kb INTEGER. The number of super- or sub-diagonals in *B* (*ka*≥*kb*≥ 0).

ab, *bb*, *work* REAL for ssbgst

DOUBLE PRECISION for dsbgst

ab(*ldab*,*) is an array containing either upper or lower triangular part of the symmetric matrix *A* (as specified by *uplo*) in band storage format.

The second dimension of the array *ab* must be at least max(1, *n*).

bb(*ldbb*,*) is an array containing the banded split Cholesky factor of *B* as specified by *uplo*, *n* and *kb* and returned by pbstf/pbstf.

The second dimension of the array *bb* must be at least max(1, *n*).

work(*) is a workspace array, dimension at least max(1, 2**n*)

ldab INTEGER. The leading dimension of the array *ab*; must be at least *ka*+1.

ldbb INTEGER. The leading dimension of the array *bb*; must be at least *kb*+1.

ldx The leading dimension of the output array x. Constraints: if *vect* = 'N', then *ldx*≥ 1;

if *vect* = 'V', then *ldx*≥ max(1, *n*).

Output Parameters

ab On exit, this array is overwritten by the upper or lower triangle of *C* as specified by *uplo*.

x REAL for ssbgst

DOUBLE PRECISION for dsbgst

Array.

If *vect* = 'V', then *x*(*ldx*,*) contains the *n*-by-*n* matrix *X* = inv(*S*)**Q*.

If *vect* = 'N', then *x* is not referenced.

The second dimension of x must be:

at least max(1, *n*), if *vect* = 'V';

at least 1, if *vect* = 'N'.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `sbgst` interface are the following:

ab	Holds the array *A* of size (*ka+1,n*).
bb	Holds the array *B* of size (*kb+1,n*).
x	Holds the matrix *X* of size (*n,n*).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
vect	Restored based on the presence of the argument *x* as follows: *vect* = `'V'`, if *x* is present, *vect* = `'N'`, if *x* is omitted.

Application Notes

Forming the reduced matrix *C* involves implicit multiplication by `inv(B)`. When the routine is used as a step in the computation of eigenvalues and eigenvectors of the original problem, there may be a significant loss of accuracy if *B* is ill-conditioned with respect to inversion.

If *ka* and *kb* are much less than *n* then the total number of floating-point operations is approximately $6n^2*kb$, when *vect* = `'N'`. Additional $(3/2)n^3*(kb/ka)$ operations are required when *vect* = `'V'`.

?hbgst

Reduces a complex Hermitian positive-definite generalized eigenproblem for banded matrices to the standard form using the factorization performed by `?pbstf`.

Syntax

```
call chbgst(vect, uplo, n, ka, kb, ab, ldab, bb, ldbb, x, ldx, work, rwork, info)
call zhbgst(vect, uplo, n, ka, kb, ab, ldab, bb, ldbb, x, ldx, work, rwork, info)
call hbgst(ab, bb [,x] [,uplo] [,info])
```

Include Files

- `mkl.fi, lapack.f90`

Description

To reduce the complex Hermitian positive-definite generalized eigenproblem $A*z = \lambda*B*z$ to the standard form $C*x = \lambda*y$, where *A*, *B* and *C* are banded, this routine must be preceded by a call to pbstf/pbstf, which computes the split Cholesky factorization of the positive-definite matrix *B*: $B = S^H*S$. The split Cholesky factorization, compared with the ordinary Cholesky factorization, allows the work to be approximately halved.

This routine overwrites *A* with $C = X^H*A*X$, where $X = \text{inv}(S)*Q$, and *Q* is a unitary matrix chosen (implicitly) to preserve the bandwidth of *A*. The routine also has an option to allow the accumulation of *X*, and then, if *z* is an eigenvector of *C*, *X*z* is an eigenvector of the original system.

Input Parameters

vect — CHARACTER*1. Must be 'N' or 'V'.

If *vect* = 'N', then matrix *X* is not returned;

If *vect* = 'V', then matrix *X* is returned.

uplo — CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', *ab* stores the upper triangular part of *A*.

If *uplo* = 'L', *ab* stores the lower triangular part of *A*.

n — INTEGER. The order of the matrices *A* and *B* (*n*≥ 0).

ka — INTEGER. The number of super- or sub-diagonals in *A*

(*ka*≥ 0).

kb — INTEGER. The number of super- or sub-diagonals in *B*

(*ka*≥*kb*≥ 0).

ab, *bb*, *work* — COMPLEX for chbgstDOUBLE COMPLEX for zhbgst

ab(*ldab*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *A* (as specified by *uplo*) in band storage format.

The second dimension of the array *ab* must be at least max(1, *n*).

bb(*ldbb*,*) is an array containing the banded split Cholesky factor of *B* as specified by *uplo*, *n* and *kb* and returned by pbstf/pbstf.

The second dimension of the array *bb* must be at least max(1, *n*).

work(*) is a workspace array, dimension at least max(1, *n*)

ldab — INTEGER. The leading dimension of the array *ab*; must be at least *ka*+1.

ldbb — INTEGER. The leading dimension of the array *bb*; must be at least *kb*+1.

ldx — The leading dimension of the output array x. Constraints:

if *vect* = 'N', then *ldx*≥ 1;

if *vect* = 'V', then *ldx*≥ max(1, *n*).

x — COMPLEX for chbgst

DOUBLE COMPLEX for zhbgst

Array.

If *vect* = 'V', then *x*(*ldx*,*) contains the *n*-by-*n* matrix *X* = inv(*S*)*Q*.

If *vect* = 'N', then *x* is not referenced.

The second dimension of x must be:

at least max(1, *n*), if *vect* = 'V';

at least 1, if *vect* = 'N'.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine hbgst interface are the following:

ab Holds the array *A* of size (*ka+1,n*).

bb Holds the array *B* of size (*kb+1,n*).

x Holds the matrix *X* of size (*n,n*).

uplo Must be 'U' or 'L'. The default value is 'U'.

vect Restored based on the presence of the argument *x* as follows: *vect* = 'V', if *x* is present, *vect* = 'N', if *x* is omitted.

Application Notes

Forming the reduced matrix *C* involves implicit multiplication by inv(*B*). When the routine is used as a step in the computation of eigenvalues and eigenvectors of the original problem, there may be a significant loss of accuracy if *B* is ill-conditioned with respect to inversion. The total number of floating-point operations is approximately $20n^2*kb$, when *vect* = 'N'. Additional $5n^3*(kb/ka)$ operations are required when *vect* = 'V'. All these estimates assume that both *ka* and *kb* are much less than *n*.

