ... group_count - 1
    trans, m, n, alpha, lda, incx, beta, incy and group_size at position i in trans_array,
m_array, n_array, alpha_array, lda_array, incx_array, beta_array, incy_array and group_size_array
    for j = 0 ... group_size - 1
        a is a matrix of size mxn at position idx in a_array
        x and y are vectors of size m or n depending on trans, at position idx in x_array and
y_array
        y := alpha * op(a) * x + beta * y
        idx := idx + 1
    end for
end for
```

The number of entries in `a_array`, `x_array`, and `y_array` is `total_batch_count` = the sum of all of the `group_size` entries.

## Input Parameters

<code>layout</code>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<code>trans_array</code>	Array of size <code>group_count</code> . For the group <code>i</code> , <code>trans<sub>i</sub> = trans_array[i]</code> specifies the transposition operation applied to <code>A</code> . if <code>trans = CblasNoTrans</code> , then <code>op(A) = A</code> ; if <code>trans = CblasTrans</code> , then <code>op(A) = A'</code> ; if <code>trans = CblasConjTrans</code> , then <code>op(A) = conjg(A')</code> .

<code>m_array</code>	Array of size <code>group_count</code> . For the group <code>i</code> , $m_i = m\_array[i]$ is the number of rows of the matrix <code>A</code> .
<code>n_array</code>	Array of size <code>group_count</code> . For the group <code>i</code> , $n_i = n\_array[i]$ is the number of columns in the matrix <code>A</code> .
<code>alpha_array</code>	Array of size <code>group_count</code> . For the group <code>i</code> , $alpha_i = alpha\_array[i]$ is the scalar <code>alpha</code> .
<code>a_array</code>	Array of size <code>total_batch_count</code> of pointers used to store <code>A</code> matrices. The array allocated for the <code>A</code> matrices of the group <code>i</code> must be of size at least $lda_i * n_i$ if column major layout is used or at least $lda_i * m_i$ if row major layout is used.
<code>lda_array</code>	Array of size <code>group_count</code> . For the group <code>i</code> , $lda_i = lda\_array[i]$ is the leading dimension of the matrix <code>A</code> . It must be positive and at least $m_i$ if column major layout is used or at least $n_i$ if row major layout is used..
<code>x_array</code>	Array of size <code>total_batch_count</code> of pointers used to store <code>x</code> vectors. The array allocated for the <code>x</code> vectors of the group <code>i</code> must be of size at least $(1 + len_i - 1) * abs(incx_i)$ where $len_i$ is $n_i$ if the <code>A</code> matrix is not transposed or $m_i$ otherwise.
<code>incx_array</code>	Array of size <code>group_count</code> . For the group <code>i</code> , $incx_i = incx\_array[i]$ is the stride of vector <code>x</code> . Must not be zero.
<code>beta_array</code>	Array of size <code>group_count</code> . For the group <code>i</code> , $beta_i = beta\_array[i]$ is the scalar <code>beta</code> .
<code>y_array</code>	Array of size <code>total_batch_count</code> of pointers used to store <code>y</code> vectors. The array allocated for the <code>y</code> vectors of the group <code>i</code> must be of size at least $(1 + len_i - 1) * abs(incy_i)$ where $len_i$ is $m_i$ if the <code>A</code> matrix is not transposed or $n_i$ otherwise.
<code>incy_array</code>	Array of size <code>group_count</code> . For the group <code>i</code> , $incy_i = incy\_array[i]$ is the stride of vector <code>y</code> . Must not be zero.
<code>group_count</code>	Number of groups. Must be at least 0.
<code>group_size</code>	Array of size <code>group_count</code> . The element <code>group_size[i]</code> is the number of operations in the group <code>i</code> . Each element in <code>group_size</code> must be at least 0.

## Output Parameters

`y_array` Array of pointers holding the `total_batch_count` updated vector `y`.

## `cblas_?dgmm_batch_strided`

Computes groups of matrix-vector product using general matrices.

### Syntax

```
void cblas_sdgmm_batch_strided (const CBLAS_LAYOUT layout, const CBLAS_SIDE left_right,
const MKL_INT m, const MKL_INT n, const float *a, const MKL_INT lda, const MKL_INT
stridea, const float *x, const MKL_INT incx, const MKL_INT stridex, const float *c,
const MKL_INT ldc, const MKL_INT stridec, const MKL_INT batch_size);
```

```
void cblas_ddgmm_batch_strided (const CBLAS_LAYOUT layout, const CBLAS_SIDE left_right,
const MKL_INT m, const MKL_INT n, const double *a, const MKL_INT lda, const MKL_INT
stridea, const double *x, const MKL_INT incx, const MKL_INT stridex, const double *c,
const MKL_INT ldc, const MKL_INT stridec, const MKL_INT batch_size);
```

```

const MKL_INT m, const MKL_INT n, const void *a, const MKL_INT lda, const MKL_INT
stridea, const void *x, const MKL_INT incx, const MKL_INT stridex, const void *c, const
MKL_INT ldc, const MKL_INT stridec, const MKL_INT batch_size);
```

```
void cblas_zdgmm_batch_strided (const CBLAS_LAYOUT layout, const CBLAS_SIDE left_right,
const MKL_INT m, const MKL_INT n, const void *a, const MKL_INT lda, const MKL_INT
stridea, const void *x, const MKL_INT incx, const MKL_INT stridex, const void *c, const
MKL_INT ldc, const MKL_INT stridec, const MKL_INT batch_size);
```

## Include Files

- mkl.h

## Description

The `cblas_?dgmm_batch_strided` routines perform a series of diagonal matrix-matrix product. The diagonal matrices are stored as dense vectors and the operations are performed with group of matrices and vectors.

All matrices  $a$  and  $c$  and vector  $x$  have the same parameters (size, increments) and are stored at constant stride, respectively, given by  $stridea$ ,  $stridec$ , and  $stridex$  from each other. The operation is defined as

```
for i = 0 ... batch_size - 1
  A and C are matrices at offset i * stridea in a and i * stridec in c
  X is a vector at offset i * stridex in x
  C = diag(X) * A or C = A * diag(X)
end for
```

## Input Parameters

<i>layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>left_right</i>	Specifies the position of the diagonal matrix in the matrix product if <i>left_right</i> = CblasLeft, then $C = \text{diag}(X) * A$ ; if <i>left_right</i> = CblasRight, then $C = A * \text{diag}(X)$ .
<i>m</i>	Number of rows of the matrices $A$ and $C$ . The value of $m$ must be at least 0.
<i>n</i>	Number of columns of the matrices $A$ and $C$ . The value of $n$ must be at least 0.
<i>a</i>	Array holding all the input matrix $A$ . Must be of size at least $lda * k + stridea * (batch\_size - 1)$ where $k$ is $n$ if column major layout is used or $m$ if row major layout is used.
<i>lda</i>	Specifies the leading dimension of the matrix $A$ . It must be positive and at least $m$ if column major layout is used or at least $n$ if row major layout is used.
<i>stridea</i>	Stride between two consecutive $A$ matrices, must be at least 0.

<i>x</i>	Array holding all the input vector <i>x</i> . Must be of size at least $(1 + (len - 1) * abs(incx)) + stridex * (batch\_size - 1)$ where <i>len</i> is <i>n</i> if the diagonal matrix is on the right of the product or <i>m</i> otherwise.
<i>incx</i>	Stride between two consecutive elements of the <i>x</i> vectors.
<i>stridex</i>	Stride between two consecutive <i>x</i> vectors, must be at least 0.
<i>c</i>	Array holding all the input matrix <i>C</i> . Must be of size at least <i>batch_size</i> * <i>stridec</i> .
<i>ldc</i>	Specifies the leading dimension of the matrix <i>C</i> . It must be positive and at least <i>mif</i> column major layout is used or at least <i>n</i> if row major layout is used.
<i>stridec</i>	Stride between two consecutive <i>A</i> matrices, must be at least <i>ldc</i> * <i>nif</i> column major layout is used or <i>ldc</i> * <i>m</i> if row major layout is used.
<i>batch_size</i>	Number of <code>dgmm</code> computations to perform and a <i>c</i> matrices and <i>x</i> vectors. Must be at least 0.

## Output Parameters

<i>c</i>	Array holding the <i>batch_size</i> updated matrices <i>c</i> .
----------	---

## `cblas_?dgmm_batch`

Computes groups of matrix-vector product using general matrices.

### Syntax

```
void cblas_sdgmm_batch (const CBLAS_LAYOUT layout, const CBLAS_SIDE *left_right_array,

### Description

The `cblas_?dgmm_batch` routines perform a series of diagonal matrix-matrix product. The diagonal matrices are stored as dense vectors and the operations are performed with group of matrices and vectors. .

Each group contains matrices and vectors with the same parameters (size, increments). The operation is defined as:

```

idx = 0
For i = 0 ... group_count - 1
    left_right, m, n, lda, incx, ldc and group_size at position i in left_right_array, m_array,
n_array, lda_array, incx_array, ldc_array and group_size_array
    for j = 0 ... group_size - 1
        a and c are matrices of size mxn at position idx in a_array and c_array
        x is a vector of size m or n depending on left_right, at position idx in x_array
        if (left_right == oneapi::mkl::side::left) c := diag(x) * a
        else c := a * diag(x)
        idx := idx + 1
    end for
end for

```

The number of entries in *a\_array*, *x\_array*, and *c\_array* is *total\_batch\_count* = the sum of all of the *group\_size* entries.

## Input Parameters

<i>layout</i>	Specifies whether two-dimensional array storage is row-major (CblasRowMajor) or column-major (CblasColMajor).
<i>left_right_array</i>	Array of size <i>group_count</i> . For the group <i>i</i> , <i>left_right<sub>i</sub></i> = <i>left_right_array</i> [ <i>i</i> ] specifies the position of the diagonal matrix in the matrix product.  if <i>left_right<sub>i</sub></i> = CblasLeft, then $C = \text{diag}(X) * A$ . if <i>left_right<sub>i</sub></i> = CblasRight, then $C = A * \text{diag}(X)$ .
<i>m_array</i>	Array of size <i>group_count</i> . For the group <i>i</i> , <i>m<sub>i</sub></i> = <i>m_array</i> [ <i>i</i> ] is the number of rows of the matrix <i>A</i> and <i>C</i> .
<i>n_array</i>	Array of size <i>group_count</i> . For the group <i>i</i> , <i>n<sub>i</sub></i> = <i>n_array</i> [ <i>i</i> ] is the number of columns in the matrix <i>A</i> and <i>C</i> .
<i>a_array</i>	Array of size <i>total_batch_count</i> of pointers used to store <i>A</i> matrices. The array allocated for the <i>A</i> matrices of the group <i>i</i> must be of size at least <i>lda<sub>i</sub></i> * <i>n<sub>i</sub></i> if column major layout is used or at least <i>lda<sub>i</sub></i> * <i>m<sub>i</sub></i> if row major layout is used.
<i>lda_array</i>	Array of size <i>group_count</i> . For the group <i>i</i> , <i>lda<sub>i</sub></i> = <i>lda_array</i> [ <i>i</i> ] is the leading dimension of the matrix <i>A</i> . It must be positive and at least <i>m<sub>i</sub></i> if column major layout is used or at least <i>n<sub>i</sub></i> if row major layout is used..
<i>x_array</i>	Array of size <i>total_batch_count</i> of pointers used to store <i>x</i> vectors. The array allocated for the <i>x</i> vectors of the group <i>i</i> must be of size at least $(1 + \text{len}_i - 1) * \text{abs}(\text{incx}_i)$ where <i>len<sub>i</sub></i> is <i>n<sub>i</sub></i> if the diagonal matrix is on the right of the product or <i>m<sub>i</sub></i> otherwise.
<i>incx_array</i>	Array of size <i>group_count</i> . For the group <i>i</i> , <i>incx<sub>i</sub></i> = <i>incx_array</i> [ <i>i</i> ] is the stride of vector <i>x</i> .
<i>c_array</i>	Array of size <i>total_batch_count</i> of pointers used to store <i>C</i> matrices. The array allocated for the <i>C</i> matrices of the group <i>i</i> must be of size at least <i>ldc<sub>i</sub></i> * <i>n<sub>i</sub></i> , if column major layout is used or at least <i>ldc<sub>i</sub></i> * <i>m<sub>i</sub></i> if row major layout is used.

<code>ldc_array</code>	Array of size <code>group_count</code> . For the group $i$ , $ldc_i = ldc\_array[i]$ is the leading dimension of the matrix $C$ . It must be positive and at least $m_i$ if column major layout is used or at least $n_i$ if row major layout is used..
<code>group_count</code>	Number of groups. Must be at least 0.
<code>group_size</code>	Array of size <code>group_count</code> . The element <code>group_count[i]</code> is the number of operations in the group $i$ . Each element in <code>group_size</code> must be at least 0.

## Output Parameters

<code>c_array</code>	Array of pointers holding the <code>total_batch_count</code> updated matrix $C$ .
----------------------	---

## mkl\_jit\_create\_?gemm

Create a GEMM kernel that computes a scalar-matrix-matrix product and adds the result to a scalar-matrix product.

### Syntax

```
mkl_jit_status_t mkl_jit_create_sgemm(void** jitter, const MKL_LAYOUT layout, const
MKL_TRANPOSE transa, const MKL_TRANSPOSE transb, const MKL_INT m, const MKL_INT n,
const MKL_INT k, const float alpha, const MKL_INT lda, const MKL_INT ldb, const float
beta, const MKL_INT ldc);
```

```
mkl_jit_status_t mkl_jit_create_dgemm(void** jitter, const MKL_LAYOUT layout, const
MKL_TRANPOSE transa, const MKL_TRANSPOSE transb, const MKL_INT m, const MKL_INT n,
const MKL_INT k, const double alpha, const MKL_INT lda, const MKL_INT ldb, const double
beta, const MKL_INT ldc);
```

```
mkl_jit_status_t mkl_jit_create_cgemm(void** jitter, const MKL_LAYOUT layout, const
MKL_TRANPOSE transa, const MKL_TRANSPOSE transb, const MKL_INT m, const MKL_INT n,
const MKL_INT k, const void* alpha, const MKL_INT lda, const MKL_INT ldb, const void*
beta, const MKL_INT ldc);
```

```
mkl_jit_status_t mkl_jit_create_zgemm(void** jitter, const MKL_LAYOUT layout, const
MKL_TRANPOSE transa, const MKL_TRANSPOSE transb, const MKL_INT m, const MKL_INT n,
const MKL_INT k, const void* alpha, const MKL_INT lda, const MKL_INT ldb, const void*
beta, const MKL_INT ldc);
```

### Include Files

- `mkl.h`

### Description

The `mkl_jit_create_?gemm` functions belong to a set of related routines that enable use of just-in-time code generation.

The `mkl_jit_create_?gemm` functions create a handle to a just-in-time code generator (a jitter) and generate a GEMM kernel that computes a scalar-matrix-matrix product and adds the result to a scalar-matrix product, with general matrices. The operation of the generated GEMM kernel is defined as follows:

```
C := alpha*op(A)*op(B) + beta*C
```

Where:

- `op(X)` is either `op(X) = X` or `op(X) = XT` or `op(X) = XH`
- `alpha` and `beta` are scalars

- A, B, and C are matrices
- $op(A)$  is an  $m$ -by- $k$  matrix
- $op(B)$  is a  $k$ -by- $n$  matrix
- C is an  $m$ -by- $n$  matrix

## NOTE

Generating a new kernel with `mkl_jit_create_?gemm` involves moderate runtime overhead. To benefit from JIT code generation, use this feature when you need to call the generated kernel many times (for example, several hundred calls).

## Input Parameters

<i>layout</i>	Specifies whether two-dimensional array storage is row-major (MKL_ROW_MAJOR) or column-major (MKL_COL_MAJOR).
<i>transa</i>	Specifies the form of $op(A)$ used in the generated matrix multiplication: <ul style="list-style-type: none"> <li>• if <i>transa</i> = MKL_NOTRANS, then <math>op(A) = A</math></li> <li>• if <i>transa</i> = MKL_TRANS, then <math>op(A) = A^T</math></li> <li>• if <i>transa</i> = MKL_CONJTRANS, then <math>op(A) = A^H</math></li> </ul>
<i>transb</i>	Specifies the form of $op(B)$ used in the generated matrix multiplication: <ul style="list-style-type: none"> <li>• if <i>transb</i> = MKL_NOTRANS, then <math>op(B) = B</math></li> <li>• if <i>transb</i> = MKL_TRANS, then <math>op(B) = B^T</math></li> <li>• if <i>transb</i> = MKL_CONJTRANS, then <math>op(B) = B^H</math></li> </ul>
<i>m</i>	Specifies the number of rows of the matrix $op(A)$ and of the matrix C. The value of <i>m</i> must be at least zero.
<i>n</i>	Specifies the number of columns of the matrix $op(B)$ and of the matrix C. The value of <i>n</i> must be at least zero.
<i>k</i>	Specifies the number of columns of the matrix $op(A)$ and the number of rows of the matrix $op(B)$ . The value of <i>k</i> must be at least zero.
<i>alpha</i>	Specifies the scalar <i>alpha</i> .

## NOTE

*alpha* is passed by pointer for `mkl_jit_create_cgemm` and `mkl_jit_create_zgemm`.

*lda* Specifies the leading dimension of *a*.

	<i>transa</i> =MKL_NOTRANS S	<i>transa</i> =MKL_TRANS or <i>transa</i> =MKL_CONJTRANS
<i>layout</i> =MKL_ROW_MAJOR	<i>lda</i> must be at least $\max(1,k)$	<i>lda</i> must be at least $\max(1,m)$
<i>layout</i> =MKL_COL_MAJOR	<i>lda</i> must be at least $\max(1,m)$	<i>lda</i> must be at least $\max(1,k)$

*ldb*Specifies the leading dimension of *b*:

	<i>transb</i> =MKL_NOTRAN S	<i>transb</i> =MKL_TRANS or <i>transb</i> =MKL_CONJTRANS
<i>layout</i> =MKL_ROW_MAJOR	<i>ldb</i> must be at least max(1,n)	<i>ldb</i> must be at least max(1,k)
<i>layout</i> =MKL_COL_MAJOR	<i>ldb</i> must be at least max(1,k)	<i>ldb</i> must be at least max(1,n)

*beta*Specifies the scalar *beta*.**NOTE**

*beta* is passed by pointer for `mkl_jit_create_cgemm` and `mkl_jit_create_zgemm`.

*ldc*Specifies the leading dimension of *c*.

<i>layout</i> =MKL_ROW_MAJOR	<i>ldc</i> must be at least max(1,n)
<i>layout</i> =MKL_COL_MAJOR	<i>ldc</i> must be at least max(1,m)

**Output Parameters***jitter*

Pointer to a handle to the newly created code generator.

**Return Values***status*

Returns one of the following:

- MKL\_JIT\_ERROR if the handle cannot be created (no memory)  
—or—
- MKL\_JIT\_SUCCESS if the jitter has been created and the GEMM kernel was successfully created  
—or—
- MKL\_NO\_JIT if the jitter has been created, but a JIT GEMM kernel was not created because JIT is not beneficial for the given input parameters. The function pointer returned by `mkl_jit_get_?gemm_ptr` will call standard (non-JIT) GEMM.

**`mkl_jit_get_?gemm_ptr`**

Return the GEMM kernel associated with a jitter previously created with `mkl_jit_create_?gemm`.

**Syntax**

```
sgemm_jit_kernel_t mkl_jit_get_sgemm_ptr(const void* jitter);
dgemm_jit_kernel_t mkl_jit_get_dgemm_ptr(const void* jitter);
cgemm_jit_kernel_t mkl_jit_get_cgemm_ptr(const void* jitter);
```

```
zgemm_jit_kernel_t mkl_jit_get_zgemm_ptr(const void* jitter);
```

## Include Files

- mkl.h

## Description

The `mkl_jit_get_?gemm_ptr` functions belong to a set of related routines that enable use of just-in-time code generation.

The `mkl_jit_get_?gemm_ptr` functions take as input a jitter previously created with `mkl_jit_create_?gemm`, and return the GEMM kernel associated with that jitter. The returned GEMM kernel computes a scalar-matrix-matrix product and adds the result to a scalar-matrix product, with general matrices. The operation is defined as follows:

```
C := alpha*op(A)*op(B) + beta*C
```

Where:

- `op(X)` is one of `op(X) = X` or `op(X) = XT` or `op(X) = XH`
- `alpha` and `beta` are scalars
- `A`, `B`, and `C` are matrices
- `op(A)` is an `m-by-k` matrix
- `op(B)` is a `k-by-n` matrix
- `C` is an `m-by-n` matrix

### NOTE

Generating a new kernel with `mkl_jit_create_?gemm` involves moderate runtime overhead. To benefit from JIT code generation, use this feature when you need to call the generated kernel many times (for example, several hundred calls).

## Input Parameter

`jitter`

Handle to the code generator.

## Return Values

`func`

- `sgemm_jit_kernel_t` – A function pointer type expecting four inputs of type `void*`, `float*`, `float*`, and `float*`

```
typedef void (*sgemm_jit_kernel_t)
(void*, float*, float*, float*);
```

- `dgemm_jit_kernel_t` – A function pointer type expecting four inputs of type `void*`, `double*`, `double*`, and `double*`

```
typedef void (*dgemm_jit_kernel_t)
(void*, double*, double*, double*);
```

- `cgemm_jit_kernel_t` – A function pointer type expecting four inputs of type `void*`, `MKL_Complex8*`, `MKL_Complex8*`, and `MKL_Complex8*`

```
typedef void (*cgemm_jit_kernel_t)
(void*, MKL_Complex8*, MKL_Complex8*, MKL_Complex8*);
```

- `zgemm_jit_kernel_t` – A function pointer type expecting four inputs of type `void*`, `MKL_Complex16*`, `MKL_Complex16*`, and `MKL_Complex16*`

```
typedef void(*zgemm_jit_kernel_t)
(void*,MKL_Complex16*,MKL_Complex16*,MKL_Complex16*);
```

If the jitter input is not NULL, returns a function pointer to a GEMM kernel. The GEMM kernel is called with four parameters: the jitter and the three matrices *a*, *b*, and *c*. Otherwise, returns NULL.

If *layout*, *transa*, *transb*, *m*, *n*, *k*, *lda*, *ldb*, and *ldc* are the parameters used during the creation of the input jitter, then:

a

	<i>layout</i> = <b>MKL_COL_MAJOR</b>	<i>layout</i> = <b>MKL_ROW_MAJOR</b>
<i>transa</i> = MKL_NOTRANS	Array of size <i>lda</i> * <i>k</i>  Before calling the returned function pointer, the leading <i>m</i> -by- <i>k</i> part of the array <i>a</i> must contain the matrix A.	Array of size <i>lda</i> * <i>m</i>  Before calling the returned function pointer, the leading <i>k</i> -by- <i>m</i> part of the array <i>a</i> must contain the matrix A.
<i>transa</i> = MKL_TRANS or <i>transa</i> = MKL_CONJTRANS	Array of size <i>lda</i> * <i>m</i>  Before calling the returned function pointer, the leading <i>k</i> -by- <i>m</i> part of the array <i>a</i> must contain the matrix A.	Array of size <i>lda</i> * <i>k</i>  Before calling the returned function pointer, the leading <i>m</i> -by- <i>k</i> part of the array <i>a</i> must contain the matrix A.

b

	<i>layout</i> = <b>MKL_COL_MAJOR</b>	<i>layout</i> = <b>MKL_ROW_MAJOR</b>
<i>transb</i> = MKL_NOTRANS	Array of size <i>ldb</i> * <i>n</i>  Before calling the returned function pointer, the leading <i>k</i> -by- <i>n</i> part of the array <i>b</i> must contain the matrix B.	Array of size <i>ldb</i> * <i>k</i>  Before calling the returned function pointer, the leading <i>n</i> -by- <i>k</i> part of the array <i>b</i> must contain the matrix B.
<i>transb</i> = MKL_TRANS or <i>transb</i> = MKL_CONJTRANS	Array of size <i>ldb</i> * <i>k</i>  Before calling the returned function pointer, the leading <i>n</i> -by- <i>k</i> part of the array <i>b</i> must contain the matrix B.	Array of size <i>ldb</i> * <i>n</i>  Before calling the returned function pointer, the leading <i>k</i> -by- <i>n</i> part of the array <i>b</i> must contain the matrix B.

## LAPACK Routines

---

Intel® oneAPI Math Kernel Library (oneMKL) implements routines from the LAPACK package that are used for solving systems of linear equations, linear least squares problems, eigenvalue and singular value problems, and performing a number of related computational tasks. The library includes LAPACK routines for both real and complex data. Routines are supported for systems of equations with the following types of matrices:

- General
- Banded
- Symmetric or Hermitian positive-definite (full, packed, and rectangular full packed (RFP) storage)
- Symmetric or Hermitian positive-definite banded
- Symmetric or Hermitian indefinite (both full and packed storage)
- Symmetric or Hermitian indefinite banded
- Triangular (full, packed, and RFP storage)
- Triangular banded
- Tridiagonal
- Diagonally dominant tridiagonal.

---

**NOTE**

Different arrays used as parameters to Intel® MKL LAPACK routines must not overlap.

---

---

**Warning**

LAPACK routines assume that input matrices do not contain IEEE 754 special values such as `INF` or `NaN` values. Using these special values may cause LAPACK to return unexpected results or become unstable.

---

## Choosing a LAPACK Routine

Intel® oneAPI Math Kernel Library (oneMKL) offers many LAPACK routines, and many perform similar operations. The Intel® oneAPI Math Kernel Library LAPACK Function Finding Advisor helps you understand the differences between routines so that you can choose the appropriate routine for your task:

Intel® oneAPI Math Kernel Library LAPACK Function Finding Advisor: <https://www.intel.com/content/www/us/en/developer/tools/oneapi/onemkl-function-finding-advisor.html>.

## C Interface Conventions for LAPACK Routines

The C interfaces are implemented for most of the Intel® oneAPI Math Kernel Library (oneMKL) LAPACK driver and computational routines.

### NaN Checking in LAPACKE

NaN checking can affect the performance of an application. By default, it is ON.

See the [Support Functions](#) section for details on the methods and options to turn NaN check off or back on with LAPACKE:.

### Function Prototypes

Intel® oneAPI Math Kernel Library (oneMKL) supports four distinct floating-point precisions. Each corresponding prototype looks similar, usually differing only in the data type. C interface LAPACK function names follow the form `<?><name>[_64]`, where `<?>` is:

- LAPACKE\_s for float
- LAPACKE\_d for double
- LAPACKE\_c for lapack\_complex\_float
- LAPACKE\_z for lapack\_complex\_double

On 64-bit platforms, Intel® oneAPI Math Kernel Library (oneMKL) provides LAPACK C interfaces with the `_64` suffix to support large data arrays in the LP64 interface library. For more interface library details, see "Using the ILP64 Interface vs. LP64 Interface" in the developer guide.

A specific example follows. To solve a system of linear equations with a packed Cholesky-factored Hermitian positive-definite matrix with complex precision, use the following:

```
lapack_int LAPACKE_cppttrs(int matrix_layout, char uplo, lapack_int n, lapack_int nrhs,
const lapack_complex_float* ap, lapack_complex_float* b, lapack_int ldb);
```

For matrices whose dimensions are greater than  $2^{31}-1$ , you can use either `LAPACKE_cppttrs` in the ILP64 interface library or `LAPACKE_cppttrs_64` in the LP64 interface library.

## Workspace Arrays

In contrast to the Fortran interface, the LAPACK C interface omits workspace parameters because workspace is allocated during runtime and released upon completion of the function operation.

If you prefer to allocate workspace arrays yourself, the LAPACK C interface provides alternate interfaces with `work` parameters. The name of the alternate interface is the same as the LAPACK C interface with `_work` appended. For example, the syntax for the singular value decomposition of a real bidiagonal matrix is:

Fortran:	<code>call sbdsdc ( uplo, compq, n, d, e, u, ldu, vt, ldvt, q, iq, work, iwork, info )</code>
C LAPACK interface:	<code>lapack_int LAPACKE_sbdsdc ( int matrix_layout, char uplo, char compq, lapack_int n, float* d, float* e, float* u, lapack_int ldu, float* vt, lapack_int ldvt, float* q, lapack_int* iq );</code>
Alternate C LAPACK interface with <code>work</code> parameters:	<code>lapack_int LAPACKE_sbdsdc_work( int matrix_layout, char uplo, char compq, lapack_int n, float* d, float* e, float* u, lapack_int ldu, float* vt, lapack_int ldvt, float* q, lapack_int* iq, float* work, lapack_int* iwork );</code>

See the `install_dir/include/mkl_lapacke.h` file for the full list of alternative C LAPACK interfaces.

The Intel® oneAPI Math Kernel Library (oneMKL) Fortran-specific documentation contains details about workspace arrays.

## Mapping Fortran Data Types against C Data Types

### Fortran Data Types vs. C Data Types

FORTRAN	C
INTEGER	lapack_int
LOGICAL	lapack_logical
REAL	float
DOUBLE PRECISION	double
COMPLEX	lapack_complex_float
COMPLEX*16/DOUBLE COMPLEX	lapack_complex_double

FORTRAN	C
CHARACTER	char

## C Type Definitions

You can find type definitions specific to Intel® oneAPI Math Kernel Library (oneMKL) such as `MKL_INT`, `MKL_Complex8`, and `MKL_Complex16` in `install_dir/mkl_types.h`.

### C types

```
#ifndef lapack_int
#define lapack_int MKL_INT
#endif

#ifndef lapack_logical
#define lapack_logical lapack_int
#endif
```

### Complex Type Definitions

Complex type for single precision:

```
#ifndef lapack_complex_float
#define lapack_complex_float MKL_Complex8
#endif
```

Complex type for double precision:

```
#ifndef lapack_complex_double
#define lapack_complex_double MKL_Complex16
#endif
```

### Matrix Layout Definitions

```
#define LAPACK_ROW_MAJOR 101
#define LAPACK_COL_MAJOR 102
```

See [Matrix Layout for LAPACK Routines](#) above for an explanation of row-major order and column-major order storage.

### Error Code Definitions

```
#define LAPACK_WORK_MEMORY_ERROR -1010 /* Failed to allocate
memory
                                     for a working array */
#define LAPACK_TRANSPOSE_MEMORY_ERROR -1011 /* Failed to allocate
memory
                                             for transposed matrix */
```

## Matrix Layout for LAPACK Routines

There are two general methods of storing a two dimensional matrix in linear (one dimensional) memory: column-wise (column major order) or row-wise (row major order). Consider an  $M$ -by- $N$  matrix  $A$ :

$$A = \begin{bmatrix} a_{1,1} & a_{1,2} & \dots & a_{1,j_0+1} & a_{1,j_0+2} & \dots & a_{1,j_0+L-1} & a_{1,j_0+L} & \dots & a_{1,N} \\ a_{2,1} & a_{2,2} & \dots & a_{2,j_0+1} & a_{2,j_0+2} & \dots & a_{2,j_0+L-1} & a_{2,j_0+L} & \dots & a_{2,N} \\ \vdots & \vdots & \ddots & \vdots & \vdots & \vdots & \vdots & \vdots & \ddots & \vdots \\ a_{i_0+1,1} & a_{i_0+1,2} & \dots & a_{i_0+1,j_0+1} & a_{i_0+1,j_0+2} & \dots & a_{i_0+1,j_0+L-1} & a_{i_0+1,j_0+L} & \dots & a_{i_0+1,N} \\ a_{i_0+2,1} & a_{i_0+2,2} & \dots & a_{i_0+2,j_0+1} & a_{i_0+2,j_0+2} & \dots & a_{i_0+2,j_0+L-1} & a_{i_0+2,j_0+L} & \dots & a_{i_0+2,N} \\ \vdots & \vdots & \dots & \vdots & \vdots & \vdots & \vdots & \vdots & \dots & \vdots \\ a_{i_0+K-1,1} & a_{i_0+K-1,2} & \dots & a_{i_0+K-1,j_0+1} & a_{i_0+K-1,j_0+2} & \dots & a_{i_0+K-1,j_0+L-1} & a_{i_0+K-1,j_0+L} & \dots & a_{i_0+K-1,N} \\ a_{i_0+K,1} & a_{i_0+K,2} & \dots & a_{i_0+K,j_0+1} & a_{i_0+K,j_0+2} & \dots & a_{i_0+K,j_0+L-1} & a_{i_0+K,j_0+L} & \dots & a_{i_0+K,N} \\ \vdots & \vdots & \ddots & \vdots & \vdots & \vdots & \vdots & \vdots & \ddots & \vdots \\ a_{M,1} & a_{M,2} & \dots & a_{M,j_0+1} & a_{M,j_0+2} & \dots & a_{M,j_0+L-1} & a_{M,j_0+L} & \dots & a_{M,N} \end{bmatrix}$$

### Column Major Layout

In column major layout the first index,  $i$ , of matrix elements  $a_{i,j}$  changes faster than the second index when accessing sequential memory locations. In other words, for  $1 \leq j < M$ , if the element  $a_{i,j}$  is stored in a specific location in memory, the element  $a_{i+1,j}$  is stored in the next location, and, for  $1 \leq j < N$ , the element  $a_{M,j}$  is stored in the location previous to element  $a_{1,j+1}$ . So the matrix elements are located in memory according to this sequence:

$$\{a_{1,1}, a_{2,1} \dots a_{M,1}, a_{1,2}, a_{2,2} \dots a_{M,2} \dots \dots a_{1,N}, a_{2,N} \dots a_{M,N}\}$$

### Row Major Layout

In row major layout the second index,  $j$ , of matrix elements  $a_{i,j}$  changes faster than the first index when accessing sequential memory locations. In other words, for  $1 \leq j < N$ , if the element  $a_{i,j}$  is stored in a specific location in memory, the element  $a_{i,j+1}$  is stored in the next location, and, for  $1 \leq i < M$ , the element  $a_{i,N}$  is stored in the location previous to element  $a_{i+1,1}$ . So the matrix elements are located in memory according to this sequence:

$$\{a_{1,1}, a_{1,2} \dots a_{1,N}, a_{2,1}, a_{2,2} \dots a_{2,N} \dots \dots a_{N,1}, a_{N,2} \dots a_{M,N}\}$$

### Leading Dimension Parameter

A leading dimension parameter allows use of LAPACK routines on a submatrix of a larger matrix. For example, the submatrix  $B$  can be extracted from the original matrix  $A$  defined previously:

$$B = \begin{bmatrix} a_{i_0+1,j_0+1} & a_{i_0+1,j_0+2} & \dots & a_{i_0+1,j_0+L-1} & a_{i_0+1,j_0+L} \\ a_{i_0+2,j_0+1} & a_{i_0+2,j_0+2} & \dots & a_{i_0+2,j_0+L-1} & a_{i_0+2,j_0+L} \\ \vdots & \vdots & \vdots & \vdots & \vdots \\ a_{i_0+K-1,j_0+1} & a_{i_0+K-1,j_0+2} & \dots & a_{i_0+K-1,j_0+L-1} & a_{i_0+K-1,j_0+L} \\ a_{i_0+K,j_0+1} & a_{i_0+K,j_0+2} & \dots & a_{i_0+K,j_0+L-1} & a_{i_0+K,j_0+L} \end{bmatrix}$$

$B$  is formed from rows with indices  $i_0 + 1$  to  $i_0 + K$  and columns  $j_0 + 1$  to  $j_0 + L$  of matrix  $A$ . To specify matrix  $B$ , LAPACK routines require four parameters:

- the number of rows  $K$ ;
- the number of columns  $L$ ;
- a pointer to the start of the array containing elements of  $B$ ;

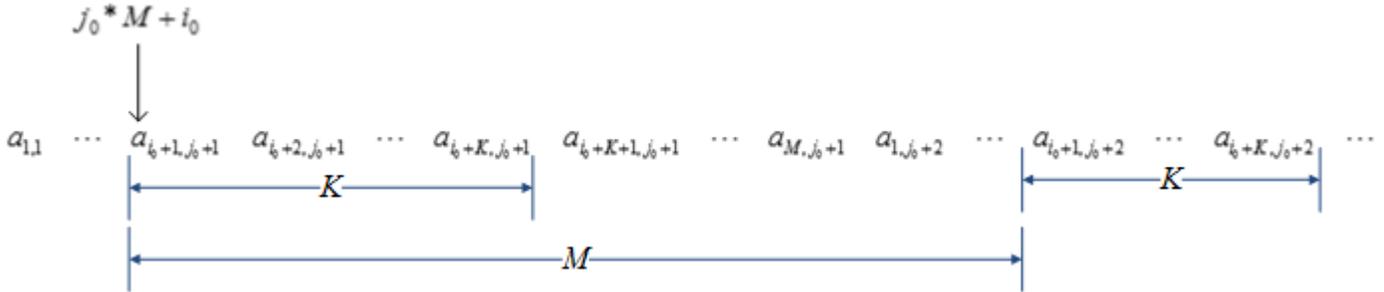

- the leading dimension of the array containing elements of  $B$ .

The leading dimension depends on the layout of the matrix:

- Column major layout

Leading dimension  $ldb=M$ , the number of rows of matrix  $A$ .

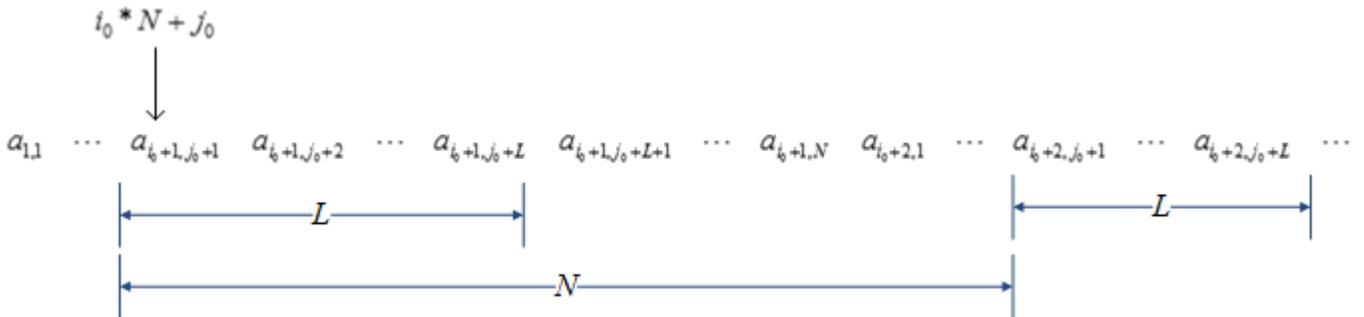

Starting address: offset by  $i_0 + j_0 * ldb$  from  $a_{1,1}$ .

- Row major layout

Leading dimension  $ldb=N$ , the number of columns of matrix  $A$ .

Starting address: offset by  $i_0 * ldb + j_0$  from  $a_{1,1}$ .

### Matrix Storage Schemes for LAPACK Routines

LAPACK routines use the following matrix storage schemes:

- Full Storage
- Packed Storage
- Band Storage
- Rectangular Full Packed (RFP) Storage

#### Full Storage

Consider an  $m$ -by- $n$  matrix  $A$  :

$$A = \begin{pmatrix} a_{1,1} & a_{1,2} & a_{1,3} & \cdots & a_{1,n} \\ a_{2,1} & a_{2,2} & a_{2,3} & \cdots & a_{2,n} \\ a_{3,1} & a_{3,2} & a_{3,3} & \cdots & a_{3,n} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ a_{m,1} & a_{m,2} & a_{m,3} & \cdots & a_{m,n} \end{pmatrix}$$

It is stored in a one-dimensional array  $a$  of length at least  $lda * n$  for column major layout or  $m * lda$  for row major layout. Element  $a_{ij}$  is stored as array element  $a[k]$  where the mapping of  $k(i, j)$  is defined as

- column major layout:  $k(i, j) = i - 1 + (j - 1) * lda$
- row major layout:  $k(i, j) = (i - 1) * lda + j - 1$

---

**NOTE**

Although LAPACK accepts parameter values of zero for matrix size, in general the size of the array used to store an  $m$ -by- $n$  matrix  $A$  with leading dimension  $lda$  should be greater than or equal to  $\max(1, n * lda)$  for column major layout and  $\max(1, m * lda)$  for row major layout.

---

---

**NOTE**

Even though the array used to store a matrix is one-dimensional, for simplicity the documentation sometimes refers parts of the array such as rows, columns, upper and lower triangular part, and diagonals. These refer to the parts of the matrix stored within the array. For example, the lower triangle of array  $a$  is defined as the subset of elements  $a[k(i, j)]$  with  $i \geq j$ .

---

## Packed Storage

The packed storage format compactly stores matrix elements when only one part of the matrix, the upper or lower triangle, is necessary to determine all of the elements of the matrix. This is the case when the matrix is upper triangular, lower triangular, symmetric, or Hermitian. For an  $n$ -by- $n$  matrix of one of these types, a linear array  $a_p$  of length  $n * (n + 1) / 2$  is adequate. Two parameters define the storage scheme:

$matrix\_layout$ , which specifies column major (with the value `LAPACK_COL_MAJOR`) or row major (with the value `LAPACK_ROW_MAJOR`) matrix layout, and  $uplo$ , which specifies that the upper triangle (with the value 'U') or the lower triangle (with the value 'L') is stored.

Element  $a_{i,j}$  is stored as array element  $a[k]$  where the mapping of  $k(i, j)$  is defined as

		$matrix\_layout = \text{LAPACK\_COL\_MAJOR}$	$matrix\_layout = \text{LAPACK\_ROW\_MAJOR}$
$uplo = 'U'$	$1 \leq i \leq j \leq n$	$k(i, j) = i - 1 + j * (j - 1) / 2$	$k(i, j) = j - 1 + (i - 1) * (2 * n - i) / 2$
$uplo = 'L'$	$1 \leq j \leq i \leq n$	$k(i, j) = i - 1 + (j - 1) * (2 * n - j) / 2$	$k(i, j) = j - 1 + i * (i - 1) / 2$

---

**NOTE**

Although LAPACK accepts parameter values of zero for matrix size, in general the size of the array should be greater than or equal to  $\max(1, n * (n + 1) / 2)$ .

---

## Band Storage

When the non-zero elements of a matrix are confined to diagonal bands, it is possible to store the elements more efficiently using band storage. For example, consider an  $m$ -by- $n$  band matrix  $A$  with  $kl$  subdiagonals and  $ku$  superdiagonals:

- Converting the Packed Matrix to a One-Dimensional Array: The packed matrix  $AB$  is stored in a linear array  $ab$  as described in [Full Storage](#) . The size of  $ab$  should be greater than or equal to the total number of elements of matrix  $AB$ :  $ldab*n$  for column major layout or  $ldab*m$  for row major layout. The leading dimension of  $ab$ ,  $ldab$ , must be greater than or equal to  $kl + ku + 1$  (and some routines require it to be even larger).

Element  $a_{i,j}$  is stored as array element  $a[k(i, j)]$  where the mapping of  $k(i, j)$  is defined as

- column major layout:  $k(i, j) = i + ku - j + (j - 1)*ldab$ ;  $1 \leq j \leq n$ ,  $\max(1, j - ku) \leq i \leq \min(m, j + kl)$
- row major layout:  $k(i,j) = j-i+k_l+(i-1)(k_l+k_u+1)$ ,  $1 \leq i \leq m$ ,  $\max(1, i - k_l) \leq j \leq \min(n, i + k_u)$

## NOTE

Although LAPACK accepts parameter values of zero for matrix size, in general the size of the array should be greater than or equal to  $\max(1, n*ldab)$  for column major layout and  $\max(1, m*ldab)$  for row major layout.

## Rectangular Full Packed Storage

A combination of full and packed storage, rectangular full packed storage can be used to store the upper or lower triangle of a matrix which is upper triangular, lower triangular, symmetric, or Hermitian. It offers the storage savings of packed storage plus the efficiency of using full storage Level 3 BLAS and LAPACK routines. Three parameters define the storage scheme: *matrix\_layout*, which specifies column major (with the value `LAPACK_COL_MAJOR`) or row major (with the value `LAPACK_ROW_MAJOR`) matrix layout; *uplo*, which specifies that the upper triangle (with the value 'U') or the lower triangle (with the value 'L') is stored; and *transr*, which specifies normal (with the value 'N'), transpose (with the value 'T'), or conjugate transpose (with the value 'C') operation on the matrix.

Consider an  $N$ -by- $N$  matrix  $A$ :

$$A = \begin{pmatrix} a_{0,0} & a_{0,1} & a_{0,2} & \cdots & a_{0,N-1} \\ a_{1,0} & a_{1,1} & a_{1,2} & \cdots & a_{1,N-1} \\ a_{2,0} & a_{2,1} & a_{2,2} & \cdots & a_{2,N-1} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ a_{N-1,0} & a_{N-1,1} & a_{N-1,2} & \cdots & a_{N-1,N-1} \end{pmatrix}$$

The upper or lower triangle of  $A$  can be stored in the array  $ap$  of length  $N*(N + 1)/2$ .

Additionally, define  $k$  as the integer part of  $N/2$ , such that  $N=2*k$  if  $N$  is even, and  $N=2*k + 1$  if  $N$  is odd.

Storing the matrix involves packing the matrix into a rectangular matrix, and then storing the matrix in a one-dimensional array. The size of rectangular matrix  $AP$  required for the  $N$ -by- $N$  matrix  $A$  is  $N + 1$  by  $N/2$  for even  $N$ , and  $N$  by  $(N + 1)/2$  for odd  $N$ .

These examples illustrate the rectangular full packed storage method.

- Upper triangular - *uplo* = 'U'

Consider a matrix  $A$  with  $N = 6$ :

$$A = \begin{pmatrix} a_{0,0} & a_{0,1} & a_{0,2} & a_{0,3} & a_{0,4} & a_{0,5} \\ a_{1,0} & a_{1,1} & a_{1,2} & a_{1,3} & a_{1,4} & a_{1,5} \\ a_{2,0} & a_{2,1} & a_{2,2} & a_{2,3} & a_{2,4} & a_{2,5} \\ a_{3,0} & a_{3,1} & a_{3,2} & a_{3,3} & a_{3,4} & a_{3,5} \\ a_{4,0} & a_{4,1} & a_{4,2} & a_{4,3} & a_{4,4} & a_{4,5} \\ a_{5,0} & a_{5,1} & a_{5,2} & a_{5,3} & a_{5,4} & a_{5,5} \end{pmatrix}$$

- Not transposed -  $transr = 'N'$

The elements of the upper triangle of  $A$  can be packed in a matrix with the dimensions  $(N + 1)$ -by- $(N/2) = 7$  by 3:

$$AP = \begin{pmatrix} a_{0,3} & a_{0,4} & a_{0,5} \\ a_{1,3} & a_{1,4} & a_{1,5} \\ a_{2,3} & a_{2,4} & a_{2,5} \\ a_{3,3} & a_{3,4} & a_{3,5} \\ a_{0,0} & a_{4,4} & a_{4,5} \\ a_{0,1} & a_{1,1} & a_{5,5} \\ a_{0,2} & a_{1,2} & a_{2,2} \end{pmatrix}$$

- Transposed or conjugate transposed -  $transr = 'T'$  or  $transr = 'C'$

The elements of the upper triangle of  $A$  can be packed in a matrix with the dimensions  $(N/2)$  by  $(N + 1) = 3$  by 7:

$$AP = \begin{pmatrix} a_{0,3} & a_{1,3} & a_{2,3} & a_{3,3} & a_{0,0} & a_{0,1} & a_{0,2} \\ a_{0,4} & a_{1,4} & a_{2,4} & a_{3,4} & a_{4,4} & a_{1,1} & a_{1,2} \\ a_{0,5} & a_{1,5} & a_{2,5} & a_{3,5} & a_{4,5} & a_{5,5} & a_{2,2} \end{pmatrix}$$

Consider a matrix  $A$  with  $N = 5$ :

$$A = \begin{pmatrix} a_{0,0} & a_{0,1} & a_{0,2} & a_{0,3} & a_{0,4} \\ a_{1,0} & a_{1,1} & a_{1,2} & a_{1,3} & a_{1,4} \\ a_{2,0} & a_{2,1} & a_{2,2} & a_{2,3} & a_{2,4} \\ a_{3,0} & a_{3,1} & a_{3,2} & a_{3,3} & a_{3,4} \\ a_{4,0} & a_{4,1} & a_{4,2} & a_{4,3} & a_{4,4} \end{pmatrix}$$

- Not transposed -  $transr = 'N'$

The elements of the upper triangle of  $A$  can be packed in a matrix with the dimensions  $(N)$ -by- $((N + 1)/2) = 5$  by 3:

$$AP = \begin{pmatrix} a_{0,2} & a_{0,3} & a_{0,4} \\ a_{1,2} & a_{1,3} & a_{1,4} \\ a_{2,2} & a_{2,3} & a_{2,4} \\ a_{0,0} & a_{3,3} & a_{3,4} \\ a_{0,1} & a_{1,1} & a_{4,4} \end{pmatrix}$$

- Transposed or conjugate transposed -  $transr = 'T'$  or  $transr = 'C'$

The elements of the upper triangle of  $A$  can be packed in a matrix with the dimensions  $((N+1)/2)$  by  $(N) = 3$  by 5:

$$AP = \begin{pmatrix} a_{0,2} & a_{1,2} & a_{2,3} & a_{0,0} & a_{0,1} \\ a_{0,3} & a_{1,3} & a_{2,3} & a_{3,3} & a_{1,1} \\ a_{0,4} & a_{1,4} & a_{2,4} & a_{3,4} & a_{4,4} \end{pmatrix}$$

- Lower triangular -  $uplo = 'L'$

Consider a matrix  $A$  with  $N = 6$ :

$$A = \begin{pmatrix} a_{0,0} & a_{0,1} & a_{0,2} & a_{0,3} & a_{0,4} & a_{0,5} \\ a_{1,0} & a_{1,1} & a_{1,2} & a_{1,3} & a_{1,4} & a_{1,5} \\ a_{2,0} & a_{2,1} & a_{2,2} & a_{2,3} & a_{2,4} & a_{2,5} \\ a_{3,0} & a_{3,1} & a_{3,2} & a_{3,3} & a_{3,4} & a_{3,5} \\ a_{4,0} & a_{4,1} & a_{4,2} & a_{4,3} & a_{4,4} & a_{4,5} \\ a_{5,0} & a_{5,1} & a_{5,2} & a_{5,3} & a_{5,4} & a_{5,5} \end{pmatrix}$$

- Not transposed -  $transr = 'N'$

The elements of the lower triangle of  $A$  can be packed in a matrix with the dimensions  $(N + 1)$ -by- $(N/2) = 7$  by 3:

$$AP = \begin{pmatrix} a_{3,3} & a_{4,3} & a_{5,3} \\ a_{0,0} & a_{4,4} & a_{5,4} \\ a_{1,0} & a_{1,1} & a_{5,5} \\ a_{2,0} & a_{2,1} & a_{2,2} \\ a_{3,0} & a_{3,1} & a_{3,2} \\ a_{3,0} & a_{4,1} & a_{4,2} \\ a_{5,0} & a_{5,1} & a_{5,2} \end{pmatrix}$$

- Transposed or conjugate transposed -  $transr = 'T'$  or  $transr = 'C'$

The elements of the lower triangle of  $A$  can be packed in a matrix with the dimensions  $(N/2)$  by  $(N + 1) = 3$  by 7:

$$AP = \begin{pmatrix} a_{3,3} & a_{0,0} & a_{1,0} & a_{2,0} & a_{3,0} & a_{4,0} & a_{5,0} \\ a_{4,3} & a_{4,4} & a_{1,1} & a_{2,1} & a_{3,1} & a_{4,1} & a_{5,1} \\ a_{5,3} & a_{5,4} & a_{5,5} & a_{2,2} & a_{3,2} & a_{4,2} & a_{5,2} \end{pmatrix}$$

Consider a matrix  $A$  with  $N = 5$ :

$$A = \begin{pmatrix} a_{0,0} & a_{0,1} & a_{0,2} & a_{0,3} & a_{0,4} \\ a_{1,0} & a_{1,1} & a_{1,2} & a_{1,3} & a_{1,4} \\ a_{2,0} & a_{2,1} & a_{2,2} & a_{2,3} & a_{2,4} \\ a_{3,0} & a_{3,1} & a_{3,2} & a_{3,3} & a_{3,4} \\ a_{4,0} & a_{4,1} & a_{4,2} & a_{4,3} & a_{4,4} \end{pmatrix}$$

- Not transposed -  $transr = 'N'$

The elements of the lower triangle of  $A$  can be packed in a matrix with the dimensions  $(N)$ -by- $((N + 1)/2) = 5$  by 3:

$$AP = \begin{pmatrix} a_{0,0} & a_{3,3} & a_{4,3} \\ a_{1,0} & a_{1,1} & a_{4,4} \\ a_{2,0} & a_{2,1} & a_{2,2} \\ a_{3,0} & a_{3,1} & a_{3,2} \\ a_{4,0} & a_{4,1} & a_{4,2} \end{pmatrix}$$

- Transposed or conjugate transposed -  $transr = 'T'$  or  $transr = 'C'$

The elements of the lower triangle of  $A$  can be packed in a matrix with the dimensions  $((N+1)/2)$  by  $(N) = 3$  by 5:

$$AP = \begin{pmatrix} a_{0,0} & a_{1,0} & a_{2,0} & a_{3,0} & a_{4,0} \\ a_{3,3} & a_{1,1} & a_{2,1} & a_{3,1} & a_{4,1} \\ a_{4,3} & a_{4,4} & a_{2,2} & a_{3,2} & a_{4,2} \end{pmatrix}$$

The packed matrix  $AP$  can be stored using column major layout or row major layout.

---

**NOTE**

The `matrix_layout` and `transr` parameters can specify the same storage scheme: for example, the storage scheme for `matrix_layout = LAPACK_COL_MAJOR` and `transr = 'N'` is the same as that for `matrix_layout = LAPACK_ROW_MAJOR` and `transr = 'T'`.

---

Element  $a_{ij}$  is stored as array element `ap[l]` where the mapping of  $l(i, j)$  is defined in the following tables.

- Column major layout: `matrix_layout = LAPACK_COL_MAJOR` a

<i>transr</i>	<i>uplo</i>	<b>N</b>	<b>l(i, j) =</b>	<b>i</b>	<b>j</b>
'N'	'U'	2*k	$(j - k) * (N + 1) + i$	$0 \leq i < N$	$\max(i, k) \leq j < N$
			$i * (N + 1) + j + k + 1$	$0 \leq i < k$	$i \leq j < k$
		2*k + 1	$(j - k) * N + i$	$0 \leq i < N$	$\max(i, k) \leq j < N$
			$i * N + j + k + 1$	$0 \leq i < k$	$i \leq j < k$
	'L'	2*k	$j * (N + 1) + i + 1$	$0 \leq i < N$	$0 \leq j \leq \min(i, k)$
			$(i - k) * (N + 1) + j - k$	$k \leq i < N$	$k \leq j \leq i$
		2*k + 1	$j * N + i$	$0 \leq i < N$	$0 \leq j \leq \min(i, k)$
			$(i - k) * N + j - k - 1$	$k + 1 \leq i < N$	$k + 1 \leq j \leq i$

'T' or 'C'	'U'	$2*k$	$(j - k)*(N + 1) + i$	$0 \leq i < N$	$\max(i, k) \leq j < N$	
			$i*(N + 1) + k + j + 1$	$0 \leq i < k$	$i \leq j < k$	
		$2*k + 1$	$(j - k)*N + i$	$0 \leq i < N$	$\max(i, k) \leq j < N$	
			$i*N + k + j + 1$	$0 \leq i < k$	$i \leq j < k$	
		'L'	$2*k$	$j*(N + 1) + i + 1$	$0 \leq i < N$	$0 \leq j \leq \min(i, k)$
				$(i - k)*(N + 1) + j - k$	$k \leq i < N$	$k \leq j \leq i$
	$2*k + 1$		$j*N + i$	$0 \leq i < N$	$0 \leq j \leq \min(i, k)$	
			$(i - k)*N + j - k - 1$	$k + 1 \leq i < N$	$k + 1 \leq j \leq i$	

**NOTE**

Although LAPACK accepts parameter values of zero for matrix size, in general the size of the array should be greater than or equal to  $\max(1, N*(N + 1)/2)$ .

**Mathematical Notation for LAPACK Routines**

Descriptions of LAPACK routines use the following notation:

$A^H$  For an  $M$ -by- $N$  matrix  $A$ , denotes the conjugate transposed  $N$ -by- $M$  matrix with elements:

$$a_{i,j}^H = \overline{a_{j,i}}$$

For a real-valued matrix,  $A^H = A^T$ .

$x \cdot y$  The *dot product* of two vectors, defined as:

$$x \cdot y = \sum_i x_i \overline{y_i}$$

$Ax = b$  A system of linear equations with an  $n$ -by- $n$  matrix  $A = \{a_{ij}\}$ , a right-hand side vector  $b = \{b_i\}$ , and an unknown vector  $x = \{x_i\}$ .

$AX = B$  A set of systems with a common matrix  $A$  and multiple right-hand sides. The columns of  $B$  are individual right-hand sides, and the columns of  $X$  are the corresponding solutions.

$|x|$  the vector with elements  $|x_i|$  (absolute values of  $x_i$ ).

$|A|$  the matrix with elements  $|a_{ij}|$  (absolute values of  $a_{ij}$ ).

$\|x\|_\infty = \max_i |x_i|$  The *infinity-norm* of the vector  $x$ .

$\|A\|_\infty = \max_i \sum_j |a_{ij}|$  The *infinity-norm* of the matrix  $A$ .

$\|A\|_1 = \max_j \sum_i |a_{ij}|$  The *one-norm* of the matrix  $A$ .  $\|A\|_1 = \|A^T\|_\infty = \|A^H\|_\infty$

$\|x\|_2$  The *2-norm* of the vector  $x$ :  $\|x\|_2 = (\sum_i |x_i|^2)^{1/2} = \|x\|_E$  (see the definition for *Euclidean norm* in this topic).

$\|A\|_2$  The *2-norm* (or *spectral norm*) of the matrix  $A$ .

$$\|A\|_2 = \max_i \sigma_i, \|A\|_2^2 = \max_{\|x\|_2=1} (Ax \cdot Ax)$$

$\|A\|_E$  The *Euclidean norm* of the matrix  $A$ :  $\|A\|_E^2 = \sum_i \sum_j |a_{ij}|^2$ .

$\kappa(A) = \|A\| \cdot \|A^{-1}\|$  The *condition number* of the matrix  $A$ .

$\lambda_j$  *Eigenvalues* of the matrix  $A$  (for the definition of eigenvalues, see [Eigenvalue Problems](#)).

$\sigma_j$  *Singular values* of the matrix  $A$ . They are equal to square roots of the eigenvalues of  $A^H A$ . (For more information, see [Singular Value Decomposition](#)).

## Error Analysis

In practice, most computations are performed with rounding errors. Besides, you often need to solve a system  $Ax = b$ , where the data (the elements of  $A$  and  $b$ ) are not known exactly. Therefore, it is important to understand how the data errors and rounding errors can affect the solution  $x$ .

**Data perturbations.** If  $x$  is the exact solution of  $Ax = b$ , and  $x + \delta x$  is the exact solution of a perturbed problem  $(A + \delta A)(x + \delta x) = (b + \delta b)$ , then this estimate, given up to linear terms of perturbations, holds:

$$\frac{\|\delta x\|}{\|x\|} \leq \kappa(A) \left( \frac{\|\delta A\|}{\|A\|} + \frac{\|\delta b\|}{\|b\|} \right)$$

where  $A + \delta A$  is nonsingular and

$$\kappa(A) = \|A\| \|A^{-1}\| .$$

In other words, relative errors in  $A$  or  $b$  may be amplified in the solution vector  $x$  by a factor  $\kappa(A) = \frac{\|A\|}{\|A^{-1}\|}$  called the *condition number* of  $A$ .

**Rounding errors** have the same effect as relative perturbations  $c(n)\varepsilon$  in the original data. Here  $\varepsilon$  is the *machine precision*, defined as the smallest positive number  $x$  such that  $1 + x > 1$ ; and  $c(n)$  is a modest function of the matrix order  $n$ . The corresponding solution error is

$$\|\delta x\| / \|x\| \leq c(n) \kappa(A) \varepsilon. \text{ (The value of } c(n) \text{ is seldom greater than } 10n\text{.)}$$

---

### NOTE

Machine precision depends on the data type used. For example, it is usually defined in the `float.h` file as `FLT_EPSILON` the `float` datatype and `DBL_EPSILON` for the `double` datatype.

---

Thus, if your matrix  $A$  is *ill-conditioned* (that is, its condition number  $\kappa(A)$  is very large), then the error in the solution  $x$  can also be large; you might even encounter a complete loss of precision. LAPACK provides routines that allow you to estimate  $\kappa(A)$  (see [Routines for Estimating the Condition Number](#)) and also give you a more precise estimate for the actual solution error (see [Refining the Solution and Estimating Its Error](#)).

## LAPACK Linear Equation Routines

This section describes routines for performing the following computations:

- factoring the matrix (except for triangular matrices)
- equilibrating the matrix (except for RFP matrices)
- solving a system of linear equations
- estimating the condition number of a matrix (except for RFP matrices)

- refining the solution of linear equations and computing its error bounds (except for RFP matrices)
- inverting the matrix.

To solve a particular problem, you can call two or more [computational routines](#) or call a corresponding [driver routine](#) that combines several tasks in one call. For example, to solve a system of linear equations with a general matrix, call `?getrf` (*LU* factorization) and then `?getrs` (computing the solution). Then, call `?gerfs` to refine the solution and get the error bounds. Alternatively, use the driver routine `?gesvx` that performs all these tasks in one call.

## LAPACK Linear Equation Computational Routines

Table "Computational Routines for Systems of Equations with Real Matrices" lists the LAPACK computational routines for factorizing, equilibrating, and inverting *real* matrices, estimating their condition numbers, solving systems of equations with real matrices, refining the solution, and estimating its error. Table "Computational Routines for Systems of Equations with Complex Matrices" lists similar routines for *complex* matrices.

### Matrix Factorization: LAPACK Computational Routines

This section describes the LAPACK routines for matrix factorization. The following factorizations are supported:

- *LU* factorization
- Cholesky factorization of real symmetric positive-definite matrices
- Cholesky factorization of real symmetric positive-definite matrices with pivoting
- Cholesky factorization of Hermitian positive-definite matrices
- Cholesky factorization of Hermitian positive-definite matrices with pivoting
- Bunch-Kaufman factorization of real and complex symmetric matrices
- Bunch-Kaufman factorization of Hermitian matrices.

You can compute:

- the *LU* factorization using full and band storage of matrices
- the Cholesky factorization using full, packed, RFP, and band storage
- the Bunch-Kaufman factorization using full and packed storage.

#### ?getrf

Computes the *LU* factorization of a general *m-by-n* matrix.

#### Syntax

```
lapack_int LAPACKE_sgetrf (int matrix_layout , lapack_int m , lapack_int n , float *
a , lapack_int lda , lapack_int * ipiv );
```

```
lapack_int LAPACKE_dgetrf (int matrix_layout , lapack_int m , lapack_int n , double *
a , lapack_int lda , lapack_int * ipiv );
```

```
lapack_int LAPACKE_cgetrf (int matrix_layout , lapack_int m , lapack_int n ,
lapack_complex_float * a , lapack_int lda , lapack_int * ipiv );
```

```
lapack_int LAPACKE_zgetrf (int matrix_layout , lapack_int m , lapack_int n ,
lapack_complex_double * a , lapack_int lda , lapack_int * ipiv );
```

#### Include Files

- mkl.h

#### Description

The routine computes the  $LU$  factorization of a general  $m$ -by- $n$  matrix  $A$  as

$$A = P * L * U,$$

where  $P$  is a permutation matrix,  $L$  is lower triangular with unit diagonal elements (lower trapezoidal if  $m > n$ ) and  $U$  is upper triangular (upper trapezoidal if  $m < n$ ). The routine uses partial pivoting, with row interchanges.

---

#### NOTE

This routine supports the Progress Routine feature. See [Progress Function](#) for details.

---

### Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>m</i>	The number of rows in the matrix $A$ ( $m \geq 0$ ).
<i>n</i>	The number of columns in $A$ ; $n \geq 0$ .
<i>a</i>	Array, size at least $\max(1, lda * n)$ for column-major layout or $\max(1, lda * m)$ for row-major layout. Contains the matrix $A$ .
<i>lda</i>	The leading dimension of array $a$ , which must be at least $\max(1, m)$ for column-major layout or $\max(1, n)$ for row-major layout.

### Output Parameters

<i>a</i>	Overwritten by $L$ and $U$ . The unit diagonal elements of $L$ are not stored.
<i>ipiv</i>	Array, size at least $\max(1, \min(m, n))$ . Contains the pivot indices; for $1 \leq i \leq \min(m, n)$ , row $i$ was interchanged with row $ipiv(i)$ .

### Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

If *info* = *i*,  $u_{ii}$  is 0. The factorization has been completed, but  $U$  is exactly singular. Division by 0 will occur if you use the factor  $U$  for solving a system of linear equations.

### Application Notes

The computed  $L$  and  $U$  are the exact factors of a perturbed matrix  $A + E$ , where

$$|E| \leq c(\min(m, n)) \varepsilon P |L| |U|$$

$c(n)$  is a modest linear function of  $n$ , and  $\varepsilon$  is the machine precision.

The approximate number of floating-point operations for real flavors is

$$(2/3)n^3 \quad \text{If } m = n,$$

$$(1/3)n^2(3m-n) \quad \text{If } m > n,$$

$(1/3)m^2(3n-m)$  If  $m < n$ .

The number of operations for complex flavors is four times greater.

After calling this routine with  $m = n$ , you can call the following:

`?getrs` to solve  $A^*X = B$  or  $A^T X = B$  or  $A^H X = B$   
`?gecon` to estimate the condition number of  $A$   
`?getri` to compute the inverse of  $A$ .

lapack_complex_double * a , lapack_int lda );
```

## Include Files

- `mkl.h`

## Description

The routine computes the LU factorization of a general  $m$ -by- $n$  matrix  $A$  as

$$A = L^*U,$$

where  $L$  is lower triangular with unit-diagonal elements (lower trapezoidal if  $m > n$ ) and  $U$  is upper triangular (upper trapezoidal if  $m < n$ ). The routine does not use pivoting.

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<code>m</code>	The number of rows in the matrix $A$ ( $m \geq 0$ ).
<code>n</code>	The number of columns in $A$ ; $n \geq 0$ .
<code>a</code>	Array, size at least $\max(1, lda * n)$ for column-major layout or $\max(1, lda * m)$ for row-major layout. Contains the matrix $A$ .

*lda* The leading dimension of array *a*, which must be at least  $\max(1, m)$  for column-major layout or  $\max(1, n)$  for row-major layout.

## Output Parameters

*a* Overwritten by *L* and *U*. The unit diagonal elements of *L* are not stored.

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

If *info* = *i*,  $u_{ii}$  is 0. The factorization has been completed, but *U* is exactly singular. Division by 0 will occur if you use the factor *U* for solving a system of linear equations.

## Application Notes

The approximate number of floating-point operations for real flavors is

$(2/3)n^3$  If  $m = n$ ,

$(1/3)n^2(3m-n)$  If  $m > n$ ,

$(1/3)m^2(3n-m)$  If  $m < n$ .

The number of operations for complex flavors is four times greater.

After calling this routine with  $m = n$ , you can call the following:

`mkl_?getrinp` to compute the inverse of *A*

lapack_int nfact, lapack_complex_float* a, lapack_int lda);
```

```
lapack_int LAPACKE_mkl_zgetrfnpi (int matrix_layout, lapack_int m, lapack_int n,
lapack_int nfact, lapack_complex_double* a, lapack_int lda);
```

## Include Files

- `mk1.h`

## Description

The routine computes the LU factorization of a general  $m$ -by- $n$  matrix  $A$  without using pivoting. It supports incomplete factorization. The factorization has the form:

$$A = L*U,$$

where  $L$  is lower triangular with unit diagonal elements (lower trapezoidal if  $m > n$ ) and  $U$  is upper triangular (upper trapezoidal if  $m < n$ ).

Incomplete factorization has the form:

$$A = L*U + \tilde{A}$$

where  $L$  is lower trapezoidal with unit diagonal elements,  $U$  is upper trapezoidal, and

$$\tilde{A}$$

is the unfactored part of matrix  $A$ . See the application notes section for further details.

---

### NOTE

Use `?getrf` if it is possible that the matrix is not diagonal dominant.

---

## Input Parameters

$A$  `<datatype>` placeholder, if present, is used for the C interface data types in the C interface section above. See [C Interface Conventions](#) for the C interface principal conventions and type definitions.

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major ( <code>LAPACK_ROW_MAJOR</code> ) or column major ( <code>LAPACK_COL_MAJOR</code> ).
<code>m</code>	The number of rows in matrix $A$ ; $m \geq 0$ .
<code>n</code>	The number of columns in matrix $A$ ; $n \geq 0$ .
<code>nfact</code>	The number of rows and columns to factor; $0 \leq nfact \leq \min(m, n)$ . Note that if $nfact < \min(m, n)$ , incomplete factorization is performed.
<code>a</code>	Array of size at least $lda*n$ for column major layout and at least $lda*m$ for row major layout. Contains the matrix $A$ .
<code>lda</code>	The leading dimension of array $a$ . $lda \geq \max(1, m)$ for column major layout and $lda \geq \max(1, n)$ for row major layout.

## Output Parameters

<code>a</code>	Overwritten by $L$ and $U$ . The unit diagonal elements of $L$ are not stored. When incomplete factorization is specified by setting $nfact < \min(m, n)$ , $a$ also contains the unfactored submatrix $\tilde{A}_{22}$ . See the application notes section for further details.
----------------	--

**Return Values**

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*,  $u_{ij}$  is 0. The requested factorization has been completed, but *U* is exactly singular. Division by 0 will occur if factorization is completed and factor *U* is used for solving a system of linear equations.

**Application Notes**

The computed *L* and *U* are the exact factors of a perturbed matrix  $A + E$ , with

$$|E| \leq c(\min(m, n)) \epsilon |L| |U|$$

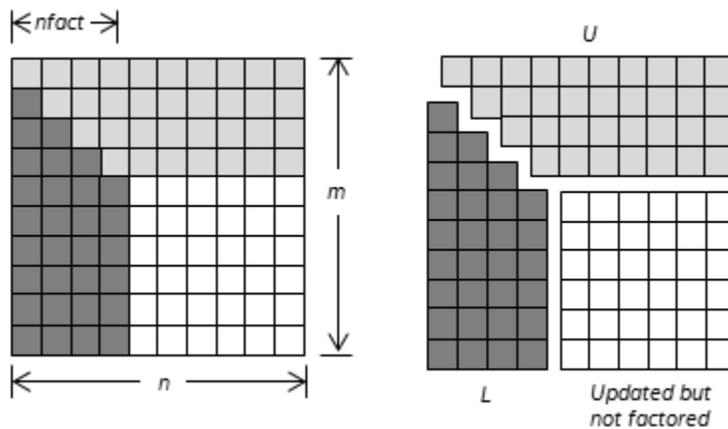

where  $c(n)$  is a modest linear function of *n*, and  $\epsilon$  is the machine precision.

The approximate number of floating-point operations for real flavors is

- $(2/3)n^3$  If  $m = n = nfact$
- $(1/3)n^2(3m-n)$  If  $m > n = nfact$
- $(1/3)m^2(3n-m)$  If  $m = nfact < n$
- $(2/3)n^3 - (n-nfact)^3$  If  $m = n, nfact < \min(m, n)$
- $(1/3)(n^2(3m-n) - (n-nfact)^2(3m - 2nfact - n))$  If  $m > n > nfact$
- $(1/3)(m^2(3n-m) - (m-nfact)^2(3n - 2nfact - m))$  If  $nfact < m < n$

The number of operations for complex flavors is four times greater.

When incomplete factorization is specified, the first *nfact* rows and columns are factored, with the update of the remaining rows and columns of *A* as follows:

If matrix *A* is represented as a block 2-by-2 matrix:

$$A = \begin{bmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{bmatrix}$$

where

- $A_{11}$  is a square matrix of order  $n_{fact}$ ,
- $A_{21}$  is an  $(m - n_{fact})$ -by- $n_{fact}$  matrix,
- $A_{12}$  is an  $n_{fact}$ -by- $(n - n_{fact})$  matrix, and
- $A_{22}$  is an  $(m - n_{fact})$ -by- $(n - n_{fact})$  matrix.

The result is

$$A = \begin{bmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{bmatrix} = \begin{bmatrix} L_1 \\ L_2 \end{bmatrix} \cdot [U_1 \ U_2] + \begin{bmatrix} 0 & 0 \\ 0 & \tilde{A}_{22} \end{bmatrix}$$

$L_1$  is a lower triangular square matrix of order  $n_{fact}$  with unit diagonal and  $U_1$  is an upper triangular square matrix of order  $n_{fact}$ .  $L_1$  and  $U_1$  result from LU factorization of matrix  $A_{11}$ :  $A_{11} = L_1 U_1$ .

$L_2$  is an  $(m - n_{fact})$ -by- $n_{fact}$  matrix and  $L_2 = A_{21} U_1^{-1}$ .  $U_2$  is an  $n_{fact}$ -by- $(n - n_{fact})$  matrix and  $U_2 = L_1^{-1} A_{12}$ .

$$\tilde{A}_{22}$$

is an  $(m - n_{fact})$ -by- $(n - n_{fact})$  matrix and

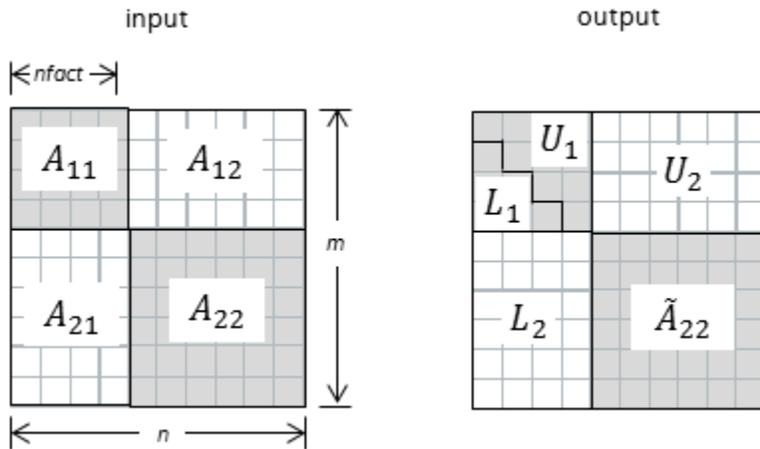

$$\tilde{A}_{22}$$

$$= A_{22} - L_2 U_2.$$

On exit, elements of the upper triangle  $U_1$  are stored in place of the upper triangle of block  $A_{11}$  in array  $a$ ; elements of the lower triangle  $L_1$  are stored in the lower triangle of block  $A_{11}$  in array  $a$  (unit diagonal elements are not stored). Elements of  $L_2$  replace elements of  $A_{21}$ ;  $U_2$  replaces elements of  $A_{12}$  and

$$\tilde{A}_{22}$$

replaces elements of  $A_{22}$ .

### `sgetrf2`

Computes LU factorization using partial pivoting with row interchanges.

### Syntax

```
lapack_int LAPACKE_sgetrf2 (int matrix_layout, lapack_int m, lapack_int n, float * a,
lapack_int lda, lapack_int * ipiv);
```

```
lapack_int LAPACKE_dgetrf2 (int matrix_layout, lapack_int m, lapack_int n, double * a,
lapack_int lda, lapack_int * ipiv);
```

```
lapack_int LAPACKE_cgetrf2 (int matrix_layout, lapack_int m, lapack_int n,
lapack_complex_float * a, lapack_int lda, lapack_int * ipiv);
```

```
lapack_int LAPACKE_zgetrf2 (int matrix_layout, lapack_int m, lapack_int n,
lapack_complex_double * a, lapack_int lda, lapack_int * ipiv);
```

## Include Files

- mkl.h

## Description

?getrf2 computes an LU factorization of a general  $m$ -by- $n$  matrix  $A$  using partial pivoting with row interchanges.

The factorization has the form

$$A = P * L * U$$

where  $P$  is a permutation matrix,  $L$  is lower triangular with unit diagonal elements (lower trapezoidal if  $m > n$ ), and  $U$  is upper triangular (upper trapezoidal if  $m < n$ ).

This is the recursive version of the algorithm. It divides the matrix into four submatrices:

$$A = \begin{pmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{pmatrix}$$

where  $A_{11}$  is  $n_1$  by  $n_1$  and  $A_{22}$  is  $n_2$  by  $n_2$  with  $n_1 = \min(m, n)$ , and  $n_2 = n - n_1$ .

The subroutine calls itself to factor  $\begin{pmatrix} A_{11} \\ A_{12} \end{pmatrix}$ ,

do the swaps on  $\begin{pmatrix} A_{12} \\ A_{22} \end{pmatrix}$ , solve  $A_{12}$ , update  $A_{22}$ , then it calls itself to factor  $A_{22}$  and do the swaps on  $A_{21}$ .

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>m</i>	The number of rows of the matrix A. $m \geq 0$ .
<i>n</i>	The number of columns of the matrix A. $n \geq 0$ .
<i>a</i>	Array, size $lda * n$ . On entry, the $m$ -by- $n$ matrix to be factored.
<i>lda</i>	The leading dimension of the array <i>a</i> . $lda \geq \max(1, m)$ .

## Output Parameters

<i>a</i>	On exit, the factors $L$ and $U$ from the factorization $A = P * L * U$ ; the unit diagonal elements of $L$ are not stored.
<i>ipiv</i>	Array, size $(\min(m, n))$ . The pivot indices; for $1 \leq i \leq \min(m, n)$ , row $i$ of the matrix was interchanged with row $ipiv[i - 1]$ .

## Return Values

This function returns a value *info*.

= 0: successful exit

< 0: if *info* = *-i*, the *i*-th argument had an illegal value.

> 0: if *info* = *i*,  $U_{i,i}$  is exactly zero. The factorization has been completed, but the factor  $U$  is exactly singular, and division by zero will occur if it is used to solve a system of equations.

### ?gbtrf

Computes the LU factorization of a general  $m$ -by- $n$  band matrix.

## Syntax

```
lapack_int LAPACKE_sgbtrf (int matrix_layout , lapack_int m , lapack_int n , lapack_int
kl , lapack_int ku , float * ab , lapack_int ldab , lapack_int * ipiv );
```

```
lapack_int LAPACKE_dgbtrf (int matrix_layout , lapack_int m , lapack_int n , lapack_int
kl , lapack_int ku , double * ab , lapack_int ldab , lapack_int * ipiv );
```

```
lapack_int LAPACKE_cgbtrf (int matrix_layout , lapack_int m , lapack_int n , lapack_int
kl , lapack_int ku , lapack_complex_float * ab , lapack_int ldab , lapack_int * ipiv );
```

```
lapack_int LAPACKE_zgbtrf (int matrix_layout , lapack_int m , lapack_int n , lapack_int
kl , lapack_int ku , lapack_complex_double * ab , lapack_int ldab , lapack_int *
ipiv );
```

## Include Files

- mkl.h

## Description

The routine forms the LU factorization of a general  $m$ -by- $n$  band matrix  $A$  with  $kl$  non-zero subdiagonals and  $ku$  non-zero superdiagonals, that is,

$$A = P * L * U,$$

where  $P$  is a permutation matrix;  $L$  is lower triangular with unit diagonal elements and at most  $kl$  non-zero elements in each column;  $U$  is an upper triangular band matrix with  $kl + ku$  superdiagonals. The routine uses partial pivoting, with row interchanges (which creates the additional  $kl$  superdiagonals in  $U$ ).

### NOTE

This routine supports the Progress Routine feature. See [Progress Function](#) for details.

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>m</i>	The number of rows in matrix $A$ ; $m \geq 0$ .
<i>n</i>	The number of columns in matrix $A$ ; $n \geq 0$ .
<i>kl</i>	The number of subdiagonals within the band of $A$ ; $kl \geq 0$ .

<i>ku</i>	The number of superdiagonals within the band of <i>A</i> ; $ku \geq 0$ .
<i>ab</i>	Array, size at least $\max(1, ldab*n)$ for column-major layout or $\max(1, ldab*m)$ for row-major layout.  The array <i>ab</i> contains the matrix <i>A</i> in band storage as described in <a href="#">Band Storage</a> .
<i>ldab</i>	The leading dimension of the array <i>ab</i> . ( $ldab \geq 2*kl + ku + 1$ )

## Output Parameters

<i>ab</i>	Overwritten with elements of <i>L</i> and <i>U</i> . <i>U</i> is stored as an upper triangular band matrix with $kl + ku$ superdiagonals, and <i>L</i> is stored as a lower triangular band matrix with $kl$ subdiagonals (diagonal unit values are not stored). Since the output array has more nonzero elements than the initial matrix <i>A</i> , there are limitations on the value of <i>ldab</i> and the placement of elements of <i>A</i> in array <i>ab</i> .  See Application Notes below for further details.
<i>ipiv</i>	Array, size at least $\max(1, \min(m, n))$ . The pivot indices; for $1 \leq i \leq \min(m, n)$ , row <i>i</i> was interchanged with row <i>ipiv</i> ( <i>i</i> ).

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

If *info* = *i*,  $u_{ii}$  is 0. The factorization has been completed, but *U* is exactly singular. Division by 0 will occur if you use the factor *U* for solving a system of linear equations.

## Application Notes

The computed *L* and *U* are the exact factors of a perturbed matrix  $A + E$ , where

$$|E| \leq c(kl+ku+1) \varepsilon P |L| |U|$$

$c(k)$  is a modest linear function of  $k$ , and  $\varepsilon$  is the machine precision.

The total number of floating-point operations for real flavors varies between approximately  $2n(ku+1)kl$  and  $2n(kl+ku+1)kl$ . The number of operations for complex flavors is four times greater. All these estimates assume that  $kl$  and  $ku$  are much less than  $\min(m, n)$ .

As described in [Band Storage](#), storage of a band matrix can be considered in two steps: packing band matrix elements into a matrix *AB*, then storing the elements in a linear array *ab* using a full storage scheme. The effect of the ?gbtrf routine on matrix *AB* is illustrated by this example, for  $m = n = 6$ ,  $kl = 2$ ,  $ku = 1$ .

- `matrix_layout = LAPACK_COL_MAJOR`

On entry:	On exit:
-----------	----------

$$\begin{array}{|c|}
 \left. \begin{array}{l}
 AB = \begin{bmatrix}
 * & * & * & + & + & + \\
 * & * & + & + & + & + \\
 * & a_{1,2} & a_{2,3} & a_{3,4} & a_{4,5} & a_{5,6} \\
 a_{1,1} & a_{2,2} & a_{3,3} & a_{4,4} & a_{5,5} & a_{6,6} \\
 a_{2,1} & a_{3,2} & a_{4,3} & a_{5,4} & a_{6,5} & * \\
 a_{3,1} & a_{4,2} & a_{5,3} & a_{6,4} & * & *
 \end{bmatrix}
 \end{array} \right\}
 \end{array}
 \quad
 \begin{array}{|c|}
 \left. \begin{array}{l}
 AB = \begin{bmatrix}
 * & * & * & u_{1,4} & u_{2,5} & u_{3,6} \\
 * & * & u_{1,3} & u_{2,4} & u_{3,5} & u_{4,6} \\
 * & u_{1,2} & u_{2,3} & u_{3,4} & u_{4,5} & u_{5,6} \\
 u_{1,1} & u_{2,2} & u_{3,3} & u_{4,4} & u_{5,5} & u_{6,6} \\
 l_{2,1} & l_{3,2} & l_{4,3} & l_{5,4} & l_{6,5} & * \\
 l_{3,1} & l_{4,2} & l_{5,3} & l_{6,4} & * & *
 \end{bmatrix}
 \end{array} \right\}
 \end{array}
 \end{array}$$

- `matrix_layout = LAPACK_ROW_MAJOR`

On entry:	On exit:
$  AB = \begin{bmatrix}  * & * & a_{1,1} & a_{1,2} & + & + \\  * & a_{2,1} & a_{2,2} & a_{2,3} & + & + \\  a_{3,1} & a_{3,2} & a_{3,3} & a_{3,4} & + & + \\  a_{4,2} & a_{4,3} & a_{4,4} & a_{4,5} & + & * \\  a_{5,3} & a_{5,4} & a_{5,5} & a_{5,6} & * & * \\  a_{6,4} & a_{6,5} & a_{6,6} & * & * & *  \end{bmatrix}  $	$  AB = \begin{bmatrix}  * & * & u_{1,1} & u_{1,2} & u_{1,3} & u_{1,4} \\  * & l_{2,1} & u_{2,2} & u_{2,3} & u_{2,4} & u_{2,5} \\  l_{3,1} & l_{3,2} & u_{3,3} & u_{3,4} & u_{3,5} & u_{3,6} \\  l_{4,2} & l_{4,3} & u_{4,4} & u_{4,5} & u_{4,6} & * \\  l_{5,3} & l_{5,4} & u_{5,5} & u_{5,6} & * & * \\  l_{6,4} & l_{6,5} & u_{6,6} & * & * & *  \end{bmatrix}  $

Elements marked \* are not used; elements marked + need not be set on entry, but are required by the routine to store elements of  $U$  because of fill-in resulting from the row interchanges.

After calling this routine with  $m = n$ , you can call the following routines:

- `gbtrs` to solve  $A * X = B$  or  $A^T * X = B$  or  $A^H * X = B$
- `gbcon` to estimate the condition number of  $A$ .

### ?gttrf

Computes the LU factorization of a tridiagonal matrix.

### Syntax

```
lapack_int LAPACKE_sgtrf (lapack_int n , float * dl , float * d , float * du , float * du2 , lapack_int * ipiv );
```

```
lapack_int LAPACKE_dgtrf (lapack_int n , double * dl , double * d , double * du , double * du2 , lapack_int * ipiv );
```

```
lapack_int LAPACKE_cgtrf (lapack_int n , lapack_complex_float * dl , lapack_complex_float * d , lapack_complex_float * du , lapack_complex_float * du2 , lapack_int * ipiv );
```

```
lapack_int LAPACKE_zgtrf (lapack_int n , lapack_complex_double * dl , lapack_complex_double * d , lapack_complex_double * du , lapack_complex_double * du2 , lapack_int * ipiv );
```

## Include Files

- `mkl.h`

## Description

The routine computes the  $LU$  factorization of a real or complex tridiagonal matrix  $A$  using elimination with partial pivoting and row interchanges.

The factorization has the form

$$A = L^*U,$$

where  $L$  is a product of permutation and unit lower bidiagonal matrices and  $U$  is upper triangular with nonzeros in only the main diagonal and first two superdiagonals.

## Input Parameters

$n$	The order of the matrix $A$ ; $n \geq 0$ .
$d1, d, du$	Arrays containing elements of $A$ . The array $d1$ of dimension $(n - 1)$ contains the subdiagonal elements of $A$ . The array $d$ of dimension $n$ contains the diagonal elements of $A$ . The array $du$ of dimension $(n - 1)$ contains the superdiagonal elements of $A$ .

## Output Parameters

$d1$	Overwritten by the $(n-1)$ multipliers that define the matrix $L$ from the $LU$ factorization of $A$ .
$d$	Overwritten by the $n$ diagonal elements of the upper triangular matrix $U$ from the $LU$ factorization of $A$ .
$du$	Overwritten by the $(n-1)$ elements of the first superdiagonal of $U$ .
$du2$	Array, dimension $(n - 2)$ . On exit, $du2$ contains $(n-2)$ elements of the second superdiagonal of $U$ .
$ipiv$	Array, dimension $(n)$ . The pivot indices: for $1 \leq i \leq n$ , row $i$ was interchanged with row $ipiv[i-1]$ . $ipiv[i-1]$ is always $i$ or $i+1$ ; $ipiv[i-1] = i$ indicates a row interchange was not required.

## Return Values

This function returns a value  $info$ .

If  $info = 0$ , the execution is successful.

If  $info = -i$ , parameter  $i$  had an illegal value.

If  $info = i$ ,  $u_{ii}$  is 0. The factorization has been completed, but  $U$  is exactly singular. Division by zero will occur if you use the factor  $U$  for solving a system of linear equations.

## Application Notes

?gbtrs

to solve  $A*X = B$  or  $A^T*X = B$  or  $A^H*X = B$

?gbcon

to estimate the condition number of  $A$ .

?dtttrfb

Computes the factorization of a diagonally dominant tridiagonal matrix.

## Syntax

```
void sdttrfb (const MKL_INT * n , float * dl , float * d , const float * du , MKL_INT * info );
```

```
void ddttrfb (const MKL_INT * n , double * dl , double * d , const double * du , MKL_INT * info );
```

```
void cdttrfb (const MKL_INT * n , MKL_Complex8 * dl , MKL_Complex8 * d , const MKL_Complex8 * du , MKL_INT * info );
```

```
void zdttrfb_ (const MKL_INT * n , MKL_Complex16 * dl , MKL_Complex16 * d , const MKL_Complex16 * du , MKL_INT * info );
```

## Include Files

- mkl.h

## Description

The ?dtttrfb routine computes the factorization of a real or complex tridiagonal matrix  $A$  with the BABE (Burning At Both Ends) algorithm without pivoting. The factorization has the form

$$A = L_1 * U * L_2$$

where

- $L_1$  and  $L_2$  are unit lower bidiagonal with  $k$  and  $n - k - 1$  subdiagonal elements, respectively, where  $k = n/2$ , and
- $U$  is an upper bidiagonal matrix with nonzeros in only the main diagonal and first superdiagonal.

## Input Parameters

$n$	The order of the matrix $A$ ; $n \geq 0$ .
$dl, d, du$	Arrays containing elements of $A$ . The array $dl$ of dimension $(n - 1)$ contains the subdiagonal elements of $A$ . The array $d$ of dimension $n$ contains the diagonal elements of $A$ . The array $du$ of dimension $(n - 1)$ contains the superdiagonal elements of $A$ .

## Output Parameters

$dl$	Overwritten by the $(n - 1)$ multipliers that define the matrix $L$ from the $LU$ factorization of $A$ .
------	--

<i>d</i>	Overwritten by the $n$ diagonal element reciprocals of the upper triangular matrix $U$ from the factorization of $A$ .
<i>du</i>	Overwritten by the $(n-1)$ elements of the superdiagonal of $U$ .
<i>info</i>	If $info = 0$ , the execution is successful. If $info = -i$ , the $i$ -th parameter had an illegal value. If $info = i$ , $u_{ii}$ is 0. The factorization has been completed, but $U$ is exactly singular. Division by zero will occur if you use the factor $U$ for solving a system of linear equations.

## Application Notes

A diagonally dominant tridiagonal system is defined such that  $|d_i| > |dl_{i-1}| + |du_i|$  for any  $i$ :

$1 < i < n$ , and  $|d_1| > |du_1|$ ,  $|d_n| > |dl_{n-1}|$

The underlying BABE algorithm is designed for diagonally dominant systems. Such systems are free from the numerical stability issue unlike the canonical systems that use elimination with partial pivoting (see [?gttrf](#)). The diagonally dominant systems are much faster than the canonical systems.

---

### NOTE

- The current implementation of BABE has a potential accuracy issue on very small or large data close to the underflow or overflow threshold respectively. Scale the matrix before applying the solver in the case of such input data.
  - Applying the [?dttrfb](#) factorization to non-diagonally dominant systems may lead to an accuracy loss, or false singularity detected due to no pivoting.
- 

### [?potrf](#)

*Computes the Cholesky factorization of a symmetric (Hermitian) positive-definite matrix.*

---

### Syntax

```
lapack_int LAPACKE_spotrf (int matrix_layout , char uplo , lapack_int n , float * a ,
lapack_int lda );

lapack_int LAPACKE_dpotrf (int matrix_layout , char uplo , lapack_int n , double * a ,
lapack_int lda );

lapack_int LAPACKE_cpotrf (int matrix_layout , char uplo , lapack_int n ,
lapack_complex_float * a , lapack_int lda );

lapack_int LAPACKE_zpotrf (int matrix_layout , char uplo , lapack_int n ,
lapack_complex_double * a , lapack_int lda );
```

### Include Files

- mkl.h

### Description

The routine forms the Cholesky factorization of a symmetric positive-definite or, for complex data, Hermitian positive-definite matrix  $A$ :

$A = U^T * U$  for real data,  $A = U^H * U$  for complex data      if `uplo='U'`  
 $A = L * L^T$  for real data,  $A = L * L^H$  for complex data      if `uplo='L'`

where  $L$  is a lower triangular matrix and  $U$  is upper triangular.

---

**NOTE**

This routine supports the Progress Routine feature. See [Progress Function](#) for details.

---

## Input Parameters

`matrix_layout`      Specifies whether matrix storage layout is row major (LAPACK\_ROW\_MAJOR) or column major (LAPACK\_COL\_MAJOR).

`uplo`      Must be 'U' or 'L'.  
 Indicates whether the upper or lower triangular part of  $A$  is stored and how  $A$  is factored:  
 If `uplo = 'U'`, the array  $a$  stores the upper triangular part of the matrix  $A$ , and the strictly lower triangular part of the matrix is not referenced.  
 If `uplo = 'L'`, the array  $a$  stores the lower triangular part of the matrix  $A$ , and the strictly upper triangular part of the matrix is not referenced.

`n`      Specifies the order of the matrix  $A$ . The value of  $n$  must be at least zero.

`a`      Array, size  $\max(1, lda * n)$ . The array  $a$  contains either the upper or the lower triangular part of the matrix  $A$  (see `uplo`).

`lda`      The leading dimension of  $a$ . Must be at least  $\max(1, n)$ .

## Output Parameters

`a`      The upper or lower triangular part of  $a$  is overwritten by the Cholesky factor  $U$  or  $L$ , as specified by `uplo`.

## Return Values

This function returns a value `info`.

If `info=0`, the execution is successful.

If `info = -i`, parameter  $i$  had an illegal value.

If `info = i`, the leading minor of order  $i$  (and therefore the matrix  $A$  itself) is not positive-definite, and the factorization could not be completed. This may indicate an error in forming the matrix  $A$ .

## Application Notes

If `uplo = 'U'`, the computed factor  $U$  is the exact factor of a perturbed matrix  $A + E$ , where

$$|E| \leq c(n)\varepsilon |U^H| |U|, \quad |e_{ij}| \leq c(n)\varepsilon \sqrt{a_{ii}a_{jj}}$$

$c(n)$  is a modest linear function of  $n$ , and  $\varepsilon$  is the machine precision.

A similar estimate holds for `uplo = 'L'`.

The total number of floating-point operations is approximately  $(1/3)n^3$  for real flavors or  $(4/3)n^3$  for complex flavors.

After calling this routine, you can call the following routines:

<code>?potrs</code>	to solve $A * X = B$
<code>?pocon</code>	to estimate the condition number of $A$
<code>?potri</code>	to compute the inverse of $A$ .

### `?potrf2`

*Computes Cholesky factorization using a recursive algorithm.*

### Syntax

```
lapack_int LAPACKE_spotrf2 (int matrix_layout, char uplo, lapack_int n, float * a,
lapack_int lda);

lapack_int LAPACKE_dpotrf2 (int matrix_layout, char uplo, lapack_int n, double * a,
lapack_int lda);

lapack_int LAPACKE_cpotrf2 (int matrix_layout, char uplo, lapack_int n,
lapack_complex_float * a, lapack_int lda);

lapack_int LAPACKE_zpotrf2 (int matrix_layout, char uplo, lapack_int n,
lapack_complex_double * a, lapack_int lda);
```

### Include Files

- `mkl.h`

### Description

`?potrf2` computes the Cholesky factorization of a real or complex symmetric positive definite matrix  $A$  using the recursive algorithm.

The factorization has the form

for real flavors:

$$A = U^T * U, \text{ if } uplo = 'U', \text{ or}$$

$$A = L * L^T, \text{ if } uplo = 'L',$$

for complex flavors:

$$A = U^H * U, \text{ if } uplo = 'U',$$

$$\text{or } A = L * L^H, \text{ if } uplo = 'L',$$

where  $U$  is an upper triangular matrix and  $L$  is lower triangular.

This is the recursive version of the algorithm. It divides the matrix into four submatrices:

$$A = \begin{pmatrix} A11 & A12 \\ A21 & A22 \end{pmatrix}$$

where  $A11$  is  $n1$  by  $n1$  and  $A22$  is  $n2$  by  $n2$ , with  $n1 = n/2$  and  $n2 = n-n1$ .

The subroutine calls itself to factor  $A_{11}$ . Update and scale  $A_{21}$  or  $A_{12}$ , update  $A_{22}$  then call itself to factor  $A_{22}$ .

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	= 'U': Upper triangle of $A$ is stored; = 'L': Lower triangle of $A$ is stored.
<i>n</i>	The order of the matrix $A$ . $n \geq 0$ .
<i>a</i>	Array, size ( $lda*n$ ). On entry, the symmetric matrix $A$ . If <i>uplo</i> = 'U', the leading $n$ -by- $n$ upper triangular part of $a$ contains the upper triangular part of the matrix $A$ , and the strictly lower triangular part of $a$ is not referenced. If <i>uplo</i> = 'L', the leading $n$ -by- $n$ lower triangular part of $a$ contains the lower triangular part of the matrix $A$ , and the strictly upper triangular part of $a$ is not referenced.
<i>lda</i>	The leading dimension of the array $a$ . $lda \geq \max(1, n)$ .

## Output Parameters

<i>a</i>	On exit, if <i>info</i> = 0, the factor $U$ or $L$ from the Cholesky factorization. For real flavors: $A = U^T * U$ or $A = L * L^T$ ; For complex flavors: $A = U^H * U$ or $A = L * L^H$ .
----------	--

## Return Values

This function returns a value *info*.

= 0: successful exit

< 0: if *info* =  $-i$ , the  $i$ -th argument had an illegal value

> 0: if *info* =  $i$ , the leading minor of order  $i$  is not positive definite, and the factorization could not be completed.

### *?pstrf*

*Computes the Cholesky factorization with complete pivoting of a real symmetric (complex Hermitian) positive semidefinite matrix.*

## Syntax

```
lapack_int LAPACKE_spstrf( int matrix_layout, char uplo, lapack_int n, float* a,
lapack_int lda, lapack_int* piv, lapack_int* rank, float tol );
```

```

lapack_int LAPACKE_dpstrf( int matrix_layout, char uplo, lapack_int n, double* a,
lapack_int lda, lapack_int* piv, lapack_int* rank, double tol );

lapack_int LAPACKE_cpstrf( int matrix_layout, char uplo, lapack_int n,
lapack_complex_float* a, lapack_int lda, lapack_int* piv, lapack_int* rank, float tol );

lapack_int LAPACKE_zpstrf( int matrix_layout, char uplo, lapack_int n,
lapack_complex_double* a, lapack_int lda, lapack_int* piv, lapack_int* rank, double
tol );

```

## Include Files

- mkl.h

## Description

The routine computes the Cholesky factorization with complete pivoting of a real symmetric (complex Hermitian) positive semidefinite matrix. The form of the factorization is:

$$\begin{aligned}
 P^T * A * P &= U^T * U, \text{ if } uplo = 'U' \text{ for real flavors,} \\
 P^T * A * P &= U^H * U, \text{ if } uplo = 'U' \text{ for complex flavors,} \\
 P^T * A * P &= L * L^T, \text{ if } uplo = 'L' \text{ for real flavors,} \\
 P^T * A * P &= L * L^H, \text{ if } uplo = 'L' \text{ for complex flavors,}
 \end{aligned}$$

where  $P$  is a permutation matrix stored as vector  $piv$ , and  $U$  and  $L$  are upper and lower triangular matrices, respectively.

This algorithm does not attempt to check that  $A$  is positive semidefinite. This version of the algorithm calls level 3 BLAS.

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Must be 'U' or 'L'.  Indicates whether the upper or lower triangular part of $A$ is stored:  If $uplo = 'U'$ , the array $a$ stores the upper triangular part of the matrix $A$ , and the strictly lower triangular part of the matrix is not referenced.  If $uplo = 'L'$ , the array $a$ stores the lower triangular part of the matrix $A$ , and the strictly upper triangular part of the matrix is not referenced.
<i>n</i>	The order of matrix $A$ ; $n \geq 0$ .
<i>a</i>	Array $a$ , size $\max(1, lda * n)$ . The array $a$ contains either the upper or the lower triangular part of the matrix $A$ (see <i>uplo</i> ).
<i>tol</i>	User defined tolerance. If $tol < 0$ , then $n * \epsilon * \max(A_{k,k})$ , where $\epsilon$ is the machine precision, will be used (see <a href="#">Error Analysis</a> for the definition of machine precision). The algorithm terminates at the $(k-1)$ -st step, if the pivot $\leq tol$ .
<i>lda</i>	The leading dimension of $a$ ; at least $\max(1, n)$ .

## Output Parameters

<i>a</i>	If <i>info</i> = 0, the factor <i>U</i> or <i>L</i> from the Cholesky factorization is as described in <i>Description</i> .
<i>piv</i>	Array, size at least $\max(1, n)$ . The array <i>piv</i> is such that the nonzero entries are $P_{piv[k-1], k}$ ( $1 \leq k \leq n$ ).
<i>rank</i>	The rank of <i>a</i> given by the number of steps the algorithm completed.

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*k*, the *k*-th argument had an illegal value.

If *info* > 0, the matrix *A* is either rank deficient with a computed rank as returned in *rank*, or is not positive semidefinite.

## Description

The routine forms the Cholesky factorization of a symmetric positive-definite or, for complex data, a Hermitian positive-definite matrix *A*:

$$\begin{array}{ll}
 A = U^T * U \text{ for real data, } A = U^H * U \text{ for complex data} & \text{if } uplo = 'U' \\
 A = L * L^T \text{ for real data, } A = L * L^H \text{ for complex data} & \text{if } uplo = 'L'
 \end{array}$$

where *L* is a lower triangular matrix and *U* is upper triangular.

The matrix *A* is in the Rectangular Full Packed (RFP) format. For the description of the RFP format, see [Matrix Storage Schemes](#).

This is the block version of the algorithm, calling Level 3 BLAS.

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>transr</i>	Must be 'N', 'T' (for real data) or 'C' (for complex data). If <i>transr</i> = 'N', the Normal <i>transr</i> of RFP <i>A</i> is stored. If <i>transr</i> = 'T', the Transpose <i>transr</i> of RFP <i>A</i> is stored. If <i>transr</i> = 'C', the Conjugate-Transpose <i>transr</i> of RFP <i>A</i> is stored.
<i>uplo</i>	Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of <i>A</i> is stored: If <i>uplo</i> = 'U', the array <i>a</i> stores the upper triangular part of the matrix <i>A</i> . If <i>uplo</i> = 'L', the array <i>a</i> stores the lower triangular part of the matrix <i>A</i> .
<i>n</i>	The order of the matrix <i>A</i> ; $n \geq 0$ .
<i>a</i>	Array, size $(n*(n+1)/2)$ . The array <i>a</i> contains the matrix <i>A</i> in the RFP format.

## Output Parameters

<i>a</i>	<i>a</i> is overwritten by the Cholesky factor <i>U</i> or <i>L</i> , as specified by <i>uplo</i> and <i>trans</i> .
----------	--

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* = *-i*, parameter *i* had an illegal value.

If *info* = *i*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite, and the factorization could not be completed. This may indicate an error in forming the matrix *A*.

### Description

The routine forms the Cholesky factorization of a symmetric positive-definite or, for complex data, Hermitian positive-definite band matrix  $A$ :

$$A = U^T * U \text{ for real data, } A = U^H * U \text{ for complex data} \quad \text{if } uplo = 'U'$$

$$A = L * L^T \text{ for real data, } A = L * L^H \text{ for complex data} \quad \text{if } uplo = 'L'$$

where  $L$  is a lower triangular matrix and  $U$  is upper triangular.

**NOTE**

This routine supports the Progress Routine feature. See [Progress Function](#) for details.

**Input Parameters**

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of <i>A</i> is stored in the array <i>ab</i> , and how <i>A</i> is factored: If <i>uplo</i> = 'U', the upper triangle of <i>A</i> is stored. If <i>uplo</i> = 'L', the lower triangle of <i>A</i> is stored.
<i>n</i>	The order of matrix <i>A</i> ; $n \geq 0$ .
<i>kd</i>	The number of superdiagonals or subdiagonals in the matrix <i>A</i> ; $kd \geq 0$ .
<i>ab</i>	Array, size $\max(1, ldab * n)$ . The array <i>ab</i> contains either the upper or the lower triangular part of the matrix <i>A</i> (as specified by <i>uplo</i> ) in band storage (see <a href="#">Matrix Storage Schemes</a> ).
<i>ldab</i>	The leading dimension of the array <i>ab</i> . ( $ldab \geq kd + 1$ )

**Output Parameters**

<i>ab</i>	The upper or lower triangular part of <i>A</i> (in band storage) is overwritten by the Cholesky factor <i>U</i> or <i>L</i> , as specified by <i>uplo</i> .
-----------	---

**Return Values**

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

If *info* = *i*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite, and the factorization could not be completed. This may indicate an error in forming the matrix *A*.

**Application Notes**

If *uplo* = 'U', the computed factor *U* is the exact factor of a perturbed matrix  $A + E$ , where

$$|E| \leq c(kd + 1)\varepsilon |U^H| |U|, |e_{ij}| \leq c(kd + 1)\varepsilon \sqrt{a_{ii}a_{jj}}$$

$c(n)$  is a modest linear function of  $n$ , and  $\varepsilon$  is the machine precision.

A similar estimate holds for *uplo* = 'L'.

The total number of floating-point operations for real flavors is approximately  $n(kd+1)^2$ . The number of operations for complex flavors is 4 times greater. All these estimates assume that  $kd$  is much less than  $n$ .