?pbstf

Computes a split Cholesky factorization of a real symmetric or complex Hermitian positive-definite banded matrix used in ?sbgst/?hbgst *.*

Syntax

```
call spbstf(uplo, n, kb, bb, ldbb, info)
call dpbstf(uplo, n, kb, bb, ldbb, info)
call cpbstf(uplo, n, kb, bb, ldbb, info)
call zpbstf(uplo, n, kb, bb, ldbb, info)
call pbstf(bb [, uplo] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes a split Cholesky factorization of a real symmetric or complex Hermitian positive-definite band matrix *B*. It is to be used in conjunction with sbgst/hbgst.

The factorization has the form $B = S^T*S$ (or $B = S^H*S$ for complex flavors), where *S* is a band matrix of the same bandwidth as *B* and the following structure: S is upper triangular in the first (*n*+*kb*)/2 rows and lower triangular in the remaining rows.

Input Parameters

uplo — CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', *bb* stores the upper triangular part of *B*.

If *uplo* = 'L', *bb* stores the lower triangular part of *B*.

n — INTEGER. The order of the matrix *B* (*n* ≥ 0).

kb — INTEGER. The number of super- or sub-diagonals in *B* (*kb* ≥ 0).

bb — REAL for spbstf

DOUBLE PRECISION for dpbstf

COMPLEX for cpbstf

DOUBLE COMPLEX for zpbstf.

bb(*ldbb*,*) is an array containing either upper or lower triangular part of the matrix *B* (as specified by *uplo*) in band storage format.

The second dimension of the array *bb* must be at least max(1, *n*).

ldbb — INTEGER. The leading dimension of *bb*; must be at least *kb*+1.

Output Parameters

bb — On exit, this array is overwritten by the elements of the split Cholesky factor *S*.

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = *i*, then the factorization could not be completed, because the updated element b_{ii} would be the square root of a negative number; hence the matrix *B* is not positive-definite.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine pbstf interface are the following:

bb — Holds the array *B* of size (*kb*+*1*,*n*).

uplo Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed factor *S* is the exact factor of a perturbed matrix $B + E$, where

$$|E| \le c(kb+1)\varepsilon |S^H||S|, \quad |e_{ij}| \le c(kb+1)\varepsilon \sqrt{b_{ii}b_{jj}}$$

$c(n)$ is a modest linear function of n, and ε is the machine precision.

The total number of floating-point operations for real flavors is approximately $n(kb+1)^2$. The number of operations for complex flavors is 4 times greater. All these estimates assume that kb is much less than n.

After calling this routine, you can call sbgst/hbgst to solve the generalized eigenproblem $Az = \lambda Bz$, where A and B are banded and B is positive-definite.

Nonsymmetric Eigenvalue Problems: LAPACK Computational Routines

This topic describes LAPACK routines for solving nonsymmetric eigenvalue problems, computing the Schur factorization of general matrices, as well as performing a number of related computational tasks.

A *nonsymmetric eigenvalue problem* is as follows: given a nonsymmetric (or non-Hermitian) matrix *A*, find the *eigenvalues*λ and the corresponding *eigenvectors*z that satisfy the equation

$Az = \lambda z$ (right eigenvectors z)

or the equation

$z^H A = \lambda z^H$ (left eigenvectors z).

Nonsymmetric eigenvalue problems have the following properties:

- The number of eigenvectors may be less than the matrix order (but is not less than the number of *distinct eigenvalues* of *A*).
- Eigenvalues may be complex even for a real matrix *A*.
- If a real nonsymmetric matrix has a complex eigenvalue $a+bi$ corresponding to an eigenvector z, then $a-bi$ is also an eigenvalue. The eigenvalue $a-bi$ corresponds to the eigenvector whose elements are complex conjugate to the elements of z.

To solve a nonsymmetric eigenvalue problem with LAPACK, you usually need to reduce the matrix to the upper Hessenberg form and then solve the eigenvalue problem with the Hessenberg matrix obtained. Table "Computational Routines for Solving Nonsymmetric Eigenvalue Problems" lists LAPACK routines to reduce the matrix to the upper Hessenberg form by an orthogonal (or unitary) similarity transformation $A = QHQ^H$ as well as routines to solve eigenvalue problems with Hessenberg matrices, forming the Schur factorization of such matrices and computing the corresponding condition numbers. The corresponding routine names in the Fortran 95 interface are without the first symbol.

The decision tree in Figure "Decision Tree: Real Nonsymmetric Eigenvalue Problems" helps you choose the right routine or sequence of routines for an eigenvalue problem with a real nonsymmetric matrix. If you need to solve an eigenvalue problem with a complex non-Hermitian matrix, use the decision tree shown in Figure "Decision Tree: Complex Non-Hermitian Eigenvalue Problems".

call zgehrd(n, ilo, ihi, a, lda, tau, work, lwork, info)
call gehrd(a [, tau] [,ilo] [,ihi] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine reduces a general matrix *A* to upper Hessenberg form *H* by an orthogonal or unitary similarity transformation $A = Q*H*Q^H$. Here *H* has real subdiagonal elements.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of *elementary reflectors*. Routines are provided to work with *Q* in this representation.

Input Parameters

n	INTEGER. The order of the matrix *A* ($n \geq 0$).
ilo, *ihi*	INTEGER. If *A* is an output by ?gebal, then *ilo* and *ihi* must contain the values returned by that routine. Otherwise $ilo = 1$ and $ihi = n$. (If $n > 0$, then $1 \leq ilo \leq ihi \leq n$; if $n = 0$, $ilo = 1$ and $ihi = 0$.)
a, *work*	REAL for sgehrd DOUBLE PRECISION for dgehrd COMPLEX for cgehrd DOUBLE COMPLEX for zgehrd. Arrays: *a*(*lda*,*) contains the matrix *A*. The second dimension of *a* must be at least max(1, *n*). *work* (*lwork*) is a workspace array.
lda	INTEGER. The leading dimension of *a*; at least max(1, *n*).
lwork	INTEGER. The size of the *work* array; at least max(1, *n*). If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a	The elements on and above the subdiagonal contain the upper Hessenberg matrix *H*. The subdiagonal elements of *H* are real. The elements below the subdiagonal, with the array tau, represent the orthogonal matrix *Q* as a product of n elementary reflectors.

tau	`REAL` for `sgehrd`
	`DOUBLE PRECISION` for `dgehrd`
	`COMPLEX` for `cgehrd`
	`DOUBLE COMPLEX` for `zgehrd`.
	Array, size at least max (1, *n*-1).
	Contains scalars that define elementary reflectors for the matrix *Q*.

work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	`INTEGER`. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `gehrd` interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
tau	Holds the vector of length (*n*-1).
ilo	Default value for this argument is *ilo* = 1.
ihi	Default value for this argument is *ihi* = *n*.

Application Notes

For better performance, try using *lwork* = *n*blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed Hessenberg matrix *H* is exactly similar to a nearby matrix $A + E$, where $||E||_2 < c(n)\varepsilon||A||_2$, $c(n)$ is a modestly increasing function of *n*, and ε is the machine precision.

The approximate number of floating-point operations for real flavors is $(2/3)*(ihi - ilo)^2(2ihi + 2ilo + 3n)$; for complex flavors it is 4 times greater.

?orghr

Generates the real orthogonal matrix Q determined by ?gehrd*.*

Syntax

```
call sorghr(n, ilo, ihi, a, lda, tau, work, lwork, info)
call dorghr(n, ilo, ihi, a, lda, tau, work, lwork, info)
call orghr(a, tau [,ilo] [,ihi] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine explicitly generates the orthogonal matrix *Q* that has been determined by a preceding call to sgehrd/dgehrd. (The routine ?gehrd reduces a real general matrix *A* to upper Hessenberg form *H* by an orthogonal similarity transformation, $A = Q*H*Q^T$, and represents the matrix *Q* as a product of *ihi*–*ilo* *elementary reflectors*. Here *ilo* and *ihi* are values determined by sgebal/dgebal when balancing the matrix; if the matrix has not been balanced, $ilo = 1$ and $ihi = n$.)

The matrix *Q* generated by ?orghr has the structure:

$$Q = \begin{bmatrix} I & 0 & 0 \\ 0 & Q_{22} & 0 \\ 0 & 0 & I \end{bmatrix}$$

where Q_{22} occupies rows and columns *ilo* to *ihi*.

Input Parameters

n — INTEGER. The order of the matrix *Q* ($n \geq 0$).

ilo, *ihi* — INTEGER. These must be the same parameters *ilo* and *ihi*, respectively, as supplied to ?gehrd. (If $n > 0$, then $1 \leq ilo \leq ihi \leq n$; if $n = 0$, $ilo = 1$ and $ihi = 0$.)

a, *tau*, *work*	REAL for sorghr DOUBLE PRECISION for dorghr Arrays: *a*(*lda*,*) contains details of the vectors which define the elementary reflectors, as returned by ?gehrd. The second dimension of *a* must be at least max(1, *n*). *tau*(*) contains further details of the elementary reflectors, as returned by ?gehrd. The dimension of *tau* must be at least max (1, *n*-1). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The leading dimension of *a*; at least max(1, *n*).
lwork	INTEGER. The size of the *work* array; *lwork*≥ max(1, *ihi*-*ilo*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a	Overwritten by the *n*-by-*n* orthogonal matrix *Q*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine orghr interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
tau	Holds the vector of length (*n*-1).
ilo	Default value for this argument is *ilo* = 1.
ihi	Default value for this argument is *ihi* = *n*.

Application Notes

For better performance, try using *lwork* =(*ihi*-*ilo*)***blocksize* where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix *Q* differs from the exact result by a matrix *E* such that $||E||_2 = O(\varepsilon)$, where ε is the machine precision.

The approximate number of floating-point operations is $(4/3)(ihi-ilo)^3$.

The complex counterpart of this routine is unghr.

?ormhr

Multiplies an arbitrary real matrix C by the real orthogonal matrix Q determined by ?gehrd.

Syntax

```
call sormhr(side, trans, m, n, ilo, ihi, a, lda, tau, c, ldc, work, lwork, info)
call dormhr(side, trans, m, n, ilo, ihi, a, lda, tau, c, ldc, work, lwork, info)
call ormhr(a, tau, c [,ilo] [,ihi] [,side] [,trans] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine multiplies a matrix *C* by the orthogonal matrix *Q* that has been determined by a preceding call to sgehrd/dgehrd. (The routine ?gehrd reduces a real general matrix *A* to upper Hessenberg form *H* by an orthogonal similarity transformation, $A = Q*H*Q^T$, and represents the matrix *Q* as a product of *ihi-iloelementary reflectors*. Here *ilo* and *ihi* are values determined by sgebal/dgebal when balancing the matrix;if the matrix has not been balanced, *ilo* = 1 and *ihi* = *n*.)

With ?ormhr, you can form one of the matrix products $Q*C$, Q^T*C, $C*Q$, or $C*Q^T$, overwriting the result on *C* (which may be any real rectangular matrix).

A common application of ?ormhr is to transform a matrix *V* of eigenvectors of *H* to the matrix *QV* of eigenvectors of *A*.

Input Parameters

side — CHARACTER*1. Must be 'L' or 'R'.

If *side*= 'L', then the routine forms $Q*C$ or Q^T*C.

If *side*= 'R', then the routine forms $C*Q$ or $C*Q^T$.

trans — CHARACTER*1. Must be 'N' or 'T'.

If *trans*= 'N', then *Q* is applied to *C*.

If *trans*= 'T', then Q^T is applied to *C*.

m — INTEGER. The number of rows in *C* (*m*≥ 0).

n — INTEGER. The number of columns in *C* (*n*≥ 0).

ilo, *ihi* — INTEGER. These must be the same parameters *ilo* and *ihi*, respectively, as supplied to ?gehrd.

If *m* > 0 and *side* = 'L', then 1 ≤*ilo*≤*ihi*≤*m*.

If *m* = 0 and *side* = 'L', then *ilo* = 1 and *ihi* = 0.

If *n* > 0 and *side* = 'R', then 1 ≤*ilo*≤*ihi*≤*n*.

If *n* = 0 and *side* = 'R', then *ilo* = 1 and *ihi* = 0.

a, *tau*, *c*, *work* — REAL for sormhr

DOUBLE PRECISION for dormhr

Arrays:

a(*lda*,*) contains details of the vectors which define the *elementary reflectors*, as returned by ?gehrd.

The second dimension of *a* must be at least max(1, *m*) if *side* = 'L' and at least max(1, *n*) if *side* = 'R'.

tau(*) contains further details of the *elementary reflectors*, as returned by ?gehrd .

The dimension of *tau* must be at least max (1, *m*-1) if *side* = 'L' and at least max (1, *n*-1) if *side* = 'R'.

c(*ldc*,*) contains the *m* by *n* matrix *C*.

The second dimension of *c* must be at least max(1, *n*).

work is a workspace array, its dimension max(1, *lwork*).

lda — INTEGER. The leading dimension of *a*; at least max(1, *m*) if *side* = 'L' and at least max (1, *n*) if *side* = 'R'.

ldc — INTEGER. The leading dimension of *c*; at least max(1, *m*) .

lwork — INTEGER. The size of the *work* array.

If *side* = 'L', *lwork*≥ max(1, *n*).

If *side* = 'R', *lwork*≥ max(1, *m*).

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

c	*C* is overwritten by product $Q*C$, Q^T*C, $C*Q$, or $C*Q^T$ as specified by *side* and *trans*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine ormhr interface are the following:

a	Holds the matrix *A* of size (*r*,*r*). *r* = *m* if *side* = 'L'. *r* = *n* if *side* = 'R'.
tau	Holds the vector of length (*r*-1).
c	Holds the matrix *C* of size (*m*,*n*).
ilo	Default value for this argument is *ilo* = 1.
ihi	Default value for this argument is *ihi* = *n*.
side	Must be 'L' or 'R'. The default value is 'L'.
trans	Must be 'N' or 'T'. The default value is 'N'.

Application Notes

For better performance, *lwork* should be at least *n***blocksize* if *side* = 'L' and at least *m***blocksize* if *side* = 'R', where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix *Q* differs from the exact result by a matrix *E* such that $||E||_2 = O(\varepsilon)*||C||_2$, where ε is the machine precision.

The approximate number of floating-point operations is

$2n(ihi-ilo)^2$ if *side* = 'L';

$2m(ihi-ilo)^2$ if *side* = 'R'.

The complex counterpart of this routine is unmhr.

?unghr
Generates the complex unitary matrix Q determined by ?gehrd*.*

Syntax