After calling this routine, you can call the following routines:

[?pbtrs](#) to solve  $A * X = B$

`?pbcon`to estimate the condition number of  $A$ .

```

## Include Files

- `mkl.h`

## Description

The routine forms the factorization of a symmetric positive-definite or, for complex data, Hermitian positive-definite tridiagonal matrix  $A$ :

$A = L * D * L^T$  for real flavors, or

$A = L * D * L^H$  for complex flavors,

where  $D$  is diagonal and  $L$  is unit lower bidiagonal. The factorization may also be regarded as having the form  $A = U^T * D * U$  for real flavors, or  $A = U^H * D * U$  for complex flavors, where  $U$  is unit upper bidiagonal.

## Input Parameters

<code>n</code>	The order of the matrix $A$ ; $n \geq 0$ .
<code>d</code>	Array, dimension $(n)$ . Contains the diagonal elements of $A$ .
<code>e</code>	Array, dimension $(n - 1)$ . Contains the subdiagonal elements of $A$ .

## Output Parameters

<code>d</code>	Overwritten by the $n$ diagonal elements of the diagonal matrix $D$ from the $L * D * L^T$ (for real flavors) or $L * D * L^H$ (for complex flavors) factorization of $A$ .
<code>e</code>	Overwritten by the $(n - 1)$ sub-diagonal elements of the unit bidiagonal factor $L$ or $U$ from the factorization of $A$ .

## Return Values

This function returns a value `info`.

If `info = 0`, the execution is successful.

If  $info = -i$ , parameter  $i$  had an illegal value.

If  $info = i$ , the leading minor of order  $i$  (and therefore the matrix  $A$  itself) is not positive-definite; if  $i < n$ , the factorization could not be completed, while if  $i = n$ , the factorization was completed, but  $d[n - 1] \leq 0$ .

?sytrf

Computes the Bunch-Kaufman factorization of a symmetric matrix.

## Description

The routine computes the factorization of a real/complex symmetric matrix  $A$  using the Bunch-Kaufman diagonal pivoting method. The form of the factorization is:

if  $uplo = 'U'$ ,  $A = U * D * U^T$

if  $uplo = 'L'$ ,  $A = L * D * L^T$

where  $A$  is the input matrix,  $U$  and  $L$  are products of permutation and triangular matrices with unit diagonal (upper triangular for  $U$  and lower triangular for  $L$ ), and  $D$  is a symmetric block-diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks.  $U$  and  $L$  have 2-by-2 unit diagonal blocks corresponding to the 2-by-2 blocks of  $D$ .

---

**NOTE** This routine supports the Progress Routine feature. See [Progress Routine](#) for details.

---

## Input Parameters

*matrix\_layout*

Specifies whether matrix storage layout is row major (LAPACK\_ROW\_MAJOR) or column major (LAPACK\_COL\_MAJOR).

*uplo*

Must be 'U' or 'L'.

Indicates whether the upper or lower triangular part of  $A$  is stored and how  $A$  is factored:

If  $uplo = 'U'$ , the array  $a$  stores the upper triangular part of the matrix  $A$ , and  $A$  is factored as  $U * D * U^T$ .

If  $uplo = 'L'$ , the array  $a$  stores the lower triangular part of the matrix  $A$ , and  $A$  is factored as  $L * D * L^T$ .

$n$

The order of matrix  $A$ ;  $n \geq 0$ .

$a$

Array, size  $\max(1, lda * n)$ . The array  $a$  contains either the upper or the lower triangular part of the matrix  $A$  (see  $uplo$ ).

$lda$

The leading dimension of  $a$ ; at least  $\max(1, n)$ .

## Output Parameters

$a$

The upper or lower triangular part of  $a$  is overwritten by details of the block-diagonal matrix  $D$  and the multipliers used to obtain the factor  $U$  (or  $L$ ).

$ipiv$

Array, size at least  $\max(1, n)$ . Contains details of the interchanges and the block structure of  $D$ . If  $ipiv[i-1] = k > 0$ , then  $d_{ii}$  is a 1-by-1 block, and the  $i$ -th row and column of  $A$  was interchanged with the  $k$ -th row and column.

If  $uplo = 'U'$  and  $ipiv[i] = ipiv[i-1] = -m < 0$ , then  $D$  has a 2-by-2 block in rows/columns  $i$  and  $i+1$ , and  $i$ -th row and column of  $A$  was interchanged with the  $m$ -th row and column.

If  $uplo = 'L'$  and  $ipiv[i] = ipiv[i-1] = -m < 0$ , then  $D$  has a 2-by-2 block in rows/columns  $i$  and  $i+1$ , and  $(i+1)$ -th row and column of  $A$  was interchanged with the  $m$ -th row and column.

## Return Values

This function returns a value  $info$ .

If  $info = 0$ , the execution is successful.

If  $info = -i$ , parameter  $i$  had an illegal value.

If  $info = i$ ,  $d_{ii}$  is 0. The factorization has been completed, but  $D$  is exactly singular. Division by 0 will occur if you use  $D$  for solving a system of linear equations.

## Application Notes

The 2-by-2 unit diagonal blocks and the unit diagonal elements of  $U$  and  $L$  are not stored. The remaining elements of  $U$  and  $L$  are stored in the corresponding columns of the array  $a$ , but additional row interchanges are required to recover  $U$  or  $L$  explicitly (which is seldom necessary).

If  $ipiv[i-1] = i$  for all  $i = 1 \dots n$ , then all off-diagonal elements of  $U$  ( $L$ ) are stored explicitly in the corresponding elements of the array  $a$ .

If  $uplo = 'U'$ , the computed factors  $U$  and  $D$  are the exact factors of a perturbed matrix  $A + E$ , where

$$|E| \leq c(n) \varepsilon P |U| |D| |U^T| P^T$$

$c(n)$  is a modest linear function of  $n$ , and  $\varepsilon$  is the machine precision. A similar estimate holds for the computed  $L$  and  $D$  when  $uplo = 'L'$ .

The total number of floating-point operations is approximately  $(1/3)n^3$  for real flavors or  $(4/3)n^3$  for complex flavors.

After calling this routine, you can call the following routines:

<code>?sytrs</code>	to solve $A * X = B$
<code>?sycon</code>	to estimate the condition number of $A$
<code>?sytri</code>	to compute the inverse of $A$ .

If `uplo = 'U'`, then  $A = U * D * U'$ , where

$$U = P(n) * U(n) * \dots * P(k) * U(k) * \dots,$$

that is,  $U$  is a product of terms  $P(k) * U(k)$ , where

- $k$  decreases from  $n$  to 1 in steps of 1 and 2.
- $D$  is a block diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks  $D(k)$ .
- $P(k)$  is a permutation matrix as defined by `ipiv[k-1]`.
- $U(k)$  is a unit upper triangular matrix, such that if the diagonal block  $D(k)$  is of order  $s$  ( $s = 1$  or  $2$ ), then

$$U(k) = \begin{pmatrix} I & v & 0 & \\ 0 & I & 0 & \\ 0 & 0 & I & \\ & & & \end{pmatrix} \begin{matrix} k - s \\ s \\ n - k \\ k - s \quad s \quad n - k \end{matrix}$$

If  $s = 1$ ,  $D(k)$  overwrites  $A(k,k)$ , and  $v$  overwrites  $A(1:k-1,k)$ .

If  $s = 2$ , the upper triangle of  $D(k)$  overwrites  $A(k-1,k-1)$ ,  $A(k-1,k)$  and  $A(k,k)$ , and  $v$  overwrites  $A(1:k-2,k-1:k)$ .

If `uplo = 'L'`, then  $A = L * D * L'$ , where

$$L = P(1) * L(1) * \dots * P(k) * L(k) * \dots,$$

that is,  $L$  is a product of terms  $P(k) * L(k)$ , where

- $k$  increases from 1 to  $n$  in steps of 1 and 2.
- $D$  is a block diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks  $D(k)$ .
- $P(k)$  is a permutation matrix as defined by `ipiv(k)`.
- $L(k)$  is a unit lower triangular matrix, such that if the diagonal block  $D(k)$  is of order  $s$  ( $s = 1$  or  $2$ ), then

$$L(k) = \begin{pmatrix} I & 0 & 0 \\ 0 & I & 0 \\ 0 & v & I \end{pmatrix} \begin{matrix} k-1 \\ s \\ n-k-s+1 \end{matrix}$$

If  $s = 1$ ,  $D(k)$  overwrites  $A(k,k)$ , and  $v$  overwrites  $A(k+1:n,k)$ .

If  $s = 2$ , the lower triangle of  $D(k)$  overwrites  $A(k,k)$ ,  $A(k+1,k)$ , and  $A(k+1,k+1)$ , and  $v$  overwrites  $A(k+2:n,k:k+1)$ .

lapack_int lda, lapack_int * ipiv);
```

```
lapack_int LAPACKE_csytrf_aa (int matrix_layout, char uplo, lapack_int n,
lapack_complex_float * A, lapack_int lda, lapack_int * ipiv);
```

```
lapack_int LAPACKE_zsytrf_aa (int matrix_layout, char uplo, lapack_int n,
lapack_complex_double * A, lapack_int lda, lapack_int * ipiv);
```

## Description

?sytrf\_aa computes the factorization of a symmetric matrix  $A$  using Aasen's algorithm. The form of the factorization is  $A = U^*T^*U^T$  or  $A = L^*T^*L^T$  where  $U$  (or  $L$ ) is a product of permutation and unit upper (lower) triangular matrices, and  $T$  is a complex symmetric tridiagonal matrix.

This is the blocked version of the algorithm, calling Level 3 BLAS.

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	<ul style="list-style-type: none"> <li>= 'U': The upper triangle of <math>A</math> is stored.</li> <li>= 'L': The lower triangle of <math>A</math> is stored.</li> </ul>
<i>n</i>	The order of the matrix $A$ . $n \geq 0$ .
<i>A</i>	Array of size $\max(1, lda*n)$ . The array $A$ contains either the upper or the lower triangular part of the matrix $A$ (see <i>uplo</i> ).
<i>lda</i>	The leading dimension of the array $A$ .

## Output Parameters

<i>A</i>	On exit, the tridiagonal matrix is stored in the diagonals and the subdiagonals of <i>A</i> just below (or above) the diagonals, and <i>L</i> is stored below (or above) the subdiagonals, when <i>uplo</i> is 'L' (or 'U').
<i>ipiv</i>	Array of size <i>n</i> . On exit, it contains the details of the interchanges; that is, the row and column <i>k</i> of <i>A</i> were interchanged with the row and column <i>ipiv(k)</i> .

## Return Values

This function returns a value *info*.

= 0: Successful exit.

< 0: If *info* = *-i*, the *i*<sup>th</sup> argument had an illegal value.

> 0: If *info* = *i*, *D(i,i)* is exactly zero. The factorization has been completed, but the block diagonal matrix *D* is exactly singular, and division by zero will occur if it is used to solve a system of equations.

```

## Include Files

- mkl.h

## Description

The routine computes the factorization of a real/complex symmetric matrix *A* using the bounded Bunch-Kaufman ("rook") diagonal pivoting method. The form of the factorization is:

$$\begin{aligned} \text{if } uplo = 'U', A &= U * D * U^T \\ \text{if } uplo = 'L', A &= L * D * L^T, \end{aligned}$$

where *A* is the input matrix, *U* and *L* are products of permutation and triangular matrices with unit diagonal (upper triangular for *U* and lower triangular for *L*), and *D* is a symmetric block-diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks. *U* and *L* have 2-by-2 unit diagonal blocks corresponding to the 2-by-2 blocks of *D*.

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout for array <i>b</i> is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<code>uplo</code>	Must be 'U' or 'L'.  Indicates whether the upper or lower triangular part of <i>A</i> is stored and how <i>A</i> is factored:  If <code>uplo = 'U'</code> , the array <i>a</i> stores the upper triangular part of the matrix <i>A</i> , and <i>A</i> is factored as $U^*D^*U^T$ .  If <code>uplo = 'L'</code> , the array <i>a</i> stores the lower triangular part of the matrix <i>A</i> , and <i>A</i> is factored as $L^*D^*L^T$ .
<code>n</code>	The order of matrix <i>A</i> ; $n \geq 0$ .
<code>a</code>	Array, size <code>lda*n</code> . The array <i>a</i> contains either the upper or the lower triangular part of the matrix <i>A</i> (see <code>uplo</code> ).
<code>lda</code>	The leading dimension of <i>a</i> ; at least $\max(1, n)$ .

## Output Parameters

<code>a</code>	The upper or lower triangular part of <i>a</i> is overwritten by details of the block-diagonal matrix <i>D</i> and the multipliers used to obtain the factor <i>U</i> (or <i>L</i> ).
<code>ipiv</code>	If <code>ipiv(k) &gt; 0</code> , then rows and columns <i>k</i> and <code>ipiv(k)</code> were interchanged and $D_{k,k}$ is a 1-by-1 diagonal block.  If <code>uplo = 'U'</code> and <code>ipiv(k) &lt; 0</code> and <code>ipiv(k - 1) &lt; 0</code> , then rows and columns <i>k</i> and <code>-ipiv(k)</code> were interchanged, rows and columns <i>k - 1</i> and <code>-ipiv(k - 1)</code> were interchanged, and $D_{k-1:k, k-1:k}$ is a 2-by-2 diagonal block.  If <code>uplo = 'L'</code> and <code>ipiv(k) &lt; 0</code> and <code>ipiv(k + 1) &lt; 0</code> , then rows and columns <i>k</i> and <code>-ipiv(k)</code> were interchanged, rows and columns <i>k + 1</i> and <code>-ipiv(k + 1)</code> were interchanged, and $D_{k:k+1, k:k+1}$ is a 2-by-2 diagonal block.

## Return Values

This function returns a value `info`.

If `info = 0`, the execution is successful.

If `info = -i`, the *i*-th parameter had an illegal value.

If `info = i`,  $D_{ii}$  is 0. The factorization has been completed, but *D* is exactly singular. Division by 0 will occur if you use *D* for solving a system of linear equations.

## Application Notes

The total number of floating-point operations is approximately  $(1/3)n^3$  for real flavors or  $(4/3)n^3$  for complex flavors.

After calling this routine, you can call the following routines:

`?sytrs_rook` to solve  $A^*X = B$

?sycon\_rook (Fortran only) to estimate the condition number of  $A$   
 ?sytri\_rook (Fortran only) to compute the inverse of  $A$ .

If  $uplo = 'U'$ , then  $A = U*D*U'$ , where

$$U = P(n)*U(n)* \dots *P(k)*U(k)* \dots,$$

that is,  $U$  is a product of terms  $P(k)*U(k)$ , where

- $k$  decreases from  $n$  to 1 in steps of 1 and 2.
- $D$  is a block diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks  $D(k)$ .
- $P(k)$  is a permutation matrix as defined by  $ipiv[k-1]$ .
- $U(k)$  is a unit upper triangular matrix, such that if the diagonal block  $D(k)$  is of order  $s$  ( $s = 1$  or  $2$ ), then

$$U(k) = \begin{pmatrix} I & v & 0 \\ 0 & I & 0 \\ 0 & 0 & I \end{pmatrix} \begin{matrix} k - s \\ s \\ n - k \end{matrix}$$

$$\begin{matrix} k - s & s & n - k \end{matrix}$$

If  $s = 1$ ,  $D(k)$  overwrites  $A(k,k)$ , and  $v$  overwrites  $A(1:k-1,k)$ .

If  $s = 2$ , the upper triangle of  $D(k)$  overwrites  $A(k-1,k-1)$ ,  $A(k-1,k)$  and  $A(k,k)$ , and  $v$  overwrites  $A(1:k-2,k-1:k)$ .

If  $uplo = 'L'$ , then  $A = L*D*L'$ , where

$$L = P(1)*L(1)* \dots *P(k)*L(k)* \dots,$$

that is,  $L$  is a product of terms  $P(k)*L(k)$ , where

- $k$  increases from 1 to  $n$  in steps of 1 and 2.
- $D$  is a block diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks  $D(k)$ .
- $P(k)$  is a permutation matrix as defined by  $ipiv(k)$ .
- $L(k)$  is a unit lower triangular matrix, such that if the diagonal block  $D(k)$  is of order  $s$  ( $s = 1$  or  $2$ ), then

$$L(k) = \begin{pmatrix} I & 0 & 0 \\ 0 & I & 0 \\ 0 & v & I \end{pmatrix} \begin{matrix} k - 1 \\ s \\ n - k - s + 1 \end{matrix}$$

$$\begin{matrix} k - 1 & s & n - k - s + 1 \end{matrix}$$

If  $s = 1$ ,  $D(k)$  overwrites  $A(k,k)$ , and  $v$  overwrites  $A(k+1:n,k)$ .

If  $s = 2$ , the lower triangle of  $D(k)$  overwrites  $A(k,k)$ ,  $A(k+1,k)$ , and  $A(k+1,k+1)$ , and  $v$  overwrites  $A(k+2:n,k:k+1)$ .

```

## Description

?sytrf\_rk computes the factorization of a real or complex symmetric matrix  $A$  using the bounded Bunch-Kaufman (rook) diagonal pivoting method:  $A = P*U*D*(U^T)*(P^T)$  or  $A = P*L*D*(L^T)*(P^T)$ , where  $U$  (or  $L$ ) is unit upper (or lower) triangular matrix,  $U^T$  (or  $L^T$ ) is the transpose of  $U$  (or  $L$ ),  $P$  is a permutation matrix,  $P^T$  is the transpose of  $P$ , and  $D$  is symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

This is the blocked version of the algorithm, calling Level-3 BLAS.

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Specifies whether the upper or lower triangular part of the symmetric matrix $A$ is stored: <ul style="list-style-type: none"> <li>• = 'U': Upper triangular</li> <li>• = 'L': Lower triangular</li> </ul>
<i>n</i>	The order of the matrix $A$ . $n \geq 0$ .
<i>A</i>	Array of size $\max(1, lda*n)$ . On entry, the symmetric matrix $A$ . If <i>uplo</i> = 'U', the leading $n$ -by- $n$ upper triangular part of $A$ contains the upper triangular part of the matrix $A$ , and the strictly lower triangular part of $A$ is not referenced. If <i>uplo</i> = 'L', the leading $n$ -by- $n$ lower triangular part of $A$ contains the lower triangular part of the matrix $A$ , and the strictly upper triangular part of $A$ is not referenced.
<i>lda</i>	The leading dimension of the array $A$ .

## Output Parameters

<i>A</i>	On exit, contains:
----------	--------------------

- *Only* diagonal elements of the symmetric block diagonal matrix D on the diagonal of A; that is,  $D(k,k) = A(k,k)$ ; (superdiagonal (or subdiagonal) elements of D are stored on exit in array *e*).
- If *uplo* = 'U', factor U in the superdiagonal part of A. If *uplo* = 'L', factor L in the subdiagonal part of A.

*e*

Array of size *n*. On exit, contains the superdiagonal (or subdiagonal) elements of the symmetric block diagonal matrix D with 1-by-1 or 2-by-2 diagonal blocks. If *uplo* = 'U',  $e(i) = D(i-1,i)$ ,  $i=2:N$ , and  $e(1)$  is set to 0. If *uplo* = 'L',  $e(i) = D(i+1,i)$ ,  $i=1:N-1$ , and  $e(n)$  is set to 0.

---

**NOTE** For 1-by-1 diagonal block  $D(k)$ , where  $1 \leq k \leq n$ , the element  $e[k-1]$  is set to 0 in both the *uplo* = 'U' and *uplo* = 'L' cases.

---

*ipiv*

Array of size *n*. *ipiv* describes the permutation matrix P in the factorization of matrix A as follows: The absolute value of *ipiv*(*k*) represents the index of the row and column that were interchanged with the *k*<sup>th</sup> row and column. The value of *uplo* describes the order in which the interchanges were applied. Also, the sign of *ipiv* represents the block structure of the symmetric block diagonal matrix D with 1-by-1 or 2-by-2 diagonal blocks, which correspond to 1 or 2 interchanges at each factorization step. If *uplo* = 'U' (in factorization order, *k* decreases from *n* to 1):

1. A single positive entry  $ipiv(k) > 0$  means that  $D(k,k)$  is a 1-by-1 diagonal block. If  $ipiv(k) \neq k$ , rows and columns *k* and *ipiv*(*k*) were interchanged in the matrix  $A(1:N,1:N)$ . If  $ipiv(k) = k$ , no interchange occurred.
2. A pair of consecutive negative entries  $ipiv(k) < 0$  and  $ipiv(k-1) < 0$  means that  $D(k-1:k,k-1:k)$  is a 2-by-2 diagonal block. (Note that negative entries in *ipiv* appear *only* in pairs.)
  - If  $-ipiv(k) \neq k$ , rows and columns *k* and  $-ipiv(k)$  were interchanged in the matrix  $A(1:N,1:N)$ . If  $-ipiv(k) = k$ , no interchange occurred.
  - If  $-ipiv(k-1) \neq k-1$ , rows and columns  $k-1$  and  $-ipiv(k-1)$  were interchanged in the matrix  $A(1:N,1:N)$ . If  $-ipiv(k-1) = k-1$ , no interchange occurred.
3. In both cases 1 and 2, always  $ABS(ipiv(k)) \leq k$ .

---

**NOTE** Any entry *ipiv*(*k*) is always nonzero on output.

---

If *uplo* = 'L' (in factorization order, *k* increases from 1 to *n*):

1. A single positive entry  $ipiv(k) > 0$  means that  $D(k,k)$  is a 1-by-1 diagonal block. If  $ipiv(k) \neq k$ , rows and columns *k* and *ipiv*(*k*) were interchanged in the matrix  $A(1:N,1:N)$ . If  $ipiv(k) = k$ , no interchange occurred.
2. A pair of consecutive negative entries  $ipiv(k) < 0$  and  $ipiv(k+1) < 0$  means that  $D(k:k+1,k:k+1)$  is a 2-by-2 diagonal block. (Note that negative entries in *ipiv* appear *only* in pairs.)

- If  $-ipiv(k) \neq k$ , rows and columns  $k$  and  $-ipiv(k)$  were interchanged in the matrix  $A(1:N,1:N)$ . If  $-ipiv(k) = k$ , no interchange occurred.
  - If  $-ipiv(k+1) \neq k+1$ , rows and columns  $k-1$  and  $-ipiv(k-1)$  were interchanged in the matrix  $A(1:N,1:N)$ . If  $-ipiv(k+1) = k+1$ , no interchange occurred.
3. In both cases 1 and 2, always  $ABS(ipiv(k)) \geq k$ .

---

**NOTE** Any entry  $ipiv(k)$  is always nonzero on output.

---

## Return Values

This function returns a value *info*.

= 0: Successful exit.

< 0: If  $info = -k$ , the  $k^{\text{th}}$  argument had an illegal value.

> 0: If  $info = k$ , the matrix  $A$  is singular. If  $uplo = 'U'$ , column  $k$  in the upper triangular part of  $A$  contains all zeros. If  $uplo = 'L'$ , column  $k$  in the lower triangular part of  $A$  contains all zeros. Therefore,  $D(k,k)$  is exactly zero, and superdiagonal elements of column  $k$  of  $U$  (or subdiagonal elements of column  $k$  of  $L$ ) are all zeros. The factorization has been completed, but the block diagonal matrix  $D$  is exactly singular, and division by zero will occur if it is used to solve a system of equations.

### ?hetrf

*Computes the Bunch-Kaufman factorization of a complex Hermitian matrix.*

## Description

The routine computes the factorization of a complex Hermitian matrix  $A$  using the Bunch-Kaufman diagonal pivoting method:

```
if uplo='U',  $A = U^*D^*U^H$ 
if uplo='L',  $A = L^*D^*L^H$ ,
```

where  $A$  is the input matrix,  $U$  and  $L$  are products of permutation and triangular matrices with unit diagonal (upper triangular for  $U$  and lower triangular for  $L$ ), and  $D$  is a Hermitian block-diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks.  $U$  and  $L$  have 2-by-2 unit diagonal blocks corresponding to the 2-by-2 blocks of  $D$ .

**NOTE**

This routine supports the Progress Routine feature. See [Progress Routine](#) for details.

**Input Parameters**

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Must be 'U' or 'L'.  Indicates whether the upper or lower triangular part of $A$ is stored and how $A$ is factored:  If <i>uplo</i> = 'U', the array $a$ stores the upper triangular part of the matrix $A$ , and $A$ is factored as $U^*D^*U^H$ .  If <i>uplo</i> = 'L', the array $a$ stores the lower triangular part of the matrix $A$ , and $A$ is factored as $L^*D^*L^H$ .
<i>n</i>	The order of matrix $A$ ; $n \geq 0$ .
<i>a</i>	Array, size $\max(1, lda * n)$ .  The array $a$ contains the upper or the lower triangular part of the matrix $A$ (see <i>uplo</i> ).
<i>lda</i>	The leading dimension of $a$ ; at least $\max(1, n)$ .

**Output Parameters**

<i>a</i>	The upper or lower triangular part of $a$ is overwritten by details of the block-diagonal matrix $D$ and the multipliers used to obtain the factor $U$ (or $L$ ).
<i>ipiv</i>	Array, size at least $\max(1, n)$ . Contains details of the interchanges and the block structure of $D$ . If <i>ipiv</i> [ $i-1$ ] = $k > 0$ , then $d_{ii}$ is a 1-by-1 block, and the $i$ -th row and column of $A$ was interchanged with the $k$ -th row and column.  If <i>uplo</i> = 'U' and <i>ipiv</i> [ $i$ ] = <i>ipiv</i> [ $i-1$ ] = $-m < 0$ , then $D$ has a 2-by-2 block in rows/columns $i$ and $i+1$ , and $i$ -th row and column of $A$ was interchanged with the $m$ -th row and column.  If <i>uplo</i> = 'L' and <i>ipiv</i> [ $i$ ] = <i>ipiv</i> [ $i-1$ ] = $-m < 0$ , then $D$ has a 2-by-2 block in rows/columns $i$ and $i+1$ , and ( $i+1$ )-th row and column of $A$ was interchanged with the $m$ -th row and column.

**Return Values**

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* =  $-i$ , parameter  $i$  had an illegal value.

If *info* =  $i$ ,  $d_{ii}$  is 0. The factorization has been completed, but  $D$  is exactly singular. Division by 0 will occur if you use  $D$  for solving a system of linear equations.

## Application Notes

This routine is suitable for Hermitian matrices that are not known to be positive-definite. If  $A$  is in fact positive-definite, the routine does not perform interchanges, and no 2-by-2 diagonal blocks occur in  $D$ .

The 2-by-2 unit diagonal blocks and the unit diagonal elements of  $U$  and  $L$  are not stored. The remaining elements of  $U$  and  $L$  are stored in the corresponding columns of the array  $a$ , but additional row interchanges are required to recover  $U$  or  $L$  explicitly (which is seldom necessary).

If  $ipiv[i-1] = i$  for all  $i = 1 \dots n$ , then all off-diagonal elements of  $U$  ( $L$ ) are stored explicitly in the corresponding elements of the array  $a$ .

If  $uplo = 'U'$ , the computed factors  $U$  and  $D$  are the exact factors of a perturbed matrix  $A + E$ , where

$$|E| \leq c(n)\epsilon P|U||D||U^T|P^T$$

$c(n)$  is a modest linear function of  $n$ , and  $\epsilon$  is the machine precision.

A similar estimate holds for the computed  $L$  and  $D$  when  $uplo = 'L'$ .

The total number of floating-point operations is approximately  $(4/3)n^3$ .

After calling this routine, you can call the following routines:

<code>?hetrs</code>	to solve $A*X = B$
<code>?hecon</code>	to estimate the condition number of $A$
<code>?hetri</code>	to compute the inverse of $A$ .

### `?hetrf_aa`

*Computes the factorization of a complex hermitian matrix using Aasen's algorithm.*

```
LAPACK_DECL lapack_int LAPACKE_chetrf_aa (int matrix_layout, char uplo, lapack_int n,
lapack_complex_float * a, lapack_int lda, lapack_int * ipiv );
```

```
LAPACK_DECL lapack_int LAPACKE_zhetrf_aa (int matrix_layout, char uplo, lapack_int n,
lapack_complex_double * a, lapack_int lda, lapack_int * ipiv );
```

## Description

`?hetrf_aa` computes the factorization of a complex Hermitian matrix  $A$  using Aasen's algorithm. The form of the factorization is  $A = U * T * U^H$  or  $a = L * T * L^H$  where  $U$  (or  $L$ ) is a product of permutation and unit upper (lower) triangular matrices, and  $T$  is a Hermitian tridiagonal matrix. This is the blocked version of the algorithm, calling Level 3 BLAS.

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major ( <code>LAPACK_ROW_MAJOR</code> ) or column major ( <code>LAPACK_COL_MAJOR</code> ).
<code>uplo</code>	= 'U': Upper triangle of $A$ is stored; = 'L': Lower triangle of $a$ is stored.
<code>n</code>	The order of the matrix $A$ . $n \geq 0$ .
<code>a</code>	Array of size $lda*n$ . On entry, the Hermitian matrix $A$ .

If `uplo = 'U'`, the leading  $n$ -by- $n$  upper triangular part of  $a$  contains the upper triangular part of the matrix  $A$ , and the strictly lower triangular part of  $a$  is not referenced.

If `uplo = 'L'`, the leading  $n$ -by- $n$  lower triangular part of  $a$  contains the lower triangular part of the matrix  $A$ , and the strictly upper triangular part of  $a$  is not referenced.

`lda`

The leading dimension of the array  $a$ .  $lda \geq \max(1, n)$ .

`lwork`

See [Syntax - Workspace](#). The length of `work`.  $lwork \geq 2 * n$ . For optimum performance  $lwork \geq n * (1 + nb)$ , where  $nb$  is the optimal block size. If  $lwork = -1$ , then a workspace query is assumed; the routine only calculates the optimal size of the `work` array, returns this value as the first entry of the `work` array, and no error message related to `lwork` is issued by `xerbla`.

## Output Parameters

`a`

On exit, the tridiagonal matrix is stored in the diagonals and the subdiagonals of  $a$  just below (or above) the diagonals, and  $L$  is stored below (or above) the subdiagonals, when `uplo` is 'L' (or 'U').

`ipiv`

array, dimension ( $n$ ) On exit, it contains the details of the interchanges: the row and column  $k$  of  $a$  were interchanged with the row and column `ipiv[k]`.

`work`

See [Syntax - Workspace](#). Array of size  $(\max(1, lwork))$ . On exit, if `info = 0`, `work[0]` returns the optimal `lwork`.

## Return Values

This function returns a value `info`.

If `info = 0`: successful exit < 0: if `info = -i`, the  $i$ -th argument had an illegal value,

If `info > 0`: if `info = i`,  $D_{i,i}$  is exactly zero. The factorization has been completed, but the block diagonal matrix  $D$  is exactly singular, and division by zero will occur if it is used to solve a system of equations.

## Syntax - Workspace

Use this interface if you want to explicitly provide the workspace array.

```
LAPACK_DECL lapack_int LAPACKE_chetrf_aa_work (int matrix_layout, char uplo, lapack_int
n, lapack_complex_float * a, lapack_int lda, lapack_int * ipiv, lapack_complex_float *
work, lapack_int lwork );
```

```
LAPACK_DECL lapack_int LAPACKE_zhetrf_aa_work (int matrix_layout, char uplo, lapack_int
n, lapack_complex_double * a, lapack_int lda, lapack_int * ipiv, lapack_complex_double

lapack_complex_double * a, lapack_int lda, lapack_int * ipiv);
```

## Include Files

- mkl.h

## Description

The routine computes the factorization of a complex Hermitian matrix  $A$  using the bounded Bunch-Kaufman diagonal pivoting method:

```
if uplo='U',  $A = U^*D^*U^H$ 
if uplo='L',  $A = L^*D^*L^H$ ,
```

where  $A$  is the input matrix,  $U$  (or  $L$ ) is a product of permutation and unit upper ( or lower) triangular matrices, and  $D$  is a Hermitian block-diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks.

This is the blocked version of the algorithm, calling Level 3 BLAS.

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout for array $b$ is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Must be 'U' or 'L'.  Indicates whether the upper or lower triangular part of $A$ is stored: If <i>uplo</i> = 'U', the array $a$ stores the upper triangular part of the matrix $A$ . If <i>uplo</i> = 'L', the array $a$ stores the lower triangular part of the matrix $A$ .
<i>n</i>	The order of matrix $A$ ; $n \geq 0$ .
<i>a</i>	Array $a$ , size $(lda*n)$  The array $a$ contains the upper or the lower triangular part of the matrix $A$ (see <i>uplo</i> ).  If <i>uplo</i> = 'U', the leading $n$ -by- $n$ upper triangular part of $a$ contains the upper triangular part of the matrix $A$ , and the strictly lower triangular part of $a$ is not referenced. If <i>uplo</i> = 'L', the leading $n$ -by- $n$ lower triangular part of $a$ contains the lower triangular part of the matrix $A$ , and the strictly upper triangular part of $a$ is not referenced.
<i>lda</i>	The leading dimension of $a$ ; at least $\max(1, n)$ .

## Output Parameters

<i>a</i>	The block diagonal matrix $D$ and the multipliers used to obtain the factor $U$ or $L$ (see Application Notes for further details).
<i>ipiv</i>	<ul style="list-style-type: none"> <li>• If <i>uplo</i> = 'U': If <math>ipiv(k) &gt; 0</math>, then rows and columns <math>k</math> and <math>ipiv(k)</math> were interchanged and <math>D_{k,k}</math> is a 1-by-1 diagonal block.</li> </ul>

If  $ipiv(k) < 0$  and  $ipiv(k - 1) < 0$ , then rows and columns  $k$  and  $-ipiv(k)$  were interchanged and rows and columns  $k - 1$  and  $-ipiv(k - 1)$  were interchanged,  $D_{k-1:k,k-1:k}$  is a 2-by-2 diagonal block.

- If  $uplo = 'L'$ :

If  $ipiv(k) > 0$ , then rows and columns  $k$  and  $ipiv(k)$  were interchanged and  $D_{k,k}$  is a 1-by-1 diagonal block.

If  $ipiv(k) < 0$  and  $ipiv(k + 1) < 0$ , then rows and columns  $k$  and  $-ipiv(k)$  were interchanged and rows and columns  $k + 1$  and  $-ipiv(k + 1)$  were interchanged,  $D_{k:k+1,k:k+1}$  is a 2-by-2 diagonal block.

## Return Values

This function returns a value  $info$ .

If  $info = 0$ , the execution is successful.

If  $info = -i$ , the  $i$ -th parameter had an illegal value.

If  $info = i$ ,  $D_{ii}$  is exactly 0. The factorization has been completed, but the block diagonal matrix  $D$  is exactly singular, and division by 0 will occur if you use  $D$  for solving a system of linear equations.

## Application Notes

If  $uplo = 'U'$ , then  $A = U * D * U^H$ , where

$$U = P(n) * U(n) * \dots * P(k) * U(k) * \dots,$$

i.e.,  $U$  is a product of terms  $P(k) * U(k)$ , where  $k$  decreases from  $n$  to 1 in steps of 1 or 2, and  $D$  is a block diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks  $D(k)$ .  $P(k)$  is a permutation matrix as defined by  $ipiv(k)$ , and  $U(k)$  is a unit upper triangular matrix, such that if the diagonal block  $D(k)$  is of order  $s$  ( $s = 1$  or  $2$ ), then

$$U(k) = \begin{matrix} & & k-s & s & n-k \\ k-s & \begin{pmatrix} I & v & 0 \\ 0 & I & 0 \\ 0 & 0 & I \end{pmatrix} \\ s & \\ n-k & \end{matrix}$$

If  $s = 1$ ,  $D(k)$  overwrites  $A(k,k)$ , and  $v$  overwrites  $A(1:k-1,k)$ .

If  $s = 2$ , the upper triangle of  $D(k)$  overwrites  $A(k-1,k-1)$ ,  $A(k-1,k)$ , and  $A(k,k)$ , and  $v$  overwrites  $A(1:k-2,k-1:k)$ .

If  $uplo = 'L'$ , then  $A = L * D * L^H$ , where

$$L = P(1) * L(1) * \dots * P(k) * L(k) * \dots,$$

i.e.,  $L$  is a product of terms  $P(k) * L(k)$ , where  $k$  increases from 1 to  $n$  in steps of 1 or 2, and  $D$  is a block diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks  $D(k)$ .  $P(k)$  is a permutation matrix as defined by  $ipiv(k)$ , and  $L(k)$  is a unit lower triangular matrix, such that if the diagonal block  $D(k)$  is of order  $s$  ( $s = 1$  or  $2$ ), then

$$L(k) = \begin{matrix} & & k-1 & s & n-k-s+1 \\ k-1 & \begin{pmatrix} I & 0 & 0 \\ 0 & I & 0 \\ 0 & v & I \end{pmatrix} \\ s & \\ n-k-s+1 & \end{matrix}$$

If  $s = 1$ ,  $D(k)$  overwrites  $A(k,k)$ , and  $v$  overwrites  $A(k+1:n,k)$ .

If  $s = 2$ , the lower triangle of  $D(k)$  overwrites  $A(k,k)$ ,  $A(k+1,k)$ , and  $A(k+1,k+1)$ , and  $v$  overwrites  $A(k+2:n,k:k+1)$ .

*Computes the factorization of a complex Hermitian indefinite matrix using the bounded Bunch-Kaufman (rook) diagonal pivoting method (BLAS3 blocked algorithm).*

```
lapack_int LAPACKE_chetrf_rk (int matrix_layout, char uplo, lapack_int n,
lapack_complex_float * A, lapack_int lda, lapack_complex_float * e, lapack_int * ipiv);
lapack_int LAPACKE_zhetrf_rk (int matrix_layout, char uplo, lapack_int n,
lapack_complex_double * A, lapack_int lda, lapack_complex_double * e, lapack_int *
ipiv);
```

## Description

?hetrf\_rk computes the factorization of a complex Hermitian matrix  $A$  using the bounded Bunch-Kaufman (rook) diagonal pivoting method:  $A = P*U*D*(U^H)*(P^T)$  or  $A = P*L*D*(L^H)*(P^T)$ , where  $U$  (or  $L$ ) is unit upper (or lower) triangular matrix,  $U^H$  (or  $L^H$ ) is the conjugate of  $U$  (or  $L$ ),  $P$  is a permutation matrix,  $P^T$  is the transpose of  $P$ , and  $D$  is Hermitian and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

This is the blocked version of the algorithm, calling Level 3 BLAS.

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Specifies whether the upper or lower triangular part of the Hermitian matrix $A$ is stored: <ul style="list-style-type: none"> <li>• = 'U': Upper triangular.</li> <li>• = 'L': Lower triangular.</li> </ul>
<i>n</i>	The order of the matrix $A$ . $n \geq 0$ .
<i>A</i>	Array of size $\max(1, lda*n)$ . On entry, the Hermitian matrix $A$ . If <i>uplo</i> = 'U': The leading $n$ -by- $n$ upper triangular part of $A$ contains the upper triangular part of the matrix $A$ , and the strictly lower triangular part of $A$ is not referenced. If <i>uplo</i> = 'L': The leading $n$ -by- $n$ lower triangular part of $A$ contains the lower triangular part of the matrix $A$ , and the strictly upper triangular part of $A$ is not referenced.
<i>lda</i>	The leading dimension of the array $A$ .

## Output Parameters

<i>A</i>	On exit, contains: <ul style="list-style-type: none"> <li>• <i>Only</i> diagonal elements of the Hermitian block diagonal matrix <math>D</math> on the diagonal of <math>A</math>; that is, <math>D(k,k) = A(k,k)</math>. Superdiagonal (or subdiagonal) elements of <math>D</math> are stored on exit in array <i>e</i>.</li> </ul>
----------	--

—and—

- If  $uplo = 'U'$ , factor U in the superdiagonal part of A. If  $uplo = 'L'$ , factor L in the subdiagonal part of A.

e

Array of size  $n$ . On exit, contains the superdiagonal (or subdiagonal) elements of the Hermitian block diagonal matrix D with 1-by-1 or 2-by-2 diagonal blocks. If  $uplo = 'U'$ ,  $e(i) = D(i-1,i)$ ,  $i=2:N$ , and  $e(1)$  is set to 0. If  $uplo = 'L'$ ,  $e(i) = D(i+1,i)$ ,  $i=1:N-1$ , and  $e(n)$  is set to 0.

---

**NOTE** For 1-by-1 diagonal block  $D(k)$ , where  $1 \leq k \leq n$ , the element  $e[k-1]$  is set to 0 in both the  $uplo = 'U'$  and  $uplo = 'L'$  cases.

---

ipiv

Array of size  $n$ .  $ipiv$  describes the permutation matrix P in the factorization of matrix A as follows: The absolute value of  $ipiv[k-1]$  represents the index of row and column that were interchanged with the  $k^{\text{th}}$  row and column. The value of  $uplo$  describes the order in which the interchanges were applied. Also, the sign of  $ipiv$  represents the block structure of the Hermitian block diagonal matrix D with 1-by-1 or 2-by-2 diagonal blocks that correspond to 1 or 2 interchanges at each factorization step. If  $uplo = 'U'$  (in factorization order,  $k$  decreases from  $n$  to 1):

1. A single positive entry  $ipiv(k) > 0$  means that  $D(k,k)$  is a 1-by-1 diagonal block. If  $ipiv(k) \neq k$ , rows and columns  $k$  and  $ipiv(k)$  were interchanged in the matrix  $A(1:N,1:N)$ . If  $ipiv(k) = k$ , no interchange occurred.
2. A pair of consecutive negative entries  $ipiv(k) < 0$  and  $ipiv(k-1) < 0$  means that  $D(k-1:k,k-1:k)$  is a 2-by-2 diagonal block. (Note that negative entries in  $ipiv$  appear *only* in pairs.)
  - If  $-ipiv(k) \neq k$ , rows and columns  $k$  and  $-ipiv(k)$  were interchanged in the matrix  $A(1:N,1:N)$ . If  $-ipiv(k) = k$ , no interchange occurred.
  - If  $-ipiv(k-1) \neq k-1$ , rows and columns  $k-1$  and  $-ipiv(k-1)$  were interchanged in the matrix  $A(1:N,1:N)$ . If  $-ipiv(k-1) = k-1$ , no interchange occurred.
3. In both cases 1 and 2, always  $ABS(ipiv(k)) \leq k$ .

---

**NOTE** Any entry  $ipiv(k)$  is always nonzero on output.

---

If  $uplo = 'L'$  (in factorization order,  $k$  increases from 1 to  $n$ ):

1. A single positive entry  $ipiv(k) > 0$  means that  $D(k,k)$  is a 1-by-1 diagonal block. If  $ipiv(k) \neq k$ , rows and columns  $k$  and  $ipiv(k)$  were interchanged in the matrix  $A(1:N,1:N)$ . If  $ipiv(k) = k$ , no interchange occurred.
2. A pair of consecutive negative entries  $ipiv(k) < 0$  and  $ipiv(k+1) < 0$  means that  $D(k:k+1,k:k+1)$  is a 2-by-2 diagonal block. (Note that negative entries in  $ipiv$  appear *only* in pairs.)

- If  $-ipiv(k) \neq k$ , rows and columns  $k$  and  $-ipiv(k)$  were interchanged in the matrix  $A(1:N,1:N)$ . If  $-ipiv(k) = k$ , no interchange occurred.
  - If  $-ipiv(k+1) \neq k+1$ , rows and columns  $k-1$  and  $-ipiv(k-1)$  were interchanged in the matrix  $A(1:N,1:N)$ . If  $-ipiv(k+1) = k+1$ , no interchange occurred.
3. In both cases 1 and 2, always  $ABS(ipiv(k)) \geq k$ .

---

**NOTE** Any entry  $ipiv(k)$  is always nonzero on output.

---

## Return Values

This function returns a value *info*.

= 0: Successful exit.

< 0: If  $info = -k$ , the  $k^{\text{th}}$  argument had an illegal value.

> 0: If  $info = k$ , the matrix  $A$  is singular. If  $uplo = 'U'$ , the column  $k$  in the upper triangular part of  $A$  contains all zeros. If  $uplo = 'L'$ , the column  $k$  in the lower triangular part of  $A$  contains all zeros. Therefore  $D(k,k)$  is exactly zero, and superdiagonal elements of column  $k$  of  $U$  (or subdiagonal elements of column  $k$  of  $L$ ) are all zeros. The factorization has been completed, but the block diagonal matrix  $D$  is exactly singular, and division by zero will occur if it is used to solve a system of equations.

## Description

The routine computes the factorization of a real/complex symmetric matrix  $A$  stored in the packed format using the Bunch-Kaufman diagonal pivoting method. The form of the factorization is:

$$\begin{aligned} \text{if } uplo='U', A &= U^*D^*U^T \\ \text{if } uplo='L', A &= L^*D^*L^T, \end{aligned}$$

where  $U$  and  $L$  are products of permutation and triangular matrices with unit diagonal (upper triangular for  $U$  and lower triangular for  $L$ ), and  $D$  is a symmetric block-diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks.  $U$  and  $L$  have 2-by-2 unit diagonal blocks corresponding to the 2-by-2 blocks of  $D$ .

**NOTE**

This routine supports the Progress Routine feature. See [Progress Function](#) for details.

**Input Parameters**

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Must be 'U' or 'L'.  Indicates whether the upper or lower triangular part of $A$ is packed in the array $ap$ and how $A$ is factored:  If $uplo = 'U'$ , the array $ap$ stores the upper triangular part of the matrix $A$ , and $A$ is factored as $U^*D^*U^T$ .  If $uplo = 'L'$ , the array $ap$ stores the lower triangular part of the matrix $A$ , and $A$ is factored as $L^*D^*L^T$ .
<i>n</i>	The order of matrix $A$ ; $n \geq 0$ .
<i>ap</i>	Array, size at least $\max(1, n(n+1)/2)$ . The array $ap$ contains the upper or the lower triangular part of the matrix $A$ (as specified by $uplo$ ) in <i>packed storage</i> (see <a href="#">Matrix Storage Schemes</a> ).

**Output Parameters**

<i>ap</i>	The upper or lower triangle of $A$ (as specified by $uplo$ ) is overwritten by details of the block-diagonal matrix $D$ and the multipliers used to obtain the factor $U$ (or $L$ ).
<i>ipiv</i>	Array, size at least $\max(1, n)$ . Contains details of the interchanges and the block structure of $D$ . If $ipiv[i-1] = k > 0$ , then $d_{ii}$ is a 1-by-1 block, and the $i$ -th row and column of $A$ was interchanged with the $k$ -th row and column.  If $uplo = 'U'$ and $ipiv[i] = ipiv[i-1] = -m < 0$ , then $D$ has a 2-by-2 block in rows/columns $i$ and $i+1$ , and $i$ -th row and column of $A$ was interchanged with the $m$ -th row and column.  If $uplo = 'L'$ and $ipiv[i] = ipiv[i-1] = -m < 0$ , then $D$ has a 2-by-2 block in rows/columns $i$ and $i+1$ , and $(i+1)$ -th row and column of $A$ was interchanged with the $m$ -th row and column.

**Return Values**

This function returns a value *info*.

If  $info = 0$ , the execution is successful.

If  $info = -i$ , parameter  $i$  had an illegal value.

If  $info = i$ ,  $d_{ii}$  is 0. The factorization has been completed, but  $D$  is exactly singular. Division by 0 will occur if you use  $D$  for solving a system of linear equations.

## Application Notes

The 2-by-2 unit diagonal blocks and the unit diagonal elements of  $U$  and  $L$  are not stored. The remaining elements of  $U$  and  $L$  overwrite elements of the corresponding columns of the array  $ap$ , but additional row interchanges are required to recover  $U$  or  $L$  explicitly (which is seldom necessary).

If  $ipiv(i) = i$  for all  $i = 1 \dots n$ , then all off-diagonal elements of  $U$  ( $L$ ) are stored explicitly in packed form.

If  $uplo = 'U'$ , the computed factors  $U$  and  $D$  are the exact factors of a perturbed matrix  $A + E$ , where

$$|E| \leq c(n) \varepsilon P |U| |D| |U^T| P^T$$

$c(n)$  is a modest linear function of  $n$ , and  $\varepsilon$  is the machine precision. A similar estimate holds for the computed  $L$  and  $D$  when  $uplo = 'L'$ .

The total number of floating-point operations is approximately  $(1/3)n^3$  for real flavors or  $(4/3)n^3$  for complex flavors.

After calling this routine, you can call the following routines:

<code>?sptrs</code>	to solve $A * X = B$
<code>?spcon</code>	to estimate the condition number of $A$
<code>?sptri</code>	to compute the inverse of $A$ .

## Description

The routine computes the factorization of a complex Hermitian packed matrix  $A$  using the Bunch-Kaufman diagonal pivoting method:

$$\begin{aligned} \text{if } uplo='U', A &= U * D * U^H \\ \text{if } uplo='L', A &= L * D * L^H, \end{aligned}$$

where  $A$  is the input matrix,  $U$  and  $L$  are products of permutation and triangular matrices with unit diagonal (upper triangular for  $U$  and lower triangular for  $L$ ), and  $D$  is a Hermitian block-diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks.  $U$  and  $L$  have 2-by-2 unit diagonal blocks corresponding to the 2-by-2 blocks of  $D$ .

**NOTE**

This routine supports the Progress Routine feature. See [Progress Function](#) for details.

**Input Parameters**

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<code>uplo</code>	Must be 'U' or 'L'.  Indicates whether the upper or lower triangular part of $A$ is packed and how $A$ is factored:  If <code>uplo = 'U'</code> , the array <code>ap</code> stores the upper triangular part of the matrix $A$ , and $A$ is factored as $U^*D^*U^H$ .  If <code>uplo = 'L'</code> , the array <code>ap</code> stores the lower triangular part of the matrix $A$ , and $A$ is factored as $L^*D^*L^H$ .
<code>n</code>	The order of matrix $A$ ; $n \geq 0$ .
<code>ap</code>	Array, size at least $\max(1, n(n+1)/2)$ . The array <code>ap</code> contains the upper or the lower triangular part of the matrix $A$ (as specified by <code>uplo</code> ) in <i>packed storage</i> (see <a href="#">Matrix Storage Schemes</a> ).

**Output Parameters**

<code>ap</code>	The upper or lower triangle of $A$ (as specified by <code>uplo</code> ) is overwritten by details of the block-diagonal matrix $D$ and the multipliers used to obtain the factor $U$ (or $L$ ).
<code>ipiv</code>	Array, size at least $\max(1, n)$ . Contains details of the interchanges and the block structure of $D$ . If <code>ipiv[i-1] = k &gt; 0</code> , then $d_{ii}$ is a 1-by-1 block, and the $i$ -th row and column of $A$ was interchanged with the $k$ -th row and column.  If <code>uplo = 'U'</code> and <code>ipiv[i] = ipiv[i-1] = -m &lt; 0</code> , then $D$ has a 2-by-2 block in rows/columns $i$ and $i+1$ , and $i$ -th row and column of $A$ was interchanged with the $m$ -th row and column.  If <code>uplo = 'L'</code> and <code>ipiv[i] = ipiv[i-1] = -m &lt; 0</code> , then $D$ has a 2-by-2 block in rows/columns $i$ and $i+1$ , and $(i+1)$ -th row and column of $A$ was interchanged with the $m$ -th row and column.

**Return Values**

This function returns a value `info`.

If `info = 0`, the execution is successful.

If `info = -i`, parameter  $i$  had an illegal value.

If `info = i`,  $d_{ii}$  is 0. The factorization has been completed, but  $D$  is exactly singular. Division by 0 will occur if you use  $D$  for solving a system of linear equations.

## Application Notes

The 2-by-2 unit diagonal blocks and the unit diagonal elements of  $U$  and  $L$  are not stored. The remaining elements of  $U$  and  $L$  are stored in the array  $ap$ , but additional row interchanges are required to recover  $U$  or  $L$  explicitly (which is seldom necessary).

If  $ipiv[i-1] = i$  for all  $i = 1 \dots n$ , then all off-diagonal elements of  $U$  ( $L$ ) are stored explicitly in the corresponding elements of the array  $a$ .

If  $uplo = 'U'$ , the computed factors  $U$  and  $D$  are the exact factors of a perturbed matrix  $A + E$ , where

$$|E| \leq c(n) \varepsilon P |U| |D| |U^T| P^T$$

$c(n)$  is a modest linear function of  $n$ , and  $\varepsilon$  is the machine precision.

A similar estimate holds for the computed  $L$  and  $D$  when  $uplo = 'L'$ .

The total number of floating-point operations is approximately  $(4/3)n^3$ .

After calling this routine, you can call the following routines:

<code>?hptrs</code>	to solve $A * X = B$
<code>?hpcon</code>	to estimate the condition number of $A$
<code>?hptri</code>	to compute the inverse of $A$ .

```

## Include Files

- `mkl.h`

## Description

The routine computes the partial factorization  $A = LDL^T$ , where  $L$  is a lower triangular matrix and  $D$  is a diagonal matrix.

---

### Caution

The routine assumes that the matrix  $A$  is factorizable. The routine does not perform pivoting and does not handle diagonal elements which are zero, which cause the routine to produce incorrect results without any indication.

---

Consider the matrix  $A = \begin{pmatrix} a & b^T \\ b & C \end{pmatrix}$ , where  $a$  is the element in the first row and first column of  $A$ ,  $b$  is a column vector of size  $n - 1$  containing the elements from the second through  $n$ -th column of  $A$ ,  $C$  is the lower-right square submatrix of  $A$ , and  $I$  is the identity matrix.

The `mkl_?spffrt2` routine performs  $ncolm$  successive factorizations of the form

$$A = \begin{pmatrix} a & b^T \\ b & C \end{pmatrix} = \begin{pmatrix} a & 0 \\ b & I \end{pmatrix} \begin{pmatrix} a^{-1} & 0 \\ 0 & C - ba^{-1}b^T \end{pmatrix} \begin{pmatrix} a & b^T \\ 0 & I \end{pmatrix}.$$

The `mkl_?spffrtx` routine performs  $ncolm$  successive factorizations of the form

$$A = \begin{pmatrix} a & b^T \\ b & C \end{pmatrix} = \begin{pmatrix} 1 & 0 \\ ba^{-1} & I \end{pmatrix} \begin{pmatrix} a & 0 \\ 0 & C - ba^{-1}b^T \end{pmatrix} \begin{pmatrix} 1 & (ba^{-1})^T \\ 0 & I \end{pmatrix}.$$

The approximate number of floating point operations performed by real flavors of these routines is  $(1/6)*ncolm*(2*ncolm^2 - 6*ncolm*n + 3*ncolm + 6*n^2 - 6*n + 7)$ .

The approximate number of floating point operations performed by complex flavors of these routines is  $(1/3)*ncolm*(4*ncolm^2 - 12*ncolm*n + 9*ncolm + 12*n^2 - 18*n + 8)$ .

## Input Parameters

<i>ap</i>	Array, size at least $\max(1, n(n+1)/2)$ . The array <i>ap</i> contains the lower triangular part of the matrix $A$ in packed storage (see <a href="#">Matrix Storage Schemes</a> for <code>uplo = 'L'</code> ).
<i>n</i>	The order of matrix $A$ ; $n \geq 0$ .
<i>ncolm</i>	The number of columns to factor, $ncolm \leq n$ .
<i>work, work2</i>	Workspace arrays, size of each at least $n$ .

## Output Parameters

<i>ap</i>	Overwritten by the factor $L$ . The first $ncolm$ diagonal elements of the input matrix $A$ are replaced with the diagonal elements of $D$ . The subdiagonal elements of the first $ncolm$ columns are replaced with the corresponding elements of $L$ . The rest of the input array is updated as indicated in the Description section.
-----------	--

**NOTE**

Specifying  $n_{colm} = n$  results in complete factorization  $A = LDL^T$ .

**Matrix Storage Schemes****Solving Systems of Linear Equations: LAPACK Computational Routines**

This section describes the LAPACK routines for solving systems of linear equations. Before calling most of these routines, you need to factorize the matrix of your system of equations (see [Routines for Matrix Factorization](#)). However, the factorization is not necessary if your system of equations has a triangular matrix.

**?getrs**

*Solves a system of linear equations with an LU-factored square coefficient matrix, with multiple right-hand sides.*

**Syntax**

```
lapack_int LAPACKE_sgetrs (int matrix_layout , char trans , lapack_int n , lapack_int
nrhs , const float * a , lapack_int lda , const lapack_int * ipiv , float * b ,
lapack_int ldb );
```

```
lapack_int LAPACKE_dgetrs (int matrix_layout , char trans , lapack_int n , lapack_int
nrhs , const double * a , lapack_int lda , const lapack_int * ipiv , double * b ,
lapack_int ldb );
```

```
lapack_int LAPACKE_cgetrs (int matrix_layout , char trans , lapack_int n , lapack_int
nrhs , const lapack_complex_float * a , lapack_int lda , const lapack_int * ipiv ,
lapack_complex_float * b , lapack_int ldb );
```

```
lapack_int LAPACKE_zgetrs (int matrix_layout , char trans , lapack_int n , lapack_int
nrhs , const lapack_complex_double * a , lapack_int lda , const lapack_int * ipiv ,
lapack_complex_double * b , lapack_int ldb );
```

**Include Files**

- mkl.h

**Description**

The routine solves for  $X$  the following systems of linear equations:

$A * X = B$	if $trans = 'N'$ ,
$A^T * X = B$	if $trans = 'T'$ ,
$A^H * X = B$	if $trans = 'C'$ (for complex matrices only).

Before calling this routine, you must call [?getrf](#) to compute the  $LU$  factorization of  $A$ .

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>trans</i>	Must be 'N' or 'T' or 'C'.  Indicates the form of the equations: If <i>trans</i> = 'N', then $A * X = B$ is solved for $X$ . If <i>trans</i> = 'T', then $A^T * X = B$ is solved for $X$ . If <i>trans</i> = 'C', then $A^H * X = B$ is solved for $X$ .
<i>n</i>	The order of $A$ ; the number of rows in $B$ ( $n \geq 0$ ).
<i>nrhs</i>	The number of right-hand sides; $nrhs \geq 0$ .
<i>a</i>	Array of size $\max(1, lda * n)$ .  The array <i>a</i> contains LU factorization of matrix $A$ resulting from the call of <code>?getrf</code> .
<i>b</i>	Array of size $\max(1, ldb * nrhs)$ for column major layout, and $\max(1, ldb * n)$ for row major layout.  The array <i>b</i> contains the matrix $B$ whose columns are the right-hand sides for the systems of equations.
<i>lda</i>	The leading dimension of <i>a</i> ; $lda \geq \max(1, n)$ .
<i>ldb</i>	The leading dimension of <i>b</i> ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.
<i>ipiv</i>	Array, size at least $\max(1, n)$ . The <i>ipiv</i> array, as returned by <code>?getrf</code> .

## Output Parameters

<i>b</i>	Overwritten by the solution matrix $X$ .
----------	--

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

## Application Notes

For each right-hand side  $b$ , the computed solution is the exact solution of a perturbed system of equations  $(A + E)x = b$ , where

$$|E| \leq c(n) \varepsilon P |L| |U|$$

$c(n)$  is a modest linear function of  $n$ , and  $\varepsilon$  is the machine precision.

If  $x_0$  is the true solution, the computed solution  $x$  satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \leq c(n) \text{cond}(A, x)\varepsilon$$

where  $\text{cond}(A, x) = \| |A^{-1}| |A| |x| \|_\infty / \|x\|_\infty \leq \|A^{-1}\|_\infty \|A\|_\infty = \kappa_\infty(A)$ .

Note that  $\text{cond}(A, x)$  can be much smaller than  $\kappa_\infty(A)$ ; the condition number of  $A^T$  and  $A^H$  might or might not be equal to  $\kappa_\infty(A)$ .

The approximate number of floating-point operations for one right-hand side vector  $b$  is  $2n^2$  for real flavors and  $8n^2$  for complex flavors.

To estimate the condition number  $\kappa_\infty(A)$ , call `?gecon`.

To refine the solution and estimate the error, call `?gerfs`.

ldab , const lapack_int * ipiv , lapack_complex_double * b , lapack_int ldb );
```

## Include Files

- `mkl.h`

## Description

The routine solves for  $X$  the following systems of linear equations:

$A * X = B$	if $trans = 'N'$ ,
$A^T * X = B$	if $trans = 'T'$ ,
$A^H * X = B$	if $trans = 'C'$ (for complex matrices only).

Here  $A$  is an  $LU$ -factored general band matrix of order  $n$  with  $kl$  non-zero subdiagonals and  $ku$  nonzero superdiagonals. Before calling this routine, call `?gbtrf` to compute the  $LU$  factorization of  $A$ .

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<code>trans</code>	Must be 'N' or 'T' or 'C'.
<code>n</code>	The order of $A$ ; the number of rows in $B$ ; $n \geq 0$ .
<code>kl</code>	The number of subdiagonals within the band of $A$ ; $kl \geq 0$ .
<code>ku</code>	The number of superdiagonals within the band of $A$ ; $ku \geq 0$ .
<code>nrhs</code>	The number of right-hand sides; $nrhs \geq 0$ .
<code>ab</code>	Array <code>ab</code> size $\max(1, ldab*n)$ The array <code>ab</code> contains elements of the $LU$ factors of the matrix $A$ as returned by <code>gbtrf</code> .
<code>b</code>	Array <code>b</code> size $\max(1, ldb*nrhs)$ for column major layout and $\max(1, ldb*n)$ for row major layout. The array <code>b</code> contains the matrix $B$ whose columns are the right-hand sides for the systems of equations.
<code>ldab</code>	The leading dimension of the array <code>ab</code> ; $ldab \geq 2*kl + ku + 1$ .
<code>ldb</code>	The leading dimension of <code>b</code> ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.
<code>ipiv</code>	Array, size at least $\max(1, n)$ . The <code>ipiv</code> array, as returned by <code>gbtrf</code> .

## Output Parameters

<code>b</code>	Overwritten by the solution matrix $X$ .
----------------	--

## Return Values

This function returns a value `info`.

If `info=0`, the execution is successful.

If `info = -i`, parameter  $i$  had an illegal value.

## Application Notes

For each right-hand side  $b$ , the computed solution is the exact solution of a perturbed system of equations  $(A + E)x = b$ , where

$$|E| \leq c(kl + ku + 1)\epsilon P|L||U|$$

$c(k)$  is a modest linear function of  $k$ , and  $\epsilon$  is the machine precision.

If  $x_0$  is the true solution, the computed solution  $x$  satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \leq c(kl + ku + 1) \text{cond}(A, x)\varepsilon$$

where  $\text{cond}(A, x) = \| |A^{-1}| |A| |x| \|_\infty / \|x\|_\infty \leq \|A^{-1}\|_\infty \|A\|_\infty = \kappa_\infty(A)$ .

Note that  $\text{cond}(A, x)$  can be much smaller than  $\kappa_\infty(A)$ ; the condition number of  $A^T$  and  $A^H$  might or might not be equal to  $\kappa_\infty(A)$ .

The approximate number of floating-point operations for one right-hand side vector is  $2n(ku + 2kl)$  for real flavors. The number of operations for complex flavors is 4 times greater. All these estimates assume that  $kl$  and  $ku$  are much less than  $\min(m, n)$ .

To estimate the condition number  $\kappa_\infty(A)$ , call `?gbcon`.

To refine the solution and estimate the error, call `?gbrfs`.

## Description

The `?dtttrs` routine solves the following systems of linear equations with multiple right hand sides for  $X$ :

$$\begin{aligned}
 A * X &= B && \text{if } trans = 'N', \\
 A^T * X &= B && \text{if } trans = 'T', \\
 A^H * X &= B && \text{if } trans = 'C' \text{ (for complex matrices only)}.
 \end{aligned}$$

Before calling this routine, call `?dtttrfb` to compute the factorization of  $A$ .

## Input Parameters

<code>trans</code>	Must be 'N' or 'T' or 'C'. Indicates the form of the equations solved for $X$ : If <code>trans = 'N'</code> , then $A * X = B$ . If <code>trans = 'T'</code> , then $A^T * X = B$ . If <code>trans = 'C'</code> , then $A^H * X = B$ .
<code>n</code>	The order of $A$ ; $n \geq 0$ .
<code>nrhs</code>	The number of right-hand sides, that is, the number of columns in $B$ ; $nrhs \geq 0$ .
<code>dl, d, du</code>	Arrays: <code>dl(n - 1)</code> , <code>d(n)</code> , <code>du(n - 1)</code> . The array <code>dl</code> contains the $(n - 1)$ multipliers that define the matrices $L_1, L_2$ from the factorization of $A$ . The array <code>d</code> contains the $n$ diagonal elements of the upper triangular matrix $U$ from the factorization of $A$ . The array <code>du</code> contains the $(n - 1)$ elements of the superdiagonal of $U$ .
<code>b</code>	Array of size $\max(1, ldb * nrhs)$ . Contains the matrix $B$ whose columns are the right-hand sides for the systems of equations.
<code>ldb</code>	The leading dimension of $b$ ; $ldb \geq \max(1, n)$ .

## Output Parameters

<code>b</code>	Overwritten by the solution matrix $X$ .
<code>info</code>	If <code>info = 0</code> , the execution is successful. If <code>info = -i</code> , the $i$ -th parameter had an illegal value.

lapack_int ldb );
```

## Include Files

- mkl.h

## Description

The routine solves for  $X$  the system of linear equations  $A*X = B$  with a symmetric positive-definite or, for complex data, Hermitian positive-definite matrix  $A$ , given the Cholesky factorization of  $A$ :

$$\begin{array}{ll}
 A = U^T * U \text{ for real data, } A = U^H * U \text{ for complex data} & \text{if } uplo = 'U' \\
 A = L * L^T \text{ for real data, } A = L * L^H \text{ for complex data} & \text{if } uplo = 'L'
 \end{array}$$

where  $L$  is a lower triangular matrix and  $U$  is upper triangular. The system is solved with multiple right-hand sides stored in the columns of the matrix  $B$ .

Before calling this routine, you must call [?potrf](#) to compute the Cholesky factorization of  $A$ .

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Must be 'U' or 'L'.  Indicates how the input matrix $A$ has been factored: If $uplo = 'U'$ , $U$ is stored, where $A = U^T * U$ for real data, $A = U^H * U$ for complex data. If $uplo = 'L'$ , $L$ is stored, where $A = L * L^T$ for real data, $A = L * L^H$ for complex data.
<i>n</i>	The order of matrix $A$ ; $n \geq 0$ .
<i>nrhs</i>	The number of right-hand sides ( $nrhs \geq 0$ ).
<i>a</i>	Array $A$ of size at least $\max(1, lda * n)$  The array $a$ contains the factor $U$ or $L$ (see <i>uplo</i> ) as returned by <a href="#">potrf</a> .
<i>lda</i>	The leading dimension of $a$ . $lda \geq \max(1, n)$ .
<i>b</i>	The array $b$ contains the matrix $B$ whose columns are the right-hand sides for the systems of equations. The size of $b$ must be at least $\max(1, ldb * nrhs)$ for column major layout and $\max(1, ldb * n)$ for row major layout.
<i>ldb</i>	The leading dimension of $b$ . $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.

## Output Parameters

`b` Overwritten by the solution matrix  $X$ .

## Return Values

This function returns a value `info`.

If `info = 0`, the execution is successful.

If `info = -i`, parameter `i` had an illegal value.

## Application Notes

If `uplo = 'U'`, the computed solution for each right-hand side  $b$  is the exact solution of a perturbed system of equations  $(A + E)x = b$ , where

$$|E| \leq c(n)\varepsilon |U^H| |U|$$

$c(n)$  is a modest linear function of  $n$ , and  $\varepsilon$  is the machine precision.

A similar estimate holds for `uplo = 'L'`. If  $x_0$  is the true solution, the computed solution  $x$  satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \leq c(n) \text{cond}(A, x) \varepsilon$$

where  $\text{cond}(A, x) = \| |A^{-1}| |A| |x| \|_\infty / \|x\|_\infty \leq \|A^{-1}\|_\infty \|A\|_\infty = \kappa_\infty(A)$ .

Note that  $\text{cond}(A, x)$  can be much smaller than  $\kappa_\infty(A)$ . The approximate number of floating-point operations for one right-hand side vector  $b$  is  $2n^2$  for real flavors and  $8n^2$  for complex flavors.

To estimate the condition number  $\kappa_\infty(A)$ , call [?pocon](#).

To refine the solution and estimate the error, call [?porfs](#).

## Description

The routine solves a system of linear equations  $A * X = B$  with a symmetric positive-definite or, for complex data, Hermitian positive-definite matrix  $A$  using the Cholesky factorization of  $A$ :

$$\begin{aligned} A &= U^T * U \text{ for real data, } A = U^H * U \text{ for complex data} && \text{if } uplo = 'U' \\ A &= L * L^T \text{ for real data, } A = L * L^H \text{ for complex data} && \text{if } uplo = 'L' \end{aligned}$$

Before calling `?pfttrs`, you must call `?pfttrf` to compute the Cholesky factorization of  $A$ .  $L$  stands for a lower triangular matrix and  $U$  for an upper triangular matrix.

The matrix  $A$  is in the Rectangular Full Packed (RFP) format. For the description of the RFP format, see [Matrix Storage Schemes](#).

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<code>transr</code>	Must be 'N', 'T' (for real data) or 'C' (for complex data). If <code>transr = 'N'</code> , the untransposed factor of $A$ is stored in RFP format. If <code>transr = 'T'</code> , the transposed factor of $A$ is stored in RFP format. If <code>transr = 'C'</code> , the conjugate-transposed factor of $A$ is stored in RFP format.
<code>uplo</code>	Must be 'U' or 'L'. Indicates how the input matrix $A$ has been factored: If <code>uplo = 'U'</code> , $U$ is stored, where $A = U^T * U$ for real data, $A = U^H * U$ for complex data. If <code>uplo = 'L'</code> , $L$ is stored, where $A = L * L^T$ for real data, $A = L * L^H$ for complex data
<code>n</code>	The order of the matrix $A$ ; $n \geq 0$ .
<code>nrhs</code>	The number of right-hand sides, that is, the number of columns of the matrix $B$ ; $nrhs \geq 0$ .
<code>a</code>	Array <code>a</code> of size $\max(1, n * (n + 1) / 2)$ . The array <code>a</code> contains, in the RFP format, the factor $U$ or $L$ obtained by factorization of matrix $A$ .
<code>b</code>	The array <code>b</code> of size $\max(1, ldb * nrhs)$ for column major layout and $\max(1, ldb * n)$ for row major layout contains the matrix $B$ whose columns are the right-hand sides for the systems of equations.

*ldb* The leading dimension of *b*;  $ldb \geq \max(1, n)$  for column major layout and  $ldb \geq nrhs$  for row major layout.

## Output Parameters

*b* The solution matrix *X*.

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

## Description

The routine solves for *X* the system of linear equations  $A * X = B$  with a packed symmetric positive-definite or, for complex data, Hermitian positive-definite matrix *A*, given the Cholesky factorization of *A*:

$$A = U^T * U \text{ for real data, } A = U^H * U \text{ for complex data} \quad \text{if } uplo = 'U'$$

$$A = L * L^T \text{ for real data, } A = L * L^H \text{ for complex data} \quad \text{if } uplo = 'L'$$

where *L* is a lower triangular matrix and *U* is upper triangular. The system is solved with multiple right-hand sides stored in the columns of the matrix *B*.

Before calling this routine, you must call [?pptrf](#) to compute the Cholesky factorization of *A*.

## Input Parameters

*matrix\_layout* Specifies whether matrix storage layout is row major (LAPACK\_ROW\_MAJOR) or column major (LAPACK\_COL\_MAJOR).

*uplo* Must be 'U' or 'L'.

Indicates how the input matrix  $A$  has been factored:

If  $uplo = 'U'$ ,  $U$  is stored, where  $A = U^T*U$  for real data,  $A = U^H*U$  for complex data.

If  $uplo = 'L'$ ,  $L$  is stored, where  $A = L*L^T$  for real data,  $A = L*L^H$  for complex data

$n$  The order of matrix  $A$ ;  $n \geq 0$ .

$nrhs$  The number of right-hand sides ( $nrhs \geq 0$ ).

$ap, b$  The size of  $ap$  must be at least  $\max(1, n(n+1)/2)$ .

The array  $ap$  contains the factor  $U$  or  $L$ , as specified by  $uplo$ , in *packed storage* (see [Matrix Storage Schemes](#)).

$b$  The array  $b$  of size  $\max(1, ldb*nrhs)$  for column major layout and  $\max(1, ldb*n)$  for row major layout contains the matrix  $B$  whose columns are the right-hand sides for the systems of equations.

$ldb$  The leading dimension of  $b$ ;  $ldb \geq \max(1, n)$  for column major layout and  $ldb \geq nrhs$  for row major layout.

## Output Parameters

$b$  Overwritten by the solution matrix  $X$ .

## Return Values

This function returns a value  $info$ .

If  $info = 0$ , the execution is successful.

If  $info = -i$ , parameter  $i$  had an illegal value.

## Application Notes

If  $uplo = 'U'$ , the computed solution for each right-hand side  $b$  is the exact solution of a perturbed system of equations  $(A + E)x = b$ , where

$$|E| \leq c(n)\varepsilon |U^H| |U|$$

$c(n)$  is a modest linear function of  $n$ , and  $\varepsilon$  is the machine precision.

A similar estimate holds for  $uplo = 'L'$ .

If  $x_0$  is the true solution, the computed solution  $x$  satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \leq c(n) \text{cond}(A, x)\varepsilon$$

where  $\text{cond}(A, x) = \| |A^{-1}| |A| |x| \|_\infty / \|x\|_\infty \leq \|A^{-1}\|_\infty \|A\|_\infty = \kappa_\infty(A)$ .

Note that  $\text{cond}(A, x)$  can be much smaller than  $\kappa_\infty(A)$ .

The approximate number of floating-point operations for one right-hand side vector  $b$  is  $2n^2$  for real flavors and  $8n^2$  for complex flavors.

To estimate the condition number  $\kappa_{\infty}(A)$ , call `?ppcon`.

To refine the solution and estimate the error, call `?pprfs`.

## Description

The routine solves for real data a system of linear equations  $A * X = B$  with a symmetric positive-definite or, for complex data, Hermitian positive-definite *band* matrix  $A$ , given the Cholesky factorization of  $A$ :

$$\begin{aligned} A &= U^T * U \text{ for real data, } A = U^H * U \text{ for complex data} && \text{if } uplo='U' \\ A &= L * L^T \text{ for real data, } A = L * L^H \text{ for complex data} && \text{if } uplo='L' \end{aligned}$$

where  $L$  is a lower triangular matrix and  $U$  is upper triangular. The system is solved with multiple right-hand sides stored in the columns of the matrix  $B$ .

Before calling this routine, you must call `?pbtrf` to compute the Cholesky factorization of  $A$  in the band storage form.

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<code>uplo</code>	Must be 'U' or 'L'. Indicates how the input matrix $A$ has been factored:

If  $uplo = 'U'$ ,  $U$  is stored in  $ab$ , where  $A = U^T*U$  for real matrices and  $A = U^H*U$  for complex matrices.

If  $uplo = 'L'$ ,  $L$  is stored in  $ab$ , where  $A = L*L^T$  for real matrices and  $A = L*L^H$  for complex matrices.

$n$	The order of matrix $A$ ; $n \geq 0$ .
$kd$	The number of superdiagonals or subdiagonals in the matrix $A$ ; $kd \geq 0$ .
$nrhs$	The number of right-hand sides; $nrhs \geq 0$ .
$ab$	Array $ab$ is of size $\max(1, ldab*n)$ . The array $ab$ contains the Cholesky factor, as returned by the factorization routine, in <i>band storage</i> form. The array $b$ contains the matrix $B$ whose columns are the right-hand sides for the systems of equations.
$b$	The array $b$ contains the matrix $B$ whose columns are the right-hand sides for the systems of equations. The size of $b$ is at least $\max(1, ldb*nrhs)$ for column major layout and $\max(1, ldb*n)$ for row major layout.
$ldab$	The leading dimension of the array $ab$ ; $ldab \geq kd + 1$ .
$ldb$	The leading dimension of $b$ ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.

## Output Parameters

$b$	Overwritten by the solution matrix $X$ .
-----	--

## Return Values

This function returns a value  $info$ .

If  $info=0$ , the execution is successful.

If  $info = -i$ , parameter  $i$  had an illegal value.

## Application Notes

For each right-hand side  $b$ , the computed solution is the exact solution of a perturbed system of equations  $(A + E)x = b$ , where

$$|E| \leq c(kd + 1)\epsilon P |U^H| |U| \text{ or } |E| \leq c(kd + 1)\epsilon P |L^H| |L|$$

$c(k)$  is a modest linear function of  $k$ , and  $\epsilon$  is the machine precision.

If  $x_0$  is the true solution, the computed solution  $x$  satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \leq c(kd + 1) \text{cond}(A, x) \epsilon$$

where  $\text{cond}(A, x) = \| |A^{-1}| |A| |x| \|_{\infty} / \|x\|_{\infty} \leq \|A^{-1}\|_{\infty} \|A\|_{\infty} = \kappa_{\infty}(A)$ .

Note that  $\text{cond}(A, x)$  can be much smaller than  $\kappa_{\infty}(A)$ .

The approximate number of floating-point operations for one right-hand side vector is  $4n*kd$  for real flavors and  $16n*kd$  for complex flavors.

To estimate the condition number  $\kappa_{\infty}(A)$ , call `?pbcon`.

To refine the solution and estimate the error, call `?pbrfs`.

## Description

The routine solves for  $X$  a system of linear equations  $A*X = B$  with a symmetric (Hermitian) positive-definite tridiagonal matrix  $A$ . Before calling this routine, call `?pttrf` to compute the  $L*D*L^T$  or  $U^T*D*U$  for real data and the  $L*D*L^H$  or  $U^H*D*U$  factorization of  $A$  for complex data.

## Input Parameters

`matrix_layout` Specifies whether matrix storage layout is row major (LAPACK\_ROW\_MAJOR) or column major (LAPACK\_COL\_MAJOR).

`uplo` Used for `cpttrs/zpttrs` only. Must be 'U' or 'L'.

Specifies whether the superdiagonal or the subdiagonal of the tridiagonal matrix  $A$  is stored and how  $A$  is factored:

If `uplo = 'U'`, the array `e` stores the conjugated values of the superdiagonal of  $U$ , and  $A$  is factored as  $U^H*D*U$ .

If `uplo = 'L'`, the array `e` stores the subdiagonal of  $L$ , and  $A$  is factored as  $L*D*L^H$ .

<i>n</i>	The order of <i>A</i> ; $n \geq 0$ .
<i>nrhs</i>	The number of right-hand sides, that is, the number of columns of the matrix <i>B</i> ; $nrhs \geq 0$ .
<i>d</i>	Array, dimension ( <i>n</i> ). Contains the diagonal elements of the diagonal matrix <i>D</i> from the factorization computed by <a href="#">?pttrf</a> .
<i>e</i>	Array <i>e</i> is of size ( <i>n</i> - 1). The array <i>e</i> contains the ( <i>n</i> - 1) sub-diagonal elements of the unit bidiagonal factor <i>L</i> or the conjugated values of the superdiagonal of <i>U</i> from the factorization computed by <a href="#">?pttrf</a> (see <i>uplo</i> ).
<i>e, b</i>	The array <i>b</i> contains the matrix <i>B</i> whose columns are the right-hand sides for the systems of equations. The size of <i>b</i> is at least $\max(1, ldb * nrhs)$ for column major layout and $\max(1, ldb * n)$ for row major layout.
<i>ldb</i>	The leading dimension of <i>b</i> ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.

## Output Parameters

<i>b</i>	Overwritten by the solution matrix <i>X</i> .
----------	---

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

## Description

The routine solves for  $X$  the system of linear equations  $A * X = B$  with a symmetric matrix  $A$ , given the Bunch-Kaufman factorization of  $A$ :

if  $uplo='U'$ ,  $A = U * D * U^T$   
 if  $uplo='L'$ ,  $A = L * D * L^T$ ,

where  $U$  and  $L$  are upper and lower triangular matrices with unit diagonal and  $D$  is a symmetric block-diagonal matrix. The system is solved with multiple right-hand sides stored in the columns of the matrix  $B$ . You must supply to this routine the factor  $U$  (or  $L$ ) and the array  $ipiv$  returned by the factorization routine [?sytrf](#).

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Must be 'U' or 'L'.  Indicates how the input matrix $A$ has been factored:  If $uplo = 'U'$ , the array $a$ stores the upper triangular factor $U$ of the factorization $A = U * D * U^T$ .  If $uplo = 'L'$ , the array $a$ stores the lower triangular factor $L$ of the factorization $A = L * D * L^T$ .
<i>n</i>	The order of matrix $A$ ; $n \geq 0$ .
<i>nrhs</i>	The number of right-hand sides; $nrhs \geq 0$ .
<i>ipiv</i>	Array, size at least $\max(1, n)$ . The $ipiv$ array, as returned by <a href="#">?sytrf</a> .
<i>a</i>	The array $a$ of size $\max(1, lda * n)$ contains the factor $U$ or $L$ (see <i>uplo</i> ).
<i>b</i>	The array $b$ contains the matrix $B$ whose columns are the right-hand sides for the system of equations.  The size of $b$ is at least $\max(1, ldb * nrhs)$ for column major layout and $\max(1, ldb * n)$ for row major layout.
<i>lda</i>	The leading dimension of $a$ ; $lda \geq \max(1, n)$ .
<i>ldb</i>	The leading dimension of $b$ ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.

## Output Parameters

<i>b</i>	Overwritten by the solution matrix $X$ .
----------	--

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

## Application Notes

For each right-hand side *b*, the computed solution is the exact solution of a perturbed system of equations  $(A + E)x = b$ , where

$$|E| \leq c(n)\varepsilon P|U||D||U^T|P^T \text{ or } |E| \leq c(n)\varepsilon P|L||D||U^T|P^T$$

$c(n)$  is a modest linear function of  $n$ , and  $\varepsilon$  is the machine precision.

If  $x_0$  is the true solution, the computed solution  $x$  satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \leq c(n) \text{cond}(A, x)\varepsilon$$

where  $\text{cond}(A, x) = \| |A^{-1}| |A| |x| \|_\infty / \|x\|_\infty \leq \|A^{-1}\|_\infty \|A\|_\infty = \kappa_\infty(A)$ .

Note that  $\text{cond}(A, x)$  can be much smaller than  $\kappa_\infty(A)$ .

The total number of floating-point operations for one right-hand side vector is approximately  $2n^2$  for real flavors or  $8n^2$  for complex flavors.

To estimate the condition number  $\kappa_\infty(A)$ , call `?sycon`.

To refine the solution and estimate the error, call `?sytrfs`.

#### `?sytrs_aa`

Solves a system of linear equations  $A * X = B$  with a symmetric matrix.

```
lapack_int LAPACKESsytrs_aa (int matrix_layout, char uplo, lapack_int n, lapack_int nrhs, const float * A, lapack_int lda, const lapack_int * ipiv, float * B, lapack_int ldb);
```

```
lapack_int LAPACKESdsytrs_aa (int matrix_layout, char uplo, lapack_int n, lapack_int nrhs, const double * A, lapack_int lda, const lapack_int * ipiv, double * B, lapack_int ldb);
```

```
lapack_int LAPACKEScsytrs_aa (int matrix_layout, char uplo, lapack_int n, lapack_int nrhs, const lapack_complex_float * A, lapack_int lda, const lapack_int * ipiv, lapack_complex_float * B, lapack_int ldb);
```

```
lapack_int LAPACKESzsytrs_aa (int matrix_layout, char uplo, lapack_int n, lapack_int nrhs, const lapack_complex_double * A, lapack_int lda, const lapack_int * ipiv, lapack_complex_double * B, lapack_int ldb);
```

## Description

?sytrs\_aa solves a system of linear equations  $A * X = B$  with a symmetric matrix  $A$  using the factorization  $A = U * T * U^T$  or  $A = L * T * L^T$  computed by ?sytrf\_aa.

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Specifies whether the details of the factorization are stored as an upper or lower triangular matrix. <ul style="list-style-type: none"> <li>= 'U': Upper triangular; the form is <math>A = U * T * U^T</math>.</li> <li>= 'L': Lower triangular; the form is <math>A = L * T * L^T</math>.</li> </ul>
<i>n</i>	The order of the matrix $A$ . $n \geq 0$ .
<i>nrhs</i>	The number of right-hand sides; that is, the number of columns of the matrix $B$ . $nrhs \geq 0$ .
<i>A</i>	Array of size $\max(1, lda * n)$ . Details of factors computed by ?sytrf_aa.
<i>lda</i>	The leading dimension of the array $A$ .
<i>ipiv</i>	Array of size $n$ . Details of the interchanges as computed by ?sytrf_aa.
<i>B</i>	Array of size $\max(1, ldb * nrhs)$ . On entry, the right-hand side matrix $B$ .
<i>ldb</i>	The leading dimension of the array $B$ . $ldb \geq \max(1, n)$ for column-major layout and $ldb \geq nrhs$ for row-major layout.

## Output Parameters

<i>B</i>	On exit, the solution matrix $X$ .
----------	------------------------------------

## Return Values

This function returns a value *info*.

= 0: Successful exit.

< 0: If *info* = -*i*, the *i*<sup>th</sup> argument had an illegal value.

## ?sytrs\_rook

*Solves a system of linear equations with a UDU- or LDL-factored symmetric coefficient matrix.*

## Description

The routine solves a system of linear equations  $A \cdot X = B$  with a symmetric matrix  $A$ , using the factorization  $A = U \cdot D \cdot U^T$  or  $A = L \cdot D \cdot L^T$  computed by [?sytrf\\_rook](#).

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout for array <i>b</i> is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Must be 'U' or 'L'.  Indicates how the input matrix $A$ has been factored: If <i>uplo</i> = 'U', the factorization is of the form $A = U \cdot D \cdot U^T$ . If <i>uplo</i> = 'L', the factorization is of the form $A = L \cdot D \cdot L^T$ .
<i>n</i>	The order of matrix $A$ ; $n \geq 0$ .
<i>nrhs</i>	The number of right-hand sides; $nrhs \geq 0$ .
<i>ipiv</i>	Array, size at least $\max(1, n)$ . The <i>ipiv</i> array, as returned by <a href="#">?sytrf_rook</a> .
<i>a, b</i>	Arrays: <i>a</i> , size ( $lda \cdot n$ ), <i>b</i> size ( $ldb \cdot nrhs$ ).  The array <i>a</i> contains the block diagonal matrix $D$ and the multipliers used to obtain $U$ or $L$ as computed by <a href="#">?sytrf_rook</a> (see <i>uplo</i> ).  The array <i>b</i> contains the matrix $B$ whose columns are the right-hand sides for the system of equations.
<i>lda</i>	The leading dimension of <i>a</i> ; $lda \geq \max(1, n)$ .
<i>ldb</i>	The leading dimension of <i>b</i> ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.

## Output Parameters

*b* Overwritten by the solution matrix  $X$ .

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If  $info = -i$ , the  $i$ -th parameter had an illegal value.

## Application Notes

The total number of floating-point operations for one right-hand side vector is approximately  $2n^2$  for real flavors or  $8n^2$  for complex flavors.

lapack_complex_double * b , lapack_int ldb );
```

## Include Files

- mkl.h

## Description

The routine solves for  $X$  the system of linear equations  $A * X = B$  with a Hermitian matrix  $A$ , given the Bunch-Kaufman factorization of  $A$ :

```
if uplo='U',           A = U*D*UH
if uplo='L',           A = L*D*LH,
```

where  $U$  and  $L$  are upper and lower triangular matrices with unit diagonal and  $D$  is a symmetric block-diagonal matrix. The system is solved with multiple right-hand sides stored in the columns of the matrix  $B$ . You must supply to this routine the factor  $U$  (or  $L$ ) and the array  $ipiv$  returned by the factorization routine [?hetrf](#).

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<code>uplo</code>	Must be 'U' or 'L'. Indicates how the input matrix $A$ has been factored: If <code>uplo = 'U'</code> , the array $a$ stores the upper triangular factor $U$ of the factorization $A = U * D * U^H$ . If <code>uplo = 'L'</code> , the array $a$ stores the lower triangular factor $L$ of the factorization $A = L * D * L^H$ .
<code>n</code>	The order of matrix $A$ ; $n \geq 0$ .

<i>nrhs</i>	The number of right-hand sides; $nrhs \geq 0$ .
<i>ipiv</i>	Array, size at least $\max(1, n)$ . The <i>ipiv</i> array, as returned by <a href="#">?hetrf</a> .
<i>a</i>	The array <i>aof</i> of size $\max(1, lda*n)$ contains the factor <i>U</i> or <i>L</i> (see <i>uplo</i> ).
<i>b</i>	The array <i>b</i> contains the matrix <i>B</i> whose columns are the right-hand sides for the system of equations. The size of <i>b</i> is at least $\max(1, ldb*nrhs)$ for column major layout and $\max(1, ldb*n)$ for row major layout.
<i>lda</i>	The leading dimension of <i>a</i> ; $lda \geq \max(1, n)$ .
<i>ldb</i>	The leading dimension of <i>b</i> ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.

## Output Parameters

<i>b</i>	Overwritten by the solution matrix <i>X</i> .
----------	---

## Return Values

This function returns a value *info*.

If  $info=0$ , the execution is successful.

If  $info = -i$ , parameter *i* had an illegal value.

## Application Notes

For each right-hand side *b*, the computed solution is the exact solution of a perturbed system of equations  $(A + E)x = b$ , where

$$|E| \leq c(n)\varepsilon P|U||D||U^H|P^T \text{ or } |E| \leq c(n)\varepsilon P|L||D||L^H|P^T$$

$c(n)$  is a modest linear function of *n*, and  $\varepsilon$  is the machine precision.

If  $x_0$  is the true solution, the computed solution *x* satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \leq c(n) \text{cond}(A, x)\varepsilon$$

where  $\text{cond}(A, x) = \| |A^{-1}||A| |x| \|_\infty / \|x\|_\infty \leq \|A^{-1}\|_\infty \|A\|_\infty = \kappa_\infty(A)$ .

Note that  $\text{cond}(A, x)$  can be much smaller than  $\kappa_\infty(A)$ .

The total number of floating-point operations for one right-hand side vector is approximately  $8n^2$ .

To estimate the condition number  $\kappa_\infty(A)$ , call [?hecon](#).

To refine the solution and estimate the error, call [?herfs](#).

## Description

The routine solves a system of linear equations  $A \cdot X = B$  with a symmetric matrix *A* using the factorization of *A*:

if *uplo*='U',  $A = U \cdot D \cdot U^T$

if *uplo*='L',  $A = L \cdot D \cdot L^T$

where

- $U$  and  $L$  are upper and lower triangular matrices with unit diagonal
- $D$  is a symmetric block-diagonal matrix.

The factorization is computed by `?sytrf`.

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<code>uplo</code>	Must be 'U' or 'L'.  Indicates how the input matrix $A$ has been factored:  If <code>uplo = 'U'</code> , the array $a$ stores the upper triangular factor $U$ of the factorization $A = U*D*U^T$ .  If <code>uplo = 'L'</code> , the array $a$ stores the lower triangular factor $L$ of the factorization $A = L*D*L^T$ .
<code>n</code>	The order of matrix $A$ ; $n \geq 0$ .
<code>nrhs</code>	The number of right-hand sides; $nrhs \geq 0$ .
<code>a</code>	The array $a$ of size $\max(1, lda*n)$ contains the block diagonal matrix $D$ and the multipliers used to obtain the factor $U$ or $L$ as computed by <code>?sytrf</code> .
<code>b</code>	The array $b$ contains the right-hand side matrix $B$ .  The size of $b$ is at least $\max(1, ldb*nrhs)$ for column major layout and $\max(1, ldb*n)$ for row major layout.
<code>lda</code>	The leading dimension of $a$ ; $lda \geq \max(1, n)$ .
<code>ldb</code>	The leading dimension of $b$ ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.
<code>ipiv</code>	Array of size $n$ . The <code>ipiv</code> array contains details of the interchanges and the block structure of $D$ as determined by <code>?sytrf</code> .

## Output Parameters

`b` Overwritten by the solution matrix  $X$ .

## Return Values

This function returns a value `info`.

If `info = 0`, the execution is successful.

If `info = -i`, parameter  $i$  had an illegal value.

```

## Description

`?sytrs_3` solves a system of linear equations  $A * X = B$  with a real or complex symmetric matrix *A* using the factorization computed by `?sytrf_rk`:  $A = P * U * D * (U^T) * (P^T)$  or  $A = P * L * D * (L^T) * (P^T)$ , where *U* (or *L*) is unit upper (or lower) triangular matrix,  $U^T$  (or  $L^T$ ) is the transpose of *U* (or *L*), *P* is a permutation matrix,  $P^T$  is the transpose of *P*, and *D* is a symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

This algorithm uses Level 3 BLAS.

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Specifies whether the details of the factorization are stored as an upper or lower triangular matrix:

	<ul style="list-style-type: none"> <li>• = 'U': Upper triangular; the form is <math>A = P*U*D*(U^T)*(P^T)</math>.</li> <li>• = 'L': Lower triangular; the form is <math>A = P*L*D*(L^T)*(P^T)</math>.</li> </ul>
<i>n</i>	The order of the matrix <i>A</i> . $n \geq 0$ .
<i>nrhs</i>	The number of right-hand sides; that is, the number of columns of the matrix <i>B</i> . $nrhs \geq 0$ .
<i>A</i>	<p>Array of size <math>\max(1, lda*n)</math>. Diagonal of the block diagonal matrix <i>D</i> and factors <i>U</i> or <i>L</i> as computed by <code>?sytrf_rk</code>:</p> <ul style="list-style-type: none"> <li>• <i>Only</i> diagonal elements of the symmetric block diagonal matrix <i>D</i> on the diagonal of <i>A</i>; that is, <math>D(k,k) = A(k,k)</math>. Superdiagonal (or subdiagonal) elements of <i>D</i> should be provided on entry in array <i>e</i>.</li> </ul> <p>—and—</p> <ul style="list-style-type: none"> <li>• If <i>uplo</i> = 'U', factor <i>U</i> in the superdiagonal part of <i>A</i>. If <i>uplo</i> = 'L', factor <i>L</i> in the subdiagonal part of <i>A</i>.</li> </ul>

## Output Parameters

*B* On exit, the solution matrix *X*.

## Return Values

This function returns a value *info*.

= 0: Successful exit.

< 0: If *info* = -*i*, the *i*<sup>th</sup> argument had an illegal value.

### ?hetrs\_3

Solves a system of linear equations  $A * X = B$  with a complex Hermitian matrix using the factorization computed by ?hetrf\_rk.

```
lapack_int LAPACKE_chetrs_3 (int matrix_layout, char uplo, lapack_int n, lapack_int
nrhs, const lapack_complex_float * A, lapack_int lda, const lapack_complex_float * e,
const lapack_int * ipiv, lapack_complex_float * B, lapack_int ldb);
```

```
lapack_int LAPACKE_zhetrs_3 (int matrix_layout, char uplo, lapack_int n, lapack_int
nrhs, const lapack_complex_double * A, lapack_int lda, const lapack_complex_double * e,
const lapack_int * ipiv, lapack_complex_double * B, lapack_int ldb);
```

### Description

?hetrs\_3 solves a system of linear equations  $A * X = B$  with a complex Hermitian matrix  $A$  using the factorization computed by ?hetrf\_rk:  $A = P * U * D * (U^H) * (P^T)$  or  $A = P * L * D * (L^H) * (P^T)$ , where  $U$  (or  $L$ ) is unit upper (or lower) triangular matrix,  $U^H$  (or  $L^H$ ) is the conjugate of  $U$  (or  $L$ ),  $P$  is a permutation matrix,  $P^T$  is the transpose of  $P$ , and  $D$  is a Hermitian and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

This algorithm uses Level 3 BLAS.

### Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Specifies whether the details of the factorization are stored as an upper or lower triangular matrix: <ul style="list-style-type: none"> <li>• = 'U': Upper triangular; form is <math>A = P * U * D * (U^H) * (P^T)</math>.</li> <li>• = 'L': Lower triangular; form is <math>A = P * L * D * (L^H) * (P^T)</math>.</li> </ul>
<i>n</i>	The order of the matrix $A$ . $n \geq 0$ .
<i>nrhs</i>	The number of right-hand sides; that is, the number of columns in the matrix $B$ . $nrhs \geq 0$ .
<i>A</i>	Array of size $\max(1, lda * n)$ . Diagonal of the block diagonal matrix $D$ and factor $U$ or $L$ as computed by ?hetrf_rk: <ul style="list-style-type: none"> <li>• Only diagonal elements of the Hermitian block diagonal matrix <math>D</math> on the diagonal of <math>A</math>; that is, <math>D(k,k) = A(k,k)</math>. Superdiagonal (or subdiagonal) elements of <math>D</math> should be provided on entry in array <math>e</math>.</li> <li>• If <i>uplo</i> = 'U', factor <math>U</math> in the superdiagonal part of <math>A</math>. If <i>uplo</i> = 'L', factor <math>L</math> in the subdiagonal part of <math>A</math>.</li> </ul>
<i>lda</i>	The leading dimension of the array $A$ .
<i>e</i>	Array of size $n$ . On entry, contains the superdiagonal (or subdiagonal) elements of the Hermitian block diagonal matrix $D$ with 1-by-1 or 2-by-2 diagonal blocks. If <i>uplo</i> = 'U', $e(i) = D(i-1,i), i=2:N$ , and $e(1)$ is not referenced. If <i>uplo</i> = 'L', $e(i) = D(i+1,i), i=1:N-1$ , and $e(n)$ is not referenced.

---

**NOTE** For 1-by-1 diagonal block  $D(k)$ , where  $1 \leq k \leq n$ , the element  $e[k-1]$  is not referenced in both the *uplo* = 'U' and *uplo* = 'L' cases.

---

<i>ipiv</i>	Array of size ( <i>n</i> ). Details of the interchanges and the block structure of <i>D</i> as determined by <code>?hetrf_rk</code> .
<i>B</i>	On entry, the right-hand side matrix <i>B</i> . The size of <i>B</i> is at least $\max(1, ldb * nrhs)$ for column-major layout and $\max(1, ldb * n)$ for row-major layout.
<i>ldb</i>	The leading dimension of the array <i>B</i> . $ldb \geq \max(1, n)$ for column-major layout and $ldb \geq nrhs$ for row-major layout.

## Output Parameters

<i>B</i>	On exit, the solution matrix <i>X</i> .
----------	---

## Return Values

This function returns a value *info*.

= 0: Successful exit.

< 0: If *info* = *-i*, the *i*<sup>th</sup> argument had an illegal value.

## ?sptrs

```

## Include Files

- mkl.h

## Description

The routine solves for *X* the system of linear equations  $A * X = B$  with a symmetric matrix *A*, given the Bunch-Kaufman factorization of *A*:

if *uplo*='U',  $A = U * D * U^T$

if *uplo*='L',  $A = L * D * L^T$ ,

where  $U$  and  $L$  are upper and lower *packed* triangular matrices with unit diagonal and  $D$  is a symmetric block-diagonal matrix. The system is solved with multiple right-hand sides stored in the columns of the matrix  $B$ . You must supply the factor  $U$  (or  $L$ ) and the array  $ipiv$  returned by the factorization routine [?spturf](#).

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<code>uplo</code>	Must be 'U' or 'L'.  Indicates how the input matrix $A$ has been factored:  If <code>uplo = 'U'</code> , the array <code>ap</code> stores the packed factor $U$ of the factorization $A = U^*D^*U^T$ . If <code>uplo = 'L'</code> , the array <code>ap</code> stores the packed factor $L$ of the factorization $A = L^*D^*L^T$ .
<code>n</code>	The order of matrix $A$ ; $n \geq 0$ .
<code>nrhs</code>	The number of right-hand sides; $nrhs \geq 0$ .
<code>ipiv</code>	Array, size at least $\max(1, n)$ . The <code>ipiv</code> array, as returned by <a href="#">?spturf</a> .
<code>ap</code>	The dimension of array <code>ap</code> must be at least $\max(1, n(n+1)/2)$ . The array <code>ap</code> contains the factor $U$ or $L$ , as specified by <code>uplo</code> , in <i>packed storage</i> (see <a href="#">Matrix Storage Schemes</a> ).
<code>b</code>	The array <code>b</code> contains the matrix $B$ whose columns are the right-hand sides for the system of equations. The size of <code>b</code> is $\max(1, ldb*nrhs)$ for column major layout and $\max(1, ldb*n)$ for row major layout.
<code>ldb</code>	The leading dimension of <code>b</code> ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.

## Output Parameters

<code>b</code>	Overwritten by the solution matrix $X$ .
----------------	--

## Return Values

This function returns a value `info`.

If `info=0`, the execution is successful.

If `info = -i`, parameter  $i$  had an illegal value.

## Application Notes

For each right-hand side  $b$ , the computed solution is the exact solution of a perturbed system of equations  $(A + E)x = b$ , where

$$|E| \leq c(n)\varepsilon P|U||D||U^T|P^T \text{ or } |E| \leq c(n)\varepsilon P|L||D||L^T|P^T$$

$c(n)$  is a modest linear function of  $n$ , and  $\varepsilon$  is the machine precision.

If  $x_0$  is the true solution, the computed solution  $x$  satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \leq c(n) \text{cond}(A, x) \varepsilon$$

where  $\text{cond}(A, x) = \| |A^{-1}| |A| |x| \|_\infty / \|x\|_\infty \leq \|A^{-1}\|_\infty \|A\|_\infty = \kappa_\infty(A)$ .

Note that  $\text{cond}(A, x)$  can be much smaller than  $\kappa_\infty(A)$ .

The total number of floating-point operations for one right-hand side vector is approximately  $2n^2$  for real flavors or  $8n^2$  for complex flavors.

To estimate the condition number  $\kappa_\infty(A)$ , call [?spcon](#).

To refine the solution and estimate the error, call [?sprfs](#).

## Description

The routine solves for  $X$  the following systems of linear equations with a band triangular matrix  $A$ , with multiple right-hand sides stored in  $B$ :

$$A * X = B \quad \text{if } trans = 'N',$$

$$A^T * X = B \quad \text{if } trans = 'T',$$

$$A^H * X = B \quad \text{if } trans = 'C' \text{ (for complex matrices only).}$$

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Must be 'U' or 'L'. Indicates whether $A$ is upper or lower triangular: If <i>uplo</i> = 'U', then $A$ is upper triangular. If <i>uplo</i> = 'L', then $A$ is lower triangular.
<i>trans</i>	Must be 'N' or 'T' or 'C'. If <i>trans</i> = 'N', then $A * X = B$ is solved for $X$ . If <i>trans</i> = 'T', then $A^T * X = B$ is solved for $X$ . If <i>trans</i> = 'C', then $A^H * X = B$ is solved for $X$ .
<i>diag</i>	Must be 'N' or 'U'. If <i>diag</i> = 'N', then $A$ is not a unit triangular matrix. If <i>diag</i> = 'U', then $A$ is unit triangular: diagonal elements are assumed to be 1 and not referenced in the array <i>ab</i> .
<i>n</i>	The order of $A$ ; the number of rows in $B$ ; $n \geq 0$ .
<i>kd</i>	The number of superdiagonals or subdiagonals in the matrix $A$ ; $kd \geq 0$ .
<i>nrhs</i>	The number of right-hand sides; $nrhs \geq 0$ .
<i>ab</i>	The array <i>ab</i> contains the matrix $A$ in <i>band storage</i> form. The size of <i>ab</i> must be $\max(1, ldab * n)$
<i>b</i>	The array <i>b</i> contains the matrix $B$ whose columns are the right-hand sides for the systems of equations. The size of <i>b</i> is $\max(1, ldb * nrhs)$ for column major layout and $\max(1, ldb * n)$ for row major layout.
<i>ldab</i>	The leading dimension of <i>ab</i> ; $ldab \geq kd + 1$ .
<i>ldb</i>	The leading dimension of <i>b</i> ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.

## Output Parameters

<i>b</i>	Overwritten by the solution matrix $X$ .
----------	--

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

## Application Notes

For each right-hand side *b*, the computed solution is the exact solution of a perturbed system of equations  $(A + E)x = b$ , where

$$|E| \leq c(n)\varepsilon|A|$$

$c(n)$  is a modest linear function of  $n$ , and  $\varepsilon$  is the machine precision. If  $x_0$  is the true solution, the computed solution  $x$  satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \leq c(n) \text{cond}(A, x)\varepsilon \text{ provided } c(n) \text{cond}(A, x)\varepsilon < 1$$

where  $\text{cond}(A, x) = \| |A^{-1}| |A| |x| \|_\infty / \|x\|_\infty \leq \|A^{-1}\|_\infty \|A\|_\infty = \kappa_\infty(A)$ .

Note that  $\text{cond}(A, x)$  can be much smaller than  $\kappa_\infty(A)$ ; the condition number of  $A^T$  and  $A^H$  might or might not be equal to  $\kappa_\infty(A)$ .

The approximate number of floating-point operations for one right-hand side vector *b* is  $2n \cdot kd$  for real flavors and  $8n \cdot kd$  for complex flavors.

To estimate the condition number  $\kappa_\infty(A)$ , call `?tbcon`.

To estimate the error in the solution, call `?tbrfs`.

### Estimating the Condition Number: LAPACK Computational Routines

This section describes the LAPACK routines for estimating the *condition number* of a matrix. The condition number is used for analyzing the errors in the solution of a system of linear equations (see [Error Analysis](#)). Since the condition number may be arbitrarily large when the matrix is nearly singular, the routines actually compute the *reciprocal* condition number.

#### `?gecon`

*Estimates the reciprocal of the condition number of a general matrix in the 1-norm or the infinity-norm.*

## Syntax

```
lapack_int LAPACKGE_sgecon( int matrix_layout, char norm, lapack_int n, const float* a,
lapack_int lda, float anorm, float* rcond );
```

```
lapack_int LAPACKGE_dgecon( int matrix_layout, char norm, lapack_int n, const double* a,
lapack_int lda, double anorm, double* rcond );
```

```
lapack_int LAPACKGE_cgecon( int matrix_layout, char norm, lapack_int n, const
lapack_complex_float* a, lapack_int lda, float anorm, float* rcond );
```

```
lapack_int LAPACKGE_zgecon( int matrix_layout, char norm, lapack_int n, const
lapack_complex_double* a, lapack_int lda, double anorm, double* rcond );
```

## Include Files

- `mkl.h`

## Description

The routine estimates the reciprocal of the condition number of a general matrix  $A$  in the 1-norm or infinity-norm:

$$\kappa_1(A) = \|A\|_1 \|A^{-1}\|_1 = \kappa_\infty(A^T) = \kappa_\infty(A^H)$$

$$\kappa_\infty(A) = \|A\|_\infty \|A^{-1}\|_\infty = \kappa_1(A^T) = \kappa_1(A^H).$$

An estimate is obtained for  $\|A^{-1}\|$ , and the reciprocal of the condition number is computed as  $rcond = 1 / (\|A\| \|A^{-1}\|)$ .

Before calling this routine:

- compute *anorm* (either  $\|A\|_1 = \max_j \sum_i |a_{ij}|$  or  $\|A\|_\infty = \max_i \sum_j |a_{ij}|$ )
- call `?getrf` to compute the *LU* factorization of  $A$ .