```
call cunghr(n, ilo, ihi, a, lda, tau, work, lwork, info)
call zunghr(n, ilo, ihi, a, lda, tau, work, lwork, info)
call unghr(a, tau [,ilo] [,ihi] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine is intended to be used following a call to cgehrd/zgehrd, which reduces a complex matrix *A* to upper Hessenberg form *H* by a unitary similarity transformation: $A = Q*H*Q^H$. ?gehrd represents the matrix *Q* as a product of *ihi-iloelementary reflectors*. Here *ilo* and *ihi* are values determined by cgebal/zgebal when balancing the matrix; if the matrix has not been balanced, *ilo* = 1 and *ihi* = *n*.

Use the routine unghr to generate *Q* explicitly as a square matrix. The matrix *Q* has the structure:

$$Q = \begin{bmatrix} I & 0 & 0 \\ 0 & Q_{22} & 0 \\ 0 & 0 & I \end{bmatrix}$$

where Q_{22} occupies rows and columns *ilo* to *ihi*.

Input Parameters

n	INTEGER. The order of the matrix *Q* (*n*≥ 0).
ilo, *ihi*	INTEGER. These must be the same parameters *ilo* and *ihi*, respectively, as supplied to ?gehrd . (If *n* > 0, then 1 ≤*ilo*≤*ihi*≤*n*. If *n* = 0, then *ilo* = 1 and *ihi* = 0.)
a, *tau*, *work*	COMPLEX for cunghr DOUBLE COMPLEX for zunghr. Arrays: *a*(*lda*,*) contains details of the vectors which define the *elementary reflectors*, as returned by ?gehrd. The second dimension of *a* must be at least max(1, *n*). *tau*(*) contains further details of the *elementary reflectors*, as returned by ?gehrd . The dimension of *tau* must be at least max (1, *n*-1). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The leading dimension of *a*; at least max(1, *n*).
lwork	INTEGER. The size of the *work* array; *lwork*≥ max(1, *ihi*-*ilo*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a	Overwritten by the *n*-by-*n* unitary matrix *Q*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine unghr interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
tau	Holds the vector of length (*n*-1).

ilo	Default value for this argument is *ilo* = 1.
ihi	Default value for this argument is *ihi* = *n*.

Application Notes

For better performance, try using *lwork* = (*ihi*-*ilo*)**blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix *Q* differs from the exact result by a matrix *E* such that $||E||_2 = O(\varepsilon)$, where ε is the machine precision.

The approximate number of real floating-point operations is $(16/3)(ihi-ilo)^3$.

The real counterpart of this routine is orghr.

?unmhr
Multiplies an arbitrary complex matrix C by the complex unitary matrix Q determined by ?gehrd.

Syntax

```
call cunmhr(side, trans, m, n, ilo, ihi, a, lda, tau, c, ldc, work, lwork, info)
call zunmhr(side, trans, m, n, ilo, ihi, a, lda, tau, c, ldc, work, lwork, info)
call unmhr(a, tau, c [,ilo] [,ihi] [,side] [,trans] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine multiplies a matrix *C* by the unitary matrix *Q* that has been determined by a preceding call to cgehrd/zgehrd. (The routine ?gehrd reduces a real general matrix *A* to upper Hessenberg form *H* by an orthogonal similarity transformation, $A = Q*H*Q^H$, and represents the matrix *Q* as a product of *ihi-ilo elementary reflectors*. Here *ilo* and *ihi* are values determined by cgebal/zgebal when balancing the matrix; if the matrix has not been balanced, *ilo* = 1 and *ihi* = *n*.)

With ?unmhr, you can form one of the matrix products *Q***C*, Q^H**C*, *C***Q*, or *C**Q^H, overwriting the result on *C* (which may be any complex rectangular matrix). A common application of this routine is to transform a matrix *V* of eigenvectors of *H* to the matrix *QV* of eigenvectors of *A*.

Input Parameters

side	CHARACTER*1. Must be 'L' or 'R'. If *side* = 'L', then the routine forms $Q*C$ or Q^H*C. If *side* = 'R', then the routine forms $C*Q$ or $C*Q^H$.
trans	CHARACTER*1. Must be 'N' or 'C'. If *trans* = 'N', then Q is applied to C. If *trans* = 'T', then Q^H is applied to C.
m	INTEGER. The number of rows in C ($m \geq 0$).
n	INTEGER. The number of columns in C ($n \geq 0$).
ilo, *ihi*	INTEGER. These must be the same parameters *ilo* and *ihi*, respectively, as supplied to ?gehrd . If $m > 0$ and *side* = 'L', then $1 \leq ilo \leq ihi \leq m$. If $m = 0$ and *side* = 'L', then *ilo* = 1 and *ihi* = 0. If $n > 0$ and *side* = 'R', then $1 \leq ilo \leq ihi \leq n$. If $n = 0$ and *side* = 'R', then *ilo* =1 and *ihi* = 0.
a, *tau*, *c*, *work*	COMPLEX for cunmhr DOUBLE COMPLEX for zunmhr. Arrays: *a*(*lda*,*) contains details of the vectors which define the elementary reflectors, as returned by ?gehrd. The second dimension of *a* must be at least max(1, *m*) if *side* = 'L' and at least max(1, *n*) if *side* = 'R'. *tau*(*) contains further details of the elementary reflectors, as returned by ?gehrd. The dimension of *tau* must be at least max (1, *m*-1) if *side* = 'L' and at least max (1, *n*-1) if *side* = 'R'. *c*(*ldc*,*) contains the *m*-by-*n* matrix C. The second dimension of *c* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The leading dimension of *a*; at least max(1, *m*) if *side* = 'L' and at least max (1, *n*) if *side* = 'R'.
ldc	INTEGER. The leading dimension of *c*; at least max(1, *m*).
lwork	INTEGER. The size of the *work* array. If *side* = 'L', *lwork* ≥ max(1,*n*). If *side* = 'R', *lwork* ≥ max(1,*m*).

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

c — *C* is overwritten by *Q***C*, or Q^H**C*, or *C**Q^H, or *C***Q* as specified by *side* and *trans*.

work(1) — If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine unmhr interface are the following:

a — Holds the matrix *A* of size (*r*,*r*).

r = *m* if *side* = 'L'.

r = *n* if *side* = 'R'.

tau — Holds the vector of length (*r*-1).

c — Holds the matrix *C* of size (*m*,*n*).

ilo — Default value for this argument is *ilo* = 1.

ihi — Default value for this argument is *ihi* = *n*.

side — Must be 'L' or 'R'. The default value is 'L'.

trans — Must be 'N' or 'C'. The default value is 'N'.

Application Notes

For better performance, *lwork* should be at least *n***blocksize* if *side* = 'L' and at least *m***blocksize* if *side* = 'R', where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix *Q* differs from the exact result by a matrix *E* such that $||E||_2 = O(\varepsilon)*||C||_2$, where ε is the machine precision.

The approximate number of floating-point operations is

$8n(ihi-ilo)^2$ if *side* = 'L';

$8m(ihi-ilo)^2$ if *side* = 'R'.

The real counterpart of this routine is ormhr.

?gebal
Balances a general matrix to improve the accuracy of computed eigenvalues and eigenvectors.

Syntax

```
call sgebal(job, n, a, lda, ilo, ihi, scale, info)
call dgebal(job, n, a, lda, ilo, ihi, scale, info)
call cgebal(job, n, a, lda, ilo, ihi, scale, info)
call zgebal(job, n, a, lda, ilo, ihi, scale, info)
call gebal(a [, scale] [,ilo] [,ihi] [,job] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine *balances* a matrix *A* by performing either or both of the following two similarity transformations:

(1) The routine first attempts to permute *A* to block upper triangular form:

$$PAP^T = A' = \begin{bmatrix} A'_{11} & A'_{12} & A'_{13} \\ 0 & A'_{22} & A'_{23} \\ 0 & 0 & A'_{33} \end{bmatrix}$$

where *P* is a permutation matrix, and A'_{11} and A'_{33} are upper triangular. The diagonal elements of A'_{11} and A'_{33} are eigenvalues of *A*. The rest of the eigenvalues of *A* are the eigenvalues of the central diagonal block A'_{22}, in rows and columns *ilo* to *ihi*. Subsequent operations to compute the eigenvalues of *A* (or its Schur factorization) need only be applied to these rows and columns; this can save a significant amount of work if $ilo > 1$ and $ihi < n$.

If no suitable permutation exists (as is often the case), the routine sets $ilo = 1$ and $ihi = n$, and A'_{22} is the whole of *A*.

(2) The routine applies a diagonal similarity transformation to A', to make the rows and columns of A'_{22} as close in norm as possible:

$$A'' = DA'D^{-1} = \begin{bmatrix} I & 0 & 0 \\ 0 & D_{22} & 0 \\ 0 & 0 & I \end{bmatrix} \times \begin{bmatrix} A'_{11} & A'_{12} & A'_{13} \\ 0 & A'_{22} & A'_{23} \\ 0 & 0 & A'_{33} \end{bmatrix} \times \begin{bmatrix} I & 0 & 0 \\ 0 & D_{22}^{-1} & 0 \\ 0 & 0 & I \end{bmatrix}$$

This scaling can reduce the norm of the matrix (that is, $||A''_{22}|| < ||A'_{22}||$), and hence reduce the effect of rounding errors on the accuracy of computed eigenvalues and eigenvectors.

Input Parameters

job

`CHARACTER*1`. Must be `'N'` or `'P'` or `'S'` or `'B'`.

If *job* = `'N'`, then *A* is neither permuted nor scaled (but *ilo*, *ihi*, and *scale* get their values).

If *job* = `'P'`, then *A* is permuted but not scaled.

If *job* = `'S'`, then *A* is scaled but not permuted.

If *job* = `'B'`, then *A* is both scaled and permuted.

n

`INTEGER`. The order of the matrix *A* ($n \geq 0$).

a

`REAL` for `sgebal`

`DOUBLE PRECISION` for `dgebal`

`COMPLEX` for `cgebal`

`DOUBLE COMPLEX` for `zgebal`.

Array *a*(*lda*,*) contains the matrix *A*.

The second dimension of *a* must be at least max(1, *n*). *a* is not referenced if *job* = `'N'`.

lda

`INTEGER`. The leading dimension of *a*; at least max(1, *n*).

Output Parameters

a

Overwritten by the balanced matrix (*a* is not referenced if *job* = `'N'`).

ilo, *ihi*

`INTEGER`. The values *ilo* and *ihi* such that on exit *a*(*i*,*j*) is zero if $i > j$ and $1 \leq j < ilo$ or $ihi < j \leq n$.

If *job* = `'N'` or `'S'`, then *ilo* = 1 and *ihi* = *n*.

scale

`REAL` for single-precision flavors `DOUBLE PRECISION` for double-precision flavors

Array, size at least max(1, *n*).

Contains details of the permutations and scaling factors.

More precisely, if p_j is the index of the row and column interchanged with row and column *j*, and d_j is the scaling factor used to balance row and column *j*, then

scale(*j*) = p_j for *j* = 1, 2,..., *ilo*-1, *ihi*+1,..., *n*;

	scale(*j*) = d_j for *j* = *ilo*, *ilo* + 1,..., *ihi*. The order in which the interchanges are made is *n* to *ihi*+1, then 1 to *ilo*-1.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine gebal interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
scale	Holds the vector of length *n*.
ilo	Default value for this argument is *ilo* = 1.
ihi	Default value for this argument is *ihi* = *n*.
job	Must be 'B', 'S', 'P', or 'N'. The default value is 'B'.

Application Notes

The errors are negligible, compared with those in subsequent computations.

If the matrix *A* is balanced by this routine, then any eigenvectors computed subsequently are eigenvectors of the matrix *A*'' and hence you must call gebak to transform them back to eigenvectors of *A*.

If the Schur vectors of *A* are required, do not call this routine with *job* = 'S' or 'B', because then the balancing transformation is not orthogonal (not unitary for complex flavors).

If you call this routine with *job* = 'P', then any Schur vectors computed subsequently are Schur vectors of the matrix *A*'', and you need to call gebak (with *side* = 'R') to transform them back to Schur vectors of *A*.

The total number of floating-point operations is proportional to n^2.

?gebak

Transforms eigenvectors of a balanced matrix to those of the original nonsymmetric matrix.