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>norm</i>	Must be '1' or 'O' or 'I'. If <i>norm</i> = '1' or 'O', then the routine estimates the condition number of matrix $A$ in 1-norm. If <i>norm</i> = 'I', then the routine estimates the condition number of matrix $A$ in infinity-norm.
<i>n</i>	The order of the matrix $A$ ; $n \geq 0$ .
<i>a</i>	The array <i>a</i> contains the <i>LU</i> -factored matrix $A$ , as returned by <code>?getrf</code> .
<i>anorm</i>	The norm of the <i>original</i> matrix $A$ (see <a href="#">Description</a> ).
<i>lda</i>	The leading dimension of <i>a</i> ; $lda \geq \max(1, n)$ .

## Output Parameters

<i>rcond</i>	An estimate of the reciprocal of the condition number. The routine sets $rcond = 0$ if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime $rcond$ is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.
--------------	--

## Return Values

This function returns a value *info*.

If  $info=0$ , the execution is successful.

If  $info = -i$ , parameter  $i$  had an illegal value.

## Application Notes

The computed  $rcond$  is never less than  $r$  (the reciprocal of the true condition number) and in practice is nearly always less than  $10r$ . A call to this routine involves solving a number of systems of linear equations  $A*x = b$  or  $A^H*x = b$ ; the number is usually 4 or 5 and never more than 11. Each solution requires approximately  $2*n^2$  floating-point operations for real flavors and  $8*n^2$  for complex flavors.

## Description

The routine estimates the reciprocal of the condition number of a general band matrix  $A$  in the 1-norm or infinity-norm:

$$\kappa_1(A) = \|A\|_1 \|A^{-1}\|_1 = \kappa_\infty(A^T) = \kappa_\infty(A^H)$$

$$\kappa_\infty(A) = \|A\|_\infty \|A^{-1}\|_\infty = \kappa_1(A^T) = \kappa_1(A^H).$$

An estimate is obtained for  $\|A^{-1}\|$ , and the reciprocal of the condition number is computed as  $rcond = 1 / (\|A\| \|A^{-1}\|)$ .

Before calling this routine:

- compute  $anorm$  (either  $\|A\|_1 = \max_j \sum_i |a_{ij}|$  or  $\|A\|_\infty = \max_i \sum_j |a_{ij}|$ )
- call `?gbtrf` to compute the  $LU$  factorization of  $A$ .

## Input Parameters

`matrix_layout` Specifies whether matrix storage layout is row major (LAPACK\_ROW\_MAJOR) or column major (LAPACK\_COL\_MAJOR).

`norm` Must be '1' or 'O' or 'I'.

If *norm* = '1' or 'O', then the routine estimates the condition number of matrix *A* in 1-norm.

If *norm* = 'I', then the routine estimates the condition number of matrix *A* in infinity-norm.

<i>n</i>	The order of the matrix <i>A</i> ; $n \geq 0$ .
<i>kl</i>	The number of subdiagonals within the band of <i>A</i> ; $kl \geq 0$ .
<i>ku</i>	The number of superdiagonals within the band of <i>A</i> ; $ku \geq 0$ .
<i>ldab</i>	The leading dimension of the array <i>ab</i> . ( $ldab \geq 2*kl + ku + 1$ ).
<i>ipiv</i>	Array, size at least $\max(1, n)$ . The <i>ipiv</i> array, as returned by <a href="#">?gbtrf</a> .
<i>ab</i>	The array <i>ab</i> of size $\max(1, ldab*n)$ contains the factored band matrix <i>A</i> , as returned by <a href="#">?gbtrf</a> .
<i>anorm</i>	The norm of the <i>original</i> matrix <i>A</i> (see <a href="#">Description</a> ).

## Output Parameters

<i>rcond</i>	An estimate of the reciprocal of the condition number. The routine sets <i>rcond</i> = 0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime <i>rcond</i> is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.
--------------	--

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

## Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than  $10r$ . A call to this routine involves solving a number of systems of linear equations  $A*x = b$  or  $A^H*x = b$ ; the number is usually 4 or 5 and never more than 11. Each solution requires approximately  $2n(ku + 2kl)$  floating-point operations for real flavors and  $8n(ku + 2kl)$  for complex flavors.

## Description

The routine estimates the reciprocal of the condition number of a symmetric (Hermitian) positive-definite matrix *A*:

$$\kappa_1(A) = \|A\|_1 \|A^{-1}\|_1 \text{ (since } A \text{ is symmetric or Hermitian, } \kappa_\infty(A) = \kappa_1(A)\text{)}.$$

An estimate is obtained for  $\|A^{-1}\|_1$ , and the reciprocal of the condition number is computed as  $rcond = 1 / (\|A\|_1 \|A^{-1}\|_1)$ .

Before calling this routine:

- compute *anorm* (either  $\|A\|_1 = \max_j \sum_i |a_{ij}|$  or  $\|A\|_\infty = \max_i \sum_j |a_{ij}|$ )

- call `?potrf` to compute the Cholesky factorization of  $A$ .

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<code>uplo</code>	Must be 'U' or 'L'.  Indicates how the input matrix $A$ has been factored:  If <code>uplo = 'U'</code> , $A$ is factored as $A = U^T * U$ for real flavors or $A = U^H * U$ for complex flavors, and $U$ is stored.  If <code>uplo = 'L'</code> , $A$ is factored as $A = L * L^T$ for real flavors or $A = L * L^H$ for complex flavors, and $L$ is stored.
<code>n</code>	The order of the matrix $A$ ; $n \geq 0$ .
<code>a</code>	The array <code>a</code> of size $\max(1, lda * n)$ contains the factored matrix $A$ , as returned by <code>?potrf</code> .
<code>lda</code>	The leading dimension of <code>a</code> ; $lda \geq \max(1, n)$ .
<code>anorm</code>	The norm of the <i>original</i> matrix $A$ (see <i>Description</i> ).

## Output Parameters

<code>rcond</code>	An estimate of the reciprocal of the condition number. The routine sets <code>rcond = 0</code> if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime <code>rcond</code> is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.
--------------------	--

## Return Values

This function returns a value `info`.

If `info = 0`, the execution is successful.

If `info = -i`, parameter `i` had an illegal value.

## Application Notes

The computed `rcond` is never less than  $r$  (the reciprocal of the true condition number) and in practice is nearly always less than  $10r$ . A call to this routine involves solving a number of systems of linear equations  $A * x = b$ ; the number is usually 4 or 5 and never more than 11. Each solution requires approximately  $2n^2$  floating-point operations for real flavors and  $8n^2$  for complex flavors.

## Description

The routine estimates the reciprocal of the condition number of a symmetric (Hermitian) positive-definite band matrix *A*:

$$\kappa_1(A) = \|A\|_1 \|A^{-1}\|_1 \text{ (since } A \text{ is symmetric or Hermitian, } \kappa_\infty(A) = \kappa_1(A)\text{)}.$$

An estimate is obtained for  $\|A^{-1}\|_1$ , and the reciprocal of the condition number is computed as  $rcond = 1 / (\|A\|_1 \|A^{-1}\|_1)$ .

Before calling this routine:

- compute *anorm* (either  $\|A\|_1 = \max_j \sum_i |a_{ij}|$  or  $\|A\|_\infty = \max_i \sum_j |a_{ij}|$ )
- call [?pbtrf](#) to compute the Cholesky factorization of *A*.

## Input Parameters

*matrix\_layout*

Specifies whether matrix storage layout is row major (LAPACK\_ROW\_MAJOR) or column major (LAPACK\_COL\_MAJOR).

<i>uplo</i>	Must be 'U' or 'L'. Indicates how the input matrix <i>A</i> has been factored: If <i>uplo</i> = 'U', <i>A</i> is factored as $A = U^T * U$ for real flavors or $A = U^H * U$ for complex flavors, and <i>U</i> is stored. If <i>uplo</i> = 'L', <i>A</i> is factored as $A = L * L^T$ for real flavors or $A = L * L^H$ for complex flavors, and <i>L</i> is stored.
<i>n</i>	The order of the matrix <i>A</i> ; $n \geq 0$ .
<i>kd</i>	The number of superdiagonals or subdiagonals in the matrix <i>A</i> ; $kd \geq 0$ .
<i>ldab</i>	The leading dimension of the array <i>ab</i> . ( $ldab \geq kd + 1$ ).
<i>ab</i>	The array <i>ab</i> of size $\max(1, ldab * n)$ contains the factored matrix <i>A</i> in band form, as returned by <code>?pbtrf</code> .
<i>anorm</i>	The norm of the <i>original</i> matrix <i>A</i> (see <i>Description</i> ).

## Output Parameters

<i>rcond</i>	An estimate of the reciprocal of the condition number. The routine sets <i>rcond</i> = 0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime <i>rcond</i> is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.
--------------	--

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

## Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than 10*r*. A call to this routine involves solving a number of systems of linear equations  $A * x = b$ ; the number is usually 4 or 5 and never more than 11. Each solution requires approximately  $4 * n * (kd + 1)$  floating-point operations for real flavors and  $16 * n * (kd + 1)$  for complex flavors.

## Description

The routine computes the reciprocal of the condition number (in the 1-norm) of a real symmetric or complex Hermitian positive-definite tridiagonal matrix using the factorization  $A = L^*D^*L^T$  for real flavors and  $A = L^*D^*L^H$  for complex flavors or  $A = U^T*D^*U$  for real flavors and  $A = U^H*D^*U$  for complex flavors computed by [?pttrf](#) :

$$\kappa_1(A) = \|A\|_1 \|A^{-1}\|_1 \text{ (since } A \text{ is symmetric or Hermitian, } \kappa_\infty(A) = \kappa_1(A)\text{)}.$$

The norm  $\|A^{-1}\|_1$  is computed by a direct method, and the reciprocal of the condition number is computed as  $rcond = 1 / (\|A\|_1 \|A^{-1}\|_1)$ .

Before calling this routine:

- compute *anorm* as  $\|A\|_1 = \max_j \sum_i |a_{ij}|$
- call [?pttrf](#) to compute the factorization of *A*.

## Input Parameters

<i>n</i>	The order of the matrix <i>A</i> ; $n \geq 0$ .
<i>d</i>	Arrays, dimension ( <i>n</i> ). The array <i>d</i> contains the <i>n</i> diagonal elements of the diagonal matrix <i>D</i> from the factorization of <i>A</i> , as computed by <a href="#">?pttrf</a> ;
<i>e</i>	Array, size ( <i>n</i> - 1). Contains off-diagonal elements of the unit bidiagonal factor <i>U</i> or <i>L</i> from the factorization computed by <a href="#">?pttrf</a> .
<i>anorm</i>	The 1- norm of the <i>original</i> matrix <i>A</i> (see <i>Description</i> ).

## Output Parameters

<i>rcond</i>	An estimate of the reciprocal of the condition number. The routine sets <i>rcond</i> = 0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime <i>rcond</i> is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.
--------------	--

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

## Application Notes

The computed  $rcond$  is never less than  $r$  (the reciprocal of the true condition number) and in practice is nearly always less than  $10r$ . A call to this routine involves solving a number of systems of linear equations  $A*x = b$ ; the number is usually 4 or 5 and never more than 11. Each solution requires approximately  $4*n*(kd + 1)$  floating-point operations for real flavors and  $16*n*(kd + 1)$  for complex flavors.

### ?sycon

*Estimates the reciprocal of the condition number of a symmetric matrix.*

### Syntax

```
lapack_int LAPACKE_ssycon( int matrix_layout, char uplo, lapack_int n, const float* a,
lapack_int lda, const lapack_int* ipiv, float anorm, float* rcond );
```

```
lapack_int LAPACKE_dsycon( int matrix_layout, char uplo, lapack_int n, const double* a,
lapack_int lda, const lapack_int* ipiv, double anorm, double* rcond );
```

```
lapack_int LAPACKE_csycon( int matrix_layout, char uplo, lapack_int n, const
lapack_complex_float* a, lapack_int lda, const lapack_int* ipiv, float anorm, float*

```

```
lapack_int LAPACKE_zsycon( int matrix_layout, char uplo, lapack_int n, const
lapack_complex_double* a, lapack_int lda, const lapack_int* ipiv, double anorm, double*
rcond );
```

### Include Files

- mkl.h

### Description

The routine estimates the reciprocal of the condition number of a symmetric matrix  $A$ :

$$\kappa_1(A) = \|A\|_1 \|A^{-1}\|_1 \text{ (since } A \text{ is symmetric, } \kappa_\infty(A) = \kappa_1(A)\text{)}.$$

An estimate is obtained for  $\|A^{-1}\|_1$ , and the reciprocal of the condition number is computed as  $rcond = 1 / (\|A\|_1 \|A^{-1}\|_1)$ .

Before calling this routine:

- compute  $anorm$  (either  $\|A\|_1 = \max_j \sum_i |a_{ij}|$  or  $\|A\|_\infty = \max_i \sum_j |a_{ij}|$ )
- call [?sytrf](#) to compute the factorization of  $A$ .

### Input Parameters

*matrix\_layout*

Specifies whether matrix storage layout is row major (LAPACK\_ROW\_MAJOR) or column major (LAPACK\_COL\_MAJOR).

*uplo*

Must be 'U' or 'L'.

Indicates how the input matrix  $A$  has been factored:

If  $uplo = 'U'$ , the array  $a$  stores the upper triangular factor  $U$  of the factorization  $A = U*D*U^T$ .

	If <code>uplo = 'L'</code> , the array <code>a</code> stores the lower triangular factor $L$ of the factorization $A = L * D * L^T$ .
<code>n</code>	The order of matrix $A$ ; $n \geq 0$ .
<code>a</code>	The array <code>a</code> of size $\max(1, lda * n)$ contains the factored matrix $A$ , as returned by <code>?sytrf</code> .
<code>lda</code>	The leading dimension of <code>a</code> ; $lda \geq \max(1, n)$ .
<code>ipiv</code>	Array, size at least $\max(1, n)$ . The array <code>ipiv</code> , as returned by <code>?sytrf</code> .
<code>anorm</code>	The norm of the <i>original</i> matrix $A$ (see <i>Description</i> ).

## Output Parameters

<code>rcond</code>	An estimate of the reciprocal of the condition number. The routine sets <code>rcond = 0</code> if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime <code>rcond</code> is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.
--------------------	--

## Return Values

This function returns a value `info`.

If `info = 0`, the execution is successful.

If `info = -i`, parameter `i` had an illegal value.

## Application Notes

The computed `rcond` is never less than  $r$  (the reciprocal of the true condition number) and in practice is nearly always less than  $10r$ . A call to this routine involves solving a number of systems of linear equations  $A * x = b$ ; the number is usually 4 or 5 and never more than 11. Each solution requires approximately  $2n^2$  floating-point operations for real flavors and  $8n^2$  for complex flavors.

```

## Description

`?sycon_3` estimates the reciprocal of the condition number (in the 1-norm) of a real or complex symmetric matrix  $A$  using the factorization computed by `?sytrf_rk`.  $A = P*U*D*(U^T)*(P^T)$  or  $A = P*L*D*(L^T)*(P^T)$ , where  $U$  (or  $L$ ) is unit upper (or lower) triangular matrix,  $U^T$  (or  $L^T$ ) is the transpose of  $U$  (or  $L$ ),  $P$  is a permutation matrix,  $P^T$  is the transpose of  $P$ , and  $D$  is symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

An estimate is obtained for  $\text{norm}(\text{inv}(A))$ , and the reciprocal of the condition number is computed as  $rcond = 1 / (anorm * \text{norm}(\text{inv}(A)))$ .

This routine uses BLAS3 solver `?sytrs_3`.

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major ( <code>LAPACK_ROW_MAJOR</code> ) or column major ( <code>LAPACK_COL_MAJOR</code> ).
<code>uplo</code>	Specifies whether the details of the factorization are stored as an upper or lower triangular matrix: <ul style="list-style-type: none"> <li>• = 'U': Upper triangular. The form is <math>A = P*U*D*(U^T)*(P^T)</math>.</li> <li>• = 'L': Lower triangular. The form is <math>A = P*L*D*(L^T)*(P^T)</math>.</li> </ul>
<code>n</code>	The order of the matrix $A$ . $n \geq 0$ .
<code>A</code>	Array of size $\max(1, lda*n)$ . Diagonal of the block diagonal matrix $D$ and factors $U$ or $L$ as computed by <code>?sytrf_rk</code> : <ul style="list-style-type: none"> <li>• <i>Only</i> diagonal elements of the symmetric block diagonal matrix <math>D</math> on the diagonal of <math>A</math>; that is, <math>D(k,k) = A(k,k)</math>. Superdiagonal (or subdiagonal) elements of <math>D</math> should be provided on entry in array <code>e</code>.</li> </ul> <p>—and—</p> <ul style="list-style-type: none"> <li>• If <code>uplo = 'U'</code>, factor <math>U</math> in the superdiagonal part of <math>A</math>. If <code>uplo = 'L'</code>, factor <math>L</math> in the subdiagonal part of <math>A</math>.</li> </ul>
<code>lda</code>	The leading dimension of the array <code>A</code> .
<code>e</code>	Array of size <code>n</code> . On entry, contains the superdiagonal (or subdiagonal) elements of the symmetric block diagonal matrix $D$ with 1-by-1 or 2-by-2 diagonal blocks. If <code>uplo = 'U'</code> , $e(i) = D(i-1,i)$ , $i=2:N$ , and $e(1)$ is not referenced. If <code>uplo = 'L'</code> , $e(i) = D(i+1,i)$ , $i=1:N-1$ , and $e(n)$ is not referenced.
<hr/> <p><b>NOTE</b> For 1-by-1 diagonal block <math>D(k)</math>, where <math>1 \leq k \leq n</math>, the element <code>e[k-1]</code> is not referenced in both the <code>uplo = 'U'</code> and <code>uplo = 'L'</code> cases.</p> <hr/>	
<code>ipiv</code>	Array of size <code>n</code> . Details of the interchanges and the block structure of $D$ as determined by <code>?sytrf_rk</code> .
<code>anorm</code>	The 1-norm of the original matrix $A$ .

## Output Parameters

*rcond* The reciprocal of the condition number of the matrix  $A$ , computed as  $rcond = 1/(anorm * AINVNM)$ , where  $AINVNM$  is an estimate of the 1-norm of  $\text{inv}(A)$  computed in this routine.

## Return Values

This function returns a value *info*.

= 0: Successful exit.

< 0: If *info* =  $-i$ , the  $i^{\text{th}}$  argument had an illegal value.

## ?hecon

*Estimates the reciprocal of the condition number of a Hermitian matrix.*

## Syntax

```
lapack_int LAPACKC_checon( int matrix_layout, char uplo, lapack_int n, const

## Description

The routine estimates the reciprocal of the condition number of a Hermitian matrix  $A$ :

$$\kappa_1(A) = \|A\|_1 \|A^{-1}\|_1 \text{ (since } A \text{ is Hermitian, } \kappa_\infty(A) = \kappa_1(A)\text{)}.$$

Before calling this routine:

- compute *anorm* (either  $\|A\|_1 = \max_j \sum_i |a_{ij}|$  or  $\|A\|_\infty = \max_i \sum_j |a_{ij}|$ )
- call [?hetrf](#) to compute the factorization of  $A$ .

## Input Parameters

*matrix\_layout* Specifies whether matrix storage layout is row major (LAPACK\_ROW\_MAJOR) or column major (LAPACK\_COL\_MAJOR).

*uplo* Must be 'U' or 'L'.

Indicates how the input matrix  $A$  has been factored:

If *uplo* = 'U', the array *a* stores the upper triangular factor  $U$  of the factorization  $A = U^*D^*U^H$ .

If *uplo* = 'L', the array *a* stores the lower triangular factor  $L$  of the factorization  $A = L^*D^*L^H$ .

*n* The order of matrix  $A$ ;  $n \geq 0$ .

<i>a</i>	The array <i>a</i> of size $\max(1, lda*n)$ contains the factored matrix <i>A</i> , as returned by <a href="#">?hetrf</a> .
<i>lda</i>	The leading dimension of <i>a</i> ; $lda \geq \max(1, n)$ .
<i>ipiv</i>	Array, size at least $\max(1, n)$ . The array <i>ipiv</i> , as returned by <a href="#">?hetrf</a> .
<i>anorm</i>	The norm of the <i>original</i> matrix <i>A</i> (see <i>Description</i> ).

## Output Parameters

<i>rcond</i>	An estimate of the reciprocal of the condition number. The routine sets <i>rcond</i> = 0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime <i>rcond</i> is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.
--------------	--

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

## Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than 10*r*. A call to this routine involves solving a number of systems of linear equations  $A*x = b$ ; the number is usually 5 and never more than 11. Each solution requires approximately  $8n^2$  floating-point operations.

## Description

The routine estimates the reciprocal of the condition number of a packed symmetric matrix  $A$ :

$$\kappa_1(A) = \|A\|_1 \|A^{-1}\|_1 \text{ (since } A \text{ is symmetric, } \kappa_\infty(A) = \kappa_1(A)\text{)}.$$

An estimate is obtained for  $\|A^{-1}\|_1$ , and the reciprocal of the condition number is computed as  $rcond = 1 / (\|A\|_1 \|A^{-1}\|_1)$ .

Before calling this routine:

- compute  $anorm$  (either  $\|A\|_1 = \max_j \sum_i |a_{ij}|$  or  $\|A\|_\infty = \max_i \sum_j |a_{ij}|$ )
- call `?sptrf` to compute the factorization of  $A$ .

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<code>uplo</code>	Must be 'U' or 'L'.  Indicates how the input matrix $A$ has been factored:  If <code>uplo = 'U'</code> , the array <code>ap</code> stores the packed upper triangular factor $U$ of the factorization $A = U^*D^*U^T$ .  If <code>uplo = 'L'</code> , the array <code>ap</code> stores the packed lower triangular factor $L$ of the factorization $A = L^*D^*L^T$ .
<code>n</code>	The order of matrix $A$ ; $n \geq 0$ .
<code>ap</code>	The array <code>ap</code> contains the packed factored matrix $A$ , as returned by <code>?sptrf</code> . The dimension of <code>ap</code> must be at least $\max(1, n(n+1)/2)$ .
<code>ipiv</code>	Array, size at least $\max(1, n)$ .  The array <code>ipiv</code> , as returned by <code>?sptrf</code> .
<code>anorm</code>	The norm of the <i>original</i> matrix $A$ (see <i>Description</i> ).

## Output Parameters

*rcond*

An estimate of the reciprocal of the condition number. The routine sets *rcond* = 0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

## Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than 10*r*. ## Description

The routine estimates the reciprocal of the condition number of a triangular matrix  $A$  in either the 1-norm or infinity-norm:

$$\kappa_1(A) = \|A\|_1 \|A^{-1}\|_1 = \kappa_\infty(A^T) = \kappa_\infty(A^H)$$

$$\kappa_\infty(A) = \|A\|_\infty \|A^{-1}\|_\infty = \kappa_1(A^T) = \kappa_1(A^H).$$

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>norm</i>	Must be '1' or 'O' or 'I'. If <i>norm</i> = '1' or 'O', then the routine estimates the condition number of matrix $A$ in 1-norm. If <i>norm</i> = 'I', then the routine estimates the condition number of matrix $A$ in infinity-norm.
<i>uplo</i>	Must be 'U' or 'L'. Indicates whether $A$ is upper or lower triangular: If <i>uplo</i> = 'U', the array $a$ stores the upper triangle of $A$ , other array elements are not referenced. If <i>uplo</i> = 'L', the array $a$ stores the lower triangle of $A$ , other array elements are not referenced.
<i>diag</i>	Must be 'N' or 'U'. If <i>diag</i> = 'N', then $A$ is not a unit triangular matrix. If <i>diag</i> = 'U', then $A$ is unit triangular: diagonal elements are assumed to be 1 and not referenced in the array $a$ .
<i>n</i>	The order of the matrix $A$ ; $n \geq 0$ .
<i>a</i>	The array $a$ of size $\max(1, lda * n)$ contains the matrix $A$ .
<i>lda</i>	The leading dimension of $a$ ; $lda \geq \max(1, n)$ .

## Output Parameters

*rcond* An estimate of the reciprocal of the condition number. The routine sets *rcond* = 0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

## Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than 10*r*. A call to this routine involves solving a number of systems of linear equations  $A^*x = b$ ; the number is usually 4 or 5 and never more than 11. Each solution requires approximately  $n^2$  floating-point operations for real flavors and  $4n^2$  operations for complex flavors.

## Description

The routine estimates the reciprocal of the condition number of a packed triangular matrix *A* in either the 1-norm or infinity-norm:

$$\kappa_1(A) = \|A\|_1 \|A^{-1}\|_1 = \kappa_\infty(A^T) = \kappa_\infty(A^H)$$

$$\kappa_\infty(A) = \|A\|_\infty \|A^{-1}\|_\infty = \kappa_1(A^T) = \kappa_1(A^H).$$

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>norm</i>	Must be '1' or 'O' or 'I'.  If <i>norm</i> = '1' or 'O', then the routine estimates the condition number of matrix <i>A</i> in 1-norm.  If <i>norm</i> = 'I', then the routine estimates the condition number of matrix <i>A</i> in infinity-norm.
<i>uplo</i>	Must be 'U' or 'L'. Indicates whether <i>A</i> is upper or lower triangular:  If <i>uplo</i> = 'U', the array <i>ap</i> stores the upper triangle of <i>A</i> in packed form.  If <i>uplo</i> = 'L', the array <i>ap</i> stores the lower triangle of <i>A</i> in packed form.
<i>diag</i>	Must be 'N' or 'U'.  If <i>diag</i> = 'N', then <i>A</i> is not a unit triangular matrix.  If <i>diag</i> = 'U', then <i>A</i> is unit triangular: diagonal elements are assumed to be 1 and not referenced in the array <i>ap</i> .
<i>n</i>	The order of the matrix <i>A</i> ; $n \geq 0$ .
<i>ap</i>	The array <i>ap</i> contains the packed matrix <i>A</i> . The dimension of <i>ap</i> must be at least $\max(1, n(n+1)/2)$ .

## Output Parameters

<i>rcond</i>	An estimate of the reciprocal of the condition number. The routine sets <i>rcond</i> = 0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime <i>rcond</i> is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.

## Description

The routine estimates the reciprocal of the condition number of a triangular band matrix  $A$  in either the 1-norm or infinity-norm:

$$\kappa_1(A) = \|A\|_1 \|A^{-1}\|_1 = \kappa_\infty(A^T) = \kappa_\infty(A^H)$$

$$\kappa_\infty(A) = \|A\|_\infty \|A^{-1}\|_\infty = \kappa_1(A^T) = \kappa_1(A^H).$$

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>norm</i>	Must be '1' or 'O' or 'I'. If <i>norm</i> = '1' or 'O', then the routine estimates the condition number of matrix $A$ in 1-norm. If <i>norm</i> = 'I', then the routine estimates the condition number of matrix $A$ in infinity-norm.
<i>uplo</i>	Must be 'U' or 'L'. Indicates whether $A$ is upper or lower triangular: If <i>uplo</i> = 'U', the array <i>ap</i> stores the upper triangle of $A$ in packed form. If <i>uplo</i> = 'L', the array <i>ap</i> stores the lower triangle of $A$ in packed form.
<i>diag</i>	Must be 'N' or 'U'. If <i>diag</i> = 'N', then $A$ is not a unit triangular matrix. If <i>diag</i> = 'U', then $A$ is unit triangular: diagonal elements are assumed to be 1 and not referenced in the array <i>ab</i> .

<i>n</i>	The order of the matrix <i>A</i> ; $n \geq 0$ .
<i>kd</i>	The number of superdiagonals or subdiagonals in the matrix <i>A</i> ; $kd \geq 0$ .
<i>ab</i>	The array <i>ab</i> of size $\max(1, ldab * n)$ contains the band matrix <i>A</i> .
<i>ldab</i>	The leading dimension of the array <i>ab</i> . ( $ldab \geq kd + 1$ ).

## Output Parameters

<i>rcond</i>	An estimate of the reciprocal of the condition number. The routine sets <i>rcond</i> = 0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime <i>rcond</i> is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.
--------------	--

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

## Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than 10*r*. A call to this routine involves solving a number of systems of linear equations  $A * x = b$ ; the number is usually 4 or 5 and never more than 11. Each solution requires approximately  $2 * n(kd + 1)$  floating-point operations for real flavors and  $8 * n(kd + 1)$  operations for complex flavors.

## Description

The routine performs an iterative refinement of the solution to a system of linear equations  $A*X = B$  or  $A^T*X = B$  or  $A^H*X = B$  with a general matrix  $A$ , with multiple right-hand sides. For each computed solution vector  $x$ , the routine computes the *component-wise backward error*  $\beta$ . This error is the smallest relative perturbation in elements of  $A$  and  $b$  such that  $x$  is the exact solution of the perturbed system:

$$|\delta a_{ij}| \leq \beta |a_{ij}|, \quad |\delta b_i| \leq \beta |b_i| \quad \text{such that } (A + \delta A)x = (b + \delta b).$$

Finally, the routine estimates the *component-wise forward error* in the computed solution  $\|x - x_e\|_\infty / \|x\|_\infty$  (here  $x_e$  is the exact solution).

Before calling this routine:

- call the factorization routine [?getrf](#)
- call the solver routine [?getrs](#).

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>trans</i>	Must be 'N' or 'T' or 'C'. Indicates the form of the equations: If <i>trans</i> = 'N', the system has the form $A*X = B$ . If <i>trans</i> = 'T', the system has the form $A^T*X = B$ . If <i>trans</i> = 'C', the system has the form $A^H*X = B$ .
<i>n</i>	The order of the matrix $A$ ; $n \geq 0$ .
<i>nrhs</i>	The number of right-hand sides; $nrhs \geq 0$ .
<i>a, af, b, x</i>	Arrays: <i>a</i> (size $\max(1, lda*n)$ ) contains the original matrix $A$ , as supplied to <a href="#">?getrf</a> . <i>af</i> (size $\max(1, ldaf*n)$ ) contains the factored matrix $A$ , as returned by <a href="#">?getrf</a> . <i>b</i> of size $\max(1, ldb*nrhs)$ for column major layout and $\max(1, ldb*n)$ for row major layout contains the right-hand side matrix $B$ .

$x$  of size  $\max(1, ldx*nrhs)$  for column major layout and  $\max(1, ldx*n)$  for row major layout contains the solution matrix  $X$ .

<code>lda</code>	The leading dimension of $a$ ; $lda \geq \max(1, n)$ .
<code>ldaf</code>	The leading dimension of $af$ ; $ldaf \geq \max(1, n)$ .
<code>ldb</code>	The leading dimension of $b$ ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.
<code>ldx</code>	The leading dimension of $x$ ; $ldx \geq \max(1, n)$ for column major layout and $ldx \geq nrhs$ for row major layout.
<code>ipiv</code>	Array, size at least $\max(1, n)$ . The <code>ipiv</code> array, as returned by <code>?getrf</code> .

## Output Parameters

<code>x</code>	The refined solution matrix $X$ .
<code>ferr, berr</code>	Arrays, size at least $\max(1, nrhs)$ . Contain the component-wise forward and backward errors, respectively, for each solution vector.

## Return Values

This function returns a value `info`.

If `info = 0`, the execution is successful.

If `info = -i`, parameter  $i$  had an illegal value.

## Application Notes

The bounds returned in `ferr` are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of  $4n^2$  floating-point operations (for real flavors) or  $16n^2$  operations (for complex flavors). In addition, each step of iterative refinement involves  $6n^2$  operations (for real flavors) or  $24n^2$  operations (for complex flavors); the number of iterations may range from 1 to 5. Estimating the forward error involves solving a number of systems of linear equations  $A*x = b$  with the same coefficient matrix  $A$  and different right hand sides  $b$ ; the number is usually 4 or 5 and never more than 11. Each solution requires approximately  $2n^2$  floating-point operations for real flavors or  $8n^2$  for complex flavors.

## Description

The routine improves the computed solution to a system of linear equations and provides error bounds and backward error estimates for the solution. In addition to a normwise error bound, the code provides a maximum componentwise error bound, if possible. See comments for *err\_bnds\_norm* and *err\_bnds\_comp* for details of the error bounds.

The original system of linear equations may have been equilibrated before calling this routine, as described by the parameters *equed*, *r*, and *c* below. In this case, the solution and error bounds returned are for the original unequilibrated system.

## Input Parameters

<i>matrix_layout</i>	Specifies whether two-dimensional array storage is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>trans</i>	Must be 'N', 'T', or 'C'. Specifies the form of the system of equations: If <i>trans</i> = 'N', the system has the form $A * X = B$ (No transpose). If <i>trans</i> = 'T', the system has the form $A^T * X = B$ (Transpose). If <i>trans</i> = 'C', the system has the form $A^H * X = B$ (Conjugate transpose for complex flavors, Transpose for real flavors).

<i>equed</i>	<p>Must be 'N', 'R', 'C', or 'B'.</p> <p>Specifies the form of equilibration that was done to <i>A</i> before calling this routine.</p> <p>If <i>equed</i> = 'N', no equilibration was done.</p> <p>If <i>equed</i> = 'R', row equilibration was done, that is, <i>A</i> has been premultiplied by <i>diag(r)</i>.</p> <p>If <i>equed</i> = 'C', column equilibration was done, that is, <i>A</i> has been postmultiplied by <i>diag(c)</i>.</p> <p>If <i>equed</i> = 'B', both row and column equilibration was done, that is, <i>A</i> has been replaced by <i>diag(r) * A * diag(c)</i>. The right-hand side <i>B</i> has been changed accordingly.</p>
<i>n</i>	The number of linear equations; the order of the matrix <i>A</i> ; $n \geq 0$ .
<i>nrhs</i>	The number of right-hand sides; the number of columns of the matrices <i>B</i> and <i>X</i> ; $nrhs \geq 0$ .
<i>a, af, b</i>	<p>Arrays: <i>a</i> (size <math>\max(1, lda * n)</math>), <i>af</i> (size <math>\max(1, ldaf * n)</math>), <i>b</i> (size <math>\max(1, ldb * nrhs)</math> for column major layout and <math>\max(1, ldb * n)</math> for row major layout).</p> <p>The array <i>a</i> contains the original <i>n</i>-by-<i>n</i> matrix <i>A</i>.</p> <p>The array <i>af</i> contains the factored form of the matrix <i>A</i>, that is, the factors <i>L</i> and <i>U</i> from the factorization <math>A = P * L * U</math> as computed by <a href="#">?getrf</a>.</p> <p>The array <i>b</i> contains the matrix <i>B</i> whose columns are the right-hand sides for the systems of equations.</p>
<i>lda</i>	The leading dimension of <i>a</i> ; $lda \geq \max(1, n)$ .
<i>ldaf</i>	The leading dimension of <i>af</i> ; $ldaf \geq \max(1, n)$ .
<i>ipiv</i>	Array, size at least $\max(1, n)$ . Contains the pivot indices as computed by <a href="#">?getrf</a> ; for row $1 \leq i \leq n$ , row <i>i</i> of the matrix was interchanged with row <i>ipiv(i)</i> .
<i>r, c</i>	<p>Arrays: <i>r</i> (size <i>n</i>), <i>c</i> (size <i>n</i>). The array <i>r</i> contains the row scale factors for <i>A</i>, and the array <i>c</i> contains the column scale factors for <i>A</i>.</p> <p><i>equed</i> = 'R' or 'B', <i>A</i> is multiplied on the left by <i>diag(r)</i>; if <i>equed</i> = 'N' or 'C', <i>r</i> is not accessed.</p> <p>If <i>equed</i> = 'R' or 'B', each element of <i>r</i> must be positive.</p> <p>If <i>equed</i> = 'C' or 'B', <i>A</i> is multiplied on the right by <i>diag(c)</i>; if <i>equed</i> = 'N' or 'R', <i>c</i> is not accessed.</p> <p>If <i>equed</i> = 'C' or 'B', each element of <i>c</i> must be positive.</p> <p>Each element of <i>r</i> or <i>c</i> should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or</p>

overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

<i>ldb</i>	The leading dimension of the array <i>b</i> ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.
<i>x</i>	Array, of size $\max(1, ldx * nrhs)$ for column major layout and $\max(1, ldx * n)$ for row major layout. The solution matrix <i>X</i> as computed by <code>?getrs</code>
<i>ldx</i>	The leading dimension of the output array <i>x</i> ; $ldx \geq \max(1, n)$ for column major layout and $ldx \geq nrhs$ for row major layout.
<i>n_err_bnds</i>	Number of error bounds to return for each right hand side and each type (normwise or componentwise). See <i>err_bnds_norm</i> and <i>err_bnds_comp</i> descriptions in <i>Output Arguments</i> section below.
<i>nparams</i>	Specifies the number of parameters set in <i>params</i> . If $\leq 0$ , the <i>params</i> array is never referenced and default values are used.
<i>params</i>	Array, size <i>nparams</i> . Specifies algorithm parameters. If an entry is less than 0.0, that entry is filled with the default value used for that parameter. Only positions up to <i>nparams</i> are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass <i>nparams</i> = 0, which prevents the source code from accessing the <i>params</i> argument.  <i>params</i> [0] : Whether to perform iterative refinement or not. Default: 1.0  =0.0                      No refinement is performed and no error bounds are computed.  =1.0                      Use the double-precision refinement algorithm, possibly with doubled-single computations if the compilation environment does not support double precision.  (Other values are reserved for future use.)  <i>params</i> [1] : Maximum number of residual computations allowed for refinement.  Default                      10.0  Aggressive                      Set to 100.0 to permit convergence using approximate factorizations or factorizations other than <i>LU</i> . If the factorization uses a technique other than Gaussian elimination, the guarantees in <i>err_bnds_norm</i> and <i>err_bnds_comp</i> may no longer be trustworthy.

*params[2]* : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

## Output Parameters

<i>x</i>	The improved solution matrix <i>X</i> .
<i>rcond</i>	Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix <i>A</i> after equilibration (if done). If <i>rcond</i> is less than the machine precision, in particular, if <i>rcond</i> = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.
<i>berr</i>	Array, size at least $\max(1, nrhs)$ . Contains the componentwise relative backward error for each solution vector $x_j$ , that is, the smallest relative change in any element of <i>A</i> or <i>B</i> that makes $x_j$ an exact solution.
<i>err_bnds_norm</i>	Array of size $nrhs * n\_err\_bnds$ . For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:

Normwise relative error in the *i*-th solution vector

$$\frac{\max_j |X_{true_{ji}} - X_{ji}|}{\max_j |X_{ji}|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.

<i>err=1</i>	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold $\sqrt{n} * slamch(\epsilon)$ for single precision flavors and $\sqrt{n} * dlamch(\epsilon)$ for double precision flavors.
<i>err=2</i>	"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold $\sqrt{n} * slamch(\epsilon)$ for single precision flavors and $\sqrt{n} * dlamch(\epsilon)$ for double precision flavors. This error bound should only be trusted if the previous boolean is true.

`err=3`

Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold  $\sqrt{n} * \text{slamch}(\epsilon)$  for single precision flavors and  $\sqrt{n} * \text{dlamch}(\epsilon)$  for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix  $Z$  are:

$$\|Z\|_{\infty} \cdot \|Z^{-1}\|_{\infty}$$

Let  $z=s*a$ , where  $s$  scales each row by a power of the radix so all absolute row sums of  $z$  are approximately 1.

The information for right-hand side  $i$ , where  $1 \leq i \leq nrhs$ , and type of error  $err$  is stored in:

- Column major layout: `err_bnds_norm[(err - 1)*nrhs + i - 1]`.
- Row major layout: `err_bnds_norm[err - 1 + (i - 1)*n_err_bnds]`

`err_bnds_comp`

Array of size  $nrhs * n\_err\_bnds$ . For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:

Componentwise relative error in the  $i$ -th solution vector:

$$\max_j \frac{|X_{true_{ji}} - X_{ji}|}{|X_{ji}|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is not requested (`params[2] = 0.0`), then `err_bnds_comp` is not accessed. If  $n\_err\_bnds < 3$ , then at most the first  $n\_err\_bnds$  columns of the `err_bnds_comp` array are returned.

`err=1`

"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold  $\sqrt{n} * \text{slamch}(\epsilon)$  for single precision flavors and  $\sqrt{n} * \text{dlamch}(\epsilon)$  for double precision flavors.

`err=2`

"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold  $\sqrt{n} * \text{slamch}(\epsilon)$  for single precision flavors and  $\sqrt{n} * \text{dlamch}(\epsilon)$  for double

precision flavors. This error bound should only be trusted if the previous boolean is true.

`err=3`

Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold  $\sqrt{n} * \text{slamch}(\epsilon)$  for single precision flavors and  $\sqrt{n} * \text{dlamch}(\epsilon)$  for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix  $Z$  are:

$$\|Z\|_{\infty} \cdot \|Z^{-1}\|_{\infty}$$

Let  $z = s * (a * \text{diag}(x))$ , where  $x$  is the solution for the current right-hand side and  $s$  scales each row of  $a * \text{diag}(x)$  by a power of the radix so all absolute row sums of  $z$  are approximately 1.

The information for right-hand side  $i$ , where  $1 \leq i \leq nrhs$ , and type of error `err` is stored in:

- Column major layout: `err_bnds_comp[(err - 1) * nrhs + i - 1]`.
- Row major layout: `err_bnds_comp[err - 1 + (i - 1) * n_err_bnds]`

`params`

Output parameter only if the input contains erroneous values, namely, in `params[0]`, `params[1]`, `params[2]`. In such a case, the corresponding elements of `params` are filled with default values on output.

## Return Values

This function returns a value `info`.

If `info = 0`, the execution is successful. The solution to every right-hand side is guaranteed.

If `info = -i`, parameter  $i$  had an illegal value.

If  $0 < info \leq n$ :  $U_{info,info}$  is exactly zero. The factorization has been completed, but the factor  $U$  is exactly singular, so the solution and error bounds could not be computed; `rcond = 0` is returned.

If `info = n+j`: The solution corresponding to the  $j$ -th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides  $k$  with  $k > j$  may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested `params[2] = 0.0`, then the  $j$ -th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest  $j$  such that for column major layout `err_bnds_norm[j - 1] = 0.0` or `err_bnds_comp[j - 1] = 0.0`; or for row major layout `err_bnds_norm[(j - 1) * n_err_bnds] = 0.0` or `err_bnds_comp[(j - 1) * n_err_bnds] = 0.0`). See the definition of `err_bnds_norm` and `err_bnds_comp` for `err = 1`. To get information about all of the right-hand sides, check `err_bnds_norm` or `err_bnds_comp`.

### Description

The routine performs an iterative refinement of the solution to a system of linear equations  $A^*X = B$  or  $A^T * X = B$  or  $A^H * X = B$  with a band matrix  $A$ , with multiple right-hand sides. For each computed solution vector  $x$ , the routine computes the *component-wise backward error*  $\beta$ . This error is the smallest relative perturbation in elements of  $A$  and  $b$  such that  $x$  is the exact solution of the perturbed system:

$$|\delta a_{ij}| \leq \beta |a_{ij}|, \quad |\delta b_i| \leq \beta |b_i| \quad \text{such that} \quad (A + \delta A)x = (b + \delta b).$$

Finally, the routine estimates the *component-wise forward error* in the computed solution  $\|x - x_e\|_\infty / \|x\|_\infty$  (here  $x_e$  is the exact solution).

Before calling this routine:

- call the factorization routine [?gbtrf](#)
- call the solver routine [?gbtrs](#).

### Input Parameters

*matrix\_layout* Specifies whether matrix storage layout is row major (LAPACK\_ROW\_MAJOR) or column major (LAPACK\_COL\_MAJOR).

*trans* Must be 'N' or 'T' or 'C'.

Indicates the form of the equations:

	If $trans = 'N'$ , the system has the form $A*X = B$ .
	If $trans = 'T'$ , the system has the form $A^T*X = B$ .
	If $trans = 'C'$ , the system has the form $A^H*X = B$ .
$n$	The order of the matrix $A$ ; $n \geq 0$ .
$kl$	The number of sub-diagonals within the band of $A$ ; $kl \geq 0$ .
$ku$	The number of super-diagonals within the band of $A$ ; $ku \geq 0$ .
$nrhs$	The number of right-hand sides; $nrhs \geq 0$ .
$ab,afb,b,x$	<p>Arrays:</p> <p><math>ab</math>(size <math>\max(1, ldab*n)</math>) contains the original band matrix <math>A</math>, as supplied to <code>?gbtrf</code>, but stored in rows from 1 to <math>kl + ku + 1</math> for column major layout, and columns from 1 to <math>kl + ku + 1</math> for row major layout.</p> <p><math>afb</math>(size <math>\max(1, ldafb*n)</math>) contains the factored band matrix <math>A</math>, as returned by <code>?gbtrf</code>.</p> <p><math>b</math> of size <math>\max(1, ldb*nrhs)</math> for column major layout and <math>\max(1, ldb*n)</math> for row major layout contains the right-hand side matrix <math>B</math>.</p> <p><math>x</math> of size <math>\max(1, ldx*nrhs)</math> for column major layout and <math>\max(1, ldx*n)</math> for row major layout contains the solution matrix <math>X</math>.</p>
$ldab$	The leading dimension of $ab$ , $ldab \geq kl + ku + 1$ .
$ldafb$	The leading dimension of $afb$ , $ldafb \geq 2*kl + ku + 1$ .
$ldb$	The leading dimension of $b$ ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.
$ldx$	The leading dimension of $x$ ; $ldx \geq \max(1, n)$ .
$ipiv$	Array, size at least $\max(1, n)$ . The $ipiv$ array, as returned by <code>?gbtrf</code> .

## Output Parameters

$x$	The refined solution matrix $X$ .
$ferr, berr$	Arrays, size at least $\max(1, nrhs)$ . Contain the component-wise forward and backward errors, respectively, for each solution vector.

## Return Values

This function returns a value  $info$ .

If  $info = 0$ , the execution is successful.

If  $info = -i$ , parameter  $i$  had an illegal value.

## Application Notes

The bounds returned in  $ferr$  are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of  $4n(kl + ku)$  floating-point operations (for real flavors) or  $16n(kl + ku)$  operations (for complex flavors). In addition, each step of iterative refinement involves  $2n(4kl + 3ku)$  operations (for real flavors) or  $8n(4kl + 3ku)$  operations (for complex flavors); the number of iterations may range from 1 to 5. Estimating the forward error involves solving a number of systems of linear equations  $A^*x = b$ ; the number is usually 4 or 5 and never more than 11. Each solution requires approximately  $2n^2$  floating-point operations for real flavors or  $8n^2$  for complex flavors.

## Description

The routine improves the computed solution to a system of linear equations and provides error bounds and backward error estimates for the solution. In addition to a normwise error bound, the code provides a maximum componentwise error bound, if possible. See comments for *err\_bnds\_norm* and *err\_bnds\_comp* for details of the error bounds.

The original system of linear equations may have been equilibrated before calling this routine, as described by the parameters *equed*, *r*, and *c* below. In this case, the solution and error bounds returned are for the original unequilibrated system.

## Input Parameters

<i>matrix_layout</i>	Specifies whether two-dimensional array storage is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>trans</i>	Must be 'N', 'T', or 'C'.  Specifies the form of the system of equations: If <i>trans</i> = 'N', the system has the form $A * X = B$ (No transpose). If <i>trans</i> = 'T', the system has the form $A^T * X = B$ (Transpose). If <i>trans</i> = 'C', the system has the form $A^H * X = B$ (Conjugate transpose for complex flavors, Transpose for real flavors).
<i>equed</i>	Must be 'N', 'R', 'C', or 'B'.  Specifies the form of equilibration that was done to <i>A</i> before calling this routine. If <i>equed</i> = 'N', no equilibration was done. If <i>equed</i> = 'R', row equilibration was done, that is, <i>A</i> has been premultiplied by <i>diag(r)</i> . If <i>equed</i> = 'C', column equilibration was done, that is, <i>A</i> has been postmultiplied by <i>diag(c)</i> . If <i>equed</i> = 'B', both row and column equilibration was done, that is, <i>A</i> has been replaced by $diag(r) * A * diag(c)$ . The right-hand side <i>B</i> has been changed accordingly.
<i>n</i>	The number of linear equations; the order of the matrix <i>A</i> ; $n \geq 0$ .
<i>kl</i>	The number of subdiagonals within the band of <i>A</i> ; $kl \geq 0$ .
<i>ku</i>	The number of superdiagonals within the band of <i>A</i> ; $ku \geq 0$ .
<i>nrhs</i>	The number of right-hand sides; the number of columns of the matrices <i>B</i> and <i>X</i> ; $nrhs \geq 0$ .
<i>ab,afb,b</i>	The array <i>abof</i> size $\max(1, ldab * n)$ contains the original matrix <i>A</i> in band storage, in rows from 1 to $kl + ku + 1$ for column major layout, and in columns from 1 to $kl + ku + 1$ for row major layout.  The array <i>afb</i> size $\max(1, ldafb * n)$ contains details of the LU factorization of the banded matrix <i>A</i> as computed by <i>?gbtrf</i> .

	The array <i>bof</i> of size $\max(1, ldb*nrhs)$ for column major layout and $\max(1, ldb*n)$ for row major layout contains the matrix <i>B</i> whose columns are the right-hand sides for the systems of equations.
<i>ldab</i>	The leading dimension of the array <i>ab</i> ; $ldab \geq kl+ku+1$ .
<i>lda<b>fb</b></i>	The leading dimension of the array <i>afb</i> ; $ldafb \geq 2*kl+ku+1$ .
<i>ipiv</i>	Array, size at least $\max(1, n)$ . Contains the pivot indices as computed by <a href="#">?gbtrf</a> ; for row $1 \leq i \leq n$ , row <i>i</i> of the matrix was interchanged with row <i>ipiv</i> [ <i>i</i> -1].
<i>r, c</i>	<p>Arrays: <i>r</i>(<i>n</i>), <i>c</i>(<i>n</i>). The array <i>r</i> contains the row scale factors for <i>A</i>, and the array <i>c</i> contains the column scale factors for <i>A</i>.</p> <p>If <i>equed</i> = 'R' or 'B', <i>A</i> is multiplied on the left by <i>diag</i>(<i>r</i>); if <i>equed</i> = 'N' or 'C', <i>r</i> is not accessed.</p> <p>If <i>equed</i> = 'R' or 'B', each element of <i>r</i> must be positive.</p> <p>If <i>equed</i> = 'C' or 'B', <i>A</i> is multiplied on the right by <i>diag</i>(<i>c</i>); if <i>equed</i> = 'N' or 'R', <i>c</i> is not accessed.</p> <p>If <i>equed</i> = 'C' or 'B', each element of <i>c</i> must be positive.</p> <p>Each element of <i>r</i> or <i>c</i> should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.</p>
<i>ldb</i>	The leading dimension of the array <i>b</i> ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.
<i>x</i>	<p>Array, size <math>\max(1, ldx*nrhs)</math> for column major layout and <math>\max(1, ldx*n)</math> for row major layout.</p> <p>The solution matrix <i>X</i> as computed by <a href="#">sgbtrs/dgbtrs</a> for real flavors or <a href="#">cgbtrs/zgbtrs</a> for complex flavors.</p>
<i>ldx</i>	The leading dimension of the output array <i>x</i> ; $ldx \geq \max(1, n)$ for column major layout and $ldx \geq nrhs$ for row major layout.
<i>n_err_bnds</i>	Number of error bounds to return for each right-hand side and each type (normwise or componentwise). See <a href="#">err_bnds_norm</a> and <a href="#">err_bnds_comp</a> descriptions in <i>Output Arguments</i> section below.
<i>nparams</i>	Specifies the number of parameters set in <i>params</i> . If $\leq 0$ , the <i>params</i> array is never referenced and default values are used.
<i>params</i>	<p>Array, size <i>nparams</i>. Specifies algorithm parameters. If an entry is less than 0.0, that entry will be filled with the default value used for that parameter. Only positions up to <i>nparams</i> are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass <i>nparams</i> = 0, which prevents the source code from accessing the <i>params</i> argument.</p> <p><i>params</i>[0] : Whether to perform iterative refinement or not. Default: 1.0 (for single precision flavors), 1.0D+0 (for double precision flavors).</p>

=0.0	No refinement is performed and no error bounds are computed.
=1.0	Use the double-precision refinement algorithm, possibly with doubled-single computations if the compilation environment does not support double precision.

(Other values are reserved for future use.)

`params[1]` : Maximum number of residual computations allowed for refinement.

Default	10.0
Aggressive	Set to 100.0 to permit convergence using approximate factorizations or factorizations other than <i>LU</i> . If the factorization uses a technique other than Gaussian elimination, the guarantees in <code>err_bnds_norm</code> and <code>err_bnds_comp</code> may no longer be trustworthy.

`params[2]` : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

## Output Parameters

<code>x</code>	The improved solution matrix <i>X</i> .
<code>rcond</code>	Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix <i>A</i> after equilibration (if done). If <code>rcond</code> is less than the machine precision, in particular, if <code>rcond</code> = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.
<code>berr</code>	Array, size at least <code>max(1, nrhs)</code> . Contains the componentwise relative backward error for each solution vector $x_j$ , that is, the smallest relative change in any element of <i>A</i> or <i>B</i> that makes $x_j$ an exact solution.
<code>err_bnds_norm</code>	Array of size <code>nrhs*n_err_bnds</code> . For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows: Normwise relative error in the <i>i</i> -th solution vector

$$\frac{\max_j |X_{true_{ji}} - X_{ji}|}{\max_j |X_{ji}|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.

<code>err=1</code>	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold $\text{sqrt}(n) * \text{slamch}(\epsilon)$ for single precision flavors and $\text{sqrt}(n) * \text{dlamch}(\epsilon)$ for double precision flavors.
<code>err=2</code>	"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold $\text{sqrt}(n) * \text{slamch}(\epsilon)$ for single precision flavors and $\text{sqrt}(n) * \text{dlamch}(\epsilon)$ for double precision flavors. This error bound should only be trusted if the previous boolean is true.
<code>err=3</code>	Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold $\text{sqrt}(n) * \text{slamch}(\epsilon)$ for single precision flavors and $\text{sqrt}(n) * \text{dlamch}(\epsilon)$ for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix $Z$ are

$$\|Z\|_{\infty} \cdot \|Z^{-1}\|_{\infty}$$

Let  $z=s*a$ , where  $s$  scales each row by a power of the radix so all absolute row sums of  $z$  are approximately 1.

The information for right-hand side  $i$ , where  $1 \leq i \leq nrhs$ , and type of error `err` is stored in:

- Column major layout: `err_bnds_norm[(err - 1)*nrhs + i - 1]`.
- Row major layout: `err_bnds_norm[err - 1 + (i - 1)*n_err_bnds]`

`err_bnds_comp`

Array of size `nrhs*n_err_bnds`. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:

Componentwise relative error in the  $i$ -th solution vector:

$$\max_j \frac{|X_{true_{ji}} - X_{ji}|}{|X_{ji}|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is not requested (`params[2] = 0.0`), then `err_bnds_comp` is not accessed.

<code>err=1</code>	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors.
<code>err=2</code>	"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors. This error bound should only be trusted if the previous boolean is true.
<code>err=3</code>	Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix $Z$ are

$$\|Z\|_{\infty} \cdot \|Z^{-1}\|_{\infty}$$

Let  $z = s * (a * \text{diag}(x))$ , where  $x$  is the solution for the current right-hand side and  $s$  scales each row of  $a * \text{diag}(x)$  by a power of the radix so all absolute row sums of  $z$  are approximately 1.

The information for right-hand side  $i$ , where  $1 \leq i \leq \text{nrhs}$ , and type of error `err` is stored in:

- Column major layout: `err_bnds_comp[(err - 1) * nrhs + i - 1]`.
- Row major layout: `err_bnds_comp[err - 1 + (i - 1) * n_err_bnds]`

`params`

Output parameter only if the input contains erroneous values, namely, in `params[0]`, `params[1]`, and `params[2]`. In such a case, the corresponding elements of `params` are filled with default values on output.

## Return Values

This function returns a value `info`.

If `info = 0`, the execution is successful. The solution to every right-hand side is guaranteed.

If `info = -i`, parameter  $i$  had an illegal value.

If  $0 < \text{info} \leq n$ :  $U_{\text{info}, \text{info}}$  is exactly zero. The factorization has been completed, but the factor  $U$  is exactly singular, so the solution and error bounds could not be computed; `rcond = 0` is returned.

If `info = n+j`: The solution corresponding to the  $j$ -th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides  $k$  with  $k > j$  may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested `params[2] = 0.0`, then the  $j$ -th

right-hand side is the first with a normwise error bound that is not guaranteed (the smallest  $j$  such that for column major layout  $err\_bnds\_norm[j - 1] = 0.0$  or  $err\_bnds\_comp[j - 1] = 0.0$ ; or for row major layout  $err\_bnds\_norm[(j - 1)*n\_err\_bnds] = 0.0$  or  $err\_bnds\_comp[(j - 1)*n\_err\_bnds] = 0.0$ ). See the definition of  $err\_bnds\_norm$  and  $err\_bnds\_comp$  for  $err = 1$ . To get information about all of the right-hand sides, check  $err\_bnds\_norm$  or  $err\_bnds\_comp$ .

## Description

The routine performs an iterative refinement of the solution to a system of linear equations  $A * X = B$  or  $A^T * X = B$  or  $A^H * X = B$  with a tridiagonal matrix  $A$ , with multiple right-hand sides. For each computed solution vector  $x$ , the routine computes the *component-wise backward error*  $\beta$ . This error is the smallest relative perturbation in elements of  $A$  and  $b$  such that  $x$  is the exact solution of the perturbed system:

$$|\delta a_{ij}| / |a_{ij}| \leq \beta |a_{ij}|, \quad |\delta b_i| / |b_i| \leq \beta |b_i| \quad \text{such that } (A + \delta A) x = (b + \delta b).$$

Finally, the routine estimates the *component-wise forward error* in the computed solution  $\|x - x_e\|_\infty / \|x\|_\infty$  (here  $x_e$  is the exact solution).

Before calling this routine:

- call the factorization routine [?gttrf](#)

- call the solver routine `?gttrs`.

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<code>trans</code>	Must be 'N' or 'T' or 'C'. Indicates the form of the equations: If <code>trans = 'N'</code> , the system has the form $A*X = B$ . If <code>trans = 'T'</code> , the system has the form $A^T*X = B$ . If <code>trans = 'C'</code> , the system has the form $A^H*X = B$ .
<code>n</code>	The order of the matrix $A$ ; $n \geq 0$ .
<code>nrhs</code>	The number of right-hand sides, that is, the number of columns of the matrix $B$ ; $nrhs \geq 0$ .
<code>dl</code>	Array <code>dl</code> of size $n - 1$ contains the subdiagonal elements of $A$ .
<code>d</code>	Array <code>d</code> of size $n$ contains the diagonal elements of $A$ .
<code>du</code>	Array <code>du</code> of size $n - 1$ contains the superdiagonal elements of $A$ .
<code>d1f</code>	Array <code>d1f</code> of size $n - 1$ contains the $(n - 1)$ multipliers that define the matrix $L$ from the $LU$ factorization of $A$ as computed by <code>?gttrf</code> .
<code>df</code>	Array <code>df</code> of size $n$ contains the $n$ diagonal elements of the upper triangular matrix $U$ from the $LU$ factorization of $A$ .
<code>duf</code>	Array <code>duf</code> of size $n - 1$ contains the $(n - 1)$ elements of the first superdiagonal of $U$ .
<code>du2</code>	Array <code>du2</code> of size $n - 2$ contains the $(n - 2)$ elements of the second superdiagonal of $U$ .
<code>b</code>	Array <code>b</code> (size $\max(1, ldb*nrhs)$ for column major layout and $\max(1, ldb*n)$ for row major layout) contains the right-hand side matrix $B$ .
<code>x</code>	Array <code>x</code> (size $\max(1, ldx*nrhs)$ for column major layout and $\max(1, ldx*n)$ ) contains the solution matrix $X$ , as computed by <code>?gttrs</code> .
<code>ldb</code>	The leading dimension of <code>b</code> ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.
<code>ldx</code>	The leading dimension of <code>x</code> ; $ldx \geq \max(1, n)$ for column major layout and $ldx \geq nrhs$ for row major layout.
<code>ipiv</code>	Array, size at least $\max(1, n)$ . The <code>ipiv</code> array, as returned by <code>?gttrf</code> .

## Output Parameters

<code>x</code>	The refined solution matrix $X$ .
<code>ferr, berr</code>	Arrays, size at least $\max(1, nrhs)$ . Contain the component-wise forward and backward errors, respectively, for each solution vector.

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

## Description

The routine performs an iterative refinement of the solution to a system of linear equations  $A \cdot X = B$  with a symmetric (Hermitian) positive definite matrix  $A$ , with multiple right-hand sides. For each computed solution vector  $x$ , the routine computes the *component-wise backward error*  $\beta$ . This error is the smallest relative perturbation in elements of  $A$  and  $b$  such that  $x$  is the exact solution of the perturbed system:

$$|\delta a_{ij}| \leq \beta |a_{ij}|, \quad |\delta b_i| \leq \beta |b_i| \quad \text{such that } (A + \delta A) x = (b + \delta b).$$

Finally, the routine estimates the *component-wise forward error* in the computed solution  $\| \|x - x_e\| \|_\infty / \|x\|_\infty$  (here  $x_e$  is the exact solution).

Before calling this routine:

- call the factorization routine [?potrf](#)
- call the solver routine [?potrs](#).

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Must be 'U' or 'L'. If <i>uplo</i> = 'U', the upper triangle of <i>A</i> is stored. If <i>uplo</i> = 'L', the lower triangle of <i>A</i> is stored.
<i>n</i>	The order of the matrix <i>A</i> ; $n \geq 0$ .
<i>nrhs</i>	The number of right-hand sides; $nrhs \geq 0$ .
<i>a</i>	Array <i>a</i> (size $\max(1, lda*n)$ ) contains the original matrix <i>A</i> , as supplied to <code>?potrf</code> .
<i>af</i>	Array <i>af</i> (size $\max(1, ldaf*n)$ ) contains the factored matrix <i>A</i> , as returned by <code>?potrf</code> .
<i>b</i>	Array <i>b</i> of size $\max(1, ldb*nrhs)$ for column major layout and $\max(1, ldb*n)$ for row major layout contains the right-hand side matrix <i>B</i> . The second dimension of <i>b</i> must be at least $\max(1, nrhs)$ .
<i>x</i>	Array <i>x</i> of size $\max(1, ldx*nrhs)$ for column major layout and $\max(1, ldx*n)$ for row major layout contains the solution matrix <i>X</i> .
<i>lda</i>	The leading dimension of <i>a</i> ; $lda \geq \max(1, n)$ .
<i>ldaf</i>	The leading dimension of <i>af</i> ; $ldaf \geq \max(1, n)$ .
<i>ldb</i>	The leading dimension of <i>b</i> ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.
<i>ldx</i>	The leading dimension of <i>x</i> ; $ldx \geq \max(1, n)$ for column major layout and $ldx \geq nrhs$ for row major layout.

## Output Parameters

<i>x</i>	The refined solution matrix <i>X</i> .
<i>ferr, berr</i>	Arrays, size at least $\max(1, nrhs)$ . Contain the component-wise forward and backward errors, respectively, for each solution vector.

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

## Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of  $4n^2$  floating-point operations (for real flavors) or  $16n^2$  operations (for complex flavors). In addition, each step of iterative refinement involves  $6n^2$  operations (for real flavors) or  $24n^2$  operations (for complex flavors); the number of iterations may range from 1 to 5. Estimating the forward error involves solving a number of systems of linear equations  $A*x = b$ ; the number is usually 4 or 5 and never more than 11. Each solution requires approximately  $2n^2$  floating-point operations for real flavors or  $8n^2$  for complex flavors.

## Description

The routine improves the computed solution to a system of linear equations and provides error bounds and backward error estimates for the solution. In addition to a normwise error bound, the code provides a maximum componentwise error bound, if possible. See comments for `err_bnds_norm` and `err_bnds_comp` for details of the error bounds.

The original system of linear equations may have been equilibrated before calling this routine, as described by the parameters `equed` and `s` below. In this case, the solution and error bounds returned are for the original unequilibrated system.

## Input Parameters

<i>matrix_layout</i>	Specifies whether two-dimensional array storage is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of <i>A</i> is stored: If <i>uplo</i> = 'U', the upper triangle of <i>A</i> is stored. If <i>uplo</i> = 'L', the lower triangle of <i>A</i> is stored.
<i>equed</i>	Must be 'N' or 'Y'. Specifies the form of equilibration that was done to <i>A</i> before calling this routine. If <i>equed</i> = 'N', no equilibration was done. If <i>equed</i> = 'Y', both row and column equilibration was done, that is, <i>A</i> has been replaced by $diag(s) * A * diag(s)$ . The right-hand side <i>B</i> has been changed accordingly.
<i>n</i>	The number of linear equations; the order of the matrix <i>A</i> ; $n \geq 0$ .
<i>nrhs</i>	The number of right-hand sides; the number of columns of the matrices <i>B</i> and <i>X</i> ; $nrhs \geq 0$ .
<i>a</i>	The array <i>a</i> (size $\max(1, lda * n)$ ) contains the symmetric/Hermitian matrix <i>A</i> as specified by <i>uplo</i> . If <i>uplo</i> = 'U', the leading <i>n</i> -by- <i>n</i> upper triangular part of <i>a</i> contains the upper triangular part of the matrix <i>A</i> and the strictly lower triangular part of <i>a</i> is not referenced. If <i>uplo</i> = 'L', the leading <i>n</i> -by- <i>n</i> lower triangular part of <i>a</i> contains the lower triangular part of the matrix <i>A</i> and the strictly upper triangular part of <i>a</i> is not referenced.
<i>af</i>	The array <i>af</i> (size $\max(1, ldaf * n)$ ) contains the triangular factor <i>L</i> or <i>U</i> from the Cholesky factorization $A = U^T * U$ or $A = L * L^T$ as computed by <a href="#">spotrf</a> for real flavors or <a href="#">dpotrf</a> for complex flavors.
<i>b</i>	The array <i>b</i> (size $\max(1, ldb * nrhs)$ for column major layout and $\max(1, ldb * n)$ for row major layout) contains the matrix <i>B</i> whose columns are the right-hand sides for the systems of equations.
<i>lda</i>	The leading dimension of <i>a</i> ; $lda \geq \max(1, n)$ .
<i>ldaf</i>	The leading dimension of <i>af</i> ; $ldaf \geq \max(1, n)$ .
<i>s</i>	Array of size <i>n</i> . The array <i>s</i> contains the scale factors for <i>A</i> . If <i>equed</i> = 'N', <i>s</i> is not accessed. If <i>equed</i> = 'Y', each element of <i>s</i> must be positive. Each element of <i>s</i> should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

<code>ldb</code>	The leading dimension of the array <code>b</code> ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.
<code>x</code>	Array, size $\max(1, ldx * nrhs)$ for column major layout and $\max(1, ldx * n)$ for row major layout.  The solution matrix <code>X</code> as computed by <code>?potrs</code>
<code>ldx</code>	The leading dimension of the output array <code>x</code> ; $ldx \geq \max(1, n)$ for column major layout and $ldx \geq nrhs$ for row major layout.
<code>n_err_bnds</code>	Number of error bounds to return for each right hand side and each type (normwise or componentwise). See <code>err_bnds_norm</code> and <code>err_bnds_comp</code> descriptions in <i>Output Arguments</i> section below.
<code>nparams</code>	Specifies the number of parameters set in <code>params</code> . If $\leq 0$ , the <code>params</code> array is never referenced and default values are used.
<code>params</code>	Array, size <code>nparams</code> . Specifies algorithm parameters. If an entry is less than 0.0, that entry will be filled with the default value used for that parameter. Only positions up to <code>nparams</code> are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass <code>nparams = 0</code> , which prevents the source code from accessing the <code>params</code> argument.  <code>params[0]</code> : Whether to perform iterative refinement or not. Default: 1.0 (for single precision flavors), 1.0D+0 (for double precision flavors).  =0.0                      No refinement is performed and no error bounds are computed.  =1.0                      Use the double-precision refinement algorithm, possibly with doubled-single computations if the compilation environment does not support double precision.  (Other values are reserved for future use.)  <code>params[1]</code> : Maximum number of residual computations allowed for refinement.  Default                      10.0  Aggressive                      Set to 100.0 to permit convergence using approximate factorizations or factorizations other than <code>LU</code> . If the factorization uses a technique other than Gaussian elimination, the guarantees in <code>err_bnds_norm</code> and <code>err_bnds_comp</code> may no longer be trustworthy.  <code>params[2]</code> : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

## Output Parameters

<code>x</code>	The improved solution matrix <code>X</code> .
----------------	---

*rcond* Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix  $A$  after equilibration (if done). If *rcond* is less than the machine precision, in particular, if *rcond* = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.

*berr* Array, size at least  $\max(1, nrhs)$ . Contains the componentwise relative backward error for each solution vector  $x_j$ , that is, the smallest relative change in any element of  $A$  or  $B$  that makes  $x_j$  an exact solution.

*err\_bnds\_norm* Array of size  $nrhs * n\_err\_bnds$ . For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:

Normwise relative error in the  $i$ -th solution vector

$$\frac{\max_j |X_{true_{ji}} - X_{ji}|}{\max_j |X_{ji}|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.

*err=1* "Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold  $\sqrt{n} * slamch(\epsilon)$  for single precision flavors and  $\sqrt{n} * dlamch(\epsilon)$  for double precision flavors.

*err=2* "Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold  $\sqrt{n} * slamch(\epsilon)$  for single precision flavors and  $\sqrt{n} * dlamch(\epsilon)$  for double precision flavors. This error bound should only be trusted if the previous boolean is true.

*err=3* Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold  $\sqrt{n} * slamch(\epsilon)$  for single precision flavors and  $\sqrt{n} * dlamch(\epsilon)$  for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix  $Z$  are

$$\|Z\|_{\infty} \cdot \|Z^{-1}\|_{\infty}$$

Let  $z = s * a$ , where  $s$  scales each row by a power of the radix so all absolute row sums of  $z$  are approximately 1.

The information for right-hand side  $i$ , where  $1 \leq i \leq nrhs$ , and type of error  $err$  is stored in:

- Column major layout:  $err\_bnds\_norm[(err - 1) * nrhs + i - 1]$ .
- Row major layout:  $err\_bnds\_norm[err - 1 + (i - 1) * n\_err\_bnds]$

`err_bnds_comp`

Array of size  $nrhs * n\_err\_bnds$ . For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:

Componentwise relative error in the  $i$ -th solution vector:

$$\max_j \frac{|X_{true_{ji}} - X_{ji}|}{|X_{ji}|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is not requested ( $params[2] = 0.0$ ), then `err_bnds_comp` is not accessed.

<code>err=1</code>	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold $\sqrt{n} * slamch(\epsilon)$ for single precision flavors and $\sqrt{n} * dlamch(\epsilon)$ for double precision flavors.
<code>err=2</code>	"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold $\sqrt{n} * slamch(\epsilon)$ for single precision flavors and $\sqrt{n} * dlamch(\epsilon)$ for double precision flavors. This error bound should only be trusted if the previous boolean is true.
<code>err=3</code>	Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold $\sqrt{n} * slamch(\epsilon)$ for single precision flavors and $\sqrt{n} * dlamch(\epsilon)$ for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix $Z$ are

$$\|Z\|_{\infty} \cdot \|Z^{-1}\|_{\infty}$$

Let  $z = s * (a * \text{diag}(x))$ , where  $x$  is the solution for the current right-hand side and  $s$  scales each row of  $a * \text{diag}(x)$  by a power of the radix so all absolute row sums of  $z$  are approximately 1.

The information for right-hand side  $i$ , where  $1 \leq i \leq nrhs$ , and type of error  $err$  is stored in:

- Column major layout: `err_bnds_comp[(err - 1)*nrhs + i - 1]`.
- Row major layout: `err_bnds_comp[err - 1 + (i - 1)*n_err_bnds]`

`params`

Output parameter only if the input contains erroneous values, namely in `params[0]`, `params[1]`, or `params[2]`. In such a case, the corresponding elements of `params` are filled with default values on output.

## Return Values

This function returns a value `info`.

If `info = 0`, the execution is successful. The solution to every right-hand side is guaranteed.

If `info = -i`, parameter `i` had an illegal value.

If  $0 < info \leq n$ :  $U_{info,info}$  is exactly zero. The factorization has been completed, but the factor  $U$  is exactly singular, so the solution and error bounds could not be computed; `rcond = 0` is returned.

If `info = n+j`: The solution corresponding to the  $j$ -th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides  $k$  with  $k > j$  may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested `params[2] = 0.0`, then the  $j$ -th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest  $j$  such that for column major layout `err_bnds_norm[j - 1] = 0.0` or `err_bnds_comp[j - 1] = 0.0`; or for row major layout `err_bnds_norm[(j - 1)*n_err_bnds] = 0.0` or `err_bnds_comp[(j - 1)*n_err_bnds] = 0.0`). See the definition of `err_bnds_norm` and `err_bnds_comp` for `err = 1`. To get information about all of the right-hand sides, check `err_bnds_norm` or `err_bnds_comp`.

## Description

The routine performs an iterative refinement of the solution to a system of linear equations  $A * X = B$  with a symmetric (Hermitian) positive definite matrix  $A$ , with multiple right-hand sides. For each computed solution vector  $x$ , the routine computes the *component-wise backward error*  $\beta$ . This error is the smallest relative perturbation in elements of  $A$  and  $b$  such that  $x$  is the exact solution of the perturbed system:

$$|\delta a_{ij}| \leq \beta |a_{ij}|, \quad |\delta b_i| \leq \beta |b_i| \text{ such that } (A + \delta A) x = (b + \delta b).$$

Finally, the routine estimates the *component-wise forward error* in the computed solution

$$\|x - x_e\|_{\infty} / \|x\|_{\infty}$$

where  $x_e$  is the exact solution.

Before calling this routine:

- call the factorization routine `?pptrf`
- call the solver routine `?pptrs`.

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<code>uplo</code>	Must be 'U' or 'L'. Indicates how the input matrix $A$ has been factored: If <code>uplo = 'U'</code> , the upper triangle of $A$ is stored. If <code>uplo = 'L'</code> , the lower triangle of $A$ is stored.
<code>n</code>	The order of the matrix $A$ ; $n \geq 0$ .
<code>nrhs</code>	The number of right-hand sides; $nrhs \geq 0$ .
<code>ap</code>	<code>ap</code> contains the original matrix $A$ in a packed format, as supplied to <code>?pptrf</code> . The dimension of <code>ap</code> must be at least $\max(1, n(n+1)/2)$ .
<code>afp</code>	<code>afp</code> contains the factored matrix $A$ in a packed format, as returned by <code>?pptrf</code> . The dimension of <code>afp</code> must be at least $\max(1, n(n+1)/2)$ .
<code>b</code>	Array $b$ of size $\max(1, ldb * nrhs)$ for column major layout and $\max(1, ldb * n)$ for row major layout contains the right-hand side matrix $B$ .
<code>x</code>	Array $x$ of size $\max(1, ldx * nrhs)$ for column major layout and $\max(1, ldx * n)$ for row major layout contains the solution matrix $X$ .
<code>ldb</code>	The leading dimension of $b$ ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.
<code>ldx</code>	The leading dimension of $x$ ; $ldx \geq \max(1, n)$ for column major layout and $ldx \geq nrhs$ for row major layout.

## Output Parameters

$x$	The refined solution matrix $X$ .
$ferr, berr$	Arrays, size at least $\max(1, nrhs)$ . Contain the component-wise forward and backward errors, respectively, for each solution vector.

## Return Values

This function returns a value  $info$ .

If  $info=0$ , the execution is successful.

If  $info = -i$ , parameter  $i$  had an illegal value.

## Application Notes

The bounds returned in  $ferr$  are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of  $4n^2$  floating-point operations (for real flavors) or  $16n^2$  operations (for complex flavors). In addition, each step of iterative refinement involves  $6n^2$  operations (for real flavors) or  $24n^2$  operations (for complex flavors); the number of iterations may range from 1 to 5.

Estimating the forward error involves solving a number of systems of linear equations  $A*x = b$ ; the number of systems is usually 4 or 5 and never more than 11. Each solution requires approximately  $2n^2$  floating-point operations for real flavors or  $8n^2$  for complex flavors.

## Description

The routine performs an iterative refinement of the solution to a system of linear equations  $A * X = B$  with a symmetric (Hermitian) positive definite band matrix  $A$ , with multiple right-hand sides. For each computed solution vector  $x$ , the routine computes the *component-wise backward error*  $\beta$ . This error is the smallest relative perturbation in elements of  $A$  and  $b$  such that  $x$  is the exact solution of the perturbed system:

$$|\delta a_{ij}| \leq \beta |a_{ij}|, \quad |\delta b_i| \leq \beta |b_i| \text{ such that } (A + \delta A) x = (b + \delta b).$$

Finally, the routine estimates the *component-wise forward error* in the computed solution  $\|x - x_e\|_\infty / \|x\|_\infty$  (here  $x_e$  is the exact solution).

Before calling this routine:

- call the factorization routine `?pbtrf`
- call the solver routine `?pbtrs`.

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<code>uplo</code>	Must be 'U' or 'L'.  Indicates how the input matrix $A$ has been factored: If <code>uplo = 'U'</code> , the upper triangle of $A$ is stored. If <code>uplo = 'L'</code> , the lower triangle of $A$ is stored.
<code>n</code>	The order of the matrix $A$ ; $n \geq 0$ .
<code>kd</code>	The number of superdiagonals or subdiagonals in the matrix $A$ ; $kd \geq 0$ .
<code>nrhs</code>	The number of right-hand sides; $nrhs \geq 0$ .
<code>ab</code>	Array <code>ab</code> (size $\max(ldab * n)$ ) contains the original band matrix $A$ , as supplied to <code>?pbtrf</code> .
<code>afb</code>	Array <code>afb</code> (size $\max(ldafb * n)$ ) contains the factored band matrix $A$ , as returned by <code>?pbtrf</code> .
<code>b</code>	Array <code>b</code> of size $\max(1, ldb * nrhs)$ for column major layout and $\max(1, ldb * n)$ for row major layout contains the right-hand side matrix $B$ .
<code>x</code>	Array <code>x</code> of size $\max(1, ldx * nrhs)$ for column major layout and $\max(1, ldx * n)$ for row major layout contains the solution matrix $X$ .
<code>ldab</code>	The leading dimension of <code>ab</code> ; $ldab \geq kd + 1$ .
<code>ldafb</code>	The leading dimension of <code>afb</code> ; $ldafb \geq kd + 1$ .
<code>ldb</code>	The leading dimension of <code>b</code> ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.

*ldx* The leading dimension of *x*;  $ldx \geq \max(1, n)$  for column major layout and  $ldx \geq nrhs$  for row major layout.

## Output Parameters

*x* The refined solution matrix *X*.

*ferr, berr* Arrays, size at least  $\max(1, nrhs)$ . Contain the component-wise forward and backward errors, respectively, for each solution vector.

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

## Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of  $8n*kd$  floating-point operations (for real flavors) or  $32n*kd$  operations (for complex flavors). In addition, each step of iterative refinement involves  $12n*kd$  operations (for real flavors) or  $48n*kd$  operations (for complex flavors); the number of iterations may range from 1 to 5.

Estimating the forward error involves solving a number of systems of linear equations  $A*x = b$ ; the number is usually 4 or 5 and never more than 11. Each solution requires approximately  $4n*kd$  floating-point operations for real flavors or  $16n*kd$  for complex flavors.

## Description

The routine performs an iterative refinement of the solution to a system of linear equations  $A * X = B$  with a symmetric (Hermitian) positive definite tridiagonal matrix  $A$ , with multiple right-hand sides. For each computed solution vector  $x$ , the routine computes the *component-wise backward error*  $\beta$ . This error is the smallest relative perturbation in elements of  $A$  and  $b$  such that  $x$  is the exact solution of the perturbed system:

$$|\delta a_{ij}| \leq \beta |a_{ij}|, \quad |\delta b_i| \leq \beta |b_i| \text{ such that } (A + \delta A) x = (b + \delta b).$$

Finally, the routine estimates the *component-wise forward error* in the computed solution  $\|x - x_e\|_\infty / \|x\|_\infty$  (here  $x_e$  is the exact solution).

Before calling this routine:

- call the factorization routine `?pttrf`
- call the solver routine `?pttrs`.

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<code>uplo</code>	Used for complex flavors only. Must be 'U' or 'L'.  Specifies whether the superdiagonal or the subdiagonal of the tridiagonal matrix $A$ is stored and how $A$ is factored:  If <code>uplo = 'U'</code> , the array <code>e</code> stores the superdiagonal of $A$ , and $A$ is factored as $U^H * D * U$ .  If <code>uplo = 'L'</code> , the array <code>e</code> stores the subdiagonal of $A$ , and $A$ is factored as $L * D * L^H$ .
<code>n</code>	The order of the matrix $A$ ; $n \geq 0$ .
<code>nrhs</code>	The number of right-hand sides; $nrhs \geq 0$ .
<code>d</code>	The array <code>d</code> (size $n$ ) contains the $n$ diagonal elements of the tridiagonal matrix $A$ .
<code>df</code>	The array <code>df</code> (size $n$ ) contains the $n$ diagonal elements of the diagonal matrix $D$ from the factorization of $A$ as computed by <code>?pttrf</code> .
<code>e, ef, b, x</code>	The array <code>e</code> (size $n - 1$ ) contains the $(n - 1)$ off-diagonal elements of the tridiagonal matrix $A$ (see <code>uplo</code> ).  The array <code>ef</code> (size $n - 1$ ) contains the $(n - 1)$ off-diagonal elements of the unit bidiagonal factor $U$ or $L$ from the factorization computed by <code>?pttrf</code> (see <code>uplo</code> ).  The array <code>b</code> of size $\max(1, ldb * nrhs)$ for column major layout and $\max(1, ldb * n)$ for row major layout contains the matrix $B$ whose columns are the right-hand sides for the systems of equations.

The array  $x$  of size  $\max(1, ldx*nrhs)$  for column major layout and  $\max(1, ldx*n)$  for row major layout contains the solution matrix  $X$  as computed by `?pttrs`.

`ldb`

The leading dimension of  $b$ ;  $ldb \geq \max(1, n)$  for column major layout and  $ldb \geq nrhs$  for row major layout.

`ldx`

The leading dimension of  $x$ ;  $ldx \geq \max(1, n)$  for column major layout and  $ldx \geq nrhs$  for row major layout.

## Output Parameters

`x`

The refined solution matrix  $X$ .

`ferr, berr`

Arrays, size at least  $\max(1, nrhs)$ . Contain the component-wise forward and backward errors, respectively, for each solution vector.

## Return Values

This function returns a value `info`.

If `info = 0`, the execution is successful.

If `info = -i`, parameter  $i$  had an illegal value.

## Description

The routine performs an iterative refinement of the solution to a system of linear equations  $A \cdot X = B$  with a symmetric full-storage matrix  $A$ , with multiple right-hand sides. For each computed solution vector  $x$ , the routine computes the *component-wise backward error*  $\beta$ . This error is the smallest relative perturbation in elements of  $A$  and  $b$  such that  $x$  is the exact solution of the perturbed system:

$$|\delta a_{ij}| \leq \beta |a_{ij}|, \quad |\delta b_i| \leq \beta |b_i| \quad \text{such that} \quad (A + \delta A) x = (b + \delta b).$$

Finally, the routine estimates the *component-wise forward error* in the computed solution  $\|x - x_e\|_\infty / \|x\|_\infty$  (here  $x_e$  is the exact solution).

Before calling this routine:

- call the factorization routine `?sytrf`
- call the solver routine `?sytrs`.

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<code>uplo</code>	Must be 'U' or 'L'. If <code>uplo = 'U'</code> , the upper triangle of $A$ is stored. If <code>uplo = 'L'</code> , the lower triangle of $A$ is stored.
<code>n</code>	The order of the matrix $A$ ; $n \geq 0$ .
<code>nrhs</code>	The number of right-hand sides; $nrhs \geq 0$ .
<code>a</code>	Array <code>a</code> (size $\max(1, lda * n)$ ) contains the original matrix $A$ , as supplied to <code>?sytrf</code> .
<code>af</code>	Array <code>af</code> (size $\max(1, ldaf * n)$ ) contains the factored matrix $A$ , as returned by <code>?sytrf</code> .
<code>b</code>	Array <code>b</code> of size $\max(1, ldb * nrhs)$ for column major layout and $\max(1, ldb * n)$ for row major layout contains the right-hand side matrix $B$ .
<code>x</code>	Array <code>x</code> of size $\max(1, ldx * nrhs)$ for column major layout and $\max(1, ldx * n)$ for row major layout contains the solution matrix $X$ .
<code>lda</code>	The leading dimension of <code>a</code> ; $lda \geq \max(1, n)$ .
<code>ldaf</code>	The leading dimension of <code>af</code> ; $ldaf \geq \max(1, n)$ .
<code>ldb</code>	The leading dimension of <code>b</code> ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.
<code>ldx</code>	The leading dimension of <code>x</code> ; $ldx \geq \max(1, n)$ for column major layout and $ldx \geq nrhs$ for row major layout.
<code>ipiv</code>	Array, size at least $\max(1, n)$ . The <code>ipiv</code> array, as returned by <code>?sytrf</code> .

## Output Parameters

$x$	The refined solution matrix $X$ .
$ferr, berr$	Arrays, size at least $\max(1, nrhs)$ . Contain the component-wise forward and backward errors, respectively, for each solution vector.

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

## Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of  $4n^2$  floating-point operations (for real flavors) or  $16n^2$  operations (for complex flavors). In addition, each step of iterative refinement involves  $6n^2$  operations (for real flavors) or  $24n^2$  operations (for complex flavors); the number of iterations may range from 1 to 5. Estimating the forward error involves solving a number of systems of linear equations  $A*x = b$ ; the number is usually 4 or 5 and never more than 11. Each solution requires approximately  $2n^2$  floating-point operations for real flavors or  $8n^2$  for complex flavors.

## Description

The routine improves the computed solution to a system of linear equations when the coefficient matrix is symmetric indefinite, and provides error bounds and backward error estimates for the solution. In addition to a normwise error bound, the code provides a maximum componentwise error bound, if possible. See comments for *err\_bnds\_norm* and *err\_bnds\_comp* for details of the error bounds.

The original system of linear equations may have been equilibrated before calling this routine, as described by the parameters *equed* and *s* below. In this case, the solution and error bounds returned are for the original unequilibrated system.

## Input Parameters

<i>matrix_layout</i>	Specifies whether two-dimensional array storage is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Must be 'U' or 'L'.  Indicates whether the upper or lower triangular part of <i>A</i> is stored: If <i>uplo</i> = 'U', the upper triangle of <i>A</i> is stored. If <i>uplo</i> = 'L', the lower triangle of <i>A</i> is stored.
<i>equed</i>	Must be 'N' or 'Y'.  Specifies the form of equilibration that was done to <i>A</i> before calling this routine.  If <i>equed</i> = 'N', no equilibration was done.  If <i>equed</i> = 'Y', both row and column equilibration was done, that is, <i>A</i> has been replaced by $diag(s) * A * diag(s)$ . The right-hand side <i>B</i> has been changed accordingly.
<i>n</i>	The number of linear equations; the order of the matrix <i>A</i> ; $n \geq 0$ .
<i>nrhs</i>	The number of right-hand sides; the number of columns of the matrices <i>B</i> and <i>X</i> ; $nrhs \geq 0$ .
<i>a, af, b</i>	The array <i>a</i> (size $\max(1, lda * n)$ ) contains the symmetric/Hermitian matrix <i>A</i> as specified by <i>uplo</i> . If <i>uplo</i> = 'U', the leading <i>n</i> -by- <i>n</i> upper triangular part of <i>a</i> contains the upper triangular part of the matrix <i>A</i> and the strictly lower triangular part of <i>a</i> is not referenced. If <i>uplo</i> = 'L', the leading <i>n</i> -by- <i>n</i> lower triangular part of <i>a</i> contains the lower triangular part of the matrix <i>A</i> and the strictly upper triangular part of <i>a</i> is not referenced.  The array <i>af</i> (size $\max(1, ldaf * n)$ ) contains the triangular factor <i>L</i> or <i>U</i> from the Cholesky factorization $A = U^T * U$ or $A = L * L^T$ as computed by <a href="#">ssytrf</a> for real flavors or <a href="#">dsytrf</a> for complex flavors.

The array  $b$  (size  $\max(1, ldb*nrhs)$  for column major layout and  $\max(1, ldb*n)$  for row major layout) contains the matrix  $B$  whose columns are the right-hand sides for the systems of equations.

<code>lda</code>	The leading dimension of $a$ ; $lda \geq \max(1, n)$ .				
<code>ldaf</code>	The leading dimension of $af$ ; $ldaf \geq \max(1, n)$ .				
<code>ipiv</code>	Array, size at least $\max(1, n)$ . Contains details of the interchanges and the block structure of $D$ as determined by <code>ssytrf</code> for real flavors or <code>dsytrf</code> for complex flavors.				
<code>s</code>	<p>Array, size <math>(n)</math>. The array <math>s</math> contains the scale factors for <math>A</math>.</p> <p>If <code>equed = 'N'</code>, <math>s</math> is not accessed.</p> <p>If <code>equed = 'Y'</code>, each element of <math>s</math> must be positive.</p> <p>Each element of <math>s</math> should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.</p>				
<code>ldb</code>	The leading dimension of the array $b$ ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.				
<code>x</code>	<p>Array, of size <math>\max(1, ldx*nrhs)</math> for column major layout and <math>\max(1, ldx*n)</math> for row major layout.</p> <p>The solution matrix <math>X</math> as computed by <code>?sytrs</code></p>				
<code>ldx</code>	The leading dimension of the output array $x$ ; $ldx \geq \max(1, n)$ for column major layout and $ldx \geq nrhs$ for row major layout.				
<code>n_err_bnds</code>	Number of error bounds to return for each right hand side and each type (normwise or componentwise). See <code>err_bnds_norm</code> and <code>err_bnds_comp</code> descriptions in <i>Output Arguments</i> section below.				
<code>nparams</code>	Specifies the number of parameters set in <code>params</code> . If $\leq 0$ , the <code>params</code> array is never referenced and default values are used.				
<code>params</code>	<p>Array, size <code>nparams</code>. Specifies algorithm parameters. If an entry is less than 0.0, that entry will be filled with the default value used for that parameter. Only positions up to <code>nparams</code> are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass <code>nparams = 0</code>, which prevents the source code from accessing the <code>params</code> argument.</p> <p><code>params[0]</code> : Whether to perform iterative refinement or not. Default: 1.0 (for single precision flavors), 1.0D+0 (for double precision flavors).</p> <table> <tr> <td>=0.0</td> <td>No refinement is performed and no error bounds are computed.</td> </tr> <tr> <td>=1.0</td> <td>Use the double-precision refinement algorithm, possibly with doubled-single computations if the compilation environment does not support double precision.</td> </tr> </table>	=0.0	No refinement is performed and no error bounds are computed.	=1.0	Use the double-precision refinement algorithm, possibly with doubled-single computations if the compilation environment does not support double precision.
=0.0	No refinement is performed and no error bounds are computed.				
=1.0	Use the double-precision refinement algorithm, possibly with doubled-single computations if the compilation environment does not support double precision.				

(Other values are reserved for future use.)

*params*[1] : Maximum number of residual computations allowed for refinement.

Default 10.0

Aggressive Set to 100.0 to permit convergence using approximate factorizations or factorizations other than *LU*. If the factorization uses a technique other than Gaussian elimination, the guarantees in *err\_bnds\_norm* and *err\_bnds\_comp* may no longer be trustworthy.

*params*[2] : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

## Output Parameters

<i>x</i>	The improved solution matrix <i>X</i> .
<i>rcond</i>	Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix <i>A</i> after equilibration (if done). If <i>rcond</i> is less than the machine precision, in particular, if <i>rcond</i> = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.
<i>berr</i>	Array, size at least $\max(1, nrhs)$ . Contains the componentwise relative backward error for each solution vector $x_j$ , that is, the smallest relative change in any element of <i>A</i> or <i>B</i> that makes $x_j$ an exact solution.
<i>err_bnds_norm</i>	Array of size $nrhs * n\_err\_bnds$ . For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows: Normwise relative error in the <i>i</i> -th solution vector

$$\frac{\max_j |X_{true_{ji}} - X_{ji}|}{\max_j |X_{ji}|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.

<i>err</i> =1	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors.
<i>err</i> =2	"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is

greater than the threshold  $\sqrt{n} * \text{slamch}(\epsilon)$  for single precision flavors and  $\sqrt{n} * \text{dlamch}(\epsilon)$  for double precision flavors. This error bound should only be trusted if the previous boolean is true.

`err=3`

Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold  $\sqrt{n} * \text{slamch}(\epsilon)$  for single precision flavors and  $\sqrt{n} * \text{dlamch}(\epsilon)$  for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix  $Z$  are:

$$\|Z\|_{\infty} \cdot \|Z^{-1}\|_{\infty}$$

The information for right-hand side  $i$ , where  $1 \leq i \leq nrhs$ , and type of error `err` is stored in:

- Column major layout: `err_bnds_norm[(err - 1)*nrhs + i - 1]`.
- Row major layout: `err_bnds_norm[err - 1 + (i - 1)*n_err_bnds]`

`err_bnds_comp`

Array of size  $nrhs * n\_err\_bnds$ . For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:

Componentwise relative error in the  $i$ -th solution vector:

$$\max_j \frac{|X_{true_{ji}} - X_{ji}|}{|X_{ji}|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is not requested (`params[2] = 0.0`), then `err_bnds_comp` is not accessed.

`err=1`

"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold  $\sqrt{n} * \text{slamch}(\epsilon)$  for single precision flavors and  $\sqrt{n} * \text{dlamch}(\epsilon)$  for double precision flavors.

`err=2`

"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold  $\sqrt{n} * \text{slamch}(\epsilon)$  for single precision flavors and  $\sqrt{n} * \text{dlamch}(\epsilon)$  for double precision flavors. This error bound should only be trusted if the previous boolean is true.

`err=3`

Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold  $\sqrt{n} * \text{slamch}(\epsilon)$  for single precision flavors and  $\sqrt{n} * \text{dlamch}(\epsilon)$  for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix  $Z$  are:

$$\|Z\|_{\infty} \cdot \|Z^{-1}\|_{\infty}$$

Let  $z = s * (a * \text{diag}(x))$ , where  $x$  is the solution for the current right-hand side and  $s$  scales each row of  $a * \text{diag}(x)$  by a power of the radix so all absolute row sums of  $z$  are approximately 1.

The information for right-hand side  $i$ , where  $1 \leq i \leq \text{nrhs}$ , and type of error `err` is stored in:

- Column major layout: `err_bnds_comp[(err - 1)*nrhs + i - 1]`.
- Row major layout: `err_bnds_comp[err - 1 + (i - 1)*n_err_bnds]`

`params`

Output parameter only if the input contains erroneous values, namely, in `params[0]`, `params[1]`, `params[2]`. In such a case, the corresponding elements of `params` are filled with default values on output.

## Return Values

This function returns a value `info`.

If `info = 0`, the execution is successful. The solution to every right-hand side is guaranteed.

If `info = -i`, parameter  $i$  had an illegal value.

If  $0 < \text{info} \leq n$ :  $U_{\text{info}, \text{info}}$  is exactly zero. The factorization has been completed, but the factor  $U$  is exactly singular, so the solution and error bounds could not be computed; `rcond = 0` is returned.

If `info = n+j`: The solution corresponding to the  $j$ -th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides  $k$  with  $k > j$  may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested `params[2] = 0.0`, then the  $j$ -th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest  $j$  such that for column major layout `err_bnds_norm[j - 1] = 0.0` or `err_bnds_comp[j - 1] = 0.0`; or for row major layout `err_bnds_norm[(j - 1)*n_err_bnds] = 0.0` or `err_bnds_comp[(j - 1)*n_err_bnds] = 0.0`). See the definition of `err_bnds_norm` and `err_bnds_comp` for `err = 1`. To get information about all of the right-hand sides, check `err_bnds_norm` or `err_bnds_comp`.

## Include Files

- mkl.h

## Description

The routine performs an iterative refinement of the solution to a system of linear equations  $A \cdot X = B$  with a complex Hermitian full-storage matrix  $A$ , with multiple right-hand sides. For each computed solution vector  $x$ , the routine computes the *component-wise backward error*  $\beta$ . This error is the smallest relative perturbation in elements of  $A$  and  $b$  such that  $x$  is the exact solution of the perturbed system:

$$|\delta a_{ij}| \leq \beta |a_{ij}|, \quad |\delta b_i| \leq \beta |b_i| \text{ such that } (A + \delta A) x = (b + \delta b).$$

Finally, the routine estimates the *component-wise forward error* in the computed solution  $\|x - x_e\|_\infty / \|x\|_\infty$  (here  $x_e$  is the exact solution).

Before calling this routine:

- call the factorization routine [?hetrf](#)
- call the solver routine [?hetrs](#).

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Must be 'U' or 'L'. If <i>uplo</i> = 'U', the upper triangle of $A$ is stored. If <i>uplo</i> = 'L', the lower triangle of $A$ is stored.
<i>n</i>	The order of the matrix $A$ ; $n \geq 0$ .
<i>nrhs</i>	The number of right-hand sides; $nrhs \geq 0$ .
<i>a, af, b, x</i>	Arrays: <i>a</i> (size $\max(1, lda * n)$ ) contains the original matrix $A$ , as supplied to <a href="#">?hetrf</a> . <i>af</i> (size $\max(1, ldaf * n)$ ) contains the factored matrix $A$ , as returned by <a href="#">?hetrf</a> . <i>b</i> of size $\max(1, ldb * nrhs)$ for column major layout and $\max(1, ldb * n)$ for row major layout contains the right-hand side matrix $B$ .

$x$  of size  $\max(1, ldx*nrhs)$  for column major layout and  $\max(1, ldx*n)$  for row major layout contains the solution matrix  $X$ .

<code>lda</code>	The leading dimension of $a$ ; $lda \geq \max(1, n)$ .
<code>ldaf</code>	The leading dimension of $af$ ; $ldaf \geq \max(1, n)$ .
<code>ldb</code>	The leading dimension of $b$ ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.
<code>ldx</code>	The leading dimension of $x$ ; $ldx \geq \max(1, n)$ for column major layout and $ldx \geq nrhs$ for row major layout.
<code>ipiv</code>	Array, size at least $\max(1, n)$ . The <code>ipiv</code> array, as returned by <a href="#">?hetrf</a> .

## Output Parameters

<code>x</code>	The refined solution matrix $X$ .
<code>ferr, berr</code>	Arrays, size at least $\max(1, nrhs)$ . Contain the component-wise forward and backward errors, respectively, for each solution vector.

## Return Values

This function returns a value `info`.

If `info = 0`, the execution is successful.

If `info = -i`, parameter  $i$  had an illegal value.

## Application Notes

The bounds returned in `ferr` are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of  $16n^2$  operations. In addition, each step of iterative refinement involves  $24n^2$  operations; the number of iterations may range from 1 to 5.

Estimating the forward error involves solving a number of systems of linear equations  $A*x = b$ ; the number is usually 4 or 5 and never more than 11. Each solution requires approximately  $8n^2$  floating-point operations.

The real counterpart of this routine is [?ssyrfs/?dsyrfs](#)

## Description

The routine improves the computed solution to a system of linear equations when the coefficient matrix is Hermitian indefinite, and provides error bounds and backward error estimates for the solution. In addition to a normwise error bound, the code provides a maximum componentwise error bound, if possible. See comments for *err\_bnds\_norm* and *err\_bnds\_comp* for details of the error bounds.

The original system of linear equations may have been equilibrated before calling this routine, as described by the parameters *equed* and *s* below. In this case, the solution and error bounds returned are for the original unequilibrated system.

## Input Parameters

<i>matrix_layout</i>	Specifies whether two-dimensional array storage is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of <i>A</i> is stored: If <i>uplo</i> = 'U', the upper triangle of <i>A</i> is stored. If <i>uplo</i> = 'L', the lower triangle of <i>A</i> is stored.
<i>equed</i>	Must be 'N' or 'Y'. Specifies the form of equilibration that was done to <i>A</i> before calling this routine. If <i>equed</i> = 'N', no equilibration was done. If <i>equed</i> = 'Y', both row and column equilibration was done, that is, <i>A</i> has been replaced by <i>diag(s) * A * diag(s)</i> . The right-hand side <i>B</i> has been changed accordingly.
<i>n</i>	The number of linear equations; the order of the matrix <i>A</i> ; $n \geq 0$ .
<i>nrhs</i>	The number of right-hand sides; the number of columns of the matrices <i>B</i> and <i>X</i> ; $nrhs \geq 0$ .
<i>a, af, b</i>	The array <i>a</i> of size $\max(1, lda * n)$ contains the Hermitian matrix <i>A</i> as specified by <i>uplo</i> . If <i>uplo</i> = 'U', the leading <i>n</i> -by- <i>n</i> upper triangular part of <i>a</i> contains the upper triangular part of the matrix <i>A</i> and the strictly lower

triangular part of  $a$  is not referenced. If  $uplo = 'L'$ , the leading  $n$ -by- $n$  lower triangular part of  $a$  contains the lower triangular part of the matrix  $A$  and the strictly upper triangular part of  $a$  is not referenced.

The array  $af$  of size  $\max(1, lda_f * n)$  contains the block diagonal matrix  $D$  and the multipliers used to obtain the factor  $U$  or  $L$  from the factorization  $A = U * D * U^T$  or  $A = L * D * L^T$  as computed by `ssytrf` for `cherfsx` or `dsytrf` for `zherfsx`.

The array  $b$  of size  $\max(1, ldb * nrhs)$  for row major layout and  $\max(1, ldb * n)$  for column major layout contains the matrix  $B$  whose columns are the right-hand sides for the systems of equations.

<code>lda</code>	The leading dimension of $a$ ; $lda \geq \max(1, n)$ .
<code>lda_f</code>	The leading dimension of $af$ ; $lda_f \geq \max(1, n)$ .
<code>ipiv</code>	Array, size at least $\max(1, n)$ . Contains details of the interchanges and the block structure of $D$ as determined by <code>ssytrf</code> for real flavors or <code>dsytrf</code> for complex flavors.
<code>s</code>	Array, size $(n)$ . The array $s$ contains the scale factors for $A$ . If $equed = 'N'$ , $s$ is not accessed. If $equed = 'Y'$ , each element of $s$ must be positive. Each element of $s$ should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.
<code>ldb</code>	The leading dimension of the array $b$ ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.
<code>x</code>	Array, size $\max(1, ldx * nrhs)$ for column major layout and $\max(1, ldx * n)$ for row major layout. The solution matrix $X$ as computed by <code>?hetrs</code>
<code>ldx</code>	The leading dimension of the output array $x$ ; $ldx \geq \max(1, n)$ for column major layout and $ldx \geq nrhs$ for row major layout.
<code>n_err_bnds</code>	Number of error bounds to return for each right hand side and each type (normwise or componentwise). See <code>err_bnds_norm</code> and <code>err_bnds_comp</code> descriptions in <i>Output Arguments</i> section below.
<code>nparams</code>	Specifies the number of parameters set in <code>params</code> . If $\leq 0$ , the <code>params</code> array is never referenced and default values are used.
<code>params</code>	Array, size <code>nparams</code> . Specifies algorithm parameters. If an entry is less than 0.0, that entry will be filled with the default value used for that parameter. Only positions up to <code>nparams</code> are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass <code>nparams = 0</code> , which prevents the source code from accessing the <code>params</code> argument. <code>params[0]</code> : Whether to perform iterative refinement or not. Default: 1.0 (for <code>cherfsx</code> ), 1.0D+0 (for <code>zherfsx</code> ).

=0.0	No refinement is performed and no error bounds are computed.
=1.0	Use the double-precision refinement algorithm, possibly with doubled-single computations if the compilation environment does not support double precision.

(Other values are reserved for future use.)

`params[1]` : Maximum number of residual computations allowed for refinement.

Default	10
Aggressive	Set to 100 to permit convergence using approximate factorizations or factorizations other than <i>LU</i> . If the factorization uses a technique other than Gaussian elimination, the guarantees in <code>err_bnds_norm</code> and <code>err_bnds_comp</code> may no longer be trustworthy.

`params[2]` : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

## Output Parameters

<code>x</code>	The improved solution matrix <i>X</i> .
<code>rcond</code>	Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix <i>A</i> after equilibration (if done). If <code>rcond</code> is less than the machine precision, in particular, if <code>rcond</code> = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.
<code>berr</code>	Array, size at least <code>max(1, nrhs)</code> . Contains the componentwise relative backward error for each solution vector $x_j$ , that is, the smallest relative change in any element of <i>A</i> or <i>B</i> that makes $x_j$ an exact solution.
<code>err_bnds_norm</code>	Array of size <code>nrhs*n_err_bnds</code> . For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows: Normwise relative error in the <i>i</i> -th solution vector

$$\frac{\max_j |X_{true_{ji}} - X_{ji}|}{\max_j |X_{ji}|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.

<code>err=1</code>	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for <code>cherfsx</code> and $\sqrt{n} * \text{dlamch}(\epsilon)$ for <code>zherfsx</code> .
<code>err=2</code>	"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for <code>cherfsx</code> and $\sqrt{n} * \text{dlamch}(\epsilon)$ for <code>zherfsx</code> . This error bound should only be trusted if the previous boolean is true.
<code>err=3</code>	Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix $Z$ are:

$$\|Z\|_{\infty} \cdot \|Z^{-1}\|_{\infty}$$

Let  $z=s*a$ , where  $s$  scales each row by a power of the radix so all absolute row sums of  $z$  are approximately 1.

The information for right-hand side  $i$ , where  $1 \leq i \leq nrhs$ , and type of error `err` is stored in:

- Column major layout: `err_bnds_norm[(err - 1)*nrhs + i - 1]`.
- Row major layout: `err_bnds_norm[err - 1 + (i - 1)*n_err_bnds]`

`err_bnds_comp`

Array of size `nrhs*n_err_bnds`. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:

Componentwise relative error in the  $i$ -th solution vector:

$$\max_j \frac{|X_{true_{ji}} - X_{ji}|}{|X_{ji}|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is not requested (`params[2] = 0.0`), then `err_bnds_comp` is not accessed.

<code>err=1</code>	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for <code>cherfsx</code> and $\sqrt{n} * \text{dlamch}(\epsilon)$ for <code>zherfsx</code> .
--------------------	---

<code>err=2</code>	"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for <code>cherfsx</code> and $\sqrt{n} * \text{dlamch}(\epsilon)$ for <code>zherfsx</code> . This error bound should only be trusted if the previous boolean is true.
<code>err=3</code>	Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix $Z$ are:

$$\|Z\|_{\infty} \cdot \|Z^{-1}\|_{\infty}$$

Let  $z = s * (a * \text{diag}(x))$ , where  $x$  is the solution for the current right-hand side and  $s$  scales each row of  $a * \text{diag}(x)$  by a power of the radix so all absolute row sums of  $z$  are approximately 1.