Syntax

```
call sgebak(job, side, n, ilo, ihi, scale, m, v, ldv, info)
call dgebak(job, side, n, ilo, ihi, scale, m, v, ldv, info)
call cgebak(job, side, n, ilo, ihi, scale, m, v, ldv, info)
call zgebak(job, side, n, ilo, ihi, scale, m, v, ldv, info)
call gebak(v, scale [,ilo] [,ihi] [,job] [,side] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine is intended to be used after a matrix *A* has been balanced by a call to ?gebal, and eigenvectors of the balanced matrix A''_{22} have subsequently been computed. For a description of balancing, see gebal. The balanced matrix *A*'' is obtained as $A'' = D*P*A*P^T*\mathrm{inv}(D)$, where *P* is a permutation matrix and *D* is a diagonal scaling matrix. This routine transforms the eigenvectors as follows:

if *x* is a right eigenvector of *A*'', then $P^T*\mathrm{inv}(D)*x$ is a right eigenvector of *A*; if *y* is a left eigenvector of *A*'', then P^T*D*y is a left eigenvector of *A*.

Input Parameters

job — CHARACTER*1. Must be 'N' or 'P' or 'S' or 'B'. The same parameter *job* as supplied to ?gebal.

side — CHARACTER*1. Must be 'L' or 'R'.

If *side* = 'L', then left eigenvectors are transformed.

If *side* = 'R', then right eigenvectors are transformed.

n — INTEGER. The number of rows of the matrix of eigenvectors ($n \geq 0$).

ilo, *ihi* — INTEGER. The values *ilo* and *ihi*, as returned by ?gebal. (If $n > 0$, then $1 \leq ilo \leq ihi \leq n$;

if $n = 0$, then $ilo = 1$ and $ihi = 0$.)

scale — REAL for single-precision flavors

DOUBLE PRECISION for double-precision flavors

Array, size at least max(1, *n*).

Contains details of the permutations and/or the scaling factors used to balance the original general matrix, as returned by ?gebal.

m — INTEGER. The number of columns of the matrix of eigenvectors ($m \geq 0$).

v — REAL for sgebak

DOUBLE PRECISION for dgebak

COMPLEX for cgebak

DOUBLE COMPLEX for zgebak.

Arrays:

v(*ldv*,*) contains the matrix of left or right eigenvectors to be transformed.

The second dimension of *v* must be at least max(1, *m*).

ldv — INTEGER. The leading dimension of *v*; at least max(1, *n*) .

Output Parameters

v — Overwritten by the transformed eigenvectors.

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = *-i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `gebak` interface are the following:

v	Holds the matrix *V* of size (*n*,*m*).
scale	Holds the vector of length *n*.
ilo	Default value for this argument is *ilo* = 1.
ihi	Default value for this argument is *ihi* = *n*.
job	Must be 'B', 'S', 'P', or 'N'. The default value is 'B'.
side	Must be 'L' or 'R'. The default value is 'L'.

Application Notes

The errors in this routine are negligible.

The approximate number of floating-point operations is approximately proportional to *m***n*.

?hseqr
Computes all eigenvalues and (optionally) the Schur factorization of a matrix reduced to Hessenberg form.

Syntax

```
call shseqr(job, compz, n, ilo, ihi, h, ldh, wr, wi, z, ldz, work, lwork, info)
call dhseqr(job, compz, n, ilo, ihi, h, ldh, wr, wi, z, ldz, work, lwork, info)
call chseqr(job, compz, n, ilo, ihi, h, ldh, w, z, ldz, work, lwork, info)
call zhseqr(job, compz, n, ilo, ihi, h, ldh, w, z, ldz, work, lwork, info)
call hseqr(h, wr, wi [,ilo] [,ihi] [,z] [,job] [,compz] [,info])
call hseqr(h, w [,ilo] [,ihi] [,z] [,job] [,compz] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes all the eigenvalues, and optionally the Schur factorization, of an upper Hessenberg matrix *H*: $H = Z*T*Z^H$, where *T* is an upper triangular (or, for real flavors, quasi-triangular) matrix (the Schur form of *H*), and *Z* is the unitary or orthogonal matrix whose columns are the Schur vectors z_i.

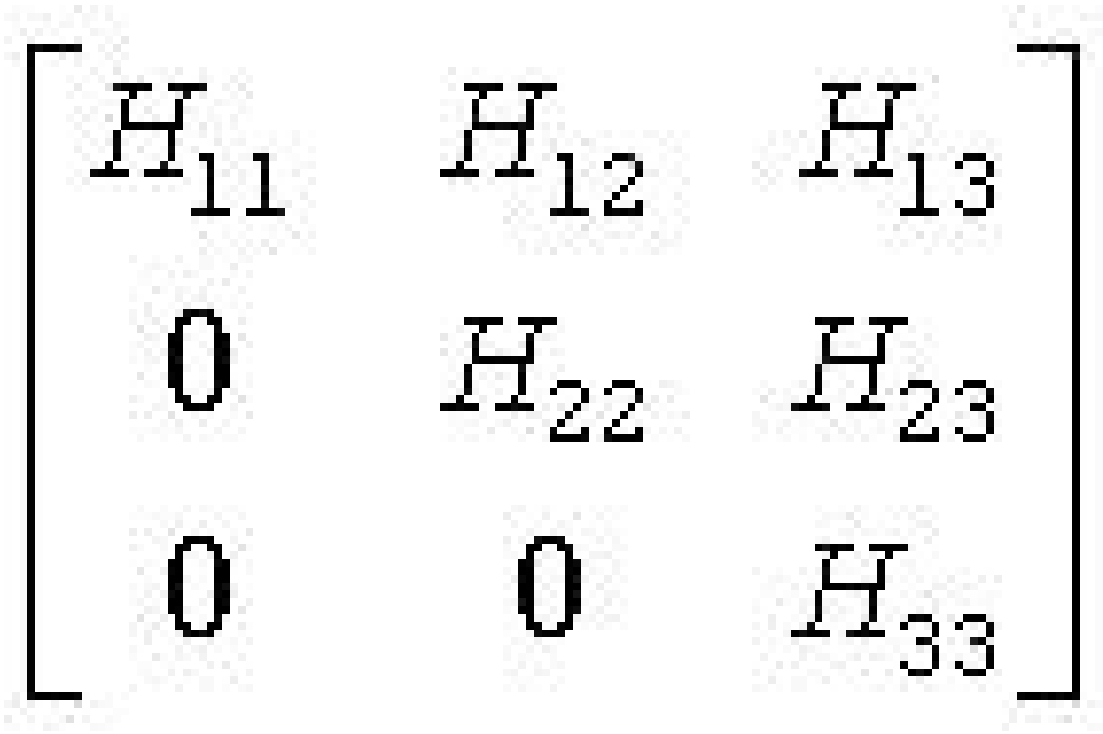
You can also use this routine to compute the Schur factorization of a general matrix *A* which has been reduced to upper Hessenberg form *H*:

$A = Q*H*Q^H$, where *Q* is unitary (orthogonal for real flavors);

$A = (QZ)*T*(QZ)^H$.

In this case, after reducing *A* to Hessenberg form by gehrd, call orghr to form *Q* explicitly and then pass *Q* to ?hseqr with *compz* = 'V'.

You can also call gebal to balance the original matrix before reducing it to Hessenberg form by ?hseqr, so that the Hessenberg matrix *H* will have the structure:



where H_{11} and H_{33} are upper triangular.

If so, only the central diagonal block H_{22} (in rows and columns *ilo* to *ihi*) needs to be further reduced to Schur form (the blocks H_{12} and H_{23} are also affected). Therefore the values of *ilo* and *ihi* can be supplied to ?hseqr directly. Also, after calling this routine you must call gebak to permute the Schur vectors of the balanced matrix to those of the original matrix.

If ?gebal has not been called, however, then *ilo* must be set to 1 and *ihi* to *n*. Note that if the Schur factorization of *A* is required, ?gebal must not be called with *job* = 'S' or 'B', because the balancing transformation is not unitary (for real flavors, it is not orthogonal).

?hseqr uses a multishift form of the upper Hessenberg *QR* algorithm. The Schur vectors are normalized so that $||z_i||_2 = 1$, but are determined only to within a complex factor of absolute value 1 (for the real flavors, to within a factor ±1).

Input Parameters

job

CHARACTER*1. Must be 'E' or 'S'.

If *job* = 'E', then eigenvalues only are required.

If *job* = 'S', then the Schur form *T* is required.

compz

CHARACTER*1. Must be 'N' or 'I' or 'V'.

If *compz* = 'N', then no Schur vectors are computed (and the array *z* is not referenced).

If *compz* = 'I', then the Schur vectors of *H* are computed (and the array *z* is initialized by the routine).

If *compz* = 'V', then the Schur vectors of *A* are computed (and the array *z* must contain the matrix *Q* on entry).

n

INTEGER. The order of the matrix *H* (*n* ≥ 0).

ilo, *ihi*

INTEGER. If *A* has been balanced by ?gebal, then *ilo* and *ihi* must contain the values returned by ?gebal. Otherwise, *ilo* must be set to 1 and *ihi* to *n*.

h, *z*, *work*

REAL for shseqr

DOUBLE PRECISION for dhseqr

COMPLEX for chseqr

DOUBLE COMPLEX for zhseqr.

Arrays:

h(*ldh*,*)) The *n*-by-*n* upper Hessenberg matrix *H*.

The second dimension of *h* must be at least max(1, *n*).

z(*ldz*,*)

If *compz* = 'V', then *z* must contain the matrix *Q* from the reduction to Hessenberg form.

If *compz* = 'I', then *z* need not be set.

If *compz* = 'N', then *z* is not referenced.

The second dimension of *z* must be

at least max(1, *n*) if *compz* = 'V' or 'I';

at least 1 if *compz* = 'N'.

work(*lwork*) is a workspace array.

The dimension of *work* must be at least max (1, *n*).

ldh

INTEGER. The leading dimension of *h*; at least max(1, *n*).

ldz

INTEGER. The leading dimension of *z*;

If *compz* = 'N', then *ldz* ≥ 1.

If *compz* = 'V' or 'I', then *ldz* ≥ max(1, *n*).

lwork

INTEGER. The dimension of the array *work*.

lwork ≥ max(1, *n*) is sufficient and delivers very good and sometimes optimal performance. However, *lwork* as large as 11**n* may be required for optimal performance. A workspace query is recommended to determine the optimal workspace size.

If *lwork* = -1, then a workspace query is assumed; the routine only estimates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for details.

Output Parameters

w

COMPLEX for chseqr

DOUBLE COMPLEX for zhseqr.

Array, size at least max (1, *n*). Contains the computed eigenvalues, unless *info*>0. The eigenvalues are stored in the same order as on the diagonal of the Schur form *T* (if computed).

wr, *wi*

`REAL` for `shseqr`

`DOUBLE PRECISION` for `dhseqr`

Arrays, size at least max (1, *n*) each.

Contain the real and imaginary parts, respectively, of the computed eigenvalues, unless *info* > 0. Complex conjugate pairs of eigenvalues appear consecutively with the eigenvalue having positive imaginary part first. The eigenvalues are stored in the same order as on the diagonal of the Schur form *T* (if computed).

h

If *info* = 0 and *job* = 'S', *h* contains the upper quasi-triangular matrix *T* from the Schur decomposition (the Schur form).

If *info* = 0 and *job* = 'E', the contents of *h* are unspecified on exit. (The output value of *h* when *info* > 0 is given under the description of *info* below.)

z

If *compz* = 'V' and *info* = 0, then *z* contains *Q*Z*.

If *compz* = 'I' and *info* = 0, then *z* contains the unitary or orthogonal matrix *Z* of the Schur vectors of *H*.

If *compz* = 'N', then *z* is not referenced.

work(1)

On exit, if *info* = 0, then *work(1)* returns the optimal *lwork*.

info

`INTEGER`.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, `?hseqr` failed to compute all of the eigenvalues. Elements 1,2, ..., *ilo*-1 and *i*+1, *i*+2, ..., *n* of the eigenvalue arrays (*wr* and *wi* for real flavors and *w* for complex flavors) contain the real and imaginary parts of those eigenvalues that have been successfully found.

If *info* > 0, and *job* = 'E', then on exit, the remaining unconverged eigenvalues are the eigenvalues of the upper Hessenberg matrix rows and columns *ilo* through *info* of the final output value of *H*.

If *info* > 0, and *job* = 'S', then on exit (initial value of *H*)**U* = *U**(final value of *H*), where *U* is a unitary matrix. The final value of *H* is upper Hessenberg and triangular in rows and columns *info*+1 through *ihi*.

If *info* > 0, and *compz* = 'V', then on exit (final value of *Z*) = (initial value of *Z*)**U*, where *U* is the unitary matrix (regardless of the value of *job*).

If *info* > 0, and *compz* = 'I', then on exit (final value of *Z*) = *U*, where *U* is the unitary matrix (regardless of the value of *job*).

If *info* > 0, and *compz* = 'N', then *Z* is not accessed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `hseqr` interface are the following:

h	Holds the matrix *H* of size (*n*,*n*).
wr	Holds the vector of length *n*. Used in real flavors only.
wi	Holds the vector of length *n*. Used in real flavors only.
w	Holds the vector of length *n*. Used in complex flavors only.
z	Holds the matrix *Z* of size (*n*,*n*).
job	Must be `'E'` or `'S'`. The default value is `'E'`.
compz	If omitted, this argument is restored based on the presence of argument *z* as follows: *compz* = `'I'`, if *z* is present, *compz* = `'N'`, if *z* is omitted. If present, *compz* must be equal to `'I'` or `'V'` and the argument *z* must also be present. Note that there will be an error condition if *compz* is present and *z* omitted.

Application Notes

The computed Schur factorization is the exact factorization of a nearby matrix $H + E$, where $||E||_2 < O(\varepsilon)||H||_2/s_i$, and ε is the machine precision.

If λ_i is an exact eigenvalue, and μ_i is the corresponding computed value, then $|\lambda_i - \mu_i| \le c(n)*\varepsilon*||H||_2/s_i$, where $c(n)$ is a modestly increasing function of n, and s_i is the reciprocal condition number of λ_i. The condition numbers s_i may be computed by calling trsna.

The total number of floating-point operations depends on how rapidly the algorithm converges; typical numbers are as follows.

If only eigenvalues are computed:	$7n^3$ for real flavors $25n^3$ for complex flavors.
If the Schur form is computed:	$10n^3$ for real flavors $35n^3$ for complex flavors.
If the full Schur factorization is computed:	$20n^3$ for real flavors $70n^3$ for complex flavors.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?hsein
Computes selected eigenvectors of an upper Hessenberg matrix that correspond to specified eigenvalues.

Syntax

```
call shsein(side, eigsrc, initv, select, n, h, ldh, wr, wi, vl, ldvl, vr, ldvr, mm, m, work, ifaill, ifailr, info)

```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes left and/or right eigenvectors of an upper Hessenberg matrix *H*, corresponding to selected eigenvalues.