The information for right-hand side  $i$ , where  $1 \leq i \leq \text{nrhs}$ , and type of error  $err$  is stored in:

- Column major layout: `err_bnds_comp[(err - 1)*nrhs + i - 1]`.
- Row major layout: `err_bnds_comp[err - 1 + (i - 1)*n_err_bnds]`

`params`

Output parameter only if the input contains erroneous values, namely, in `params[0]`, `params[1]`, `params[2]`. In such a case, the corresponding elements of `params` are filled with default values on output.

## Return Values

This function returns a value `info`.

If `info = 0`, the execution is successful. The solution to every right-hand side is guaranteed.

If `info = -i`, parameter  $i$  had an illegal value.

If  $0 < \text{info} \leq n$ :  $U_{\text{info}, \text{info}}$  is exactly zero. The factorization has been completed, but the factor  $D$  is exactly singular, so the solution and error bounds could not be computed; `rcond = 0` is returned.

If `info = n+j`: The solution corresponding to the  $j$ -th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides  $k$  with  $k > j$  may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested `params[2] = 0.0`, then the  $j$ -th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest  $j$  such that for column major layout `err_bnds_norm[j - 1] = 0.0` or `err_bnds_comp[j - 1] = 0.0`; or for row major layout `err_bnds_norm[(j - 1)*n_err_bnds] = 0.0` or `err_bnds_comp[(j - 1)*n_err_bnds] = 0.0`). See the definition of `err_bnds_norm` and `err_bnds_comp` for `err = 1`. To get information about all of the right-hand sides, check `err_bnds_norm` or `err_bnds_comp`.

### Description

The routine performs an iterative refinement of the solution to a system of linear equations  $A \cdot X = B$  with a packed symmetric matrix  $A$ , with multiple right-hand sides. For each computed solution vector  $x$ , the routine computes the *component-wise backward error*  $\beta$ . This error is the smallest relative perturbation in elements of  $A$  and  $b$  such that  $x$  is the exact solution of the perturbed system:

$$|\delta a_{ij}| \leq \beta |a_{ij}|, \quad |\delta b_i| \leq \beta |b_i| \quad \text{such that } (A + \delta A)x = (b + \delta b).$$

Finally, the routine estimates the *component-wise forward error* in the computed solution  $\|x - x_e\|_\infty / \|x\|_\infty$  (here  $x_e$  is the exact solution).

Before calling this routine:

- call the factorization routine [?sptrf](#)
- call the solver routine [?sptrs](#).

### Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Must be 'U' or 'L'. If <i>uplo</i> = 'U', the upper triangle of $A$ is stored. If <i>uplo</i> = 'L', the lower triangle of $A$ is stored.
<i>n</i>	The order of the matrix $A$ ; $n \geq 0$ .
<i>nrhs</i>	The number of right-hand sides; $nrhs \geq 0$ .

<i>ap,afp,b,x</i>	<p>Arrays:</p> <p><i>ap</i> of size <math>\max(1, n(n+1)/2)</math> contains the original packed matrix <i>A</i>, as supplied to <code>?sptrf</code>.</p> <p><i>afp</i> of size <math>\max(1, n(n+1)/2)</math> contains the factored packed matrix <i>A</i>, as returned by <code>?sptrf</code>.</p> <p><i>b</i> of size <math>\max(1, ldb*nrhs)</math> for column major layout and <math>\max(1, ldb*n)</math> for row major layout contains the right-hand side matrix <i>B</i>.</p> <p><i>x</i> of size <math>\max(1, ldx*nrhs)</math> for column major layout and <math>\max(1, ldx*n)</math> for row major layout contains the solution matrix <i>X</i>.</p>
<i>ldb</i>	The leading dimension of <i>b</i> ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.
<i>ldx</i>	The leading dimension of <i>x</i> ; $ldx \geq \max(1, n)$ for column major layout and $ldx \geq \max(1, nrhs)$ for row major layout.
<i>ipiv</i>	Array, size at least $\max(1, n)$ . The <i>ipiv</i> array, as returned by <code>?sptrf</code> .

## Output Parameters

<i>x</i>	The refined solution matrix <i>X</i> .
<i>ferr, berr</i>	Arrays, size at least $\max(1, nrhs)$ . Contain the component-wise forward and backward errors, respectively, for each solution vector.

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

## Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of  $4n^2$  floating-point operations (for real flavors) or  $16n^2$  operations (for complex flavors). In addition, each step of iterative refinement involves  $6n^2$  operations (for real flavors) or  $24n^2$  operations (for complex flavors); the number of iterations may range from 1 to 5.

Estimating the forward error involves solving a number of systems of linear equations  $A*x = b$ ; the number of systems is usually 4 or 5 and never more than 11. Each solution requires approximately  $2n^2$  floating-point operations for real flavors or  $8n^2$  for complex flavors.

## Description

The routine performs an iterative refinement of the solution to a system of linear equations  $A \cdot X = B$  with a packed complex Hermitian matrix  $A$ , with multiple right-hand sides. For each computed solution vector  $x$ , the routine computes the *component-wise backward error*  $\beta$ . This error is the smallest relative perturbation in elements of  $A$  and  $b$  such that  $x$  is the exact solution of the perturbed system:

$$|\delta a_{ij}| \leq \beta |a_{ij}|, \quad |\delta b_i| \leq \beta |b_i| \text{ such that } (A + \delta A)x = (b + \delta b).$$

Finally, the routine estimates the *component-wise forward error* in the computed solution  $\|x - x_e\|_\infty / \|x\|_\infty$  (here  $x_e$  is the exact solution).

Before calling this routine:

- call the factorization routine [?hptrf](#)
- call the solver routine [?hptrs](#).

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Must be 'U' or 'L'. If <i>uplo</i> = 'U', the upper triangle of $A$ is stored. If <i>uplo</i> = 'L', the lower triangle of $A$ is stored.
<i>n</i>	The order of the matrix $A$ ; $n \geq 0$ .
<i>nrhs</i>	The number of right-hand sides; $nrhs \geq 0$ .
<i>ap, afp, b, x</i>	Arrays: <i>ap</i> max(1, $n(n + 1)/2$ ) contains the original packed matrix $A$ , as supplied to <a href="#">?hptrf</a> . <i>afp</i> max(1, $n(n + 1)/2$ ) contains the factored packed matrix $A$ , as returned by <a href="#">?hptrf</a> . <i>b</i> of size max(1, $ldb \cdot nrhs$ ) for column major layout and max(1, $ldb \cdot n$ ) for row major layout contains the right-hand side matrix $B$ .

$x$  of size  $\max(1, ldx*nrhs)$  for column major layout and  $\max(1, ldx*n)$  for row major layout contains the solution matrix  $X$ .

*ldb*

The leading dimension of  $b$ ;  $ldb \geq \max(1, n)$  for column major layout and  $ldb \geq nrhs$  for row major layout.

*ldx*

The leading dimension of  $x$ ;  $ldx \geq \max(1, n)$  for column major layout and  $ldx \geq nrhs$  for row major layout.

*ipiv*

Array, size at least  $\max(1, n)$ . The *ipiv* array, as returned by [?hptrf](#).

## Output Parameters

*x*

The refined solution matrix  $X$ .

*ferr, berr*

Arrays, size at least  $\max(1, nrhs)$ . Contain the component-wise forward and backward errors, respectively, for each solution vector.

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

## Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of  $16n^2$  operations. In addition, each step of iterative refinement involves  $24n^2$  operations; the number of iterations may range from 1 to 5.

Estimating the forward error involves solving a number of systems of linear equations  $A*x = b$ ; the number is usually 4 or 5 and never more than 11. Each solution requires approximately  $8n^2$  floating-point operations.

## Description

The routine estimates the errors in the solution to a system of linear equations  $A^*X = B$  or  $A^T X = B$  or  $A^H X = B$  with a triangular matrix  $A$ , with multiple right-hand sides. For each computed solution vector  $x$ , the routine computes the *component-wise backward error*  $\beta$ . This error is the smallest relative perturbation in elements of  $A$  and  $b$  such that  $x$  is the exact solution of the perturbed system:

$$|\delta a_{ij}| \leq \beta |a_{ij}|, \quad |\delta b_i| \leq \beta |b_i| \text{ such that } (A + \delta A)x = (b + \delta b).$$

The routine also estimates the *component-wise forward error* in the computed solution  $\|x - x_e\|_\infty / \|x\|_\infty$  (here  $x_e$  is the exact solution).

Before calling this routine, call the solver routine [?trtrs](#).

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Must be 'U' or 'L'. Indicates whether $A$ is upper or lower triangular: If <i>uplo</i> = 'U', then $A$ is upper triangular. If <i>uplo</i> = 'L', then $A$ is lower triangular.
<i>trans</i>	Must be 'N' or 'T' or 'C'. Indicates the form of the equations: If <i>trans</i> = 'N', the system has the form $A^*X = B$ . If <i>trans</i> = 'T', the system has the form $A^T X = B$ . If <i>trans</i> = 'C', the system has the form $A^H X = B$ .
<i>diag</i>	Must be 'N' or 'U'. If <i>diag</i> = 'N', then $A$ is not a unit triangular matrix. If <i>diag</i> = 'U', then $A$ is unit triangular: diagonal elements of $A$ are assumed to be 1 and not referenced in the array $a$ .
<i>n</i>	The order of the matrix $A$ ; $n \geq 0$ .
<i>nrhs</i>	The number of right-hand sides; $nrhs \geq 0$ .

$a, b, x$	<p>Arrays:</p> <p><math>a</math> (size <math>\max(1, lda*n)</math>) contains the upper or lower triangular matrix <math>A</math>, as specified by <math>uplo</math>.</p> <p><math>b</math> of size <math>\max(1, ldb*nrhs)</math> for column major layout and <math>\max(1, ldb*n)</math> for row major layout contains the right-hand side matrix <math>B</math>.</p> <p><math>x</math> of size <math>\max(1, ldx*nrhs)</math> for column major layout and <math>\max(1, ldx*n)</math> for row major layout contains the solution matrix <math>X</math>.</p>
$lda$	The leading dimension of $a$ ; $lda \geq \max(1, n)$ .
$ldb$	The leading dimension of $b$ ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.
$ldx$	The leading dimension of $x$ ; $ldx \geq \max(1, n)$ for column major layout and $ldx \geq nrhs$ for row major layout.

## Output Parameters

$ferr, berr$	Arrays, size at least $\max(1, nrhs)$ . Contain the component-wise forward and backward errors, respectively, for each solution vector.
--------------	---

## Return Values

This function returns a value  $info$ .

If  $info = 0$ , the execution is successful.

If  $info = -i$ , parameter  $i$  had an illegal value.

## Application Notes

The bounds returned in  $ferr$  are not rigorous, but in practice they almost always overestimate the actual error.

A call to this routine involves, for each right-hand side, solving a number of systems of linear equations  $A*x = b$ ; the number of systems is usually 4 or 5 and never more than 11. Each solution requires approximately  $n^2$  floating-point operations for real flavors or  $4n^2$  for complex flavors.

## Description

The routine estimates the errors in the solution to a system of linear equations  $A^*X = B$  or  $A^T * X = B$  or  $A^H * X = B$  with a triangular band matrix  $A$ , with multiple right-hand sides. For each computed solution vector  $x$ , the routine computes the *component-wise backward error*  $\beta$ . This error is the smallest relative perturbation in elements of  $A$  and  $b$  such that  $x$  is the exact solution of the perturbed system:

$$|\delta a_{ij}| \leq \beta |a_{ij}|, \quad |\delta b_i| \leq \beta |b_i| \text{ such that } (A + \delta A)x = (b + \delta b).$$

The routine also estimates the *component-wise forward error* in the computed solution  $\|x - x_e\|_\infty / \|x\|_\infty$  (here  $x_e$  is the exact solution).

Before calling this routine, call the solver routine [?tbrs](#).

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Must be 'U' or 'L'. Indicates whether $A$ is upper or lower triangular: If <i>uplo</i> = 'U', then $A$ is upper triangular. If <i>uplo</i> = 'L', then $A$ is lower triangular.
<i>trans</i>	Must be 'N' or 'T' or 'C'. Indicates the form of the equations: If <i>trans</i> = 'N', the system has the form $A^*X = B$ . If <i>trans</i> = 'T', the system has the form $A^T * X = B$ . If <i>trans</i> = 'C', the system has the form $A^H * X = B$ .
<i>diag</i>	Must be 'N' or 'U'. If <i>diag</i> = 'N', $A$ is not a unit triangular matrix. If <i>diag</i> = 'U', $A$ is unit triangular: diagonal elements of $A$ are assumed to be 1 and not referenced in the array <i>ab</i> .
<i>n</i>	The order of the matrix $A$ ; $n \geq 0$ .
<i>kd</i>	The number of super-diagonals or sub-diagonals in the matrix $A$ ; $kd \geq 0$ .

<i>nrhs</i>	The number of right-hand sides; $nrhs \geq 0$ .
<i>ab, b, x</i>	Arrays: <i>ab</i> (size $\max(1, ldab*n)$ ) contains the upper or lower triangular matrix <i>A</i> , as specified by <i>uplo</i> , in band storage format. <i>b</i> of size $\max(1, ldb*nrhs)$ for column major layout and $\max(1, ldb*n)$ for row major layout contains the right-hand side matrix <i>B</i> . <i>x</i> of size $\max(1, ldx*nrhs)$ for column major layout and $\max(1, ldx*n)$ for row major layout contains the solution matrix <i>X</i> .
<i>ldab</i>	The leading dimension of the array <i>ab</i> ; $ldab \geq kd + 1$ .
<i>ldb</i>	The leading dimension of <i>b</i> ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.
<i>ldx</i>	The leading dimension of <i>x</i> ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.

## Output Parameters

*ferr, berr* Arrays, size at least  $\max(1, nrhs)$ . Contain the component-wise forward and backward errors, respectively, for each solution vector.

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

## Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

A call to this routine involves, for each right-hand side, solving a number of systems of linear equations  $A*x = b$ ; the number of systems is usually 4 or 5 and never more than 11. Each solution requires approximately  $2n*kd$  floating-point operations for real flavors or  $8n*kd$  operations for complex flavors.

### Matrix Inversion: LAPACK Computational Routines

It is seldom necessary to compute an explicit inverse of a matrix. In particular, do not attempt to solve a system of equations  $Ax = b$  by first computing  $A^{-1}$  and then forming the matrix-vector product  $x = A^{-1}b$ . Call a solver routine instead (see [Routines for Solving Systems of Linear Equations](#)); this is more efficient and more accurate.

However, matrix inversion routines are provided for the rare occasions when an explicit inverse matrix is needed.

*?getri*

*Computes the inverse of an LU-factored general matrix.*

---

## Syntax

```
lapack_int LAPACKE_sgetri (int matrix_layout , lapack_int n , float * a , lapack_int
lda , const lapack_int * ipiv );
```

```
lapack_int LAPACKE_dgetri (int matrix_layout , lapack_int n , double * a , lapack_int
lda , const lapack_int * ipiv );
```

```
lapack_int LAPACKE_cgetri (int matrix_layout , lapack_int n , lapack_complex_float *
a , lapack_int lda , const lapack_int * ipiv );
```

```
lapack_int LAPACKE_zgetri (int matrix_layout , lapack_int n , lapack_complex_double *
a , lapack_int lda , const lapack_int * ipiv );
```

## Include Files

- mkl.h

## Description

The routine computes the inverse  $\text{inv}(A)$  of a general matrix  $A$ . Before calling this routine, call `?getrf` to factorize  $A$ .

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>n</i>	The order of the matrix $A$ ; $n \geq 0$ .
<i>a</i>	Array $a$ (size $\max(1, lda * n)$ ) contains the factorization of the matrix $A$ , as returned by <code>?getrf</code> : $A = P * L * U$ . The second dimension of $a$ must be at least $\max(1, n)$ .
<i>lda</i>	The leading dimension of $a$ ; $lda \geq \max(1, n)$ .
<i>ipiv</i>	Array, size at least $\max(1, n)$ . The <i>ipiv</i> array, as returned by <code>?getrf</code> .

## Output Parameters

<i>a</i>	Overwritten by the $n$ -by- $n$ matrix $\text{inv}(A)$ .
----------	--

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

If *info* = *i*, the *i*-th diagonal element of the factor  $U$  is zero,  $U$  is singular, and the inversion could not be completed.

## Application Notes

The computed inverse  $X$  satisfies the following error bound:

$$\|XA - I\| \leq c(n)\epsilon \|X\| \|L\| \|U\|,$$

where  $c(n)$  is a modest linear function of  $n$ ;  $\varepsilon$  is the machine precision;  $I$  denotes the identity matrix;  $P$ ,  $L$ , and  $U$  are the factors of the matrix factorization  $A = P*U*L$ .

The total number of floating-point operations is approximately  $(4/3)n^3$  for real flavors and  $(16/3)n^3$  for complex flavors.

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>n</i>	The order of the matrix $A$ ; $n \geq 0$ .
<i>a</i>	Array $a$ (size $\max(1, lda*n)$ ) contains the factorization of the matrix $A$ , as returned by <a href="#">mkl_?getrfnp</a> : $A = L*U$ . The second dimension of $a$ must be at least $\max(1, n)$ .
<i>lda</i>	The leading dimension of $a$ ; $lda \geq \max(1, n)$ .

## Output Parameters

<i>a</i>	Overwritten by the $n$ -by- $n$ matrix $\text{inv}(A)$ .
----------	--

## Return Values

This function returns a value *info*.

If  $info = 0$ , the execution is successful.

If  $info = -i$ , parameter  $i$  had an illegal value.

If  $info = i$ , the  $i$ -th diagonal element of the factor  $U$  is zero,  $U$  is singular, and the inversion could not be completed.

## Application Notes

The total number of floating-point operations is approximately  $(4/3)n^3$  for real flavors and  $(16/3)n^3$  for complex flavors.

lapack_complex_double * a , lapack_int lda );
```

## Include Files

- mkl.h

## Description

The routine computes the inverse  $inv(A)$  of a symmetric positive definite or, for complex flavors, Hermitian positive-definite matrix  $A$ . Before calling this routine, call [?potrf](#) to factorize  $A$ .

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Must be 'U' or 'L'. Indicates how the input matrix $A$ has been factored: If <i>uplo</i> = 'U', the upper triangle of $A$ is stored. If <i>uplo</i> = 'L', the lower triangle of $A$ is stored.
<i>n</i>	The order of the matrix $A$ ; $n \geq 0$ .
<i>a</i>	Array $a$ (size $\max(1, lda*n)$ ). Contains the factorization of the matrix $A$ , as returned by <a href="#">?potrf</a> .
<i>lda</i>	The leading dimension of $a$ . $lda \geq \max(1, n)$ .

## Output Parameters

*a* Overwritten by the upper or lower triangle of the inverse of *A*.

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

If *info* = *i*, the *i*-th diagonal element of the Cholesky factor (and therefore the factor itself) is zero, and the inversion could not be completed.

## Application Notes

The computed inverse *X* satisfies the following error bounds:

$$\|XA - I\|_2 \leq c(n) \varepsilon \kappa_2(A), \quad \|AX - I\|_2 \leq c(n) \varepsilon \kappa_2(A),$$

where  $c(n)$  is a modest linear function of  $n$ , and  $\varepsilon$  is the machine precision; *I* denotes the identity matrix.

The 2-norm  $\|A\|_2$  of a matrix *A* is defined by  $\|A\|_2 = \max_{x \cdot x=1} (Ax \cdot Ax)^{1/2}$ , and the condition number  $\kappa_2(A)$  is defined by  $\kappa_2(A) = \|A\|_2 \|A^{-1}\|_2$ .

The total number of floating-point operations is approximately  $(2/3)n^3$  for real flavors and  $(8/3)n^3$  for complex flavors.

lapack_complex_float * a );
```

```
lapack_int LAPACKE_zpftri (int matrix_layout , char transr , char uplo , lapack_int n ,
lapack_complex_double * a );
```

## Include Files

- mkl.h

## Description

The routine computes the inverse  $\text{inv}(A)$  of a symmetric positive definite or, for complex data, Hermitian positive-definite matrix *A* using the Cholesky factorization:

$$A = U^T * U \text{ for real data, } A = U^H * U \text{ for complex data} \quad \text{if } uplo='U'$$

$A = L * L^T$  for real data,  $A = L * L^H$  for complex data if  $uplo = 'L'$

Before calling this routine, call `?pftfrf` to factorize  $A$ .

The matrix  $A$  is in the Rectangular Full Packed (RFP) format. For the description of the RFP format, see [Matrix Storage Schemes](#).

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<code>transr</code>	Must be 'N', 'T' (for real data) or 'C' (for complex data).  If <code>transr = 'N'</code> , the Normal <code>transr</code> of RFP $U$ (if <code>uplo = 'U'</code> ) or $L$ (if <code>uplo = 'L'</code> ) is stored.  If <code>transr = 'T'</code> , the Transpose <code>transr</code> of RFP $U$ (if <code>uplo = 'U'</code> ) or $L$ (if <code>uplo = 'L'</code> ) is stored.  If <code>transr = 'C'</code> , the Conjugate-Transpose <code>transr</code> of RFP $U$ (if <code>uplo = 'U'</code> ) or $L$ (if <code>uplo = 'L'</code> ) is stored.
<code>uplo</code>	Must be 'U' or 'L'.  Indicates how the input matrix $A$ has been factored:  If <code>uplo = 'U'</code> , $A = U^T * U$ for real data or $A = U^H * U$ for complex data, and $U$ is stored.  If <code>uplo = 'L'</code> , $A = L * L^T$ for real data or $A = L * L^H$ for complex data, and $L$ is stored.
<code>n</code>	The order of the matrix $A$ ; $n \geq 0$ .
<code>a</code>	Array, size $(n * (n + 1) / 2)$ . The array <code>a</code> contains the factor $U$ or $L$ matrix $A$ in the RFP format.

## Output Parameters

<code>a</code>	The symmetric/Hermitian inverse of the original matrix in the same storage format.
----------------	--

## Return Values

This function returns a value `info`.

If `info=0`, the execution is successful.

If `info = -i`, parameter  $i$  had an illegal value.

If `info = i`, the  $(i, i)$  element of the factor  $U$  or  $L$  is zero, and the inverse could not be computed.

### Description

The routine computes the inverse  $\text{inv}(A)$  of a symmetric indefinite matrix  $A$  using the factorization  $A = U^*D^*U^T$  or  $A = L^*D^*L^T$  computed by ?sytrf.

The ?sytri2 routine allocates a temporary buffer before calling ?sytri2x that actually computes the inverse.

### Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Must be 'U' or 'L'. Indicates how the input matrix $A$ has been factored: If <i>uplo</i> = 'U', the array $a$ stores the factorization $A = U^*D^*U^T$ . If <i>uplo</i> = 'L', the array $a$ stores the factorization $A = L^*D^*L^T$ .
<i>n</i>	The order of the matrix $A$ ; $n \geq 0$ .
<i>a</i>	Array $a$ (size $\max(1, lda*n)$ ) contains the block diagonal matrix $D$ and the multipliers used to obtain the factor $U$ or $L$ as returned by ?sytrf.
<i>lda</i>	The leading dimension of $a$ ; $lda \geq \max(1, n)$ .
<i>ipiv</i>	Array, size at least $\max(1, n)$ . Details of the interchanges and the block structure of $D$ as returned by ?sytrf.

### Output Parameters

<i>a</i>	If <i>info</i> = 0, the symmetric inverse of the original matrix. If <i>uplo</i> = 'U', the upper triangular part of the inverse is formed and the part of $A$ below the diagonal is not referenced.
----------	---

If `uplo = 'L'`, the lower triangular part of the inverse is formed and the part of  $A$  above the diagonal is not referenced.

## Return Values

This function returns a value `info`.

If `info = 0`, the execution is successful.

If `info = -i`, the  $i$ -th parameter had an illegal value.

If `info = i`,  $D(i,i) = 0$ ;  $D$  is singular and its inversion could not be computed.

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Must be 'U' or 'L'. Indicates how the input matrix $A$ has been factored: If <i>uplo</i> = 'U', the array <i>a</i> stores the factorization $A = U^*D^*U^H$ . If <i>uplo</i> = 'L', the array <i>a</i> stores the factorization $A = L^*D^*L^H$ .
<i>n</i>	The order of the matrix $A$ ; $n \geq 0$ .
<i>a</i>	Arrays <i>a</i> (size $\max(1, lda*n)$ ) contains the <i>nb</i> (block size) diagonal matrix $D$ and the multipliers used to obtain the factor $U$ or $L$ as returned by ?hetrf.
<i>lda</i>	The leading dimension of <i>a</i> ; $lda \geq \max(1, n)$ .
<i>ipiv</i>	Array, size at least $\max(1, n)$ . Details of the interchanges and the <i>nb</i> structure of $D$ as returned by ?hetrf.
<i>nb</i>	Block size.

## Output Parameters

<i>a</i>	If <i>info</i> = 0, the symmetric inverse of the original matrix. If <i>info</i> = 'U', the upper triangular part of the inverse is formed and the part of $A$ below the diagonal is not referenced. If <i>info</i> = 'L', the lower triangular part of the inverse is formed and the part of $A$ above the diagonal is not referenced.
----------	---

## Return Values

This function returns a value *info*.

If `info = 0`, the execution is successful.

If `info = -i`, parameter `i` had an illegal value.

If `info = i`,  $D_{ii} = 0$ ;  $D$  is singular and its inversion could not be computed.

lapack_int LAPACKE_zsytri_3 (int matrix_layout, char uplo, lapack_int n,
lapack_complex_double * A, lapack_int lda, const lapack_complex_double * e, const
lapack_int * ipiv);
```

## Description

`?sytri_3` computes the inverse of a real or complex symmetric matrix  $A$  using the factorization computed by `?sytrf_rk`:  $A = P*U*D*(U^T)*(P^T)$  or  $A = P*L*D*(L^T)*(P^T)$ , where  $U$  (or  $L$ ) is a unit upper (or lower) triangular matrix,  $U^T$  (or  $L^T$ ) is the transpose of  $U$  (or  $L$ ),  $P$  is a permutation matrix,  $P^T$  is the transpose of  $P$ , and  $D$  is symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

`?sytri_3` sets the leading dimension of the workspace before calling `?sytri_3x`, which actually computes the inverse. This is the blocked version of the algorithm, calling Level-3 BLAS.

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major ( <code>LAPACK_ROW_MAJOR</code> ) or column major ( <code>LAPACK_COL_MAJOR</code> ).
<code>uplo</code>	Specifies whether the details of the factorization are stored as an upper or lower triangular matrix. <ul style="list-style-type: none"> <li><code>= 'U'</code>: The upper triangle of <math>A</math> is stored.</li> <li><code>= 'L'</code>: The lower triangle of <math>A</math> is stored.</li> </ul>
<code>n</code>	The order of the matrix $A$ . $n \geq 0$ .
<code>A</code>	Array of size $\max(1, lda*n)$ . On entry, diagonal of the block diagonal matrix $D$ and factors $U$ or $L$ as computed by <code>?sytrf_rk</code> : <ul style="list-style-type: none"> <li><i>Only</i> diagonal elements of the symmetric block diagonal matrix <math>D</math> on the diagonal of <math>A</math>; that is, <math>D(k,k) = A(k,k)</math>. Superdiagonal (or subdiagonal) elements of <math>D</math> should be provided on entry in array <code>e</code>.</li> </ul> <p style="text-align: center;">—and—</p>

- If `uplo = 'U'`, factor U in the superdiagonal part of A. If `uplo = 'L'`, factor L in the subdiagonal part of A.

`lda`

The leading dimension of the array A.

`e`

Array of size  $n$ . On entry, contains the superdiagonal (or subdiagonal) elements of the symmetric block diagonal matrix D with 1-by-1 or 2-by-2 diagonal blocks. If `uplo = 'U'`,  $e(i) = D(i-1,i)$ ,  $i=2:N$ , and  $e(1)$  is not referenced. If `uplo = 'L'`,  $e(i) = D(i+1,i)$ ,  $i=1:N-1$ , and  $e(n)$  is not referenced.

---

**NOTE** For 1-by-1 diagonal block  $D(k)$ , where  $1 \leq k \leq n$ , the element  $e[k-1]$  is not referenced in both the `uplo = 'U'` and `uplo = 'L'` cases.

---

`ipiv`

Array of size  $n$ . Details of the interchanges and the block structure of D as determined by `?sytrf_rk`.

## Output Parameters

`A`

On exit, if `info = 0`, the symmetric inverse of the original matrix. If `uplo = 'U'`, the upper triangular part of the inverse is formed and the part of A below the diagonal is not referenced. If `uplo = 'L'`, the lower triangular part of the inverse is formed and the part of A above the diagonal is not referenced.

## Return Values

This function returns a value `info`.

= 0: Successful exit.

< 0: If `info = -i`, the  $i^{\text{th}}$  argument had an illegal value.

> 0: If `info = i`,  $D(i,i) = 0$ ; the matrix is singular and its inverse could not be computed.

### ?hetri\_3

*Computes the inverse of a complex Hermitian matrix using the factorization computed by ?hetrf\_rk.*

```
lapack_int LAPACKE_chetri_3 (int matrix_layout, char uplo, lapack_int n,
lapack_complex_float * A, lapack_int lda, const lapack_complex_float * e, const
lapack_int * ipiv);
```

<i>lda</i>	The leading dimension of the array A.
<i>e</i>	Array of size <i>n</i> . On entry, contains the superdiagonal (or subdiagonal) elements of the Hermitian block diagonal matrix D with 1-by-1 or 2-by-2 diagonal blocks. If <i>uplo</i> = 'U', $e(i) = D(i-1,i)$ , $i=2:N$ , and $e(1)$ is not referenced. If <i>uplo</i> = 'L', $e(i) = D(i+1,i)$ , $i=1:N-1$ , and $e(n)$ is not referenced.
<hr/> <p><b>NOTE</b> For 1-by-1 diagonal block <math>D(k)</math>, where <math>1 \leq k \leq n</math>, the element <math>e[k-1]</math> is not referenced in both the <i>uplo</i> = 'U' and <i>uplo</i> = 'L' cases.</p> <hr/>	
<i>ipiv</i>	Array of size <i>n</i> . Details of the interchanges and the block structure of D as determined by ?hetrf_rk.

## Output Parameters

<i>A</i>	On exit, if <i>info</i> = 0, the Hermitian inverse of the original matrix. If <i>uplo</i> = 'U', the upper triangular part of the inverse is formed and the part of A below the diagonal is not referenced. If <i>uplo</i> = 'L', the lower triangular part of the inverse is formed and the part of A above the diagonal is not referenced.
----------	--

## Return Values

This function returns a value *info*.

= 0: Successful exit.

< 0: If *info* = -*i*, the *i*<sup>th</sup> argument had an illegal value.

> 0: If *info* = *i*,  $D(i,i) = 0$ ; the matrix is singular and its inverse could not be computed.

## ?sptri

Computes the inverse of a symmetric matrix using  $U*D*U^T$  or  $L*D*L^T$  Bunch-Kaufman factorization of matrix in packed storage.

### Syntax

```
lapack_int LAPACKE_ssptri (int matrix_layout , char uplo , lapack_int n , float * ap ,
const lapack_int * ipiv );
```

```
lapack_int LAPACKE_dsptri (int matrix_layout , char uplo , lapack_int n , double * ap ,
const lapack_int * ipiv );
```

```
lapack_int LAPACKE_csptri (int matrix_layout , char uplo , lapack_int n ,
lapack_complex_float * ap , const lapack_int * ipiv );
```

```
lapack_int LAPACKE_zsptri (int matrix_layout , char uplo , lapack_int n ,
lapack_complex_double * ap , const lapack_int * ipiv );
```

### Include Files

- mkl.h

### Description

The routine computes the inverse  $\text{inv}(A)$  of a packed symmetric matrix  $A$ . Before calling this routine, call [?sptrf](#) to factorize  $A$ .

### Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Must be 'U' or 'L'. Indicates how the input matrix $A$ has been factored: If <i>uplo</i> = 'U', the array <i>ap</i> stores the Bunch-Kaufman factorization $A = U*D*U^T$ . If <i>uplo</i> = 'L', the array <i>ap</i> stores the Bunch-Kaufman factorization $A = L*D*L^T$ .
<i>n</i>	The order of the matrix $A$ ; $n \geq 0$ .
<i>ap</i>	Arrays <i>ap</i> (size $\max(1, n(n+1)/2)$ ) contains the factorization of the matrix $A$ , as returned by <a href="#">?sptrf</a> .
<i>ipiv</i>	Array, size at least $\max(1, n)$ . The <i>ipiv</i> array, as returned by <a href="#">?sptrf</a> .

### Output Parameters

*ap* Overwritten by the matrix  $\text{inv}(A)$  in packed form.

### Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If  $info = -i$ , parameter  $i$  had an illegal value.

If  $info = i$ , the  $i$ -th diagonal element of  $D$  is zero,  $D$  is singular, and the inversion could not be completed.

## Application Notes

The computed inverse  $X$  satisfies the following error bounds:

$$|D^*U^T*P^T*X*P*U - I| \leq c(n)\epsilon(|D||U^T|P^T|X|P|U| + |D||D^{-1}|)$$

for  $uplo = 'U'$ , and

$$|D*L^T*P^T*X*P*L - I| \leq c(n)\epsilon(|D||L^T|P^T|X|P|L| + |D||D^{-1}|)$$

for  $uplo = 'L'$ . Here  $c(n)$  is a modest linear function of  $n$ , and  $\epsilon$  is the machine precision;  $I$  denotes the identity matrix.

The total number of floating-point operations is approximately  $(2/3)n^3$  for real flavors and  $(8/3)n^3$  for complex flavors.

lapack_int n , lapack_complex_double * a );
```

### Include Files

- mkl.h

### Description

Computes the inverse of a triangular matrix  $A$  stored in the Rectangular Full Packed (RFP) format. For the description of the RFP format, see [Matrix Storage Schemes](#).

This is the block version of the algorithm, calling Level 3 BLAS.

### Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>transr</i>	Must be 'N', 'T' (for real data) or 'C' (for complex data). If <i>transr</i> = 'N', the Normal <i>transr</i> of RFP $A$ is stored. If <i>transr</i> = 'T', the Transpose <i>transr</i> of RFP $A$ is stored. If <i>transr</i> = 'C', the Conjugate-Transpose <i>transr</i> of RFP $A$ is stored.
<i>uplo</i>	Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of RFP $A$ is stored: If <i>uplo</i> = 'U', the array <i>a</i> stores the upper triangular part of the matrix $A$ . If <i>uplo</i> = 'L', the array <i>a</i> stores the lower triangular part of the matrix $A$ .
<i>diag</i>	Must be 'N' or 'U'. If <i>diag</i> = 'N', then $A$ is not a unit triangular matrix. If <i>diag</i> = 'U', $A$ is unit triangular: diagonal elements of $A$ are assumed to be 1 and not referenced in the array <i>a</i> .
<i>n</i>	The order of the matrix $A$ ; $n \geq 0$ .

*a* Array, size  $\max(1, n*(n + 1)/2)$ . The array *a* contains the matrix *A* in the RFP format.

## Output Parameters

*a* The (triangular) inverse of the original matrix in the same storage format.

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* = *-i*, parameter *i* had an illegal value.

If *info* = *i*,  $A_{i,i}$  is exactly zero. The triangular matrix is singular and its inverse cannot be computed.

## Description

The routine computes the inverse  $\text{inv}(A)$  of a packed triangular matrix *A*.

## Input Parameters

*matrix\_layout* Specifies whether matrix storage layout is row major (LAPACK\_ROW\_MAJOR) or column major (LAPACK\_COL\_MAJOR).

*uplo* Must be 'U' or 'L'.

Indicates whether *A* is upper or lower triangular:

If *uplo* = 'U', then *A* is upper triangular.

If *uplo* = 'L', then *A* is lower triangular.

<i>diag</i>	Must be 'N' or 'U'. If <i>diag</i> = 'N', then <i>A</i> is not a unit triangular matrix. If <i>diag</i> = 'U', <i>A</i> is unit triangular: diagonal elements of <i>A</i> are assumed to be 1 and not referenced in the array <i>ap</i> .
<i>n</i>	The order of the matrix <i>A</i> ; $n \geq 0$ .
<i>ap</i>	Array, size at least $\max(1, n(n+1)/2)$ . Contains the packed triangular matrix <i>A</i> .

## Output Parameters

<i>ap</i>	Overwritten by the packed <i>n</i> -by- <i>n</i> matrix $\text{inv}(A)$ .
-----------	---

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

If *info* = *i*, the *i*-th diagonal element of *A* is zero, *A* is singular, and the inversion could not be completed.

## Application Notes

The computed inverse *X* satisfies the following error bounds:

$$|XA - I| \leq c(n)\varepsilon |X||A|$$

$$|X - A^{-1}| \leq c(n)\varepsilon |A^{-1}||A||X|,$$

where  $c(n)$  is a modest linear function of *n*;  $\varepsilon$  is the machine precision; *I* denotes the identity matrix.

The total number of floating-point operations is approximately  $(1/3)n^3$  for real flavors and  $(4/3)n^3$  for complex flavors.

### Matrix Equilibration: LAPACK Computational Routines

Routines described in this section are used to compute scaling factors needed to equilibrate a matrix. Note that these routines do not actually scale the matrices.

#### ?gseequ

*Computes row and column scaling factors intended to equilibrate a general matrix and reduce its condition number.*

## Syntax

```
lapack_int LAPACKE_sgeequ( int matrix_layout, lapack_int m, lapack_int n, const float*
a, lapack_int lda, float* r, float* c, float* rowcnd, float* colcnd, float* amax );
```

```
lapack_int LAPACKE_dgeequ( int matrix_layout, lapack_int m, lapack_int n, const double*
a, lapack_int lda, double* r, double* c, double* rowcnd, double* colcnd, double* amax );
```

```
lapack_int LAPACKE_cgeequ( int matrix_layout, lapack_int m, lapack_int n, const
lapack_complex_float* a, lapack_int lda, float* r, float* c, float* rowcnd, float*
colcnd, float* amax );
```

```
lapack_int LAPACKE_zgeequ( int matrix_layout, lapack_int m, lapack_int n, const
lapack_complex_double* a, lapack_int lda, double* r, double* c, double* rowcnd, double*
colcnd, double* amax );
```

## Include Files

- mkl.h

## Description

The routine computes row and column scalings intended to equilibrate an  $m$ -by- $n$  matrix  $A$  and reduce its condition number. The output array  $r$  returns the row scale factors and the array  $c$  the column scale factors. These factors are chosen to try to make the largest element in each row and column of the matrix  $B$  with elements  $b_{ij}=r[i-1]*a_{ij}*c[j-1]$  have absolute value 1.

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>m</i>	The number of rows of the matrix $A$ ; $m \geq 0$ .
<i>n</i>	The number of columns of the matrix $A$ ; $n \geq 0$ .
<i>a</i>	Array: size $\max(1, lda*n)$ for column major layout and $\max(1, lda*m)$ for row major layout. Contains the $m$ -by- $n$ matrix $A$ whose equilibration factors are to be computed.
<i>lda</i>	The leading dimension of $a$ ; $lda \geq \max(1, m)$ .

## Output Parameters

<i>r, c</i>	Arrays: $r$ (size $m$ ), $c$ (size $n$ ). If $info = 0$ , or $info > m$ , the array $r$ contains the row scale factors of the matrix $A$ . If $info = 0$ , the array $c$ contains the column scale factors of the matrix $A$ .
<i>rowcnd</i>	If $info = 0$ or $info > m$ , <i>rowcnd</i> contains the ratio of the smallest $r[i]$ to the largest $r[i]$ .
<i>colcnd</i>	If $info = 0$ , <i>colcnd</i> contains the ratio of the smallest $c[i]$ to the largest $c[i]$ .
<i>amax</i>	Absolute value of the largest element of the matrix $A$ .

## Return Values

This function returns a value *info*.

If  $info = 0$ , the execution is successful.

If  $info = -i$ , parameter  $i$  had an illegal value.

If  $info = i$ ,  $i > 0$ , and

$i \leq m$ , the  $i$ -th row of  $A$  is exactly zero;

$i > m$ , the  $(i-m)$ th column of  $A$  is exactly zero.

## Application Notes

All the components of  $r$  and  $c$  are restricted to be between  $SMLNUM =$  smallest safe number and  $BIGNUM =$  largest safe number. Use of these scaling factors is not guaranteed to reduce the condition number of  $A$  but works well in practice.

$SMLNUM$  and  $BIGNUM$  are parameters representing machine precision. You can use the [?lamch](#) routines to compute them. For example, compute single precision values of  $SMLNUM$  and  $BIGNUM$  as follows:

```
SMLNUM = slamch ('s')
BIGNUM = 1 / SMLNUM
```

If  $rowcnd \geq 0.1$  and  $amax$  is neither too large nor too small, it is not worth scaling by  $r$ .

If  $colcnd \geq 0.1$ , it is not worth scaling by  $c$ .

If  $amax$  is very close to  $SMLNUM$  or very close to  $BIGNUM$ , the matrix  $A$  should be scaled.

```

## Include Files

- mkl.h

## Description

The routine computes row and column scalings intended to equilibrate an  $m$ -by- $n$  general matrix  $A$  and reduce its condition number. The output array  $r$  returns the row scale factors and the array  $c$  - the column scale factors. These factors are chosen to try to make the largest element in each row and column of the matrix  $B$  with elements  $b_{i,j} = r[i-1]*a_{i,j}*c[j-1]$  have an absolute value of at most the radix.

$r[i-1]$  and  $c[j-1]$  are restricted to be a power of the radix between  $SMLNUM$  = smallest safe number and  $BIGNUM$  = largest safe number. Use of these scaling factors is not guaranteed to reduce the condition number of  $a$  but works well in practice.

$SMLNUM$  and  $BIGNUM$  are parameters representing machine precision. You can use the `?lamch` routines to compute them. For example, compute single precision values of  $SMLNUM$  and  $BIGNUM$  as follows:

```
SMLNUM = slamch ('s')
BIGNUM = 1 / SMLNUM
```

This routine differs from `?geequ` by restricting the scaling factors to a power of the radix. Except for over- and underflow, scaling by these factors introduces no additional rounding errors. However, the scaled entries' magnitudes are no longer equal to approximately 1 but lie between  $\sqrt{\text{radix}}$  and  $1/\sqrt{\text{radix}}$ .

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<code>m</code>	The number of rows of the matrix $A$ ; $m \geq 0$ .
<code>n</code>	The number of columns of the matrix $A$ ; $n \geq 0$ .
<code>a</code>	Array: size $\max(1, lda*n)$ for column major layout and $\max(1, lda*m)$ for row major layout. Contains the $m$ -by- $n$ matrix $A$ whose equilibration factors are to be computed.
<code>lda</code>	The leading dimension of $a$ ; $lda \geq \max(1, m)$ .

## Output Parameters

<code>r, c</code>	Arrays: $r(m)$ , $c(n)$ . If $info = 0$ , or $info > m$ , the array $r$ contains the row scale factors for the matrix $A$ . If $info = 0$ , the array $c$ contains the column scale factors for the matrix $A$ .
<code>rowcnd</code>	If $info = 0$ or $info > m$ , <code>rowcnd</code> contains the ratio of the smallest $r[i]$ to the largest $r[i]$ . If <code>rowcnd</code> $\geq 0.1$ , and <code>amax</code> is neither too large nor too small, it is not worth scaling by $r$ .
<code>colcnd</code>	If $info = 0$ , <code>colcnd</code> contains the ratio of the smallest $c[i]$ to the largest $c[i]$ . If <code>colcnd</code> $\geq 0.1$ , it is not worth scaling by $c$ .
<code>amax</code>	Absolute value of the largest element of the matrix $A$ . If <code>amax</code> is very close to $SMLNUM$ or very close to $BIGNUM$ , the matrix should be scaled.

## Return Values

This function returns a value `info`.

If  $info = 0$ , the execution is successful.

If  $info = -i$ , parameter  $i$  had an illegal value.

If  $info = i$ ,  $i > 0$ , and

$i \leq m$ , the  $i$ -th row of  $A$  is exactly zero;

$i > m$ , the  $(i-m)$ -th column of  $A$  is exactly zero.

## Description

The routine computes row and column scalings intended to equilibrate an  $m$ -by- $n$  band matrix  $A$  and reduce its condition number. The output array  $r$  returns the row scale factors and the array  $c$  the column scale factors. These factors are chosen to try to make the largest element in each row and column of the matrix  $B$  with elements  $b_{ij}=r[i - 1]*a_{ij}*c[j - 1]$  have absolute value 1.

## Input Parameters

$matrix\_layout$	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
$m$	The number of rows of the matrix $A$ ; $m \geq 0$ .
$n$	The number of columns of the matrix $A$ ; $n \geq 0$ .
$kl$	The number of subdiagonals within the band of $A$ ; $kl \geq 0$ .

<i>ku</i>	The number of superdiagonals within the band of <i>A</i> ; $ku \geq 0$ .
<i>ab</i>	Array, size $\max(1, ldab*n)$ for column major layout and $\max(1, ldab*m)$ for row major layout. Contains the original band matrix <i>A</i> .
<i>ldab</i>	The leading dimension of <i>ab</i> ; $ldab \geq kl + ku + 1$ .

## Output Parameters

<i>r, c</i>	Arrays: <i>r</i> (size <i>m</i> ), <i>c</i> (size <i>n</i> ). If <i>info</i> = 0, or <i>info</i> > <i>m</i> , the array <i>r</i> contains the row scale factors of the matrix <i>A</i> . If <i>info</i> = 0, the array <i>c</i> contains the column scale factors of the matrix <i>A</i> .
<i>rowcnd</i>	If <i>info</i> = 0 or <i>info</i> > <i>m</i> , <i>rowcnd</i> contains the ratio of the smallest <i>r</i> [ <i>i</i> ] to the largest <i>r</i> [ <i>i</i> ].
<i>colcnd</i>	If <i>info</i> = 0, <i>colcnd</i> contains the ratio of the smallest <i>c</i> [ <i>i</i> ] to the largest <i>c</i> [ <i>i</i> ].
<i>amax</i>	Absolute value of the largest element of the matrix <i>A</i> .

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

If *info* = *i* and

$i \leq m$ , the *i*-th row of *A* is exactly zero;

$i > m$ , the (*i*-*m*)th column of *A* is exactly zero.

## Application Notes

All the components of *r* and *c* are restricted to be between *SMLNUM* = smallest safe number and *BIGNUM* = largest safe number. Use of these scaling factors is not guaranteed to reduce the condition number of *A* but works well in practice.

## Description

The routine computes row and column scalings intended to equilibrate a symmetric (Hermitian) positive-definite matrix  $A$  and reduce its condition number (with respect to the two-norm). The output array  $s$  returns scale factors such that contains

$$\frac{1}{\sqrt{a_{i,i}}}$$

These factors are chosen so that the scaled matrix  $B$  with elements  $B_{i,j}=s[i-1]*A_{i,j}*s[j-1]$  has diagonal elements equal to 1.

This choice of  $s$  puts the condition number of  $B$  within a factor  $n$  of the smallest possible condition number over all possible diagonal scalings.

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>n</i>	The order of the matrix $A$ ; $n \geq 0$ .
<i>a</i>	Array: size $\max(1, lda*n)$ . Contains the $n$ -by- $n$ symmetric or Hermitian positive definite matrix $A$ whose scaling factors are to be computed. Only the diagonal elements of $A$ are referenced.
<i>lda</i>	The leading dimension of $a$ ; $lda \geq \max(1, n)$ .

## Output Parameters

<i>s</i>	Array, size $n$ . If $info = 0$ , the array $s$ contains the scale factors for $A$ .
<i>scond</i>	If $info = 0$ , <i>scond</i> contains the ratio of the smallest $s[i]$ to the largest $s[i]$ .
<i>amax</i>	Absolute value of the largest element of the matrix $A$ .

## Return Values

This function returns a value *info*.

If  $info = 0$ , the execution is successful.

If  $info = -i$ , parameter  $i$  had an illegal value.

If  $info = i$ , the  $i$ -th diagonal element of  $A$  is nonpositive.

## Application Notes

If  $scond \geq 0.1$  and  $amax$  is neither too large nor too small, it is not worth scaling by  $s$ .

If  $amax$  is very close to `SMLNUM` or very close to `BIGNUM`, the matrix  $A$  should be scaled.

## Description

The routine computes row and column scalings intended to equilibrate a symmetric (Hermitian) positive definite matrix *A* in packed storage and reduce its condition number (with respect to the two-norm). The output array *s* returns scale factors such that contains

$$s(i) = \frac{1}{\sqrt{a_{i,i}}}$$

These factors are chosen so that the scaled matrix  $B$  with elements  $b_{ij}=s[i-1]*a_{ij}*s[j-1]$  has diagonal elements equal to 1.

This choice of  $s$  puts the condition number of  $B$  within a factor  $n$  of the smallest possible condition number over all possible diagonal scalings.

### Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<code>uplo</code>	Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of $A$ is packed in the array $ap$ : If <code>uplo = 'U'</code> , the array $ap$ stores the upper triangular part of the matrix $A$ . If <code>uplo = 'L'</code> , the array $ap$ stores the lower triangular part of the matrix $A$ .
<code>n</code>	The order of matrix $A$ ; $n \geq 0$ .
<code>ap</code>	Array, size at least $\max(1, n(n+1)/2)$ . The array $ap$ contains the upper or the lower triangular part of the matrix $A$ (as specified by <code>uplo</code> ) in <i>packed storage</i> (see <a href="#">Matrix Storage Schemes</a> ).

### Output Parameters

<code>s</code>	Array, size ( $n$ ). If <code>info = 0</code> , the array $s$ contains the scale factors for $A$ .
<code>scond</code>	If <code>info = 0</code> , <code>scond</code> contains the ratio of the smallest $s[i]$ to the largest $s[i]$ .
<code>amax</code>	Absolute value of the largest element of the matrix $A$ .

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

If *info* = *i*, the *i*-th diagonal element of *A* is nonpositive.

## Application Notes

If *scond* ≥ 0.1 and *amax* is neither too large nor too small, it is not worth scaling by *s*.

If *amax* is very close to SMLNUM or very close to BIGNUM, the matrix *A* should be scaled.

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Must be 'U' or 'L'.  Indicates whether the upper or lower triangular part of <i>A</i> is stored in the array <i>ab</i> :  If <i>uplo</i> = 'U', the array <i>ab</i> stores the upper triangular part of the matrix <i>A</i> .  If <i>uplo</i> = 'L', the array <i>ab</i> stores the lower triangular part of the matrix <i>A</i> .
<i>n</i>	The order of matrix <i>A</i> ; $n \geq 0$ .
<i>kd</i>	The number of superdiagonals or subdiagonals in the matrix <i>A</i> ; $kd \geq 0$ .
<i>ab</i>	Array, size $\max(1, ldab * n)$ .  The array <i>ap</i> contains either the upper or the lower triangular part of the matrix <i>A</i> (as specified by <i>uplo</i> ) in <i>band storage</i> (see <a href="#">Matrix Storage Schemes</a> ).
<i>ldab</i>	The leading dimension of the array <i>ab</i> ; $ldab \geq kd + 1$ .

## Output Parameters

<i>s</i>	Array, size ( <i>n</i> ).  If <i>info</i> = 0, the array <i>s</i> contains the scale factors for <i>A</i> .
<i>scond</i>	If <i>info</i> = 0, <i>scond</i> contains the ratio of the smallest $s[i]$ to the largest $s[i]$ .
<i>amax</i>	Absolute value of the largest element of the matrix <i>A</i> .

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

If *info* = *i*, the *i*-th diagonal element of *A* is nonpositive.

## Application Notes

If  $scond \geq 0.1$  and *amax* is neither too large nor too small, it is not worth scaling by *s*.

If *amax* is very close to SMLNUM or very close to BIGNUM, the matrix *A* should be scaled.

## ?syequb

Computes row and column scaling factors intended to equilibrate a symmetric indefinite matrix and reduce its condition number.

### Syntax

```
lapack_int LAPACKE_ssysequb( int matrix_layout, char uplo, lapack_int n, const float* a,
lapack_int lda, float* s, float* scond, float* amax );
```

```
lapack_int LAPACKE_dsyequb( int matrix_layout, char uplo, lapack_int n, const double*
a, lapack_int lda, double* s, double* scond, double* amax );
```

```
lapack_int LAPACKE_csyequb( int matrix_layout, char uplo, lapack_int n, const
lapack_complex_float* a, lapack_int lda, float* s, float* scond, float* amax );
```

```
lapack_int LAPACKE_zsyequb( int matrix_layout, char uplo, lapack_int n, const
lapack_complex_double* a, lapack_int lda, double* s, double* scond, double* amax );
```

### Include Files

- mkl.h

### Description

The routine computes row and column scalings intended to equilibrate a symmetric indefinite matrix  $A$  and reduce its condition number (with respect to the two-norm).

The array  $s$  contains the scale factors,  $s[i-1] = 1/\sqrt{A(i,i)}$ . These factors are chosen so that the scaled matrix  $B$  with elements  $b_{i,j}=s[i-1]*a_{i,j}*s[j-1]$  has ones on the diagonal.

This choice of  $s$  puts the condition number of  $B$  within a factor  $n$  of the smallest possible condition number over all possible diagonal scalings.

### Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of $A$ is stored: If <i>uplo</i> = 'U', the array $a$ stores the upper triangular part of the matrix $A$ . If <i>uplo</i> = 'L', the array $a$ stores the lower triangular part of the matrix $A$ .
<i>n</i>	The order of the matrix $A$ ; $n \geq 0$ .
<i>a</i>	Array $a$ : $\max(1, lda*n)$ . Contains the $n$ -by- $n$ symmetric indefinite matrix $A$ whose scaling factors are to be computed. Only the diagonal elements of $A$ are referenced.
<i>lda</i>	The leading dimension of $a$ ; $lda \geq \max(1, n)$ .

## Output Parameters

<i>s</i>	Array, size ( <i>n</i> ). If <i>info</i> = 0, the array <i>s</i> contains the scale factors for <i>A</i> .
<i>scond</i>	If <i>info</i> = 0, <i>scond</i> contains the ratio of the smallest <i>s</i> [ <i>i</i> ] to the largest <i>s</i> [ <i>i</i> ]. If <i>scond</i> ≥ 0.1, and <i>amax</i> is neither too large nor too small, it is not worth scaling by <i>s</i> .
<i>amax</i>	Absolute value of the largest element of the matrix <i>A</i> . If <i>amax</i> is very close to SMLNUM or BIGNUM, the matrix should be scaled.

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

If *info* = *i*, the *i*-th diagonal element of *A* is nonpositive.

### ?heequb

*Computes row and column scaling factors intended to equilibrate a Hermitian indefinite matrix and reduce its condition number.*

## Syntax

```
lapack_int LAPACKE_cheequb( int matrix_layout, char uplo, lapack_int n, const
lapack_complex_float* a, lapack_int lda, float* s, float* scnd, float* amax );
lapack_int LAPACKE_zheequb( int matrix_layout, char uplo, lapack_int n, const
lapack_complex_double* a, lapack_int lda, double* s, double* scnd, double* amax );
```

## Include Files

- mkl.h

## Description

The routine computes row and column scalings intended to equilibrate a Hermitian indefinite matrix *A* and reduce its condition number (with respect to the two-norm).

The array *s* contains the scale factors,  $s[i-1] = 1/\sqrt{a_{i,i}}$ . These factors are chosen so that the scaled matrix *B* with elements  $b_{i,j}=s[i-1]*a_{i,j}*s[j-1]$  has ones on the diagonal.

This choice of *s* puts the condition number of *B* within a factor *n* of the smallest possible condition number over all possible diagonal scalings.

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
----------------------	---

<i>uplo</i>	Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of <i>A</i> is stored: If <i>uplo</i> = 'U', the array <i>a</i> stores the upper triangular part of the matrix <i>A</i> . If <i>uplo</i> = 'L', the array <i>a</i> stores the lower triangular part of the matrix <i>A</i> .
<i>n</i>	The order of the matrix <i>A</i> ; $n \geq 0$ .
<i>a</i>	Array <i>a</i> : size $\max(1, lda * n)$ . Contains the <i>n</i> -by- <i>n</i> symmetric indefinite matrix <i>A</i> whose scaling factors are to be computed. Only the diagonal elements of <i>A</i> are referenced.
<i>lda</i>	The leading dimension of <i>a</i> ; $lda \geq \max(1, m)$ .

## Output Parameters

<i>s</i>	Array, size ( <i>n</i> ). If <i>info</i> = 0, the array <i>s</i> contains the scale factors for <i>A</i> .
<i>scond</i>	If <i>info</i> = 0, <i>scond</i> contains the ratio of the smallest <i>s</i> [ <i>i</i> ] to the largest <i>s</i> [ <i>i</i> ]. If <i>scond</i> $\geq 0.1$ , and <i>amax</i> is neither too large nor too small, it is not worth scaling by <i>s</i> .
<i>amax</i>	Absolute value of the largest element of the matrix <i>A</i> . If <i>amax</i> is very close to SMLNUM or BIGNUM, the matrix should be scaled.

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

If *info* = *i*, the *i*-th diagonal element of *A* is nonpositive.

## LAPACK Linear Equation Driver Routines

Table "Driver Routines for Solving Systems of Linear Equations" lists the LAPACK driver routines for solving systems of linear equations with real or complex matrices.

### Driver Routines for Solving Systems of Linear Equations

Matrix type, storage scheme	Simple Driver	Expert Driver	Expert Driver using Extra-Precise Iterative Refinement
general	?gesv	?gesvx	?gesvxx
general band	?gbsv	?gbsvx	?gbsvxx

Matrix type, storage scheme	Simple Driver	Expert Driver	Expert Driver using Extra-Precise Iterative Refinement
general tridiagonal	?gtsv	?gtsvx	
diagonally dominant tridiagonal	?dtsvb		
symmetric/Hermitian positive-definite	?posv	?posvx	?posvxx
symmetric/Hermitian positive-definite, storage	?ppsv	?ppsvx	
symmetric/Hermitian positive-definite, band	?pbsv	?pbsvx	
symmetric/Hermitian positive-definite, tridiagonal	?ptsv	?ptsvx	
symmetric/Hermitian indefinite	?sysv/?hesv ?sysv_rook/?sysv_rk/ ?hesv_rk ?sysv_aa/?hesv_aa	?sysvx/?hesvx	?sysvxx/?hesvxx
symmetric/Hermitian indefinite, packed storage	?spsv/?hpsv	?spsvx/?hpsvx	
complex symmetric	?sysv ?sysv_rook	?sysvx	
complex symmetric, packed storage	?spsv	?spsvx	

In this table ? stands for s (single precision real), d (double precision real), c (single precision complex), or z (double precision complex). In the description of ?gesv and ?posv routines, the ? sign stands for combined character codes ds and zc for the mixed precision subroutines.

### ?gesv

Computes the solution to the system of linear equations with a square coefficient matrix *A* and multiple right-hand sides.

### Syntax

```
lapack_int LAPACKE_sgesv (int matrix_layout , lapack_int n , lapack_int nrhs , float *
a , lapack_int lda , lapack_int * ipiv , float * b , lapack_int ldb );

lapack_int LAPACKE_dgesv (int matrix_layout , lapack_int n , lapack_int nrhs , double *
a , lapack_int lda , lapack_int * ipiv , double * b , lapack_int ldb );

lapack_int LAPACKE_cgesv (int matrix_layout , lapack_int n , lapack_int nrhs ,
lapack_complex_float * a , lapack_int lda , lapack_int * ipiv , lapack_complex_float *
b , lapack_int ldb );
```

```

lapack_int LAPACKE_zgesv (int matrix_layout , lapack_int n , lapack_int nrhs ,
lapack_complex_double * a , lapack_int lda , lapack_int * ipiv , lapack_complex_double
* b , lapack_int ldb );

lapack_int LAPACKE_dsgesv (int matrix_layout, lapack_int n, lapack_int nrhs, double *
a, lapack_int lda, lapack_int * ipiv, double * b, lapack_int ldb, double * x, lapack_int
ldx, lapack_int * iter);

lapack_int LAPACKE_zcgesv (int matrix_layout, lapack_int n, lapack_int nrhs,
lapack_complex_double * a, lapack_int lda, lapack_int * ipiv, lapack_complex_double *
b, lapack_int ldb, lapack_complex_double * x, lapack_int ldx, lapack_int * iter);

```

## Include Files

- mkl.h

## Description

The routine solves for  $X$  the system of linear equations  $A * X = B$ , where  $A$  is an  $n$ -by- $n$  matrix, the columns of matrix  $B$  are individual right-hand sides, and the columns of  $X$  are the corresponding solutions.

The  $LU$  decomposition with partial pivoting and row interchanges is used to factor  $A$  as  $A = P * L * U$ , where  $P$  is a permutation matrix,  $L$  is unit lower triangular, and  $U$  is upper triangular. The factored form of  $A$  is then used to solve the system of equations  $A * X = B$ .

The `dsgesv` and `zcgesv` are mixed precision iterative refinement subroutines for exploiting fast single precision hardware. They first attempt to factorize the matrix in single precision (`dsgesv`) or single complex precision (`zcgesv`) and use this factorization within an iterative refinement procedure to produce a solution with double precision (`dsgesv`) / double complex precision (`zcgesv`) normwise backward error quality (see below). If the approach fails, the method switches to a double precision or double complex precision factorization respectively and computes the solution.

The iterative refinement is not going to be a winning strategy if the ratio single precision performance over double precision performance is too small. A reasonable strategy should take the number of right-hand sides and the size of the matrix into account. This might be done with a call to `ilaenv` in the future. At present, iterative refinement is implemented.

The iterative refinement process is stopped if

```
iter > itermax
```

or for all the right-hand sides:

```
rnmr < sqrt(n)*xnrm*anrm*eps*bwdmax
```

where

- `iter` is the number of the current iteration in the iterativerefinement process
- `rnmr` is the infinity-norm of the residual
- `xnrm` is the infinity-norm of the solution
- `anrm` is the infinity-operator-norm of the matrix  $A$
- `eps` is the machine epsilon returned by `dlamch ('Epsilon')`.

The values `itermax` and `bwdmax` are fixed to 30 and 1.0d+00 respectively.

## Input Parameters

`matrix_layout` Specifies whether matrix storage layout is row major (LAPACK\_ROW\_MAJOR) or column major (LAPACK\_COL\_MAJOR).

<i>n</i>	The number of linear equations, that is, the order of the matrix <i>A</i> ; $n \geq 0$ .
<i>nrhs</i>	The number of right-hand sides, that is, the number of columns of the matrix <i>B</i> ; $nrhs \geq 0$ .
<i>a</i>	The array <i>a</i> (size $\max(1, lda * n)$ ) contains the <i>n</i> -by- <i>n</i> coefficient matrix <i>A</i> .
<i>b</i>	The array <i>b</i> of size $\max(1, ldb * nrhs)$ for column major layout and $\max(1, ldb * n)$ for row major layout contains the <i>n</i> -by- <i>nrhs</i> matrix of right hand side matrix <i>B</i> .
<i>lda</i>	The leading dimension of the array <i>a</i> ; $lda \geq \max(1, n)$ .
<i>ldb</i>	The leading dimension of the array <i>b</i> ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.
<i>ldx</i>	The leading dimension of the array <i>x</i> ; $ldx \geq \max(1, n)$ for column major layout and $ldx \geq nrhs$ for row major layout.

## Output Parameters

<i>a</i>	<p>Overwritten by the factors <i>L</i> and <i>U</i> from the factorization of <math>A = P * L * U</math>; the unit diagonal elements of <i>L</i> are not stored.</p> <p>If iterative refinement has been successfully used (<math>info = 0</math> and <math>iter \geq 0</math>), then <i>A</i> is unchanged.</p> <p>If double precision factorization has been used (<math>info = 0</math> and <math>iter &lt; 0</math>), then the array <i>A</i> contains the factors <i>L</i> and <i>U</i> from the factorization <math>A = P * L * U</math>; the unit diagonal elements of <i>L</i> are not stored.</p>
<i>b</i>	Overwritten by the solution matrix <i>X</i> for <i>dgesv</i> , <i>sgesv</i> , <i>zgesv</i> , <i>zgesv</i> . Unchanged for <i>dsgesv</i> and <i>zcgsv</i> .
<i>ipiv</i>	Array, size at least $\max(1, n)$ . The pivot indices that define the permutation matrix <i>P</i> ; row <i>i</i> of the matrix was interchanged with row <i>ipiv</i> [ <i>i</i> -1]. Corresponds to the single precision factorization (if $info = 0$ and $iter \geq 0$ ) or the double precision factorization (if $info = 0$ and $iter < 0$ ).
<i>x</i>	Array, size $\max(1, ldx * nrhs)$ for column major layout and $\max(1, ldx * n)$ for row major layout. If $info = 0$ , contains the <i>n</i> -by- <i>nrhs</i> solution matrix <i>X</i> .
<i>iter</i>	<p>If <math>iter &lt; 0</math>: iterative refinement has failed, double precision factorization has been performed</p> <ul style="list-style-type: none"> <li>• If <math>iter = -1</math>: the routine fell back to full precision for implementation- or machine-specific reason</li> <li>• If <math>iter = -2</math>: narrowing the precision induced an overflow, the routine fell back to full precision</li> <li>• If <math>iter = -3</math>: failure of <i>sgetrf</i> for <i>dsgesv</i>, or <i>cgetrf</i> for <i>zcgsv</i></li> <li>• If <math>iter = -31</math>: stop the iterative refinement after the 30th iteration.</li> </ul>

If  $iter > 0$ : iterative refinement has been successfully used. Returns the number of iterations.

## Return Values

This function returns a value *info*.

If  $info=0$ , the execution is successful.

If  $info = -i$ , parameter *i* had an illegal value.

If  $info = i$ ,  $U_{i, i}$  (computed in double precision for mixed precision subroutines) is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution could not be computed.

## Include Files

- `mkl.h`

## Description

The routine uses the *LU* factorization to compute the solution to a real or complex system of linear equations  $A \cdot X = B$ , where *A* is an *n*-by-*n* matrix, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine `?gesvx` performs the following steps:

1. If `fact = 'E'`, real scaling factors  $r$  and  $c$  are computed to equilibrate the system:

$$\text{trans} = \text{'N'}: \text{diag}(r) * A * \text{diag}(c) * \text{inv}(\text{diag}(c)) * X = \text{diag}(r) * B$$

$$\text{trans} = \text{'T'}: (\text{diag}(r) * A * \text{diag}(c))^T * \text{inv}(\text{diag}(r)) * X = \text{diag}(c) * B$$

$$\text{trans} = \text{'C'}: (\text{diag}(r) * A * \text{diag}(c))^H * \text{inv}(\text{diag}(r)) * X = \text{diag}(c) * B$$

Whether or not the system will be equilibrated depends on the scaling of the matrix  $A$ , but if equilibration is used,  $A$  is overwritten by  $\text{diag}(r) * A * \text{diag}(c)$  and  $B$  by  $\text{diag}(r) * B$  (if `trans='N'`) or  $\text{diag}(c) * B$  (if `trans = 'T'` or `'C'`).

2. If `fact = 'N'` or `'E'`, the  $LU$  decomposition is used to factor the matrix  $A$  (after equilibration if `fact = 'E'`) as  $A = P * L * U$ , where  $P$  is a permutation matrix,  $L$  is a unit lower triangular matrix, and  $U$  is upper triangular.
3. If some  $U_{i,i} = 0$ , so that  $U$  is exactly singular, then the routine returns with `info = i`. Otherwise, the factored form of  $A$  is used to estimate the condition number of the matrix  $A$ . If the reciprocal of the condition number is less than machine precision, `info = n + 1` is returned as a warning, but the routine still goes on to solve for  $X$  and compute error bounds as described below.
4. The system of equations is solved for  $X$  using the factored form of  $A$ .
5. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.
6. If equilibration was used, the matrix  $X$  is premultiplied by  $\text{diag}(c)$  (if `trans = 'N'`) or  $\text{diag}(r)$  (if `trans = 'T'` or `'C'`) so that it solves the original system before equilibration.

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<code>fact</code>	<p>Must be 'F', 'N', or 'E'.</p> <p>Specifies whether or not the factored form of the matrix <math>A</math> is supplied on entry, and if not, whether the matrix <math>A</math> should be equilibrated before it is factored.</p> <p>If <code>fact = 'F'</code>: on entry, <code>af</code> and <code>ipiv</code> contain the factored form of <math>A</math>. If <code>equed</code> is not 'N', the matrix <math>A</math> has been equilibrated with scaling factors given by <math>r</math> and <math>c</math>. <code>a</code>, <code>af</code>, and <code>ipiv</code> are not modified.</p> <p>If <code>fact = 'N'</code>, the matrix <math>A</math> will be copied to <code>af</code> and factored.</p> <p>If <code>fact = 'E'</code>, the matrix <math>A</math> will be equilibrated if necessary, then copied to <code>af</code> and factored.</p>
<code>trans</code>	<p>Must be 'N', 'T', or 'C'.</p> <p>Specifies the form of the system of equations:</p> <p>If <code>trans = 'N'</code>, the system has the form <math>A * X = B</math> (No transpose).</p> <p>If <code>trans = 'T'</code>, the system has the form <math>A^T * X = B</math> (Transpose).</p> <p>If <code>trans = 'C'</code>, the system has the form <math>A^H * X = B</math> (Transpose for real flavors, conjugate transpose for complex flavors).</p>
<code>n</code>	The number of linear equations; the order of the matrix $A$ ; $n \geq 0$ .

<i>nrhs</i>	The number of right hand sides; the number of columns of the matrices <i>B</i> and <i>X</i> ; $nrhs \geq 0$ .
<i>a</i>	The array <i>a</i> (size $\max(1, lda * n)$ ) contains the matrix <i>A</i> . If <i>fact</i> = 'F' and <i>equed</i> is not 'N', then <i>A</i> must have been equilibrated by the scaling factors in <i>r</i> and/or <i>c</i> .
<i>af</i>	The array <i>afaf</i> (size $\max(1, ldaf * n)$ ) is an input argument if <i>fact</i> = 'F'. It contains the factored form of the matrix <i>A</i> , that is, the factors <i>L</i> and <i>U</i> from the factorization $A = P * L * U$ as computed by <code>?getrf</code> . If <i>equed</i> is not 'N', then <i>af</i> is the factored form of the equilibrated matrix <i>A</i> .
<i>b</i>	The array <i>b</i> of size $\max(1, ldb * nrhs)$ for column major layout and $\max(1, ldb * n)$ for row major layout contains the matrix <i>B</i> whose columns are the right-hand sides for the systems of equations.
<i>lda</i>	The leading dimension of <i>a</i> ; $lda \geq \max(1, n)$ .
<i>ldaf</i>	The leading dimension of <i>af</i> ; $ldaf \geq \max(1, n)$ .
<i>ldb</i>	The leading dimension of <i>b</i> ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.
<i>ipiv</i>	Array, size at least $\max(1, n)$ . The array <i>ipiv</i> is an input argument if <i>fact</i> = 'F'. It contains the pivot indices from the factorization $A = P * L * U$ as computed by <code>?getrf</code> ; row <i>i</i> of the matrix was interchanged with row <i>ipiv</i> [ <i>i</i> -1].
<i>equed</i>	Must be 'N', 'R', 'C', or 'B'.  <i>equed</i> is an input argument if <i>fact</i> = 'F'. It specifies the form of equilibration that was done:  If <i>equed</i> = 'N', no equilibration was done (always true if <i>fact</i> = 'N').  If <i>equed</i> = 'R', row equilibration was done, that is, <i>A</i> has been premultiplied by <i>diag</i> ( <i>r</i> ).  If <i>equed</i> = 'C', column equilibration was done, that is, <i>A</i> has been postmultiplied by <i>diag</i> ( <i>c</i> ).  If <i>equed</i> = 'B', both row and column equilibration was done, that is, <i>A</i> has been replaced by <i>diag</i> ( <i>r</i> ) * <i>A</i> * <i>diag</i> ( <i>c</i> ).
<i>r, c</i>	Arrays: <i>r</i> (size <i>n</i> ), <i>c</i> (size <i>n</i> ). The array <i>r</i> contains the row scale factors for <i>A</i> , and the array <i>c</i> contains the column scale factors for <i>A</i> . These arrays are input arguments if <i>fact</i> = 'F' only; otherwise they are output arguments.  If <i>equed</i> = 'R' or 'B', <i>A</i> is multiplied on the left by <i>diag</i> ( <i>r</i> ); if <i>equed</i> = 'N' or 'C', <i>r</i> is not accessed.  If <i>fact</i> = 'F' and <i>equed</i> = 'R' or 'B', each element of <i>r</i> must be positive.  If <i>equed</i> = 'C' or 'B', <i>A</i> is multiplied on the right by <i>diag</i> ( <i>c</i> ); if <i>equed</i> = 'N' or 'R', <i>c</i> is not accessed.

If  $fact = 'F'$  and  $equed = 'C'$  or  $'B'$ , each element of  $c$  must be positive.

$ldx$

The leading dimension of the output array  $x$ ;  $ldx \geq \max(1, n)$  for column major layout and  $ldx \geq nrhs$  for row major layout.

## Output Parameters

$x$

Array, size  $\max(1, ldx * nrhs)$  for column major layout and  $\max(1, ldx * n)$  for row major layout.

If  $info = 0$  or  $info = n+1$ , the array  $x$  contains the solution matrix  $X$  to the *original* system of equations. Note that  $A$  and  $B$  are modified on exit if  $equed \neq 'N'$ , and the solution to the *equilibrated* system is:

$diag(C)^{-1} * X$ , if  $trans = 'N'$  and  $equed = 'C'$  or  $'B'$ ;  
 $diag(R)^{-1} * X$ , if  $trans = 'T'$  or  $'C'$  and  $equed = 'R'$  or  $'B'$ . The second dimension of  $x$  must be at least  $\max(1, nrhs)$ .

$a$

Array  $a$  is not modified on exit if  $fact = 'F'$  or  $'N'$ , or if  $fact = 'E'$  and  $equed = 'N'$ . If  $equed \neq 'N'$ ,  $A$  is scaled on exit as follows:

$equed = 'R'$ :  $A = diag(R) * A$   
 $equed = 'C'$ :  $A = A * diag(c)$   
 $equed = 'B'$ :  $A = diag(R) * A * diag(c)$ .

$af$

If  $fact = 'N'$  or  $'E'$ , then  $af$  is an output argument and on exit returns the factors  $L$  and  $U$  from the factorization  $A = PLU$  of the original matrix  $A$  (if  $fact = 'N'$ ) or of the equilibrated matrix  $A$  (if  $fact = 'E'$ ). See the description of  $a$  for the form of the equilibrated matrix.

$b$

Overwritten by  $diag(r) * B$  if  $trans = 'N'$  and  $equed = 'R'$  or  $'B'$ ;  
 overwritten by  $diag(c) * B$  if  $trans = 'T'$  or  $'C'$  and  $equed = 'C'$  or  $'B'$ ;  
 not changed if  $equed = 'N'$ .

$r, c$

These arrays are output arguments if  $fact \neq 'F'$ . See the description of  $r, c$  in *Input Arguments* section.

$rcond$

An estimate of the reciprocal condition number of the matrix  $A$  after equilibration (if done). If  $rcond$  is less than the machine precision, in particular, if  $rcond = 0$ , the matrix is singular to working precision. This condition is indicated by a return code of  $info > 0$ .

$ferr$

Array, size at least  $\max(1, nrhs)$ . Contains the estimated forward error bound for each solution vector  $x_j$  (the  $j$ -th column of the solution matrix  $X$ ). If  $x_{true}$  is the true solution corresponding to  $x_j$ ,  $ferr[j-1]$  is an estimated upper bound for the magnitude of the largest element in  $(x_j - x_{true})$  divided by the magnitude of the largest element in  $x_j$ . The estimate is as reliable as the estimate for  $rcond$ , and is almost always a slight overestimate of the true error.

<i>berr</i>	Array, size at least $\max(1, nrhs)$ . Contains the component-wise relative backward error for each solution vector $x_j$ , that is, the smallest relative change in any element of $A$ or $B$ that makes $x_j$ an exact solution.
<i>ipiv</i>	If <i>fact</i> = 'N' or 'E', then <i>ipiv</i> is an output argument and on exit contains the pivot indices from the factorization $A = P*L*U$ of the original matrix $A$ (if <i>fact</i> = 'N') or of the equilibrated matrix $A$ (if <i>fact</i> = 'E').
<i>equed</i>	If <i>fact</i> ≠ 'F', then <i>equed</i> is an output argument. It specifies the form of equilibration that was done (see the description of <i>equed</i> in <i>Input Arguments</i> section).
<i>rpivot</i>	On exit, <i>rpivot</i> contains the reciprocal pivot growth factor:

$$\|A\|/\|U\|$$

If *rpivot* is much less than 1, then the stability of the  $LU$  factorization of the (equilibrated) matrix  $A$  could be poor. This also means that the solution  $x$ , condition estimator *rcond*, and forward error bound *ferr* could be unreliable. If factorization fails with  $0 < info \leq n$ , then *rpivot* contains the reciprocal pivot growth factor for the leading *info* columns of  $A$ .

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

If *info* = *i*, and  $i \leq n$ , then  $U(i, i)$  is exactly zero. The factorization has been completed, but the factor  $U$  is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned.

If *info* =  $n + 1$ , then  $U$  is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

## Description

The routine uses the *LU* factorization to compute the solution to a real or complex system of linear equations  $A \cdot X = B$ , where  $A$  is an  $n$ -by- $n$  matrix, the columns of the matrix  $B$  are individual right-hand sides, and the columns of  $X$  are the corresponding solutions.

Both normwise and maximum componentwise error bounds are also provided on request. The routine returns a solution with a small guaranteed error ( $O(\text{eps})$ ), where  $\text{eps}$  is the working machine precision) unless the matrix is very ill-conditioned, in which case a warning is returned. Relevant condition numbers are also calculated and returned.

The routine accepts user-provided factorizations and equilibration factors; see definitions of the *fact* and *equed* options. Solving with refinement and using a factorization from a previous call of the routine also produces a solution with  $O(\text{eps})$  errors or warnings but that may not be true for general user-provided factorizations and equilibration factors if they differ from what the routine would itself produce.

The routine `?gesvxx` performs the following steps:

1. If *fact* = 'E', scaling factors  $r$  and  $c$  are computed to equilibrate the system:

$$\text{trans} = \text{'N'}: \text{diag}(r) * A * \text{diag}(c) * \text{inv}(\text{diag}(c)) * X = \text{diag}(r) * B$$

$$\text{trans} = \text{'T'}: (\text{diag}(r) * A * \text{diag}(c))^T * \text{inv}(\text{diag}(r)) * X = \text{diag}(c) * B$$

$$\text{trans} = \text{'C'}: (\text{diag}(r) * A * \text{diag}(c))^H * \text{inv}(\text{diag}(r)) * X = \text{diag}(c) * B$$

Whether or not the system will be equilibrated depends on the scaling of the matrix  $A$ , but if equilibration is used,  $A$  is overwritten by  $\text{diag}(r) * A * \text{diag}(c)$  and  $B$  by  $\text{diag}(r) * B$  (if *trans*='N') or  $\text{diag}(c) * B$  (if *trans* = 'T' or 'C').

2. If *fact* = 'N' or 'E', the *LU* decomposition is used to factor the matrix  $A$  (after equilibration if *fact* = 'E') as  $A = P * L * U$ , where  $P$  is a permutation matrix,  $L$  is a unit lower triangular matrix, and  $U$  is upper triangular.

3. If some  $U_{i,i} = 0$ , so that  $U$  is exactly singular, then the routine returns with  $info = i$ . Otherwise, the factored form of  $A$  is used to estimate the condition number of the matrix  $A$  (see the  $rcond$  parameter). If the reciprocal of the condition number is less than machine precision, the routine still goes on to solve for  $X$  and compute error bounds.
4. The system of equations is solved for  $X$  using the factored form of  $A$ .
5. By default, unless is set to zero, the routine applies iterative refinement to improve the computed solution matrix and calculate error bounds. Refinement calculates the residual to at least twice the working precision.
6. If equilibration was used, the matrix  $X$  is premultiplied by  $diag(c)$  (if  $trans = 'N'$ ) or  $diag(r)$  (if  $trans = 'T'$  or  $'C'$ ) so that it solves the original system before equilibration.

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>fact</i>	<p>Must be 'F', 'N', or 'E'.</p> <p>Specifies whether or not the factored form of the matrix <math>A</math> is supplied on entry, and if not, whether the matrix <math>A</math> should be equilibrated before it is factored.</p> <p>If <math>fact = 'F'</math>, on entry, <math>af</math> and <math>ipiv</math> contain the factored form of <math>A</math>. If <math>equed</math> is not 'N', the matrix <math>A</math> has been equilibrated with scaling factors given by <math>r</math> and <math>c</math>. Parameters <math>a</math>, <math>af</math>, and <math>ipiv</math> are not modified.</p> <p>If <math>fact = 'N'</math>, the matrix <math>A</math> will be copied to <math>af</math> and factored.</p> <p>If <math>fact = 'E'</math>, the matrix <math>A</math> will be equilibrated, if necessary, copied to <math>af</math> and factored.</p>
<i>trans</i>	<p>Must be 'N', 'T', or 'C'.</p> <p>Specifies the form of the system of equations:</p> <p>If <math>trans = 'N'</math>, the system has the form <math>A * X = B</math> (No transpose).</p> <p>If <math>trans = 'T'</math>, the system has the form <math>A^T * X = B</math> (Transpose).</p> <p>If <math>trans = 'C'</math>, the system has the form <math>A^H * X = B</math> (Conjugate Transpose = Transpose for real flavors, Conjugate Transpose for complex flavors).</p>
<i>n</i>	The number of linear equations; the order of the matrix $A$ ; $n \geq 0$ .
<i>nrhs</i>	The number of right hand sides; the number of columns of the matrices $B$ and $X$ ; $nrhs \geq 0$ .
<i>a, af, b</i>	<p>Arrays: <math>a</math>(size <math>\max(lda * n)</math>), <math>af</math>(size <math>\max(ldaf * n)</math>), <math>b</math>(size <math>\max(1, ldb * nrhs)</math>) for column major layout and <math>\max(1, ldb * n)</math> for row major layout).</p> <p>The array <math>a</math> contains the matrix <math>A</math>. If <math>fact = 'F'</math> and <math>equed</math> is not 'N', then <math>A</math> must have been equilibrated by the scaling factors in <math>r</math> and/or <math>c</math>.</p>

The array *af* is an input argument if *fact* = 'F'. It contains the factored form of the matrix *A*, that is, the factors *L* and *U* from the factorization  $A = P*L*U$  as computed by `?getrf`. If *equed* is not 'N', then *af* is the factored form of the equilibrated matrix *A*.

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations.

*lda*

The leading dimension of *a*;  $lda \geq \max(1, n)$ .

*ldaf*

The leading dimension of *af*;  $ldaf \geq \max(1, n)$ .

*ipiv*

Array, size at least  $\max(1, n)$ . The array *ipiv* is an input argument if *fact* = 'F'. It contains the pivot indices from the factorization  $A = P*L*U$  as computed by `?getrf`; row *i* of the matrix was interchanged with row *ipiv*[*i*-1].

*equed*

Must be 'N', 'R', 'C', or 'B'.

*equed* is an input argument if *fact* = 'F'. It specifies the form of equilibration that was done:

If *equed* = 'N', no equilibration was done (always true if *fact* = 'N').

If *equed* = 'R', row equilibration was done, that is, *A* has been premultiplied by *diag*(*r*).

If *equed* = 'C', column equilibration was done, that is, *A* has been postmultiplied by *diag*(*c*).

If *equed* = 'B', both row and column equilibration was done, that is, *A* has been replaced by  $diag(r)*A*diag(c)$ .

*r, c*

Arrays: *r* (size *n*), *c* (size *n*). The array *r* contains the row scale factors for *A*, and the array *c* contains the column scale factors for *A*. These arrays are input arguments if *fact* = 'F' only; otherwise they are output arguments.

If *equed* = 'R' or 'B', *A* is multiplied on the left by *diag*(*r*); if *equed* = 'N' or 'C', *r* is not accessed.

If *fact* = 'F' and *equed* = 'R' or 'B', each element of *r* must be positive.

If *equed* = 'C' or 'B', *A* is multiplied on the right by *diag*(*c*); if *equed* = 'N' or 'R', *c* is not accessed.

If *fact* = 'F' and *equed* = 'C' or 'B', each element of *c* must be positive.

Each element of *r* or *c* should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

*ldb*

The leading dimension of the array *b*;  $ldb \geq \max(1, n)$  for column major layout and  $ldb \geq nrhs$  for row major layout.

<code>ldx</code>	The leading dimension of the output array <code>x</code> ; $ldx \geq \max(1, n)$ for column major layout and $ldx \geq nrhs$ for row major layout.								
<code>n_err_bnds</code>	Number of error bounds to return for each right hand side and each type (normwise or componentwise). See <code>err_bnds_norm</code> and <code>err_bnds_comp</code> descriptions in <i>Output Arguments</i> section below.								
<code>nparams</code>	Specifies the number of parameters set in <code>params</code> . If $\leq 0$ , the <code>params</code> array is never referenced and default values are used.								
<code>params</code>	<p>Array, size <math>\max(1, nparams)</math>. Specifies algorithm parameters. If an entry is less than 0.0, that entry is filled with the default value used for that parameter. Only positions up to <code>nparams</code> are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass <code>nparams = 0</code>, which prevents the source code from accessing the <code>params</code> argument.</p> <p><code>params[0]</code> : Whether to perform iterative refinement or not. Default: 1.0</p> <table> <tr> <td>=0.0</td> <td>No refinement is performed and no error bounds are computed.</td> </tr> <tr> <td>=1.0</td> <td>Use the double-precision refinement algorithm, possibly with doubled-single computations if the compilation environment does not support double precision.</td> </tr> </table> <p>(Other values are reserved for future use.)</p> <p><code>params[1]</code> : Maximum number of residual computations allowed for refinement.</p> <table> <tr> <td>Default</td> <td>10.0</td> </tr> <tr> <td>Aggressive</td> <td>Set to 100.0 to permit convergence using approximate factorizations or factorizations other than <i>LU</i>. If the factorization uses a technique other than Gaussian elimination, the guarantees in <code>err_bnds_norm</code> and <code>err_bnds_comp</code> may no longer be trustworthy.</td> </tr> </table> <p><code>params[2]</code> : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).</p>	=0.0	No refinement is performed and no error bounds are computed.	=1.0	Use the double-precision refinement algorithm, possibly with doubled-single computations if the compilation environment does not support double precision.	Default	10.0	Aggressive	Set to 100.0 to permit convergence using approximate factorizations or factorizations other than <i>LU</i> . If the factorization uses a technique other than Gaussian elimination, the guarantees in <code>err_bnds_norm</code> and <code>err_bnds_comp</code> may no longer be trustworthy.
=0.0	No refinement is performed and no error bounds are computed.								
=1.0	Use the double-precision refinement algorithm, possibly with doubled-single computations if the compilation environment does not support double precision.								
Default	10.0								
Aggressive	Set to 100.0 to permit convergence using approximate factorizations or factorizations other than <i>LU</i> . If the factorization uses a technique other than Gaussian elimination, the guarantees in <code>err_bnds_norm</code> and <code>err_bnds_comp</code> may no longer be trustworthy.								

## Output Parameters

<code>x</code>	<p>Array, size <math>\max(1, ldx*nrhs)</math> for column major layout and <math>\max(1, ldx*n)</math> for row major layout.</p> <p>If <code>info = 0</code>, the array <code>x</code> contains the solution <math>n</math>-by-<code>nrhs</code> matrix <math>X</math> to the <i>original</i> system of equations. Note that <math>A</math> and <math>B</math> are modified on exit if <code>equed ≠ 'N'</code>, and the solution to the <i>equilibrated</i> system is:</p>
----------------	--

$\text{inv}(\text{diag}(c)) * X$ , if  $\text{trans} = 'N'$  and  $\text{equed} = 'C'$  or  $'B'$ ; or  
 $\text{inv}(\text{diag}(r)) * X$ , if  $\text{trans} = 'T'$  or  $'C'$  and  $\text{equed} = 'R'$  or  $'B'$ .

*a*

Array *a* is not modified on exit if  $\text{fact} = 'F'$  or  $'N'$ , or if  $\text{fact} = 'E'$  and  $\text{equed} = 'N'$ .

If  $\text{equed} \neq 'N'$ , *A* is scaled on exit as follows:

$\text{equed} = 'R'$ :  $A = \text{diag}(r) * A$

$\text{equed} = 'C'$ :  $A = A * \text{diag}(c)$

$\text{equed} = 'B'$ :  $A = \text{diag}(r) * A * \text{diag}(c)$ .

*af*

If  $\text{fact} = 'N'$  or  $'E'$ , then *af* is an output argument and on exit returns the factors *L* and *U* from the factorization  $A = PLU$  of the original matrix *A* (if  $\text{fact} = 'N'$ ) or of the equilibrated matrix *A* (if  $\text{fact} = 'E'$ ). See the description of *a* for the form of the equilibrated matrix.

*b*

Overwritten by  $\text{diag}(r) * B$  if  $\text{trans} = 'N'$  and  $\text{equed} = 'R'$  or  $'B'$ ;  
 overwritten by  $\text{trans} = 'T'$  or  $'C'$  and  $\text{equed} = 'C'$  or  $'B'$ ;  
 not changed if  $\text{equed} = 'N'$ .

*r, c*

These arrays are output arguments if  $\text{fact} \neq 'F'$ . Each element of these arrays is a power of the radix. See the description of *r, c* in *Input Arguments* section.

*rcond*

Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision, in particular, if  $\text{rcond} = 0$ , the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.

*rpvgrw*

Contains the reciprocal pivot growth factor:

$$\|A\|/\|U\|$$

If this is much less than 1, the stability of the *LU* factorization of the (equilibrated) matrix *A* could be poor. This also means that the solution *X*, estimated condition numbers, and error bounds could be unreliable. If factorization fails with  $0 < \text{info} \leq n$ , this parameter contains the reciprocal pivot growth factor for the leading *info* columns of *A*. In `?gesvx`, this quantity is returned in *rpivot*.

*berr*

Array, size at least  $\max(1, \text{nrhs})$ . Contains the componentwise relative backward error for each solution vector  $x_j$ , that is, the smallest relative change in any element of *A* or *B* that makes  $x_j$  an exact solution.

*err\_bnds\_norm*

Array of size  $\text{nrhs} * n_{\text{err\_bnds}}$ . For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:

Normwise relative error in the *i*-th solution vector

$$\frac{\max_j |X_{true_{ji}} - X_{ji}|}{\max_j |X_{ji}|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.

<code>err=1</code>	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors.
<code>err=2</code>	"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors. This error bound should only be trusted if the previous boolean is true.
<code>err=3</code>	Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix $Z$ are:

$$\|Z\|_{\infty} \cdot \|Z^{-1}\|_{\infty}$$

Let  $z=s*a$ , where  $s$  scales each row by a power of the radix so all absolute row sums of  $z$  are approximately 1.

The information for right-hand side  $i$ , where  $1 \leq i \leq nrhs$ , and type of error `err` is stored in `err_bnds_norm[(err-1)*nrhs + i - 1]`.

`err_bnds_comp`

Array of size `nrhs*n_err_bnds`. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:

Componentwise relative error in the  $i$ -th solution vector:

$$\max_j \frac{|X_{true_{ji}} - X_{ji}|}{|X_{ji}|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is not requested ( $params[2] = 0.0$ ), then  $err\_bnds\_comp$  is not accessed.

$err=1$	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold $\sqrt{n} * slamch(\epsilon)$ for single precision flavors and $\sqrt{n} * dlamch(\epsilon)$ for double precision flavors.
$err=2$	"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold $\sqrt{n} * slamch(\epsilon)$ for single precision flavors and $\sqrt{n} * dlamch(\epsilon)$ for double precision flavors. This error bound should only be trusted if the previous boolean is true.
$err=3$	Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold $\sqrt{n} * slamch(\epsilon)$ for single precision flavors and $\sqrt{n} * dlamch(\epsilon)$ for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix $Z$ are:

$$\|Z\|_{\infty} \cdot \|Z^{-1}\|_{\infty}$$

Let  $z = s * (a * \text{diag}(x))$ , where  $x$  is the solution for the current right-hand side and  $s$  scales each row of  $a * \text{diag}(x)$  by a power of the radix so all absolute row sums of  $z$  are approximately 1.

The information for right-hand side  $i$ , where  $1 \leq i \leq nrhs$ , and type of error  $err$  is stored in  $err\_bnds\_comp[(err-1)*nrhs + i - 1]$ .

$ipiv$	If $fact = 'N'$ or $'E'$ , then $ipiv$ is an output argument and on exit contains the pivot indices from the factorization $A = P * L * U$ of the original matrix $A$ (if $fact = 'N'$ ) or of the equilibrated matrix $A$ (if $fact = 'E'$ ).
$equed$	If $fact \neq 'F'$ , then $equed$ is an output argument. It specifies the form of equilibration that was done (see the description of $equed$ in <i>Input Arguments</i> section).
$params$	If an entry is less than 0.0, that entry is filled with the default value used for that parameter, otherwise the entry is not modified

## Return Values

This function returns a value  $info$ .

If  $info = 0$ , the execution is successful. The solution to every right-hand side is guaranteed.

If  $info = -i$ , parameter  $i$  had an illegal value.

If  $0 < info \leq n$ :  $U_{info,info}$  is exactly zero. The factorization has been completed, but the factor  $U$  is exactly singular, so the solution and error bounds could not be computed;  $rcond = 0$  is returned.

If  $info = n+j$ : The solution corresponding to the  $j$ -th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides  $k$  with  $k > j$  may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested  $params[2] = 0.0$ , then the  $j$ -th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest  $j$  such that for column major layout  $err\_bnds\_norm[j - 1] = 0.0$  or  $err\_bnds\_comp[j - 1] = 0.0$ ; or for row major layout  $err\_bnds\_norm[(j - 1)*n\_err\_bnds] = 0.0$  or  $err\_bnds\_comp[(j - 1)*n\_err\_bnds] = 0.0$ ). See the definition of  $err\_bnds\_norm$  and  $err\_bnds\_comp$  for  $err = 1$ . To get information about all of the right-hand sides, check  $err\_bnds\_norm$  or  $err\_bnds\_comp$ .

## Description

The routine solves for  $X$  the real or complex system of linear equations  $A*X = B$ , where  $A$  is an  $n$ -by- $n$  band matrix with  $kl$  subdiagonals and  $ku$  superdiagonals, the columns of matrix  $B$  are individual right-hand sides, and the columns of  $X$  are the corresponding solutions.

The  $LU$  decomposition with partial pivoting and row interchanges is used to factor  $A$  as  $A = L*U$ , where  $L$  is a product of permutation and unit lower triangular matrices with  $kl$  subdiagonals, and  $U$  is upper triangular with  $kl+ku$  superdiagonals. The factored form of  $A$  is then used to solve the system of equations  $A*X = B$ .

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>n</i>	The order of <i>A</i> . The number of rows in <i>B</i> ; $n \geq 0$ .
<i>kl</i>	The number of subdiagonals within the band of <i>A</i> ; $kl \geq 0$ .
<i>ku</i>	The number of superdiagonals within the band of <i>A</i> ; $ku \geq 0$ .
<i>nrhs</i>	The number of right-hand sides. The number of columns in <i>B</i> ; $nrhs \geq 0$ .
<i>ab, b</i>	Arrays: <i>ab</i> (size $\max(1, ldab*n)$ ), <i>b</i> of size $\max(1, ldb*nrhs)$ for column major layout and $\max(1, ldb*n)$ for row major layout.  The array <i>ab</i> contains the matrix <i>A</i> in band storage (see <a href="#">Matrix Storage Schemes</a> ).  The array <i>b</i> contains the matrix <i>B</i> whose columns are the right-hand sides for the systems of equations.
<i>ldab</i>	The leading dimension of the array <i>ab</i> . ( $ldab \geq 2kl + ku + 1$ )
<i>ldb</i>	The leading dimension of <i>b</i> ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.

## Output Parameters

<i>ab</i>	Overwritten by <i>L</i> and <i>U</i> . <i>U</i> is stored as an upper triangular band matrix with $kl + ku$ superdiagonals and <i>L</i> is stored as a lower triangular band matrix with $kl$ subdiagonals. See <a href="#">Matrix Storage Schemes</a> .
<i>b</i>	Overwritten by the solution matrix <i>X</i> .
<i>ipiv</i>	Array, size at least $\max(1, n)$ . The pivot indices: row <i>i</i> was interchanged with row <i>ipiv</i> [ <i>i</i> -1].

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

If *info* = *i*,  $U_{i,i}$  is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution could not be computed.

## Description

The routine uses the *LU* factorization to compute the solution to a real or complex system of linear equations  $A*X = B$ ,  $A^T*X = B$ , or  $A^H*X = B$ , where  $A$  is a band matrix of order  $n$  with  $kl$  subdiagonals and  $ku$  superdiagonals, the columns of matrix  $B$  are individual right-hand sides, and the columns of  $X$  are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine `?gbsvx` performs the following steps:

1. If `fact = 'E'`, real scaling factors  $r$  and  $c$  are computed to equilibrate the system:

$$\text{trans} = \text{'N'}: \text{diag}(r) * A * \text{diag}(c) * \text{inv}(\text{diag}(c)) * X = \text{diag}(r) * B$$

$$\text{trans} = \text{'T'}: (\text{diag}(r) * A * \text{diag}(c))^T * \text{inv}(\text{diag}(r)) * X = \text{diag}(c) * B$$

$$\text{trans} = \text{'C'}: (\text{diag}(r) * A * \text{diag}(c))^H * \text{inv}(\text{diag}(r)) * X = \text{diag}(c) * B$$

Whether the system will be equilibrated depends on the scaling of the matrix  $A$ , but if equilibration is used,  $A$  is overwritten by  $\text{diag}(r) * A * \text{diag}(c)$  and  $B$  by  $\text{diag}(r) * B$  (if `trans = 'N'`) or  $\text{diag}(c) * B$  (if `trans = 'T'` or `'C'`).

2. If `fact = 'N'` or `'E'`, the *LU* decomposition is used to factor the matrix  $A$  (after equilibration if `fact = 'E'`) as  $A = L*U$ , where  $L$  is a product of permutation and unit lower triangular matrices with  $kl$  subdiagonals, and  $U$  is upper triangular with  $kl+ku$  superdiagonals.
3. If some  $U_{i,i} = 0$ , so that  $U$  is exactly singular, then the routine returns with `info = i`. Otherwise, the factored form of  $A$  is used to estimate the condition number of the matrix  $A$ . If the reciprocal of the condition number is less than machine precision, `info = n + 1` is returned as a warning, but the routine still goes on to solve for  $X$  and compute error bounds as described below.
4. The system of equations is solved for  $X$  using the factored form of  $A$ .

5. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.
6. If equilibration was used, the matrix  $X$  is premultiplied by  $diag(c)$  (if  $trans = 'N'$ ) or  $diag(r)$  (if  $trans = 'T'$  or  $'C'$ ) so that it solves the original system before equilibration.

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<code>fact</code>	<p>Must be 'F', 'N', or 'E'.</p> <p>Specifies whether the factored form of the matrix <math>A</math> is supplied on entry, and if not, whether the matrix <math>A</math> should be equilibrated before it is factored.</p> <p>If <math>fact = 'F'</math>: on entry, <math>afb</math> and <math>ipiv</math> contain the factored form of <math>A</math>. If <math>equed</math> is not 'N', the matrix <math>A</math> is equilibrated with scaling factors given by <math>r</math> and <math>c</math>. <math>ab</math>, <math>afb</math>, and <math>ipiv</math> are not modified.</p> <p>If <math>fact = 'N'</math>, the matrix <math>A</math> will be copied to <math>afb</math> and factored.</p> <p>If <math>fact = 'E'</math>, the matrix <math>A</math> will be equilibrated if necessary, then copied to <math>afb</math> and factored.</p>
<code>trans</code>	<p>Must be 'N', 'T', or 'C'.</p> <p>Specifies the form of the system of equations:</p> <p>If <math>trans = 'N'</math>, the system has the form <math>A*X = B</math> (No transpose).</p> <p>If <math>trans = 'T'</math>, the system has the form <math>A^T*X = B</math> (Transpose).</p> <p>If <math>trans = 'C'</math>, the system has the form <math>A^H*X = B</math> (Transpose for real flavors, conjugate transpose for complex flavors).</p>
<code>n</code>	The number of linear equations, the order of the matrix $A$ ; $n \geq 0$ .
<code>kl</code>	The number of subdiagonals within the band of $A$ ; $kl \geq 0$ .
<code>ku</code>	The number of superdiagonals within the band of $A$ ; $ku \geq 0$ .
<code>nrhs</code>	The number of right hand sides, the number of columns of the matrices $B$ and $X$ ; $nrhs \geq 0$ .
<code>ab, afb, b</code>	<p>Arrays: <math>ab</math> (<math>\max(ldab*n)</math>), <math>afb</math> (<math>\max(ldafb*n)</math>), <math>b</math> (<math>\max(1, ldb*nrhs)</math>) for column major layout and <math>\max(1, ldb*n)</math> for row major layout).</p> <p>The array <math>ab</math> contains the matrix <math>A</math> in band storage (see <a href="#">Matrix Storage Schemes</a>). If <math>fact = 'F'</math> and <math>equed</math> is not 'N', then <math>A</math> must have been equilibrated by the scaling factors in <math>r</math> and/or <math>c</math>.</p> <p>The array <math>afb</math> is an input argument if <math>fact = 'F'</math>. It contains the factored form of the matrix <math>A</math>, that is, the factors <math>L</math> and <math>U</math> from the factorization <math>A = P*L*U</math> as computed by <code>?gbtrf</code>. <math>U</math> is stored as an upper triangular band matrix with <math>kl + ku</math> superdiagonals. <math>L</math> is stored as lower triangular band matrix with <math>kl</math> subdiagonals. If <math>equed</math> is not 'N', then <math>afb</math> is the factored form of the equilibrated matrix <math>A</math>.</p>

The array  $b$  contains the matrix  $B$  whose columns are the right-hand sides for the systems of equations.

$ldab$

The leading dimension of  $ab$ ;  $ldab \geq kl + ku + 1$ .

$ldafb$

The leading dimension of  $afb$ ;  $ldafb \geq 2 * kl + ku + 1$ .

$ldb$

The leading dimension of  $b$ ;  $ldb \geq \max(1, n)$  for column major layout and  $ldb \geq nrhs$  for row major layout.

$ipiv$

Array, size at least  $\max(1, n)$ . The array  $ipiv$  is an input argument if  $fact = 'F'$ . It contains the pivot indices from the factorization  $A = P * L * U$  as computed by `?gbtrf`; row  $i$  of the matrix was interchanged with row  $ipiv[i-1]$ .

$equed$

Must be 'N', 'R', 'C', or 'B'.

$equed$  is an input argument if  $fact = 'F'$ . It specifies the form of equilibration that was done:

If  $equed = 'N'$ , no equilibration was done (always true if  $fact = 'N'$ ).

If  $equed = 'R'$ , row equilibration was done, that is,  $A$  has been premultiplied by  $diag(r)$ .

If  $equed = 'C'$ , column equilibration was done, that is,  $A$  has been postmultiplied by  $diag(c)$ .

if  $equed = 'B'$ , both row and column equilibration was done, that is,  $A$  has been replaced by  $diag(r) * A * diag(c)$ .

$r, c$

Arrays:  $r$  (size  $n$ ),  $c$  (size  $n$ ).

The array  $r$  contains the row scale factors for  $A$ , and the array  $c$  contains the column scale factors for  $A$ . These arrays are input arguments if  $fact = 'F'$  only; otherwise they are output arguments.

If  $equed = 'R'$  or 'B',  $A$  is multiplied on the left by  $diag(r)$ ; if  $equed = 'N'$  or 'C',  $r$  is not accessed.

If  $fact = 'F'$  and  $equed = 'R'$  or 'B', each element of  $r$  must be positive.

If  $equed = 'C'$  or 'B',  $A$  is multiplied on the right by  $diag(c)$ ; if  $equed = 'N'$  or 'R',  $c$  is not accessed.

If  $fact = 'F'$  and  $equed = 'C'$  or 'B', each element of  $c$  must be positive.

$ldx$

The leading dimension of the output array  $x$ ;  $ldx \geq \max(1, n)$  for column major layout and  $ldx \geq nrhs$  for row major layout.

## Output Parameters

$x$

Array, size  $\max(1, ldx * nrhs)$  for column major layout and  $\max(1, ldx * n)$  for row major layout.

If  $info = 0$  or  $info = n+1$ , the array  $x$  contains the solution matrix  $X$  to the *original* system of equations. Note that  $A$  and  $B$  are modified on exit if  $equed \neq 'N'$ , and the solution to the *equilibrated* system is:  
 $inv(diag(c)) * X$ , if  $trans = 'N'$  and  $equed = 'C'$  or  $'B'$ ;  
 $inv(diag(r)) * X$ , if  $trans = 'T'$  or  $'C'$  and  $equed = 'R'$  or  $'B'$ .

*ab*

Array *ab* is not modified on exit if  $fact = 'F'$  or  $'N'$ , or if  $fact = 'E'$  and  $equed = 'N'$ .

If  $equed \neq 'N'$ ,  $A$  is scaled on exit as follows:

$equed = 'R'$ :  $A = diag(r) * A$

$equed = 'C'$ :  $A = A * diag(c)$

$equed = 'B'$ :  $A = diag(r) * A * diag(c)$ .

*afb*

If  $fact = 'N'$  or  $'E'$ , then *afb* is an output argument and on exit returns details of the *LU* factorization of the original matrix  $A$  (if  $fact = 'N'$ ) or of the equilibrated matrix  $A$  (if  $fact = 'E'$ ). See the description of *ab* for the form of the equilibrated matrix.

*b*

Overwritten by  $diag(r) * b$  if  $trans = 'N'$  and  $equed = 'R'$  or  $'B'$ ;  
 overwritten by  $diag(c) * b$  if  $trans = 'T'$  or  $'C'$  and  $equed = 'C'$  or  $'B'$ ;

not changed if  $equed = 'N'$ .

*r, c*

These arrays are output arguments if  $fact \neq 'F'$ . See the description of *r, c* in *Input Arguments* section.

*rcond*

An estimate of the reciprocal condition number of the matrix  $A$  after equilibration (if done).

If *rcond* is less than the machine precision (in particular, if  $rcond = 0$ ), the matrix is singular to working precision. This condition is indicated by a return code of  $info > 0$ .

*ferr*

Array, size at least  $\max(1, nrhs)$ . Contains the estimated forward error bound for each solution vector  $x_j$  (the  $j$ -th column of the solution matrix  $X$ ). If  $x_{true}$  is the true solution corresponding to  $x_j$ ,  $ferr[j-1]$  is an estimated upper bound for the magnitude of the largest element in  $(x_j - x_{true})$  divided by the magnitude of the largest element in  $x_j$ . The estimate is as reliable as the estimate for *rcond*, and is almost always a slight overestimate of the true error.

*berr*

Array, size at least  $\max(1, nrhs)$ . Contains the component-wise relative backward error for each solution vector  $x_j$ , that is, the smallest relative change in any element of  $A$  or  $B$  that makes  $x_j$  an exact solution.

*ipiv*

If  $fact = 'N'$  or  $'E'$ , then *ipiv* is an output argument and on exit contains the pivot indices from the factorization  $A = L * U$  of the original matrix  $A$  (if  $fact = 'N'$ ) or of the equilibrated matrix  $A$  (if  $fact = 'E'$ ).

*equed* If *fact* ≠ 'F', then *equed* is an output argument. It specifies the form of equilibration that was done (see the description of *equed* in *Input Arguments* section).

*rpivot* On exit, *rpivot* contains the reciprocal pivot growth factor:

$$\|A\|/\|U\|$$

If *rpivot* is much less than 1, then the stability of the *LU* factorization of the (equilibrated) matrix *A* could be poor. This also means that the solution *x*, condition estimator *rcond*, and forward error bound *ferr* could be unreliable. If factorization fails with  $0 < \text{info} \leq n$ , then *rpivot* contains the reciprocal pivot growth factor for the leading *info* columns of *A*.

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

If *info* = *i*, and  $i \leq n$ , then  $U_{i,i}$  is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned. If *info* = *i*, and  $i = n+1$ , then *U* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

## Description

The routine uses the  $LU$  factorization to compute the solution to a real or complex system of linear equations  $A^*X = B$ ,  $A^T * X = B$ , or  $A^H * X = B$ , where  $A$  is an  $n$ -by- $n$  banded matrix, the columns of the matrix  $B$  are individual right-hand sides, and the columns of  $X$  are the corresponding solutions.

Both normwise and maximum componentwise error bounds are also provided on request. The routine returns a solution with a small guaranteed error ( $O(\text{eps})$ , where  $\text{eps}$  is the working machine precision) unless the matrix is very ill-conditioned, in which case a warning is returned. Relevant condition numbers are also calculated and returned.

The routine accepts user-provided factorizations and equilibration factors; see definitions of the *fact* and *equed* options. Solving with refinement and using a factorization from a previous call of the routine also produces a solution with  $O(\text{eps})$  errors or warnings but that may not be true for general user-provided factorizations and equilibration factors if they differ from what the routine would itself produce.

The routine `?gbsvxx` performs the following steps:

1. If *fact* = 'E', scaling factors *r* and *c* are computed to equilibrate the system:

$$\text{trans} = \text{'N'}: \text{diag}(r) * A * \text{diag}(c) * \text{inv}(\text{diag}(c)) * X = \text{diag}(r) * B$$

$$\text{trans} = \text{'T'}: (\text{diag}(r) * A * \text{diag}(c))^T * \text{inv}(\text{diag}(r)) * X = \text{diag}(c) * B$$

$$\text{trans} = \text{'C'}: (\text{diag}(r) * A * \text{diag}(c))^H * \text{inv}(\text{diag}(r)) * X = \text{diag}(c) * B$$

Whether or not the system will be equilibrated depends on the scaling of the matrix  $A$ , but if equilibration is used,  $A$  is overwritten by  $\text{diag}(r) * A * \text{diag}(c)$  and  $B$  by  $\text{diag}(r) * B$  (if *trans*='N') or  $\text{diag}(c) * B$  (if *trans* = 'T' or 'C').

2. If *fact* = 'N' or 'E', the  $LU$  decomposition is used to factor the matrix  $A$  (after equilibration if *fact* = 'E') as  $A = P * L * U$ , where  $P$  is a permutation matrix,  $L$  is a unit lower triangular matrix, and  $U$  is upper triangular.
3. If some  $U_{i,i} = 0$ , so that  $U$  is exactly singular, then the routine returns with *info* =  $i$ . Otherwise, the factored form of  $A$  is used to estimate the condition number of the matrix  $A$  (see the *rcond* parameter). If the reciprocal of the condition number is less than machine precision, the routine still goes on to solve for  $X$  and compute error bounds.
4. The system of equations is solved for  $X$  using the factored form of  $A$ .
5. By default, unless `params[0]` is set to zero, the routine applies iterative refinement to improve the computed solution matrix and calculate error bounds. Refinement calculates the residual to at least twice the working precision.
6. If equilibration was used, the matrix  $X$  is premultiplied by  $\text{diag}(c)$  (if *trans* = 'N') or  $\text{diag}(r)$  (if *trans* = 'T' or 'C') so that it solves the original system before equilibration.

## Input Parameters

<i>matrix_layout</i>	Specifies whether two-dimensional array storage is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>fact</i>	<p>Must be 'F', 'N', or 'E'.</p> <p>Specifies whether or not the factored form of the matrix <i>A</i> is supplied on entry, and if not, whether the matrix <i>A</i> should be equilibrated before it is factored.</p> <p>If <i>fact</i> = 'F', on entry, <i>afb</i> and <i>ipiv</i> contain the factored form of <i>A</i>. If <i>equed</i> is not 'N', the matrix <i>A</i> has been equilibrated with scaling factors given by <i>r</i> and <i>c</i>. Parameters <i>ab</i>, <i>afb</i>, and <i>ipiv</i> are not modified.</p> <p>If <i>fact</i> = 'N', the matrix <i>A</i> will be copied to <i>afb</i> and factored.</p> <p>If <i>fact</i> = 'E', the matrix <i>A</i> will be equilibrated, if necessary, copied to <i>afb</i> and factored.</p>
<i>trans</i>	<p>Must be 'N', 'T', or 'C'.</p> <p>Specifies the form of the system of equations:</p> <p>If <i>trans</i> = 'N', the system has the form <math>A^*X = B</math> (No transpose).</p> <p>If <i>trans</i> = 'T', the system has the form <math>A^T*X = B</math> (Transpose).</p> <p>If <i>trans</i> = 'C', the system has the form <math>A^H*X = B</math> (Conjugate Transpose = Transpose for real flavors, Conjugate Transpose for complex flavors).</p>
<i>n</i>	The number of linear equations; the order of the matrix <i>A</i> ; $n \geq 0$ .
<i>kl</i>	The number of subdiagonals within the band of <i>A</i> ; $kl \geq 0$ .
<i>ku</i>	The number of superdiagonals within the band of <i>A</i> ; $ku \geq 0$ .
<i>nrhs</i>	The number of right-hand sides; the number of columns of the matrices <i>B</i> and <i>X</i> ; $nrhs \geq 0$ .
<i>ab, afb, b</i>	<p>Arrays: <i>ab</i> (<math>\max(ldab*n)</math>), <i>afb</i> (<math>\max(ldafb*n)</math>), <i>b</i> (<math>\max(1, ldb*nrhs)</math>) for column major layout and <math>\max(1, ldb*n)</math> for row major layout).</p> <p>The array <i>ab</i> contains the matrix <i>A</i> in band storage.</p> <p>If <i>fact</i> = 'F' and <i>equed</i> is not 'N', then <i>AB</i> must have been equilibrated by the scaling factors in <i>r</i> and/or <i>c</i>.</p> <p>The array <i>afb</i> is an input argument if <i>fact</i> = 'F'. It contains the factored form of the banded matrix <i>A</i>, that is, the factors <i>L</i> and <i>U</i> from the factorization <math>A = P*L*U</math> as computed by <code>?gbtrf</code>. <i>U</i> is stored as an upper triangular banded matrix with <math>kl + ku</math> superdiagonals. <i>L</i> is stored as lower triangular band matrix with <i>kl</i> subdiagonals. If <i>equed</i> is not 'N', then <i>afb</i> is the factored form of the equilibrated matrix <i>A</i>.</p> <p>The array <i>b</i> contains the matrix <i>B</i> whose columns are the right-hand sides for the systems of equations.</p>
<i>ldab</i>	The leading dimension of the array <i>ab</i> ; $ldab \geq kl + ku + 1$ .

<i>ldafb</i>	The leading dimension of the array <i>afb</i> ; $ldafb \geq 2 * kl + ku + 1$ .
<i>ipiv</i>	Array, size at least $\max(1, n)$ . The array <i>ipiv</i> is an input argument if <i>fact</i> = 'F'. It contains the pivot indices from the factorization $A = P * L * U$ as computed by <i>?gbtrf</i> ; row <i>i</i> of the matrix was interchanged with row <i>ipiv</i> [ <i>i</i> -1].
<i>equed</i>	<p>Must be 'N', 'R', 'C', or 'B'.</p> <p><i>equed</i> is an input argument if <i>fact</i> = 'F'. It specifies the form of equilibration that was done:</p> <p>If <i>equed</i> = 'N', no equilibration was done (always true if <i>fact</i> = 'N').</p> <p>If <i>equed</i> = 'R', row equilibration was done, that is, <i>A</i> has been premultiplied by <i>diag</i>(<i>r</i>).</p> <p>If <i>equed</i> = 'C', column equilibration was done, that is, <i>A</i> has been postmultiplied by <i>diag</i>(<i>c</i>).</p> <p>If <i>equed</i> = 'B', both row and column equilibration was done, that is, <i>A</i> has been replaced by <i>diag</i>(<i>r</i>) * <i>A</i> * <i>diag</i>(<i>c</i>).</p>
<i>r, c</i>	<p>Arrays: <i>r</i> (size <i>n</i>), <i>c</i> (size <i>n</i>). The array <i>r</i> contains the row scale factors for <i>A</i>, and the array <i>c</i> contains the column scale factors for <i>A</i>. These arrays are input arguments if <i>fact</i> = 'F' only; otherwise they are output arguments.</p> <p>If <i>equed</i> = 'R' or 'B', <i>A</i> is multiplied on the left by <i>diag</i>(<i>r</i>); if <i>equed</i> = 'N' or 'C', <i>r</i> is not accessed.</p> <p>If <i>fact</i> = 'F' and <i>equed</i> = 'R' or 'B', each element of <i>r</i> must be positive.</p> <p>If <i>equed</i> = 'C' or 'B', <i>A</i> is multiplied on the right by <i>diag</i>(<i>c</i>); if <i>equed</i> = 'N' or 'R', <i>c</i> is not accessed.</p> <p>If <i>fact</i> = 'F' and <i>equed</i> = 'C' or 'B', each element of <i>c</i> must be positive.</p> <p>Each element of <i>r</i> or <i>c</i> should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.</p>
<i>ldb</i>	The leading dimension of the array <i>b</i> ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.
<i>ldx</i>	The leading dimension of the output array <i>x</i> ; $ldx \geq \max(1, n)$ for column major layout and $ldx \geq nrhs$ for row major layout.
<i>n_err_bnds</i>	Number of error bounds to return for each right hand side and each type (normwise or componentwise). See <i>err_bnds_norm</i> and <i>err_bnds_comp</i> descriptions in <i>Output Arguments</i> section below.
<i>nparams</i>	Specifies the number of parameters set in <i>params</i> . If $\leq 0$ , the <i>params</i> array is never referenced and default values are used.

*params*

Array, size  $\max(1, nparams)$ . Specifies algorithm parameters. If an entry is less than 0.0, that entry is filled with the default value used for that parameter. Only positions up to *nparams* are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass *nparams* = 0, which prevents the source code from accessing the *params* argument.

*params*[0] : Whether to perform iterative refinement or not. Default: 1.0 (for single precision flavors), 1.0D+0 (for double precision flavors).

=0.0	No refinement is performed and no error bounds are computed.
=1.0	Use the extra-precise refinement algorithm.

(Other values are reserved for future use.)

*params*[1] : Maximum number of residual computations allowed for refinement.

Default	10.0
Aggressive	Set to 100.0 to permit convergence using approximate factorizations or factorizations other than <i>LU</i> . If the factorization uses a technique other than Gaussian elimination, the guarantees in <i>err_bnds_norm</i> and <i>err_bnds_comp</i> may no longer be trustworthy.

*params*[2] : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

## Output Parameters

*x*

Array, size  $\max(1, ldx*nrhs)$  for column major layout and  $\max(1, ldx*n)$  for row major layout.

If *info* = 0, the array *x* contains the solution *n*-by-*nrhs* matrix *X* to the *original* system of equations. Note that *A* and *B* are modified on exit if *equed* ≠ 'N', and the solution to the *equilibrated* system is:

$\text{inv}(\text{diag}(c)) * X$ , if *trans* = 'N' and *equed* = 'C' or 'B'; or  
 $\text{inv}(\text{diag}(r)) * X$ , if *trans* = 'T' or 'C' and *equed* = 'R' or 'B'.

*ab*

Array *ab* is not modified on exit if *fact* = 'F' or 'N', or if *fact* = 'E' and *equed* = 'N'.

If *equed* ≠ 'N', *A* is scaled on exit as follows:

*equed* = 'R':  $A = \text{diag}(r) * A$   
*equed* = 'C':  $A = A * \text{diag}(c)$   
*equed* = 'B':  $A = \text{diag}(r) * A * \text{diag}(c)$ .

<i>afb</i>	If <i>fact</i> = 'N' or 'E', then <i>afb</i> is an output argument and on exit returns the factors <i>L</i> and <i>U</i> from the factorization $A = PLU$ of the original matrix <i>A</i> (if <i>fact</i> = 'N') or of the equilibrated matrix <i>A</i> (if <i>fact</i> = 'E').
<i>b</i>	Overwritten by $diag(r)*B$ if <i>trans</i> = 'N' and <i>equed</i> = 'R' or 'B'; overwritten by <i>trans</i> = 'T' or 'C' and <i>equed</i> = 'C' or 'B'; not changed if <i>equed</i> = 'N'.
<i>r, c</i>	These arrays are output arguments if <i>fact</i> ≠ 'F'. Each element of these arrays is a power of the radix. See the description of <i>r, c</i> in <i>Input Arguments</i> section.
<i>rcond</i>	Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix <i>A</i> after equilibration (if done). If <i>rcond</i> is less than the machine precision, in particular, if <i>rcond</i> = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.
<i>rpvgrw</i>	Contains the reciprocal pivot growth factor: $\ A\ /\ U\ $ If this is much less than 1, the stability of the <i>LU</i> factorization of the (equilibrated) matrix <i>A</i> could be poor. This also means that the solution <i>X</i> , estimated condition numbers, and error bounds could be unreliable. If factorization fails with $0 < info \leq n$ , this parameter contains the reciprocal pivot growth factor for the leading <i>info</i> columns of <i>A</i> . In ?gbsvx, this quantity is returned in <i>rpivot</i> .
<i>berr</i>	Array, size at least $\max(1, nrhs)$ . Contains the componentwise relative backward error for each solution vector $x_j$ , that is, the smallest relative change in any element of <i>A</i> or <i>B</i> that makes $x_j$ an exact solution.
<i>err_bnds_norm</i>	Array of size $nrhs*n\_err\_bnds$ . For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows: Normwise relative error in the <i>i</i> -th solution vector

$$\frac{\max_j |X_{true_{ji}} - X_{ji}|}{\max_j |X_{ji}|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.

<i>err=1</i>	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold $\sqrt{n} * slamch(\epsilon)$ for single precision flavors and $\sqrt{n} * dlamch(\epsilon)$ for double precision flavors.
--------------	--

`err=2` "Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold  $\sqrt{n} * \text{slamch}(\epsilon)$  for single precision flavors and  $\sqrt{n} * \text{dlamch}(\epsilon)$  for double precision flavors. This error bound should only be trusted if the previous boolean is true.

`err=3` Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold  $\sqrt{n} * \text{slamch}(\epsilon)$  for single precision flavors and  $\sqrt{n} * \text{dlamch}(\epsilon)$  for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix  $Z$  are:

$$\|Z\|_{\infty} \cdot \|Z^{-1}\|_{\infty}$$

Let  $z=s*a$ , where  $s$  scales each row by a power of the radix so all absolute row sums of  $z$  are approximately 1.

The information for right-hand side  $i$ , where  $1 \leq i \leq nrhs$ , and type of error `err` is stored in `err_bnds_norm[(err-1)*nrhs + i - 1]`.

`err_bnds_comp`

Array of size  $nrhs * n\_err\_bnds$ . For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:

Componentwise relative error in the  $i$ -th solution vector:

$$\max_j \frac{|X_{true_{ji}} - X_{ji}|}{|X_{ji}|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is not requested (`params[2] = 0.0`), then `err_bnds_comp` is not accessed.

`err=1` "Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold  $\sqrt{n} * \text{slamch}(\epsilon)$  for single precision flavors and  $\sqrt{n} * \text{dlamch}(\epsilon)$  for double precision flavors.

`err=2` "Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold  $\sqrt{n} * \text{slamch}(\epsilon)$  for single precision flavors and

$\sqrt{n} * dlamch(\epsilon)$  for double precision flavors. This error bound should only be trusted if the previous boolean is true.

`err=3`

Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold  $\sqrt{n} * slamch(\epsilon)$  for single precision flavors and  $\sqrt{n} * dlamch(\epsilon)$  for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix  $Z$  are:

$$\|Z\|_{\infty} \cdot \|Z^{-1}\|_{\infty}$$

Let  $z = s * (a * \text{diag}(x))$ , where  $x$  is the solution for the current right-hand side and  $s$  scales each row of  $a * \text{diag}(x)$  by a power of the radix so all absolute row sums of  $z$  are approximately 1.

The information for right-hand side  $i$ , where  $1 \leq i \leq nrhs$ , and type of error `err` is stored in `err_bnds_comp[(err-1)*nrhs + i - 1]`.

`ipiv`

If `fact = 'N'` or `'E'`, then `ipiv` is an output argument and on exit contains the pivot indices from the factorization  $A = P * L * U$  of the original matrix  $A$  (if `fact = 'N'`) or of the equilibrated matrix  $A$  (if `fact = 'E'`).

`equed`

If `fact != 'F'`, then `equed` is an output argument. It specifies the form of equilibration that was done (see the description of `equed` in *Input Arguments* section).

`params`

If an entry is less than 0.0, that entry is filled with the default value used for that parameter, otherwise the entry is not modified.

`info`

If `info = 0`, the execution is successful. The solution to every right-hand side is guaranteed.

If `info = -i`, the  $i$ -th parameter had an illegal value.

If  $0 < info \leq n$ :  $U_{info,info}$  is exactly zero. The factorization has been completed, but the factor  $U$  is exactly singular, so the solution and error bounds could not be computed; `rcond = 0` is returned.

If `info = n+j`: The solution corresponding to the  $j$ -th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides  $k$  with  $k > j$  may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested `params[2] = 0.0`, then the  $j$ -th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest  $j$  such that `err_bnds_norm[j - 1] = 0.0` or `err_bnds_comp[j - 1] = 0.0`). See the definition of `err_bnds_norm` and `err_bnds_comp` for `err = 1`. To get information about all of the right-hand sides, check `err_bnds_norm` or `err_bnds_comp`.

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful. The solution to every right-hand side is guaranteed.

If *info* = -*i*, parameter *i* had an illegal value.

If  $0 < info \leq n$ :  $U_{info,info}$  is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned.

If *info* = *n*+*j*: The solution corresponding to the *j*-th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides *k* with *k* > *j* may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested *params*[2] = 0.0, then the *j*-th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest *j* such that for column major layout *err\_bnds\_norm*[*j* - 1] = 0.0 or *err\_bnds\_comp*[*j* - 1] = 0.0; or for row major layout *err\_bnds\_norm*[(*j* - 1)\**n\_err\_bnds*] = 0.0 or *err\_bnds\_comp*[(*j* - 1)\**n\_err\_bnds*] = 0.0). See the definition of *err\_bnds\_norm* and *err\_bnds\_comp* for *err* = 1. To get information about all of the right-hand sides, check *err\_bnds\_norm* or *err\_bnds\_comp*.

## Description

The routine solves for *X* the system of linear equations  $A*X = B$ , where *A* is an *n*-by-*n* tridiagonal matrix, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions. The routine uses Gaussian elimination with partial pivoting.

Note that the equation  $A^T*X = B$  may be solved by interchanging the order of the arguments *du* and *dl*.

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<code>n</code>	The order of $A$ , the number of rows in $B$ ; $n \geq 0$ .
<code>nrhs</code>	The number of right-hand sides, the number of columns in $B$ ; $nrhs \geq 0$ .
<code>dl</code>	The array <code>dl</code> (size $n - 1$ ) contains the $(n - 1)$ subdiagonal elements of $A$ .
<code>d</code>	The array <code>d</code> (size $n$ ) contains the diagonal elements of $A$ .
<code>du</code>	The array <code>du</code> (size $n - 1$ ) contains the $(n - 1)$ superdiagonal elements of $A$ .
<code>b</code>	The array <code>b</code> of size $\max(1, ldb * nrhs)$ for column major layout and $\max(1, ldb * n)$ for row major layout contains the matrix $B$ whose columns are the right-hand sides for the systems of equations.
<code>ldb</code>	The leading dimension of <code>b</code> ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.

## Output Parameters

<code>dl</code>	Overwritten by the $(n-2)$ elements of the second superdiagonal of the upper triangular matrix $U$ from the $LU$ factorization of $A$ . These elements are stored in <code>dl[0], ..., dl[n - 3]</code> .
<code>d</code>	Overwritten by the $n$ diagonal elements of $U$ .
<code>du</code>	Overwritten by the $(n-1)$ elements of the first superdiagonal of $U$ .
<code>b</code>	Overwritten by the solution matrix $X$ .

## Return Values

This function returns a value `info`.

If `info = 0`, the execution is successful.

If `info = -i`, parameter  $i$  had an illegal value.

If `info = i`,  $U_{i,i}$  is exactly zero, and the solution has not been computed. The factorization has not been completed unless  $i = n$ .

## Description

The routine uses the  $LU$  factorization to compute the solution to a real or complex system of linear equations  $A^*X = B$ ,  $A^T * X = B$ , or  $A^H * X = B$ , where  $A$  is a tridiagonal matrix of order  $n$ , the columns of matrix  $B$  are individual right-hand sides, and the columns of  $X$  are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine `?gtsvx` performs the following steps:

1. If  $fact = 'N'$ , the  $LU$  decomposition is used to factor the matrix  $A$  as  $A = L * U$ , where  $L$  is a product of permutation and unit lower bidiagonal matrices and  $U$  is an upper triangular matrix with nonzeros in only the main diagonal and first two superdiagonals.
2. If some  $U_{i,i} = 0$ , so that  $U$  is exactly singular, then the routine returns with  $info = i$ . Otherwise, the factored form of  $A$  is used to estimate the condition number of the matrix  $A$ . If the reciprocal of the condition number is less than machine precision,  $info = n + 1$  is returned as a warning, but the routine still goes on to solve for  $X$  and compute error bounds as described below.
3. The system of equations is solved for  $X$  using the factored form of  $A$ .
4. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>fact</i>	Must be 'F' or 'N'.

	Specifies whether or not the factored form of the matrix $A$ has been supplied on entry.
	If $fact = 'F'$ : on entry, $d1f$ , $df$ , $duf$ , $du2$ , and $ipiv$ contain the factored form of $A$ ; arrays $d1$ , $d$ , $du$ , $d1f$ , $df$ , $duf$ , $du2$ , and $ipiv$ will not be modified.
	If $fact = 'N'$ , the matrix $A$ will be copied to $d1f$ , $df$ , and $duf$ and factored.
$trans$	Must be 'N', 'T', or 'C'.
	Specifies the form of the system of equations:
	If $trans = 'N'$ , the system has the form $A^*X = B$ (No transpose).
	If $trans = 'T'$ , the system has the form $A^T*X = B$ (Transpose).
	If $trans = 'C'$ , the system has the form $A^H*X = B$ (Conjugate transpose).
$n$	The number of linear equations, the order of the matrix $A$ ; $n \geq 0$ .
$nrhs$	The number of right hand sides, the number of columns of the matrices $B$ and $X$ ; $nrhs \geq 0$ .
$d1, d, du, d1f, df, duf, du2, b$	Arrays: $d1$ , size $(n - 1)$ , contains the subdiagonal elements of $A$ . $d$ , size $(n)$ , contains the diagonal elements of $A$ . $du$ , size $(n - 1)$ , contains the superdiagonal elements of $A$ . $d1f$ , size $(n - 1)$ . If $fact = 'F'$ , then $d1f$ is an input argument and on entry contains the $(n - 1)$ multipliers that define the matrix $L$ from the $LU$ factorization of $A$ as computed by <code>?gttrf</code> . $df$ , size $(n)$ . If $fact = 'F'$ , then $df$ is an input argument and on entry contains the $n$ diagonal elements of the upper triangular matrix $U$ from the $LU$ factorization of $A$ . $duf$ , size $(n - 1)$ . If $fact = 'F'$ , then $duf$ is an input argument and on entry contains the $(n - 1)$ elements of the first superdiagonal of $U$ . $du2$ , size $(n - 2)$ . If $fact = 'F'$ , then $du2$ is an input argument and on entry contains the $(n - 2)$ elements of the second superdiagonal of $U$ . $b$ , size $\max(ldb*nrhs)$ for column major layout and $\max(ldb*n)$ for row major layout, contains the right-hand side matrix $B$ .
$ldb$	The leading dimension of $b$ ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.
$ldx$	The leading dimension of $x$ ; $ldx \geq \max(1, n)$ for column major layout and $ldx \geq nrhs$ for row major layout.
$ipiv$	Array, size at least $\max(1, n)$ . If $fact = 'F'$ , then $ipiv$ is an input argument and on entry contains the pivot indices, as returned by <code>?gttrf</code> .

## Output Parameters

<i>x</i>	Array, size $\max(1, ldx*nrhs)$ for column major layout and $\max(1, ldx*n)$ for row major layout.  If <i>info</i> = 0 or <i>info</i> = <i>n</i> +1, the array <i>x</i> contains the solution matrix <i>X</i> .
<i>d1f</i>	If <i>fact</i> = 'N', then <i>d1f</i> is an output argument and on exit contains the ( <i>n</i> -1) multipliers that define the matrix <i>L</i> from the <i>LU</i> factorization of <i>A</i> .
<i>df</i>	If <i>fact</i> = 'N', then <i>df</i> is an output argument and on exit contains the <i>n</i> diagonal elements of the upper triangular matrix <i>U</i> from the <i>LU</i> factorization of <i>A</i> .
<i>duf</i>	If <i>fact</i> = 'N', then <i>duf</i> is an output argument and on exit contains the ( <i>n</i> -1) elements of the first superdiagonal of <i>U</i> .
<i>du2</i>	If <i>fact</i> = 'N', then <i>du2</i> is an output argument and on exit contains the ( <i>n</i> -2) elements of the second superdiagonal of <i>U</i> .
<i>ipiv</i>	The array <i>ipiv</i> is an output argument if <i>fact</i> = 'N' and, on exit, contains the pivot indices from the factorization $A = L*U$ ; row <i>i</i> of the matrix was interchanged with row <i>ipiv</i> [ <i>i</i> -1]. The value of <i>ipiv</i> [ <i>i</i> -1] will always be <i>i</i> or <i>i</i> +1; <i>ipiv</i> [ <i>i</i> -1]= <i>i</i> indicates a row interchange was not required.
<i>rcond</i>	An estimate of the reciprocal condition number of the matrix <i>A</i> . If <i>rcond</i> is less than the machine precision (in particular, if <i>rcond</i> = 0), the matrix is singular to working precision. This condition is indicated by a return code of <i>info</i> >0.
<i>ferr</i>	Array, size at least $\max(1, nrhs)$ . Contains the estimated forward error bound for each solution vector $x_j$ (the <i>j</i> -th column of the solution matrix <i>X</i> ). If <i>xtrue</i> is the true solution corresponding to $x_j$ , <i>ferr</i> [ <i>j</i> -1] is an estimated upper bound for the magnitude of the largest element in $x_j - xtrue$ divided by the magnitude of the largest element in $x_j$ . The estimate is as reliable as the estimate for <i>rcond</i> , and is almost always a slight overestimate of the true error.
<i>berr</i>	Array, size at least $\max(1, nrhs)$ . Contains the component-wise relative backward error for each solution vector $x_j$ , that is, the smallest relative change in any element of <i>A</i> or <i>B</i> that makes $x_j$ an exact solution.

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

If *info* = *i*, and  $i \leq n$ , then  $U_{i,i}$  is exactly zero. The factorization has not been completed unless  $i = n$ , but the factor *U* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned. If *info* = *i*, and  $i = n + 1$ , then *U* is nonsingular, but *rcond* is less than machine precision,

meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

## Description

The ?dtsvb routine solves a system of linear equations  $A^*X = B$  for  $X$ , where  $A$  is an  $n$ -by- $n$  diagonally dominant tridiagonal matrix, the columns of matrix  $B$  are individual right-hand sides, and the columns of  $X$  are the corresponding solutions. The routine uses the BABE (Burning At Both Ends) algorithm.

Note that the equation  $A^T * X = B$  may be solved by interchanging the order of the arguments *du* and *dl*.

## Input Parameters

<i>n</i>	The order of $A$ , the number of rows in $B$ ; $n \geq 0$ .
<i>nrhs</i>	The number of right-hand sides, the number of columns in $B$ ; $nrhs \geq 0$ .
<i>dl, d, du, b</i>	Arrays: <i>dl</i> (size $n - 1$ ), <i>d</i> (size $n$ ), <i>du</i> (size $n - 1$ ), <i>b</i> ( $\max(ldb * nrhs)$ for column major layout and $\max(ldb * n)$ for row major layout). The array <i>dl</i> contains the $(n - 1)$ subdiagonal elements of $A$ . The array <i>d</i> contains the diagonal elements of $A$ . The array <i>du</i> contains the $(n - 1)$ superdiagonal elements of $A$ . The array <i>b</i> contains the matrix $B$ whose columns are the right-hand sides for the systems of equations.
<i>ldb</i>	The leading dimension of <i>b</i> ; $ldb \geq \max(1, n)$ .

## Output Parameters

<code>dl</code>	Overwritten by the $(n-1)$ elements of the subdiagonal of the lower triangular matrices $L_1, L_2$ from the factorization of $A$ (see <a href="#">dttfrfb</a> ).
<code>d</code>	Overwritten by the $n$ diagonal element reciprocals of $U$ .
<code>b</code>	Overwritten by the solution matrix $X$ .
<code>info</code>	<p>If <code>info</code> = 0, the execution is successful.</p> <p>If <code>info</code> = <math>-i</math>, the <math>i</math>-th parameter had an illegal value.</p> <p>If <code>info</code> = <math>i</math>, <math>u_{ii}</math> is exactly zero, and the solution has not been computed. The factorization has not been completed unless <math>i = n</math>.</p>

## Application Notes

A diagonally dominant tridiagonal system is defined such that  $|d_i| > |dl_{i-1}| + |du_i|$  for any  $i$ :

$1 < i < n$ , and  $|d_1| > |du_1|$ ,  $|d_n| > |dl_{n-1}|$

The underlying BABE algorithm is designed for diagonally dominant systems. Such systems have no numerical stability issue unlike the canonical systems that use elimination with partial pivoting (see [?gtsv](#)). The diagonally dominant systems are much faster than the canonical systems.

---

### NOTE

- The current implementation of BABE has a potential accuracy issue on very small or large data close to the underflow or overflow threshold respectively. Scale the matrix before applying the solver in the case of such input data.
  - Applying the [?dtsvb](#) factorization to non-diagonally dominant systems may lead to an accuracy loss, or false singularity detected due to no pivoting.
-

## Description

The routine solves for  $X$  the real or complex system of linear equations  $A*X = B$ , where  $A$  is an  $n$ -by- $n$  symmetric/Hermitian positive-definite matrix, the columns of matrix  $B$  are individual right-hand sides, and the columns of  $X$  are the corresponding solutions.

The Cholesky decomposition is used to factor  $A$  as

$A = U^T*U$  (real flavors) and  $A = U^H*U$  (complex flavors), if  $uplo = 'U'$

or  $A = L*L^T$  (real flavors) and  $A = L*L^H$  (complex flavors), if  $uplo = 'L'$ ,

where  $U$  is an upper triangular matrix and  $L$  is a lower triangular matrix. The factored form of  $A$  is then used to solve the system of equations  $A*X = B$ .

The `dsposv` and `zcposv` are mixed precision iterative refinement subroutines for exploiting fast single precision hardware. They first attempt to factorize the matrix in single precision (`dsposv`) or single complex precision (`zcposv`) and use this factorization within an iterative refinement procedure to produce a solution with double precision (`dsposv`) / double complex precision (`zcposv`) normwise backward error quality (see below). If the approach fails, the method switches to a double precision or double complex precision factorization respectively and computes the solution.

The iterative refinement is not going to be a winning strategy if the ratio single precision/complex performance over double precision/double complex performance is too small. A reasonable strategy should take the number of right-hand sides and the size of the matrix into account. This might be done with a call to `ilaenv` in the future. At present, iterative refinement is implemented.

The iterative refinement process is stopped if

`iter > itermax`

or for all the right-hand sides:

`rnmr < sqrt(n)*xnrm*anrm*eps*bwdmax`,

where

- `iter` is the number of the current iteration in the iterative refinement process
- `rnmr` is the infinity-norm of the residual
- `xnrm` is the infinity-norm of the solution
- `anrm` is the infinity-operator-norm of the matrix  $A$
- `eps` is the machine epsilon returned by `dlamch ('Epsilon')`.

The values `itermax` and `bwdmax` are fixed to 30 and 1.0d+00 respectively.

## Input Parameters

`matrix_layout` Specifies whether matrix storage layout is row major (LAPACK\_ROW\_MAJOR) or column major (LAPACK\_COL\_MAJOR).

`uplo` Must be 'U' or 'L'.

Indicates whether the upper or lower triangular part of  $A$  is stored:

If `uplo = 'U'`, the upper triangle of  $A$  is stored.

	If <i>uplo</i> = 'L', the lower triangle of <i>A</i> is stored.
<i>n</i>	The order of matrix <i>A</i> ; $n \geq 0$ .
<i>nrhs</i>	The number of right-hand sides, the number of columns in <i>B</i> ; $nrhs \geq 0$ .
<i>a, b</i>	Arrays: <i>a</i> (size $\max(1, lda)$ ), <i>b</i> , size $\max(ldb*nrhs)$ for column major layout and $\max(ldb*n)$ for row major layout,. The array <i>a</i> contains the upper or the lower triangular part of the matrix <i>A</i> (see <i>uplo</i> ).  Note that in the case of <i>zcposv</i> the imaginary parts of the diagonal elements need not be set and are assumed to be zero.  The array <i>b</i> contains the matrix <i>B</i> whose columns are the right-hand sides for the systems of equations.
<i>lda</i>	The leading dimension of <i>a</i> ; $lda \geq \max(1, n)$ .
<i>ldb</i>	The leading dimension of <i>b</i> ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.
<i>ldx</i>	The leading dimension of the array <i>x</i> ; $ldx \geq \max(1, n)$ for column major layout and $ldx \geq nrhs$ for row major layout.

## Output Parameters

<i>a</i>	If <i>info</i> = 0, the upper or lower triangular part of <i>a</i> is overwritten by the Cholesky factor <i>U</i> or <i>L</i> , as specified by <i>uplo</i> .  If iterative refinement has been successfully used ( <i>info</i> = 0 and <i>iter</i> $\geq$ 0), then <i>A</i> is unchanged.  If double precision factorization has been used ( <i>info</i> = 0 and <i>iter</i> < 0), then the array <i>A</i> contains the factors <i>L</i> or <i>U</i> from the Cholesky factorization.
<i>b</i>	Overwritten by the solution matrix <i>X</i> .
<i>x</i>	Array, size $\max(1, ldx*nrhs)$ for column major layout and $\max(1, ldx*n)$ for row major layout. If <i>info</i> = 0, contains the <i>n</i> -by- <i>nrhs</i> solution matrix <i>X</i> .
<i>iter</i>	If <i>iter</i> < 0: iterative refinement has failed, double precision factorization has been performed <ul style="list-style-type: none"> <li>• If <i>iter</i> = -1: the routine fell back to full precision for implementation- or machine-specific reason</li> <li>• If <i>iter</i> = -2: narrowing the precision induced an overflow, the routine fell back to full precision</li> <li>• If <i>iter</i> = -3: failure of <i>spotrf</i> for <i>dsposv</i>, or <i>cpotrf</i> for <i>zcposv</i></li> <li>• If <i>iter</i> = -31: stop the iterative refinement after the 30th iteration.</li> </ul> <p>If <i>iter</i> &gt; 0: iterative refinement has been successfully used. Returns the number of iterations.</p>

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

If *info* = *i*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive definite, so the factorization could not be completed, and the solution has not been computed.

## Description

The routine uses the *Cholesky* factorization  $A=U^T*U$  (real flavors) /  $A=U^H*U$  (complex flavors) or  $A=L*L^T$  (real flavors) /  $A=L*L^H$  (complex flavors) to compute the solution to a real or complex system of linear equations  $A*X = B$ , where *A* is a *n*-by-*n* real symmetric/Hermitian positive definite matrix, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?posvx performs the following steps:

1. If *fact* = 'E', real scaling factors *s* are computed to equilibrate the system:

$$diag(s)*A*diag(s)*inv(diag(s))*X = diag(s)*B.$$

Whether or not the system will be equilibrated depends on the scaling of the matrix  $A$ , but if equilibration is used,  $A$  is overwritten by  $diag(s)*A*diag(s)$  and  $B$  by  $diag(s)*B$ .

2. If  $fact = 'N'$  or  $'E'$ , the Cholesky decomposition is used to factor the matrix  $A$  (after equilibration if  $fact = 'E'$ ) as

$A = U^T*U$  (real),  $A = U^H*U$  (complex), if  $uplo = 'U'$ ,

or  $A = L*L^T$  (real),  $A = L*L^H$  (complex), if  $uplo = 'L'$ ,

where  $U$  is an upper triangular matrix and  $L$  is a lower triangular matrix.

3. If the leading  $i$ -by- $i$  principal minor is not positive-definite, then the routine returns with  $info = i$ . Otherwise, the factored form of  $A$  is used to estimate the condition number of the matrix  $A$ . If the reciprocal of the condition number is less than machine precision,  $info = n + 1$  is returned as a warning, but the routine still goes on to solve for  $X$  and compute error bounds as described below.
4. The system of equations is solved for  $X$  using the factored form of  $A$ .
5. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.
6. If equilibration was used, the matrix  $X$  is premultiplied by  $diag(s)$  so that it solves the original system before equilibration.

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<code>fact</code>	<p>Must be 'F', 'N', or 'E'.</p> <p>Specifies whether or not the factored form of the matrix <math>A</math> is supplied on entry, and if not, whether the matrix <math>A</math> should be equilibrated before it is factored.</p> <p>If <math>fact = 'F'</math>: on entry, <math>af</math> contains the factored form of <math>A</math>. If <math>equed = 'Y'</math>, the matrix <math>A</math> has been equilibrated with scaling factors given by <math>s</math>. <math>a</math> and <math>af</math> will not be modified.</p> <p>If <math>fact = 'N'</math>, the matrix <math>A</math> will be copied to <math>af</math> and factored.</p> <p>If <math>fact = 'E'</math>, the matrix <math>A</math> will be equilibrated if necessary, then copied to <math>af</math> and factored.</p>
<code>uplo</code>	<p>Must be 'U' or 'L'.</p> <p>Indicates whether the upper or lower triangular part of <math>A</math> is stored:</p> <p>If <math>uplo = 'U'</math>, the upper triangle of <math>A</math> is stored.</p> <p>If <math>uplo = 'L'</math>, the lower triangle of <math>A</math> is stored.</p>
<code>n</code>	The order of matrix $A$ ; $n \geq 0$ .
<code>nrhs</code>	The number of right-hand sides, the number of columns in $B$ ; $nrhs \geq 0$ .
<code>a, af, b</code>	Arrays: $a$ (size $\max(1, lda*n)$ ), $af$ (size $\max(1, ldaf*n)$ ), $b$ , size $\max(ldb*nrhs)$ for column major layout and $\max(ldb*n)$ for row major layout, .

The array *a* contains the matrix *A* as specified by *uplo*. If *fact* = 'F' and *equed* = 'Y', then *A* must have been equilibrated by the scaling factors in *s*, and *a* must contain the equilibrated matrix  $diag(s)*A*diag(s)$ .

The array *af* is an input argument if *fact* = 'F'. It contains the triangular factor *U* or *L* from the Cholesky factorization of *A* in the same storage format as *A*. If *equed* is not 'N', then *af* is the factored form of the equilibrated matrix  $diag(s)*A*diag(s)$ .

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations.

*lda* The leading dimension of *a*;  $lda \geq \max(1, n)$ .

*ldaf* The leading dimension of *af*;  $ldaf \geq \max(1, n)$ .

*ldb* The leading dimension of *b*;  $ldb \geq \max(1, n)$  for column major layout and  $ldb \geq nrhs$  for row major layout.

*equed* Must be 'N' or 'Y'.

*equed* is an input argument if *fact* = 'F'. It specifies the form of equilibration that was done:

if *equed* = 'N', no equilibration was done (always true if *fact* = 'N');

if *equed* = 'Y', equilibration was done, that is, *A* has been replaced by  $diag(s)*A*diag(s)$ .

*s* Array, size (*n*). The array *s* contains the scale factors for *A*. This array is an input argument if *fact* = 'F' only; otherwise it is an output argument.

If *equed* = 'N', *s* is not accessed.

If *fact* = 'F' and *equed* = 'Y', each element of *s* must be positive.

*ldx* The leading dimension of the output array *x*;  $ldx \geq \max(1, n)$  for column major layout and  $ldx \geq nrhs$  for row major layout.

## Output Parameters

*x* Array, size  $\max(1, ldx*nrhs)$  for column major layout and  $\max(1, ldx*n)$  for row major layout.

If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X* to the *original* system of equations. Note that if *equed* = 'Y', *A* and *B* are modified on exit, and the solution to the equilibrated system is  $inv(diag(s))*X$ .

*a* Array *a* is not modified on exit if *fact* = 'F' or 'N', or if *fact* = 'E' and *equed* = 'N'.

If *fact* = 'E' and *equed* = 'Y', *A* is overwritten by  $diag(s)*A*diag(s)$ .

<i>af</i>	If <i>fact</i> = 'N' or 'E', then <i>af</i> is an output argument and on exit returns the triangular factor <i>U</i> or <i>L</i> from the Cholesky factorization $A=U^T*U$ or $A=L*L^T$ (real routines), $A=U^H*U$ or $A=L*L^H$ (complex routines) of the original matrix <i>A</i> (if <i>fact</i> = 'N'), or of the equilibrated matrix <i>A</i> (if <i>fact</i> = 'E'). See the description of <i>a</i> for the form of the equilibrated matrix.
<i>b</i>	Overwritten by $diag(s)*B$ , if <i>equed</i> = 'Y'; not changed if <i>equed</i> = 'N'.
<i>s</i>	This array is an output argument if <i>fact</i> ≠ 'F'. See the description of <i>s</i> in <i>Input Arguments</i> section.
<i>rcond</i>	An estimate of the reciprocal condition number of the matrix <i>A</i> after equilibration (if done). If <i>rcond</i> is less than the machine precision (in particular, if <i>rcond</i> = 0), the matrix is singular to working precision. This condition is indicated by a return code of <i>info</i> > 0.
<i>ferr</i>	Array, size at least $\max(1, nrhs)$ . Contains the estimated forward error bound for each solution vector $x_j$ (the <i>j</i> -th column of the solution matrix <i>X</i> ). If <i>xtrue</i> is the true solution corresponding to $x_j$ , <i>ferr</i> [ <i>j</i> -1] is an estimated upper bound for the magnitude of the largest element in $(x_j) - xtrue$ divided by the magnitude of the largest element in $x_j$ . The estimate is as reliable as the estimate for <i>rcond</i> , and is almost always a slight overestimate of the true error.
<i>berr</i>	Array, size at least $\max(1, nrhs)$ . Contains the component-wise relative backward error for each solution vector $x_j$ , that is, the smallest relative change in any element of <i>A</i> or <i>B</i> that makes $x_j$ an exact solution.
<i>equed</i>	If <i>fact</i> ≠ 'F', then <i>equed</i> is an output argument. It specifies the form of equilibration that was done (see the description of <i>equed</i> in <i>Input Arguments</i> section).

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

If *info* = *i*, and  $i \leq n$ , the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite, so the factorization could not be completed, and the solution and error bounds could not be computed; *rcond* = 0 is returned.

If *info* = *i*, and  $i = n + 1$ , then *U* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

### Description

The routine uses the *Cholesky* factorization  $A=U^T*U$  (real flavors) /  $A=U^H*U$  (complex flavors) or  $A=L*L^T$  (real flavors) /  $A=L*L^H$  (complex flavors) to compute the solution to a real or complex system of linear equations  $A*X = B$ , where  $A$  is an  $n$ -by- $n$  real symmetric/Hermitian positive definite matrix, the columns of matrix  $B$  are individual right-hand sides, and the columns of  $X$  are the corresponding solutions.

Both normwise and maximum componentwise error bounds are also provided on request. The routine returns a solution with a small guaranteed error ( $O(\text{eps})$ , where  $\text{eps}$  is the working machine precision) unless the matrix is very ill-conditioned, in which case a warning is returned. Relevant condition numbers are also calculated and returned.

The routine accepts user-provided factorizations and equilibration factors; see definitions of the *fact* and *equed* options. Solving with refinement and using a factorization from a previous call of the routine also produces a solution with  $O(\text{eps})$  errors or warnings but that may not be true for general user-provided factorizations and equilibration factors if they differ from what the routine would itself produce.

The routine ?posvxx performs the following steps:

1. If *fact* = 'E', scaling factors are computed to equilibrate the system:

$$\text{diag}(s) * A * \text{diag}(s) * \text{inv}(\text{diag}(s)) * X = \text{diag}(s) * B$$

Whether or not the system will be equilibrated depends on the scaling of the matrix  $A$ , but if equilibration is used,  $A$  is overwritten by  $\text{diag}(s) * A * \text{diag}(s)$  and  $B$  by  $\text{diag}(s) * B$ .

2. If  $fact = 'N'$  or  $'E'$ , the Cholesky decomposition is used to factor the matrix  $A$  (after equilibration if  $fact = 'E'$ ) as

$$A = U^T * U \text{ (real)}, A = U^H * U \text{ (complex)}, \text{ if } uplo = 'U',$$

$$\text{or } A = L * L^T \text{ (real)}, A = L * L^H \text{ (complex)}, \text{ if } uplo = 'L',$$

where  $U$  is an upper triangular matrix and  $L$  is a lower triangular matrix.

3. If the leading  $i$ -by- $i$  principal minor is not positive-definite, the routine returns with  $info = i$ . Otherwise, the factored form of  $A$  is used to estimate the condition number of the matrix  $A$  (see the  $rcond$  parameter). If the reciprocal of the condition number is less than machine precision, the routine still goes on to solve for  $X$  and compute error bounds.
4. The system of equations is solved for  $X$  using the factored form of  $A$ .
5. By default, unless  $params[0]$  is set to zero, the routine applies iterative refinement to get a small error and error bounds. Refinement calculates the residual to at least twice the working precision.
6. If equilibration was used, the matrix  $X$  is premultiplied by  $\text{diag}(s)$  so that it solves the original system before equilibration.

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>fact</i>	<p>Must be 'F', 'N', or 'E'.</p> <p>Specifies whether or not the factored form of the matrix <math>A</math> is supplied on entry, and if not, whether the matrix <math>A</math> should be equilibrated before it is factored.</p> <p>If <math>fact = 'F'</math>, on entry, <math>af</math> contains the factored form of <math>A</math>. If <math>equed</math> is not 'N', the matrix <math>A</math> has been equilibrated with scaling factors given by <math>s</math>. Parameters <math>a</math> and <math>af</math> are not modified.</p> <p>If <math>fact = 'N'</math>, the matrix <math>A</math> will be copied to <math>af</math> and factored.</p> <p>If <math>fact = 'E'</math>, the matrix <math>A</math> will be equilibrated, if necessary, copied to <math>af</math> and factored.</p>
<i>uplo</i>	<p>Must be 'U' or 'L'.</p> <p>Indicates whether the upper or lower triangular part of <math>A</math> is stored:</p> <p>If <math>uplo = 'U'</math>, the upper triangle of <math>A</math> is stored.</p> <p>If <math>uplo = 'L'</math>, the lower triangle of <math>A</math> is stored.</p>
<i>n</i>	The number of linear equations; the order of the matrix $A$ ; $n \geq 0$ .
<i>nrhs</i>	The number of right-hand sides; the number of columns of the matrices $B$ and $X$ ; $nrhs \geq 0$ .
<i>a, af, b</i>	Arrays: $a$ (size $\max(lda * n)$ ), $af$ (size $\max(ldaf * n)$ ), $b$ (size $\max(1, ldb * nrhs)$ ) for column major layout and $\max(1, ldb * n)$ for row major layout).

The array *a* contains the matrix *A* as specified by *uplo*. If *fact* = 'F' and *equed* = 'Y', then *A* must have been equilibrated by the scaling factors in *s*, and *a* must contain the equilibrated matrix  $diag(s)*A*diag(s)$ .

The array *af* is an input argument if *fact* = 'F'. It contains the triangular factor *U* or *L* from the Cholesky factorization of *A* in the same storage format as *A*. If *equed* is not 'N', then *af* is the factored form of the equilibrated matrix  $diag(s)*A*diag(s)$ .

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations.

*lda* The leading dimension of the array *a*;  $lda \geq \max(1, n)$ .

*ldaf* The leading dimension of the array *af*;  $ldaf \geq \max(1, n)$ .

*equed* Must be 'N' or 'Y'.

*equed* is an input argument if *fact* = 'F'. It specifies the form of equilibration that was done:

If *equed* = 'N', no equilibration was done (always true if *fact* = 'N').

if *equed* = 'Y', both row and column equilibration was done, that is, *A* has been replaced by  $diag(s)*A*diag(s)$ .

*s* Array, size (*n*). The array *s* contains the scale factors for *A*. This array is an input argument if *fact* = 'F' only; otherwise it is an output argument.

If *equed* = 'N', *s* is not accessed.

If *fact* = 'F' and *equed* = 'Y', each element of *s* must be positive.

Each element of *s* should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

*ldb* The leading dimension of the array *b*;  $ldb \geq \max(1, n)$  for column major layout and  $ldb \geq nrhs$  for row major layout.

*ldx* The leading dimension of the output array *x*;  $ldx \geq \max(1, n)$  for column major layout and  $ldx \geq nrhs$  for row major layout.

*n\_err\_bnds* Number of error bounds to return for each right hand side and each type (normwise or componentwise). See *err\_bnds\_norm* and *err\_bnds\_comp* descriptions in the *Output Arguments* section below.

*nparams* Specifies the number of parameters set in *params*. If  $\leq 0$ , the *params* array is never referenced and default values are used.

*params* Array, size  $\max(1, nparams)$ . Specifies algorithm parameters. If an entry is less than 0.0, that entry is filled with the default value used for that parameter. Only positions up to *nparams* are accessed;

defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass  $nparams = 0$ , which prevents the source code from accessing the  $params$  argument.

$params[0]$  : Whether to perform iterative refinement or not. Default: 1.0 (for single precision flavors), 1.0D+0 (for double precision flavors).

=0.0 No refinement is performed and no error bounds are computed.

=1.0 Use the extra-precise refinement algorithm.

(Other values are reserved for future use.)

$params[1]$  : Maximum number of residual computations allowed for refinement.

Default 10.0

Aggressive Set to 100.0 to permit convergence using approximate factorizations or factorizations other than  $LU$ . If the factorization uses a technique other than Gaussian elimination, the guarantees in  $err\_bnds\_norm$  and  $err\_bnds\_comp$  may no longer be trustworthy.

$params[2]$  : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

## Output Parameters

$x$	<p>Array, size <math>\max(1, ldx*nrhs)</math> for column major layout and <math>\max(1, ldx*n)</math> for row major layout.</p> <p>If <math>info = 0</math>, the array <math>x</math> contains the solution <math>n</math>-by-<math>nrhs</math> matrix <math>X</math> to the original system of equations. Note that <math>A</math> and <math>B</math> are modified on exit if <math>equed \neq 'N'</math>, and the solution to the equilibrated system is:</p> $\text{inv}(\text{diag}(s)) * X.$
$a$	<p>Array <math>a</math> is not modified on exit if <math>fact = 'F'</math> or <math>'N'</math>, or if <math>fact = 'E'</math> and <math>equed = 'N'</math>.</p> <p>If <math>fact = 'E'</math> and <math>equed = 'Y'</math>, <math>A</math> is overwritten by <math>\text{diag}(s) * A * \text{diag}(s)</math>.</p>
$af$	<p>If <math>fact = 'N'</math> or <math>'E'</math>, then <math>af</math> is an output argument and on exit returns the triangular factor <math>U</math> or <math>L</math> from the Cholesky factorization <math>A = U^T * U</math> or <math>A = L * L^T</math> (real routines), <math>A = U^H * U</math> or <math>A = L * L^H</math> (complex routines) of the original matrix <math>A</math> (if <math>fact = 'N'</math>), or of the equilibrated matrix <math>A</math> (if <math>fact = 'E'</math>). See the description of <math>a</math> for the form of the equilibrated matrix.</p>
$b$	<p>If <math>equed = 'N'</math>, <math>B</math> is not modified.</p> <p>If <math>equed = 'Y'</math>, <math>B</math> is overwritten by <math>\text{diag}(s) * B</math>.</p>

<i>s</i>	This array is an output argument if <i>fact</i> ≠'F'. Each element of this array is a power of the radix. See the description of <i>s</i> in <i>Input Arguments</i> section.
<i>rcond</i>	Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix <i>A</i> after equilibration (if done). If <i>rcond</i> is less than the machine precision, in particular, if <i>rcond</i> = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.
<i>rpvgrw</i>	Contains the reciprocal pivot growth factor:

$$\|A\|/\|U\|$$

If this is much less than 1, the stability of the *LU* factorization of the (equilibrated) matrix *A* could be poor. This also means that the solution *X*, estimated condition numbers, and error bounds could be unreliable. If factorization fails with  $0 < info \leq n$ , this parameter contains the reciprocal pivot growth factor for the leading *info* columns of *A*.

<i>berr</i>	Array, size at least $\max(1, nrhs)$ . Contains the componentwise relative backward error for each solution vector $x_j$ , that is, the smallest relative change in any element of <i>A</i> or <i>B</i> that makes $x_j$ an exact solution.
-------------	---

<i>err_bnds_norm</i>	Array of size <i>nrhs</i> * <i>n_err_bnds</i> . For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:
----------------------	--

Normwise relative error in the *i*-th solution vector

$$\frac{\max_j |X_{true_{ji}} - X_{ji}|}{\max_j |X_{ji}|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.

<i>err</i> =1	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold $\sqrt{n} * slamch(\epsilon)$ for single precision flavors and $\sqrt{n} * dlamch(\epsilon)$ for double precision flavors.
<i>err</i> =2	"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold $\sqrt{n} * slamch(\epsilon)$ for single precision flavors and $\sqrt{n} * dlamch(\epsilon)$ for double precision flavors. This error bound should only be trusted if the previous boolean is true.
<i>err</i> =3	Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold

$\sqrt{n} * \text{slamch}(\epsilon)$  for single precision flavors and  $\sqrt{n} * \text{dlamch}(\epsilon)$  for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix  $Z$  are:

$$\|Z\|_{\infty} \cdot \|Z^{-1}\|_{\infty}$$

Let  $z = s * a$ , where  $s$  scales each row by a power of the radix so all absolute row sums of  $z$  are approximately 1.

The information for right-hand side  $i$ , where  $1 \leq i \leq nrhs$ , and type of error  $err$  is stored in `err_bnds_norm[(err-1)*nrhs + i - 1]`.

`err_bnds_comp`

Array of size  $nrhs * n\_err\_bnds$ . For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:

Componentwise relative error in the  $i$ -th solution vector:

$$\max_j \frac{|X_{true_{ji}} - X_{ji}|}{|X_{ji}|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is not requested (`params[2] = 0.0`), then `err_bnds_comp` is not accessed.

<code>err=1</code>	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors.
<code>err=2</code>	"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors. This error bound should only be trusted if the previous boolean is true.
<code>err=3</code>	Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold $\sqrt{n} * \text{slamch}(\epsilon)$ for single precision flavors and $\sqrt{n} * \text{dlamch}(\epsilon)$ for double precision flavors to determine if the error estimate is

"guaranteed". These reciprocal condition numbers for some appropriately scaled matrix  $Z$  are:

$$\|Z\|_{\infty} \cdot \|Z^{-1}\|_{\infty}$$

Let  $z = s * (a * \text{diag}(x))$ , where  $x$  is the solution for the current right-hand side and  $s$  scales each row of  $a * \text{diag}(x)$  by a power of the radix so all absolute row sums of  $z$  are approximately 1.

The information for right-hand side  $i$ , where  $1 \leq i \leq nrhs$ , and type of error  $err$  is stored in `err_bnds_comp[(err-1)*nrhs + i - 1]`.

*equed*

If `fact# 'F'`, then *equed* is an output argument. It specifies the form of equilibration that was done (see the description of *equed* in *Input Arguments* section).

*params*

If an entry is less than 0.0, that entry is filled with the default value used for that parameter, otherwise the entry is not modified.

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful. The solution to every right-hand side is guaranteed.

If *info* = -*i*, parameter *i* had an illegal value.

If  $0 < info \leq n$ :  $U_{info,info}$  is exactly zero. The factorization has been completed, but the factor  $U$  is exactly singular, so the solution and error bounds could not be computed; `rcond` = 0 is returned.

If *info* =  $n+j$ : The solution corresponding to the  $j$ -th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides  $k$  with  $k > j$  may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested `params[2] = 0.0`, then the  $j$ -th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest  $j$  such that for column major layout `err_bnds_norm[j - 1] = 0.0` or `err_bnds_comp[j - 1] = 0.0`; or for row major layout `err_bnds_norm[(j - 1)*n_err_bnds] = 0.0` or `err_bnds_comp[(j - 1)*n_err_bnds] = 0.0`). See the definition of `err_bnds_norm` and `err_bnds_comp` for `err` = 1. To get information about all of the right-hand sides, check `err_bnds_norm` or `err_bnds_comp`.

## Description

The routine solves for  $X$  the real or complex system of linear equations  $A^*X = B$ , where  $A$  is an  $n$ -by- $n$  real symmetric/Hermitian positive-definite matrix stored in packed format, the columns of matrix  $B$  are individual right-hand sides, and the columns of  $X$  are the corresponding solutions.

The Cholesky decomposition is used to factor  $A$  as

$A = U^T * U$  (real flavors) and  $A = U^H * U$  (complex flavors), if  $uplo = 'U'$

or  $A = L * L^T$  (real flavors) and  $A = L * L^H$  (complex flavors), if  $uplo = 'L'$ ,

where  $U$  is an upper triangular matrix and  $L$  is a lower triangular matrix. The factored form of  $A$  is then used to solve the system of equations  $A^*X = B$ .

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of $A$ is stored: If $uplo = 'U'$ , the upper triangle of $A$ is stored. If $uplo = 'L'$ , the lower triangle of $A$ is stored.
<i>n</i>	The order of matrix $A$ ; $n \geq 0$ .
<i>nrhs</i>	The number of right-hand sides, the number of columns in $B$ ; $nrhs \geq 0$ .
<i>ap, b</i>	Arrays: $ap$ (size $\max(1, n*(n+1)/2)$ , $b$ , size $\max(ldb*nrhs)$ for column major layout and $\max(ldb*n)$ for row major layout,. The array $ap$ contains the upper or the lower triangular part of the matrix $A$ (as specified by $uplo$ ) in <i>packed storage</i> (see <a href="#">Matrix Storage Schemes</a> ). The array $b$ contains the matrix $B$ whose columns are the right-hand sides for the systems of equations.
<i>ldb</i>	The leading dimension of $b$ ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.

## Output Parameters

*ap* If  $info = 0$ , the upper or lower triangular part of  $A$  in packed storage is overwritten by the Cholesky factor  $U$  or  $L$ , as specified by  $uplo$ .

$b$ Overwritten by the solution matrix  $X$ .

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

If *info* = *i*, the leading minor of order *i* (and therefore the matrix  $A$  itself) is not positive-definite, so the factorization could not be completed, and the solution has not been computed.

## Description

The routine uses the Cholesky factorization  $A=U^T*U$  (real flavors) /  $A=U^H*U$  (complex flavors) or  $A=L*L^T$  (real flavors) /  $A=L*L^H$  (complex flavors) to compute the solution to a real or complex system of linear equations  $A*X = B$ , where  $A$  is a  $n$ -by- $n$  symmetric or Hermitian positive-definite matrix stored in packed format, the columns of matrix  $B$  are individual right-hand sides, and the columns of  $X$  are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?ppsvx performs the following steps:

1. If  $fact = 'E'$ , real scaling factors  $s$  are computed to equilibrate the system:

$$diag(s)*A*diag(s)*inv(diag(s))*X = diag(s)*B.$$

Whether or not the system will be equilibrated depends on the scaling of the matrix  $A$ , but if equilibration is used,  $A$  is overwritten by  $diag(s)*A*diag(s)$  and  $B$  by  $diag(s)*B$ .

2. If  $fact = 'N'$  or  $'E'$ , the Cholesky decomposition is used to factor the matrix  $A$  (after equilibration if  $fact = 'E'$ ) as

$$A = U^T*U \text{ (real), } A = U^H*U \text{ (complex), if } uplo = 'U',$$

$$\text{or } A = L*L^T \text{ (real), } A = L*L^H \text{ (complex), if } uplo = 'L',$$

where  $U$  is an upper triangular matrix and  $L$  is a lower triangular matrix.

3. If the leading  $i$ -by- $i$  principal minor is not positive-definite, then the routine returns with  $info = i$ . Otherwise, the factored form of  $A$  is used to estimate the condition number of the matrix  $A$ . If the reciprocal of the condition number is less than machine precision,  $info = n+1$  is returned as a warning, but the routine still goes on to solve for  $X$  and compute error bounds as described below.
4. The system of equations is solved for  $X$  using the factored form of  $A$ .
5. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.
6. If equilibration was used, the matrix  $X$  is premultiplied by  $diag(s)$  so that it solves the original system before equilibration.

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<code>fact</code>	<p>Must be 'F', 'N', or 'E'.</p> <p>Specifies whether or not the factored form of the matrix <math>A</math> is supplied on entry, and if not, whether the matrix <math>A</math> should be equilibrated before it is factored.</p> <p>If <math>fact = 'F'</math>: on entry, <math>afp</math> contains the factored form of <math>A</math>. If <math>equed = 'Y'</math>, the matrix <math>A</math> has been equilibrated with scaling factors given by <math>s</math>. <math>ap</math> and <math>afp</math> will not be modified.</p> <p>If <math>fact = 'N'</math>, the matrix <math>A</math> will be copied to <math>afp</math> and factored.</p> <p>If <math>fact = 'E'</math>, the matrix <math>A</math> will be equilibrated if necessary, then copied to <math>afp</math> and factored.</p>
<code>uplo</code>	<p>Must be 'U' or 'L'.</p> <p>Indicates whether the upper or lower triangular part of <math>A</math> is stored:</p> <p>If <math>uplo = 'U'</math>, the upper triangle of <math>A</math> is stored.</p> <p>If <math>uplo = 'L'</math>, the lower triangle of <math>A</math> is stored.</p>
<code>n</code>	The order of matrix $A$ ; $n \geq 0$ .
<code>nrhs</code>	The number of right-hand sides; the number of columns in $B$ ; $nrhs \geq 0$ .
<code>ap, afp, b</code>	Arrays: (size $\max(1, n*(n+1)/2)$ , $afp$ (size $\max(1, n*(n+1)/2)$ , $bof$ size $\max(1, ldb*nrhs)$ for column major layout and $\max(1, ldb*n)$ for row major layout.

The array *ap* contains the upper or lower triangle of the original symmetric/Hermitian matrix *A* in *packed storage* (see [Matrix Storage Schemes](#)). In case when *fact* = 'F' and *equed* = 'Y', *ap* must contain the equilibrated matrix  $diag(s) * A * diag(s)$ .

The array *afp* is an input argument if *fact* = 'F' and contains the triangular factor *U* or *L* from the Cholesky factorization of *A* in the same storage format as *A*. If *equed* is not 'N', then *afp* is the factored form of the equilibrated matrix *A*.

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations.

*ldb* The leading dimension of *b*;  $ldb \geq \max(1, n)$  for column major layout and  $ldb \geq nrhs$  for row major layout.

*equed* Must be 'N' or 'Y'.

*equed* is an input argument if *fact* = 'F'. It specifies the form of equilibration that was done:

if *equed* = 'N', no equilibration was done (always true if *fact* = 'N');

if *equed* = 'Y', equilibration was done, that is, *A* has been replaced by  $diag(s) * A * diag(s)$ .

*s* Array, size (*n*). The array *s* contains the scale factors for *A*. This array is an input argument if *fact* = 'F' only; otherwise it is an output argument.

If *equed* = 'N', *s* is not accessed.

If *fact* = 'F' and *equed* = 'Y', each element of *s* must be positive.

*ldx* The leading dimension of the output array *x*;  $ldx \geq \max(1, n)$  for column major layout and  $ldx \geq nrhs$  for row major layout.

## Output Parameters

*x* Array, size  $\max(1, ldx * nrhs)$  for column major layout and  $\max(1, ldx * n)$  for row major layout.

If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X* to the *original* system of equations. Note that if *equed* = 'Y', *A* and *B* are modified on exit, and the solution to the equilibrated system is  $inv(diag(s)) * X$ .

*ap* Array *ap* is not modified on exit if *fact* = 'F' or 'N', or if *fact* = 'E' and *equed* = 'N'.

If *fact* = 'E' and *equed* = 'Y', *ap* is overwritten by  $diag(s) * A * diag(s)$ .

*afp* If *fact* = 'N' or 'E', then *afp* is an output argument and on exit returns the triangular factor *U* or *L* from the Cholesky factorization  $A = U^T * U$  or  $A = L * L^T$  (real routines),  $A = U^H * U$  or  $A = L * L^H$  (complex

	routines) of the original matrix $A$ (if $fact = 'N'$ ), or of the equilibrated matrix $A$ (if $fact = 'E'$ ). See the description of $ap$ for the form of the equilibrated matrix.
$b$	Overwritten by $diag(s)*B$ , if $equed = 'Y'$ ; not changed if $equed = 'N'$ .
$s$	This array is an output argument if $fact \neq 'F'$ . See the description of $s$ in <i>Input Arguments</i> section.
$rcond$	An estimate of the reciprocal condition number of the matrix $A$ after equilibration (if done). If $rcond$ is less than the machine precision (in particular, if $rcond = 0$ ), the matrix is singular to working precision. This condition is indicated by a return code of $info > 0$ .
$ferr$	Array, size at least $\max(1, nrhs)$ . Contains the estimated forward error bound for each solution vector $x_j$ (the $j$ -th column of the solution matrix $X$ ). If $xtrue$ is the true solution corresponding to $x_j$ , $ferr[j-1]$ is an estimated upper bound for the magnitude of the largest element in $(x_j - xtrue)$ divided by the magnitude of the largest element in $x_j$ . The estimate is as reliable as the estimate for $rcond$ , and is almost always a slight overestimate of the true error.
$berr$	Array, size at least $\max(1, nrhs)$ . Contains the component-wise relative backward error for each solution vector $x_j$ , that is, the smallest relative change in any element of $A$ or $B$ that makes $x_j$ an exact solution.
$equed$	If $fact \neq 'F'$ , then $equed$ is an output argument. It specifies the form of equilibration that was done (see the description of $equed$ in <i>Input Arguments</i> section).

## Return Values

This function returns a value  $info$ .

If  $info=0$ , the execution is successful.

If  $info = -i$ , parameter  $i$  had an illegal value.

If  $info = i$ , and  $i \leq n$ , the leading minor of order  $i$  (and therefore the matrix  $A$  itself) is not positive-definite, so the factorization could not be completed, and the solution and error bounds could not be computed;  $rcond = 0$  is returned.

If  $info = i$ , and  $i = n + 1$ , then  $U$  is nonsingular, but  $rcond$  is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of  $rcond$  would suggest.

## Description

The routine solves for  $X$  the real or complex system of linear equations  $A \cdot X = B$ , where  $A$  is an  $n$ -by- $n$  symmetric/Hermitian positive definite band matrix, the columns of matrix  $B$  are individual right-hand sides, and the columns of  $X$  are the corresponding solutions.

The Cholesky decomposition is used to factor  $A$  as

$A = U^T \cdot U$  (real flavors) and  $A = U^H \cdot U$  (complex flavors), if  $uplo = 'U'$

or  $A = L \cdot L^T$  (real flavors) and  $A = L \cdot L^H$  (complex flavors), if  $uplo = 'L'$ ,

where  $U$  is an upper triangular band matrix and  $L$  is a lower triangular band matrix, with the same number of superdiagonals or subdiagonals as  $A$ . The factored form of  $A$  is then used to solve the system of equations  $A \cdot X = B$ .

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of $A$ is stored: If $uplo = 'U'$ , the upper triangle of $A$ is stored. If $uplo = 'L'$ , the lower triangle of $A$ is stored.
<i>n</i>	The order of matrix $A$ ; $n \geq 0$ .
<i>kd</i>	The number of superdiagonals of the matrix $A$ if $uplo = 'U'$ , or the number of subdiagonals if $uplo = 'L'$ ; $kd \geq 0$ .
<i>nrhs</i>	The number of right-hand sides, the number of columns in $B$ ; $nrhs \geq 0$ .

<i>ab, b</i>	Arrays: <i>ab</i> (size $\max(1, ldab*n)$ ), <i>bof</i> size $\max(1, ldb*nrhs)$ for column major layout and $\max(1, ldb*n)$ for row major layout. The array <i>ab</i> contains the upper or the lower triangular part of the matrix <i>A</i> (as specified by <i>uplo</i> ) in <i>band storage</i> (see <a href="#">Matrix Storage Schemes</a> ).  The array <i>b</i> contains the matrix <i>B</i> whose columns are the right-hand sides for the systems of equations.
<i>ldab</i>	The leading dimension of the array <i>ab</i> ; $ldab \geq kd + 1$ .
<i>ldb</i>	The leading dimension of <i>b</i> ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.

## Output Parameters

<i>ab</i>	The upper or lower triangular part of <i>A</i> (in band storage) is overwritten by the Cholesky factor <i>U</i> or <i>L</i> , as specified by <i>uplo</i> , in the same storage format as <i>A</i> .
<i>b</i>	Overwritten by the solution matrix <i>X</i> .

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

If *info* = *i*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite, so the factorization could not be completed, and the solution has not been computed.

## Description

The routine uses the Cholesky factorization  $A=U^T*U$  (real flavors) /  $A=U^H*U$  (complex flavors) or  $A=L*L^T$  (real flavors) /  $A=L*L^H$  (complex flavors) to compute the solution to a real or complex system of linear equations  $A*X = B$ , where  $A$  is a  $n$ -by- $n$  symmetric or Hermitian positive definite band matrix, the columns of matrix  $B$  are individual right-hand sides, and the columns of  $X$  are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine `?pbsvx` performs the following steps:

1. If `fact = 'E'`, real scaling factors  $s$  are computed to equilibrate the system:

$$diag(s)*A*diag(s)*inv(diag(s))*X = diag(s)*B.$$

Whether or not the system will be equilibrated depends on the scaling of the matrix  $A$ , but if equilibration is used,  $A$  is overwritten by  $diag(s)*A*diag(s)$  and  $B$  by  $diag(s)*B$ .

2. If `fact = 'N'` or `'E'`, the Cholesky decomposition is used to factor the matrix  $A$  (after equilibration if `fact = 'E'`) as

$$A = U^T*U \text{ (real), } A = U^H*U \text{ (complex), if } uplo = 'U',$$

$$\text{or } A = L*L^T \text{ (real), } A = L*L^H \text{ (complex), if } uplo = 'L',$$

where  $U$  is an upper triangular band matrix and  $L$  is a lower triangular band matrix.

3. If the leading  $i$ -by- $i$  principal minor is not positive definite, then the routine returns with `info = i`. Otherwise, the factored form of  $A$  is used to estimate the condition number of the matrix  $A$ . If the reciprocal of the condition number is less than machine precision, `info = n+1` is returned as a warning, but the routine still goes on to solve for  $X$  and compute error bounds as described below.
4. The system of equations is solved for  $X$  using the factored form of  $A$ .
5. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.
6. If equilibration was used, the matrix  $X$  is premultiplied by  $diag(s)$  so that it solves the original system before equilibration.

## Input Parameters

`matrix_layout` Specifies whether matrix storage layout is row major (LAPACK\_ROW\_MAJOR) or column major (LAPACK\_COL\_MAJOR).

`fact` Must be 'F', 'N', or 'E'.

Specifies whether or not the factored form of the matrix  $A$  is supplied on entry, and if not, whether the matrix  $A$  should be equilibrated before it is factored.

If `fact = 'F'`: on entry, `afb` contains the factored form of  $A$ . If `equed = 'Y'`, the matrix  $A$  has been equilibrated with scaling factors given by  $s$ .

	<i>ab</i> and <i>afb</i> will not be modified.
	If <i>fact</i> = 'N', the matrix <i>A</i> will be copied to <i>afb</i> and factored.
	If <i>fact</i> = 'E', the matrix <i>A</i> will be equilibrated if necessary, then copied to <i>afb</i> and factored.
<i>uplo</i>	Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of <i>A</i> is stored: If <i>uplo</i> = 'U', the upper triangle of <i>A</i> is stored. If <i>uplo</i> = 'L', the lower triangle of <i>A</i> is stored.
<i>n</i>	The order of matrix <i>A</i> ; $n \geq 0$ .
<i>kd</i>	The number of superdiagonals or subdiagonals in the matrix <i>A</i> ; $kd \geq 0$ .
<i>nrhs</i>	The number of right-hand sides, the number of columns in <i>B</i> ; $nrhs \geq 0$ .
<i>ab, afb, b</i>	Arrays: <i>ab</i> (size $\max(1, ldab*n)$ ), <i>afb</i> (size $\max(1, ldafb*n)$ ), <i>b</i> of size $\max(1, ldb*nrhs)$ for column major layout and $\max(1, ldb*n)$ for row major layout. The array <i>ab</i> contains the upper or lower triangle of the matrix <i>A</i> in <i>band storage</i> (see <a href="#">Matrix Storage Schemes</a> ). If <i>fact</i> = 'F' and <i>equed</i> = 'Y', then <i>ab</i> must contain the equilibrated matrix $diag(s)*A*diag(s)$ . The array <i>afb</i> is an input argument if <i>fact</i> = 'F'. It contains the triangular factor <i>U</i> or <i>L</i> from the Cholesky factorization of the band matrix <i>A</i> in the same storage format as <i>A</i> . If <i>equed</i> = 'Y', then <i>afb</i> is the factored form of the equilibrated matrix <i>A</i> . The array <i>b</i> contains the matrix <i>B</i> whose columns are the right-hand sides for the systems of equations.
<i>ldab</i>	The leading dimension of <i>ab</i> ; $ldab \geq kd+1$ .
<i>ldaafb</i>	The leading dimension of <i>afb</i> ; $ldaafb \geq kd+1$ .
<i>ldb</i>	The leading dimension of <i>b</i> ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.
<i>equed</i>	Must be 'N' or 'Y'. <i>equed</i> is an input argument if <i>fact</i> = 'F'. It specifies the form of equilibration that was done: if <i>equed</i> = 'N', no equilibration was done (always true if <i>fact</i> = 'N') if <i>equed</i> = 'Y', equilibration was done, that is, <i>A</i> has been replaced by $diag(s)*A*diag(s)$ .
<i>s</i>	Array, size ( <i>n</i> ). The array <i>s</i> contains the scale factors for <i>A</i> . This array is an input argument if <i>fact</i> = 'F' only; otherwise it is an output argument. If <i>equed</i> = 'N', <i>s</i> is not accessed.

If  $fact = 'F'$  and  $equed = 'Y'$ , each element of  $s$  must be positive.

$ldx$

The leading dimension of the output array  $x$ ;  $ldx \geq \max(1, n)$  for column major layout and  $ldx \geq nrhs$  for row major layout.

## Output Parameters

$x$

Array, size  $\max(1, ldx * nrhs)$  for column major layout and  $\max(1, ldx * n)$  for row major layout.

If  $info = 0$  or  $info = n + 1$ , the array  $x$  contains the solution matrix  $X$  to the *original* system of equations. Note that if  $equed = 'Y'$ ,  $A$  and  $B$  are modified on exit, and the solution to the equilibrated system is  $\text{inv}(\text{diag}(s)) * X$ .

$ab$

On exit, if  $fact = 'E'$  and  $equed = 'Y'$ ,  $A$  is overwritten by  $\text{diag}(s) * A * \text{diag}(s)$ .

$afb$

If  $fact = 'N'$  or  $'E'$ , then  $afb$  is an output argument and on exit returns the triangular factor  $U$  or  $L$  from the Cholesky factorization  $A = U^T * U$  or  $A = L * L^T$  (real routines),  $A = U^H * U$  or  $A = L * L^H$  (complex routines) of the original matrix  $A$  (if  $fact = 'N'$ ), or of the equilibrated matrix  $A$  (if  $fact = 'E'$ ). See the description of  $ab$  for the form of the equilibrated matrix.

$b$

Overwritten by  $\text{diag}(s) * B$ , if  $equed = 'Y'$ ; not changed if  $equed = 'N'$ .

$s$

This array is an output argument if  $fact \neq 'F'$ . See the description of  $s$  in *Input Arguments* section.

$rcond$

An estimate of the reciprocal condition number of the matrix  $A$  after equilibration (if done). If  $rcond$  is less than the machine precision (in particular, if  $rcond = 0$ ), the matrix is singular to working precision. This condition is indicated by a return code of  $info > 0$ .

$ferr$

Array, size at least  $\max(1, nrhs)$ . Contains the estimated forward error bound for each solution vector  $x_j$  (the  $j$ -th column of the solution matrix  $X$ ). If  $x_{true}$  is the true solution corresponding to  $x_j$ ,  $ferr[j-1]$  is an estimated upper bound for the magnitude of the largest element in  $(x_j - x_{true})$  divided by the magnitude of the largest element in  $x_j$ . The estimate is as reliable as the estimate for  $rcond$ , and is almost always a slight overestimate of the true error.

$berr$

Array, size at least  $\max(1, nrhs)$ . Contains the component-wise relative backward error for each solution vector  $x_j$ , that is, the smallest relative change in any element of  $A$  or  $B$  that makes  $x_j$  an exact solution.

$equed$

If  $fact \neq 'F'$ , then  $equed$  is an output argument. It specifies the form of equilibration that was done (see the description of  $equed$  in *Input Arguments* section).

## Return Values

This function returns a value  $info$ .

If  $info = 0$ , the execution is successful.

If  $info = -i$ , parameter  $i$  had an illegal value.

If  $info = i$ , and  $i \leq n$ , the leading minor of order  $i$  (and therefore the matrix  $A$  itself) is not positive definite, so the factorization could not be completed, and the solution and error bounds could not be computed;  $rcond = 0$  is returned. If  $info = i$ , and  $i = n + 1$ , then  $U$  is nonsingular, but  $rcond$  is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of  $rcond$  would suggest.

## Description

The routine solves for  $X$  the real or complex system of linear equations  $A^*X = B$ , where  $A$  is an  $n$ -by- $n$  symmetric/Hermitian positive-definite tridiagonal matrix, the columns of matrix  $B$  are individual right-hand sides, and the columns of  $X$  are the corresponding solutions.

$A$  is factored as  $A = L^*D^*L^T$  (real flavors) or  $A = L^*D^*L^H$  (complex flavors), and the factored form of  $A$  is then used to solve the system of equations  $A^*X = B$ .

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>n</i>	The order of matrix $A$ ; $n \geq 0$ .
<i>nrhs</i>	The number of right-hand sides, the number of columns in $B$ ; $nrhs \geq 0$ .

<i>d</i>	Array, dimension at least $\max(1, n)$ . Contains the diagonal elements of the tridiagonal matrix <i>A</i> .
<i>e, b</i>	Arrays: <i>e</i> (size $n - 1$ ), <i>b</i> of size $\max(1, ldb * nrhs)$ for column major layout and $\max(1, ldb * n)$ for row major layout. The array <i>e</i> contains the $(n - 1)$ subdiagonal elements of <i>A</i> .  The array <i>b</i> contains the matrix <i>B</i> whose columns are the right-hand sides for the systems of equations.
<i>ldb</i>	The leading dimension of <i>b</i> ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.

## Output Parameters

<i>d</i>	Overwritten by the $n$ diagonal elements of the diagonal matrix <i>D</i> from the $L * D * L^T$ (real) / $L * D * L^H$ (complex) factorization of <i>A</i> .
<i>e</i>	Overwritten by the $(n - 1)$ subdiagonal elements of the unit bidiagonal factor <i>L</i> from the factorization of <i>A</i> .
<i>b</i>	Overwritten by the solution matrix <i>X</i> .

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

If *info* = *i*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite, and the solution has not been computed. The factorization has not been completed unless  $i = n$ .

## Description

The routine uses the Cholesky factorization  $A = L^*D^*L^T$  (real)/ $A = L^*D^*L^H$  (complex) to compute the solution to a real or complex system of linear equations  $A^*X = B$ , where  $A$  is a  $n$ -by- $n$  symmetric or Hermitian positive definite tridiagonal matrix, the columns of matrix  $B$  are individual right-hand sides, and the columns of  $X$  are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine `?ptsvx` performs the following steps:

1. If `fact = 'N'`, the matrix  $A$  is factored as  $A = L^*D^*L^T$  (real flavors)/ $A = L^*D^*L^H$  (complex flavors), where  $L$  is a unit lower bidiagonal matrix and  $D$  is diagonal. The factorization can also be regarded as having the form  $A = U^T*D*U$  (real flavors)/ $A = U^H*D*U$  (complex flavors).
2. If the leading  $i$ -by- $i$  principal minor is not positive-definite, then the routine returns with `info = i`. Otherwise, the factored form of  $A$  is used to estimate the condition number of the matrix  $A$ . If the reciprocal of the condition number is less than machine precision, `info = n+1` is returned as a warning, but the routine still goes on to solve for  $X$  and compute error bounds as described below.
3. The system of equations is solved for  $X$  using the factored form of  $A$ .
4. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<code>fact</code>	Must be 'F' or 'N'.  Specifies whether or not the factored form of the matrix $A$ is supplied on entry.  If <code>fact = 'F'</code> : on entry, <code>df</code> and <code>ef</code> contain the factored form of $A$ . Arrays <code>d</code> , <code>e</code> , <code>df</code> , and <code>ef</code> will not be modified.  If <code>fact = 'N'</code> , the matrix $A$ will be copied to <code>df</code> and <code>ef</code> , and factored.
<code>n</code>	The order of matrix $A$ ; $n \geq 0$ .
<code>nrhs</code>	The number of right-hand sides, the number of columns in $B$ ; $nrhs \geq 0$ .
<code>d, df</code>	Arrays: <code>d</code> (size $n$ ), <code>df</code> (size $n$ ).  The array <code>d</code> contains the $n$ diagonal elements of the tridiagonal matrix $A$ .  The array <code>df</code> is an input argument if <code>fact = 'F'</code> and on entry contains the $n$ diagonal elements of the diagonal matrix $D$ from the $L^*D^*L^T$ (real)/ $L^*D^*L^H$ (complex) factorization of $A$ .

$e, ef, b$	<p>Arrays: <math>e</math> (size <math>n - 1</math>), <math>ef</math> (size <math>n - 1</math>), <math>b</math>, size <math>\max(ldb * nrhs)</math> for column major layout and <math>\max(ldb * n)</math> for row major layout. The array <math>e</math> contains the <math>(n - 1)</math> subdiagonal elements of the tridiagonal matrix <math>A</math>.</p> <p>The array <math>ef</math> is an input argument if <math>fact = 'F'</math> and on entry contains the <math>(n - 1)</math> subdiagonal elements of the unit bidiagonal factor <math>L</math> from the <math>L * D * L^T</math> (real)/ <math>L * D * L^H</math> (complex) factorization of <math>A</math>.</p> <p>The array <math>b</math> contains the matrix <math>B</math> whose columns are the right-hand sides for the systems of equations.</p>
$ldb$	The leading dimension of $b$ ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.
$ldx$	The leading dimension of $x$ ; $ldx \geq \max(1, n)$ for column major layout and $ldx \geq nrhs$ for row major layout.

## Output Parameters

$x$	<p>Array, size <math>\max(1, ldx * nrhs)</math> for column major layout and <math>\max(1, ldx * n)</math> for row major layout.</p> <p>If <math>info = 0</math> or <math>info = n + 1</math>, the array <math>x</math> contains the solution matrix <math>X</math> to the system of equations.</p>
$df, ef$	These arrays are output arguments if $fact = 'N'$ . See the description of $df, ef$ in <i>Input Arguments</i> section.
$rcond$	An estimate of the reciprocal condition number of the matrix $A$ after equilibration (if done). If $rcond$ is less than the machine precision (in particular, if $rcond = 0$ ), the matrix is singular to working precision. This condition is indicated by a return code of $info > 0$ .
$ferr$	Array, size at least $\max(1, nrhs)$ . Contains the estimated forward error bound for each solution vector $x_j$ (the $j$ -th column of the solution matrix $X$ ). If $x_{true}$ is the true solution corresponding to $x_j$ , $ferr_j$ is an estimated upper bound for the magnitude of the largest element in $(x_j - x_{true})$ divided by the magnitude of the largest element in $x_j$ . The estimate is as reliable as the estimate for $rcond$ , and is almost always a slight overestimate of the true error.
$berr$	Array, size at least $\max(1, nrhs)$ . Contains the component-wise relative backward error for each solution vector $x_j$ , that is, the smallest relative change in any element of $A$ or $B$ that makes $x_j$ an exact solution.

## Return Values

This function returns a value  $info$ .

If  $info = 0$ , the execution is successful.

If  $info = -i$ , parameter  $i$  had an illegal value.

If  $info = i$ , and  $i \leq n$ , the leading minor of order  $i$  (and therefore the matrix  $A$  itself) is not positive-definite, so the factorization could not be completed, and the solution and error bounds could not be computed;  $rcond = 0$  is returned.

If  $info = i$ , and  $i = n + 1$ , then  $U$  is nonsingular, but  $rcond$  is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of  $rcond$  would suggest.

## Description

The routine solves for  $X$  the real or complex system of linear equations  $A*X = B$ , where  $A$  is an  $n$ -by- $n$  symmetric matrix, the columns of matrix  $B$  are individual right-hand sides, and the columns of  $X$  are the corresponding solutions.

The diagonal pivoting method is used to factor  $A$  as  $A = U*D*U^T$  or  $A = L*D*L^T$ , where  $U$  (or  $L$ ) is a product of permutation and unit upper (lower) triangular matrices, and  $D$  is symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

The factored form of  $A$  is then used to solve the system of equations  $A*X = B$ .

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of $A$ is stored: If <i>uplo</i> = 'U', the upper triangle of $A$ is stored. If <i>uplo</i> = 'L', the lower triangle of $A$ is stored.
<i>n</i>	The order of matrix $A$ ; $n \geq 0$ .

<i>nrhs</i>	The number of right-hand sides; the number of columns in <i>B</i> ; $nrhs \geq 0$ .
<i>a, b</i>	Arrays: <i>a</i> (size $\max(1, lda*n)$ ), <i>b</i> of size $\max(1, ldb*nrhs)$ for column major layout and $\max(1, ldb*n)$ for row major layout.  The array <i>a</i> contains the upper or the lower triangular part of the symmetric matrix <i>A</i> (see <i>uplo</i> ).  The array <i>b</i> contains the matrix <i>B</i> whose columns are the right-hand sides for the systems of equations.
<i>lda</i>	The leading dimension of <i>a</i> ; $lda \geq \max(1, n)$ .
<i>ldb</i>	The leading dimension of <i>b</i> ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.

## Output Parameters

<i>a</i>	If <i>info</i> = 0, <i>a</i> is overwritten by the block-diagonal matrix <i>D</i> and the multipliers used to obtain the factor <i>U</i> (or <i>L</i> ) from the factorization of <i>A</i> as computed by <code>?sytrf</code> .
<i>b</i>	If <i>info</i> = 0, <i>b</i> is overwritten by the solution matrix <i>X</i> .
<i>ipiv</i>	Array, size at least $\max(1, n)$ . Contains details of the interchanges and the block structure of <i>D</i> , as determined by <code>?sytrf</code> .  If <i>ipiv</i> [ <i>i</i> -1] = <i>k</i> > 0, then <i>d<sub>ii</sub></i> is a 1-by-1 diagonal block, and the <i>i</i> -th row and column of <i>A</i> was interchanged with the <i>k</i> -th row and column.  If <i>uplo</i> = 'U' and <i>ipiv</i> [ <i>i</i> ] = <i>ipiv</i> [ <i>i</i> -1] = - <i>m</i> < 0, then <i>D</i> has a 2-by-2 block in rows/columns <i>i</i> and <i>i</i> +1, and ( <i>i</i> )-th row and column of <i>A</i> was interchanged with the <i>m</i> -th row and column.  If <i>uplo</i> = 'L' and <i>ipiv</i> [ <i>i</i> ] = <i>ipiv</i> [ <i>i</i> -1] = - <i>m</i> < 0, then <i>D</i> has a 2-by-2 block in rows/columns <i>i</i> and <i>i</i> +1, and ( <i>i</i> +1)-th row and column of <i>A</i> was interchanged with the <i>m</i> -th row and column.

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

If *info* = *i*, *d<sub>ii</sub>* is 0. The factorization has been completed, but *D* is exactly singular, so the solution could not be computed.

#### `?sysv_aa`

Computes the solution to a system of linear equations

$A * X = B$  for symmetric matrices.

```
lapack_int LAPACKE_ssysv_aa (int matrix_layout, char uplo, lapack_int n, lapack_int nrhs, float * A, lapack_int lda, lapack_int * ipiv, float * B, lapack_int ldb);
```

```

lapack_int LAPACKE_dsysv_aa (int matrix_layout, char uplo, lapack_int n, lapack_int
nrhs, double * A, lapack_int lda, lapack_int * ipiv, double * B, lapack_int ldb);

lapack_int LAPACKE_csysv_aa (int matrix_layout, char uplo, lapack_int n, lapack_int
nrhs, lapack_complex_float * A, lapack_int lda, lapack_int * ipiv, lapack_complex_float
* B, lapack_int ldb);

lapack_int LAPACKE_zsysv_aa (int matrix_layout, char uplo, lapack_int n, lapack_int
nrhs, lapack_complex_double * A, lapack_int lda, lapack_int * ipiv,
lapack_complex_double * B, lapack_int ldb);

```

## Description

The `?sysv` routine computes the solution to a complex system of linear equations  $A * X = B$ , where  $A$  is an  $n$ -by- $n$  symmetric matrix and  $X$  and  $B$  are  $n$ -by- $nrhs$  matrices.

Aasen's algorithm is used to factor  $A$  as  $A = U * T * U^T$ , if `uplo = 'U'`, or  $A = L * T * L^T$ , if `uplo = 'L'`, where  $U$  (or  $L$ ) is a product of permutation and unit upper (lower) triangular matrices, and  $T$  is symmetric tri-diagonal. The factored form of  $A$  is then used to solve the system of equations  $A * X = B$ .

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major ( <code>LAPACK_ROW_MAJOR</code> ) or column major ( <code>LAPACK_COL_MAJOR</code> ).
<code>uplo</code>	<ul style="list-style-type: none"> <li>= 'U': The upper triangle of <math>A</math> is stored.</li> <li>= 'L': The lower triangle of <math>A</math> is stored.</li> </ul>
<code>n</code>	The number of linear equations; that is, the order of the matrix $A$ . $n \geq 0$ .
<code>nrhs</code>	The number of right-hand sides; that is, the number of columns of the matrix $B$ . $nrhs \geq 0$ .
<code>A</code>	Array of size $\max(1, lda * n)$ . On entry, the symmetric matrix $A$ . If <code>uplo = 'U'</code> , the leading $n$ -by- $n$ upper triangular part of $A$ contains the upper triangular part of the matrix $A$ , and the strictly lower triangular part of $A$ is not referenced. If <code>uplo = 'L'</code> , the leading $n$ -by- $n$ lower triangular part of $A$ contains the lower triangular part of the matrix $A$ , and the strictly upper triangular part of $A$ is not referenced.
<code>lda</code>	The leading dimension of the array $A$ .
<code>B</code>	Array of size $\max(1, ldb * nrhs)$ for column-major layout and $\max(1, ldb * n)$ for row-major layout. On entry, the $n$ -by- $nrhs$ right-hand side matrix $B$ .
<code>ldb</code>	The leading dimension of the array $B$ . $ldb \geq \max(1, n)$ for column-major layout and $ldb \geq nrhs$ for row-major layout.

## Output Parameters

<code>A</code>	On exit, if <code>info = 0</code> , the tridiagonal matrix $T$ and the multipliers used to obtain the factor $U$ or $L$ from the factorization $A = U * T * U^T$ or $A = L * T * L^T$ as computed by <code>?sytrf</code> .
<code>ipiv</code>	Array of size $n$ . On exit, it contains the details of the interchanges; that is, the row and column $k$ of $A$ were interchanged with the row and column <code>ipiv(k)</code> .

$B$  On exit, if  $info = 0$ , the  $n$ -by- $nrhs$  solution matrix  $X$ .

## Return Values

This function returns a value  $info$ .

= 0: Successful exit.

< 0: If  $info = -i$ , the  $i^{\text{th}}$  argument had an illegal value.

> 0: If  $info = i$ ,  $D(i,i)$  is exactly zero. The factorization has been completed, but the block diagonal matrix  $D$  is exactly singular, so the solution could not be computed.

## ?sysv\_rook

*Computes the solution to the system of linear equations with a real or complex symmetric coefficient matrix  $A$  and multiple right-hand sides.*

## Syntax

```
lapack_int LAPACKE_ssysv_rook (int matrix_layout , char uplo , lapack_int n ,
lapack_int nrhs , float * a , lapack_int lda , lapack_int * ipiv , float * b ,
lapack_int ldb );
```

```
lapack_int LAPACKE_dsysv_rook (int matrix_layout , char uplo , lapack_int n ,
lapack_int nrhs , double * a , lapack_int lda , lapack_int * ipiv , double * b ,

## Description

The routine solves for  $X$  the real or complex system of linear equations  $A*X = B$ , where  $A$  is an  $n$ -by- $n$  symmetric matrix, the columns of matrix  $B$  are individual right-hand sides, and the columns of  $X$  are the corresponding solutions.

The diagonal pivoting method is used to factor  $A$  as  $A = U*D*U^T$  or  $A = L*D*L^T$ , where  $U$  (or  $L$ ) is a product of permutation and unit upper (lower) triangular matrices, and  $D$  is symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

The ?sysv\_rook routine is called to compute the factorization of a complex symmetric matrix  $A$  using the bounded Bunch-Kaufman ("rook") diagonal pivoting method.

The factored form of  $A$  is then used to solve the system of equations  $A*X = B$ .

## Input Parameters

$matrix\_layout$  Specifies whether matrix storage layout is row major (LAPACK\_ROW\_MAJOR) or column major (LAPACK\_COL\_MAJOR).

<i>uplo</i>	<p>Must be 'U' or 'L'.</p> <p>Indicates whether the upper or lower triangular part of <math>A</math> is stored:</p> <p>If <math>uplo = 'U'</math>, the upper triangle of <math>A</math> is stored.</p> <p>If <math>uplo = 'L'</math>, the lower triangle of <math>A</math> is stored.</p>
<i>n</i>	The order of matrix $A$ ; $n \geq 0$ .
<i>nrhs</i>	The number of right-hand sides; the number of columns in $B$ ; $nrhs \geq 0$ .
<i>a, b</i>	<p>Arrays: <math>a</math>(size <math>\max(1, lda*n)</math>), <math>b</math> of size <math>\max(1, ldb*nrhs)</math> for column major layout and <math>\max(1, ldb*n)</math> for row major layout.</p> <p>The array <math>a</math> contains the upper or the lower triangular part of the symmetric matrix <math>A</math> (see <i>uplo</i>). The second dimension of <math>a</math> must be at least <math>\max(1, n)</math>.</p> <p>The array <math>b</math> contains the matrix <math>B</math> whose columns are the right-hand sides for the systems of equations. The second dimension of <math>b</math> must be at least <math>\max(1, nrhs)</math>.</p>
<i>lda</i>	The leading dimension of $a$ ; $lda \geq \max(1, n)$ .
<i>ldb</i>	The leading dimension of $b$ ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.

## Output Parameters

<i>a</i>	If $info = 0$ , $a$ is overwritten by the block-diagonal matrix $D$ and the multipliers used to obtain the factor $U$ (or $L$ ) from the factorization of $A$ .
<i>b</i>	If $info = 0$ , $b$ is overwritten by the solution matrix $X$ .
<i>ipiv</i>	<p>Array, size at least <math>\max(1, n)</math>. Contains details of the interchanges and the block structure of <math>D</math>.</p> <p>If <math>ipiv[k - 1] &gt; 0</math>, then rows and columns <math>k</math> and <math>ipiv[k - 1]</math> were interchanged and <math>D_{k,k}</math> is a 1-by-1 diagonal block.</p> <p>If <math>uplo = 'U'</math> and <math>ipiv[k - 1] &lt; 0</math> and <math>ipiv[k - 2] &lt; 0</math>, then rows and columns <math>k</math> and <math>-ipiv[k - 1]</math> were interchanged, rows and columns <math>k - 1</math> and <math>-ipiv[k - 2]</math> were interchanged, and <math>D_{k-1:k, k-1:k}</math> is a 2-by-2 diagonal block.</p> <p>If <math>uplo = 'L'</math> and <math>ipiv[k - 1] &lt; 0</math> and <math>ipiv[k] &lt; 0</math>, then rows and columns <math>k</math> and <math>-ipiv[k - 1]</math> were interchanged, rows and columns <math>k + 1</math> and <math>-ipiv[k]</math> were interchanged, and <math>D_{k:k+1, k:k+1}</math> is a 2-by-2 diagonal block.</p>

## Return Values

This function returns a value *info*.

If  $info = 0$ , the execution is successful.

If  $info = -i$ , the  $i$ -th parameter had an illegal value.

If  $info = i$ ,  $d_{ii}$  is 0. The factorization has been completed, but  $D$  is exactly singular, so the solution could not be computed.

ldb);
```

```
lapack_int LAPACKE_csysv_rk (int matrix_layout, char uplo, lapack_int n, lapack_int
nrhs, lapack_complex_float * A, lapack_int lda, lapack_complex_float * e, lapack_int *
ipiv, lapack_complex_float * B, lapack_int ldb);
```

```
lapack_int LAPACKE_zsysv_rk (int matrix_layout, char uplo, lapack_int n, lapack_int
nrhs, lapack_complex_double * A, lapack_int lda, lapack_complex_double * e, lapack_int
* ipiv, lapack_complex_double * B, lapack_int ldb);
```

## Description

?sysv\_rk computes the solution to a real or complex system of linear equations  $A * X = B$ , where  $A$  is an  $n$ -by- $n$  symmetric matrix and  $X$  and  $B$  are  $n$ -by- $nrhs$  matrices.

The bounded Bunch-Kaufman (rook) diagonal pivoting method is used to factor  $A$  as  $A = P * U * D * (U^T) * (P^T)$ , if  $uplo = 'U'$ , or  $A = P * L * D * (L^T) * (P^T)$ , if  $uplo = 'L'$ , where  $U$  (or  $L$ ) is unit upper (or lower) triangular matrix,  $U^T$  (or  $L^T$ ) is the transpose of  $U$  (or  $L$ ),  $P$  is a permutation matrix,  $P^T$  is the transpose of  $P$ , and  $D$  is symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

?sytrf\_rk is called to compute the factorization of a real or complex symmetric matrix. The factored form of  $A$  is then used to solve the system of equations  $A * X = B$  by calling BLAS3 routine ?sytrs\_3.

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Specifies whether the upper or lower triangular part of the symmetric matrix $A$ is stored: <ul style="list-style-type: none"> <li>= 'U': The upper triangle of <math>A</math> is stored.</li> <li>= 'L': The lower triangle of <math>A</math> is stored.</li> </ul>
<i>n</i>	The number of linear equations; that is, the order of the matrix $A$ . $n \geq 0$ .
<i>nrhs</i>	The number of right-hand sides; that is, the number of columns of the matrix $B$ . $nrhs \geq 0$ .
<i>A</i>	Array of size $\max(1, lda * n)$ . On entry, the symmetric matrix $A$ . If $uplo = 'U'$ , the leading $n$ -by- $n$ upper triangular part of $A$ contains the upper triangular part of the matrix $A$ , and the strictly lower triangular part of $A$ is

not referenced. If `uplo = 'L'`, the leading  $n$ -by- $n$  lower triangular part of  $A$  contains the lower triangular part of the matrix  $A$ , and the strictly upper triangular part of  $A$  is not referenced.

<code>lda</code>	The leading dimension of the array $A$ .
<code>B</code>	Array of size $\max(1, ldb * nrhs)$ . On entry, the $n$ -by- $nrhs$ right-hand side matrix $B$ .
<code>ldb</code>	The leading dimension of the array $B$ . $ldb \geq \max(1, n)$ for column-major layout and $ldb \geq nrhs$ for row-major layout.

## Output Parameters

<code>A</code>	On exit, if <code>info = 0</code> , the diagonal of the block diagonal matrix $D$ and factors $U$ or $L$ as computed by <code>?sytrf_rk</code> : <ul style="list-style-type: none"> <li>• Only diagonal elements of the symmetric block diagonal matrix <math>D</math> on the diagonal of <math>A</math>; that is, <math>D(k,k) = A(k,k)</math>. Superdiagonal (or subdiagonal) elements of <math>D</math> are stored on exit in array <math>e</math>.</li> <li>• If <code>uplo = 'U'</code>, factor <math>U</math> in the superdiagonal part of <math>A</math>. If <code>uplo = 'L'</code>, factor <math>L</math> in the subdiagonal part of <math>A</math>. For more information, see the description of the <code>?sytrf_rk</code> routine.</li> </ul>
----------------	---

<code>e</code>	Array of size $n$ . On exit, contains the output computed by the factorization routine <code>?sytrf_rk</code> ; that is, the superdiagonal (or subdiagonal) elements of the symmetric block diagonal matrix $D$ with 1-by-1 or 2-by-2 diagonal blocks. If <code>uplo = 'U'</code> , $e(i) = D(i-1,i)$ , $i=1:N-1$ , and $e(1)$ is set to 0. If <code>uplo = 'L'</code> , $e(i) = D(i+1,i)$ , $i=1:N-1$ , and $e(n)$ is set to 0.
----------------	--

---

**NOTE** For 1-by-1 diagonal block  $D(k)$ , where  $1 \leq k \leq n$ , the element  $e(k)$  is set to 0 in both the `uplo = 'U'` and `uplo = 'L'` cases. For more information, see the description of the `?sytrf_rk` routine.

---

<code>ipiv</code>	Array of size $n$ . Details of the interchanges and the block structure of $D$ , as determined by <code>?sytrf_rk</code> . For more information, see the description of the <code>?sytrf_rk</code> routine.
<code>B</code>	On exit, if <code>info = 0</code> , the $n$ -by- $nrhs$ solution matrix $X$ .

## Return Values

This function returns a value `info`.

= 0: Successful exit.

< 0: If `info = -k`, the  $k^{\text{th}}$  argument had an illegal value.

> 0: If `info = k`, the matrix  $A$  is singular. If `uplo = 'U'`, column  $k$  in the upper triangular part of  $A$  contains all zeros. If `uplo = 'L'`, column  $k$  in the lower triangular part of  $A$  contains all zeros. Therefore  $D(k,k)$  is exactly zero, and superdiagonal elements of column  $k$  of  $U$  (or subdiagonal elements of column  $k$  of  $L$ ) are all zeros. The factorization has been completed, but the block diagonal matrix  $D$  is exactly singular, and division by zero will occur if it is used to solve a system of equations.

## ?sysvx

Uses the diagonal pivoting factorization to compute the solution to the system of linear equations with a real or complex symmetric coefficient matrix  $A$ , and provides error bounds on the solution.

### Syntax

```

### Description

The routine uses the diagonal pivoting factorization to compute the solution to a real or complex system of linear equations  $A \cdot X = B$ , where  $A$  is a  $n$ -by- $n$  symmetric matrix, the columns of matrix  $B$  are individual right-hand sides, and the columns of  $X$  are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?sysvx performs the following steps:

1. If  $fact = 'N'$ , the diagonal pivoting method is used to factor the matrix  $A$ . The form of the factorization is  $A = U \cdot D \cdot U^T$  or  $A = L \cdot D \cdot L^T$ , where  $U$  (or  $L$ ) is a product of permutation and unit upper (lower) triangular matrices, and  $D$  is symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.
2. If some  $d_{i,i} = 0$ , so that  $D$  is exactly singular, then the routine returns with  $info = i$ . Otherwise, the factored form of  $A$  is used to estimate the condition number of the matrix  $A$ . If the reciprocal of the condition number is less than machine precision,  $info = n+1$  is returned as a warning, but the routine still goes on to solve for  $X$  and compute error bounds as described below.
3. The system of equations is solved for  $X$  using the factored form of  $A$ .
4. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.

### Input Parameters

*matrix\_layout* Specifies whether matrix storage layout is row major (LAPACK\_ROW\_MAJOR) or column major (LAPACK\_COL\_MAJOR).

<i>fact</i>	<p>Must be 'F' or 'N'.</p> <p>Specifies whether or not the factored form of the matrix <i>A</i> has been supplied on entry.</p> <p>If <i>fact</i> = 'F': on entry, <i>af</i> and <i>ipiv</i> contain the factored form of <i>A</i>. Arrays <i>a</i>, <i>af</i>, and <i>ipiv</i> will not be modified.</p> <p>If <i>fact</i> = 'N', the matrix <i>A</i> will be copied to <i>af</i> and factored.</p>
<i>uplo</i>	<p>Must be 'U' or 'L'.</p> <p>Indicates whether the upper or lower triangular part of <i>A</i> is stored:</p> <p>If <i>uplo</i> = 'U', the upper triangle of <i>A</i> is stored.</p> <p>If <i>uplo</i> = 'L', the lower triangle of <i>A</i> is stored.</p>
<i>n</i>	The order of matrix <i>A</i> ; $n \geq 0$ .
<i>nrhs</i>	The number of right-hand sides, the number of columns in <i>B</i> ; $nrhs \geq 0$ .
<i>a, af, b</i>	<p>Arrays: <i>a</i>(size <math>\max(1, lda*n)</math>), <i>af</i>(size <math>\max(1, ldaf*n)</math>), <i>b</i> of size <math>\max(1, ldb*nrhs)</math> for column major layout and <math>\max(1, ldb*n)</math> for row major layout .</p> <p>The array <i>a</i> contains the upper or the lower triangular part of the symmetric matrix <i>A</i> (see <i>uplo</i>).</p> <p>The array <i>af</i> is an input argument if <i>fact</i> = 'F'. It contains the block diagonal matrix <i>D</i> and the multipliers used to obtain the factor <i>U</i> or <i>L</i> from the factorization <math>A = U*D*U^T</math> or <math>A = L*D*L^T</math> as computed by <a href="#">?sytrf</a>.</p> <p>The array <i>b</i> contains the matrix <i>B</i> whose columns are the right-hand sides for the systems of equations.</p>
<i>lda</i>	The leading dimension of <i>a</i> ; $lda \geq \max(1, n)$ .
<i>ldaf</i>	The leading dimension of <i>af</i> ; $ldaf \geq \max(1, n)$ .
<i>ldb</i>	The leading dimension of <i>b</i> ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.
<i>ipiv</i>	<p>Array, size at least <math>\max(1, n)</math>. The array <i>ipiv</i> is an input argument if <i>fact</i> = 'F'. It contains details of the interchanges and the block structure of <i>D</i>, as determined by <a href="#">?sytrf</a>.</p> <p>If <math>ipiv[i-1] = k &gt; 0</math>, then <math>d_{ii}</math> is a 1-by-1 diagonal block, and the <i>i</i>-th row and column of <i>A</i> was interchanged with the <i>k</i>-th row and column.</p> <p>If <math>uplo = 'U'</math> and <math>ipiv[i] = ipiv[i-1] = -m &lt; 0</math>, then <i>D</i> has a 2-by-2 block in rows/columns <i>i</i> and <i>i+1</i>, and (<i>i</i>)-th row and column of <i>A</i> was interchanged with the <i>m</i>-th row and column.</p> <p>If <math>uplo = 'L'</math> and <math>ipiv[i] = ipiv[i-1] = -m &lt; 0</math>, then <i>D</i> has a 2-by-2 block in rows/columns <i>i</i> and <i>i+1</i>, and (<i>i+1</i>)-th row and column of <i>A</i> was interchanged with the <i>m</i>-th row and column.</p>

*ldx* The leading dimension of the output array *x*;  $ldx \geq \max(1, n)$  for column major layout and  $ldx \geq nrhs$  for row major layout.

## Output Parameters

*x* Array, size  $\max(1, ldx * nrhs)$  for column major layout and  $\max(1, ldx * n)$  for row major layout.  
If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X* to the system of equations.

*af, ipiv* These arrays are output arguments if *fact* = 'N'.  
See the description of *af, ipiv* in *Input Arguments* section.

*rcond* An estimate of the reciprocal condition number of the matrix *A*. If *rcond* is less than the machine precision (in particular, if *rcond* = 0), the matrix is singular to working precision. This condition is indicated by a return code of *info* > 0.

*ferr* Array, size at least  $\max(1, nrhs)$ . Contains the estimated forward error bound for each solution vector  $x_j$  (the *j*-th column of the solution matrix *X*). If *xtrue* is the true solution corresponding to  $x_j$ , *ferr*[*j*-1] is an estimated upper bound for the magnitude of the largest element in  $(x_j - xtrue)$  divided by the magnitude of the largest element in  $x_j$ . The estimate is as reliable as the estimate for *rcond*, and is almost always a slight overestimate of the true error.

*berr* Array, size at least  $\max(1, nrhs)$ . Contains the component-wise relative backward error for each solution vector  $x_j$ , that is, the smallest relative change in any element of *A* or *B* that makes  $x_j$  an exact solution.

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

If *info* = *i*, and  $i \leq n$ , then  $d_{ii}$  is exactly zero. The factorization has been completed, but the block diagonal matrix *D* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned.

If *info* = *i*, and  $i = n + 1$ , then *D* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

## Description

The routine uses the *diagonal pivoting* factorization to compute the solution to a real or complex system of linear equations  $A*X = B$ , where  $A$  is an  $n$ -by- $n$  real symmetric/Hermitian matrix, the columns of matrix  $B$  are individual right-hand sides, and the columns of  $X$  are the corresponding solutions.

Both normwise and maximum componentwise error bounds are also provided on request. The routine returns a solution with a small guaranteed error ( $O(\text{eps})$ , where  $\text{eps}$  is the working machine precision) unless the matrix is very ill-conditioned, in which case a warning is returned. Relevant condition numbers are also calculated and returned.

The routine accepts user-provided factorizations and equilibration factors; see definitions of the *fact* and *equed* options. Solving with refinement and using a factorization from a previous call of the routine also produces a solution with  $O(\text{eps})$  errors or warnings but that may not be true for general user-provided factorizations and equilibration factors if they differ from what the routine would itself produce.

The routine `?sysvxx` performs the following steps:

1. If *fact* = 'E', scaling factors are computed to equilibrate the system:

$$\text{diag}(s)*A*\text{diag}(s) * \text{inv}(\text{diag}(s))*X = \text{diag}(s)*B$$

Whether or not the system will be equilibrated depends on the scaling of the matrix  $A$ , but if equilibration is used,  $A$  is overwritten by  $\text{diag}(s)*A*\text{diag}(s)$  and  $B$  by  $\text{diag}(s)*B$ .

2. If *fact* = 'N' or 'E', the LU decomposition is used to factor the matrix  $A$  (after equilibration if *fact* = 'E') as

$A = U^*D*U^T$ , if  $uplo = 'U'$ ,

or  $A = L^*D*L^T$ , if  $uplo = 'L'$ ,

where  $U$  or  $L$  is a product of permutation and unit upper (lower) triangular matrices, and  $D$  is a symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

3. If some  $D(i, i) = 0$ , so that  $D$  is exactly singular, the routine returns with  $info = i$ . Otherwise, the factored form of  $A$  is used to estimate the condition number of the matrix  $A$  (see the  $rcond$  parameter). If the reciprocal of the condition number is less than machine precision, the routine still goes on to solve for  $X$  and compute error bounds.
4. The system of equations is solved for  $X$  using the factored form of  $A$ .
5. By default, unless  $params[0]$  is set to zero, the routine applies iterative refinement to get a small error and error bounds. Refinement calculates the residual to at least twice the working precision.
6. If equilibration was used, the matrix  $X$  is premultiplied by  $diag(r)$  so that it solves the original system before equilibration.

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>fact</i>	<p>Must be 'F', 'N', or 'E'.</p> <p>Specifies whether or not the factored form of the matrix <math>A</math> is supplied on entry, and if not, whether the matrix <math>A</math> should be equilibrated before it is factored.</p> <p>If <math>fact = 'F'</math>, on entry, <math>af</math> and <math>ipiv</math> contain the factored form of <math>A</math>. If <math>equed</math> is not 'N', the matrix <math>A</math> has been equilibrated with scaling factors given by <math>s</math>. Parameters <math>a</math>, <math>af</math>, and <math>ipiv</math> are not modified.</p> <p>If <math>fact = 'N'</math>, the matrix <math>A</math> will be copied to <math>af</math> and factored.</p> <p>If <math>fact = 'E'</math>, the matrix <math>A</math> will be equilibrated, if necessary, copied to <math>af</math> and factored.</p>
<i>uplo</i>	<p>Must be 'U' or 'L'.</p> <p>Indicates whether the upper or lower triangular part of <math>A</math> is stored:</p> <p>If <math>uplo = 'U'</math>, the upper triangle of <math>A</math> is stored.</p> <p>If <math>uplo = 'L'</math>, the lower triangle of <math>A</math> is stored.</p>
<i>n</i>	The number of linear equations; the order of the matrix $A$ ; $n \geq 0$ .
<i>nrhs</i>	The number of right-hand sides; the number of columns of the matrices $B$ and $X$ ; $nrhs \geq 0$ .
<i>a, af, b</i>	<p>Arrays: <math>a</math>(size <math>\max(1, lda*n)</math>), <math>af</math>(size <math>\max(1, ldaf*n)</math>), <math>b</math>, size <math>\max(ldb*nrhs)</math> for column major layout and <math>\max(ldb*n)</math> for row major layout,</p> <p>The array <math>a</math> contains the symmetric matrix <math>A</math> as specified by <math>uplo</math>. If <math>uplo = 'U'</math>, the leading <math>n</math>-by-<math>n</math> upper triangular part of <math>a</math> contains the upper triangular part of the matrix <math>A</math> and the strictly lower triangular part of <math>a</math> is not referenced. If <math>uplo = 'L'</math>, the leading <math>n</math>-by-<math>n</math> lower triangular part of <math>a</math> contains the lower triangular part of the matrix <math>A</math> and the strictly upper triangular part of <math>a</math> is not referenced.</p>

The array *af* is an input argument if *fact* = 'F'. It contains the block diagonal matrix *D* and the multipliers used to obtain the factor *U* and *L* from the factorization  $A = U^*D^*U^T$  or  $A = L^*D^*L^T$  as computed by `?sytrf`.

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations.

*lda*

The leading dimension of the array *a*;  $lda \geq \max(1, n)$ .

*ldaf*

The leading dimension of the array *af*;  $ldaf \geq \max(1, n)$ .

*ipiv*

Array, size at least  $\max(1, n)$ . The array *ipiv* is an input argument if *fact* = 'F'. It contains details of the interchanges and the block structure of *D* as determined by `?sytrf`. If *ipiv*[*k*-1] > 0, rows and columns *k* and *ipiv*[*k*-1] were interchanged and *D*(*k*,*k*) is a 1-by-1 diagonal block.

If *uplo* = 'U' and *ipiv*[*i*] = *ipiv*[*i* - 1] = *m* < 0, *D* has a 2-by-2 diagonal block in rows and columns *i* and *i* + 1, and the *i*-th row and column of *A* were interchanged with the *m*-th row and column.

If *uplo* = 'L' and *ipiv*[*i*] = *ipiv*[*i* - 1] = *m* < 0, *D* has a 2-by-2 diagonal block in rows and columns *i* and *i* + 1, and the (*i* + 1)-st row and column of *A* were interchanged with the *m*-th row and column.

*equed*

Must be 'N' or 'Y'.

*equed* is an input argument if *fact* = 'F'. It specifies the form of equilibration that was done:

If *equed* = 'N', no equilibration was done (always true if *fact* = 'N').

if *equed* = 'Y', both row and column equilibration was done, that is, *A* has been replaced by  $diag(s) * A * diag(s)$ .

*s*

Array, size (*n*). The array *s* contains the scale factors for *A*. If *equed* = 'Y', *A* is multiplied on the left and right by  $diag(s)$ .

This array is an input argument if *fact* = 'F' only; otherwise it is an output argument.

If *fact* = 'F' and *equed* = 'Y', each element of *s* must be positive.

Each element of *s* should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

*ldb*

The leading dimension of the array *b*;  $ldb \geq \max(1, n)$  for column major layout and  $ldb \geq nrhs$  for row major layout.

*ldx*

The leading dimension of the output array *x*;  $ldx \geq \max(1, n)$  for column major layout and  $ldx \geq nrhs$  for row major layout.

<i>n_err_bnds</i>	Number of error bounds to return for each right hand side and each type (normwise or componentwise). See <i>err_bnds_norm</i> and <i>err_bnds_comp</i> descriptions in the <i>Output Arguments</i> section below.								
<i>nparams</i>	Specifies the number of parameters set in <i>params</i> . If $\leq 0$ , the <i>params</i> array is never referenced and default values are used.								
<i>params</i>	<p>Array, size <math>\max(1, nparams)</math>. Specifies algorithm parameters. If an entry is less than 0.0, that entry is filled with the default value used for that parameter. Only positions up to <i>nparams</i> are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass <i>nparams</i> = 0, which prevents the source code from accessing the <i>params</i> argument.</p> <p><i>params</i>[0] : Whether to perform iterative refinement or not. Default: 1.0 (for single precision flavors), 1.0D+0 (for double precision flavors).</p> <table> <tr> <td>=0.0</td> <td>No refinement is performed and no error bounds are computed.</td> </tr> <tr> <td>=1.0</td> <td>Use the extra-precise refinement algorithm.</td> </tr> </table> <p>(Other values are reserved for future use.)</p> <p><i>params</i>[1] : Maximum number of residual computations allowed for refinement.</p> <table> <tr> <td>Default</td> <td>10.0</td> </tr> <tr> <td>Aggressive</td> <td>Set to 100.0 to permit convergence using approximate factorizations or factorizations other than <i>LU</i>. If the factorization uses a technique other than Gaussian elimination, the guarantees in <i>err_bnds_norm</i> and <i>err_bnds_comp</i> may no longer be trustworthy.</td> </tr> </table> <p><i>params</i>[2] : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).</p>	=0.0	No refinement is performed and no error bounds are computed.	=1.0	Use the extra-precise refinement algorithm.	Default	10.0	Aggressive	Set to 100.0 to permit convergence using approximate factorizations or factorizations other than <i>LU</i> . If the factorization uses a technique other than Gaussian elimination, the guarantees in <i>err_bnds_norm</i> and <i>err_bnds_comp</i> may no longer be trustworthy.
=0.0	No refinement is performed and no error bounds are computed.								
=1.0	Use the extra-precise refinement algorithm.								
Default	10.0								
Aggressive	Set to 100.0 to permit convergence using approximate factorizations or factorizations other than <i>LU</i> . If the factorization uses a technique other than Gaussian elimination, the guarantees in <i>err_bnds_norm</i> and <i>err_bnds_comp</i> may no longer be trustworthy.								

## Output Parameters

<i>x</i>	<p>Array, size <math>\max(1, ldx*nrhs)</math> for column major layout and <math>\max(1, ldx*n)</math> for row major layout).</p> <p>If <i>info</i> = 0, the array <i>x</i> contains the solution <i>n</i>-by-<i>nrhs</i> matrix <i>X</i> to the original system of equations. Note that <i>A</i> and <i>B</i> are modified on exit if <i>equed</i> ≠ 'N', and the solution to the equilibrated system is:</p> $\text{inv}(\text{diag}(s)) * X.$
<i>a</i>	If <i>fact</i> = 'E' and <i>equed</i> = 'Y', overwritten by $\text{diag}(s) * A * \text{diag}(s)$ .

<i>af</i>	If <i>fact</i> = 'N', <i>af</i> is an output argument and on exit returns the block diagonal matrix <i>D</i> and the multipliers used to obtain the factor <i>U</i> or <i>L</i> from the factorization $A = U^*D^*U^T$ or $A = L^*D^*L^T$ .
<i>b</i>	If <i>equed</i> = 'N', <i>B</i> is not modified. If <i>equed</i> = 'Y', <i>B</i> is overwritten by $diag(s) * B$ .
<i>s</i>	This array is an output argument if <i>fact</i> ≠ 'F'. Each element of this array is a power of the radix. See the description of <i>s</i> in <i>Input Arguments</i> section.
<i>rcond</i>	Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix <i>A</i> after equilibration (if done). If <i>rcond</i> is less than the machine precision, in particular, if <i>rcond</i> = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.
<i>rpvgrw</i>	Contains the reciprocal pivot growth factor:

$$\|A\|/\|U\|$$

If this is much less than 1, the stability of the *LU* factorization of the (equilibrated) matrix *A* could be poor. This also means that the solution *X*, estimated condition numbers, and error bounds could be unreliable. If factorization fails with  $0 < info \leq n$ , this parameter contains the reciprocal pivot growth factor for the leading *info* columns of *A*.

<i>berr</i>	Array, size at least $\max(1, nrhs)$ . Contains the componentwise relative backward error for each solution vector $x_j$ , that is, the smallest relative change in any element of <i>A</i> or <i>B</i> that makes $x_j$ an exact solution.
<i>err_bnds_norm</i>	Array of size $nrhs * n\_err\_bnds$ . For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:

Normwise relative error in the *i*-th solution vector

$$\frac{\max_j |X_{true_{ji}} - X_{ji}|}{\max_j |X_{ji}|}$$

The array is indexed by the type of error information as described below. Up to three pieces of information are returned.

<i>err</i> =1	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold $\sqrt{n} * slamch(\epsilon)$ for single precision flavors and $\sqrt{n} * dlamch(\epsilon)$ for double precision flavors.
<i>err</i> =2	"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold $\sqrt{n} * slamch(\epsilon)$ for single precision flavors and

$\sqrt{n} * dlamch(\epsilon)$  for double precision flavors. This error bound should only be trusted if the previous boolean is true.

`err=3`

Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold  $\sqrt{n} * slamch(\epsilon)$  for single precision flavors and  $\sqrt{n} * dlamch(\epsilon)$  for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix  $Z$  are:

$$\|Z\|_{\infty} \cdot \|Z^{-1}\|_{\infty}$$

Let  $z = s * a$ , where  $s$  scales each row by a power of the radix so all absolute row sums of  $z$  are approximately 1.

The information for right-hand side  $i$ , where  $1 \leq i \leq nrhs$ , and type of error `err` is stored in `err_bnds_norm[(err-1)*nrhs + i - 1]`.

`err_bnds_comp`

Array of size `nrhs*n_err_bnds`. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:

Componentwise relative error in the  $i$ -th solution vector:

$$\max_j \frac{|X_{true_{ji}} - X_{ji}|}{|X_{ji}|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is not requested (`params[2] = 0.0`), then `err_bnds_comp` is not accessed.

`err=1`

"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold  $\sqrt{n} * slamch(\epsilon)$  for single precision flavors and  $\sqrt{n} * dlamch(\epsilon)$  for double precision flavors.

`err=2`

"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold  $\sqrt{n} * slamch(\epsilon)$  for single precision flavors and  $\sqrt{n} * dlamch(\epsilon)$  for double precision flavors. This error bound should only be trusted if the previous boolean is true.

*err=3*

Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold  $\sqrt{n} * \text{slamch}(\epsilon)$  for single precision flavors and  $\sqrt{n} * \text{dlamch}(\epsilon)$  for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix  $Z$  are:

$$\|Z\|_{\infty} \cdot \|Z^{-1}\|_{\infty}$$

Let  $z = s * (a * \text{diag}(x))$ , where  $x$  is the solution for the current right-hand side and  $s$  scales each row of  $a * \text{diag}(x)$  by a power of the radix so all absolute row sums of  $z$  are approximately 1.

The information for right-hand side  $i$ , where  $1 \leq i \leq \text{nrhs}$ , and type of error *err* is stored in `err_bnds_comp[(err-1)*nrhs + i - 1]`.

*ipiv*

If *fact* = 'N', *ipiv* is an output argument and on exit contains details of the interchanges and the block structure  $D$ , as determined by `ssytrf` for single precision flavors and `dsytrf` for double precision flavors.

*equed*

If *fact* ≠ 'F', then *equed* is an output argument. It specifies the form of equilibration that was done (see the description of *equed* in *Input Arguments* section).

*params*

If an entry is less than 0.0, that entry is filled with the default value used for that parameter, otherwise the entry is not modified.

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful. The solution to every right-hand side is guaranteed.

If *info* = -*i*, parameter *i* had an illegal value.

If  $0 < \text{info} \leq n$ :  $U_{\text{info}, \text{info}}$  is exactly zero. The factorization has been completed, but the factor  $U$  is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned.

If *info* =  $n+j$ : The solution corresponding to the  $j$ -th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides  $k$  with  $k > j$  may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested `params[2] = 0.0`, then the  $j$ -th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest  $j$  such that for column major layout `err_bnds_norm[j - 1] = 0.0` or `err_bnds_comp[j - 1] = 0.0`; or for row major layout `err_bnds_norm[(j - 1)*n_err_bnds] = 0.0` or `err_bnds_comp[(j - 1)*n_err_bnds] = 0.0`). See the definition of `err_bnds_norm` and `err_bnds_comp` for *err* = 1. To get information about all of the right-hand sides, check `err_bnds_norm` or `err_bnds_comp`.

## ?hesv

Computes the solution to the system of linear equations with a Hermitian matrix  $A$  and multiple right-hand sides.

### Syntax

```
lapack_int LAPACKE_chesv (int matrix_layout , char uplo , lapack_int n , lapack_int
nrhs , lapack_complex_float * a , lapack_int lda , lapack_int * ipiv ,
lapack_complex_float * b , lapack_int ldb );
```

```
lapack_int LAPACKE_zhesv (int matrix_layout , char uplo , lapack_int n , lapack_int
nrhs , lapack_complex_double * a , lapack_int lda , lapack_int * ipiv ,
lapack_complex_double * b , lapack_int ldb );
```

### Include Files

- mkl.h

### Description

The routine solves for  $X$  the complex system of linear equations  $A^*X = B$ , where  $A$  is an  $n$ -by- $n$  symmetric matrix, the columns of matrix  $B$  are individual right-hand sides, and the columns of  $X$  are the corresponding solutions.

The diagonal pivoting method is used to factor  $A$  as  $A = U^*D^*U^H$  or  $A = L^*D^*L^H$ , where  $U$  (or  $L$ ) is a product of permutation and unit upper (lower) triangular matrices, and  $D$  is Hermitian and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

The factored form of  $A$  is then used to solve the system of equations  $A^*X = B$ .

### Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Must be 'U' or 'L'.  Indicates whether the upper or lower triangular part of $A$ is stored and how $A$ is factored:  If <i>uplo</i> = 'U', the array $a$ stores the upper triangular part of the matrix $A$ , and $A$ is factored as $U^*D^*U^H$ .  If <i>uplo</i> = 'L', the array $a$ stores the lower triangular part of the matrix $A$ , and $A$ is factored as $L^*D^*L^H$ .
<i>n</i>	The order of matrix $A$ ; $n \geq 0$ .
<i>nrhs</i>	The number of right-hand sides, the number of columns in $B$ ; $nrhs \geq 0$ .
<i>a, b</i>	Arrays: $a$ (size $\max(1, lda*n)$ ), $b$ of size $\max(1, ldb*nrhs)$ for column major layout and $\max(1, ldb*n)$ for row major layout. The array $a$ contains the upper or the lower triangular part of the Hermitian matrix $A$ (see <i>uplo</i> ).  The array $b$ contains the matrix $B$ whose columns are the right-hand sides for the systems of equations.

<i>lda</i>	The leading dimension of <i>a</i> ; $lda \geq \max(1, n)$ .
<i>ldb</i>	The leading dimension of <i>b</i> ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.

## Output Parameters

<i>a</i>	If <i>info</i> = 0, <i>a</i> is overwritten by the block-diagonal matrix <i>D</i> and the multipliers used to obtain the factor <i>U</i> (or <i>L</i> ) from the factorization of <i>A</i> as computed by <a href="#">?hetrf</a> .
<i>b</i>	If <i>info</i> = 0, <i>b</i> is overwritten by the solution matrix <i>X</i> .
<i>ipiv</i>	Array, size at least $\max(1, n)$ . Contains details of the interchanges and the block structure of <i>D</i> , as determined by <a href="#">?hetrf</a> .  If $ipiv[i-1] = k > 0$ , then $d_{ii}$ is a 1-by-1 diagonal block, and the <i>i</i> -th row and column of <i>A</i> was interchanged with the <i>k</i> -th row and column.  If $uplo = 'U'$ and $ipiv[i] = ipiv[i-1] = -m < 0$ , then <i>D</i> has a 2-by-2 block in rows/columns <i>i</i> and <i>i+1</i> , and ( <i>i</i> )-th row and column of <i>A</i> was interchanged with the <i>m</i> -th row and column.  If $uplo = 'L'$ and $ipiv[i] = ipiv[i-1] = -m < 0$ , then <i>D</i> has a 2-by-2 block in rows/columns <i>i</i> and <i>i+1</i> , and ( <i>i+1</i> )-th row and column of <i>A</i> was interchanged with the <i>m</i> -th row and column.

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

If *info* = *i*,  $d_{ii}$  is 0. The factorization has been completed, but *D* is exactly singular, so the solution could not be computed.

### [?hesv\\_aa](#)

*Computes the solution to system of linear equations for HE matrices.*

```
LAPACK_DECL lapack_int LAPACKE_chesv_aa (int matrix_layout, char uplo, lapack_int n,
lapack_int nrhs, lapack_complex_float * a, lapack_int lda, lapack_int * ipiv,
lapack_complex_float * b, lapack_int ldb );
```

```
LAPACK_DECL lapack_int LAPACKE_chesv_aa_work (int matrix_layout, char uplo, lapack_int n,
lapack_int nrhs, lapack_complex_float * a, lapack_int lda, lapack_int * ipiv,
lapack_complex_float * b, lapack_int ldb, lapack_complex_float * work, lapack_int lwork );
```

## Description

[?hesv\\_aa](#) computes the solution to a complex system of linear equations  $A * X = B$ , where *A* is an *n*-by-*n* Hermitian matrix and *X* and *B* are *n*-by-*nrhs* matrices. Aasen's algorithm is used to factor *A* as

$A = U * T * U^H$  if  $uplo = 'U'$ , or

$A = L * T * L^H$  if  $uplo = 'L'$ ,

where  $U$  (or  $L$ ) is a product of permutation and unit upper (lower) triangular matrices, and  $T$  is Hermitian and tridiagonal. The factored form of  $A$  is then used to solve the system of equations  $A * X = B$ .

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	If <i>uplo</i> = 'U': The upper triangle of $A$ is stored. If <i>uplo</i> = 'L': the lower triangle of $A$ is stored.
<i>n</i>	The number of linear equations or the order of the matrix $A$ . $n \geq 0$ .
<i>nrhs</i>	The number of right hand sides or the number of columns of the matrix $B$ . $nrhs \geq 0$ .
<i>a</i>	Array of size $lda * n$ . On entry, the Hermitian matrix $A$ . If <i>uplo</i> = 'U', the leading $n$ -by- $n$ upper triangular part of $a$ contains the upper triangular part of the matrix $A$ , and the strictly lower triangular part of $a$ is not referenced. If <i>uplo</i> = 'L', the leading $n$ -by- $n$ lower triangular part of $a$ contains the lower triangular part of the matrix $A$ , and the strictly upper triangular part of $a$ is not referenced.
<i>lda</i>	The leading dimension of the array $a$ . $lda \geq \max(1, n)$ .
<i>b</i>	Array of size $ldb * nrhs$ . On entry, the $n$ -by- $nrhs$ right hand side matrix $B$ .
<i>ldb</i>	The leading dimension of the array $b$ . $ldb \geq \max(1, n)$ .
<i>lwork</i>	The length of <i>work</i> . $lwork \geq \max(1, 2 * n, 3 * n - 2)$ , and for best performance $lwork \geq \max(1, n * nb)$ , where $nb$ is the optimal blocksize for ?hetrf. If $lwork < n$ , TRS is done with Level BLAS 2. If $lwork \geq n$ , TRS is done with Level BLAS 3. If $lwork = -1$ , then a workspace query is assumed; the routine only calculates the optimal size of the <i>work</i> array, returns this value as the first entry of the <i>work</i> array, and no error message related to <i>lwork</i> is issued by xerbla.

## Output Parameters

<i>a</i>	On exit, if <i>info</i> = 0, the tridiagonal matrix $T$ and the multipliers used to obtain the factor $U$ or $L$ from the factorization $A = U * T * U^H$ or $A = L * T * L^H$ as computed by ?hetrf_aa.
<i>ipiv</i>	Array of size ( $n$ ) On exit, it contains the details of the interchanges: row and column $k$ of $A$ were interchanged with the row and column $ipiv[k]$ .
<i>b</i>	On exit, if <i>info</i> = 0, the $n$ -by- $nrhs$ solution matrix $X$ .
<i>work</i>	Array of size ( $\max(1, lwork)$ ). On exit, if <i>info</i> = 0, <i>work</i> [0] returns the optimal <i>lwork</i> .

## Return Values

This function returns a value *info*.

If *info* = 0: successful exit.

If *info* < 0: if *info* = -*i*, the *i*-th argument had an illegal value.

If *info* > 0: if *info* = *i*,  $D_{i,i}$  is exactly zero. The factorization has been completed, but the block diagonal matrix *D* is exactly singular, so the solution could not be computed.

## ?hesv\_rk

?hesv\_rk computes the solution to a system of linear equations  $A * X = B$  for Hermitian matrices.

```
lapack_int LAPACKE_chesv_rk (int matrix_layout, char uplo, lapack_int n, lapack_int
nrhs, lapack_complex_float * A, lapack_int lda, lapack_complex_float * e, lapack_int *
ipiv, lapack_complex_float * B, lapack_int ldb);
```

```
lapack_int LAPACKE_zhesv_rk (int matrix_layout, char uplo, lapack_int n, lapack_int
nrhs, lapack_complex_double * A, lapack_int lda, lapack_complex_double * e, lapack_int
* ipiv, lapack_complex_double * B, lapack_int ldb);
```

## Description

?hesv\_rk computes the solution to a complex system of linear equations  $A * X = B$ , where *A* is an *n*-by-*n* Hermitian matrix and *X* and *B* are *n*-by-*nrhs* matrices.

The bounded Bunch-Kaufman (rook) diagonal pivoting method is used to factor *A* as  $A = P * U * D * (U^H) * (P^T)$ , if *uplo* = 'U', or  $A = P * L * D * (L^H) * (P^T)$ , if *uplo* = 'L', where *U* (or *L*) is unit upper (or lower) triangular matrix,  $U^H$  (or  $L^H$ ) is the conjugate of *U* (or *L*), *P* is a permutation matrix,  $P^T$  is the transpose of *P*, and *D* is Hermitian and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

?hetrf\_rk is called to compute the factorization of a complex Hermitian matrix. The factored form of *A* is then used to solve the system of equations  $A * X = B$  by calling BLAS3 routine ?hetrs\_3.

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Specifies whether the upper or lower triangular part of the Hermitian matrix <i>A</i> is stored: <ul style="list-style-type: none"> <li>• = 'U': The upper triangle of <i>A</i> is stored.</li> <li>• = 'L': The lower triangle of <i>A</i> is stored.</li> </ul>
<i>n</i>	The number of linear equations; that is, the order of the matrix <i>A</i> . $n \geq 0$ .
<i>nrhs</i>	The number of right-hand sides; that is, the number of columns of the matrix <i>B</i> . $nrhs \geq 0$ .
<i>A</i>	Array of size $\max(1, lda * n)$ . On entry, the Hermitian matrix <i>A</i> . If <i>uplo</i> = 'U': the leading <i>n</i> -by- <i>n</i> upper triangular part of <i>A</i> contains the upper triangular part of the matrix <i>A</i> , and the strictly lower triangular part of <i>A</i> is not referenced. If <i>uplo</i> = 'L': the leading <i>n</i> -by- <i>n</i> lower triangular part of <i>A</i> contains the lower triangular part of the matrix <i>A</i> , and the strictly upper triangular part of <i>A</i> is not referenced.
<i>lda</i>	The leading dimension of the array <i>A</i> .

<i>B</i>	On entry, the <i>n</i> -by- <i>nrhs</i> right-hand side matrix <i>B</i> .  The size of <i>B</i> is $\max(1, \text{l}db * nrhs)$ for column-major layout and $\max(1, \text{l}db * n)$ for row-major layout.
<i>ldb</i>	The leading dimension of the array <i>B</i> . $\text{l}db \geq \max(1, n)$ for column-major layout and $\text{l}db \geq nrhs$ for row-major layout.

## Output Parameters

<i>A</i>	On exit, if <i>info</i> = 0, diagonal of the block diagonal matrix <i>D</i> and factors <i>U</i> or <i>L</i> as computed by ?hetrf_rk: <ul style="list-style-type: none"> <li>• Only diagonal elements of the Hermitian block diagonal matrix <i>D</i> on the diagonal of <i>A</i>; that is, <math>D(k,k) = A(k,k)</math>; (superdiagonal (or subdiagonal) elements of <i>D</i> are stored on exit in array <i>e</i>).</li> </ul> <p>—and—</p> <ul style="list-style-type: none"> <li>• If <i>uplo</i> = 'U', factor <i>U</i> in the superdiagonal part of <i>A</i>. If <i>uplo</i> = 'L', factor <i>L</i> in the subdiagonal part of <i>A</i>.</li> </ul> <p>For more information, see the description of the ?hetrf_rk routine.</p>
<i>e</i>	Array of size <i>n</i> . On exit, contains the output computed by the factorization routine ?hetrf_rk; that is, the superdiagonal (or subdiagonal) elements of the Hermitian block diagonal matrix <i>D</i> with 1-by-1 or 2-by-2 diagonal blocks: <ul style="list-style-type: none"> <li>• If <i>uplo</i> = 'U', <math>e(i) = D(i-1,i)</math>, <math>i=2:N</math>, <math>e(1)</math> is set to 0.</li> <li>• If <i>uplo</i> = 'L', <math>e(i) = D(i+1,i)</math>, <math>i=1:N-1</math>, <math>e(n)</math> is set to 0.</li> </ul>

---

**NOTE** For a 1-by-1 diagonal block  $D(k)$ , where  $1 \leq k \leq n$ , the element  $e(k)$  is set to 0 in both the *uplo* = 'U' and *uplo* = 'L' cases.

---

<i>ipiv</i>	For more information, see the description of the ?hetrf_rk routine.  Array of size <i>n</i> . Details of the interchanges and the block structure of <i>D</i> , as determined by ?hetrf_rk.
<i>B</i>	On exit, if <i>info</i> = 0, the <i>n</i> -by- <i>nrhs</i> solution matrix <i>X</i> .

## Return Values

This function returns a value *info*.

= 0: Successful exit.

< 0: If *info* = -*k*, the *k*<sup>th</sup> argument had an illegal value.

> 0: If *info* = *k*, the matrix *A* is singular. If *uplo* = 'U', column *k* in the upper triangular part of *A* contains all zeros. If *uplo* = 'L', column *k* in the lower triangular part of *A* contains all zeros. Therefore  $D(k,k)$  is exactly zero, and superdiagonal elements of column *k* of *U* (or subdiagonal elements of column *k* of *L*) are all zeros. The factorization has been completed, but the block diagonal matrix *D* is exactly singular, and division by zero will occur if it is used to solve a system of equations.

## ?hesvx

Uses the diagonal pivoting factorization to compute the solution to the complex system of linear equations with a Hermitian coefficient matrix  $A$ , and provides error bounds on the solution.

## Syntax

```
lapack_int LAPACKE_chesvx( int matrix_layout, char fact, char uplo, lapack_int n,
lapack_int nrhs, const lapack_complex_float* a, lapack_int lda, lapack_complex_float*
af, lapack_int ldaf, lapack_int* ipiv, const lapack_complex_float* b, lapack_int ldb,
lapack_complex_float* x, lapack_int ldx, float* rcond, float* ferr, float* berr );
```

```
lapack_int LAPACKE_zhesvx( int matrix_layout, char fact, char uplo, lapack_int n,
lapack_int nrhs, const lapack_complex_double* a, lapack_int lda, lapack_complex_double*
af, lapack_int ldaf, lapack_int* ipiv, const lapack_complex_double* b, lapack_int ldb,
lapack_complex_double* x, lapack_int ldx, double* rcond, double* ferr, double* berr );
```

## Include Files

- mkl.h

## Description

The routine uses the diagonal pivoting factorization to compute the solution to a complex system of linear equations  $A*X = B$ , where  $A$  is an  $n$ -by- $n$  Hermitian matrix, the columns of matrix  $B$  are individual right-hand sides, and the columns of  $X$  are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?hesvx performs the following steps:

1. If  $fact = 'N'$ , the diagonal pivoting method is used to factor the matrix  $A$ . The form of the factorization is  $A = U*D*U^H$  or  $A = L*D*L^H$ , where  $U$  (or  $L$ ) is a product of permutation and unit upper (lower) triangular matrices, and  $D$  is Hermitian and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.
2. If some  $d_{i,i} = 0$ , so that  $D$  is exactly singular, then the routine returns with  $info = i$ . Otherwise, the factored form of  $A$  is used to estimate the condition number of the matrix  $A$ . If the reciprocal of the condition number is less than machine precision,  $info = n+1$  is returned as a warning, but the routine still goes on to solve for  $X$  and compute error bounds as described below.
3. The system of equations is solved for  $X$  using the factored form of  $A$ .
4. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>fact</i>	Must be 'F' or 'N'.  Specifies whether or not the factored form of the matrix $A$ has been supplied on entry.  If $fact = 'F'$ : on entry, $af$ and $ipiv$ contain the factored form of $A$ . Arrays $a$ , $af$ , and $ipiv$ are not modified.  If $fact = 'N'$ , the matrix $A$ is copied to $af$ and factored.

<i>uplo</i>	<p>Must be 'U' or 'L'.</p> <p>Indicates whether the upper or lower triangular part of <math>A</math> is stored and how <math>A</math> is factored:</p> <p>If <math>uplo = 'U'</math>, the array <math>a</math> stores the upper triangular part of the Hermitian matrix <math>A</math>, and <math>A</math> is factored as <math>U^*D^*U^H</math>.</p> <p>If <math>uplo = 'L'</math>, the array <math>a</math> stores the lower triangular part of the Hermitian matrix <math>A</math>; <math>A</math> is factored as <math>L^*D^*L^H</math>.</p>
<i>n</i>	The order of matrix $A$ ; $n \geq 0$ .
<i>nrhs</i>	The number of right-hand sides, the number of columns in $B$ ; $nrhs \geq 0$ .
<i>a, af, b</i>	<p>Arrays: <math>a</math>(size <math>\max(1, lda*n)</math>), <math>af</math>(size <math>\max(1, ldaf*n)</math>), <math>b</math> of size <math>\max(1, ldb*nrhs)</math> for column major layout and <math>\max(1, ldb*n)</math> for row major layout.</p> <p>The array <math>a</math> contains the upper or the lower triangular part of the Hermitian matrix <math>A</math> (see <i>uplo</i>).</p> <p>The array <math>af</math> is an input argument if <math>fact = 'F'</math>. It contains the block diagonal matrix <math>D</math> and the multipliers used to obtain the factor <math>U</math> or <math>L</math> from the factorization <math>A = U^*D^*U^H</math> or <math>A = L^*D^*L^H</math> as computed by <a href="#">?hetrf</a>.</p> <p>The array <math>b</math> contains the matrix <math>B</math> whose columns are the right-hand sides for the systems of equations.</p>
<i>lda</i>	The leading dimension of $a$ ; $lda \geq \max(1, n)$ .
<i>ldaf</i>	The leading dimension of $af$ ; $ldaf \geq \max(1, n)$ .
<i>ldb</i>	The leading dimension of $b$ ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.
<i>ipiv</i>	<p>Array, size at least <math>\max(1, n)</math>. The array <i>ipiv</i> is an input argument if <math>fact = 'F'</math>. It contains details of the interchanges and the block structure of <math>D</math>, as determined by <a href="#">?hetrf</a>.</p> <p>If <math>ipiv[i-1] = k &gt; 0</math>, then <math>d_{ii}</math> is a 1-by-1 diagonal block, and the <math>i</math>-th row and column of <math>A</math> was interchanged with the <math>k</math>-th row and column.</p> <p>If <math>uplo = 'U'</math> and <math>ipiv[i] = ipiv[i-1] = -m &lt; 0</math>, then <math>D</math> has a 2-by-2 block in rows/columns <math>i</math> and <math>i+1</math>, and <math>(i)</math>-th row and column of <math>A</math> was interchanged with the <math>m</math>-th row and column.</p> <p>If <math>uplo = 'L'</math> and <math>ipiv[i] = ipiv[i-1] = -m &lt; 0</math>, then <math>D</math> has a 2-by-2 block in rows/columns <math>i</math> and <math>i+1</math>, and <math>(i+1)</math>-th row and column of <math>A</math> was interchanged with the <math>m</math>-th row and column.</p>
<i>ldx</i>	The leading dimension of the output array $x$ ; $ldx \geq \max(1, n)$ for column major layout and $ldx \geq nrhs$ for row major layout.

## Output Parameters

<code>x</code>	Array, size $\max(1, ldx*nrhs)$ for column major layout and $\max(1, ldx*n)$ for row major layout.  If <code>info = 0</code> or <code>info = n+1</code> , the array <code>x</code> contains the solution matrix <code>X</code> to the system of equations.
<code>af, ipiv</code>	These arrays are output arguments if <code>fact = 'N'</code> . See the description of <code>af, ipiv</code> in <i>Input Arguments</i> section.
<code>rcond</code>	An estimate of the reciprocal condition number of the matrix <code>A</code> . If <code>rcond</code> is less than the machine precision (in particular, if <code>rcond = 0</code> ), the matrix is singular to working precision. This condition is indicated by a return code of <code>info &gt; 0</code> .
<code>ferr</code>	Array, size at least $\max(1, nrhs)$ . Contains the estimated forward error bound for each solution vector $x_j$ (the $j$ -th column of the solution matrix <code>X</code> ). If <code>xtrue</code> is the true solution corresponding to $x_j$ , <code>ferr[j-1]</code> is an estimated upper bound for the magnitude of the largest element in $(x_j) - xtrue$ divided by the magnitude of the largest element in $x_j$ . The estimate is as reliable as the estimate for <code>rcond</code> , and is almost always a slight overestimate of the true error.
<code>berr</code>	Array, size at least $\max(1, nrhs)$ . Contains the component-wise relative backward error for each solution vector $x_j$ , that is, the smallest relative change in any element of <code>A</code> or <code>B</code> that makes $x_j$ an exact solution.

## Return Values

This function returns a value `info`.

If `info = 0`, the execution is successful.

If `info = -i`, parameter `i` had an illegal value.

If `info = i`, and  $i \leq n$ , then  $d_{ii}$  is exactly zero. The factorization has been completed, but the block diagonal matrix `D` is exactly singular, so the solution and error bounds could not be computed; `rcond = 0` is returned.

If `info = i`, and  $i = n + 1$ , then `D` is nonsingular, but `rcond` is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of `rcond` would suggest.

## Description

The routine uses the *diagonal pivoting* factorization to compute the solution to a complex/double complex system of linear equations  $A \cdot X = B$ , where  $A$  is an  $n$ -by- $n$  Hermitian matrix, the columns of matrix  $B$  are individual right-hand sides, and the columns of  $X$  are the corresponding solutions.

Both normwise and maximum componentwise error bounds are also provided on request. The routine returns a solution with a small guaranteed error ( $O(\text{eps})$ , where  $\text{eps}$  is the working machine precision) unless the matrix is very ill-conditioned, in which case a warning is returned. Relevant condition numbers are also calculated and returned.

The routine accepts user-provided factorizations and equilibration factors; see definitions of the *fact* and *equed* options. Solving with refinement and using a factorization from a previous call of the routine also produces a solution with  $O(\text{eps})$  errors or warnings but that may not be true for general user-provided factorizations and equilibration factors if they differ from what the routine would itself produce.

The routine `?hesvxx` performs the following steps:

1. If *fact* = 'E', scaling factors are computed to equilibrate the system:

$$\text{diag}(s) * A * \text{diag}(s) * \text{inv}(\text{diag}(s)) * X = \text{diag}(s) * B$$

Whether or not the system will be equilibrated depends on the scaling of the matrix  $A$ , but if equilibration is used,  $A$  is overwritten by  $\text{diag}(s) * A * \text{diag}(s)$  and  $B$  by  $\text{diag}(s) * B$ .

2. If *fact* = 'N' or 'E', the LU decomposition is used to factor the matrix  $A$  (after equilibration if *fact* = 'E') as

$$A = U * D * U^T, \text{ if } \text{uplo} = \text{'U'},$$

$$\text{or } A = L * D * L^T, \text{ if } \text{uplo} = \text{'L'},$$

where  $U$  or  $L$  is a product of permutation and unit upper (lower) triangular matrices, and  $D$  is a symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

3. If some  $D(i, i) = 0$ , so that  $D$  is exactly singular, the routine returns with *info* =  $i$ . Otherwise, the factored form of  $A$  is used to estimate the condition number of the matrix  $A$  (see the *rcond* parameter). If the reciprocal of the condition number is less than machine precision, the routine still goes on to solve for  $X$  and compute error bounds.
4. The system of equations is solved for  $X$  using the factored form of  $A$ .
5. By default, unless `params[0]` is set to zero, the routine applies iterative refinement to get a small error and error bounds. Refinement calculates the residual to at least twice the working precision.
6. If equilibration was used, the matrix  $X$  is premultiplied by  $\text{diag}(r)$  so that it solves the original system before equilibration.

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>fact</i>	<p>Must be 'F', 'N', or 'E'.</p> <p>Specifies whether or not the factored form of the matrix <i>A</i> is supplied on entry, and if not, whether the matrix <i>A</i> should be equilibrated before it is factored.</p> <p>If <i>fact</i> = 'F', on entry, <i>af</i> and <i>ipiv</i> contain the factored form of <i>A</i>. If <i>equed</i> is not 'N', the matrix <i>A</i> has been equilibrated with scaling factors given by <i>s</i>. Parameters <i>a</i>, <i>af</i>, and <i>ipiv</i> are not modified.</p> <p>If <i>fact</i> = 'N', the matrix <i>A</i> will be copied to <i>af</i> and factored.</p> <p>If <i>fact</i> = 'E', the matrix <i>A</i> will be equilibrated, if necessary, copied to <i>af</i> and factored.</p>
<i>uplo</i>	<p>Must be 'U' or 'L'.</p> <p>Indicates whether the upper or lower triangular part of <i>A</i> is stored:</p> <p>If <i>uplo</i> = 'U', the upper triangle of <i>A</i> is stored.</p> <p>If <i>uplo</i> = 'L', the lower triangle of <i>A</i> is stored.</p>
<i>n</i>	The number of linear equations; the order of the matrix <i>A</i> ; $n \geq 0$ .
<i>nrhs</i>	The number of right-hand sides; the number of columns of the matrices <i>B</i> and <i>X</i> ; $nrhs \geq 0$ .
<i>a</i> , <i>af</i> , <i>b</i>	<p>Arrays: <i>a</i>(size <math>\max(lda*n)</math>), <i>af</i>(size <math>\max(ldaf*n)</math>), <i>b</i>, (size <math>\max(l db*nrhs)</math> for column major layout and <math>\max(l db*n)</math> for row major layout),.</p> <p>The array <i>a</i> contains the Hermitian matrix <i>A</i> as specified by <i>uplo</i>. If <i>uplo</i> = 'U', the leading <i>n</i>-by-<i>n</i> upper triangular part of <i>a</i> contains the upper triangular part of the matrix <i>A</i> and the strictly lower triangular part of <i>a</i> is not referenced. If <i>uplo</i> = 'L', the leading <i>n</i>-by-<i>n</i> lower triangular part of <i>a</i> contains the lower triangular part of the matrix <i>A</i> and the strictly upper triangular part of <i>a</i> is not referenced.</p> <p>The array <i>af</i> is an input argument if <i>fact</i> = 'F'. It contains the block diagonal matrix <i>D</i> and the multipliers used to obtain the factor <i>U</i> and <i>L</i> from the factorization <math>A = U*D*U^T</math> or <math>A = L*D*L^T</math> as computed by <a href="#">?hetrf</a>.</p> <p>The array <i>b</i> contains the matrix <i>B</i> whose columns are the right-hand sides for the systems of equations.</p>
<i>lda</i>	The leading dimension of the array <i>a</i> ; $lda \geq \max(1, n)$ .
<i>ldaf</i>	The leading dimension of the array <i>af</i> ; $ldaf \geq \max(1, n)$ .
<i>ipiv</i>	Array, size at least $\max(1, n)$ . The array <i>ipiv</i> is an input argument if <i>fact</i> = 'F'. It contains details of the interchanges and the block structure of <i>D</i> as determined by <a href="#">?sytrf</a> .

If  $ipiv[k-1] > 0$ , rows and columns  $k$  and  $ipiv[k-1]$  were interchanged and  $D_{k,k}$  is a 1-by-1 diagonal block.

If  $uplo = 'U'$  and  $ipiv[i] = ipiv[i - 1] = m < 0$ ,  $D$  has a 2-by-2 diagonal block in rows and columns  $i$  and  $i + 1$ , and the  $i$ -th row and column of  $A$  were interchanged with the  $m$ -th row and column.

If  $uplo = 'L'$  and  $ipiv[i] = ipiv[i - 1] = m < 0$ ,  $D$  has a 2-by-2 diagonal block in rows and columns  $i$  and  $i + 1$ , and the  $(i + 1)$ -st row and column of  $A$  were interchanged with the  $m$ -th row and column.

Must be 'N' or 'Y'.

*equed* is an input argument if  $fact = 'F'$ . It specifies the form of equilibration that was done:

If  $equed = 'N'$ , no equilibration was done (always true if  $fact = 'N'$ ).

if  $equed = 'Y'$ , both row and column equilibration was done, that is,  $A$  has been replaced by  $diag(s) * A * diag(s)$ .

Array, size ( $n$ ). The array  $s$  contains the scale factors for  $A$ . If  $equed = 'Y'$ ,  $A$  is multiplied on the left and right by  $diag(s)$ .

This array is an input argument if  $fact = 'F'$  only; otherwise it is an output argument.

If  $fact = 'F'$  and  $equed = 'Y'$ , each element of  $s$  must be positive.

Each element of  $s$  should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

The leading dimension of the array  $b$ ;  $ldb \geq \max(1, n)$  for column major layout and  $ldb \geq nrhs$  for row major layout.

The leading dimension of the output array  $x$ ;  $ldx \geq \max(1, n)$  for column major layout and  $ldx \geq nrhs$  for row major layout.

Number of error bounds to return for each right hand side and each type (normwise or componentwise). See *err\_bnds\_norm* and *err\_bnds\_comp* descriptions in the *Output Arguments* section below.

Specifies the number of parameters set in *params*. If  $\leq 0$ , the *params* array is never referenced and default values are used.

Array, size  $\max(1, nparams)$ . Specifies algorithm parameters. If an entry is less than 0.0, that entry is filled with the default value used for that parameter. Only positions up to  $nparams$  are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass  $nparams = 0$ , which prevents the source code from accessing the *params* argument.

*equed*

*s*

*ldb*

*ldx*

*n\_err\_bnds*

*nparams*

*params*

*params*[0] : Whether to perform iterative refinement or not. Default: 1.0 (for single precision flavors), 1.0D+0 (for double precision flavors).

=0.0 No refinement is performed and no error bounds are computed.

=1.0 Use the extra-precise refinement algorithm.

(Other values are reserved for future use.)

*params*[1] : Maximum number of residual computations allowed for refinement.

Default 10

Aggressive Set to 100 to permit convergence using approximate factorizations or factorizations other than *LU*. If the factorization uses a technique other than Gaussian elimination, the guarantees in *err\_bnds\_norm* and *err\_bnds\_comp* may no longer be trustworthy.

*params*[2] : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

## Output Parameters

<i>x</i>	Array, size $\max(1, ldx*nrhs)$ for column major layout and $\max(1, ldx*n)$ for row major layout.  If <i>info</i> = 0, the array <i>x</i> contains the solution <i>n</i> -by- <i>nrhs</i> matrix <i>X</i> to the original system of equations. Note that <i>A</i> and <i>B</i> are modified on exit if <i>equed</i> ≠ 'N', and the solution to the equilibrated system is: $\text{inv}(\text{diag}(s)) * X.$
<i>a</i>	If <i>fact</i> = 'E' and <i>equed</i> = 'Y', overwritten by $\text{diag}(s) * A * \text{diag}(s)$ .
<i>af</i>	If <i>fact</i> = 'N', <i>af</i> is an output argument and on exit returns the block diagonal matrix <i>D</i> and the multipliers used to obtain the factor <i>U</i> or <i>L</i> from the factorization $A = U * D * U^T$ or $A = L * D * L^T$ .
<i>b</i>	If <i>equed</i> = 'N', <i>B</i> is not modified.  If <i>equed</i> = 'Y', <i>B</i> is overwritten by $\text{diag}(s) * B$ .
<i>s</i>	This array is an output argument if <i>fact</i> ≠ 'F'. Each element of this array is a power of the radix. See the description of <i>s</i> in <i>Input Arguments</i> section.
<i>rcond</i>	Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix <i>A</i> after equilibration (if done). If <i>rcond</i> is less than the machine precision, in particular, if <i>rcond</i> = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.

*rpvgrw*

Contains the reciprocal pivot growth factor:

$$\|A\|/\|U\|$$

If this is much less than 1, the stability of the *LU* factorization of the (equilibrated) matrix *A* could be poor. This also means that the solution *X*, estimated condition numbers, and error bounds could be unreliable. If factorization fails with  $0 < info \leq n$ , this parameter contains the reciprocal pivot growth factor for the leading *info* columns of *A*.

*berr*

Array, size at least  $\max(1, nrhs)$ . Contains the component-wise relative backward error for each solution vector  $x_j$ , that is, the smallest relative change in any element of *A* or *B* that makes  $x_j$  an exact solution.

*err\_bnds\_norm*

Array of size  $nrhs * n\_err\_bnds$ . For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:

Normwise relative error in the *i*-th solution vector

$$\frac{\max_j |X_{true_{ji}} - X_{ji}|}{\max_j |X_{ji}|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.

*err=1*

"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold  $\sqrt{n} * slamch(\epsilon)$  for *chesvxx* and  $\sqrt{n} * dlamch(\epsilon)$  for *zhesvxx*.

*err=2*

"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold  $\sqrt{n} * slamch(\epsilon)$  for *chesvxx* and  $\sqrt{n} * dlamch(\epsilon)$  for *zhesvxx*. This error bound should only be trusted if the previous boolean is true.

*err=3*

Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold  $\sqrt{n} * slamch(\epsilon)$  for *chesvxx* and  $\sqrt{n} * dlamch(\epsilon)$  for *zhesvxx* to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix *Z* are:

$$\|Z\|_{\infty} \cdot \|Z^{-1}\|_{\infty}$$

Let  $z = s * a$ , where *s* scales each row by a power of the radix so all absolute row sums of *z* are approximately 1.

The information for right-hand side  $i$ , where  $1 \leq i \leq nrhs$ , and type of error  $err$  is stored in `err_bnds_norm[(err-1)*nrhs + i - 1]`.

`err_bnds_comp`

Array of size `nrhs*n_err_bnds`. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:

Componentwise relative error in the  $i$ -th solution vector:

$$\max_j \frac{|X_{true_{ji}} - X_{ji}|}{|X_{ji}|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is not requested (`params[2] = 0.0`), then `err_bnds_comp` is not accessed.

<code>err=1</code>	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold <code>sqrt(n)*slamch(ε)</code> for <code>chesvxx</code> and <code>sqrt(n)*dlamch(ε)</code> for <code>zhesvxx</code> .
<code>err=2</code>	"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold <code>sqrt(n)*slamch(ε)</code> for <code>chesvxx</code> and <code>sqrt(n)*dlamch(ε)</code> for <code>zhesvxx</code> . This error bound should only be trusted if the previous boolean is true.
<code>err=3</code>	Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold <code>sqrt(n)*slamch(ε)</code> for <code>chesvxx</code> and <code>sqrt(n)*dlamch(ε)</code> for <code>zhesvxx</code> to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix $Z$ are:

$$\|Z\|_{\infty} \cdot \|Z^{-1}\|_{\infty}$$

Let  $z = s * (a * \text{diag}(x))$ , where  $x$  is the solution for the current right-hand side and  $s$  scales each row of  $a * \text{diag}(x)$  by a power of the radix so all absolute row sums of  $z$  are approximately 1.

The information for right-hand side  $i$ , where  $1 \leq i \leq nrhs$ , and type of error  $err$  is stored in `err_bnds_comp[(err-1)*nrhs + i - 1]`.

`ipiv`

If `fact = 'N'`, `ipiv` is an output argument and on exit contains details of the interchanges and the block structure  $D$ , as determined by `ssytrf` for single precision flavors and `dsytrf` for double precision flavors.

<i>equed</i>	If <i>fact</i> ≠ 'F', then <i>equed</i> is an output argument. It specifies the form of equilibration that was done (see the description of <i>equed</i> in <i>Input Arguments</i> section).
<i>params</i>	If an entry is less than 0.0, that entry is filled with the default value used for that parameter, otherwise the entry is not modified.

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful. The solution to every right-hand side is guaranteed.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If  $0 < info \leq n$ :  $U_{info,info}$  is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned.

If *info* = *n*+*j*: The solution corresponding to the *j*-th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides *k* with *k* > *j* may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested *params*[2] = 0.0, then the *j*-th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest *j* such that for column major layout *err\_bnds\_norm*[*j* - 1] = 0.0 or *err\_bnds\_comp*[*j* - 1] = 0.0; or for row major layout *err\_bnds\_norm*[(*j* - 1)\**n\_err\_bnds*] = 0.0 or *err\_bnds\_comp*[(*j* - 1)\**n\_err\_bnds*] = 0.0). See the definition of *err\_bnds\_norm* and *err\_bnds\_comp* for *err* = 1. To get information about all of the right-hand sides, check *err\_bnds\_norm* or *err\_bnds\_comp*.

## Description

The routine solves for  $X$  the real or complex system of linear equations  $A^*X = B$ , where  $A$  is an  $n$ -by- $n$  symmetric matrix stored in packed format, the columns of matrix  $B$  are individual right-hand sides, and the columns of  $X$  are the corresponding solutions.

The diagonal pivoting method is used to factor  $A$  as  $A = U^*D^*U^T$  or  $A = L^*D^*L^T$ , where  $U$  (or  $L$ ) is a product of permutation and unit upper (lower) triangular matrices, and  $D$  is symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

The factored form of  $A$  is then used to solve the system of equations  $A^*X = B$ .

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<code>uplo</code>	Must be 'U' or 'L'.  Indicates whether the upper or lower triangular part of $A$ is stored: If <code>uplo = 'U'</code> , the upper triangle of $A$ is stored. If <code>uplo = 'L'</code> , the lower triangle of $A$ is stored.
<code>n</code>	The order of matrix $A$ ; $n \geq 0$ .
<code>nrhs</code>	The number of right-hand sides, the number of columns in $B$ ; $nrhs \geq 0$ .
<code>ap, b</code>	Arrays: <code>ap</code> (size $\max(1, n*(n+1)/2)$ , <code>bof</code> size $\max(1, ldb*nrhs)$ for column major layout and $\max(1, ldb*n)$ for row major layout.  The array <code>ap</code> contains the factor $U$ or $L$ , as specified by <code>uplo</code> , in <i>packed storage</i> (see <a href="#">Matrix Storage Schemes</a> ).  The array <code>b</code> contains the matrix $B$ whose columns are the right-hand sides for the systems of equations.
<code>ldb</code>	The leading dimension of <code>b</code> ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.

## Output Parameters

<code>ap</code>	The block-diagonal matrix $D$ and the multipliers used to obtain the factor $U$ (or $L$ ) from the factorization of $A$ as computed by <code>?sptrf</code> , stored as a packed triangular matrix in the same storage format as $A$ .
<code>b</code>	If <code>info = 0</code> , <code>b</code> is overwritten by the solution matrix $X$ .
<code>ipiv</code>	Array, size at least $\max(1, n)$ . Contains details of the interchanges and the block structure of $D$ , as determined by <code>?sptrf</code> .  If <code>ipiv[i-1] = k &gt; 0</code> , then $d_{ii}$ is a 1-by-1 block, and the $i$ -th row and column of $A$ was interchanged with the $k$ -th row and column.  If <code>uplo = 'U'</code> and <code>ipiv[i]=ipiv[i-1] = -m &lt; 0</code> , then $D$ has a 2-by-2 block in rows/columns $i$ and $i+1$ , and $i$ -th row and column of $A$ was interchanged with the $m$ -th row and column.  If <code>uplo = 'L'</code> and <code>ipiv[i-1] = ipiv[i] = -m &lt; 0</code> , then $D$ has a 2-by-2 block in rows/columns $i$ and $i+1$ , and $(i+1)$ -th row and column of $A$ was interchanged with the $m$ -th row and column.

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

If *info* = *i*,  $d_{ii}$  is 0. The factorization has been completed, but *D* is exactly singular, so the solution could not be computed.

## Description

The routine uses the diagonal pivoting factorization to compute the solution to a real or complex system of linear equations  $A \cdot X = B$ , where *A* is a *n*-by-*n* symmetric matrix stored in packed format, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?spsvx performs the following steps:

1. If *fact* = 'N', the diagonal pivoting method is used to factor the matrix *A*. The form of the factorization is  $A = U \cdot D \cdot U^T$  or  $A = L \cdot D \cdot L^T$ , where *U* (or *L*) is a product of permutation and unit upper (lower) triangular matrices, and *D* is symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

2. If some  $d_{i,i} = 0$ , so that  $D$  is exactly singular, then the routine returns with  $info = i$ . Otherwise, the factored form of  $A$  is used to estimate the condition number of the matrix  $A$ . If the reciprocal of the condition number is less than machine precision,  $info = n+1$  is returned as a warning, but the routine still goes on to solve for  $X$  and compute error bounds as described below.
3. The system of equations is solved for  $X$  using the factored form of  $A$ .
4. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>fact</i>	<p>Must be 'F' or 'N'.</p> <p>Specifies whether or not the factored form of the matrix <math>A</math> has been supplied on entry.</p> <p>If <math>fact = 'F'</math>: on entry, <math>afp</math> and <math>ipiv</math> contain the factored form of <math>A</math>. Arrays <math>ap</math>, <math>afp</math>, and <math>ipiv</math> are not modified.</p> <p>If <math>fact = 'N'</math>, the matrix <math>A</math> is copied to <math>afp</math> and factored.</p>
<i>uplo</i>	<p>Must be 'U' or 'L'.</p> <p>Indicates whether the upper or lower triangular part of <math>A</math> is stored and how <math>A</math> is factored:</p> <p>If <math>uplo = 'U'</math>, the array <math>ap</math> stores the upper triangular part of the symmetric matrix <math>A</math>, and <math>A</math> is factored as <math>U^*D^*U^T</math>.</p> <p>If <math>uplo = 'L'</math>, the array <math>ap</math> stores the lower triangular part of the symmetric matrix <math>A</math>; <math>A</math> is factored as <math>L^*D^*L^T</math>.</p>
<i>n</i>	The order of matrix $A$ ; $n \geq 0$ .
<i>nrhs</i>	The number of right-hand sides, the number of columns in $B$ ; $nrhs \geq 0$ .
<i>ap, afp, b</i>	<p>Arrays: <math>ap</math> (size <math>\max(1, n*(n+1)/2)</math>), <math>afp</math> (size <math>\max(1, n*(n+1)/2)</math>), <math>bof</math> size <math>\max(1, ldb*nrhs)</math> for column major layout and <math>\max(1, ldb*n)</math> for row major layout.</p> <p>The array <math>ap</math> contains the upper or lower triangle of the symmetric matrix <math>A</math> in <i>packed storage</i> (see <a href="#">Matrix Storage Schemes</a>).</p> <p>The array <math>afp</math> is an input argument if <math>fact = 'F'</math>. It contains the block diagonal matrix <math>D</math> and the multipliers used to obtain the factor <math>U</math> or <math>L</math> from the factorization <math>A = U^*D^*U^T</math> or <math>A = L^*D^*L^T</math> as computed by <code>?sptrf</code>, in the same storage format as <math>A</math>.</p> <p>The array <math>b</math> contains the matrix <math>B</math> whose columns are the right-hand sides for the systems of equations.</p>
<i>ldb</i>	The leading dimension of $b$ ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.
<i>ipiv</i>	Array, size at least $\max(1, n)$ . The array $ipiv$ is an input argument if $fact = 'F'$ . It contains details of the interchanges and the block structure of $D$ , as determined by <code>?sptrf</code> .

If  $ipiv[i-1] = k > 0$ , then  $d_{ii}$  is a 1-by-1 block, and the  $i$ -th row and column of  $A$  was interchanged with the  $k$ -th row and column.

If  $uplo = 'U'$  and  $ipiv[i]=ipiv[i-1] = -m < 0$ , then  $D$  has a 2-by-2 block in rows/columns  $i$  and  $i+1$ , and  $i$ -th row and column of  $A$  was interchanged with the  $m$ -th row and column.

If  $uplo = 'L'$  and  $ipiv[i-1]=ipiv[i] = -m < 0$ , then  $D$  has a 2-by-2 block in rows/columns  $i$  and  $i+1$ , and  $(i+1)$ -th row and column of  $A$  was interchanged with the  $m$ -th row and column.

*ldx*

The leading dimension of the output array  $x$ ;  $ldx \geq \max(1, n)$  for column major layout and  $ldx \geq nrhs$  for row major layout.

## Output Parameters

*x*

Array, size  $\max(1, ldx * nrhs)$  for column major layout and  $\max(1, ldx * n)$  for row major layout.

If  $info = 0$  or  $info = n+1$ , the array  $x$  contains the solution matrix  $X$  to the system of equations.

*afp, ipiv*

These arrays are output arguments if  $fact = 'N'$ . See the description of *afp, ipiv* in *Input Arguments* section.

*rcond*

An estimate of the reciprocal condition number of the matrix  $A$ . If *rcond* is less than the machine precision (in particular, if  $rcond = 0$ ), the matrix is singular to working precision. This condition is indicated by a return code of  $info > 0$ .

*ferr, berr*

Arrays, size at least  $\max(1, nrhs)$ . Contain the component-wise forward and relative backward errors, respectively, for each solution vector.

## Return Values

This function returns a value *info*.

If  $info = 0$ , the execution is successful.

If  $info = -i$ , parameter  $i$  had an illegal value.

If  $info = i$ , and  $i \leq n$ , then  $d_{ii}$  is exactly zero. The factorization has been completed, but the block diagonal matrix  $D$  is exactly singular, so the solution and error bounds could not be computed;  $rcond = 0$  is returned.

If  $info = i$ , and  $i = n + 1$ , then  $D$  is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

## Description

The routine solves for  $X$  the system of linear equations  $A^*X = B$ , where  $A$  is an  $n$ -by- $n$  Hermitian matrix stored in packed format, the columns of matrix  $B$  are individual right-hand sides, and the columns of  $X$  are the corresponding solutions.

The diagonal pivoting method is used to factor  $A$  as  $A = U^*D^*U^H$  or  $A = L^*D^*L^H$ , where  $U$  (or  $L$ ) is a product of permutation and unit upper (lower) triangular matrices, and  $D$  is Hermitian and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

The factored form of  $A$  is then used to solve the system of equations  $A^*X = B$ .

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of $A$ is stored: If <i>uplo</i> = 'U', the upper triangle of $A$ is stored. If <i>uplo</i> = 'L', the lower triangle of $A$ is stored.
<i>n</i>	The order of matrix $A$ ; $n \geq 0$ .
<i>nrhs</i>	The number of right-hand sides; the number of columns in $B$ ; $nrhs \geq 0$ .
<i>ap</i> , <i>b</i>	Arrays: <i>ap</i> (size $\max(1, n*(n+1)/2)$ , <i>bof</i> size $\max(1, ldb*nrhs)$ for column major layout and $\max(1, ldb*n)$ for row major layout. The array <i>ap</i> contains the factor $U$ or $L$ , as specified by <i>uplo</i> , in <i>packed storage</i> (see <a href="#">Matrix Storage Schemes</a> ). The array <i>b</i> contains the matrix $B$ whose columns are the right-hand sides for the systems of equations.
<i>ldb</i>	The leading dimension of $b$ ; $ldb \geq \max(1, n)$ for column major layout and $ldb \geq nrhs$ for row major layout.

## Output Parameters

<i>ap</i>	The block-diagonal matrix $D$ and the multipliers used to obtain the factor $U$ (or $L$ ) from the factorization of $A$ as computed by <code>?hptrf</code> , stored as a packed triangular matrix in the same storage format as $A$ .
<i>b</i>	If $info = 0$ , $b$ is overwritten by the solution matrix $X$ .
<i>ipiv</i>	<p>Array, size at least <math>\max(1, n)</math>. Contains details of the interchanges and the block structure of <math>D</math>, as determined by <code>?hptrf</code>.</p> <p>If <math>ipiv[i-1] = k &gt; 0</math>, then <math>d_{ii}</math> is a 1-by-1 block, and the <math>i</math>-th row and column of <math>A</math> was interchanged with the <math>k</math>-th row and column.</p> <p>If <math>uplo = 'U'</math> and <math>ipiv[i]=ipiv[i-1] = -m &lt; 0</math>, then <math>D</math> has a 2-by-2 block in rows/columns <math>i</math> and <math>i+1</math>, and <math>i</math>-th row and column of <math>A</math> was interchanged with the <math>m</math>-th row and column.</p> <p>If <math>uplo = 'L'</math> and <math>ipiv[i-1]=ipiv[i] = -m &lt; 0</math>, then <math>D</math> has a 2-by-2 block in rows/columns <math>i</math> and <math>i+1</math>, and <math>(i+1)</math>-th row and column of <math>A</math> was interchanged with the <math>m</math>-th row and column.</p>

## Return Values

This function returns a value *info*.

If  $info = 0$ , the execution is successful.

If  $info = -i$ , parameter  $i$  had an illegal value.

If  $info = i$ ,  $d_{ii}$  is 0. The factorization has been completed, but  $D$  is exactly singular, so the solution could not be computed.

## Description

The routine uses the diagonal pivoting factorization to compute the solution to a complex system of linear equations  $A \cdot X = B$ , where  $A$  is a  $n$ -by- $n$  Hermitian matrix stored in packed format, the columns of matrix  $B$  are individual right-hand sides, and the columns of  $X$  are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine `?hpsvx` performs the following steps:

1. If `fact = 'N'`, the diagonal pivoting method is used to factor the matrix  $A$ . The form of the factorization is  $A = U \cdot D \cdot U^H$  or  $A = L \cdot D \cdot L^H$ , where  $U$  (or  $L$ ) is a product of permutation and unit upper (lower) triangular matrices, and  $D$  is a Hermitian and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.
2. If some  $d_{i,i} = 0$ , so that  $D$  is exactly singular, then the routine returns with `info = i`. Otherwise, the factored form of  $A$  is used to estimate the condition number of the matrix  $A$ . If the reciprocal of the condition number is less than machine precision, `info = n+1` is returned as a warning, but the routine still goes on to solve for  $X$  and compute error bounds as described below.
3. The system of equations is solved for  $X$  using the factored form of  $A$ .
4. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<code>fact</code>	Must be 'F' or 'N'.  Specifies whether or not the factored form of the matrix $A$ has been supplied on entry.  If <code>fact = 'F'</code> : on entry, <code>ap</code> and <code>ipiv</code> contain the factored form of $A$ . Arrays <code>ap</code> , <code>afp</code> , and <code>ipiv</code> are not modified.  If <code>fact = 'N'</code> , the matrix $A$ is copied to <code>afp</code> and factored.
<code>uplo</code>	Must be 'U' or 'L'.  Indicates whether the upper or lower triangular part of $A$ is stored and how $A$ is factored:  If <code>uplo = 'U'</code> , the array <code>ap</code> stores the upper triangular part of the Hermitian matrix $A$ , and $A$ is factored as $U \cdot D \cdot U^H$ .  If <code>uplo = 'L'</code> , the array <code>ap</code> stores the lower triangular part of the Hermitian matrix $A$ , and $A$ is factored as $L \cdot D \cdot L^H$ .
<code>n</code>	The order of matrix $A$ ; $n \geq 0$ .
<code>nrhs</code>	The number of right-hand sides, the number of columns in $B$ ; $nrhs \geq 0$ .
<code>ap, afp, b</code>	Arrays: <code>ap</code> (size $\max(1, n \cdot (n+1)/2)$ ), <code>afp</code> (size $\max(1, n \cdot (n+1)/2)$ ), <code>bof</code> (size $\max(1, ldb \cdot nrhs)$ for column major layout and $\max(1, ldb \cdot n)$ for row major layout).  The array <code>ap</code> contains the upper or lower triangle of the Hermitian matrix $A$ in <i>packed storage</i> (see <a href="#">Matrix Storage Schemes</a> ).

The array *afp* is an input argument if *fact* = 'F'. It contains the block diagonal matrix *D* and the multipliers used to obtain the factor *U* or *L* from the factorization  $A = U * D * U^H$  or  $A = L * D * L^H$  as computed by `?hptrf`, in the same storage format as *A*.

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations.

*ldb*

The leading dimension of *b*;  $ldb \geq \max(1, n)$  for column major layout and  $ldb \geq nrhs$  for row major layout.

*ipiv*

Array, size at least  $\max(1, n)$ . The array *ipiv* is an input argument if *fact* = 'F'. It contains details of the interchanges and the block structure of *D*, as determined by `?hptrf`.

If  $ipiv[i-1] = k > 0$ , then  $d_{ii}$  is a 1-by-1 block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column.

If  $uplo = 'U'$  and  $ipiv[i]=ipiv[i-1] = -m < 0$ , then *D* has a 2-by-2 block in rows/columns *i* and *i+1*, and *i*-th row and column of *A* was interchanged with the *m*-th row and column.

If  $uplo = 'L'$  and  $ipiv[i-1]=ipiv[i] = -m < 0$ , then *D* has a 2-by-2 block in rows/columns *i* and *i+1*, and (*i+1*)-th row and column of *A* was interchanged with the *m*-th row and column.

*ldx*

The leading dimension of the output array *x*;  $ldx \geq \max(1, n)$  for column major layout and  $ldx \geq nrhs$  for row major layout.

## Output Parameters

*x*

Array, size  $\max(1, ldx * nrhs)$  for column major layout and  $\max(1, ldx * n)$  for row major layout.

If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X* to the system of equations.

*afp, ipiv*

These arrays are output arguments if *fact* = 'N'. See the description of *afp, ipiv* in *Input Arguments* section.

*rcond*

An estimate of the reciprocal condition number of the matrix *A*. If *rcond* is less than the machine precision (in particular, if *rcond* = 0), the matrix is singular to working precision. This condition is indicated by a return code of *info* > 0.

*ferr*

Array, size at least  $\max(1, nrhs)$ . Contains the estimated forward error bound for each solution vector  $x_j$  (the *j*-th column of the solution matrix *X*). If *xtrue* is the true solution corresponding to  $x_j$ ,  $ferr[j-1]$  is an estimated upper bound for the magnitude of the largest element in  $(x_j - xtrue)$  divided by the magnitude of the largest element in  $x_j$ . The estimate is as reliable as the estimate for *rcond*, and is almost always a slight overestimate of the true error.

*berr*

Array, size at least  $\max(1, nrhs)$ . Contains the component-wise relative backward error for each solution vector  $x_j$ , that is, the smallest relative change in any element of *A* or *B* that makes  $x_j$  an exact solution.

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, parameter *i* had an illegal value.

If *info* = *i*, and  $i \leq n$ , then  $d_{ii}$  is exactly zero. The factorization has been completed, but the block diagonal matrix *D* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned.

If *info* = *i*, and  $i = n + 1$ , then *D* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

## LAPACK Least Squares and Eigenvalue Problem Routines

This section includes descriptions of LAPACK [computational routines](#) and [driver routines](#) for solving linear least squares problems, eigenvalue and singular value problems, and performing a number of related computational tasks. For a full reference on LAPACK routines and related information see [LUG].

**Least Squares Problems.** A typical *least squares problem* is as follows: given a matrix *A* and a vector *b*, find the vector *x* that minimizes the sum of squares  $\sum_i ((Ax)_i - b_i)^2$  or, equivalently, find the vector *x* that minimizes the 2-norm  $\|Ax - b\|_2$ .

In the most usual case, *A* is an *m*-by-*n* matrix with  $m \geq n$  and  $\text{rank}(A) = n$ . This problem is also referred to as finding the *least squares solution* to an *overdetermined* system of linear equations (here we have more equations than unknowns). To solve this problem, you can use the QR factorization of the matrix *A* (see [QR Factorization](#)).

If  $m < n$  and  $\text{rank}(A) = m$ , there exist an infinite number of solutions *x* which exactly satisfy  $Ax = b$ , and thus minimize the norm  $\|Ax - b\|_2$ . In this case it is often useful to find the unique solution that minimizes  $\|x\|_2$ . This problem is referred to as finding the *minimum-norm solution* to an *underdetermined* system of linear equations (here we have more unknowns than equations). To solve this problem, you can use the LQ factorization of the matrix *A* (see [LQ Factorization](#)).

In the general case you may have a *rank-deficient least squares problem*, with  $\text{rank}(A) < \min(m, n)$ : find the *minimum-norm least squares solution* that minimizes both  $\|x\|_2$  and  $\|Ax - b\|_2^2$ . In this case (or when the rank of *A* is in doubt) you can use the QR factorization with pivoting or *singular value decomposition* (see [Singular Value Decomposition](#)).

**Eigenvalue Problems.** The eigenvalue problems (from German *eigen* "own") are stated as follows: given a matrix *A*, find the *eigenvalues*  $\lambda$  and the corresponding *eigenvectors* *z* that satisfy the equation

$$Az = \lambda z \text{ (right eigenvectors } z)$$

or the equation

$$z^H A = \lambda z^H \text{ (left eigenvectors } z).$$

If *A* is a real symmetric or complex Hermitian matrix, the above two equations are equivalent, and the problem is called a *symmetric eigenvalue problem*. Routines for solving this type of problems are described in the topic [Symmetric Eigenvalue Problems](#).

Routines for solving eigenvalue problems with nonsymmetric or non-Hermitian matrices are described in the topic [Nonsymmetric Eigenvalue Problems](#).

The library also includes routines that handle *generalized symmetric-definite eigenvalue problems*: find the eigenvalues  $\lambda$  and the corresponding eigenvectors *x* that satisfy one of the following equations:

$$Az = \lambda Bz, \quad ABz = \lambda z, \quad \text{or} \quad BAz = \lambda z,$$

where  $A$  is symmetric or Hermitian, and  $B$  is symmetric positive-definite or Hermitian positive-definite. Routines for reducing these problems to standard symmetric eigenvalue problems are described in the topic [Generalized Symmetric-Definite Eigenvalue Problems](#).

To solve a particular problem, you usually call several computational routines. Sometimes you need to combine the routines of this chapter with other LAPACK routines described in "LAPACK Routines: Linear Equations" as well as with BLAS routines described in "BLAS and Sparse BLAS Routines".

For example, to solve a set of least squares problems minimizing  $\|Ax - b\|^2$  for all columns  $b$  of a given matrix  $B$  (where  $A$  and  $B$  are real matrices), you can call `?geqrf` to form the factorization  $A = QR$ , then call `?ormqr` to compute  $C = Q^H B$  and finally call the BLAS routine `?trsm` to solve for  $X$  the system of equations  $RX = C$ .

Another way is to call an appropriate driver routine that performs several tasks in one call. For example, to solve the least squares problem the driver routine `?gels` can be used.

### LAPACK Least Squares and Eigenvalue Problem Computational Routines

In the topics that follow, the descriptions of LAPACK computational routines are given. These routines perform distinct computational tasks that can be used for:

[Orthogonal Factorizations](#)

[Singular Value Decomposition](#)

[Symmetric Eigenvalue Problems](#)

[Generalized Symmetric-Definite Eigenvalue Problems](#)

[Nonsymmetric Eigenvalue Problems](#)

[Generalized Nonsymmetric Eigenvalue Problems](#)

[Generalized Singular Value Decomposition](#)

See also the respective [driver routines](#).

### Orthogonal Factorizations: LAPACK Computational Routines

This topic describes the LAPACK routines for the  $QR$  ( $RQ$ ) and  $LQ$  ( $QL$ ) factorization of matrices. Routines for the  $RZ$  factorization as well as for generalized  $QR$  and  $RQ$  factorizations are also included.

**QR Factorization.** Assume that  $A$  is an  $m$ -by- $n$  matrix to be factored.

If  $m \geq n$ , the  $QR$  factorization is given by

$$A = Q \begin{pmatrix} R \\ 0 \end{pmatrix} = (Q_1, Q_2) \begin{pmatrix} R \\ 0 \end{pmatrix}$$

where  $R$  is an  $n$ -by- $n$  upper triangular matrix with real diagonal elements, and  $Q$  is an  $m$ -by- $m$  orthogonal (or unitary) matrix.

You can use the  $QR$  factorization for solving the following least squares problem: minimize  $\|Ax - b\|^2$  where  $A$  is a full-rank  $m$ -by- $n$  matrix ( $m \geq n$ ). After factoring the matrix, compute the solution  $x$  by solving  $Rx = (Q_1)^T b$ .

If  $m < n$ , the  $QR$  factorization is given by

$$A = QR = Q(R_1 R_2)$$

where  $R$  is trapezoidal,  $R_1$  is upper triangular and  $R_2$  is rectangular.

$Q$  is represented as a product of  $\min(m, n)$  elementary reflectors. Routines are provided to work with  $Q$  in this representation.

**LQ Factorization** LQ factorization of an  $m$ -by- $n$  matrix  $A$  is as follows. If  $m \leq n$ ,

$$A = (L, 0) Q = (L, 0) \begin{pmatrix} Q_1 \\ Q_2 \end{pmatrix} = (LQ_1)$$

where  $L$  is an  $m$ -by- $m$  lower triangular matrix with real diagonal elements, and  $Q$  is an  $n$ -by- $n$  orthogonal (or unitary) matrix.

If  $m > n$ , the LQ factorization is

$$A = \begin{pmatrix} L_1 \\ L_2 \end{pmatrix} Q$$

where  $L_1$  is an  $n$ -by- $n$  lower triangular matrix,  $L_2$  is rectangular, and  $Q$  is an  $n$ -by- $n$  orthogonal (or unitary) matrix.

You can use the LQ factorization to find the minimum-norm solution of an underdetermined system of linear equations  $Ax = b$  where  $A$  is an  $m$ -by- $n$  matrix of rank  $m$  ( $m < n$ ). After factoring the matrix, compute the solution vector  $x$  as follows: solve  $Ly = b$  for  $y$ , and then compute  $x = (Q_1)^H y$ .

Table "Computational Routines for Orthogonal Factorization" lists LAPACK routines that perform orthogonal factorization of matrices.

### ?geqrf

Computes the QR factorization of a general  $m$ -by- $n$  matrix.

### Syntax

```
lapack_int LAPACKE_sgeqrf (int matrix_layout, lapack_int m, lapack_int n, float* a,
lapack_int lda, float* tau);
```

```
lapack_int LAPACKE_dgeqrf (int matrix_layout, lapack_int m, lapack_int n, double* a,
lapack_int lda, double* tau);
```

```
lapack_int LAPACKE_cgeqrf (int matrix_layout, lapack_int m, lapack_int n,
lapack_complex_float* a, lapack_int lda, lapack_complex_float* tau);
```

```
lapack_int LAPACKE_zgeqrf (int matrix_layout, lapack_int m, lapack_int n,
lapack_complex_double* a, lapack_int lda, lapack_complex_double* tau);
```

### Include Files

- `mkl.h`

### Description

The routine forms the QR factorization of a general  $m$ -by- $n$  matrix  $A$  (see [Orthogonal Factorizations](#)). No pivoting is performed.

The routine does not form the matrix  $Q$  explicitly. Instead,  $Q$  is represented as a product of  $\min(m, n)$  elementary reflectors. Routines are provided to work with  $Q$  in this representation.

### NOTE

This routine supports the Progress Routine feature. See [Progress Function](#) for details.

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major ( <code>LAPACK_ROW_MAJOR</code> ) or column major ( <code>LAPACK_COL_MAJOR</code> ).
<i>m</i>	The number of rows in the matrix <i>A</i> ( $m \geq 0$ ).
<i>n</i>	The number of columns in <i>A</i> ( $n \geq 0$ ).
<i>a</i>	Array <i>a</i> of size $\max(1, lda*n)$ for column major layout and $\max(1, lda*m)$ for row major layout contains the matrix <i>A</i> .
<i>lda</i>	The leading dimension of <i>a</i> ; at least $\max(1, m)$ for column major layout and at least $\max(1, n)$ for row major layout.

## Output Parameters

<i>a</i>	Overwritten by the factorization data as follows: The elements on and above the diagonal of the array contain the $\min(m,n)$ -by- <i>n</i> upper trapezoidal matrix <i>R</i> ( <i>R</i> is upper triangular if $m \geq n$ ); the elements below the diagonal, with the array <i>tau</i> , present the orthogonal matrix <i>Q</i> as a product of $\min(m,n)$ elementary reflectors (see <a href="#">Orthogonal Factorizations</a> ).
<i>tau</i>	Array, size at least $\max(1, \min(m, n))$ . Contains scalars that define elementary reflectors for the matrix <i>Q</i> in its decomposition in a product of elementary reflectors (see <a href="#">Orthogonal Factorizations</a> ).

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

## Application Notes

The computed factorization is the exact factorization of a matrix  $A + E$ , where

$$\|E\|_2 = O(\epsilon) \|A\|_2.$$

The approximate number of floating-point operations for real flavors is

$$(4/3)n^3 \quad \text{if } m = n,$$

$$(2/3)n^2(3m-n) \quad \text{if } m > n,$$

$$(2/3)m^2(3n-m) \quad \text{if } m < n.$$

The number of operations for complex flavors is 4 times greater.

To solve a set of least squares problems minimizing  $\|A*x - b\|_2$  for all columns *b* of a given matrix *B*, you can call the following:

<code>?geqrf</code> (this routine)	to factorize $A = QR$ ;
<code>ormqr</code>	to compute $C = Q^T*B$ (for real matrices);
<code>unmqr</code>	to compute $C = Q^H*B$ (for complex matrices);

`trsm` (a BLAS routine) to solve  $R^*X = C$ .

(The columns of the computed  $X$  are the least squares solution vectors  $x$ .)

To compute the elements of  $Q$  explicitly, call

`orgqr` (for real matrices)

`ungqr` (for complex matrices).

```
lapack_int LAPACKE_zgeqrfp (int matrix_layout, lapack_int m, lapack_int n,
lapack_complex_double* a, lapack_int lda, lapack_complex_double* tau);
```

### Include Files

- `mkl.h`

### Description

The routine forms the QR factorization of a general  $m$ -by- $n$  matrix  $A$  (see [Orthogonal Factorizations](#)). No pivoting is performed. The diagonal entries of  $R$  are real and nonnegative.

The routine does not form the matrix  $Q$  explicitly. Instead,  $Q$  is represented as a product of  $\min(m, n)$  elementary reflectors. Routines are provided to work with  $Q$  in this representation.

---

#### NOTE

This routine supports the Progress Routine feature. See [Progress Function](#) for details.

---

### Input Parameters

*matrix\_layout* Specifies whether matrix storage layout is row major (`LAPACK_ROW_MAJOR`) or column major (`LAPACK_COL_MAJOR`).

*m* The number of rows in the matrix  $A$  ( $m \geq 0$ ).

*n* The number of columns in  $A$  ( $n \geq 0$ ).

<i>a</i>	Array, size $\max(1, lda * n)$ for column major layout and $\max(1, lda * m)$ for row major layout, containing the matrix <i>A</i> .
<i>lda</i>	The leading dimension of <i>a</i> ; at least $\max(1, m)$ for column major layout and at least $\max(1, n)$ for row major layout.

## Output Parameters

<i>a</i>	Overwritten by the factorization data as follows:  The elements on and above the diagonal of the array contain the $\min(m, n)$ -by- <i>n</i> upper trapezoidal matrix <i>R</i> ( <i>R</i> is upper triangular if $m \geq n$ ); the elements below the diagonal, with the array <i>tau</i> , present the orthogonal matrix <i>Q</i> as a product of $\min(m, n)$ elementary reflectors (see <a href="#">Orthogonal Factorizations</a> ).  The diagonal elements of the matrix <i>R</i> are real and non-negative.
<i>tau</i>	Array, size at least $\max(1, \min(m, n))$ . Contains scalars that define elementary reflectors for the matrix <i>Q</i> in its decomposition in a product of elementary reflectors (see <a href="#">Orthogonal Factorizations</a> ).

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

## Application Notes

The computed factorization is the exact factorization of a matrix  $A + E$ , where

$$\|E\|_2 = O(\epsilon) \|A\|_2.$$

The approximate number of floating-point operations for real flavors is

$$\begin{aligned} (4/3)n^3 & \quad \text{if } m = n, \\ (2/3)n^2(3m-n) & \quad \text{if } m > n, \\ (2/3)m^2(3n-m) & \quad \text{if } m < n. \end{aligned}$$

The number of operations for complex flavors is 4 times greater.

To solve a set of least squares problems minimizing  $\|A * x - b\|_2$  for all columns *b* of a given matrix *B*, you can call the following:

<code>?geqrfp</code> (this routine)	to factorize $A = QR$ ;
<code>ormqr</code>	to compute $C = Q^T * B$ (for real matrices);
<code>unmqr</code>	to compute $C = Q^H * B$ (for complex matrices);
<code>trsm</code> (a BLAS routine)	to solve $R * X = C$ .

(The columns of the computed *X* are the least squares solution vectors *x*.)

To compute the elements of *Q* explicitly, call

`orgqr` (for real matrices)

ungqr (for complex matrices).

## Matrix Storage Schemes

*?sgeqrt*

*Computes a blocked QR factorization of a general real or complex matrix using the compact WY representation of Q.*

## Syntax

```
lapack_int LAPACKE_sgeqrt (int matrix_layout, lapack_int m, lapack_int n, lapack_int nb, float* a, lapack_int lda, float* t, lapack_int ldt);
```

```
lapack_int LAPACKE_dgeqrt (int matrix_layout, lapack_int m, lapack_int n, lapack_int nb, double* a, lapack_int lda, double* t, lapack_int ldt);
```

```
lapack_int LAPACKE_cgeqrt (int matrix_layout, lapack_int m, lapack_int n, lapack_int nb, lapack_complex_float* a, lapack_int lda, lapack_complex_float* t, lapack_int ldt);
```

```
lapack_int LAPACKE_zgeqrt (int matrix_layout, lapack_int m, lapack_int n, lapack_int nb, lapack_complex_double* a, lapack_int lda, lapack_complex_double* t, lapack_int ldt);
```

## Include Files

- mkl.h

## Description

The strictly lower triangular matrix  $V$  contains the elementary reflectors  $H(i)$  in the  $i$ th column below the diagonal. For example, if  $m=5$  and  $n=3$ , the matrix  $V$  is

$$V = \begin{bmatrix} 1 & & & & \\ v_1 & 1 & & & \\ v_1 & v_2 & 1 & & \\ v_1 & v_2 & v_3 & & \\ v_1 & v_2 & v_3 & & \end{bmatrix}$$

where  $v_i$  represents one of the vectors that define  $H(i)$ . The vectors are returned in the lower triangular part of array  $a$ .

**NOTE**

The 1s along the diagonal of  $V$  are not stored in  $a$ .

Let  $k = \min(m, n)$ . The number of blocks is  $b = \text{ceiling}(k/nb)$ , where each block is of order  $nb$  except for the last block, which is of order  $ib = k - (b-1)*nb$ . For each of the  $b$  blocks, an upper triangular block reflector factor is computed:  $t_1, t_2, \dots, t_b$ . The  $nb$ -by- $nb$  (and  $ib$ -by- $ib$  for the last block)  $t$ s are stored in the  $nb$ -by- $n$  array  $t$  as

$$t = (t_1 t_2 \dots t_b).$$

**Input Parameters**

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>m</i>	The number of rows in the matrix $A$ ( $m \geq 0$ ).
<i>n</i>	The number of columns in $A$ ( $n \geq 0$ ).
<i>nb</i>	The block size to be used in the blocked QR ( $\min(m, n) \geq nb \geq 1$ ).
<i>a</i>	Array $a$ of size $\max(1, lda*n)$ for column major layout and $\max(1, lda*m)$ for row major layout contains the $m$ -by- $n$ matrix $A$ .
<i>lda</i>	The leading dimension of $a$ ; at least $\max(1, m)$ for column major layout and $\max(1, n)$ for row major layout.
<i>ldt</i>	The leading dimension of $t$ ; at least $nb$ for column major layout and $\max(1, \min(m, n))$ for row major layout.

**Output Parameters**

<i>a</i>	Overwritten by the factorization data as follows: The elements on and above the diagonal of the array contain the $\min(m, n)$ -by- $n$ upper trapezoidal matrix $R$ ( $R$ is upper triangular if $m \geq n$ ); the elements below the diagonal, with the array $t$ , present the orthogonal matrix $Q$ as a product of $\min(m, n)$ elementary reflectors (see <a href="#">Orthogonal Factorizations</a> ).
<i>t</i>	Array, size $\max(1, ldt*\min(m, n))$ for column major layout and $\max(1, ldt*nb)$ for row major layout.  The upper triangular block reflector's factors stored as a sequence of upper triangular blocks.

**Return Values**

This function returns a value *info*.

If  $info=0$ , the execution is successful.

If  $info < 0$  and  $info = -i$ , the  $i$ -th parameter had an illegal value.

## ?gemqrt

Multiplies a general matrix by the orthogonal/unitary matrix  $Q$  of the QR factorization formed by `?geqrt`.

### Syntax

```
lapack_int LAPACKE_sgemqrt (int matrix_layout, char side, char trans, lapack_int m,
lapack_int n, lapack_int k, lapack_int nb, const float* v, lapack_int ldv, const float*
t, lapack_int ldt, float* c, lapack_int ldc);
```

```
lapack_int LAPACKE_dgemqrt (int matrix_layout, char side, char trans, lapack_int m,
lapack_int n, lapack_int k, lapack_int nb, const double* v, lapack_int ldv, const
double* t, lapack_int ldt, double* c, lapack_int ldc);
```

```
lapack_int LAPACKE_cgemqrt (int matrix_layout, char side, char trans, lapack_int m,
lapack_int n, lapack_int k, lapack_int nb, const lapack_complex_float* v, lapack_int
ldv, const lapack_complex_float* t, lapack_int ldt, lapack_complex_float* c, lapack_int
ldc);
```

```
lapack_int LAPACKE_zgemqrt (int matrix_layout, char side, char trans, lapack_int m,
lapack_int n, lapack_int k, lapack_int nb, const lapack_complex_double* v, lapack_int
ldv, const lapack_complex_double* t, lapack_int ldt, lapack_complex_double* c,
lapack_int ldc);
```

### Include Files

- `mkl.h`

### Description

The `?gemqrt` routine overwrites the general real or complex  $m$ -by- $n$  matrix  $C$  with

	<i>side</i> = 'L'	<i>side</i> = 'R'
<i>trans</i> = 'N':	$Q * C$	$C * Q$
<i>trans</i> = 'T':	$Q^T * C$	$C * Q^T$
<i>trans</i> = 'C':	$Q^H * C$	$C * Q^H$

where  $Q$  is a real orthogonal (complex unitary) matrix defined as the product of  $k$  elementary reflectors

$Q = H(1) H(2) \dots H(k) = I - V * T * V^T$  for real flavors, and

$Q = H(1) H(2) \dots H(k) = I - V * T * V^H$  for complex flavors,

generated using the compact WY representation as returned by `geqrt`.  $Q$  is of order  $m$  if *side* = 'L' and of order  $n$  if *side* = 'R'.

### Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major ( <code>LAPACK_ROW_MAJOR</code> ) or column major ( <code>LAPACK_COL_MAJOR</code> ).
<i>side</i>	= 'L': apply $Q$ , $Q^T$ , or $Q^H$ from the left. = 'R': apply $Q$ , $Q^T$ , or $Q^H$ from the right.
<i>trans</i>	= 'N', no transpose, apply $Q$ . = 'T', transpose, apply $Q^T$ . = 'C', transpose, apply $Q^H$ .
<i>m</i>	The number of rows in the matrix $C$ , ( $m \geq 0$ ).

$n$	The number of columns in the matrix $C$ , ( $n \geq 0$ ).
$k$	The number of elementary reflectors whose product defines the matrix $Q$ . Constraints: If $side = 'L'$ , $m \geq k \geq 0$ If $side = 'R'$ , $n \geq k \geq 0$ .
$nb$	The block size used for the storage of $t$ , $k \geq nb \geq 1$ . This must be the same value of $nb$ used to generate $t$ in <a href="#">geqrt</a> .
$v$	Array of size $\max(1, ldv*k)$ for column major layout, $\max(1, ldv*m)$ for row major layout and $side = 'L'$ , and $\max(1, ldv*n)$ for row major layout and $side = 'R'$ .  The $i$ th column must contain the vector which defines the elementary reflector $H(i)$ , for $i = 1, 2, \dots, k$ , as returned by <a href="#">geqrt</a> in the first $k$ columns of its array argument $a$ .
$ldv$	The leading dimension of the array $v$ .  if $side = 'L'$ , $ldv$ must be at least $\max(1, m)$ for column major layout and $\max(1, k)$ for row major layout;  if $side = 'R'$ , $ldv$ must be at least $\max(1, n)$ for column major layout and $\max(1, k)$ for row major layout.
$t$	Array, size $\max(1, ldt*\min(m, n))$ for column major layout and $\max(1, ldt*nb)$ for row major layout.  The upper triangular factors of the block reflectors as returned by <a href="#">geqrt</a> .
$ldt$	The leading dimension of the array $t$ . $ldt$ must be at least $nb$ for column major layout and $\max(1, k)$ for row major layout.
$c$	The $m$ -by- $n$ matrix $C$ .
$ldc$	The leading dimension of the array $c$ . $ldc$ must be at least $\max(1, m)$ for column major layout and $\max(1, n)$ for row major layout.

## Output Parameters

$c$	Overwritten by the product $Q*C$ , $C*Q$ , $Q^T*C$ , $C*Q^T$ , $Q^H*C$ , or $C*Q^H$ as specified by $side$ and $trans$ .
-----	--

## Return Values

This function returns a value  $info$ .

If  $info=0$ , the execution is successful.

If  $info = -i$ , the  $i$ -th parameter had an illegal value.

### ?geqpf

Computes the QR factorization of a general  $m$ -by- $n$  matrix with pivoting.

---

## Syntax

```
lapack_int LAPACKE_sgeqpf (int matrix_layout, lapack_int m, lapack_int n, float* a,
lapack_int lda, lapack_int* jpvt, float* tau);
```

```
lapack_int LAPACKE_dgeqpf (int matrix_layout, lapack_int m, lapack_int n, double* a,
lapack_int lda, lapack_int* jpvt, double* tau);
```

```
lapack_int LAPACKE_cgeqpf (int matrix_layout, lapack_int m, lapack_int n,
lapack_complex_float* a, lapack_int lda, lapack_int* jpvt, lapack_complex_float* tau);
```

```
lapack_int LAPACKE_zgeqpf (int matrix_layout, lapack_int m, lapack_int n,
lapack_complex_double* a, lapack_int lda, lapack_int* jpvt, lapack_complex_double*
tau);
```

## Include Files

- mkl.h

## Description

The routine is deprecated and has been replaced by routine [geqp3](#).

The routine `?geqpf` forms the  $QR$  factorization of a general  $m$ -by- $n$  matrix  $A$  with column pivoting:  $A*P = Q*R$  (see [Orthogonal Factorizations](#)). Here  $P$  denotes an  $n$ -by- $n$  permutation matrix.

The routine does not form the matrix  $Q$  explicitly. Instead,  $Q$  is represented as a product of  $\min(m, n)$  *elementary reflectors*. Routines are provided to work with  $Q$  in this representation.

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>m</i>	The number of rows in the matrix $A$ ( $m \geq 0$ ).
<i>n</i>	The number of columns in $A$ ( $n \geq 0$ ).
<i>a</i>	Array <i>a</i> of size $\max(1, lda*n)$ for column major layout and $\max(1, lda*m)$ for row major layout contains the matrix $A$ .
<i>lda</i>	The leading dimension of <i>a</i> ; at least $\max(1, m)$ for column major layout and $\max(1, n)$ for row major layout.
<i>jpvt</i>	Array, size at least $\max(1, n)$ . On entry, if $jpvt[i - 1] > 0$ , the $i$ -th column of $A$ is moved to the beginning of $A*P$ before the computation, and fixed in place during the computation. If $jpvt[i - 1] = 0$ , the $i$ th column of $A$ is a free column (that is, it may be interchanged during the computation with any other free column).

## Output Parameters

<i>a</i>	Overwritten by the factorization data as follows: The elements on and above the diagonal of the array contain the $\min(m, n)$ -by- $n$ upper trapezoidal matrix $R$ ( $R$ is upper triangular if $m \geq n$ ); the elements below the diagonal, with the array <i>tau</i> , present the orthogonal matrix $Q$ as a product of $\min(m, n)$ elementary reflectors (see <a href="#">Orthogonal Factorizations</a> ).
----------	--

<code>tau</code>	Array, size at least $\max(1, \min(m, n))$ . Contains additional information on the matrix $Q$ .
<code>jpvt</code>	Overwritten by details of the permutation matrix $P$ in the factorization $A*P = Q*R$ . More precisely, the columns of $A*P$ are the columns of $A$ in the following order: <code>jpvt[0], jpvt[1], ..., jpvt[n - 1]</code> .

## Return Values

This function returns a value `info`.

If `info=0`, the execution is successful.

If `info = -i`, the  $i$ -th parameter had an illegal value.

## Application Notes

The computed factorization is the exact factorization of a matrix  $A + E$ , where

$$\|E\|_2 = O(\epsilon) \|A\|_2.$$

The approximate number of floating-point operations for real flavors is

$$\begin{aligned} (4/3)n^3 & \quad \text{if } m = n, \\ (2/3)n^2(3m-n) & \quad \text{if } m > n, \\ (2/3)m^2(3n-m) & \quad \text{if } m < n. \end{aligned}$$

The number of operations for complex flavors is 4 times greater.

To solve a set of least squares problems minimizing  $\|A*x - b\|_2$  for all columns  $b$  of a given matrix  $B$ , you can call the following:

<code>?gelsf</code> (this routine)	to factorize $A*P = Q*R$ ;
<code>ormqr</code>	to compute $C = Q^T*B$ (for real matrices);
<code>unmqr</code>	to compute $C = Q^H*B$ (for complex matrices);
<code>trsm</code> (a BLAS routine)	to solve $R*X = C$ .

(The columns of the computed  $X$  are the permuted least squares solution vectors  $x$ ; the output array `jpvt` specifies the permutation order.)

To compute the elements of  $Q$  explicitly, call

<code>orgqr</code>	(for real matrices)
<code>ungqr</code>	(for complex matrices).

## ?geqp3

Computes the QR factorization of a general  $m$ -by- $n$  matrix with column pivoting using level 3 BLAS.

## Syntax

```
lapack_int LAPACKE_sgeqp3 (int matrix_layout, lapack_int m, lapack_int n, float* a,
lapack_int lda, lapack_int* jpvt, float* tau);
```

```
lapack_int LAPACKE_dgeqp3 (int matrix_layout, lapack_int m, lapack_int n, double* a,
lapack_int lda, lapack_int* jpvt, double* tau);
```

```
lapack_int LAPACKE_cgeqp3 (int matrix_layout, lapack_int m, lapack_int n,
lapack_complex_float* a, lapack_int lda, lapack_int* jpvt, lapack_complex_float* tau);
```

```
lapack_int LAPACKE_zgeqp3 (int matrix_layout, lapack_int m, lapack_int n,
lapack_complex_double* a, lapack_int lda, lapack_int* jpvt, lapack_complex_double*
tau);
```

## Include Files

- mkl.h

## Description

The routine forms the *QR* factorization of a general *m*-by-*n* matrix *A* with column pivoting:  $A*P = Q*R$  (see [Orthogonal Factorizations](#)) using Level 3 BLAS. Here *P* denotes an *n*-by-*n* permutation matrix. Use this routine instead of [geqpf](#) for better performance.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of  $\min(m, n)$  *elementary reflectors*. Routines are provided to work with *Q* in this representation.

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>m</i>	The number of rows in the matrix <i>A</i> ( $m \geq 0$ ).
<i>n</i>	The number of columns in <i>A</i> ( $n \geq 0$ ).
<i>a</i>	Array <i>a</i> of size $\max(1, lda*n)$ for column major layout and $\max(1, lda*m)$ for row major layout contains the matrix <i>A</i> .
<i>lda</i>	The leading dimension of <i>a</i> ; at least $\max(1, m)$ for column major layout and $\max(1, n)$ for row major layout.
<i>jpvt</i>	Array, size at least $\max(1, n)$ .  On entry, if $jpvt[i - 1] \neq 0$ , the <i>i</i> -th column of <i>A</i> is moved to the beginning of <i>AP</i> before the computation, and fixed in place during the computation.  If $jpvt[i - 1] = 0$ , the <i>i</i> -th column of <i>A</i> is a free column (that is, it may be interchanged during the computation with any other free column).

## Output Parameters

<i>a</i>	Overwritten by the factorization data as follows:  The elements on and above the diagonal of the array contain the $\min(m, n)$ -by- <i>n</i> upper trapezoidal matrix <i>R</i> ( <i>R</i> is upper triangular if $m \geq n$ ); the elements below the diagonal, with the array <i>tau</i> , present the orthogonal matrix <i>Q</i> as a product of $\min(m, n)$ elementary reflectors (see <a href="#">Orthogonal Factorizations</a> ).
<i>tau</i>	Array, size at least $\max(1, \min(m, n))$ . Contains scalar factors of the elementary reflectors for the matrix <i>Q</i> .

`jpvt` Overwritten by details of the permutation matrix  $P$  in the factorization  $A^*P = Q^*R$ . More precisely, the columns of  $AP$  are the columns of  $A$  in the following order:  
`jpvt[0], jpvt[1], ..., jpvt[n - 1]`.

## Return Values

This function returns a value `info`.

If `info=0`, the execution is successful.

If `info = -i`, the  $i$ -th parameter had an illegal value.

## Application Notes

To solve a set of least squares problems minimizing  $\|A^*x - b\|_2$  for all columns  $b$  of a given matrix  $B$ , you can call the following:

<code>?geqp3</code> (this routine)	to factorize $A^*P = Q^*R$ ;
<code>ormqr</code>	to compute $C = Q^T*B$ (for real matrices);
<code>unmqr</code>	to compute $C = Q^H*B$ (for complex matrices);
<code>trsm</code> (a BLAS routine)	to solve $R*X = C$ .

(The columns of the computed  $X$  are the permuted least squares solution vectors  $x$ ; the output array `jpvt` specifies the permutation order.)

To compute the elements of  $Q$  explicitly, call

<code>orgqr</code>	(for real matrices)
<code>ungqr</code>	(for complex matrices).

## `?orgqr`

*Generates the real orthogonal matrix  $Q$  of the QR factorization formed by `?geqrf`.*

## Syntax

```

## Description

The routine generates the whole or part of  $m$ -by- $m$  orthogonal matrix  $Q$  of the QR factorization formed by the routine `?geqrf` or `geqpf`. Use this routine after a call to `sgeqrf/dgeqrf` or `sgeqpf/dgeqpf`.

Usually  $Q$  is determined from the  $QR$  factorization of an  $m$  by  $p$  matrix  $A$  with  $m \geq p$ . To compute the whole matrix  $Q$ , use:

```
LAPACKE_?orgqr(matrix_layout, m, m, p, a, lda, tau)
```

To compute the leading  $p$  columns of  $Q$  (which form an orthonormal basis in the space spanned by the columns of  $A$ ):

```
LAPACKE_?orgqr(matrix_layout, m, p, p, a, lda)
```

To compute the matrix  $Q^k$  of the  $QR$  factorization of leading  $k$  columns of the matrix  $A$ :

```
LAPACKE_?orgqr(matrix_layout, m, m, k, a, lda, tau)
```

To compute the leading  $k$  columns of  $Q^k$  (which form an orthonormal basis in the space spanned by leading  $k$  columns of the matrix  $A$ ):

```
LAPACKE_?orgqr(matrix_layout, m, k, k, a, lda, tau)
```

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>m</i>	The order of the orthogonal matrix $Q$ ( $m \geq 0$ ).
<i>n</i>	The number of columns of $Q$ to be computed ( $0 \leq n \leq m$ ).
<i>k</i>	The number of elementary reflectors whose product defines the matrix $Q$ ( $0 \leq k \leq n$ ).
<i>a, tau</i>	Arrays: <i>a</i> and <i>tau</i> are the arrays returned by <i>sgeqrf</i> / <i>dgeqrf</i> or <i>sgeqpf</i> / <i>dgeqpf</i> . The size of <i>a</i> is $\max(1, lda * n)$ for column major layout and $\max(1, lda * m)$ for row major layout . The size of <i>tau</i> must be at least $\max(1, k)$ .
<i>lda</i>	The leading dimension of <i>a</i> ; at least $\max(1, m)$ for column major layout and $\max(1, n)$ for row major layout.

## Output Parameters

<i>a</i>	Overwritten by $n$ leading columns of the $m$ -by- $m$ orthogonal matrix $Q$ .
----------	--

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

## Application Notes

The computed  $Q$  differs from an exactly orthogonal matrix by a matrix  $E$  such that

$\|E\|_2 = O(\epsilon) \|A\|_2$  where  $\epsilon$  is the machine precision.

The total number of floating-point operations is approximately  $4 * m * n * k - 2 * (m + n) * k^2 + (4/3) * k^3$ .

If  $n = k$ , the number is approximately  $(2/3) * n^2 * (3m - n)$ .

The complex counterpart of this routine is [ungqr](#).

### `?ormqr`

*Multiplies a real matrix by the orthogonal matrix  $Q$  of the QR factorization formed by `?geqrf` or `?geqpf`.*

### Syntax

```
lapack_int LAPACKE_sormqr (int matrix_layout, char side, char trans, lapack_int m,
lapack_int n, lapack_int k, const float* a, lapack_int lda, const float* tau, float* c,
lapack_int ldc);
```

```
lapack_int LAPACKE_dormqr (int matrix_layout, char side, char trans, lapack_int m,
lapack_int n, lapack_int k, const double* a, lapack_int lda, const double* tau, double*
c, lapack_int ldc);
```

### Include Files

- `mkl.h`

### Description

The routine multiplies a real matrix  $C$  by  $Q$  or  $Q^T$ , where  $Q$  is the orthogonal matrix  $Q$  of the QR factorization formed by the routine `?geqrf` or `?geqpf`.

Depending on the parameters `sideleft_right` and `trans`, the routine can form one of the matrix products  $Q^*C$ ,  $Q^T*C$ ,  $C*Q$ , or  $C*Q^T$  (overwriting the result on  $C$ ).

### Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major ( <code>LAPACK_ROW_MAJOR</code> ) or column major ( <code>LAPACK_COL_MAJOR</code> ).
<code>side</code>	Must be either 'L' or 'R'. If <code>side='L'</code> , $Q$ or $Q^T$ is applied to $C$ from the left. If <code>side='R'</code> , $Q$ or $Q^T$ is applied to $C$ from the right.
<code>trans</code>	Must be either 'N' or 'T'. If <code>trans='N'</code> , the routine multiplies $C$ by $Q$ . If <code>trans='T'</code> , the routine multiplies $C$ by $Q^T$ .
<code>m</code>	The number of rows in the matrix $C$ ( $m \geq 0$ ).
<code>n</code>	The number of columns in $C$ ( $n \geq 0$ ).
<code>k</code>	The number of elementary reflectors whose product defines the matrix $Q$ . Constraints: $0 \leq k \leq m$ if <code>side='L'</code> ; $0 \leq k \leq n$ if <code>side='R'</code> .
<code>a, tau, c</code>	Arrays: $a$ and $tau$ are the arrays returned by <code>sgeqrf / dgeqrf</code> or <code>sgeqpf / dgeqpf</code> .

The size of  $a$  is  $\max(1, lda*k)$  for column major layout,  $\max(1, lda*m)$  for row major layout and  $side = 'L'$ , and  $\max(1, lda*n)$  for row major layout and  $side = 'R'$ .

The size of  $tau$  must be at least  $\max(1, k)$ .

Array  $c$  of size  $\max(1, ldc*n)$  for column major layout and  $\max(1, ldc*m)$  for row major layout contains the  $m$ -by- $n$  matrix  $C$ .

$lda$

The leading dimension of  $a$ . Constraints:

if  $side = 'L'$ ,  $lda \geq \max(1, m)$  for column major layout and  $\max(1, k)$  for row major layout ;

if  $side = 'R'$ ,  $lda \geq \max(1, n)$  for column major layout and  $\max(1, k)$  for row major layout.

$ldc$

The leading dimension of  $c$ . Constraint:

$ldc \geq \max(1, m)$  for column major layout and  $\max(1, n)$  for row major layout.

## Output Parameters

$c$

Overwritten by the product  $Q*C$ ,  $Q^T*C$ ,  $C*Q$ , or  $C*Q^T$  (as specified by  $side$  and  $trans$ ).

## Return Values

This function returns a value  $info$ .

If  $info=0$ , the execution is successful.

If  $info = -i$ , the  $i$ -th parameter had an illegal value.

## Application Notes

The complex counterpart of this routine is [unmqr](#).

[?ungqr](#)

*Generates the complex unitary matrix  $Q$  of the QR factorization formed by [?geqrf](#).*

## Syntax

```
lapack_int LAPACKE_cungqr (int matrix_layout, lapack_int m, lapack_int n, lapack_int k,
lapack_complex_float* a, lapack_int lda, const lapack_complex_float* tau);
```

```
lapack_int LAPACKE_zungqr (int matrix_layout, lapack_int m, lapack_int n, lapack_int k,
lapack_complex_double* a, lapack_int lda, const lapack_complex_double* tau);
```

## Include Files

- `mk1.h`

## Description

The routine generates the whole or part of  $m$ -by- $m$  unitary matrix  $Q$  of the QR factorization formed by the routines [?geqrf](#) or [geqpf](#). Use this routine after a call to [cgeqrf/zgeqrf](#) or [cgeqpf/zgeqpf](#).

Usually  $Q$  is determined from the  $QR$  factorization of an  $m$  by  $p$  matrix  $A$  with  $m \geq p$ . To compute the whole matrix  $Q$ , use:

```
LAPACKE_?ungqr(matrix_layout, m, m, p, a, lda, tau)
```

To compute the leading  $p$  columns of  $Q$  (which form an orthonormal basis in the space spanned by the columns of  $A$ ):

```
LAPACKE_?ungqr(matrix_layout, m, p, p, a, lda, tau)
```

To compute the matrix  $Q^k$  of the  $QR$  factorization of the leading  $k$  columns of the matrix  $A$ :

```
LAPACKE_?ungqr(matrix_layout, m, m, k, a, lda, tau)
```

To compute the leading  $k$  columns of  $Q^k$  (which form an orthonormal basis in the space spanned by the leading  $k$  columns of the matrix  $A$ ):

```
LAPACKE_?ungqr(matrix_layout, m, k, k, a, lda, tau)
```

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>m</i>	The order of the unitary matrix $Q$ ( $m \geq 0$ ).
<i>n</i>	The number of columns of $Q$ to be computed ( $0 \leq n \leq m$ ).
<i>k</i>	The number of elementary reflectors whose product defines the matrix $Q$ ( $0 \leq k \leq n$ ).
<i>a, tau</i>	Arrays: <i>a</i> and <i>tau</i> are the arrays returned by <i>cgeqrf/zgeqrf</i> or <i>cgeqpf/zgeqpf</i> . The size of <i>a</i> is $\max(1, lda * n)$ for column major layout and $\max(1, lda * m)$ for row major layout . The size of <i>tau</i> must be at least $\max(1, k)$ .
<i>lda</i>	The leading dimension of <i>a</i> ; at least $\max(1, m)$ for column major layout and $\max(1, n)$ for row major layout.

## Output Parameters

*a*

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* = *-i*, the *i*-th parameter had an illegal value.

## Application Notes

The computed  $Q$  differs from an exactly unitary matrix by a matrix  $E$  such that  $\|E\|_2 = O(\varepsilon) * \|A\|_2$ , where  $\varepsilon$  is the machine precision.

The total number of floating-point operations is approximately  $16 * m * n * k - 8 * (m + n) * k^2 + (16/3) * k^3$ .

If  $n = k$ , the number is approximately  $(8/3) * n^2 * (3m - n)$ .

The real counterpart of this routine is [orgqr](#).

### ?unmqr

*Multiplies a complex matrix by the unitary matrix  $Q$  of the QR factorization formed by ?geqrf.*

### Syntax

```
lapack_int LAPACKE_cunmqr (int matrix_layout, char side, char trans, lapack_int m,
lapack_int n, lapack_int k, const lapack_complex_float* a, lapack_int lda, const
lapack_complex_float* tau, lapack_complex_float* c, lapack_int ldc);
```

```
lapack_int LAPACKE_zunmqr (int matrix_layout, char side, char trans, lapack_int m,
lapack_int n, lapack_int k, const lapack_complex_double* a, lapack_int lda, const
lapack_complex_double* tau, lapack_complex_double* c, lapack_int ldc);
```

### Include Files

- mkl.h

### Description

The routine multiplies a rectangular complex matrix  $C$  by  $Q$  or  $Q^H$ , where  $Q$  is the unitary matrix  $Q$  of the QR factorization formed by the routines [?geqrf](#) or [geqpf](#).

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products  $Q^*C$ ,  $Q^H*C$ ,  $C*Q$ , or  $C*Q^H$  (overwriting the result on  $C$ ).

### Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>side</i>	Must be either 'L' or 'R'. If <i>side</i> = 'L', $Q$ or $Q^H$ is applied to $C$ from the left. If <i>side</i> = 'R', $Q$ or $Q^H$ is applied to $C$ from the right.
<i>trans</i>	Must be either 'N' or 'C'. If <i>trans</i> = 'N', the routine multiplies $C$ by $Q$ . If <i>trans</i> = 'C', the routine multiplies $C$ by $Q^H$ .
<i>m</i>	The number of rows in the matrix $C$ ( $m \geq 0$ ).
<i>n</i>	The number of columns in $C$ ( $n \geq 0$ ).
<i>k</i>	The number of elementary reflectors whose product defines the matrix $Q$ . Constraints: $0 \leq k \leq m$ if <i>side</i> = 'L'; $0 \leq k \leq n$ if <i>side</i> = 'R'.
<i>a, c, tau</i>	Arrays:

$a$  size  $\max(1, lda*k)$  for column major layout,  $\max(1, lda*m)$  for row major layout when  $side = 'L'$ , and  $\max(1, lda*n)$  for row major layout when  $side = 'R'$  and  $tau$  are the arrays returned by `cgeqrf / zgeqrf` or `cgeqpf / zgeqpf`.

The size of  $tau$  must be at least  $\max(1, k)$ .

$c$  (size  $\max(1, ldc*n)$  for column major layout and  $\max(1, ldc*m$  for row major layout) contains the  $m$ -by- $n$  matrix  $C$ .

$lda$

The leading dimension of  $a$ . Constraints:

$lda \geq \max(1, m)$  for column major layout and  $lda \geq \max(1, k)$  for row major layout if  $side = 'L'$ ;

$lda \geq \max(1, n)$  for column major layout and  $lda \geq \max(1, k)$  for row major layout if  $side = 'R'$ .

$ldc$

The leading dimension of  $c$ . Constraint:

$ldc \geq \max(1, m)$  for column major layout and  $\max(1, n)$  for row major layout.

## Output Parameters

$c$

Overwritten by the product  $Q*C$ ,  $Q^H*C$ ,  $C*Q$ , or  $C*Q^H$  (as specified by  $side$  and  $trans$ ).

## Return Values

This function returns a value  $info$ .

If  $info=0$ , the execution is successful.

If  $info = -i$ , the  $i$ -th parameter had an illegal value.

## Application Notes

The real counterpart of this routine is [ormqr](#).

### ?gelqf

*Computes the LQ factorization of a general  $m$ -by- $n$  matrix.*

## Syntax

```
lapack_int LAPACKE_sgelqf (int matrix_layout, lapack_int m, lapack_int n, float* a,
lapack_int lda, float* tau);
```

```
lapack_int LAPACKE_dgelqf (int matrix_layout, lapack_int m, lapack_int n, double* a,
lapack_int lda, double* tau);
```

```
lapack_int LAPACKE_cgelqf (int matrix_layout, lapack_int m, lapack_int n,
lapack_complex_float* a, lapack_int lda, lapack_complex_float* tau);
```

```
lapack_int LAPACKE_zgelqf (int matrix_layout, lapack_int m, lapack_int n,
lapack_complex_double* a, lapack_int lda, lapack_complex_double* tau);
```

## Include Files

- `mk1.h`

## Description

The routine forms the  $LQ$  factorization of a general  $m$ -by- $n$  matrix  $A$  (see [Orthogonal Factorizations](#)). No pivoting is performed.

The routine does not form the matrix  $Q$  explicitly. Instead,  $Q$  is represented as a product of  $\min(m, n)$  *elementary reflectors*. Routines are provided to work with  $Q$  in this representation.

---

### NOTE

This routine supports the Progress Routine feature. See [Progress Function](#) for details.

---

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major ( <code>LAPACK_ROW_MAJOR</code> ) or column major ( <code>LAPACK_COL_MAJOR</code> ).
<i>m</i>	The number of rows in the matrix $A$ ( $m \geq 0$ ).
<i>n</i>	The number of columns in $A$ ( $n \geq 0$ ).
<i>a</i>	Array <i>a</i> of size $\max(1, lda * n)$ for column major layout and $\max(1, lda * m)$ for row major layout contains the matrix $A$ .
<i>lda</i>	The leading dimension of <i>a</i> ; at least $\max(1, m)$ for column major layout and $\max(1, n)$ for row major layout.

## Output Parameters

<i>a</i>	Overwritten by the factorization data as follows:  The elements on and below the diagonal of the array contain the $m$ -by- $\min(m, n)$ lower trapezoidal matrix $L$ ( $L$ is lower triangular if $m \leq n$ ); the elements above the diagonal, with the array <i>tau</i> , represent the orthogonal matrix $Q$ as a product of elementary reflectors.
<i>tau</i>	Array, size at least $\max(1, \min(m, n))$ .  Contains scalars that define elementary reflectors for the matrix $Q$ (see <a href="#">Orthogonal Factorizations</a> ).

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* =  $-i$ , the  $i$ -th parameter had an illegal value.

## Application Notes

The computed factorization is the exact factorization of a matrix  $A + E$ , where

$$\|E\|_2 = O(\epsilon) \|A\|_2.$$

The approximate number of floating-point operations for real flavors is

$$(4/3)n^3 \quad \text{if } m = n,$$

$(2/3)n^2(3m-n)$  if  $m > n$ ,

$(2/3)m^2(3n-m)$  if  $m < n$ .

The number of operations for complex flavors is 4 times greater.

To find the minimum-norm solution of an underdetermined least squares problem minimizing  $\|A^*x - b\|_2$  for all columns  $b$  of a given matrix  $B$ , you can call the following:

`?gelqf` (this routine) to factorize  $A = L^*Q$ ;  
`trsm` (a BLAS routine) to solve  $L^*Y = B$  for  $Y$ ;  
`ormlq` to compute  $X = (Q_1)^T * Y$  (for real matrices);  
`unmlq` to compute  $X = (Q_1)^H * Y$  (for complex matrices).

(The columns of the computed  $X$  are the minimum-norm solution vectors  $x$ . Here  $A$  is an  $m$ -by- $n$  matrix with  $m < n$ ;  $Q_1$  denotes the first  $m$  columns of  $Q$ ).

To compute the elements of  $Q$  explicitly, call

`orglq` (for real matrices)  
`unglq` (for complex matrices).

## Matrix Storage Schemes

### `?orglq`

*Generates the real orthogonal matrix  $Q$  of the  $LQ$  factorization formed by `?gelqf`.*

## Syntax

```
lapack_int LAPACKE_sorglq (int matrix_layout, lapack_int m, lapack_int n, lapack_int k,
float* a, lapack_int lda, const float* tau);
```

```
lapack_int LAPACKE_dorglq (int matrix_layout, lapack_int m, lapack_int n, lapack_int k,
double* a, lapack_int lda, const double* tau);
```

## Include Files

- `mkl.h`

## Description

The routine generates the whole or part of  $n$ -by- $n$  orthogonal matrix  $Q$  of the  $LQ$  factorization formed by the routines `gelqf`. Use this routine after a call to `sgelqf/dgelqf`.

Usually  $Q$  is determined from the  $LQ$  factorization of an  $p$ -by- $n$  matrix  $A$  with  $n \geq p$ . To compute the whole matrix  $Q$ , use:

```
info = LAPACKE_?orglq(matrix_layout, n, n, p, a, lda, tau)
```

To compute the leading  $p$  rows of  $Q$ , which form an orthonormal basis in the space spanned by the rows of  $A$ , use:

```
info = LAPACKE_?orglq(matrix_layout, p, n, p, a, lda, tau)
```

To compute the matrix  $Q^k$  of the LQ factorization of the leading  $k$  rows of  $A$ , use:

```
info = LAPACKE_?orglq(matrix_layout, n, n, k, a, lda, tau)
```

To compute the leading  $k$  rows of  $Q^k$ , which form an orthonormal basis in the space spanned by the leading  $k$  rows of  $A$ , use:

```
info = LAPACKE_?orgqr(matrix_layout, k, n, k, a, lda, tau)
```

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<code>m</code>	The number of rows of $Q$ to be computed ( $0 \leq m \leq n$ ).
<code>n</code>	The order of the orthogonal matrix $Q$ ( $n \geq m$ ).
<code>k</code>	The number of elementary reflectors whose product defines the matrix $Q$ ( $0 \leq k \leq m$ ).
<code>a, tau</code>	Arrays: $a$ (size $\max(1, lda * n)$ for column major layout and $\max(1, lda * m)$ for row major layout) and $tau$ are the arrays returned by <code>sgelqf/dgelqf</code> . The size of $tau$ must be at least $\max(1, k)$ .
<code>lda</code>	The leading dimension of $a$ ; at least $\max(1, m)$ for column major layout and $\max(1, n)$ for row major layout.

## Output Parameters

<code>a</code>	Overwritten by $m$ leading rows of the $n$ -by- $n$ orthogonal matrix $Q$ .
----------------	---

## Return Values

This function returns a value `info`.

If `info=0`, the execution is successful.

If `info = -i`, the  $i$ -th parameter had an illegal value.

## Application Notes

The computed  $Q$  differs from an exactly orthogonal matrix by a matrix  $E$  such that  $\|E\|_2 = O(\epsilon) * \|A\|_2$ , where  $\epsilon$  is the machine precision.

The total number of floating-point operations is approximately  $4 * m * n * k - 2 * (m + n) * k^2 + (4/3) * k^3$ .

If  $m = k$ , the number is approximately  $(2/3) * m^2 * (3n - m)$ .

The complex counterpart of this routine is [unglq](#).

### `?ormlq`

*Multiplies a real matrix by the orthogonal matrix  $Q$  of the LQ factorization formed by `?gelqf`.*

## Syntax

```
lapack_int LAPACKE_sormlq (int matrix_layout, char side, char trans, lapack_int m,
lapack_int n, lapack_int k, const float* a, lapack_int lda, const float* tau, float* c,
lapack_int ldc);
```

```
lapack_int LAPACKE_dormlq (int matrix_layout, char side, char trans, lapack_int m,
lapack_int n, lapack_int k, const double* a, lapack_int lda, const double* tau, double*
c, lapack_int ldc);
```

## Include Files

- `mkl.h`

## Description

The routine multiplies a real  $m$ -by- $n$  matrix  $C$  by  $Q$  or  $Q^T$ , where  $Q$  is the orthogonal matrix  $Q$  of the  $LQ$  factorization formed by the routine `gelqf`.

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products  $Q^*C$ ,  $Q^T*C$ ,  $C*Q$ , or  $C*Q^T$  (overwriting the result on  $C$ ).

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>side</i>	Must be either 'L' or 'R'. If <i>side</i> = 'L', $Q$ or $Q^T$ is applied to $C$ from the left. If <i>side</i> = 'R', $Q$ or $Q^T$ is applied to $C$ from the right.
<i>trans</i>	Must be either 'N' or 'T'. If <i>trans</i> = 'N', the routine multiplies $C$ by $Q$ . If <i>trans</i> = 'T', the routine multiplies $C$ by $Q^T$ .
<i>m</i>	The number of rows in the matrix $C$ ( $m \geq 0$ ).
<i>n</i>	The number of columns in $C$ ( $n \geq 0$ ).
<i>k</i>	The number of elementary reflectors whose product defines the matrix $Q$ . Constraints: $0 \leq k \leq m$ if <i>side</i> = 'L'; $0 \leq k \leq n$ if <i>side</i> = 'R'.
<i>a</i> , <i>c</i> , <i>tau</i>	Arrays: <i>a</i> and <i>tau</i> are arrays returned by <code>?gelqf</code> . The size of <i>a</i> must be: For <i>side</i> = 'L' and column major layout, $\max(1, lda*m)$ . For <i>side</i> = 'R' and column major layout, $\max(1, lda*n)$ . For row major layout regardless of <i>side</i> , $\max(1, lda*k)$ . The dimension of <i>tau</i> must be at least $\max(1, k)$ . <i>c</i> (size $\max(1, ldc*n)$ for column major layout and $\max(1, ldc*m)$ for row major layout) contains the $m$ -by- $n$ matrix $C$ .

<i>lda</i>	The leading dimension of <i>a</i> . For column major layout, $lda \geq \max(1, k)$ . For row major layout, if <i>side</i> = 'L', $lda \geq \max(1, m)$ , or, if <i>side</i> = 'R', $lda \geq \max(1, n)$ .
<i>ldc</i>	The leading dimension of <i>c</i> ; $ldc \geq \max(1, m)$ for column major layout and $\max(1, n)$ for row major layout.

## Output Parameters

<i>c</i>	Overwritten by the product $Q^*C$ , $Q^T * C$ , $C * Q$ , or $C * Q^T$ (as specified by <i>side</i> and <i>trans</i> ).
----------	---

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

## Application Notes

The complex counterpart of this routine is [unmlq](#).

### ?unglq

Generates the complex unitary matrix *Q* of the LQ factorization formed by [?gelqf](#).

## Syntax

```
lapack_int LAPACKE_cunglq (int matrix_layout, lapack_int m, lapack_int n, lapack_int k,
lapack_complex_float* a, lapack_int lda, const lapack_complex_float* tau);
```

```
lapack_int LAPACKE_zunglq (int matrix_layout, lapack_int m, lapack_int n, lapack_int k,
lapack_complex_double* a, lapack_int lda, const lapack_complex_double* tau);
```

## Include Files

- mkl.h

## Description

The routine generates the whole or part of *n*-by-*n* unitary matrix *Q* of the LQ factorization formed by the routines [gelqf](#). Use this routine after a call to [cgelqf/zgelqf](#).

Usually *Q* is determined from the LQ factorization of an *p*-by-*n* matrix *A* with  $n < p$ . To compute the whole matrix *Q*, use:

```
info = LAPACKE_?unglq(matrix_layout, n, n, p, a, lda, tau)
```

To compute the leading *p* rows of *Q*, which form an orthonormal basis in the space spanned by the rows of *A*, use:

```
info = LAPACKE_?unglq(matrix_layout, p, n, p, a, lda, tau)
```

To compute the matrix  $Q^k$  of the LQ factorization of the leading *k* rows of *A*, use:

```
info = LAPACKE_?unglq(matrix_layout, n, n, k, a, lda, tau)
```

To compute the leading  $k$  rows of  $Q^k$ , which form an orthonormal basis in the space spanned by the leading  $k$  rows of  $A$ , use:

```
info = LAPACKE_?ungqr(matrix_layout, k, n, k, a, lda, tau)
```

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>m</i>	The number of rows of $Q$ to be computed ( $0 \leq m \leq n$ ).
<i>n</i>	The order of the unitary matrix $Q$ ( $n \geq m$ ).
<i>k</i>	The number of elementary reflectors whose product defines the matrix $Q$ ( $0 \leq k \leq m$ ).
<i>a, tau</i>	Arrays: <i>a</i> (size $\max(1, lda * n)$ for column major layout and $\max(1, lda * m)$ for row major layout) and <i>tau</i> are the arrays returned by <i>cgelqf/zgelqf</i> . The dimension of <i>tau</i> must be at least $\max(1, k)$ .
<i>lda</i>	The leading dimension of <i>a</i> ; at least $\max(1, m)$ for column major layout and $\max(1, n)$ for row major layout.

## Output Parameters

<i>a</i>	Overwritten by $m$ leading rows of the $n$ -by- $n$ unitary matrix $Q$ .
----------	--

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* =  $-i$ , the  $i$ -th parameter had an illegal value.

## Application Notes

The computed  $Q$  differs from an exactly unitary matrix by a matrix  $E$  such that  $\|E\|_2 = O(\epsilon) * \|A\|_2$ , where  $\epsilon$  is the machine precision.

The total number of floating-point operations is approximately  $16 * m * n * k - 8 * (m + n) * k^2 + (16/3) * k^3$ .

If  $m = k$ , the number is approximately  $(8/3) * m^2 * (3n - m)$ .

The real counterpart of this routine is [orglq](#).

### ?unmlq

*Multiplies a complex matrix by the unitary matrix  $Q$  of the LQ factorization formed by ?gelqf.*

## Syntax

```
lapack_int LAPACKE_cunmlq (int matrix_layout, char side, char trans, lapack_int m,
lapack_int n, lapack_int k, const lapack_complex_float* a, lapack_int lda, const
lapack_complex_float* tau, lapack_complex_float* c, lapack_int ldc);
```

```
lapack_int LAPACKE_zunmlq (int matrix_layout, char side, char trans, lapack_int m,
lapack_int n, lapack_int k, const lapack_complex_double* a, lapack_int lda, const
lapack_complex_double* tau, lapack_complex_double* c, lapack_int ldc);
```

## Include Files

- `mkl.h`

## Description

The routine multiplies a real  $m$ -by- $n$  matrix  $C$  by  $Q$  or  $Q^H$ , where  $Q$  is the unitary matrix  $Q$  of the  $LQ$  factorization formed by the routine [gelqf](#).

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products  $Q^H C$ ,  $Q^H C$ ,  $C Q$ , or  $C Q^H$  (overwriting the result on  $C$ ).

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>side</i>	Must be either 'L' or 'R'. If <i>side</i> = 'L', $Q$ or $Q^H$ is applied to $C$ from the left. If <i>side</i> = 'R', $Q$ or $Q^H$ is applied to $C$ from the right.
<i>trans</i>	Must be either 'N' or 'C'. If <i>trans</i> = 'N', the routine multiplies $C$ by $Q$ . If <i>trans</i> = 'C', the routine multiplies $C$ by $Q^H$ .
<i>m</i>	The number of rows in the matrix $C$ ( $m \geq 0$ ).
<i>n</i>	The number of columns in $C$ ( $n \geq 0$ ).
<i>k</i>	The number of elementary reflectors whose product defines the matrix $Q$ . Constraints: $0 \leq k \leq m$ if <i>side</i> = 'L'; $0 \leq k \leq n$ if <i>side</i> = 'R'.
<i>a, c, tau</i>	Arrays: <i>a</i> and <i>tau</i> are arrays returned by <a href="#">?gelqf</a> . The size of <i>a</i> must be: For <i>side</i> = 'L' and column major layout, $\max(1, lda * m)$ . For <i>side</i> = 'R' and column major layout, $\max(1, lda * n)$ . For row major layout regardless of <i>side</i> , $\max(1, lda * k)$ . The size of <i>tau</i> must be at least $\max(1, k)$ . <i>c</i> (size $\max(1, ldc * n)$ for column major layout and $\max(1, ldc * m)$ for row major layout) contains the $m$ -by- $n$ matrix $C$ .
<i>lda</i>	The leading dimension of <i>a</i> . For column major layout, $lda \geq \max(1, k)$ . For row major layout, if <i>side</i> = 'L', $lda \geq \max(1, m)$ , or, if <i>side</i> = 'R', $lda \geq \max(1, n)$ .
<i>ldc</i>	The leading dimension of <i>c</i> ; $ldc \geq \max(1, m)$ for column major layout and $\max(1, n)$ for row major layout.

## Output Parameters

*c* Overwritten by the product  $Q^*C$ ,  $Q^H*C$ ,  $C*Q$ , or  $C*Q^H$  (as specified by *side* and *trans*).

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

## Application Notes

The real counterpart of this routine is [ormlq](#).

### ?geqlf

Computes the QL factorization of a general *m*-by-*n* matrix.

---

## Syntax

```
lapack_int LAPACKE_sgelqf (int matrix_layout, lapack_int m, lapack_int n, float* a,
lapack_int lda, float* tau);
```

```
lapack_int LAPACKE_dgelqf (int matrix_layout, lapack_int m, lapack_int n, double* a,
lapack_int lda, double* tau);
```

```
lapack_int LAPACKE_cgelqf (int matrix_layout, lapack_int m, lapack_int n,
lapack_complex_float* a, lapack_int lda, lapack_complex_float* tau);
```

```
lapack_int LAPACKE_zgelqf (int matrix_layout, lapack_int m, lapack_int n,
lapack_complex_double* a, lapack_int lda, lapack_complex_double* tau);
```

## Include Files

- mkl.h

## Description

The routine forms the QL factorization of a general *m*-by-*n* matrix *A* (see [Orthogonal Factorizations](#)). No pivoting is performed.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of  $\min(m, n)$  elementary reflectors. Routines are provided to work with *Q* in this representation.

---

### NOTE

This routine supports the Progress Routine feature. See [Progress Function](#) for details.

---

## Input Parameters

*matrix\_layout* Specifies whether matrix storage layout is row major (LAPACK\_ROW\_MAJOR) or column major (LAPACK\_COL\_MAJOR).

*m* The number of rows in the matrix *A* ( $m \geq 0$ ).

<i>n</i>	The number of columns in <i>A</i> ( $n \geq 0$ ).
<i>a</i>	Array <i>a</i> of size $\max(1, lda * n)$ for column major layout and $\max(1, lda * m)$ for row major layout contains the matrix <i>A</i> .
<i>lda</i>	The leading dimension of <i>a</i> ; at least $\max(1, m)$ for column major layout and $\max(1, n)$ for row major layout.

## Output Parameters

<i>a</i>	Overwritten on exit by the factorization data as follows: if $m \geq n$ , the lower triangle of the subarray $a(m-n+1:m, 1:n)$ contains the $n$ -by- $n$ lower triangular matrix <i>L</i> ; if $m \leq n$ , the elements on and below the $(n-m)$ -th superdiagonal contain the $m$ -by- $n$ lower trapezoidal matrix <i>L</i> ; in both cases, the remaining elements, with the array <i>tau</i> , represent the orthogonal/unitary matrix <i>Q</i> as a product of elementary reflectors.
<i>tau</i>	Array, size at least $\max(1, \min(m, n))$ . Contains scalar factors of the elementary reflectors for the matrix <i>Q</i> (see <a href="#">Orthogonal Factorizations</a> ).

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* =  $-i$ , the *i*-th parameter had an illegal value.

## Application Notes

Related routines include:

<a href="#">orgql</a>	to generate matrix <i>Q</i> (for real matrices);
<a href="#">ungql</a>	to generate matrix <i>Q</i> (for complex matrices);
<a href="#">ormql</a>	to apply matrix <i>Q</i> (for real matrices);
<a href="#">unmq</a>	to apply matrix <i>Q</i> (for complex matrices).

## Matrix Storage Schemes

### *?orgql*

*Generates the real matrix Q of the QL factorization formed by ?geqlf.*

## Syntax

```
lapack_int LAPACKE_sorgql (int matrix_layout, lapack_int m, lapack_int n, lapack_int k, float* a, lapack_int lda, const float* tau);
```

```
lapack_int LAPACKE_dorgql (int matrix_layout, lapack_int m, lapack_int n, lapack_int k, double* a, lapack_int lda, const double* tau);
```

## Include Files

- `mkl.h`

## Description

The routine generates an  $m$ -by- $n$  real matrix  $Q$  with orthonormal columns, which is defined as the last  $n$  columns of a product of  $k$  elementary reflectors  $H(i)$  of order  $m$ :  $Q = H(k) * \dots * H(2) * H(1)$  as returned by the routines [sgeqlf](#). Use this routine after a call to [sgeqlf/dgeqlf](#).

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major ( <code>LAPACK_ROW_MAJOR</code> ) or column major ( <code>LAPACK_COL_MAJOR</code> ).
<code>m</code>	The number of rows of the matrix $Q$ ( $m \geq 0$ ).
<code>n</code>	The number of columns of the matrix $Q$ ( $m \geq n \geq 0$ ).
<code>k</code>	The number of elementary reflectors whose product defines the matrix $Q$ ( $n \geq k \geq 0$ ).
<code>a, tau</code>	Arrays: $a$ (size $\max(1, lda*n)$ for column major layout and $\max(1, lda*m)$ for row major layout), $tau$ .  On entry, the $(n - k + i)$ th column of $a$ must contain the vector which defines the elementary reflector $H(i)$ , for $i = 1, 2, \dots, k$ , as returned by <a href="#">sgeqlf/dgeqlf</a> in the last $k$ columns of its array argument $a$ ; $tau[i - 1]$ must contain the scalar factor of the elementary reflector $H(i)$ , as returned by <a href="#">sgeqlf/dgeqlf</a> ;  The size of $tau$ must be at least $\max(1, k)$ .
<code>lda</code>	The leading dimension of $a$ ; at least $\max(1, m)$ for column major layout and $\max(1, n)$ for row major layout.

## Output Parameters

<code>a</code>	Overwritten by the last $n$ columns of the $m$ -by- $m$ orthogonal matrix $Q$ .
----------------	---

## Return Values

This function returns a value `info`.

If `info=0`, the execution is successful.

If `info = -i`, the  $i$ -th parameter had an illegal value.

## Application Notes

The complex counterpart of this routine is [ungql](#).

### `?ungql`

Generates the complex matrix  $Q$  of the  $QL$  factorization formed by [?geqlf](#).

## Syntax

```
lapack_int LAPACKE_cungql (int matrix_layout, lapack_int m, lapack_int n, lapack_int k,
lapack_complex_float* a, lapack_int lda, const lapack_complex_float* tau);
```

```
lapack_int LAPACKE_zungql (int matrix_layout, lapack_int m, lapack_int n, lapack_int k,
lapack_complex_double* a, lapack_int lda, const lapack_complex_double* tau);
```

## Include Files

- mkl.h

## Description

The routine generates an  $m$ -by- $n$  complex matrix  $Q$  with orthonormal columns, which is defined as the last  $n$  columns of a product of  $k$  elementary reflectors  $H(i)$  of order  $m$ :  $Q = H(k) * \dots * H(2) * H(1)$  as returned by the routines [geqlf/geqlf](#) . Use this routine after a call to [cgeqlf/zgeqlf](#).

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>m</i>	The number of rows of the matrix $Q$ ( $m \geq 0$ ).
<i>n</i>	The number of columns of the matrix $Q$ ( $m \geq n \geq 0$ ).
<i>k</i>	The number of elementary reflectors whose product defines the matrix $Q$ ( $n \geq k \geq 0$ ).
<i>a</i> , <i>tau</i>	Arrays: <i>a</i> (size $\max(1, lda * n)$ for column major layout and $\max(1, lda * m)$ for row major layout), <i>tau</i> .  On entry, the $(n - k + i)$ th column of <i>a</i> must contain the vector which defines the elementary reflector $H(i)$ , for $i = 1, 2, \dots, k$ , as returned by <a href="#">cgeqlf/zgeqlf</a> in the last $k$ columns of its array argument <i>a</i> ;  <i>tau</i> [ $i - 1$ ] must contain the scalar factor of the elementary reflector $H(i)$ , as returned by <a href="#">cgeqlf/zgeqlf</a> ;  The size of <i>tau</i> must be at least $\max(1, k)$ .
<i>lda</i>	The leading dimension of <i>a</i> ; at least $\max(1, m)$ for column major layout and $\max(1, n)$ for row major layout.

## Output Parameters

<i>a</i>	Overwritten by the last $n$ columns of the $m$ -by- $m$ unitary matrix $Q$ .
----------	--

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* =  $-i$ , the  $i$ -th parameter had an illegal value.

## Application Notes

The real counterpart of this routine is [orgql](#).

## `?ormql`

Multiplies a real matrix by the orthogonal matrix  $Q$  of the  $QL$  factorization formed by `?geqlf`.

### Syntax

```
lapack_int LAPACKE_sormql (int matrix_layout, char side, char trans, lapack_int m,
lapack_int n, lapack_int k, const float* a, lapack_int lda, const float* tau, float* c,
lapack_int ldc);
```

```
lapack_int LAPACKE_dormql (int matrix_layout, char side, char trans, lapack_int m,
lapack_int n, lapack_int k, const double* a, lapack_int lda, const double* tau, double*
c, lapack_int ldc);
```

### Include Files

- `mkl.h`

### Description

The routine multiplies a real  $m$ -by- $n$  matrix  $C$  by  $Q$  or  $Q^T$ , where  $Q$  is the orthogonal matrix  $Q$  of the  $QL$  factorization formed by the routine `geqlf`.

Depending on the parameters `side` and `trans`, the routine `ormql` can form one of the matrix products  $Q^T C$ ,  $C^T Q$ , or  $C^* Q^T$  (overwriting the result over  $C$ ).

### Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major ( <code>LAPACK_ROW_MAJOR</code> ) or column major ( <code>LAPACK_COL_MAJOR</code> ).
<code>side</code>	Must be either 'L' or 'R'. If <code>side = 'L'</code> , $Q$ or $Q^T$ is applied to $C$ from the left. If <code>side = 'R'</code> , $Q$ or $Q^T$ is applied to $C$ from the right.
<code>trans</code>	Must be either 'N' or 'T'. If <code>trans = 'N'</code> , the routine multiplies $C$ by $Q$ . If <code>trans = 'T'</code> , the routine multiplies $C$ by $Q^T$ .
<code>m</code>	The number of rows in the matrix $C$ ( $m \geq 0$ ).
<code>n</code>	The number of columns in $C$ ( $n \geq 0$ ).
<code>k</code>	The number of elementary reflectors whose product defines the matrix $Q$ . Constraints: $0 \leq k \leq m$ if <code>side = 'L'</code> ; $0 \leq k \leq n$ if <code>side = 'R'</code> .
<code>a, tau, c</code>	Arrays: <code>a</code> , <code>tau</code> , <code>c</code> . The size of <code>a</code> must be: For column major layout regardless of <code>side</code> , $\max(1, lda * k)$ . For <code>side = 'L'</code> and row major layout, $\max(1, lda * m)$ . For <code>side = 'R'</code> and row major layout, $\max(1, lda * n)$ .

On entry, the  $i$ th column of  $a$  must contain the vector which defines the elementary reflector  $H_i$ , for  $i = 1, 2, \dots, k$ , as returned by `sgeqlf/dgeqlf` in the last  $k$  columns of its array argument  $a$ .

$\tau[i - 1]$  must contain the scalar factor of the elementary reflector  $H_i$ , as returned by `sgeqlf/dgeqlf`.

The size of  $\tau$  must be at least  $\max(1, k)$ .

$c$  (size  $\max(1, ldc*n)$  for column major layout and  $\max(1, ldc*m)$  for row major layout) contains the  $m$ -by- $n$  matrix  $C$ .

*lda*

The leading dimension of  $a$ ;

if  $side = 'L'$ ,  $lda \geq \max(1, m)$  for column major layout and  $\max(1, k)$  for row major layout ;

if  $side = 'R'$ ,  $lda \geq \max(1, n)$  for column major layout and  $\max(1, k)$  for row major layout.

*ldc*

The leading dimension of  $c$ ;  $ldc \geq \max(1, m)$  for column major layout and  $\max(1, n)$  for row major layout.

## Output Parameters

*c*

Overwritten by the product  $Q^*C$ ,  $Q^T C$ ,  $C^*Q$ , or  $C^*Q^T$  (as specified by  $side$  and  $trans$ ).

## Return Values

This function returns a value *info*.

If  $info=0$ , the execution is successful.

If  $info = -i$ , the  $i$ -th parameter had an illegal value.

## Application Notes

The complex counterpart of this routine is [unmql](#).

*?unmql*

*Multiplies a complex matrix by the unitary matrix Q of the QL factorization formed by ?geqlf.*

## Syntax

```
lapack_int LAPACKE_cunmql (int matrix_layout, char side, char trans, lapack_int m,
lapack_int n, lapack_int k, const lapack_complex_float* a, lapack_int lda, const
lapack_complex_float* tau, lapack_complex_float* c, lapack_int ldc);
```

```
lapack_int LAPACKE_zunmql (int matrix_layout, char side, char trans, lapack_int m,
lapack_int n, lapack_int k, const lapack_complex_double* a, lapack_int lda, const
lapack_complex_double* tau, lapack_complex_double* c, lapack_int ldc);
```

## Include Files

- `mkl.h`

## Description

The routine multiplies a complex  $m$ -by- $n$  matrix  $C$  by  $Q$  or  $Q^H$ , where  $Q$  is the unitary matrix  $Q$  of the  $QL$  factorization formed by the routine [geqlf](#).

Depending on the parameters *side* and *trans*, the routine [unmql](#) can form one of the matrix products  $Q^*C$ ,  $Q^H*C$ ,  $C*Q$ , or  $C*Q^H$  (overwriting the result over  $C$ ).

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major ( <code>LAPACK_ROW_MAJOR</code> ) or column major ( <code>LAPACK_COL_MAJOR</code> ).
<i>side</i>	Must be either 'L' or 'R'. If <i>side</i> = 'L', $Q$ or $Q^H$ is applied to $C$ from the left. If <i>side</i> = 'R', $Q$ or $Q^H$ is applied to $C$ from the right.
<i>trans</i>	Must be either 'N' or 'C'. If <i>trans</i> = 'N', the routine multiplies $C$ by $Q$ . If <i>trans</i> = 'C', the routine multiplies $C$ by $Q^H$ .
<i>m</i>	The number of rows in the matrix $C$ ( $m \geq 0$ ).
<i>n</i>	The number of columns in $C$ ( $n \geq 0$ ).
<i>k</i>	The number of elementary reflectors whose product defines the matrix $Q$ . Constraints: $0 \leq k \leq m$ if <i>side</i> = 'L'; $0 \leq k \leq n$ if <i>side</i> = 'R'.
<i>a, tau, c</i>	Arrays: <i>a, tau, c</i> . The size of <i>a</i> must be: For column major layout regardless of <i>side</i> , $\max(1, lda*k)$ . For <i>side</i> = 'L' and row major layout, $\max(1, lda*m)$ . For <i>side</i> = 'R' and row major layout, $\max(1, lda*n)$ . On entry, the $i$ -th column of <i>a</i> must contain the vector which defines the elementary reflector $H(i)$ , for $i = 1, 2, \dots, k$ , as returned by <a href="#">cgeqlf/zgeqlf</a> in the last $k$ columns of its array argument <i>a</i> . <i>tau</i> [ $i - 1$ ] must contain the scalar factor of the elementary reflector $H(i)$ , as returned by <a href="#">cgeqlf/zgeqlf</a> . The size of <i>tau</i> must be at least $\max(1, k)$ . <i>c</i> (size $\max(1, ldc*n)$ for column major layout and $\max(1, ldc*m)$ for row major layout) contains the $m$ -by- $n$ matrix $C$ .
<i>lda</i>	The leading dimension of <i>a</i> . If <i>side</i> = 'L', $lda \geq \max(1, m)$ for column major layout and $\max(1, k)$ for row major layout. If <i>side</i> = 'R', $lda \geq \max(1, n)$ for column major layout and $\max(1, k)$ for row major layout.

*ldc* The leading dimension of *c*;  $ldc \geq \max(1, m)$  for column major layout and  $\max(1, n)$  for row major layout.

## Output Parameters

*c* Overwritten by the product  $Q^*C$ ,  $Q^H*C$ ,  $C*Q$ , or  $C*Q^H$  (as specified by *side* and *trans*).

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* = *-i*, the *i*-th parameter had an illegal value.

## Application Notes

The real counterpart of this routine is [ormql](#).

### ?gerqf

Computes the RQ factorization of a general *m*-by-*n* matrix.

---

## Syntax

```
lapack_int LAPACKE_sgerqf (int matrix_layout, lapack_int m, lapack_int n, float* a,
lapack_int lda, float* tau);
```

```
lapack_int LAPACKE_dgerqf (int matrix_layout, lapack_int m, lapack_int n, double* a,
lapack_int lda, double* tau);
```

```

## Description

The routine forms the RQ factorization of a general *m*-by-*n* matrix *A* (see [Orthogonal Factorizations](#)). No pivoting is performed.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of  $\min(m, n)$  *elementary reflectors*. Routines are provided to work with *Q* in this representation.

---

### NOTE

This routine supports the Progress Routine feature. See [Progress Function](#) for details.

---

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major ( <code>LAPACK_ROW_MAJOR</code> ) or column major ( <code>LAPACK_COL_MAJOR</code> ).
<i>m</i>	The number of rows in the matrix <i>A</i> ( $m \geq 0$ ).
<i>n</i>	The number of columns in <i>A</i> ( $n \geq 0$ ).
<i>a</i>	Array <i>a</i> of size $\max(1, lda * n)$ for column major layout and $\max(1, lda * m)$ for row major layout contains the <i>m</i> -by- <i>n</i> matrix <i>A</i> .
<i>lda</i>	The leading dimension of <i>a</i> ; at least $\max(1, m)$ for column major layout and $\max(1, n)$ for row major layout.

## Output Parameters

<i>a</i>	Overwritten on exit by the factorization data as follows: if $m \leq n$ , the upper triangle of the subarray <i>a</i> (1: <i>m</i> , <i>n</i> - <i>m</i> +1: <i>n</i> ) contains the <i>m</i> -by- <i>m</i> upper triangular matrix <i>R</i> ; if $m \geq n$ , the elements on and above the ( <i>m</i> - <i>n</i> )th subdiagonal contain the <i>m</i> -by- <i>n</i> upper trapezoidal matrix <i>R</i> ; in both cases, the remaining elements, with the array <i>tau</i> , represent the orthogonal/unitary matrix <i>Q</i> as a product of $\min(m, n)$ elementary reflectors.
<i>tau</i>	Array, size at least $\max(1, \min(m, n))$ . (See <a href="#">Orthogonal Factorizations</a> .) Contains scalar factors of the elementary reflectors for the matrix <i>Q</i> .

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

## Application Notes

Related routines include:

<code>orgqr</code>	to generate matrix <i>Q</i> (for real matrices);

```

## Include Files

- `mkl.h`

## Description

The routine generates an  $m$ -by- $n$  real matrix with orthonormal rows, which is defined as the last  $m$  rows of a product of  $k$  elementary reflectors  $H(i)$  of order  $n$ :  $Q = H(1) * H(2) * \dots * H(k)$  as returned by the routines `gerqf`. Use this routine after a call to `sgerqf/dgerqf`.

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major ( <code>LAPACK_ROW_MAJOR</code> ) or column major ( <code>LAPACK_COL_MAJOR</code> ).
<code>m</code>	The number of rows of the matrix $Q$ ( $m \geq 0$ ).
<code>n</code>	The number of columns of the matrix $Q$ ( $n \geq m$ ).
<code>k</code>	The number of elementary reflectors whose product defines the matrix $Q$ ( $m \geq k \geq 0$ ).
<code>a, tau</code>	Arrays: $a$ (size $\max(1, lda * n)$ for column major layout and $\max(1, lda * m)$ for row major layout), $tau$ . On entry, the $(m - k + i)$ -th row of $a$ must contain the vector which defines the elementary reflector $H(i)$ , for $i = 1, 2, \dots, k$ , as returned by <code>sgerqf/dgerqf</code> in the last $k$ rows of its array argument $a$ ; $tau[j - 1]$ must contain the scalar factor of the elementary reflector $H(i)$ , as returned by <code>sgerqf/dgerqf</code> ; The size of $tau$ must be at least $\max(1, k)$ .
<code>lda</code>	The leading dimension of $a$ ; at least $\max(1, m)$ for column major layout and $\max(1, n)$ for row major layout.

## Output Parameters

`a` Overwritten by the last  $m$  rows of the  $n$ -by- $n$  orthogonal matrix  $Q$ .

## Return Values

This function returns a value `info`.

If `info=0`, the execution is successful.

If `info = -i`, the  $i$ -th parameter had an illegal value.

## Application Notes

The complex counterpart of this routine is [ungrq](#).

*?ungrq*

Generates the complex matrix  $Q$  of the  $RQ$  factorization formed by *?gerqf*.

## Syntax

## Description

The routine generates an  $m$ -by- $n$  complex matrix with orthonormal rows, which is defined as the last  $m$  rows of a product of  $k$  elementary reflectors  $H(i)$  of order  $n$ :  $Q = H(1)^H * H(2)^H * \dots * H(k)^H$  as returned by the routines [gerqf](#). Use this routine after a call to [cgerqf/zgerqf](#).

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major ( <code>LAPACK_ROW_MAJOR</code> ) or column major ( <code>LAPACK_COL_MAJOR</code> ).
<i>m</i>	The number of rows of the matrix $Q$ ( $m \geq 0$ ).
<i>n</i>	The number of columns of the matrix $Q$ ( $n \geq m$ ).
<i>k</i>	The number of elementary reflectors whose product defines the matrix $Q$ ( $m \geq k \geq 0$ ).
<i>a, tau</i>	Arrays: $a$ (size $\max(1, lda * n)$ for column major layout and $\max(1, lda * m)$ for row major layout), $tau$ . On entry, the $(m - k + i)$ th row of $a$ must contain the vector which defines the elementary reflector $H(i)$ , for $i = 1, 2, \dots, k$ , as returned by <a href="#">cgerqf/zgerqf</a> in the last $k$ rows of its array argument $a$ ; $tau[i - 1]$ must contain the scalar factor of the elementary reflector $H(i)$ , as returned by <a href="#">cgerqf/zgerqf</a> ; The size of $tau$ must be at least $\max(1, k)$ .
<i>lda</i>	The leading dimension of $a$ ; at least $\max(1, m)$ for column major layout and $\max(1, n)$ for row major layout.

## Output Parameters

*a* Overwritten by the  $m$  last rows of the  $n$ -by- $n$  unitary matrix  $Q$ .

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* = *-i*, the *i*-th parameter had an illegal value.

## Application Notes

## Description

The routine multiplies a real *m*-by-*n* matrix *C* by *Q* or  $Q^T$ , where *Q* is the real orthogonal matrix defined as a product of *k* elementary reflectors  $H_i$ :  $Q = H_1 H_2 \dots H_k$  as returned by the RQ factorization routine [gerqf](#).

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products  $Q^*C$ ,  $Q^{T*}C$ ,  $C^*Q$ , or  $C^*Q^T$  (overwriting the result over *C*).

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>side</i>	Must be either 'L' or 'R'. If <i>side</i> = 'L', <i>Q</i> or $Q^T$ is applied to <i>C</i> from the left. If <i>side</i> = 'R', <i>Q</i> or $Q^T$ is applied to <i>C</i> from the right.
<i>trans</i>	Must be either 'N' or 'T'. If <i>trans</i> = 'N', the routine multiplies <i>C</i> by <i>Q</i> . If <i>trans</i> = 'T', the routine multiplies <i>C</i> by $Q^T$ .
<i>m</i>	The number of rows in the matrix <i>C</i> ( $m \geq 0$ ).
<i>n</i>	The number of columns in <i>C</i> ( $n \geq 0$ ).

<i>k</i>	The number of elementary reflectors whose product defines the matrix <i>Q</i> . Constraints: $0 \leq k \leq m$ , if <i>side</i> = 'L'; $0 \leq k \leq n$ , if <i>side</i> = 'R'.
<i>a</i> , <i>tau</i> , <i>c</i>	Arrays: <i>a</i> (size for <i>side</i> = 'L': $\max(1, lda * m)$ for column major layout and $\max(1, lda * k)$ for row major layout; for <i>side</i> = 'R': $\max(1, lda * n)$ for column major layout and $\max(1, lda * k)$ for row major layout), <i>tau</i> , <i>c</i> (size $\max(1, ldc * n)$ for column major layout and $\max(1, ldc * m)$ for row major layout).  On entry, the <i>i</i> th row of <i>a</i> must contain the vector which defines the elementary reflector $H_i$ , for $i = 1, 2, \dots, k$ , as returned by <i>sgerqf</i> / <i>dgerqf</i> in the last <i>k</i> rows of its array argument <i>a</i> .  <i>tau</i> [ <i>i</i> - 1] must contain the scalar factor of the elementary reflector $H_i$ , as returned by <i>sgerqf</i> / <i>dgerqf</i> .  The size of <i>tau</i> must be at least $\max(1, k)$ .  <i>c</i> contains the <i>m</i> -by- <i>n</i> matrix <i>C</i> .
<i>lda</i>	The leading dimension of <i>a</i> ; $lda \geq \max(1, k)$ for column major layout. For row major layout, $lda \geq \max(1, m)$ if <i>side</i> = 'L', and $lda \geq \max(1, n)$ if <i>side</i> = 'R'.
<i>ldc</i>	The leading dimension of <i>c</i> ; $ldc \geq \max(1, m)$ for column major layout and $\max(1, n)$ for row major layout.

## Output Parameters

<i>c</i>	Overwritten by the product $Q * C$ , $Q^T * C$ , $C * Q$ , or $C * Q^T$ (as specified by <i>side</i> and <i>trans</i> ).
----------	--

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

## Include Files

- `mk1.h`

## Description

The routine reduces the  $m$ -by- $n$  ( $m \leq n$ ) real/complex upper trapezoidal matrix  $A$  to upper triangular form by means of orthogonal/unitary transformations. The upper trapezoidal matrix  $A = [A1 \ A2] = [A_{1:m, 1:m}, A_{1:m, m+1:n}]$  is factored as

$$A = [R \ 0] * Z,$$

where  $Z$  is an  $n$ -by- $n$  orthogonal/unitary matrix,  $R$  is an  $m$ -by- $m$  upper triangular matrix, and  $0$  is the  $m$ -by- $(n-m)$  zero matrix.

The `?tzrzf` routine replaces the deprecated `?tzrqf` routine.

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major ( <code>LAPACK_ROW_MAJOR</code> ) or column major ( <code>LAPACK_COL_MAJOR</code> ).
<i>m</i>	The number of rows in the matrix <i>A</i> ( $m \geq 0$ ).
<i>n</i>	The number of columns in <i>A</i> ( $n \geq m$ ).
<i>a</i>	Array <i>a</i> is of size $\max(1, lda * n)$ for column major layout and $\max(1, lda * m)$ for row major layout.  The leading <i>m</i> -by- <i>n</i> upper trapezoidal part of the array <i>a</i> contains the matrix <i>A</i> to be factorized.
<i>lda</i>	The leading dimension of <i>a</i> ; at least $\max(1, m)$ for column major layout and $\max(1, n)$ for row major layout.

## Output Parameters

<i>a</i>	Overwritten on exit by the factorization data as follows:  the leading <i>m</i> -by- <i>m</i> upper triangular part of <i>a</i> contains the upper triangular matrix <i>R</i> , and elements <i>m</i> + 1 to <i>n</i> of the first <i>m</i> rows of <i>a</i> , with the array <i>tau</i> , represent the orthogonal matrix <i>Z</i> as a product of <i>m</i> elementary reflectors.
<i>tau</i>	Array, size at least $\max(1, m)$ . Contains scalar factors of the elementary reflectors for the matrix <i>Z</i> .

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

## Application Notes

The factorization is obtained by Householder's method. The *k*-th transformation matrix, *Z*(*k*), which is used to introduce zeros into the (*m* - *k* + 1)-th row of *A*, is given in the form

$$Z(k) = \begin{bmatrix} I & 0 \\ 0 & T(k) \end{bmatrix}$$

where for real flavors

$$T(k) = I - \tau u^* u(k) u(k)^T, \quad u(k) = \begin{bmatrix} 1 \\ 0 \\ z(k) \end{bmatrix}$$

and for complex flavors

$$T(k) = I - \tau u^* u(k) u(k)^H, \quad u(k) = \begin{bmatrix} 1 \\ 0 \\ z(k) \end{bmatrix}$$

$\tau$  is a scalar and  $z(k)$  is an  $l$ -element vector.  $\tau$  and  $z(k)$  are chosen to annihilate the elements of the  $k$ -th row of  $A_2$ .

The scalar  $\tau$  is returned in the  $k$ -th element of  $\tau$  and the vector  $u(k)$  in the  $k$ -th row of  $A$ , such that the elements of  $z(k)$  are stored in the last  $m - n$  elements of the  $k$ -th row of array  $a$ .

The elements of  $R$  are returned in the upper triangular part of  $A$ .

The matrix  $Z$  is given by

$$Z = Z(1) * Z(2) * \dots * Z(m).$$

## Description

The `?ormrz` routine multiplies a real  $m$ -by- $n$  matrix  $C$  by  $Q$  or  $Q^T$ , where  $Q$  is the real orthogonal matrix defined as a product of  $k$  elementary reflectors  $H(i)$  of order  $n$ :  $Q = H(1) * H(2) * \dots * H(k)$  as returned by the factorization routine `tzrzf`.

Depending on the parameters `side` and `trans`, the routine can form one of the matrix products  $Q * C$ ,  $Q^T * C$ ,  $C * Q$ , or  $C * Q^T$  (overwriting the result over  $C$ ).

The matrix  $Q$  is of order  $m$  if `side = 'L'` and of order  $n$  if `side = 'R'`.

The `?ormrz` routine replaces the deprecated `?latzm` routine.

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major ( <code>LAPACK_ROW_MAJOR</code> ) or column major ( <code>LAPACK_COL_MAJOR</code> ).
<code>side</code>	Must be either 'L' or 'R'. If <code>side = 'L'</code> , $Q$ or $Q^T$ is applied to $C$ from the left. If <code>side = 'R'</code> , $Q$ or $Q^T$ is applied to $C$ from the right.
<code>trans</code>	Must be either 'N' or 'T'. If <code>trans = 'N'</code> , the routine multiplies $C$ by $Q$ . If <code>trans = 'T'</code> , the routine multiplies $C$ by $Q^T$ .
<code>m</code>	The number of rows in the matrix $C$ ( $m \geq 0$ ).
<code>n</code>	The number of columns in $C$ ( $n \geq 0$ ).
<code>k</code>	The number of elementary reflectors whose product defines the matrix $Q$ . Constraints: $0 \leq k \leq m$ , if <code>side = 'L'</code> ; $0 \leq k \leq n$ , if <code>side = 'R'</code> .
<code>l</code>	The number of columns of the matrix $A$ containing the meaningful part of the Householder reflectors. Constraints: $0 \leq l \leq m$ , if <code>side = 'L'</code> ; $0 \leq l \leq n$ , if <code>side = 'R'</code> .
<code>a, tau, c</code>	Arrays: $a$ (size for <code>side = 'L'</code> : $\max(1, lda * m)$ for column major layout and $\max(1, lda * k)$ for row major layout; for <code>side = 'R'</code> : $\max(1, lda * b)$ for column major layout and $\max(1, lda * k)$ for row major layout), $tau$ , $c$ (size $\max(1, ldc * n)$ for column major layout and $\max(1, ldc * m)$ for row major layout). On entry, the $i$ th row of $a$ must contain the vector which defines the elementary reflector $H(i)$ , for $i = 1, 2, \dots, k$ , as returned by <code>stzrzf/dtzrzf</code> in the last $k$ rows of its array argument $a$ . $tau[i - 1]$ must contain the scalar factor of the elementary reflector $H(i)$ , as returned by <code>stzrzf/dtzrzf</code> . The size of $tau$ must be at least $\max(1, k)$ .

$c$  contains the  $m$ -by- $n$  matrix  $C$ .

$lda$  The leading dimension of  $a$ ;  $lda \geq \max(1, k)$  for column major layout. For row major layout,  $lda \geq \max(1, m)$  if  $side = 'L'$ , and  $lda \geq \max(1, n)$  if  $side = 'R'$ .

$ldc$  The leading dimension of  $c$ ;  $ldc \geq \max(1, m)$  for column major layout and  $\max(1, n)$  for row major layout.

## Output Parameters

$c$  Overwritten by the product  $Q^*C$ ,  $Q^T * C$ ,  $C^*Q$ , or  $C^*Q^T$  (as specified by  $side$  and  $trans$ ).

## Return Values

This function returns a value  $info$ .

If  $info=0$ , the execution is successful.

If  $info = -i$ , the  $i$ -th parameter had an illegal value.

## Description

The routine multiplies a complex  $m$ -by- $n$  matrix  $C$  by  $Q$  or  $Q^H$ , where  $Q$  is the unitary matrix defined as a product of  $k$  elementary reflectors  $H(i)$ :

$Q = H(1)^{H*} H(2)^{H*} \dots H(k)^H$  as returned by the factorization routine [tzrzf](#).

Depending on the parameters  $side$  and  $trans$ , the routine can form one of the matrix products  $Q^*C$ ,  $Q^H * C$ ,  $C^*Q$ , or  $C^*Q^H$  (overwriting the result over  $C$ ).

The matrix  $Q$  is of order  $m$  if  $side = 'L'$  and of order  $n$  if  $side = 'R'$ .

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major ( <code>LAPACK_ROW_MAJOR</code> ) or column major ( <code>LAPACK_COL_MAJOR</code> ).
<i>side</i>	Must be either 'L' or 'R'. If <i>side</i> = 'L', $Q$ or $Q^H$ is applied to $C$ from the left. If <i>side</i> = 'R', $Q$ or $Q^H$ is applied to $C$ from the right.
<i>trans</i>	Must be either 'N' or 'C'. If <i>trans</i> = 'N', the routine multiplies $C$ by $Q$ . If <i>trans</i> = 'C', the routine multiplies $C$ by $Q^H$ .
<i>m</i>	The number of rows in the matrix $C$ ( $m \geq 0$ ).
<i>n</i>	The number of columns in $C$ ( $n \geq 0$ ).
<i>k</i>	The number of elementary reflectors whose product defines the matrix $Q$ . Constraints: $0 \leq k \leq m$ , if <i>side</i> = 'L'; $0 \leq k \leq n$ , if <i>side</i> = 'R'.
<i>l</i>	The number of columns of the matrix $A$ containing the meaningful part of the Householder reflectors. Constraints: $0 \leq l \leq m$ , if <i>side</i> = 'L'; $0 \leq l \leq n$ , if <i>side</i> = 'R'.
<i>a, tau, c</i>	Arrays: $a$ (size for <i>side</i> = 'L': $\max(1, lda * m)$ for column major layout and $\max(1, lda * k)$ for row major layout; for <i>side</i> = 'R': $\max(1, lda * b)$ for column major layout and $\max(1, lda * k)$ for row major layout), $tau$ , $c$ (size $\max(1, ldc * n)$ for column major layout and $\max(1, ldc * m)$ for row major layout). On entry, the $i$ th row of $a$ must contain the vector which defines the elementary reflector $H(i)$ , for $i = 1, 2, \dots, k$ , as returned by <code>ctzrzf/ztzrzf</code> in the last $k$ rows of its array argument $a$ . $tau[i - 1]$ must contain the scalar factor of the elementary reflector $H(i)$ , as returned by <code>ctzrzf/ztzrzf</code> . The size of $tau$ must be at least $\max(1, k)$ . $c$ contains the $m$ -by- $n$ matrix $C$ .
<i>lda</i>	The leading dimension of $a$ ; $lda \geq \max(1, k)$ for column major layout. For row major layout, $lda \geq \max(1, m)$ if <i>side</i> = 'L', and $lda \geq \max(1, n)$ if <i>side</i> = 'R'.
<i>ldc</i>	The leading dimension of $c$ ; $ldc \geq \max(1, m)$ for column major layout and $\max(1, n)$ for row major layout.

$$R = \begin{matrix} & n & m - n \\ n & \begin{pmatrix} R_{11} & R_{12} \end{pmatrix} \end{matrix}, \quad \text{if } n < m$$

where  $R_{11}$  is upper triangular, and

$$T = \begin{matrix} & p - n & n \\ n & \begin{pmatrix} 0 & T_{12} \end{pmatrix} \end{matrix}, \quad \text{if } n \leq p,$$

$$T = \begin{matrix} & & p \\ n - p & \begin{pmatrix} T_{11} \\ T_{21} \end{pmatrix} \\ p & \end{matrix}, \quad \text{if } n > p,$$

where  $T_{12}$  or  $T_{21}$  is a  $p$ -by- $p$  upper triangular matrix.

In particular, if  $B$  is square and nonsingular, the  $GQR$  factorization of  $A$  and  $B$  implicitly gives the  $QR$  factorization of  $B^{-1}A$  as:

$$B^{-1}A = Z^T (T^{-1}R) \quad (\text{for real flavors}) \quad \text{or} \quad B^{-1}A = Z^{H*} (T^{-1}R) \quad (\text{for complex flavors}).$$

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major ( <code>LAPACK_ROW_MAJOR</code> ) or column major ( <code>LAPACK_COL_MAJOR</code> ).
<code>n</code>	The number of rows of the matrices $A$ and $B$ ( $n \geq 0$ ).
<code>m</code>	The number of columns in $A$ ( $m \geq 0$ ).
<code>p</code>	The number of columns in $B$ ( $p \geq 0$ ).
<code>a, b</code>	Array $a$ of size $\max(1, lda*m)$ for column major layout and $\max(1, lda*n)$ for row major layout contains the matrix $A$ . Array $b$ of size $\max(1, ldb*p)$ for column major layout and $\max(1, ldb*n)$ for row major layout contains the matrix $B$ .
<code>lda</code>	The leading dimension of $a$ ; at least $\max(1, n)$ for column major layout and at least $\max(1, m)$ for row major layout.
<code>ldb</code>	The leading dimension of $b$ ; at least $\max(1, n)$ for column major layout and at least $\max(1, p)$ for row major layout.

## Output Parameters

*a, b*

Overwritten by the factorization data as follows:

on exit, the elements on and above the diagonal of the array *a* contain the  $\min(n,m)$ -by-*m* upper trapezoidal matrix *R* (*R* is upper triangular if  $n \geq m$ ); the elements below the diagonal, with the array *taua*, represent the orthogonal/unitary matrix *Q* as a product of  $\min(n,m)$  elementary reflectors ;

if  $n \leq p$ , the upper triangle of the subarray *b*(1:*n*, *p*-*n*+1:*p* ) contains the *n*-by-*n* upper triangular matrix *T*;

if  $n > p$ , the elements on and above the (*n*-*p*)th subdiagonal contain the *n*-by-*p* upper trapezoidal matrix *T*; the remaining elements, with the array *taub*, represent the orthogonal/unitary matrix *Z* as a product of elementary reflectors.

*taua, taub*

Arrays, size at least  $\max(1, \min(n, m))$  for *taua* and at least  $\max(1, \min(n, p))$  for *taub*. The array *taua* contains the scalar factors of the elementary reflectors which represent the orthogonal/unitary matrix *Q*.

The array *taub* contains the scalar factors of the elementary reflectors which represent the orthogonal/unitary matrix *Z*.

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

## Application Notes

The matrix *Q* is represented as a product of elementary reflectors

$$Q = H(1)H(2) \dots H(k), \text{ where } k = \min(n, m).$$

Each *H*(*i*) has the form

$$H(i) = I - \tau_a * v * v^T \text{ for real flavors, or}$$

$$H(i) = I - \tau_a * v * v^H \text{ for complex flavors,}$$

where  $\tau_a$  is a real/complex scalar, and *v* is a real/complex vector with  $v_j = 0$  for  $1 \leq j \leq i - 1$ ,  $v_i = 1$ .

On exit, for  $i + 1 \leq j \leq n$ ,  $v_j$  is stored in  $a[(j - 1) + (i - 1) * lda]$  for column major layout and in  $a[(j - 1) * lda + (i - 1)]$  for row major layout and  $\tau_a$  is stored in  $taua[i - 1]$

The matrix *Z* is represented as a product of elementary reflectors

$$Z = H(1)H(2) \dots H(k), \text{ where } k = \min(n, p).$$

Each *H*(*i*) has the form

$$H(i) = I - \tau_b * v * v^T \text{ for real flavors, or}$$

$$H(i) = I - \tau_b * v * v^H \text{ for complex flavors,}$$

where  $\tau_b$  is a real/complex scalar, and *v* is a real/complex vector with  $v_{p-k+1} = 1$ ,  $v_j = 0$  for  $p - k + 1 \leq j \leq p - 1$ .

On exit, for  $1 \leq j \leq p - k + i - 1$ ,  $v_j$  is stored in  $b[(n - k + i - 1) + (j - 1) * ldb]$  for column major layout and in  $b[(n - k + i - 1) * ldb + (j - 1)]$  for row major layout and  $\tau_b$  is stored in  $taub[i - 1]$ .

## *?ggrqf*

Computes the generalized RQ factorization of two matrices.

### Syntax

```
lapack_int LAPACKE_sggrqf (int matrix_layout, lapack_int m, lapack_int p, lapack_int n,
float* a, lapack_int lda, float* taua, float* b, lapack_int ldb, float* taub);
```

```
lapack_int LAPACKE_dggrqf (int matrix_layout, lapack_int m, lapack_int p, lapack_int n,

### Description

The routine forms the generalized RQ factorization of an  $m$ -by- $n$  matrix  $A$  and an  $p$ -by- $n$  matrix  $B$  as  $A = R^*Q$ ,  $B = Z^*T^*Q$ , where  $Q$  is an  $n$ -by- $n$  orthogonal/unitary matrix,  $Z$  is a  $p$ -by- $p$  orthogonal/unitary matrix, and  $R$  and  $T$  assume one of the forms:

$$R = \begin{matrix} n - m & m \\ m & \end{matrix} \begin{pmatrix} 0 & R_{12} \end{pmatrix}, \quad \text{if } m \leq n,$$

or

$$R = \begin{matrix} m - n & n \\ n & \end{matrix} \begin{pmatrix} R_{11} \\ R_{21} \end{pmatrix}, \quad \text{if } m > n,$$

where  $R_{11}$  or  $R_{21}$  is upper triangular, and

$$T = \begin{matrix} & & n \\ & n & \\ p - n & \begin{pmatrix} T_{11} \\ 0 \end{pmatrix} & \end{matrix}, \quad \text{if } p \geq n,$$

or

$$T = \begin{matrix} & p & n - p \\ p & \begin{pmatrix} T_{11} & T_{12} \end{pmatrix} & \end{matrix}, \quad \text{if } p < n,$$

where  $T_{11}$  is upper triangular.

In particular, if  $B$  is square and nonsingular, the  $GRQ$  factorization of  $A$  and  $B$  implicitly gives the  $RQ$  factorization of  $A*B^{-1}$  as:

$$A*B^{-1} = (R*T^{-1})*Z^T \text{ (for real flavors) or } A*B^{-1} = (R*T^{-1})*Z^H \text{ (for complex flavors).}$$

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major ( <code>LAPACK_ROW_MAJOR</code> ) or column major ( <code>LAPACK_COL_MAJOR</code> ).
<code>m</code>	The number of rows of the matrix $A$ ( $m \geq 0$ ).
<code>p</code>	The number of rows in $B$ ( $p \geq 0$ ).
<code>n</code>	The number of columns of the matrices $A$ and $B$ ( $n \geq 0$ ).
<code>a, b</code>	Arrays: $a$ (size $\max(1, lda*n)$ for column major layout and $\max(1, lda*m)$ for row major layout) contains the $m$ -by- $n$ matrix $A$ . $b$ (size $\max(1, ldb*n)$ for column major layout and $\max(1, ldb*p)$ for row major layout) contains the $p$ -by- $n$ matrix $B$ .
<code>lda</code>	The leading dimension of $a$ ; at least $\max(1, m)$ for column major layout and $\max(1, n)$ for row major layout.
<code>ldb</code>	The leading dimension of $b$ ; at least $\max(1, p)$ for column major layout and $\max(1, n)$ for row major layout.

## Output Parameters

<code>a, b</code>	Overwritten by the factorization data as follows: on exit, if $m \leq n$ , element $R_{ij}$ ( $1 \leq i \leq j \leq m$ ) of upper triangular matrix $R$ is stored in $a[(i - 1) + (n - m + j - 1)*lda]$ for column major layout and in $a[(i - 1)*lda + (n - m + j - 1)]$ for row major layout.
-------------------	--

if  $m > n$ , the elements on and above the  $(m-n)$ th subdiagonal contain the  $m$ -by- $n$  upper trapezoidal matrix  $R$ ;

the remaining elements, with the array  $taua$ , represent the orthogonal/unitary matrix  $Q$  as a product of elementary reflectors.

The elements on and above the diagonal of the array  $b$  contain the  $\min(p,n)$ -by- $n$  upper trapezoidal matrix  $T$  ( $T$  is upper triangular if  $p \geq n$ ); the elements below the diagonal, with the array  $taub$ , represent the orthogonal/unitary matrix  $Z$  as a product of elementary reflectors.

$taua, taub$

Arrays, size at least  $\max(1, \min(m, n))$  for  $taua$  and at least  $\max(1, \min(p, n))$  for  $taub$ .

The array  $taua$  contains the scalar factors of the elementary reflectors which represent the orthogonal/unitary matrix  $Q$ .

The array  $taub$  contains the scalar factors of the elementary reflectors which represent the orthogonal/unitary matrix  $Z$ .

## Return Values

This function returns a value  $info$ .

If  $info=0$ , the execution is successful.

If  $info = -i$ , the  $i$ -th parameter had an illegal value.

## Application Notes

The matrix  $Q$  is represented as a product of elementary reflectors

$$Q = H(1)H(2) \dots H(k), \text{ where } k = \min(m, n).$$

Each  $H(i)$  has the form

$$H(i) = I - taua * v * v^T \text{ for real flavors, or}$$

$$H(i) = I - taua * v * v^H \text{ for complex flavors,}$$

where  $taua$  is a real/complex scalar, and  $v$  is a real/complex vector with  $v_{n-k+i} = 1$ ,  $v_{n-k+i+1:n} = 0$ .

On exit,  $v_{1:n-k+i-1}$  is stored in  $a(m-k+i, 1:n-k+i-1)$  and  $taua$  is stored in  $taua[i-1]$ .

The matrix  $Z$  is represented as a product of elementary reflectors

$$Z = H(1)H(2) \dots H(k), \text{ where } k = \min(p, n).$$

Each  $H(i)$  has the form

$$H(i) = I - taub * v * v^T \text{ for real flavors, or}$$

$$H(i) = I - taub * v * v^H \text{ for complex flavors,}$$

where  $taub$  is a real/complex scalar, and  $v$  is a real/complex vector with  $v_{1:i-1} = 0$ ,  $v_i = 1$ .

On exit,  $v_{i+1:p}$  is stored in  $b(i+1:p, i)$  and  $taub$  is stored in  $taub[i-1]$ .

## ?tpqrt

*Computes a blocked QR factorization of a real or complex "triangular-pentagonal" matrix, which is composed of a triangular block and a pentagonal block, using the compact WY representation for  $Q$ .*

## Syntax

```
lapack_int LAPACKE_stpqrt (int matrix_layout, lapack_int m, lapack_int n, lapack_int l,
lapack_int nb, float* a, lapack_int lda, float* b, lapack_int ldb, float* t, lapack_int
ldt);
```

```
lapack_int LAPACKE_dtpqrt (int matrix_layout, lapack_int m, lapack_int n, lapack_int l,
lapack_int nb, double* a, lapack_int lda, double* b, lapack_int ldb, double* t,
lapack_int ldt);
```

```
lapack_int LAPACKE_ctpqrt (int matrix_layout, lapack_int m, lapack_int n, lapack_int l,
lapack_int nb, lapack_complex_float* a, lapack_int lda, lapack_complex_float* b,
lapack_int ldb, lapack_complex_float* t, lapack_int ldt);
```

```
lapack_int LAPACKE_ztpqrt (int matrix_layout, lapack_int m, lapack_int n, lapack_int l,
lapack_int nb, lapack_complex_double* a, lapack_int lda, lapack_complex_double* b,
lapack_int ldb, lapack_complex_double* t, lapack_int ldt);
```

## Include Files

- mkl.h

## Description

The input matrix  $C$  is an  $(n+m)$ -by- $n$  matrix

$$C = \begin{bmatrix} A \\ B \end{bmatrix} \leftarrow \begin{array}{l} n \times n \text{ upper triangular} \\ m \times n \text{ pentagonal} \end{array}$$

where  $A$  is an  $n$ -by- $n$  upper triangular matrix, and  $B$  is an  $m$ -by- $n$  pentagonal matrix consisting of an  $(m-1)$ -by- $n$  rectangular matrix  $B1$  on top of an  $l$ -by- $n$  upper trapezoidal matrix  $B2$ :

$$B = \begin{bmatrix} B1 \\ B2 \end{bmatrix} \leftarrow \begin{array}{l} (m-l) \times n \text{ rectangular} \\ l \times n \text{ upper trapezoidal} \end{array}$$

The upper trapezoidal matrix  $B2$  consists of the first  $l$  rows of an  $n$ -by- $n$  upper triangular matrix, where  $0 \leq l \leq \min(m, n)$ . If  $l=0$ ,  $B$  is an  $m$ -by- $n$  rectangular matrix. If  $m=l=n$ ,  $B$  is upper triangular. The elementary reflectors  $H(i)$  are stored in the  $i$ th column below the diagonal in the  $(n+m)$ -by- $n$  input matrix  $C$ . The structure of vectors defining the elementary reflectors is illustrated by:

$$\begin{bmatrix} I \\ V \end{bmatrix} \leftarrow \begin{matrix} n \times n \text{ identity} \\ m \times n \text{ pentagonal} \end{matrix}$$

The elements of the unit matrix  $I$  are not stored. Thus,  $V$  contains all of the necessary information, and is returned in array  $b$ .

**NOTE**

Note that  $V$  has the same form as  $B$ :

$$V = \begin{bmatrix} V1 \\ V2 \end{bmatrix} \leftarrow \begin{matrix} (m-l) \times n \text{ rectangular} \\ l \times n \text{ upper trapezoidal} \end{matrix}$$

The columns of  $V$  represent the vectors which define the  $H(i)$ s.

The number of blocks is  $k = \text{ceiling}(n/nb)$ , where each block is of order  $nb$  except for the last block, which is of order  $ib = n - (k-1)*nb$ . For each of the  $k$  blocks, an upper triangular block reflector factor is computed:  $T1, T2, \dots, Tk$ . The  $nb$ -by- $nb$  ( $ib$ -by- $ib$  for the last block)  $T$ s are stored in the  $nb$ -by- $n$  array  $t$  as

$$t = [T1T2 \dots Tk] .$$

**Input Parameters**

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>m</i>	The total number of rows in the matrix $B$ ( $m \geq 0$ ).
<i>n</i>	The number of columns in $B$ and the order of the triangular matrix $A$ ( $n \geq 0$ ).
<i>l</i>	The number of rows of the upper trapezoidal part of $B$ ( $\min(m, n) \geq l \geq 0$ ).
<i>nb</i>	The block size to use in the blocked $QR$ factorization ( $n \geq nb \geq 1$ ).
<i>a, b</i>	Arrays: <i>a</i> size $lda*n$ contains the $n$ -by- $n$ upper triangular matrix $A$ . <i>b</i> size $\max(1, ldb*n)$ for column major layout and $\max(1, ldb*m)$ for row major layout, the pentagonal $m$ -by- $n$ matrix $B$ . The first $(m-1)$ rows contain the rectangular $B1$ matrix, and the next $l$ rows contain the upper trapezoidal $B2$ matrix.
<i>lda</i>	The leading dimension of <i>a</i> ; at least $\max(1, n)$ .

<i>ldb</i>	The leading dimension of <i>b</i> ; at least $\max(1, m)$ for column major layout and at least $\max(1, n)$ for row major layout.
<i>ldt</i>	The leading dimension of <i>t</i> ; at least <i>nb</i> for column major layout and at least $\max(1, n)$ for row major layout.

## Output Parameters

<i>a</i>	The elements on and above the diagonal of the array contain the upper triangular matrix <i>R</i> .
<i>b</i>	The pentagonal matrix <i>V</i> .
<i>t</i>	Array, size <i>ldt</i> * <i>n</i> for column major layout and <i>ldt</i> * <i>nb</i> for row major layout.  The upper triangular block reflectors stored in compact form as a sequence of upper triangular blocks.

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

### ?tpmqrt

*Applies a real or complex orthogonal matrix obtained from a "triangular-pentagonal" complex block reflector to a general real or complex matrix, which consists of two blocks.*

## Syntax

```
lapack_int LAPACKE_stpmqrt (int matrix_layout, char side, char trans, lapack_int m,
lapack_int n, lapack_int k, lapack_int l, lapack_int nb, const float* v, lapack_int ldv,
const float* t, lapack_int ldt, float* a, lapack_int lda, float* b, lapack_int ldb);
```

```
lapack_int LAPACKE_dtpmqrt (int matrix_layout, char side, char trans, lapack_int m,
lapack_int n, lapack_int k, lapack_int l, lapack_int nb, const double* v, lapack_int
ldv, const double* t, lapack_int ldt, double* a, lapack_int lda, double* b, lapack_int
ldb);
```

```
lapack_int LAPACKE_ctpmqrt (int matrix_layout, char side, char trans, lapack_int m,
lapack_int n, lapack_int k, lapack_int l, lapack_int nb, const lapack_complex_float* v,
lapack_int ldv, const lapack_complex_float* t, lapack_int ldt, lapack_complex_float* a,
lapack_int lda, lapack_complex_float* b, lapack_int ldb);
```

```

v, lapack_int ldv, const lapack_complex_double* t, lapack_int ldt,
lapack_complex_double* a, lapack_int lda, lapack_complex_double* b, lapack_int ldb);
```

## Include Files

- mkl.h

## Description

The columns of the pentagonal matrix  $V$  contain the elementary reflectors  $H(1), H(2), \dots, H(k)$ ;  $V$  is composed of a rectangular block  $V1$  and a trapezoidal block  $V2$ :

$$V = \begin{bmatrix} V1 \\ V2 \end{bmatrix}$$

The size of the trapezoidal block  $V2$  is determined by the parameter  $l$ , where  $0 \leq l \leq k$ .  $V2$  is upper trapezoidal, consisting of the first  $l$  rows of a  $k$ -by- $k$  upper triangular matrix.

If  $l=k$ ,  $V2$  is upper triangular;

If  $l=0$ , there is no trapezoidal block, so  $V = V1$  is rectangular.

If  $side = 'L'$ :

$$C = \begin{bmatrix} A \\ B \end{bmatrix}$$

where  $A$  is  $k$ -by- $n$ ,  $B$  is  $m$ -by- $n$  and  $V$  is  $m$ -by- $k$ .

If  $side = 'R'$ :

$$C = \begin{bmatrix} A & B \end{bmatrix}$$

where  $A$  is  $m$ -by- $k$ ,  $B$  is  $m$ -by- $n$  and  $V$  is  $n$ -by- $k$ .

The real/complex orthogonal matrix  $Q$  is formed from  $V$  and  $T$ .

If  $trans='N'$  and  $side='L'$ ,  $C$  contains  $Q * C$  on exit.

If  $trans='T'$  and  $side='L'$ ,  $C$  contains  $Q^T * C$  on exit.

If  $trans='C'$  and  $side='L'$ ,  $C$  contains  $Q^H * C$  on exit.

If  $trans='N'$  and  $side='R'$ ,  $C$  contains  $C * Q$  on exit.

If  $trans='T'$  and  $side='R'$ ,  $C$  contains  $C * Q^T$  on exit.

If  $trans='C'$  and  $side='R'$ ,  $C$  contains  $C * Q^H$  on exit.

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>side</i>	= 'L': apply $Q$ , $Q^T$ , or $Q^H$ from the left. = 'R': apply $Q$ , $Q^T$ , or $Q^H$ from the right.
<i>trans</i>	= 'N', no transpose, apply $Q$ . = 'T', transpose, apply $Q^T$ . = 'C', transpose, apply $Q^H$ .
<i>m</i>	The number of rows in the matrix $B$ , ( $m \geq 0$ ).
<i>n</i>	The number of columns in the matrix $B$ , ( $n \geq 0$ ).
<i>k</i>	The number of elementary reflectors whose product defines the matrix $Q$ , ( $k \geq 0$ ).
<i>l</i>	The order of the trapezoidal part of $V$ ( $k \geq l \geq 0$ ).
<i>nb</i>	The block size used for the storage of $t$ , $k \geq nb \geq 1$ . This must be the same value of $nb$ used to generate $t$ in <code>tpqrt</code> .
<i>v</i>	Size $ldv*k$ for column major layout; $ldv*m$ for row major layout and $side = 'L'$ , $ldv*n$ for row major layout and $side = 'R'$ .  The $i$ th column must contain the vector which defines the elementary reflector $H(i)$ , for $i = 1, 2, \dots, k$ , as returned by <code>tpqrt</code> in array argument $b$ .
<i>ldv</i>	The leading dimension of the array $v$ .  If $side = 'L'$ , $ldv$ must be at least $\max(1, m)$ for column major layout and $\max(1, k)$ for row major layout;  If $side = 'R'$ , $ldv$ must be at least $\max(1, n)$ for column major layout and $\max(1, k)$ for row major layout.
<i>t</i>	Array, size $ldt*k$ for column major layout and $ldt*nb$ for row major layout.  The upper triangular factors of the block reflectors as returned by <code>tpqrt</code>
<i>ldt</i>	The leading dimension of the array $t$ . $ldt$ must be at least $nb$ for column major layout and $\max(1, k)$ for row major layout.
<i>a</i>	If $side = 'L'$ , size $lda*n$ for column major layout and $lda*k$ for row major layout ..  If $side = 'R'$ , size $lda*k$ for column major layout and $lda*m$ for row major layout ..  The $k$ -by- $n$ or $m$ -by- $k$ matrix $A$ .
<i>lda</i>	The leading dimension of the array $a$ .

If  $side = 'L'$ ,  $lda$  must be at least  $\max(1, k)$  for column major layout and  $\max(1, n)$  for row major layout.

If  $side = 'R'$ ,  $lda$  must be at least  $\max(1, m)$  for column major layout and  $\max(1, k)$  for row major layout.

$b$  Size  $ldb*n$  for column major layout and  $ldb*m$  for row major layout.

The  $m$ -by- $n$  matrix  $B$ .

$ldb$  The leading dimension of the array  $b$ .  $ldb$  must be at least  $\max(1, m)$  for column major layout and  $\max(1, n)$  for row major layout.

## Output Parameters

$a$  Overwritten by the corresponding block of the product  $Q*C$ ,  $C*Q$ ,  $Q^T*C$ ,  $C*Q^T$ ,  $Q^H*C$ , or  $C*Q^H$ .

$b$  Overwritten by the corresponding block of the product  $Q*C$ ,  $C*Q$ ,  $Q^T*C$ ,  $C*Q^T$ ,  $Q^H*C$ , or  $C*Q^H$ .

## Return Values

This function returns a value  $info$ .

If  $info=0$ , the execution is successful.

If  $info = -i$ , the  $i$ -th parameter had an illegal value.

## Singular Value Decomposition: LAPACK Computational Routines

This topic describes LAPACK routines for computing the *singular value decomposition* (SVD) of a general  $m$ -by- $n$  matrix  $A$ :

$$A = U\Sigma V^H.$$

In this decomposition,  $U$  and  $V$  are unitary (for complex  $A$ ) or orthogonal (for real  $A$ );  $\Sigma$  is an  $m$ -by- $n$  diagonal matrix with real diagonal elements  $\sigma_i$ :

$$\sigma_1 \geq \sigma_2 \geq \dots \geq \sigma_{\min(m, n)} \geq 0.$$

The diagonal elements  $\sigma_i$  are *singular values* of  $A$ . The first  $\min(m, n)$  columns of the matrices  $U$  and  $V$  are, respectively, *left* and *right singular vectors* of  $A$ . The singular values and singular vectors satisfy

$$AV_i = \sigma_i u_i \text{ and } A^H u_i = \sigma_i v_i$$

where  $u_i$  and  $v_i$  are the  $i$ -th columns of  $U$  and  $V$ , respectively.

To find the SVD of a general matrix  $A$ , call the LAPACK routine `?gebrd` or `?gbbbrd` for reducing  $A$  to a bidiagonal matrix  $B$  by a unitary (orthogonal) transformation:  $A = QBP^H$ . Then call `?bdsqr`, which forms the SVD of a bidiagonal matrix:  $B = U_1 \Sigma V_1^H$ .

Thus, the sought-for SVD of  $A$  is given by  $A = U\Sigma V^H = (QU_1)\Sigma(V_1^H P^H)$ .

Table "Computational Routines for Singular Value Decomposition (SVD)" lists LAPACK routines that perform singular value decomposition of matrices.

## Computational Routines for Singular Value Decomposition (SVD)

Operation	Real matrices	Complex matrices
Reduce $A$ to a bidiagonal matrix $B$ : $A = QBP^H$ (full storage)	<code>?gebrd</code>	<code>?gebrd</code>

Operation	Real matrices	Complex matrices
Reduce $A$ to a bidiagonal matrix $B$ : $A = QBP^H$ (band storage)	?gbbird	?gbbrd
Generate the orthogonal (unitary) matrix $Q$ or $P$	?orgbr	?ungbr
Apply the orthogonal (unitary) matrix $Q$ or $P$	?ormbr	?unmbr
Form singular value decomposition of the bidiagonal matrix $B$ : $B = U\Sigma V^H$	?bdsqr ?bdsdc	?bdsqr

**Decision Tree: Singular Value Decomposition**

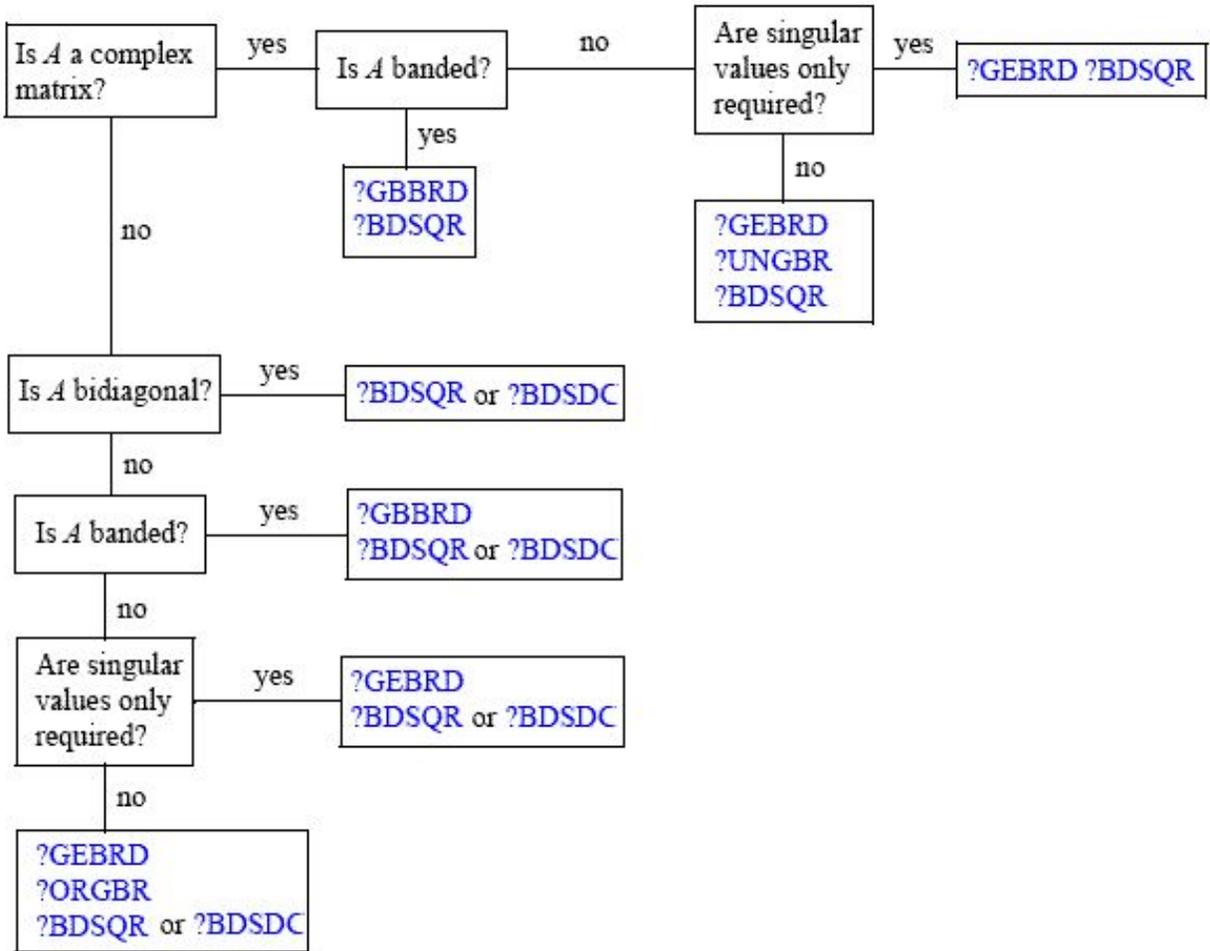

Figure "Decision Tree: Singular Value Decomposition" presents a decision tree that helps you choose the right sequence of routines for SVD, depending on whether you need singular values only or singular vectors as well, whether  $A$  is real or complex, and so on.

You can use the SVD to find a minimum-norm solution to a (possibly) rank-deficient least squares problem of minimizing  $\|Ax - b\|^2$ . The effective rank  $k$  of the matrix  $A$  can be determined as the number of singular values which exceed a suitable threshold. The minimum-norm solution is

$$x = V_k(\Sigma_k)^{-1}c$$

where  $\Sigma_k$  is the leading  $k$ -by- $k$  submatrix of  $\Sigma$ , the matrix  $V_k$  consists of the first  $k$  columns of  $V = PV_1$ , and the vector  $c$  consists of the first  $k$  elements of  $U^H b = U_1^H Q^H b$ .

## ?gebrd

Reduces a general matrix to bidiagonal form.

### Syntax

```
lapack_int LAPACKE_sgebrd( int matrix_layout, lapack_int m, lapack_int n, float* a,
lapack_int lda, float* d, float* e, float* tauq, float* taup );
```

```
lapack_int LAPACKE_dgebrd( int matrix_layout, lapack_int m, lapack_int n, double* a,
lapack_int lda, double* d, double* e, double* tauq, double* taup );
```

```
lapack_int LAPACKE_cgebrd( int matrix_layout, lapack_int m, lapack_int n,
lapack_complex_float* a, lapack_int lda, float* d, float* e, lapack_complex_float*
tauq, lapack_complex_float* taup );
```

```
lapack_int LAPACKE_zgebrd( int matrix_layout, lapack_int m, lapack_int n,
lapack_complex_double* a, lapack_int lda, double* d, double* e, lapack_complex_double*
tauq, lapack_complex_double* taup );
```

### Include Files

- mkl.h

### Description

The routine reduces a general  $m$ -by- $n$  matrix  $A$  to a bidiagonal matrix  $B$  by an orthogonal (unitary) transformation.

If  $m \geq n$ , the reduction is given by  $A = QBP^H = \begin{pmatrix} B_1 \\ 0 \end{pmatrix} P^H = Q_1 B_1 P^H$ ,

where  $B_1$  is an  $n$ -by- $n$  upper diagonal matrix,  $Q$  and  $P$  are orthogonal or, for a complex  $A$ , unitary matrices;  $Q_1$  consists of the first  $n$  columns of  $Q$ .

If  $m < n$ , the reduction is given by

$$A = Q^* B^* P^H = Q^* (B_1 \ 0) P^H = Q_1^* B_1^* P_1^H,$$

where  $B_1$  is an  $m$ -by- $m$  lower diagonal matrix,  $Q$  and  $P$  are orthogonal or, for a complex  $A$ , unitary matrices;  $P_1$  consists of the first  $m$  columns of  $P$ .

The routine does not form the matrices  $Q$  and  $P$  explicitly, but represents them as products of elementary reflectors. Routines are provided to work with the matrices  $Q$  and  $P$  in this representation:

If the matrix  $A$  is real,

- to compute  $Q$  and  $P$  explicitly, call [orgbr](#).
- to multiply a general matrix by  $Q$  or  $P$ , call [ormbr](#).

If the matrix  $A$  is complex,

- to compute  $Q$  and  $P$  explicitly, call [ungbr](#).
- to multiply a general matrix by  $Q$  or  $P$ , call [unmbr](#).

### Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>m</i>	The number of rows in the matrix $A$ ( $m \geq 0$ ).
<i>n</i>	The number of columns in $A$ ( $n \geq 0$ ).

<i>a</i>	Arrays: <i>a</i> (size $\max(1, lda*n)$ for column major layout and $\max(1, lda*m)$ for row major layout) contains the matrix <i>A</i> .
<i>lda</i>	The leading dimension of <i>a</i> ; at least $\max(1, m)$ for column major layout and at least $\max(1, n)$ for row major layout.

## Output Parameters

<i>a</i>	<p>If <math>m \geq n</math>, the diagonal and first super-diagonal of <i>a</i> are overwritten by the upper bidiagonal matrix <i>B</i>. The elements below the diagonal, with the array <i>tauq</i>, represent the orthogonal matrix <i>Q</i> as a product of elementary reflectors, and the elements above the first superdiagonal, with the array <i>taup</i>, represent the orthogonal matrix <i>P</i> as a product of elementary reflectors.</p> <p>If <math>m &lt; n</math>, the diagonal and first sub-diagonal of <i>a</i> are overwritten by the lower bidiagonal matrix <i>B</i>. The elements below the first subdiagonal, with the array <i>tauq</i>, represent the orthogonal matrix <i>Q</i> as a product of elementary reflectors, and the elements above the diagonal, with the array <i>taup</i>, represent the orthogonal matrix <i>P</i> as a product of elementary reflectors.</p>
<i>d</i>	<p>Array, size at least <math>\max(1, \min(m, n))</math>.</p> <p>Contains the diagonal elements of <i>B</i>.</p>
<i>e</i>	<p>Array, size at least <math>\max(1, \min(m, n) - 1)</math>. Contains the off-diagonal elements of <i>B</i>.</p>
<i>tauq, taup</i>	<p>Arrays, size at least <math>\max(1, \min(m, n))</math>. The scalar factors of the elementary reflectors which represent the orthogonal or unitary matrices <i>P</i> and <i>Q</i>.</p>

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

## Application Notes

The computed matrices *Q*, *B*, and *P* satisfy  $QB P^H = A + E$ , where  $\|E\|_2 = c(n)\varepsilon \|A\|_2$ ,  $c(n)$  is a modestly increasing function of  $n$ , and  $\varepsilon$  is the machine precision.

The approximate number of floating-point operations for real flavors is

$$(4/3) * n^2 * (3 * m - n) \text{ for } m \geq n,$$

$$(4/3) * m^2 * (3 * n - m) \text{ for } m < n.$$

The number of operations for complex flavors is four times greater.

If  $n$  is much less than  $m$ , it can be more efficient to first form the *QR* factorization of *A* by calling [geqrf](#) and then reduce the factor *R* to bidiagonal form. This requires approximately  $2 * n^2 * (m + n)$  floating-point operations.

If  $m$  is much less than  $n$ , it can be more efficient to first form the  $LQ$  factorization of  $A$  by calling `gelqf` and then reduce the factor  $L$  to bidiagonal form. This requires approximately  $2*m^2*(m + n)$  floating-point operations.

### `?gbbbrd`

Reduces a general band matrix to bidiagonal form.

### Syntax

```
lapack_int LAPACKE_sgbbrd( int matrix_layout, char vect, lapack_int m, lapack_int n,
lapack_int ncc, lapack_int kl, lapack_int ku, float* ab, lapack_int ldab, float* d,
float* e, float* q, lapack_int ldq, float* pt, lapack_int ldpt, float* c, lapack_int
ldc );
```

```
lapack_int LAPACKE_dgbbrd( int matrix_layout, char vect, lapack_int m, lapack_int n,
lapack_int ncc, lapack_int kl, lapack_int ku, double* ab, lapack_int ldab, double* d,
double* e, double* q, lapack_int ldq, double* pt, lapack_int ldpt, double* c, lapack_int
ldc );
```

```
lapack_int LAPACKE_cgbbrd( int matrix_layout, char vect, lapack_int m, lapack_int n,
lapack_int ncc, lapack_int kl, lapack_int ku, lapack_complex_float* ab, lapack_int
ldab, float* d, float* e, lapack_complex_float* q, lapack_int ldq,
lapack_complex_float* pt, lapack_int ldpt, lapack_complex_float* c, lapack_int ldc );
```

```
lapack_int LAPACKE_zgbbrd( int matrix_layout, char vect, lapack_int m, lapack_int n,
lapack_int ncc, lapack_int kl, lapack_int ku, lapack_complex_double* ab, lapack_int
ldab, double* d, double* e, lapack_complex_double* q, lapack_int ldq,
lapack_complex_double* pt, lapack_int ldpt, lapack_complex_double* c, lapack_int ldc );
```

### Include Files

- `mkl.h`

### Description

The routine reduces an  $m$ -by- $n$  band matrix  $A$  to upper bidiagonal matrix  $B$ :  $A = Q*B*P^H$ . Here the matrices  $Q$  and  $P$  are orthogonal (for real  $A$ ) or unitary (for complex  $A$ ). They are determined as products of Givens rotation matrices, and may be formed explicitly by the routine if required. The routine can also update a matrix  $C$  as follows:  $C = Q^H*C$ .

### Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major ( <code>LAPACK_ROW_MAJOR</code> ) or column major ( <code>LAPACK_COL_MAJOR</code> ).
<code>vect</code>	Must be 'N' or 'Q' or 'P' or 'B'. If <code>vect = 'N'</code> , neither $Q$ nor $P^H$ is generated. If <code>vect = 'Q'</code> , the routine generates the matrix $Q$ . If <code>vect = 'P'</code> , the routine generates the matrix $P^H$ . If <code>vect = 'B'</code> , the routine generates both $Q$ and $P^H$ .
<code>m</code>	The number of rows in the matrix $A$ ( $m \geq 0$ ).
<code>n</code>	The number of columns in $A$ ( $n \geq 0$ ).

<i>ncc</i>	The number of columns in $C$ ( $ncc \geq 0$ ).
<i>kl</i>	The number of sub-diagonals within the band of $A$ ( $kl \geq 0$ ).
<i>ku</i>	The number of super-diagonals within the band of $A$ ( $ku \geq 0$ ).
<i>ab, c</i>	Arrays: $ab$ (size $\max(1, ldab * n)$ for column major layout and $\max(1, ldab * m)$ for row major layout) contains the matrix $A$ in band storage (see <a href="#">Matrix Storage Schemes</a> ). $c$ (size $\max(1, ldc * ncc)$ for column major layout and $\max(1, ldc * m)$ for row major layout) contains an $m$ -by- $ncc$ matrix $C$ . If $ncc = 0$ , the array $c$ is not referenced.
<i>ldab</i>	The leading dimension of the array $ab$ ( $ldab \geq kl + ku + 1$ ).
<i>ldq</i>	The leading dimension of the output array $q$ . $ldq \geq \max(1, m)$ if $vect = 'Q'$ or $'B'$ , $ldq \geq 1$ otherwise.
<i>ldpt</i>	The leading dimension of the output array $pt$ . $ldpt \geq \max(1, n)$ if $vect = 'P'$ or $'B'$ , $ldpt \geq 1$ otherwise.
<i>ldc</i>	The leading dimension of the array $c$ . $ldc \geq \max(1, m)$ if $ncc > 0$ ; $ldc \geq 1$ if $ncc = 0$ .

## Output Parameters

<i>ab</i>	Overwritten by values generated during the reduction.
<i>d</i>	Array, size at least $\max(1, \min(m, n))$ . Contains the diagonal elements of the matrix $B$ .
<i>e</i>	Array, size at least $\max(1, \min(m, n) - 1)$ . Contains the off-diagonal elements of $B$ .
<i>q, pt</i>	Arrays: $q$ size $\max(1, ldq * m)$ contains the output $m$ -by- $m$ matrix $Q$ . $pt$ size $\max(1, ldpt * n)$ contains the output $n$ -by- $n$ matrix $P^T$ .
<i>c</i>	Overwritten by the product $Q^H * C$ . $c$ is not referenced if $ncc = 0$ .

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* =  $-i$ , the  $i$ -th parameter had an illegal value.

## Application Notes

The computed matrices  $Q$ ,  $B$ , and  $P$  satisfy  $Q * B * P^H = A + E$ , where  $\|E\|_2 = c(n)\varepsilon \|A\|_2$ ,  $c(n)$  is a modestly increasing function of  $n$ , and  $\varepsilon$  is the machine precision.

If  $m = n$ , the total number of floating-point operations for real flavors is approximately the sum of:

$6*n^2*(kl + ku)$  if  $vect = 'N'$  and  $ncc = 0$ ,

$3*n^2*ncc*(kl + ku - 1)/(kl + ku)$  if  $C$  is updated, and

$3*n^3*(kl + ku - 1)/(kl + ku)$  if either  $Q$  or  $P^H$  is generated (double this if both).

To estimate the number of operations for complex flavors, use the same formulas with the coefficients 20 and 10 (instead of 6 and 3).

`?orgbr`

Generates the real orthogonal matrix  $Q$  or  $P^T$  determined by `?gebrd`.

## Syntax

```
lapack_int LAPACKE_sorgbr (int matrix_layout, char vect, lapack_int m, lapack_int n,
lapack_int k, float* a, lapack_int lda, const float* tau);
```

```
lapack_int LAPACKE_dorgbr (int matrix_layout, char vect, lapack_int m, lapack_int n,
lapack_int k, double* a, lapack_int lda, const double* tau);
```

## Include Files

- `mkl.h`

## Description

The routine generates the whole or part of the orthogonal matrices  $Q$  and  $P^T$  formed by the routines `gebrd`. Use this routine after a call to `sgebrd/dgebrd`. All valid combinations of arguments are described in *Input parameters*. In most cases you need the following:

To compute the whole  $m$ -by- $m$  matrix  $Q$ :

```
LAPACKE_?orgbr(matrix_layout, 'Q', m, m, n, a, lda, tau )
```

(note that the array  $a$  must have at least  $m$  columns).

To form the  $n$  leading columns of  $Q$  if  $m > n$ :

```
LAPACKE_?orgbr(matrix_layout, 'Q', m, n, n, a, lda, tau )
```

To compute the whole  $n$ -by- $n$  matrix  $P^T$ :

```
LAPACKE_?orgbr(matrix_layout, 'P', n, n, m, a, lda, tau )
```

(note that the array  $a$  must have at least  $n$  rows).

To form the  $m$  leading rows of  $P^T$  if  $m < n$ :

```
LAPACKE_?orgbr(matrix_layout, 'P', m, n, m, a, lda, tau )
```

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major ( <code>LAPACK_ROW_MAJOR</code> ) or column major ( <code>LAPACK_COL_MAJOR</code> ).
<code>vect</code>	Must be 'Q' or 'P'. If <code>vect = 'Q'</code> , the routine generates the matrix $Q$ . If <code>vect = 'P'</code> , the routine generates the matrix $P^T$ .

$m, n$	The number of rows ( $m$ ) and columns ( $n$ ) in the matrix $Q$ or $P^T$ to be returned ( $m \geq 0, n \geq 0$ ). If $vect = 'Q', m \geq n \geq \min(m, k)$ . If $vect = 'P', n \geq m \geq \min(n, k)$ .
$k$	If $vect = 'Q'$ , the number of columns in the original $m$ -by- $k$ matrix reduced by <code>gebrd</code> . If $vect = 'P'$ , the number of rows in the original $k$ -by- $n$ matrix reduced by <code>gebrd</code> .
$a$	Array, size at least $lda*n$ for column major layout and $lda*m$ for row major layout. The vectors which define the elementary reflectors, as returned by <code>gebrd</code> .
$lda$	The leading dimension of the array $a$ . $lda \geq \max(1, m)$ for column major layout and at least $\max(1, n)$ for row major layout .
$tau$	Array, size $\min(m, k)$ if $vect = 'Q'$ , $\min(n, k)$ if $vect = 'P'$ . Scalar factor of the elementary reflector $H(i)$ or $G(i)$ , which determines $Q$ and $P^T$ as returned by <code>gebrd</code> in the array $tauq$ or $taup$ .

## Output Parameters

$a$	Overwritten by the orthogonal matrix $Q$ or $P^T$ (or the leading rows or columns thereof) as specified by $vect, m,$ and $n$ .
-----	---

## Return Values

This function returns a value  $info$ .

If  $info=0$ , the execution is successful.

If  $info = -i$ , the  $i$ -th parameter had an illegal value.

## Application Notes

The computed matrix  $Q$  differs from an exactly orthogonal matrix by a matrix  $E$  such that  $\|E\|_2 = O(\epsilon)$ .

The approximate numbers of floating-point operations for the cases listed in *Description* are as follows:

To form the whole of  $Q$ :

$$(4/3) * n * (3m^2 - 3m * n + n^2) \text{ if } m > n;$$

$$(4/3) * m^3 \text{ if } m \leq n.$$

To form the  $n$  leading columns of  $Q$  when  $m > n$ :

$$(2/3) * n^2 * (3m - n) \text{ if } m > n.$$

To form the whole of  $P^T$ :

$$(4/3) * n^3 \text{ if } m \geq n;$$

$$(4/3) * m * (3n^2 - 3m * n + m^2) \text{ if } m < n.$$

To form the  $m$  leading columns of  $P^T$  when  $m < n$ :

$$(2/3) * n^2 * (3m - n) \text{ if } m > n.$$

The complex counterpart of this routine is `ungbr`.

*?ormbr*

Multiplies an arbitrary real matrix by the real orthogonal matrix  $Q$  or  $P^T$  determined by *?gebrd*.

## Syntax

```
lapack_int LAPACKE_sormbr (int matrix_layout, char vect, char side, char trans,
lapack_int m, lapack_int n, lapack_int k, const float* a, lapack_int lda, const float*
tau, float* c, lapack_int ldc);
```

```
lapack_int LAPACKE_dormbr (int matrix_layout, char vect, char side, char trans,
lapack_int m, lapack_int n, lapack_int k, const double* a, lapack_int lda, const
double* tau, double* c, lapack_int ldc);
```

## Include Files

- mkl.h

## Description

Given an arbitrary real matrix  $C$ , this routine forms one of the matrix products  $Q^*C$ ,  $Q^T*C$ ,  $C*Q$ ,  $C*Q^T$ ,  $P^*C$ ,  $P^T*C$ ,  $C*P$ ,  $C*P^T$ , where  $Q$  and  $P$  are orthogonal matrices computed by a call to [gebrd](#). The routine overwrites the product on  $C$ .

## Input Parameters

In the descriptions below,  $r$  denotes the order of  $Q$  or  $P^T$ :

If  $side = 'L'$ ,  $r = m$ ; if  $side = 'R'$ ,  $r = n$ .

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>vect</i>	Must be 'Q' or 'P'. If $vect = 'Q'$ , then $Q$ or $Q^T$ is applied to $C$ . If $vect = 'P'$ , then $P$ or $P^T$ is applied to $C$ .
<i>side</i>	Must be 'L' or 'R'. If $side = 'L'$ , multipliers are applied to $C$ from the left. If $side = 'R'$ , they are applied to $C$ from the right.
<i>trans</i>	Must be 'N' or 'T'. If $trans = 'N'$ , then $Q$ or $P$ is applied to $C$ . If $trans = 'T'$ , then $Q^T$ or $P^T$ is applied to $C$ .
<i>m</i>	The number of rows in $C$ .
<i>n</i>	The number of columns in $C$ .
<i>k</i>	One of the dimensions of $A$ in <i>?gebrd</i> : If $vect = 'Q'$ , the number of columns in $A$ ; If $vect = 'P'$ , the number of rows in $A$ . Constraints: $m \geq 0$ , $n \geq 0$ , $k \geq 0$ .

*a, c*

Arrays:

*a* is the array *a* as returned by `?gebrd`.The size of *a* depends on the value of the *matrix\_layout*, *vect*, and *side* parameters:

<i>matrix_layout</i>	<i>vect</i>	<i>side</i>	<b>size</b>
column major	'Q'	-	$\max(1, lda*k)$
column major	'P'	'L'	$\max(1, lda*m)$
column major	'P'	'R'	$\max(1, lda*n)$
row major	'Q'	'L'	$\max(1, lda*m)$
row major	'Q'	'R'	$\max(1, lda*n)$
row major	'P'	-	$\max(1, lda*k)$

*c* (size  $\max(1, ldc*n)$  for column major layout and  $\max(1, ldc*m)$  for row major layout) holds the matrix *C*.*lda*The leading dimension of *a*. Constraints:*lda*  $\geq \max(1, r)$  for column major layout and at least  $\max(1, k)$  for row major layout if *vect* = 'Q';*lda*  $\geq \max(1, \min(r, k))$  for column major layout and at least  $\max(1, r)$  for row major layout if *vect* = 'P'.*ldc*The leading dimension of *c*; *ldc*  $\geq \max(1, m)$  for column major layout and *ldc*  $\geq \max(1, n)$  for row major layout.*tau*Array, size at least  $\max(1, \min(r, k))$ .For *vect* = 'Q', the array *tauq* as returned by `?gebrd`. For *vect* = 'P', the array *taup* as returned by `?gebrd`.

## Output Parameters

*c*Overwritten by the product  $Q^*C$ ,  $Q^T*C$ ,  $C*Q$ ,  $C*Q^T$ ,  $P^*C$ ,  $P^T*C$ ,  $C^*P$ , or  $C^*P^T$ , as specified by *vect*, *side*, and *trans*.

## Return Values

This function returns a value *info*.If *info*=0, the execution is successful.If *info* = -*i*, the *i*-th parameter had an illegal value.

## Application Notes

The computed product differs from the exact product by a matrix *E* such that  $\|E\|_2 = O(\epsilon) * \|C\|_2$ .

The total number of floating-point operations is approximately

 $2*n*k(2*m - k)$  if *side* = 'L' and  $m \geq k$ ; $2*m*k(2*n - k)$  if *side* = 'R' and  $n \geq k$ ;

$2*m^2*n$  if *side* = 'L' and  $m < k$ ;

$2*n^2*m$  if *side* = 'R' and  $n < k$ .

The complex counterpart of this routine is [unmbr](#).

### ?ungbr

Generates the complex unitary matrix  $Q$  or  $P^H$  determined by ?gebrd.

## Syntax

```
lapack_int LAPACKE_cungbr (int matrix_layout, char vect, lapack_int m, lapack_int n,
lapack_int k, lapack_complex_float* a, lapack_int lda, const lapack_complex_float*
tau);
```

```
lapack_int LAPACKE_zungbr (int matrix_layout, char vect, lapack_int m, lapack_int n,
lapack_int k, lapack_complex_double* a, lapack_int lda, const lapack_complex_double*
tau);
```

## Include Files

- mkl.h

## Description

The routine generates the whole or part of the unitary matrices  $Q$  and  $P^H$  formed by the routines [gebrd](#). Use this routine after a call to [cgebrd/zgebrd](#). All valid combinations of arguments are described in *Input Parameters*; in most cases you need the following:

To compute the whole  $m$ -by- $m$  matrix  $Q$ , use:

```
LAPACKE_?ungbr(matrix_layout, 'Q', m, m, n, a, lda, tau)
```

(note that the array *a* must have at least  $m$  columns).

To form the  $n$  leading columns of  $Q$  if  $m > n$ , use:

```
LAPACKE_?ungbr(matrix_layout, 'Q', m, n, n, a, lda, tau)
```

To compute the whole  $n$ -by- $n$  matrix  $P^H$ , use:

```
LAPACKE_?ungbr(matrix_layout, 'P', n, n, m, a, lda, tau)
```

(note that the array *a* must have at least  $n$  rows).

To form the  $m$  leading rows of  $P^H$  if  $m < n$ , use:

```
LAPACKE_?ungbr(matrix_layout, 'P', m, m, n, a, lda, tau)
```

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>vect</i>	Must be 'Q' or 'P'. If <i>vect</i> = 'Q', the routine generates the matrix $Q$ . If <i>vect</i> = 'P', the routine generates the matrix $P^H$ .
<i>m</i>	The number of required rows of $Q$ or $P^H$ .
<i>n</i>	The number of required columns of $Q$ or $P^H$ .

<i>k</i>	<p>One of the dimensions of <i>A</i> in ?gebrd:</p> <p>If <i>vect</i> = 'Q', the number of columns in <i>A</i>;</p> <p>If <i>vect</i> = 'P', the number of rows in <i>A</i>.</p> <p>Constraints: <math>m \geq 0, n \geq 0, k \geq 0</math>.</p> <p>For <i>vect</i> = 'Q': <math>k \leq n \leq m</math> if <math>m &gt; k</math>, or <math>m = n</math> if <math>m \leq k</math>.</p> <p>For <i>vect</i> = 'P': <math>k \leq m \leq n</math> if <math>n &gt; k</math>, or <math>m = n</math> if <math>n \leq k</math>.</p>
<i>a</i>	<p>Arrays:</p> <p><i>a</i>, size at least <math>lda * n</math> for column major layout and <math>lda * m</math> for row major layout, is the array <i>a</i> as returned by ?gebrd.</p>
<i>lda</i>	The leading dimension of <i>a</i> ; at least $\max(1, m)$ for column major layout and $\max(1, n)$ for row major layout.
<i>tau</i>	<p>For <i>vect</i> = 'Q', the array <i>tauq</i> as returned by ?gebrd. For <i>vect</i> = 'P', the array <i>taup</i> as returned by ?gebrd.</p> <p>The dimension of <i>tau</i> must be at least <math>\max(1, \min(m, k))</math> for <i>vect</i> = 'Q', or <math>\max(1, \min(m, k))</math> for <i>vect</i> = 'P'.</p>

## Output Parameters

<i>a</i>	Overwritten by the orthogonal matrix <i>Q</i> or $P^T$ (or the leading rows or columns thereof) as specified by <i>vect</i> , <i>m</i> , and <i>n</i> .
----------	---

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

## Application Notes

The computed matrix *Q* differs from an exactly orthogonal matrix by a matrix *E* such that  $\|E\|_2 = O(\epsilon)$ .

The approximate numbers of possible floating-point operations are listed below:

To compute the whole matrix *Q*:

$(16/3)n(3m^2 - 3m*n + n^2)$  if  $m > n$ ;

$(16/3)m^3$  if  $m \leq n$ .

To form the *n* leading columns of *Q* when  $m > n$ :

$(8/3)n^2(3m - n^2)$ .

To compute the whole matrix  $P^H$ :

$(16/3)n^3$  if  $m \geq n$ ;

$(16/3)m(3n^2 - 3m*n + m^2)$  if  $m < n$ .

To form the *m* leading columns of  $P^H$  when  $m < n$ :

$(8/3)n^2(3m - n^2)$  if  $m > n$ .

The real counterpart of this routine is [orgbr](#).

**?unmbr**

Multiplies an arbitrary complex matrix by the unitary matrix  $Q$  or  $P$  determined by ?gebrd.

**Syntax**

```
lapack_int LAPACKE_cunmbr (int matrix_layout, char vect, char side, char trans,
lapack_int m, lapack_int n, lapack_int k, const lapack_complex_float* a, lapack_int
lda, const lapack_complex_float* tau, lapack_complex_float* c, lapack_int ldc);
```

```
lapack_int LAPACKE_zunmbr (int matrix_layout, char vect, char side, char trans,
lapack_int m, lapack_int n, lapack_int k, const lapack_complex_double* a, lapack_int
lda, const lapack_complex_double* tau, lapack_complex_double* c, lapack_int ldc);
```

**Include Files**

- mkl.h

**Description**

Given an arbitrary complex matrix  $C$ , this routine forms one of the matrix products  $Q*C$ ,  $Q^H*C$ ,  $C*Q$ ,  $C*Q^H$ ,  $P*C$ ,  $P^H*C$ ,  $C*P$ , or  $C*P^H$ , where  $Q$  and  $P$  are unitary matrices computed by a call to [gebrd/gebrd](#). The routine overwrites the product on  $C$ .

**Input Parameters**

In the descriptions below,  $r$  denotes the order of  $Q$  or  $P^H$ :

If  $side = 'L'$ ,  $r = m$ ; if  $side = 'R'$ ,  $r = n$ .

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>vect</i>	Must be 'Q' or 'P'. If $vect = 'Q'$ , then $Q$ or $Q^H$ is applied to $C$ . If $vect = 'P'$ , then $P$ or $P^H$ is applied to $C$ .
<i>side</i>	Must be 'L' or 'R'. If $side = 'L'$ , multipliers are applied to $C$ from the left. If $side = 'R'$ , they are applied to $C$ from the right.
<i>trans</i>	Must be 'N' or 'C'. If $trans = 'N'$ , then $Q$ or $P$ is applied to $C$ . If $trans = 'C'$ , then $Q^H$ or $P^H$ is applied to $C$ .
<i>m</i>	The number of rows in $C$ .
<i>n</i>	The number of columns in $C$ .
<i>k</i>	One of the dimensions of $A$ in ?gebrd: If $vect = 'Q'$ , the number of columns in $A$ ; If $vect = 'P'$ , the number of rows in $A$ . Constraints: $m \geq 0$ , $n \geq 0$ , $k \geq 0$ .

*a, c*

Arrays:

*a* is the array *a* as returned by ?gebrd.The size of *a* depends on the value of the *matrix\_layout*, *vect*, and *side* parameters:

<i>matrix_layout</i>	<i>vect</i>	<i>side</i>	<b>size</b>
column major	'Q'	-	$\max(1, lda*k)$
column major	'P'	'L'	$\max(1, lda*m)$
column major	'P'	'R'	$\max(1, lda*n)$
row major	'Q'	'L'	$\max(1, lda*m)$
row major	'Q'	'R'	$\max(1, lda*n)$
row major	'P'	-	$\max(1, lda*k)$

*c* (size  $\max(1, ldc*n)$  for column major layout and  $\max(1, ldc*m)$  for row major layout) holds the matrix *C*.*lda*The leading dimension of *a*. Constraints: $lda \geq \max(1, r)$  for column major layout and at least  $\max(1, k)$  for row major layout if *vect* = 'Q'; $lda \geq \max(1, \min(r, k))$  for column major layout and at least  $\max(1, r)$  for row major layout if *vect* = 'P'.*ldc*The leading dimension of *c*;  $ldc \geq \max(1, m)$ .*tau*Array, size at least  $\max(1, \min(r, k))$ .For *vect* = 'Q', the array *tauq* as returned by ?gebrd. For *vect* = 'P', the array *taup* as returned by ?gebrd.

## Output Parameters

*c*Overwritten by the product  $Q*C, Q^H*C, C*Q, C*Q^H, P*C, P^H*C, C*P,$  or  $C*P^H$ , as specified by *vect*, *side*, and *trans*.

## Return Values

This function returns a value *info*.If *info*=0, the execution is successful.If *info* = -*i*, the *i*-th parameter had an illegal value.

## Application Notes

The computed product differs from the exact product by a matrix *E* such that  $\|E\|_2 = O(\epsilon) * \|C\|_2$ .

The total number of floating-point operations is approximately

 $8*n*k(2*m - k)$  if *side* = 'L' and  $m \geq k$ ;

$8*m*k(2*n - k)$  if *side* = 'R' and  $n \geq k$ ;

$8*m^2*n$  if *side* = 'L' and  $m < k$ ;

$8*n^2*m$  if *side* = 'R' and  $n < k$ .

The real counterpart of this routine is [ormbr](#).

### Description

The routine computes the singular values and, optionally, the right and/or left singular vectors from the [Singular Value Decomposition](#) (SVD) of a real  $n$ -by- $n$  (upper or lower) bidiagonal matrix  $B$  using the implicit zero-shift  $QR$  algorithm. The SVD of  $B$  has the form  $B = Q*S*P^H$  where  $S$  is the diagonal matrix of singular values,  $Q$  is an orthogonal matrix of left singular vectors, and  $P$  is an orthogonal matrix of right singular vectors. If left singular vectors are requested, this subroutine actually returns  $U*Q$  instead of  $Q$ , and, if right singular vectors are requested, this subroutine returns  $P^H*VT$  instead of  $P^H$ , for given real/complex input matrices  $U$  and  $VT$ . When  $U$  and  $VT$  are the orthogonal/unitary matrices that reduce a general matrix  $A$  to bidiagonal form:  $A = U*B*VT$ , as computed by [?gebrd](#), then

$$A = (U*Q) * S * (P^H * VT)$$

is the SVD of  $A$ . Optionally, the subroutine may also compute  $Q^H * C$  for a given real/complex input matrix  $C$ .

### Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Must be 'U' or 'L'.

	<p>If <math>uplo = 'U'</math>, <math>B</math> is an upper bidiagonal matrix.</p> <p>If <math>uplo = 'L'</math>, <math>B</math> is a lower bidiagonal matrix.</p>
$n$	The order of the matrix $B$ ( $n \geq 0$ ).
$ncvt$	<p>The number of columns of the matrix <math>VT</math>, that is, the number of right singular vectors (<math>ncvt \geq 0</math>).</p> <p>Set <math>ncvt = 0</math> if no right singular vectors are required.</p>
$nru$	<p>The number of rows in <math>U</math>, that is, the number of left singular vectors (<math>nru \geq 0</math>).</p> <p>Set <math>nru = 0</math> if no left singular vectors are required.</p>
$ncc$	The number of columns in the matrix $C$ used for computing the product $Q^H * C$ ( $ncc \geq 0$ ). Set $ncc = 0$ if no matrix $C$ is supplied.
$d, e$	<p>Arrays:</p> <p><math>d</math> contains the diagonal elements of <math>B</math>.</p> <p>The size of <math>d</math> must be at least <math>\max(1, n)</math>.</p> <p><math>e</math> contains the <math>(n-1)</math> off-diagonal elements of <math>B</math>.</p> <p>The size of <math>e</math> must be at least <math>\max(1, n - 1)</math>.</p>
$vt, u, c$	<p>Arrays:</p> <p><math>vt</math>, size <math>\max(1, ldvt * ncvt)</math> for column major layout and <math>\max(1, ldvt * n)</math> for row major layout, contains an <math>n</math>-by-<math>ncvt</math> matrix <math>VT</math>.</p> <p><math>vt</math> is not referenced if <math>ncvt = 0</math>.</p> <p><math>u</math>, size <math>\max(1, ldu * n)</math> for column major layout and <math>\max(1, ldu * nru)</math> for row major layout, contains an <math>nru</math> by <math>n</math> matrix <math>U</math>.</p> <p><math>u</math> is not referenced if <math>nru = 0</math>.</p> <p><math>c</math>, size <math>\max(1, ldc * ncc)</math> for column major layout and <math>\max(1, ldc * n)</math> for row major layout, contains the <math>n</math>-by-<math>ncc</math> matrix <math>C</math> for computing the product <math>Q^H * C</math>.</p>
$ldvt$	<p>The leading dimension of <math>vt</math>. Constraints:</p> <p><math>ldvt \geq \max(1, n)</math> if <math>ncvt &gt; 0</math> for column major layout and <math>ldvt \geq \max(1, ncvt)</math> for row major layout;</p> <p><math>ldvt \geq 1</math> if <math>ncvt = 0</math>.</p>
$ldu$	<p>The leading dimension of <math>u</math>. Constraint:</p> <p><math>ldu \geq \max(1, nru)</math> for column major layout and <math>ldu \geq \max(1, n)</math> for row major layout .</p>
$ldc$	<p>The leading dimension of <math>c</math>. Constraints:</p> <p><math>ldc \geq \max(1, n)</math> if <math>ncc &gt; 0</math> for column major layout and <math>ldc \geq \max(1, ncc)</math> for row major layout; <math>ldc \geq 1</math> otherwise.</p>

## Output Parameters

<i>d</i>	On exit, if <i>info</i> = 0, overwritten by the singular values in decreasing order (see <i>info</i> ).
<i>e</i>	On exit, if <i>info</i> = 0, <i>e</i> is destroyed. See also <i>info</i> below.
<i>c</i>	Overwritten by the product $Q^H * C$ .
<i>vt</i>	On exit, this array is overwritten by $P^H * VT$ . Not referenced if <i>ncvt</i> = 0.
<i>u</i>	On exit, this array is overwritten by $U * Q$ . Not referenced if <i>nru</i> = 0.

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* > 0,

If *ncvt* = *nru* = *ncc* = 0,

- *info* = 1, a split was marked by a positive value in *e*
- *info* = 2, the current block of *z* not diagonalized after 100\**n* iterations (in the inner `while` loop)
- *info* = 3, termination criterion of the outer `while` loop is not met (the program created more than *n* unreduced blocks).

In all other cases when *ncvt*, *nru*, or *ncc* > 0, the algorithm did not converge; *d* and *e* contain the elements of a bidiagonal matrix that is orthogonally similar to the input matrix *B*; if *info* = *i*, *i* elements of *e* have not converged to zero.

## Application Notes

Each singular value and singular vector is computed to high relative accuracy. However, the reduction to bidiagonal form (prior to calling the routine) may decrease the relative accuracy in the small singular values of the original matrix if its singular values vary widely in magnitude.

If  $s_i$  is an exact singular value of *B*, and  $\hat{s}_i$  is the corresponding computed value, then

$$|s_i - \hat{s}_i| \leq p(m, n) * \varepsilon * s_i$$

where  $p(m, n)$  is a modestly increasing function of *m* and *n*, and  $\varepsilon$  is the machine precision.

If only singular values are computed, they are computed more accurately than when some singular vectors are also computed (that is, the function  $p(m, n)$  is smaller).

If  $u_i$  is the corresponding exact left singular vector of *B*, and  $w_i$  is the corresponding computed left singular vector, then the angle  $\theta(u_i, w_i)$  between them is bounded as follows:

$$\theta(u_i, w_i) \leq p(m, n) * \varepsilon / \min_{i \neq j} (|\sigma_i - \sigma_j| / |\sigma_i + \sigma_j|).$$

Here  $\min_{i \neq j} (|\sigma_i - \sigma_j| / |\sigma_i + \sigma_j|)$  is the *relative gap* between  $\sigma_i$  and the other singular values. A similar error bound holds for the right singular vectors.

The total number of real floating-point operations is roughly proportional to  $n^2$  if only the singular values are computed. About  $6n^2 * nru$  additional operations ( $12n^2 * nru$  for complex flavors) are required to compute the left singular vectors and about  $6n^2 * ncvt$  operations ( $12n^2 * ncvt$  for complex flavors) to compute the right singular vectors.

## ?bdsdc

Computes the singular value decomposition of a real bidiagonal matrix using a divide and conquer method.

### Syntax

```
lapack_int LAPACKE_sbdsdc (int matrix_layout, char uplo, char compq, lapack_int n,
float* d, float* e, float* u, lapack_int ldu, float* vt, lapack_int ldvt, float* q,
lapack_int* iq);
```

```
lapack_int LAPACKE_dbdsdc (int matrix_layout, char uplo, char compq, lapack_int n,
double* d, double* e, double* u, lapack_int ldu, double* vt, lapack_int ldvt, double* q,
lapack_int* iq);
```

### Include Files

- mkl.h

### Description

The routine computes the [Singular Value Decomposition](#) (SVD) of a real  $n$ -by- $n$  (upper or lower) bidiagonal matrix  $B$ :  $B = U \Sigma V^T$ , using a divide and conquer method, where  $\Sigma$  is a diagonal matrix with non-negative diagonal elements (the singular values of  $B$ ), and  $U$  and  $V$  are orthogonal matrices of left and right singular vectors, respectively. ?bdsdc can be used to compute all singular values, and optionally, singular vectors or singular vectors in compact form.

This routine

uses ?lasd0, ?lasd1, ?lasd2, ?lasd3, ?lasd4, ?lasd5, ?lasd6, ?lasd7, ?lasd8, ?lasd9, ?lasda, ?lasdq, ?lasdt.

### Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Must be 'U' or 'L'. If <i>uplo</i> = 'U', $B$ is an upper bidiagonal matrix. If <i>uplo</i> = 'L', $B$ is a lower bidiagonal matrix.
<i>compq</i>	Must be 'N', 'P', or 'I'. If <i>compq</i> = 'N', compute singular values only. If <i>compq</i> = 'P', compute singular values and compute singular vectors in compact form. If <i>compq</i> = 'I', compute singular values and singular vectors.
<i>n</i>	The order of the matrix $B$ ( $n \geq 0$ ).
<i>d, e</i>	Arrays: $d$ contains the $n$ diagonal elements of the bidiagonal matrix $B$ . The size of $d$ must be at least $\max(1, n)$ . $e$ contains the off-diagonal elements of the bidiagonal matrix $B$ . The size of $e$ must be at least $\max(1, n)$ .
<i>ldu</i>	The leading dimension of the output array $u$ ; $ldu \geq 1$ .

If singular vectors are desired, then  $ldu \geq \max(1, n)$ , regardless of the value of *matrix\_layout*.

*ldvt*

The leading dimension of the output array *vt*;  $ldvt \geq 1$ .

If singular vectors are desired, then  $ldvt \geq \max(1, n)$ , regardless of the value of *matrix\_layout*.

## Output Parameters

*d*

If *info* = 0, overwritten by the singular values of *B*.

*e*

On exit, *e* is overwritten.

*u*, *vt*, *q*

Arrays: *u*(size  $ldu * n$ ), *vt*(size  $ldvt * n$ ), *q*(size  $\geq n * (11 + 2 * smlsiz + 8 * \text{int}(\log_2(n / (smlsiz + 1))))$ ) where *smlsiz* is returned by *ilaenv* and is equal to maximum size of the subproblems at the bottom of the computation tree).

If *compq* = 'I', then on exit *u* contains the left singular vectors of the bidiagonal matrix *B*, unless *info* ≠ 0 (*seeinfo*). For other values of *compq*, *u* is not referenced.

if *compq* = 'I', then on exit *vt*<sup>T</sup> contains the right singular vectors of the bidiagonal matrix *B*, unless *info* ≠ 0 (*seeinfo*). For other values of *compq*, *vt* is not referenced.

If *compq* = 'P', then on exit, if *info* = 0, *q* and *iq* contain the left and right singular vectors in a compact form. Specifically, *q* contains all the float (for *sbdsc*) or double (for *dbdsc*) data for singular vectors. For other values of *compq*, *q* is not referenced.

*iq*

Array: *iq*(size  $\geq n * (3 + 3 * \text{int}(\log_2(n / (smlsiz + 1))))$ ) where *smlsiz* is returned by *ilaenv* and is equal to maximum size of the subproblems at the bottom of the computation tree).

If *compq* = 'P', then on exit, if *info* = 0, *q* and *iq* contain the left and right singular vectors in a compact form. Specifically, *iq* contains all the *lapack\_int* data for singular vectors. For other values of *compq*, *iq* is not referenced.

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, the algorithm failed to compute a singular value. The update process of divide and conquer failed.

## Symmetric Eigenvalue Problems: LAPACK Computational Routines

*Symmetric eigenvalue problems* are posed as follows: given an *n*-by-*n* real symmetric or complex Hermitian matrix *A*, find the *eigenvalues*  $\lambda$  and the corresponding *eigenvectors* *z* that satisfy the equation

$$Az = \lambda z \text{ (or, equivalently, } z^H A = \lambda z^H \text{)}.$$

In such eigenvalue problems, all  $n$  eigenvalues are real not only for real symmetric but also for complex Hermitian matrices  $A$ , and there exists an orthonormal system of  $n$  eigenvectors. If  $A$  is a symmetric or Hermitian positive-definite matrix, all eigenvalues are positive.

To solve a symmetric eigenvalue problem with LAPACK, you usually need to reduce the matrix to tridiagonal form and then solve the eigenvalue problem with the tridiagonal matrix obtained. LAPACK includes routines for reducing the matrix to a tridiagonal form by an orthogonal (or unitary) similarity transformation  $A = QTQ^H$  as well as for solving tridiagonal symmetric eigenvalue problems. These routines are listed in [Table "Computational Routines for Solving Symmetric Eigenvalue Problems"](#).

There are different routines for symmetric eigenvalue problems, depending on whether you need all eigenvectors or only some of them or eigenvalues only, whether the matrix  $A$  is positive-definite or not, and so on.

These routines are based on three primary algorithms for computing eigenvalues and eigenvectors of symmetric problems: the divide and conquer algorithm, the QR algorithm, and bisection followed by inverse iteration. The divide and conquer algorithm is generally more efficient and is recommended for computing all eigenvalues and eigenvectors. Furthermore, to solve an eigenvalue problem using the divide and conquer algorithm, you need to call only one routine. In general, more than one routine has to be called if the QR algorithm or bisection followed by inverse iteration is used.

?sytrd

Reduces a real symmetric matrix to tridiagonal form.

## Syntax

```
lapack_int LAPACKE_ssytrd (int matrix_layout, char uplo, lapack_int n, float* a,
lapack_int lda, float* d, float* e, float* tau);
```

```
lapack_int LAPACKE_dsytrd (int matrix_layout, char uplo, lapack_int n, double* a,
lapack_int lda, double* d, double* e, double* tau);
```

## Include Files

- mkl.h

## Description

The routine reduces a real symmetric matrix  $A$  to symmetric tridiagonal form  $T$  by an orthogonal similarity transformation:  $A = Q^T T Q$ . The orthogonal matrix  $Q$  is not formed explicitly but is represented as a product of  $n-1$  elementary reflectors. Routines are provided for working with  $Q$  in this representation (see *Application Notes* below).

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Must be 'U' or 'L'. If <i>uplo</i> = 'U', <i>a</i> stores the upper triangular part of $A$ . If <i>uplo</i> = 'L', <i>a</i> stores the lower triangular part of $A$ .
<i>n</i>	The order of the matrix $A$ ( $n \geq 0$ ).
<i>a</i>	<i>a</i> (size $\max(1, lda * n)$ ) is an array containing either upper or lower triangular part of the matrix $A$ , as specified by <i>uplo</i> . If <i>uplo</i> = 'U', the leading $n$ -by- $n$ upper triangular part of <i>a</i> contains the upper triangular part of the matrix $A$ , and the strictly lower triangular part of $A$ is not referenced. If <i>uplo</i> = 'L', the leading $n$ -by- $n$ lower triangular part of <i>a</i> contains the lower triangular part of the matrix $A$ , and the strictly upper triangular part of $A$ is not referenced.
<i>lda</i>	The leading dimension of <i>a</i> ; at least $\max(1, n)$ .

## Output Parameters

<i>a</i>	On exit, if <i>uplo</i> = 'U', the diagonal and first superdiagonal of $A$ are overwritten by the corresponding elements of the tridiagonal matrix $T$ , and the elements above the first superdiagonal, with the array <i>tau</i> , represent the orthogonal matrix $Q$ as a product of elementary reflectors; if <i>uplo</i> = 'L', the diagonal and first subdiagonal of $A$ are overwritten by the corresponding elements of the tridiagonal matrix $T$ , and the elements below the first subdiagonal, with the array <i>tau</i> , represent the orthogonal matrix $Q$ as a product of elementary reflectors.
----------	--

*d*, *e*, *tau*

Arrays:

*d* contains the diagonal elements of the matrix *T*.

The size of *d* must be at least  $\max(1, n)$ .

*e* contains the off-diagonal elements of *T*.

The size of *e* must be at least  $\max(1, n-1)$ .

*tau* stores  $(n-1)$  scalars that define elementary reflectors in decomposition of the orthogonal matrix *Q* in a product of  $n-1$  elementary reflectors. *tau*(*n*) is used as workspace.

The size of *tau* must be at least  $\max(1, n)$ .

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

## Application Notes

The computed matrix *T* is exactly similar to a matrix *A+E*, where  $\|E\|_2 = c(n) * \epsilon * \|A\|_2$ , *c*(*n*) is a modestly increasing function of *n*, and  $\epsilon$  is the machine precision.

The approximate number of floating-point operations is  $(4/3)n^3$ .

After calling this routine, you can call the following:

[orgtr](#) to form the computed matrix *Q* explicitly

[ormtr](#) to multiply a real matrix by *Q*.

The complex counterpart of this routine is [?hetrd](#).

[?orgtr](#)

Generates the real orthogonal matrix *Q* determined by [?sytrd](#).

## Syntax

```

## Description

The routine explicitly generates the *n*-by-*n* orthogonal matrix *Q* formed by [?sytrd](#) when reducing a real symmetric matrix *A* to tridiagonal form:  $A = Q * T * Q^T$ . Use this routine after a call to [?sytrd](#).

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major ( <code>LAPACK_ROW_MAJOR</code> ) or column major ( <code>LAPACK_COL_MAJOR</code> ).
<code>uplo</code>	Must be 'U' or 'L'. Use the same <code>uplo</code> as supplied to <code>?sytrd</code> .
<code>n</code>	The order of the matrix $Q$ ( $n \geq 0$ ).
<code>a, tau</code>	Arrays: <code>a</code> (size $\max(1, lda*n)$ ) is the array <code>a</code> as returned by <code>?sytrd</code> . <code>tau</code> is the array <code>tau</code> as returned by <code>?sytrd</code> . The size of <code>tau</code> must be at least $\max(1, n-1)$ .
<code>lda</code>	The leading dimension of <code>a</code> ; at least $\max(1, n)$ .

## Output Parameters

<code>a</code>	Overwritten by the orthogonal matrix $Q$ .
----------------	--

## Return Values

This function returns a value `info`.

If `info=0`, the execution is successful.

If `info = -i`, the  $i$ -th parameter had an illegal value.

## Application Notes

The computed matrix  $Q$  differs from an exactly orthogonal matrix by a matrix  $E$  such that  $\|E\|_2 = O(\varepsilon)$ , where  $\varepsilon$  is the machine precision.

The approximate number of floating-point operations is  $(4/3)n^3$ .

The complex counterpart of this routine is `ungtr`.

### `?ormtr`

*Multiplies a real matrix by the real orthogonal matrix  $Q$  determined by `?sytrd`.*

## Syntax

```
lapack_int LAPACKE_sormtr (int matrix_layout, char side, char uplo, char trans,
lapack_int m, lapack_int n, const float* a, lapack_int lda, const float* tau, float* c,
lapack_int ldc);
```

```
lapack_int LAPACKE_dormtr (int matrix_layout, char side, char uplo, char trans,
lapack_int m, lapack_int n, const double* a, lapack_int lda, const double* tau, double*
c, lapack_int ldc);
```

## Include Files

- `mk1.h`

## Description

The routine multiplies a real matrix  $C$  by  $Q$  or  $Q^T$ , where  $Q$  is the orthogonal matrix  $Q$  formed by `sytrd` when reducing a real symmetric matrix  $A$  to tridiagonal form:  $A = Q^T T Q$ . Use this routine after a call to `?sytrd`.

Depending on the parameters `side` and `trans`, the routine can form one of the matrix products  $Q^T C$ ,  $Q^T C$ ,  $C^T Q$ , or  $C^T Q^T$  (overwriting the result on  $C$ ).

## Input Parameters

In the descriptions below,  $r$  denotes the order of  $Q$ :

If `side = 'L'`,  $r = m$ ; if `side = 'R'`,  $r = n$ .

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major ( <code>LAPACK_ROW_MAJOR</code> ) or column major ( <code>LAPACK_COL_MAJOR</code> ).
<code>side</code>	Must be either 'L' or 'R'. If <code>side = 'L'</code> , $Q$ or $Q^T$ is applied to $C$ from the left. If <code>side = 'R'</code> , $Q$ or $Q^T$ is applied to $C$ from the right.
<code>uplo</code>	Must be 'U' or 'L'. Use the same <code>uplo</code> as supplied to <code>?sytrd</code> .
<code>trans</code>	Must be either 'N' or 'T'. If <code>trans = 'N'</code> , the routine multiplies $C$ by $Q$ . If <code>trans = 'T'</code> , the routine multiplies $C$ by $Q^T$ .
<code>m</code>	The number of rows in the matrix $C$ ( $m \geq 0$ ).
<code>n</code>	The number of columns in $C$ ( $n \geq 0$ ).
<code>a, c, tau</code>	$a$ (size $\max(1, lda * r)$ ) and $tau$ are the arrays returned by <code>?sytrd</code> . The size of $tau$ must be at least $\max(1, r - 1)$ . $c$ (size $\max(1, ldc * n)$ for column major layout and $\max(1, ldc * m)$ for row major layout) contains the matrix $C$ .
<code>lda</code>	The leading dimension of $a$ ; $lda \geq \max(1, r)$ .
<code>ldc</code>	The leading dimension of $c$ ; $ldc \geq \max(1, m)$ for column major layout and at least $\max(1, n)$ for row major layout.

## Output Parameters

<code>c</code>	Overwritten by the product $Q^T C$ , $Q^T C$ , $C^T Q$ , or $C^T Q^T$ (as specified by <code>side</code> and <code>trans</code> ).
----------------	--

## Return Values

This function returns a value `info`.

If `info=0`, the execution is successful.

If `info = -i`, the  $i$ -th parameter had an illegal value.

## Application Notes

The computed product differs from the exact product by a matrix  $E$  such that  $\|E\|_2 = O(\epsilon) * \|C\|_2$ .

The total number of floating-point operations is approximately  $2*m^2*n$ , if *side* = 'L', or  $2*n^2*m$ , if *side* = 'R'.

The complex counterpart of this routine is [unmtr](#).

### ?hetrd

*Reduces a complex Hermitian matrix to tridiagonal form.*

## Syntax

```
lapack_int LAPACKE_chetrd( int matrix_layout, char uplo, lapack_int n,
lapack_complex_float* a, lapack_int lda, float* d, float* e, lapack_complex_float*
tau );
```

```
lapack_int LAPACKE_zhetrd( int matrix_layout, char uplo, lapack_int n,
lapack_complex_double* a, lapack_int lda, double* d, double* e, lapack_complex_double*
tau );
```

## Include Files

- mkl.h

## Description

The routine reduces a complex Hermitian matrix *A* to symmetric tridiagonal form *T* by a unitary similarity transformation:  $A = Q*T*Q^H$ . The unitary matrix *Q* is not formed explicitly but is represented as a product of *n*-1 elementary reflectors. Routines are provided to work with *Q* in this representation. (They are described later in this topic.)

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Must be 'U' or 'L'. If <i>uplo</i> = 'U', <i>a</i> stores the upper triangular part of <i>A</i> . If <i>uplo</i> = 'L', <i>a</i> stores the lower triangular part of <i>A</i> .
<i>n</i>	The order of the matrix <i>A</i> ( $n \geq 0$ ).
<i>a</i>	<i>a</i> (size $\max(1, lda*n)$ ) is an array containing either upper or lower triangular part of the matrix <i>A</i> , as specified by <i>uplo</i> . If <i>uplo</i> = 'U', the leading <i>n</i> -by- <i>n</i> upper triangular part of <i>a</i> contains the upper triangular part of the matrix <i>A</i> , and the strictly lower triangular part of <i>A</i> is not referenced. If <i>uplo</i> = 'L', the leading <i>n</i> -by- <i>n</i> lower triangular part of <i>a</i> contains the lower triangular part of the matrix <i>A</i> , and the strictly upper triangular part of <i>A</i> is not referenced.
<i>lda</i>	The leading dimension of <i>a</i> ; at least $\max(1, n)$ .

## Output Parameters

<i>a</i>	On exit,
----------	----------

if `uplo = 'U'`, the diagonal and first superdiagonal of  $A$  are overwritten by the corresponding elements of the tridiagonal matrix  $T$ , and the elements above the first superdiagonal, with the array `tau`, represent the orthogonal matrix  $Q$  as a product of elementary reflectors;

if `uplo = 'L'`, the diagonal and first subdiagonal of  $A$  are overwritten by the corresponding elements of the tridiagonal matrix  $T$ , and the elements below the first subdiagonal, with the array `tau`, represent the orthogonal matrix  $Q$  as a product of elementary reflectors.

`d, e`

Arrays:

`d` contains the diagonal elements of the matrix  $T$ .

The dimension of `d` must be at least  $\max(1, n)$ .

`e` contains the off-diagonal elements of  $T$ .

The dimension of `e` must be at least  $\max(1, n-1)$ .

`tau`

Array, size at least  $\max(1, n-1)$ . Stores  $(n-1)$  scalars that define elementary reflectors in decomposition of the unitary matrix  $Q$  in a product of  $n-1$  elementary reflectors.

## Return Values

This function returns a value `info`.

If `info=0`, the execution is successful.

If `info = -i`, the  $i$ -th parameter had an illegal value.

## Application Notes

The computed matrix  $T$  is exactly similar to a matrix  $A + E$ , where  $\|E\|_2 = c(n) * \epsilon * \|A\|_2$ ,  $c(n)$  is a modestly increasing function of  $n$ , and  $\epsilon$  is the machine precision.

The approximate number of floating-point operations is  $(16/3)n^3$ .

After calling this routine, you can call the following:

`ungtr` to form the computed matrix  $Q$  explicitly

`unmtr` to multiply a complex matrix by  $Q$ .

The real counterpart of this routine is [?sytrd](#).

[?ungtr](#)

*Generates the complex unitary matrix  $Q$  determined by [?hetrd](#).*

## Syntax

```
lapack_int LAPACKE_cungtr (int matrix_layout, char uplo, lapack_int n,
lapack_complex_float* a, lapack_int lda, const lapack_complex_float* tau);
```

```
lapack_int LAPACKE_zungtr (int matrix_layout, char uplo, lapack_int n,
lapack_complex_double* a, lapack_int lda, const lapack_complex_double* tau);
```

## Include Files

- `mkl.h`

## Description

The routine explicitly generates the  $n$ -by- $n$  unitary matrix  $Q$  formed by `?hetrd` when reducing a complex Hermitian matrix  $A$  to tridiagonal form:  $A = Q^*T^*Q^H$ . Use this routine after a call to `?hetrd`.

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major ( <code>LAPACK_ROW_MAJOR</code> ) or column major ( <code>LAPACK_COL_MAJOR</code> ).
<code>uplo</code>	Must be 'U' or 'L'. Use the same <code>uplo</code> as supplied to <code>?hetrd</code> .
<code>n</code>	The order of the matrix $Q$ ( $n \geq 0$ ).
<code>a, tau</code>	Arrays: <code>a</code> (size $\max(1, lda*n)$ ) is the array <code>a</code> as returned by <code>?hetrd</code> . <code>tau</code> is the array <code>tau</code> as returned by <code>?hetrd</code> . The dimension of <code>tau</code> must be at least $\max(1, n-1)$ .
<code>lda</code>	The leading dimension of <code>a</code> ; at least $\max(1, n)$ .

## Output Parameters

<code>a</code>	Overwritten by the unitary matrix $Q$ .
----------------	---

## Return Values

This function returns a value `info`.

If `info=0`, the execution is successful.

If `info = -i`, the  $i$ -th parameter had an illegal value.

## Application Notes

The computed matrix  $Q$  differs from an exactly unitary matrix by a matrix  $E$  such that  $\|E\|_2 = O(\epsilon)$ , where  $\epsilon$  is the machine precision.

The approximate number of floating-point operations is  $(16/3)n^3$ .

The real counterpart of this routine is [orgtr](#).

### `?unmtr`

*Multiplies a complex matrix by the complex unitary matrix  $Q$  determined by `?hetrd`.*

## Syntax

```
lapack_int LAPACKE_cunmtr (int matrix_layout, char side, char uplo, char trans,
lapack_int m, lapack_int n, const lapack_complex_float* a, lapack_int lda, const
lapack_complex_float* tau, lapack_complex_float* c, lapack_int ldc);
```

```
lapack_int LAPACKE_zunmtr (int matrix_layout, char side, char uplo, char trans,
lapack_int m, lapack_int n, const lapack_complex_double* a, lapack_int lda, const
lapack_complex_double* tau, lapack_complex_double* c, lapack_int ldc);
```

## Include Files

- mkl.h

## Description

The routine multiplies a complex matrix  $C$  by  $Q$  or  $Q^H$ , where  $Q$  is the unitary matrix  $Q$  formed by `?hetrd` when reducing a complex Hermitian matrix  $A$  to tridiagonal form:  $A = Q^*T^*Q^H$ . Use this routine after a call to `?hetrd`.

Depending on the parameters `side` and `trans`, the routine can form one of the matrix products  $Q^*C$ ,  $Q^H*C$ ,  $C*Q$ , or  $C*Q^H$  (overwriting the result on  $C$ ).

## Input Parameters

In the descriptions below,  $r$  denotes the order of  $Q$ :

If `side = 'L'`,  $r = m$ ; if `side = 'R'`,  $r = n$ .

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major ( <code>LAPACK_ROW_MAJOR</code> ) or column major ( <code>LAPACK_COL_MAJOR</code> ).
<code>side</code>	Must be either 'L' or 'R'. If <code>side = 'L'</code> , $Q$ or $Q^H$ is applied to $C$ from the left. If <code>side = 'R'</code> , $Q$ or $Q^H$ is applied to $C$ from the right.
<code>uplo</code>	Must be 'U' or 'L'. Use the same <code>uplo</code> as supplied to <code>?hetrd</code> .
<code>trans</code>	Must be either 'N' or 'T'. If <code>trans = 'N'</code> , the routine multiplies $C$ by $Q$ . If <code>trans = 'C'</code> , the routine multiplies $C$ by $Q^H$ .
$m$	The number of rows in the matrix $C$ ( $m \geq 0$ ).
$n$	The number of columns in $C$ ( $n \geq 0$ ).
<code>a</code> , <code>c</code> , <code>tau</code>	<code>a</code> (size $\max(1, lda*r)$ ) and <code>tau</code> are the arrays returned by <code>?hetrd</code> . The dimension of <code>tau</code> must be at least $\max(1, r-1)$ . <code>c</code> (size $\max(1, ldc*n)$ for column major layout and $\max(1, ldc*m)$ for row major layout) contains the matrix $C$ .
<code>lda</code>	The leading dimension of <code>a</code> ; $lda \geq \max(1, r)$ .
<code>ldc</code>	The leading dimension of <code>c</code> ; $ldc \geq \max(1, n)$ for column major layout and $ldc \geq \max(1, m)$ for row major layout .

## Output Parameters

<code>c</code>	Overwritten by the product $Q^*C$ , $Q^H*C$ , $C*Q$ , or $C*Q^H$ (as specified by <code>side</code> and <code>trans</code> ).
----------------	---

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

## Application Notes

The computed product differs from the exact product by a matrix *E* such that  $\|E\|_2 = O(\varepsilon) * \|C\|_2$ , where  $\varepsilon$  is the machine precision.

The total number of floating-point operations is approximately  $8*m^2*n$  if *side* = 'L' or  $8*n^2*m$  if *side* = 'R'.

The real counterpart of this routine is [ormtr](#).

### ?sptrd

*Reduces a real symmetric matrix to tridiagonal form using packed storage.*

## Syntax

```
lapack_int LAPACKE_ssptrd (int matrix_layout, char uplo, lapack_int n, float* ap,
float* d, float* e, float* tau);
```

```
lapack_int LAPACKE_dsptrd (int matrix_layout, char uplo, lapack_int n, double* ap,
double* d, double* e, double* tau);
```

## Include Files

- mkl.h

## Description

The routine reduces a packed real symmetric matrix *A* to symmetric tridiagonal form *T* by an orthogonal similarity transformation:  $A = Q * T * Q^T$ . The orthogonal matrix *Q* is not formed explicitly but is represented as a product of *n*-1 elementary reflectors. Routines are provided for working with *Q* in this representation. See *Application Notes* below for details.

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>uplo</i>	Must be 'U' or 'L'. If <i>uplo</i> = 'U', <i>ap</i> stores the packed upper triangle of <i>A</i> . If <i>uplo</i> = 'L', <i>ap</i> stores the packed lower triangle of <i>A</i> .
<i>n</i>	The order of the matrix <i>A</i> ( $n \geq 0$ ).
<i>ap</i>	Array, size at least $\max(1, n(n+1)/2)$ . Contains either upper or lower triangle of <i>A</i> (as specified by <i>uplo</i> ) in the packed form described in <a href="#">Matrix Storage Schemes</a> .

## Output Parameters

<i>ap</i>	Overwritten by the tridiagonal matrix $T$ and details of the orthogonal matrix $Q$ , as specified by <i>uplo</i> .
<i>d, e, tau</i>	Arrays: $d$ contains the diagonal elements of the matrix $T$ . The dimension of $d$ must be at least $\max(1, n)$ . $e$ contains the off-diagonal elements of $T$ . The dimension of $e$ must be at least $\max(1, n-1)$ . $tau$ Stores $(n-1)$ scalars that define elementary reflectors in decomposition of the matrix $Q$ in a product of $n-1$ reflectors. The dimension of $tau$ must be at least $\max(1, n-1)$ .

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* =  $-i$ , the  $i$ -th parameter had an illegal value.

## Application Notes

The matrix  $Q$  is represented as a product of  $n-1$  *elementary reflectors*, as follows :

- If *uplo* = 'U',  $Q = H(n-1) \dots H(2)H(1)$

Each  $H(i)$  has the form

$$H(i) = I - \tau v v^T$$

where  $\tau$  is a real scalar and  $v$  is a real vector with  $v(i+1:n) = 0$  and  $v(i) = 1$ .

On exit,  $\tau$  is stored in  $tau[i - 1]$ , and  $v(1:i-1)$  is stored in  $AP$ , overwriting  $A(1:i-1, i+1)$ .

- If *uplo* = 'L',  $Q = H(1)H(2) \dots H(n-1)$

Each  $H(i)$  has the form

$$H(i) = I - \tau v v^T$$

where  $\tau$  is a real scalar and  $v$  is a real vector with  $v(1:i) = 0$  and  $v(i+1) = 1$ .

On exit,  $\tau$  is stored in  $tau[i - 1]$ , and  $v(i+2:n)$  is stored in  $AP$ , overwriting  $A(i+2:n, i)$ .

The computed matrix  $T$  is exactly similar to a matrix  $A+E$ , where  $\|E\|_2 = c(n) * \epsilon * \|A\|_2$ ,  $c(n)$  is a modestly increasing function of  $n$ , and  $\epsilon$  is the machine precision. The approximate number of floating-point operations is  $(4/3) n^3$ .

After calling this routine, you can call the following:

[opgtr](#) to form the computed matrix  $Q$  explicitly

[opmtr](#) to multiply a real matrix by  $Q$ .

The complex counterpart of this routine is [hptrd](#).

## ?opgtr

Generates the real orthogonal matrix  $Q$  determined by ?sptrd.

### Syntax

```
lapack_int LAPACKE_sopgtr (int matrix_layout, char uplo, lapack_int n, const float* ap,
const float* tau, float* q, lapack_int ldq);
```

```
lapack_int LAPACKE_dopgtr (int matrix_layout, char uplo, lapack_int n, const double*
ap, const double* tau, double* q, lapack_int ldq);
```

### Include Files

- mkl.h

### Description

The routine explicitly generates the  $n$ -by- $n$  orthogonal matrix  $Q$  formed by `sptrd` when reducing a packed real symmetric matrix  $A$  to tridiagonal form:  $A = Q^T Q^T$ . Use this routine after a call to `?sptrd`.

### Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<code>uplo</code>	Must be 'U' or 'L'. Use the same <code>uplo</code> as supplied to <code>?sptrd</code> .
<code>n</code>	The order of the matrix $Q$ ( $n \geq 0$ ).
<code>ap, tau</code>	Arrays <code>ap</code> and <code>tau</code> , as returned by <code>?sptrd</code> . The size of <code>ap</code> must be at least $\max(1, n(n+1)/2)$ . The size of <code>tau</code> must be at least $\max(1, n-1)$ .
<code>ldq</code>	The leading dimension of the output array <code>q</code> ; at least $\max(1, n)$ .

### Output Parameters

<code>q</code>	Array, size (size $\max(1, ldq*n)$ ) . Contains the computed matrix $Q$ .
----------------	--

### Return Values

This function returns a value `info`.

If `info=0`, the execution is successful.

If `info = -i`, the  $i$ -th parameter had an illegal value.

### Application Notes

The computed matrix  $Q$  differs from an exactly orthogonal matrix by a matrix  $E$  such that  $\|E\|_2 = O(\epsilon)$ , where  $\epsilon$  is the machine precision.

The approximate number of floating-point operations is  $(4/3)n^3$ .

The complex counterpart of this routine is `upgtr`.

## ?opmtr

Multiplies a real matrix by the real orthogonal matrix  $Q$  determined by ?sptrd.

### Syntax

```
lapack_int LAPACKE_sopmtr (int matrix_layout, char side, char uplo, char trans,
lapack_int m, lapack_int n, const float* ap, const float* tau, float* c, lapack_int
ldc);
```

```
lapack_int LAPACKE_dopmtr (int matrix_layout, char side, char uplo, char trans,
lapack_int m, lapack_int n, const double* ap, const double* tau, double* c, lapack_int
ldc);
```

### Include Files

- mkl.h

### Description

The routine multiplies a real matrix  $C$  by  $Q$  or  $Q^T$ , where  $Q$  is the orthogonal matrix  $Q$  formed by `sptrd` when reducing a packed real symmetric matrix  $A$  to tridiagonal form:  $A = Q^T * Q^T$ . Use this routine after a call to ?sptrd.

Depending on the parameters `side` and `trans`, the routine can form one of the matrix products  $Q * C$ ,  $Q^T * C$ ,  $C * Q$ , or  $C * Q^T$  (overwriting the result on  $C$ ).

### Input Parameters

In the descriptions below,  $r$  denotes the order of  $Q$ :

If `side = 'L'`,  $r = m$ ; if `side = 'R'`,  $r = n$ .

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<code>side</code>	Must be either 'L' or 'R'. If <code>side = 'L'</code> , $Q$ or $Q^T$ is applied to $C$ from the left. If <code>side = 'R'</code> , $Q$ or $Q^T$ is applied to $C$ from the right.
<code>uplo</code>	Must be 'U' or 'L'. Use the same <code>uplo</code> as supplied to ?sptrd.
<code>trans</code>	Must be either 'N' or 'T'. If <code>trans = 'N'</code> , the routine multiplies $C$ by $Q$ . If <code>trans = 'T'</code> , the routine multiplies $C$ by $Q^T$ .
<code>m</code>	The number of rows in the matrix $C$ ( $m \geq 0$ ).
<code>n</code>	The number of columns in $C$ ( $n \geq 0$ ).
<code>ap, tau, c</code>	<code>ap</code> and <code>tau</code> are the arrays returned by ?sptrd. The dimension of <code>ap</code> must be at least $\max(1, r(r+1)/2)$ . The dimension of <code>tau</code> must be at least $\max(1, r-1)$ .

$c$  (size  $\max(1, ldc*n)$  for column major layout and  $\max(1, ldc*m)$  for row major layout) contains the matrix  $C$ .

$ldc$

The leading dimension of  $c$ ;  $ldc \geq \max(1, n)$  for column major layout and  $ldc \geq \max(1, m)$  for row major layout .

## Output Parameters

$c$

Overwritten by the product  $Q^*C$ ,  $Q^T*C$ ,  $C*Q$ , or  $C*Q^T$  (as specified by *side* and *trans*).

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* =  $-i$ , the  $i$ -th parameter had an illegal value.

## Application Notes

The computed product differs from the exact product by a matrix  $E$  such that  $\|E\|_2 = O(\epsilon) \|C\|_2$ , where  $\epsilon$  is the machine precision.

The total number of floating-point operations is approximately  $2*m^2*n$  if *side* = 'L', or  $2*n^2*m$  if *side* = 'R'.

The complex counterpart of this routine is [upmtr](#).

*?hptrd*

*Reduces a complex Hermitian matrix to tridiagonal form using packed storage.*

## Syntax

```
lapack_int LAPACKE_chptrd( int matrix_layout, char uplo, lapack_int n,
lapack_complex_float* ap, float* d, float* e, lapack_complex_float* tau );
```

lapack_int LAPACKE_zhptrd( int matrix_layout, char uplo, lapack_int n,
lapack_complex_double* ap, double* d, double* e, lapack_complex_double* tau );
```

## Include Files

- mkl.h

## Description

The routine reduces a packed complex Hermitian matrix  $A$  to symmetric tridiagonal form  $T$  by a unitary similarity transformation:  $A = Q^*T*Q^H$ . The unitary matrix  $Q$  is not formed explicitly but is represented as a product of  $n-1$  elementary reflectors. Routines are provided for working with  $Q$  in this representation (see *Application Notes* below).

## Input Parameters

*matrix\_layout*

Specifies whether matrix storage layout is row major (LAPACK\_ROW\_MAJOR) or column major (LAPACK\_COL\_MAJOR).

*uplo*

Must be 'U' or 'L'.

If `uplo = 'U'`, `ap` stores the packed upper triangle of  $A$ .

If `uplo = 'L'`, `ap` stores the packed lower triangle of  $A$ .

`n` The order of the matrix  $A$  ( $n \geq 0$ ).

`ap` Array, size at least  $\max(1, n(n+1)/2)$ . Contains either upper or lower triangle of  $A$  (as specified by `uplo`) in the packed form described in "[Matrix Storage Schemes](#)".

## Output Parameters

`ap` Overwritten by the tridiagonal matrix  $T$  and details of the unitary matrix  $Q$ , as specified by `uplo`.

`d, e` Arrays:  
`d` contains the diagonal elements of the matrix  $T$ .  
 The size of `d` must be at least  $\max(1, n)$ .  
`e` contains the off-diagonal elements of  $T$ .  
 The size of `e` must be at least  $\max(1, n-1)$ .

`tau` Array, size at least  $\max(1, n-1)$ . Stores  $(n-1)$  scalars that define elementary reflectors in decomposition of the unitary matrix  $Q$  in a product of reflectors.

## Return Values

This function returns a value `info`.

If `info=0`, the execution is successful.

If `info = -i`, the  $i$ -th parameter had an illegal value.

## Application Notes

The computed matrix  $T$  is exactly similar to a matrix  $A + E$ , where  $\|E\|_2 = c(n) * \epsilon * \|A\|_2$ ,  $c(n)$  is a modestly increasing function of  $n$ , and  $\epsilon$  is the machine precision.

The approximate number of floating-point operations is  $(16/3)n^3$ .

After calling this routine, you can call the following:

`upgtr` to form the computed matrix  $Q$  explicitly

`upmtr` to multiply a complex matrix by  $Q$ .

The real counterpart of this routine is [sptrd](#).

`?upgtr`

Generates the complex unitary matrix  $Q$  determined by `?hptrd`.

## Syntax

```
lapack_int LAPACKE_cupgtr (int matrix_layout, char uplo, lapack_int n, const
lapack_complex_float* ap, const lapack_complex_float* tau, lapack_complex_float* q,
lapack_int ldq);
```

```
lapack_int LAPACKE_zupgtr (int matrix_layout, char uplo, lapack_int n, const
lapack_complex_double* ap, const lapack_complex_double* tau, lapack_complex_double* q,
lapack_int ldq);
```

## Include Files

- mkl.h

## Description

The routine explicitly generates the  $n$ -by- $n$  unitary matrix  $Q$  formed by `hptrd` when reducing a packed complex Hermitian matrix  $A$  to tridiagonal form:  $A = Q^*T^*Q^H$ . Use this routine after a call to `?hptrd`.

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major ( <code>LAPACK_ROW_MAJOR</code> ) or column major ( <code>LAPACK_COL_MAJOR</code> ).
<code>uplo</code>	Must be 'U' or 'L'. Use the same <code>uplo</code> as supplied to <code>?hptrd</code> .
<code>n</code>	The order of the matrix $Q$ ( $n \geq 0$ ).
<code>ap, tau</code>	Arrays <code>ap</code> and <code>tau</code> , as returned by <code>?hptrd</code> . The dimension of <code>ap</code> must be at least $\max(1, n(n+1)/2)$ . The dimension of <code>tau</code> must be at least $\max(1, n-1)$ .
<code>ldq</code>	The leading dimension of the output array <code>q</code> ; at least $\max(1, n)$ .

## Output Parameters

<code>q</code>	Array, size $(\max(1, ldq * n))$ . Contains the computed matrix $Q$ .
----------------	--

## Return Values

This function returns a value `info`.

If `info=0`, the execution is successful.

If `info = -i`, the  $i$ -th parameter had an illegal value.

## Application Notes

The computed matrix  $Q$  differs from an exactly orthogonal matrix by a matrix  $E$  such that  $\|E\|_2 = O(\varepsilon)$ , where  $\varepsilon$  is the machine precision.

The approximate number of floating-point operations is  $(16/3)n^3$ .

The real counterpart of this routine is `opgtr`.

## ?upmtr

*Multiplies a complex matrix by the unitary matrix  $Q$  determined by `?hptrd`.*

---

## Syntax

```
lapack_int LAPACKE_cupmtr (int matrix_layout, char side, char uplo, char trans,
lapack_int m, lapack_int n, const lapack_complex_float* ap, const lapack_complex_float*
tau, lapack_complex_float* c, lapack_int ldc);
```

```
lapack_int LAPACKE_zupmtr (int matrix_layout, char side, char uplo, char trans,
lapack_int m, lapack_int n, const lapack_complex_double* ap, const
lapack_complex_double* tau, lapack_complex_double* c, lapack_int ldc);
```

## Include Files

- mkl.h

## Description

The routine multiplies a complex matrix  $C$  by  $Q$  or  $Q^H$ , where  $Q$  is the unitary matrix formed by `hptrd` when reducing a packed complex Hermitian matrix  $A$  to tridiagonal form:  $A = Q^*T^*Q^H$ . Use this routine after a call to `?hptrd`.

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products  $Q^*C$ ,  $Q^H^*C$ ,  $C^*Q$ , or  $C^*Q^H$  (overwriting the result on  $C$ ).

## Input Parameters

In the descriptions below,  $r$  denotes the order of  $Q$ :

If *side* = 'L',  $r = m$ ; if *side* = 'R',  $r = n$ .

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>side</i>	Must be either 'L' or 'R'. If <i>side</i> = 'L', $Q$ or $Q^H$ is applied to $C$ from the left. If <i>side</i> = 'R', $Q$ or $Q^H$ is applied to $C$ from the right.
<i>uplo</i>	Must be 'U' or 'L'. Use the same <i>uplo</i> as supplied to <code>?hptrd</code> .
<i>trans</i>	Must be either 'N' or 'T'. If <i>trans</i> = 'N', the routine multiplies $C$ by $Q$ . If <i>trans</i> = 'T', the routine multiplies $C$ by $Q^H$ .
<i>m</i>	The number of rows in the matrix $C$ ( $m \geq 0$ ).
<i>n</i>	The number of columns in $C$ ( $n \geq 0$ ).
<i>ap</i> , <i>tau</i> , <i>c</i> ,	<i>ap</i> and <i>tau</i> are the arrays returned by <code>?hptrd</code> . The size of <i>ap</i> must be at least $\max(1, r(r+1)/2)$ . The size of <i>tau</i> must be at least $\max(1, r-1)$ . <i>c</i> (size $\max(1, ldc*n)$ for column major layout and $\max(1, ldc*m)$ for row major layout) contains the matrix $C$ .

*ldc* The leading dimension of *c*;  $ldc \geq \max(1, m)$  for column major layout and  $ldc \geq \max(1, n)$  for row major layout .

## Output Parameters

*c* Overwritten by the product  $Q^*C$ ,  $Q^H*C$ ,  $C*Q$ , or  $C*Q^H$  (as specified by *side* and *trans*).

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* = *-i*, the *i*-th parameter had an illegal value.

## Application Notes

The computed product differs from the exact product by a matrix *E* such that  $\|E\|_2 = O(\epsilon) * \|C\|_2$ , where  $\epsilon$  is the machine precision.

The total number of floating-point operations is approximately  $8*m^2*n$  if *side* = 'L' or  $8*n^2*m$  if *side* = 'R'.

The real counterpart of this routine is [opmtr](#).

### ?sbtrd

*Reduces a real symmetric band matrix to tridiagonal form.*

## Syntax

```
lapack_int LAPACKE_ssbtrd (int matrix_layout, char vect, char uplo, lapack_int n,
lapack_int kd, float* ab, lapack_int ldab, float* d, float* e, float* q, lapack_int
ldq);
```

```
lapack_int LAPACKE_dsbtrd (int matrix_layout, char vect, char uplo, lapack_int n,
lapack_int kd, double* ab, lapack_int ldab, double* d, double* e, double* q, lapack_int
ldq);
```

## Include Files

- mkl.h

## Description

The routine reduces a real symmetric band matrix *A* to symmetric tridiagonal form *T* by an orthogonal similarity transformation:  $A = Q^*T^*Q^T$ . The orthogonal matrix *Q* is determined as a product of Givens rotations.

If required, the routine can also form the matrix *Q* explicitly.

## Input Parameters

*matrix\_layout* Specifies whether matrix storage layout is row major (LAPACK\_ROW\_MAJOR) or column major (LAPACK\_COL\_MAJOR).

*vect* Must be 'V', 'N', or 'U'.

	If <i>vect</i> = 'V', the routine returns the explicit matrix <i>Q</i> .
	If <i>vect</i> = 'N', the routine does not return <i>Q</i> .
	If <i>vect</i> = 'U', the routine updates matrix <i>X</i> by forming $X*Q$ .
<i>uplo</i>	Must be 'U' or 'L'.
	If <i>uplo</i> = 'U', <i>ab</i> stores the upper triangular part of <i>A</i> .
	If <i>uplo</i> = 'L', <i>ab</i> stores the lower triangular part of <i>A</i> .
<i>n</i>	The order of the matrix <i>A</i> ( $n \geq 0$ ).
<i>kd</i>	The number of super- or sub-diagonals in <i>A</i> ( $kd \geq 0$ ).
<i>ab, q</i>	<i>ab</i> (size at least $\max(1, ldab*n)$ for column major layout and at least $\max(1, ldab*(kd+1))$ for row major layout) is an array containing either upper or lower triangular part of the matrix <i>A</i> (as specified by <i>uplo</i> ) in band storage format.  <i>q</i> (size $\max(1, ldq*n)$ ) is an array. If <i>vect</i> = 'U', the <i>q</i> array must contain an <i>n</i> -by- <i>n</i> matrix <i>X</i> . If <i>vect</i> = 'N' or 'V', the <i>q</i> parameter need not be set.
<i>ldab</i>	The leading dimension of <i>ab</i> ; at least <i>kd</i> +1 for column major layout and <i>n</i> for row major layout .
<i>ldq</i>	The leading dimension of <i>q</i> . Constraints: $ldq \geq \max(1, n)$ if <i>vect</i> = 'V' or 'U'; $ldq \geq 1$ if <i>vect</i> = 'N'.

## Output Parameters

<i>ab</i>	On exit, the diagonal elements of the array <i>ab</i> are overwritten by the diagonal elements of the tridiagonal matrix <i>T</i> . If <i>kd</i> > 0, the elements on the first superdiagonal (if <i>uplo</i> = 'U') or the first subdiagonal (if <i>uplo</i> = 'L') are overwritten by the off-diagonal elements of <i>T</i> . The rest of <i>ab</i> is overwritten by values generated during the reduction.
<i>d, e, q</i>	Arrays: <i>d</i> contains the diagonal elements of the matrix <i>T</i> . The size of <i>d</i> must be at least $\max(1, n)$ . <i>e</i> contains the off-diagonal elements of <i>T</i> . The size of <i>e</i> must be at least $\max(1, n-1)$ . <i>q</i> is not referenced if <i>vect</i> = 'N'. If <i>vect</i> = 'V', <i>q</i> contains the <i>n</i> -by- <i>n</i> matrix <i>Q</i> . If <i>vect</i> = 'U', <i>q</i> contains the product $X*Q$ .

## Return Values

This function returns a value *info*.

If  $info=0$ , the execution is successful.

If  $info = -i$ , the  $i$ -th parameter had an illegal value.

## Application Notes

The computed matrix  $T$  is exactly similar to a matrix  $A+E$ , where  $\|E\|_2 = c(n)*\epsilon*\|A\|_2$ ,  $c(n)$  is a modestly increasing function of  $n$ , and  $\epsilon$  is the machine precision. The computed matrix  $Q$  differs from an exactly orthogonal matrix by a matrix  $E$  such that  $\|E\|_2 = O(\epsilon)$ .

The total number of floating-point operations is approximately  $6n^2*kd$  if  $vect = 'N'$ , with  $3n^3*(kd-1)/kd$  additional operations if  $vect = 'V'$ .

The complex counterpart of this routine is [hbtrd](#).

### ?hbtrd

*Reduces a complex Hermitian band matrix to tridiagonal form.*

## Syntax

```
lapack_int LAPACKE_chbtrd( int matrix_layout, char vect, char uplo, lapack_int n,
lapack_int kd, lapack_complex_float* ab, lapack_int ldab, float* d, float* e,
lapack_complex_float* q, lapack_int ldq );
```

```

## Description

The routine reduces a complex Hermitian band matrix  $A$  to symmetric tridiagonal form  $T$  by a unitary similarity transformation:  $A = Q*T*Q^H$ . The unitary matrix  $Q$  is determined as a product of Givens rotations.

If required, the routine can also form the matrix  $Q$  explicitly.

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>vect</i>	Must be 'V', 'N', or 'U'. If $vect = 'V'$ , the routine returns the explicit matrix $Q$ . If $vect = 'N'$ , the routine does not return $Q$ . If $vect = 'U'$ , the routine updates matrix $X$ by forming $Q*X$ .
<i>uplo</i>	Must be 'U' or 'L'. If $uplo = 'U'$ , $ab$ stores the upper triangular part of $A$ . If $uplo = 'L'$ , $ab$ stores the lower triangular part of $A$ .
<i>n</i>	The order of the matrix $A$ ( $n \geq 0$ ).

<i>kd</i>	The number of super- or sub-diagonals in <i>A</i> ( $kd \geq 0$ ).
<i>ab</i>	<i>ab</i> (size at least $\max(1, ldab * n)$ for column major layout and at least $\max(1, ldab * (kd + 1))$ for row major layout) is an array containing either upper or lower triangular part of the matrix <i>A</i> (as specified by <i>uplo</i> ) in band storage format.
<i>q</i>	<i>q</i> (size $\max(1, ldq * n)$ ) is an array. If <i>vect</i> = 'U', the <i>q</i> array must contain an <i>n</i> -by- <i>n</i> matrix <i>X</i> . If <i>vect</i> = 'N' or 'V', the <i>q</i> parameter need not be set.'
<i>ldab</i>	The leading dimension of <i>ab</i> ; at least <i>kd</i> +1 for column major layout and <i>n</i> for row major layout.
<i>ldq</i>	The leading dimension of <i>q</i> . Constraints: $ldq \geq \max(1, n)$ if <i>vect</i> = 'V' or 'U'; $ldq \geq 1$ if <i>vect</i> = 'N'.

## Output Parameters

<i>ab</i>	On exit, the diagonal elements of the array <i>ab</i> are overwritten by the diagonal elements of the tridiagonal matrix <i>T</i> . If <i>kd</i> > 0, the elements on the first superdiagonal (if <i>uplo</i> = 'U') or the first subdiagonal (if <i>uplo</i> = 'L') are overwritten by the off-diagonal elements of <i>T</i> . The rest of <i>ab</i> is overwritten by values generated during the reduction.
<i>d, e</i>	Arrays: <i>d</i> contains the diagonal elements of the matrix <i>T</i> . The dimension of <i>d</i> must be at least $\max(1, n)$ . <i>e</i> contains the off-diagonal elements of <i>T</i> . The dimension of <i>e</i> must be at least $\max(1, n-1)$ .
<i>q</i>	If <i>vect</i> = 'N', <i>q</i> is not referenced. If <i>vect</i> = 'V', <i>q</i> contains the <i>n</i> -by- <i>n</i> matrix <i>Q</i> . If <i>vect</i> = 'U', <i>q</i> contains the product $X * Q$ .

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

## Application Notes

The computed matrix *T* is exactly similar to a matrix  $A + E$ , where  $\|E\|_2 = c(n) * \epsilon * \|A\|_2$ ,  $c(n)$  is a modestly increasing function of *n*, and  $\epsilon$  is the machine precision. The computed matrix *Q* differs from an exactly unitary matrix by a matrix *E* such that  $\|E\|_2 = O(\epsilon)$ .

The total number of floating-point operations is approximately  $20n^2kd$  if  $vect = 'N'$ , with  $10n^3(kd-1)/kd$  additional operations if  $vect = 'V'$ .

The real counterpart of this routine is [sbtrd](#).

### ?sterf

*Computes all eigenvalues of a real symmetric tridiagonal matrix using QR algorithm.*

## Syntax

```
lapack_int LAPACKE_ssterf (lapack_int n, float* d, float* e);
lapack_int LAPACKE_dsterf (lapack_int n, double* d, double* e);
```

## Include Files

- `mkl.h`

## Description

The routine computes all the eigenvalues of a real symmetric tridiagonal matrix  $T$  (which can be obtained by reducing a symmetric or Hermitian matrix to tridiagonal form). The routine uses a square-root-free variant of the  $QR$  algorithm.

If you need not only the eigenvalues but also the eigenvectors, call [steqr](#).

## Input Parameters

$n$	The order of the matrix $T$ ( $n \geq 0$ ).
$d, e$	Arrays: $d$ contains the diagonal elements of $T$ . The dimension of $d$ must be at least $\max(1, n)$ . $e$ contains the off-diagonal elements of $T$ . The dimension of $e$ must be at least $\max(1, n-1)$ .

## Output Parameters

$d$	The $n$ eigenvalues in ascending order, unless $info > 0$ . See also <i>info</i> .
$e$	On exit, the array is overwritten; see <i>info</i> .

## Return Values

This function returns a value *info*.

If  $info=0$ , the execution is successful.

If  $info = i$ , the algorithm failed to find all the eigenvalues after  $30n$  iterations:

$i$  off-diagonal elements have not converged to zero. On exit,  $d$  and  $e$  contain, respectively, the diagonal and off-diagonal elements of a tridiagonal matrix orthogonally similar to  $T$ .

If  $info = -i$ , the  $i$ -th parameter had an illegal value.

## Application Notes

The computed eigenvalues and eigenvectors are exact for a matrix  $T+E$  such that  $\|E\|_2 = O(\epsilon) * \|T\|_2$ , where  $\epsilon$  is the machine precision.

If  $\lambda_i$  is an exact eigenvalue, and  $m_i$  is the corresponding computed value, then

$$|\mu_i - \lambda_i| \leq c(n) * \epsilon * \|T\|_2$$

where  $c(n)$  is a modestly increasing function of  $n$ .

The total number of floating-point operations depends on how rapidly the algorithm converges. Typically, it is about  $14n^2$ .

### ?steqr

*Computes all eigenvalues and eigenvectors of a symmetric or Hermitian matrix reduced to tridiagonal form (QR algorithm).*

### Syntax

```
lapack_int LAPACKE_ssteqr( int matrix_layout, char compz, lapack_int n, float* d,
float* e, float* z, lapack_int ldz );
```

```
lapack_int LAPACKE_dsteqr( int matrix_layout, char compz, lapack_int n, double* d,
double* e, double* z, lapack_int ldz );
```

```
lapack_int LAPACKE_csteqr( int matrix_layout, char compz, lapack_int n, float* d,
float* e, lapack_complex_float* z, lapack_int ldz );
```

```
lapack_int LAPACKE_zsteqr( int matrix_layout, char compz, lapack_int n, double* d,
double* e, lapack_complex_double* z, lapack_int ldz );
```

### Include Files

- mkl.h

### Description

The routine computes all the eigenvalues and (optionally) all the eigenvectors of a real symmetric tridiagonal matrix  $T$ . In other words, the routine can compute the spectral factorization:  $T = Z * \Lambda * Z^T$ . Here  $\Lambda$  is a diagonal matrix whose diagonal elements are the eigenvalues  $\lambda_i$ ;  $Z$  is an orthogonal matrix whose columns are eigenvectors. Thus,

$$T * z_i = \lambda_i * z_i \text{ for } i = 1, 2, \dots, n.$$

The routine normalizes the eigenvectors so that  $\|z_i\|_2 = 1$ .

You can also use the routine for computing the eigenvalues and eigenvectors of an arbitrary real symmetric (or complex Hermitian) matrix  $A$  reduced to tridiagonal form  $T$ :  $A = Q * T * Q^H$ . In this case, the spectral factorization is as follows:  $A = Q * T * Q^H = (Q * Z) * \Lambda * (Q * Z)^H$ . Before calling `?steqr`, you must reduce  $A$  to tridiagonal form and generate the explicit matrix  $Q$  by calling the following routines:

	for real matrices:	for complex matrices:
<b>full storage</b>	?sytrd, ?orgtr	?hetrd, ?ungtr
<b>packed storage</b>	?sptrd, ?opgtr	?hptrd, ?upgtr

	for real matrices:	for complex matrices:
<b>band storage</b>	?sbtrd( <i>vect</i> ='V')	?hbtrd( <i>vect</i> ='V')

If you need eigenvalues only, it's more efficient to call [sterf](#). If  $T$  is positive-definite, [pteqr](#) can compute small eigenvalues more accurately than [?steqr](#).

To solve the problem by a single call, use one of the divide and conquer routines [stevd](#), [syevd](#), [spevd](#), or [sbevd](#) for real symmetric matrices or [heevd](#), [hpevd](#), or [hbevd](#) for complex Hermitian matrices.

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>compz</i>	<p>Must be 'N' or 'I' or 'V'.</p> <p>If <i>compz</i> = 'N', the routine computes eigenvalues only.</p> <p>If <i>compz</i> = 'I', the routine computes the eigenvalues and eigenvectors of the tridiagonal matrix <math>T</math>.</p> <p>If <i>compz</i> = 'V', the routine computes the eigenvalues and eigenvectors of the original symmetric matrix. On entry, <math>z</math> must contain the orthogonal matrix used to reduce the original matrix to tridiagonal form.</p>
<i>n</i>	The order of the matrix $T$ ( $n \geq 0$ ).
<i>d, e</i>	<p>Arrays:</p> <p><math>d</math> contains the diagonal elements of <math>T</math>.</p> <p>The size of <math>d</math> must be at least <math>\max(1, n)</math>.</p> <p><math>e</math> contains the off-diagonal elements of <math>T</math>.</p> <p>The size of <math>e</math> must be at least <math>\max(1, n-1)</math>.</p>
<i>z</i>	<p>Array, size <math>\max(1, ldz*n)</math>.</p> <p>If <i>compz</i> = 'N' or 'I', <math>z</math> need not be set.</p> <p>If <i>vect</i> = 'V', <math>z</math> must contain the orthogonal matrix used in the reduction to tridiagonal form.</p>
<i>ldz</i>	<p>The leading dimension of <math>z</math>. Constraints:</p> <p><math>ldz \geq 1</math> if <i>compz</i> = 'N';</p> <p><math>ldz \geq \max(1, n)</math> if <i>compz</i> = 'V' or 'I'.</p>

## Output Parameters

<i>d</i>	<p>The <math>n</math> eigenvalues in ascending order, unless <i>info</i> &gt; 0.</p> <p>See also <i>info</i>.</p>
<i>e</i>	On exit, the array is overwritten; see <i>info</i> .
<i>z</i>	If <i>info</i> = 0, contains the $n$ -by- $n$ matrix the columns of which are orthonormal eigenvectors (the $i$ -th column corresponds to the $i$ -th eigenvalue).

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* = *i*, the algorithm failed to find all the eigenvalues after  $30n$  iterations: *i* off-diagonal elements have not converged to zero. On exit, *d* and *e* contain, respectively, the diagonal and off-diagonal elements of a tridiagonal matrix orthogonally similar to *T*.

If *info* =  $-i$ , the *i*-th parameter had an illegal value.

## Application Notes

The computed eigenvalues and eigenvectors are exact for a matrix  $T+E$  such that  $\|E\|_2 = O(\varepsilon) * \|T\|_2$ , where  $\varepsilon$  is the machine precision.

If  $\lambda_i$  is an exact eigenvalue, and  $\mu_i$  is the corresponding computed value, then

$$|\mu_i - \lambda_i| \leq c(n) * \varepsilon * \|T\|_2$$

where  $c(n)$  is a modestly increasing function of  $n$ .

If  $z_i$  is the corresponding exact eigenvector, and  $w_i$  is the corresponding computed vector, then the angle  $\theta(z_i, w_i)$  between them is bounded as follows:

$$\theta(z_i, w_i) \leq c(n) * \varepsilon * \|T\|_2 / \min_{i \neq j} |\lambda_i - \lambda_j|.$$

The total number of floating-point operations depends on how rapidly the algorithm converges. Typically, it is about

$24n^2$  if *compz* = 'N';

$7n^3$  (for complex flavors,  $14n^3$ ) if *compz* = 'V' or 'I'.

## Description

The routine computes selected eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix  $T$ . Any such unreduced matrix has a well defined set of pairwise different real eigenvalues, the corresponding real eigenvectors are pairwise orthogonal.

The spectrum may be computed either completely or partially by specifying either an interval  $(vl, vu]$  or a range of indices  $il:iu$  for the desired eigenvalues.

Depending on the number of desired eigenvalues, these are computed either by bisection or the *dqds* algorithm. Numerically orthogonal eigenvectors are computed by the use of various suitable  $L*D*L^T$  factorizations near clusters of close eigenvalues (referred to as RRRs, Relatively Robust Representations). An informal sketch of the algorithm follows.

For each unreduced block (submatrix) of  $T$ ,

- Compute  $T - \sigma I = L*D*L^T$ , so that  $L$  and  $D$  define all the wanted eigenvalues to high relative accuracy. This means that small relative changes in the entries of  $L$  and  $D$  cause only small relative changes in the eigenvalues and eigenvectors. The standard (unfactored) representation of the tridiagonal matrix  $T$  does not have this property in general.
- Compute the eigenvalues to suitable accuracy. If the eigenvectors are desired, the algorithm attains full accuracy of the computed eigenvalues only right before the corresponding vectors have to be computed, see steps c and d.
- For each cluster of close eigenvalues, select a new shift close to the cluster, find a new factorization, and refine the shifted eigenvalues to suitable accuracy.
- For each eigenvalue with a large enough relative separation compute the corresponding eigenvector by forming a rank revealing twisted factorization. Go back to step c for any clusters that remain.

Normal execution of `?stemr` may create NaNs and infinities and may abort due to a floating point exception in environments that do not handle NaNs and infinities in the IEEE standard default manner.

For more details, see: [Dhillon04], [Dhillon04-02], [Dhillon97]

## Input Parameters

<code>matrix_layout</code>	Specifies whether matrix storage layout is row major ( <code>LAPACK_ROW_MAJOR</code> ) or column major ( <code>LAPACK_COL_MAJOR</code> ).
<code>jobz</code>	Must be 'N' or 'V'. If <code>jobz = 'N'</code> , then only eigenvalues are computed. If <code>jobz = 'V'</code> , then eigenvalues and eigenvectors are computed.
<code>range</code>	Must be 'A' or 'V' or 'I'. If <code>range = 'A'</code> , the routine computes all eigenvalues. If <code>range = 'V'</code> , the routine computes all eigenvalues in the half-open interval: $(vl, vu]$ . If <code>range = 'I'</code> , the routine computes eigenvalues with indices $il$ to $iu$ .
<code>n</code>	The order of the matrix $T$ ( $n \geq 0$ ).
<code>d</code>	Array, size $n$ .

	Contains $n$ diagonal elements of the tridiagonal matrix $T$ .
$e$	Array, size $n$ . Contains $(n-1)$ off-diagonal elements of the tridiagonal matrix $T$ in elements 0 to $n-2$ of $e$ . $e[n-1]$ need not be set on input, but is used internally as workspace.
$vl, vu$	If $range = 'V'$ , the lower and upper bounds of the interval to be searched for eigenvalues. Constraint: $vl < vu$ . If $range = 'A'$ or $'I'$ , $vl$ and $vu$ are not referenced.
$il, iu$	If $range = 'I'$ , the indices in ascending order of the smallest and largest eigenvalues to be returned. Constraint: $1 \leq il \leq iu \leq n$ , if $n > 0$ . If $range = 'A'$ or $'V'$ , $il$ and $iu$ are not referenced.
$ldz$	The leading dimension of the output array $z$ . if $jobz = 'V'$ , then $ldz \geq \max(1, n)$ for column major layout and $ldz \geq \max(1, m)$ for row major layout ; $ldz \geq 1$ otherwise.
$nzc$	The number of eigenvectors to be held in the array $z$ . If $range = 'A'$ , then $nzc \geq \max(1, n)$ ; If $range = 'V'$ , then $nzc$ is greater than or equal to the number of eigenvalues in the half-open interval: $(vl, vu]$ . If $range = 'I'$ , then $nzc \geq iu - il + 1$ . If $nzc = -1$ , then a workspace query is assumed; the routine calculates the number of columns of the array $z$ that are needed to hold the eigenvectors. This value is returned as the first entry of the array $z$ , and no error message related to $nzc$ is issued by the routine <code>xerbla</code> .
$tryrac$	If $tryrac$ is true, it indicates that the code should check whether the tridiagonal matrix defines its eigenvalues to high relative accuracy. If so, the code uses relative-accuracy preserving algorithms that might be (a bit) slower depending on the matrix. If the matrix does not define its eigenvalues to high relative accuracy, the code can use possibly faster algorithms. If $tryrac$ is not true, the code is not required to guarantee relatively accurate eigenvalues and can use the fastest possible techniques.

## Output Parameters

$d$	On exit, the array $d$ is overwritten.
$e$	On exit, the array $e$ is overwritten.
$m$	The total number of eigenvalues found, $0 \leq m \leq n$ . If $range = 'A'$ , then $m = n$ , and if $range = 'I'$ , then $m = iu - il + 1$ .

<i>w</i>	<p>Array, size <i>n</i>.</p> <p>The first <i>m</i> elements contain the selected eigenvalues in ascending order.</p>
<i>z</i>	<p>Array <i>z</i>(size <math>\max(1, ldz*m)</math> for column major layout and <math>\max(1, ldz*n)</math> for row major layout) .</p> <p>If <i>jobz</i> = 'V', and <i>info</i> = 0, then the first <i>m</i> columns of <i>z</i> contain the orthonormal eigenvectors of the matrix <i>T</i> corresponding to the selected eigenvalues, with the <i>i</i>-th column of <i>z</i> holding the eigenvector associated with <i>w</i>(<i>i</i>).</p> <p>If <i>jobz</i> = 'N', then <i>z</i> is not referenced.</p> <p>Note: the exact value of <i>m</i> is not known in advance and can be computed with a workspace query by setting <i>nzc</i>=-1, see description of the parameter <i>nzc</i>.</p>
<i>isuppz</i>	<p>Array, size <math>(2*\max(1, m))</math>.</p> <p>The support of the eigenvectors in <i>z</i>, that is the indices indicating the nonzero elements in <i>z</i>. The <i>i</i>-th computed eigenvector is nonzero only in elements <i>isuppz</i>[2*<i>i</i> - 2] through <i>isuppz</i>[2*<i>i</i> - 1]. This is relevant in the case when the matrix is split. <i>isuppz</i> is only accessed when <i>jobz</i> = 'V' and <i>n</i>&gt;0.</p>
<i>tryrac</i>	<p>On exit, , set to true. <i>tryrac</i> is set to false if the matrix does not define its eigenvalues to high relative accuracy.</p>

## Return Values

This function returns a value *info*.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* > 0, an internal error occurred.

### ?stedc

*Computes all eigenvalues and eigenvectors of a symmetric tridiagonal matrix using the divide and conquer method.*

## Description

The routine computes all the eigenvalues and (optionally) all the eigenvectors of a symmetric tridiagonal matrix using the divide and conquer method. The eigenvectors of a full or band real symmetric or complex Hermitian matrix can also be found if [sytrd/hetrd](#) or [sptrd/hptrd](#) or [sbtrd/hbtrd](#) has been used to reduce this matrix to tridiagonal form.

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major ( <code>LAPACK_ROW_MAJOR</code> ) or column major ( <code>LAPACK_COL_MAJOR</code> ).
<i>compz</i>	<p>Must be 'N' or 'I' or 'V'.</p> <p>If <i>compz</i> = 'N', the routine computes eigenvalues only.</p> <p>If <i>compz</i> = 'I', the routine computes the eigenvalues and eigenvectors of the tridiagonal matrix.</p> <p>If <i>compz</i> = 'V', the routine computes the eigenvalues and eigenvectors of original symmetric/Hermitian matrix. On entry, the array <i>z</i> must contain the orthogonal/unitary matrix used to reduce the original matrix to tridiagonal form.</p>
<i>n</i>	The order of the symmetric tridiagonal matrix ( $n \geq 0$ ).
<i>d, e</i>	<p>Arrays:</p> <p><i>d</i> contains the diagonal elements of the tridiagonal matrix.</p> <p>The dimension of <i>d</i> must be at least <math>\max(1, n)</math>.</p> <p><i>e</i> contains the subdiagonal elements of the tridiagonal matrix.</p> <p>The dimension of <i>e</i> must be at least <math>\max(1, n-1)</math>.</p>
<i>z</i>	<p>Array <i>z</i> is of size <math>\max(1, ldz * n)</math>.</p> <p>If <i>compz</i> = 'V', then, on entry, <i>z</i> must contain the orthogonal/unitary matrix used to reduce the original matrix to tridiagonal form.</p>
<i>ldz</i>	<p>The leading dimension of <i>z</i>. Constraints:</p> <p><math>ldz \geq 1</math> if <i>compz</i> = 'N';</p> <p><math>ldz \geq \max(1, n)</math> if <i>compz</i> = 'V' or 'I'.</p>

## Output Parameters

<i>d</i>	<p>The <i>n</i> eigenvalues in ascending order, unless <i>info</i> <math>\neq 0</math>.</p> <p>See also <i>info</i>.</p>
<i>e</i>	On exit, the array is overwritten; see <i>info</i> .
<i>z</i>	<p>If <i>info</i> = 0, then if <i>compz</i> = 'V', <i>z</i> contains the orthonormal eigenvectors of the original symmetric/Hermitian matrix, and if <i>compz</i> = 'I', <i>z</i> contains the orthonormal eigenvectors of the symmetric tridiagonal matrix. If <i>compz</i> = 'N', <i>z</i> is not referenced.</p>

## Return Values

This function returns a value *info*.

If *info*=0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, the algorithm failed to compute an eigenvalue while working on the submatrix lying in rows and columns *i*/(*n*+1) through mod(*i*, *n*+1).

### ?stegr

*Computes selected eigenvalues and eigenvectors of a real symmetric tridiagonal matrix.*

## Syntax

```

lapack_int* m, double* w, lapack_complex_double* z, lapack_int ldz, lapack_int*
isuppz );
```

## Include Files

- mkl.h

## Description

The routine computes selected eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix *T*.

The spectrum may be computed either completely or partially by specifying either an interval (*vl*, *vu*] or a range of indices *il*:*iu* for the desired eigenvalues.

?stegr is a compatibility wrapper around the improved [stemr](#) routine. See its description for further details.

Note that the *abstol* parameter no longer provides any benefit and hence is no longer used.

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>jobz</i>	Must be 'N' or 'V'. If <i>job</i> = 'N', then only eigenvalues are computed. If <i>job</i> = 'V', then eigenvalues and eigenvectors are computed.

<i>range</i>	<p>Must be 'A' or 'V' or 'I'.</p> <p>If <i>range</i> = 'A', the routine computes all eigenvalues.</p> <p>If <i>range</i> = 'V', the routine computes eigenvalues <math>w[i]</math> in the half-open interval:</p> $vl < w[i] \leq vu.$ <p>If <i>range</i> = 'I', the routine computes eigenvalues with indices <i>il</i> to <i>iu</i>.</p>
<i>n</i>	The order of the matrix $T$ ( $n \geq 0$ ).
<i>d, e</i>	<p>Arrays:</p> <p><i>d</i> contains the diagonal elements of <math>T</math>.</p> <p>The dimension of <i>d</i> must be at least <math>\max(1, n)</math>.</p> <p><i>e</i> contains the subdiagonal elements of <math>T</math> in elements 1 to <math>n-1</math>; <math>e(n)</math> need not be set on input, but it is used as a workspace.</p> <p>The dimension of <i>e</i> must be at least <math>\max(1, n)</math>.</p>
<i>vl, vu</i>	<p>If <i>range</i> = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.</p> <p>Constraint: <math>vl &lt; vu</math>.</p> <p>If <i>range</i> = 'A' or 'I', <i>vl</i> and <i>vu</i> are not referenced.</p>
<i>il, iu</i>	<p>If <i>range</i> = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.</p> <p>Constraint: <math>1 \leq il \leq iu \leq n</math>, if <math>n &gt; 0</math>.</p> <p>If <i>range</i> = 'A' or 'V', <i>il</i> and <i>iu</i> are not referenced.</p>
<i>abstol</i>	Unused. Was the absolute error tolerance for the eigenvalues/eigenvectors in previous versions.
<i>ldz</i>	<p>The leading dimension of the output array <i>z</i>. Constraints:</p> <p><math>ldz \geq 1</math> if <i>jobz</i> = 'N';</p> <p><math>ldz \geq \max(1, n)</math> if <i>jobz</i> = 'V'.</p>

## Output Parameters

<i>d, e</i>	On exit, <i>d</i> and <i>e</i> are overwritten.
<i>m</i>	<p>The total number of eigenvalues found,</p> $0 \leq m \leq n.$ <p>If <i>range</i> = 'A', <math>m = n</math>, and if <i>range</i> = 'I', <math>m = iu - il + 1</math>.</p>
<i>w</i>	<p>Array, size at least <math>\max(1, n)</math>.</p> <p>The selected eigenvalues in ascending order, stored in <math>w[0]</math> to <math>w[m - 1]</math>.</p>
<i>z</i>	Array $z(\text{size } \max(1, ldz * m))$ .

If `jobz = 'V'`, and if `info = 0`, the first  $m$  columns of  $z$  contain the orthonormal eigenvectors of the matrix  $T$  corresponding to the selected eigenvalues, with the  $i$ -th column of  $z$  holding the eigenvector associated with  $w[i - 1]$ .

If `jobz = 'N'`, then  $z$  is not referenced.

Note: if `range = 'V'`, the exact value of  $m$  is not known in advance and an upper bound must be used. Using  $n = m$  is always safe.

`isuppz`

Array, size at least  $(2 * \max(1, m))$ .

The support of the eigenvectors in  $z$ , that is the indices indicating the nonzero elements in  $z$ . The  $i$ -th computed eigenvector is nonzero only in elements `isuppz[2*i - 2]` through `isuppz[2*i - 1]`. This is relevant in the case when the matrix is split. `isuppz` is only accessed when `jobz = 'V'`, and  $n > 0$ .

## Return Values

This function returns a value `info`.

If `info=0`, the execution is successful.

If `info = -i`, the  $i$ -th parameter had an illegal value.

If `info > 0`, an internal error occurred.

`?pteqr`

*Computes all eigenvalues and (optionally) all eigenvectors of a real symmetric positive-definite tridiagonal matrix.*

## Syntax

```
lapack_int LAPACKE_spteqr( int matrix_layout, char compz, lapack_int n, float* d,
float* e, float* z, lapack_int ldz );
```

```
lapack_int LAPACKE_dpteqr( int matrix_layout, char compz, lapack_int n, double* d,
double* e, double* z, lapack_int ldz );
```

```
lapack_int LAPACKE_cpteqr( int matrix_layout, char compz, lapack_int n, float* d,
float* e, lapack_complex_float* z, lapack_int ldz );
```

```
lapack_int LAPACKE_zpteqr( int matrix_layout, char compz, lapack_int n, double* d,
double* e, lapack_complex_double* z, lapack_int ldz );
```

## Include Files

- `mkl.h`

## Description

The routine computes all the eigenvalues and (optionally) all the eigenvectors of a real symmetric positive-definite tridiagonal matrix  $T$ . In other words, the routine can compute the spectral factorization:  $T = Z * \Lambda * Z^T$ .

Here  $\Lambda$  is a diagonal matrix whose diagonal elements are the eigenvalues  $\lambda_i$ ;  $Z$  is an orthogonal matrix whose columns are eigenvectors. Thus,

$$T^*z_i = \lambda_i * z_i \text{ for } i = 1, 2, \dots, n.$$

(The routine normalizes the eigenvectors so that  $\|z_i\|_2 = 1$ .)

You can also use the routine for computing the eigenvalues and eigenvectors of real symmetric (or complex Hermitian) positive-definite matrices  $A$  reduced to tridiagonal form  $T$ :  $A = Q^*T^*Q^H$ . In this case, the spectral factorization is as follows:  $A = Q^*T^*Q^H = (QZ)^*\Lambda^*(QZ)^H$ . Before calling `?pteqr`, you must reduce  $A$  to tridiagonal form and generate the explicit matrix  $Q$  by calling the following routines:

	for real matrices:	for complex matrices:
<b>full storage</b>	?sytrd, ?orgtr	?hetrd, ?ungtr
<b>packed storage</b>	?sptrd, ?opgtr	?hptrd, ?upgtr
<b>band storage</b>	?sbtrd( <i>vect</i> ='V')	?hbtrd( <i>vect</i> ='V')

The routine first factorizes  $T$  as  $L^*D^*L^H$  where  $L$  is a unit lower bidiagonal matrix, and  $D$  is a diagonal matrix. Then it forms the bidiagonal matrix  $B = L^*D^{1/2}$  and calls `?bdsqr` to compute the singular values of  $B$ , which are the square roots of the eigenvalues of  $T$ .

## Input Parameters

<i>matrix_layout</i>	Specifies whether matrix storage layout is row major (LAPACK_ROW_MAJOR) or column major (LAPACK_COL_MAJOR).
<i>compz</i>	Must be 'N' or 'I' or 'V'. If <i>compz</i> = 'N', the routine computes eigenvalues only. If <i>compz</i> = 'I', the routine computes the eigenvalues and eigenvectors of the tridiagonal matrix $T$ . If <i>compz</i> = 'V', the routine computes the eigenvalues and eigenvectors of $A$ (and the array $z$ must contain the matrix $Q$ on entry).
<i>n</i>	The order of the matrix $T$ ( $n \geq 0$ ).
<i>d, e</i>	Arrays: <i>d</i> contains the diagonal elements of $T$ . The size of <i>d</i> must be at least $\max(1, n)$ . <i>e</i> contains the off-diagonal elements of $T$ . The size of <i>e</i> must be at least $\max(1, n-1)$ .
<i>z</i>	Array, size $\max(1, ldz*n)$ If <i>compz</i> = 'N' or 'I', $z$ need not be set. If <i>compz</i> = 'V', $z$ must contain the orthogonal matrix used in the reduction to tridiagonal form..
<i>ldz</i>	The leading dimension of $z$ . Constraints: <i>ldz</i> $\geq 1$ if <i>compz</i> = 'N'; <i>ldz</i> $\geq \max(1, n)$ if <i>compz</i> = 'V' or 'I'.

## Output Parameters

<i>d</i>	The $n$ eigenvalues in descending order, unless $info > 0$ . See also <i>info</i> .
<i>e</i>	On exit, the array is overwritten.
<i>z</i>	If $info = 0$ , contains an $n$ -by- $n$ matrix the columns of which are orthonormal eigenvectors. (The $i$ -th column corresponds to the $i$ -th eigenvalue.)

## Return Values

This function returns a value *info*.

If  $info=0$ , the execution is successful.

If  $info = i$ , the leading minor of order  $i$  (and hence  $T$  itself) is not positive-definite.

If  $info = n + i$ , the algorithm for computing singular values failed to converge;  $i$  off-diagonal elements have not converged to zero.

If  $info = -i$ , the  $i$ -th parameter had an illegal value.

## Application Notes

If  $\lambda_j$  is an exact eigenvalue, and  $\mu_j$  is the corresponding computed value, then

$$|\mu_i - \lambda_i| \leq c(n) * \varepsilon * K * \lambda_i$$

where  $c(n)$  is a modestly increasing function of  $n$ ,  $\varepsilon$  is the machine precision, and  $K = \|(DTD)^{-1}\|_2 * \|(DTD)\|_2$ ,  $D$  is diagonal with  $d_{ii} = t_{ii}^{-1/2}$ .

If  $z_j$  is the corresponding exact eigenvector, and  $w_j$  is the corresponding computed vector, then the angle  $\theta(z_i, w_j)$  between them is bounded as follows:

$$\theta(u_i, w_j) \leq c(n) \varepsilon K / \min_{i \neq j} (|\lambda_i - \lambda_j| / |\lambda_i + \lambda_j|).$$

Here  $\min_{i \neq j} (|\lambda_i - \lambda_j| / |\lambda_i + \lambda_j|)$  is the *relative gap* between  $\lambda_j$  and the other eigenvalues.

The total number of floating-point operations depends on how rapidly the algorithm converges.

Typically, it is about

$$30n^2 \text{ if } compz = 'N';$$

$$6n^3 \text{ (for complex flavors, } 12n^3) \text{ if } compz = 'V' \text{ or 'I'}.$$

### ?stebz

*Computes selected eigenvalues of a real symmetric tridiagonal matrix by bisection.*

## Syntax

```
lapack_int LAPACKE_sstebz (char range, char order, lapack_int n, float vl, float vu,
lapack_int il, lapack_int iu, float abstol, const float* d, const float* e, lapack_int*
m, lapack_int* nsplit, float* w, lapack_int* iblock, lapack_int* isplit);
```

```
lapack_int LAPACKE_dstebz (char range, char order, lapack_int n, double vl, double vu,
lapack_int il, lapack_int iu, double abstol, const double* d, const double* e,
lapack_int* m, lapack_int* nsplit, double* w, lapack_int* iblock, lapack_int* isplit);
```

## Include Files

- `mkl.h`

## Description

The routine computes some (or all) of the eigenvalues of a real symmetric tridiagonal matrix  $T$  by bisection. The routine searches for zero or negligible off-diagonal elements to see if  $T$  splits into block-diagonal form  $T = \text{diag}(T_1, T_2, \dots)$ . Then it performs bisection on each of the blocks  $T_i$  and returns the block index of each computed eigenvalue, so that a subsequent call to [stein](#) can also take advantage of the block structure.

## Input Parameters

<i>range</i>	<p>Must be 'A' or 'V' or 'I'.</p> <p>If <i>range</i> = 'A', the routine computes all eigenvalues.</p> <p>If <i>range</i> = 'V', the routine computes eigenvalues <math>w[i]</math> in the half-open interval: <math>vl &lt; w[i] \leq vu</math>.</p> <p>If <i>range</i> = 'I', the routine computes eigenvalues with indices <i>il</i> to <i>iu</i>.</p>
<i>order</i>	<p>Must be 'B' or 'E'.</p> <p>If <i>order</i> = 'B', the eigenvalues are to be ordered from smallest to largest within each split-off block.</p> <p>If <i>order</i> = 'E', the eigenvalues for the entire matrix are to be ordered from smallest to largest.</p>
<i>n</i>	The order of the matrix $T$ ( $n \geq 0$ ).
<i>vl, vu</i>	<p>If <i>range</i> = 'V', the routine computes eigenvalues <math>w[i]</math> in the half-open interval:</p> $vl < w[i] \leq vu.$ <p>If <i>range</i> = 'A' or 'I', <i>vl</i> and <i>vu</i> are not referenced.</p>
<i>il, iu</i>	<p>Constraint: <math>1 \leq il \leq iu \leq n</math>.</p> <p>If <i>range</i> = 'I', the routine computes eigenvalues <math>w[i]</math> such that <math>il \leq i \leq iu</math> (assuming that the eigenvalues <math>w[i]</math> are in ascending order).</p> <p>If <i>range</i> = 'A' or 'V', <i>il</i> and <i>iu</i> are not referenced.</p>