The right eigenvector *x* and the left eigenvector *y*, corresponding to an eigenvalue λ, are defined by: $H*x = \lambda*x$ and $y^H*H = \lambda*y^H$ (or $H^H*y = \lambda^**y$). Here λ^* denotes the conjugate of λ.

The eigenvectors are computed by inverse iteration. They are scaled so that, for a real eigenvector x, $\max|x_i| = 1$, and for a complex eigenvector, $\max(|\mathrm{Re}x_i| + |\mathrm{Im}x_i|) = 1$.

If *H* has been formed by reduction of a general matrix *A* to upper Hessenberg form, then eigenvectors of *H* may be transformed to eigenvectors of *A* by ormhr or unmhr.

Input Parameters

side

CHARACTER*1. Must be 'R' or 'L' or 'B'.

If *side* = 'R', then only right eigenvectors are computed.

If *side* = 'L', then only left eigenvectors are computed.

If *side* = 'B', then all eigenvectors are computed.

eigsrc

CHARACTER*1. Must be 'Q' or 'N'.

If *eigsrc* = 'Q', then the eigenvalues of *H* were found using hseqr; thus if *H* has any zero sub-diagonal elements (and so is block triangular), then the *j*-th eigenvalue can be assumed to be an eigenvalue of the block containing

the *j*-th row/column. This property allows the routine to perform inverse iteration on just one diagonal block. If *eigsrc* = 'N', then no such assumption is made and the routine performs inverse iteration using the whole matrix.

initv — CHARACTER*1. Must be 'N' or 'U'.

If *initv* = 'N', then no initial estimates for the selected eigenvectors are supplied.

If *initv* = 'U', then initial estimates for the selected eigenvectors are supplied in *vl* and/or *vr*.

select — LOGICAL.

Array, size at least max (1, *n*). Specifies which eigenvectors are to be computed.

For real flavors:

To obtain the real eigenvector corresponding to the real eigenvalue *wr*(*j*), set *select*(*j*) to .TRUE.

To select the complex eigenvector corresponding to the complex eigenvalue (*wr*(*j*), *wi*(*j*)) with complex conjugate (*wr*(*j*+1), *wi*(*j*+1)), set *select*(*j*) and/or *select*(*j*+1) to .TRUE.; the eigenvector corresponding to the first eigenvalue in the pair is computed.

For complex flavors:

To select the eigenvector corresponding to the eigenvalue *w*(*j*), set *select*(*j*) to .TRUE.

n — INTEGER. The order of the matrix *H* (*n*≥ 0).

h, *vl*, *vr*, *work* — REAL for shsein

DOUBLE PRECISION for dhsein

COMPLEX for chsein

DOUBLE COMPLEX for zhsein.

Arrays:

h(*ldh*,*) The *n*-by-*n* upper Hessenberg matrix *H*. If an NAN value is detected in *h*, the routine returns with *info* = -6.

The second dimension of *h* must be at least max(1, *n*).

vl(*ldvl*,*)

If *initv* = 'V' and *side* = 'L' or 'B', then *vl* must contain starting vectors for inverse iteration for the left eigenvectors. Each starting vector must be stored in the same column or columns as will be used to store the corresponding eigenvector.

If *initv* = 'N', then *vl* need not be set.

The second dimension of *vl* must be at least max(1, *mm*) if *side* = 'L' or 'B' and at least 1 if *side* = 'R'.

The array *vl* is not referenced if *side* = 'R'.

vr(*ldvr*,*)

If *initv* = 'V' and *side* = 'R' or 'B', then *vr* must contain starting vectors for inverse iteration for the right eigenvectors. Each starting vector must be stored in the same column or columns as will be used to store the corresponding eigenvector.

If *initv* = 'N', then *vr* need not be set.

The second dimension of *vr* must be at least max(1, *mm*) if *side* = 'R' or 'B' and at least 1 if *side* = 'L'.

The array *vr* is not referenced if *side* = 'L'.

work(*) is a workspace array.

size at least max (1, *n**(*n*+*2*)) for real flavors and at least max (1, *n***n*) for complex flavors.

ldh INTEGER. The leading dimension of *h*; at least max(1, *n*).

w COMPLEX for chsein

DOUBLE COMPLEX for zhsein.

Array, size at least max (1, *n*).

Contains the eigenvalues of the matrix *H*.

If *eigsrc* = 'Q', the array must be exactly as returned by ?hseqr.

wr, *wi* REAL for shsein

DOUBLE PRECISION for dhsein

Arrays, size at least max (1, *n*) each.

Contain the real and imaginary parts, respectively, of the eigenvalues of the matrix *H*. Complex conjugate pairs of values must be stored in consecutive elements of the arrays. If *eigsrc* = 'Q', the arrays must be exactly as returned by ?hseqr.

ldvl INTEGER. The leading dimension of *vl*.

If *side* = 'L' or 'B', *ldvl*≥ max(1,*n*) .

If *side* = 'R', *ldvl*≥ 1.

ldvr INTEGER. The leading dimension of *vr*.

If *side* = 'R' or 'B', *ldvr*≥ max(1,*n*) .

If *side* = 'L', *ldvr*≥1.

mm INTEGER. The number of columns in *vl* and/or *vr*.

Must be at least *m*, the actual number of columns required (see *Output Parameters* below).

For real flavors, *m* is obtained by counting 1 for each selected real eigenvector and 2 for each selected complex eigenvector (see *select*).

For complex flavors, *m* is the number of selected eigenvectors (see *select*).

Constraint:

0 ≤*mm*≤*n*.

rwork

REAL for chsein

DOUBLE PRECISION for zhsein.

Array, size at least max (1, *n*).

Output Parameters

select

Overwritten for real flavors only.

If a complex eigenvector was selected as specified above, then *select*(*j*) is set to .TRUE. and *select*(*j* + 1) to .FALSE.

w

The real parts of some elements of *w* may be modified, as close eigenvalues are perturbed slightly in searching for independent eigenvectors.

wr

Some elements of *wr* may be modified, as close eigenvalues are perturbed slightly in searching for independent eigenvectors.

vl, *vr*

If *side* = 'L' or 'B', *vl* contains the computed left eigenvectors (as specified by *select*).

If *side* = 'R' or 'B', *vr* contains the computed right eigenvectors (as specified by *select*).

The eigenvectors treated column-wise form a rectangular *n*-by-*mm* matrix.

For real flavors: a real eigenvector corresponding to a real eigenvalue occupies one column of the matrix; a complex eigenvector corresponding to a complex eigenvalue occupies two columns: the first column holds the real part of the eigenvector and the second column holds the imaginary part of the eigenvector. The matrix is stored in a one-dimensional array as described by *matrix_layout* (using either column major or row major layout).

m

INTEGER. *For real flavors*: the number of columns of *vl* and/or *vr* required to store the selected eigenvectors.

For complex flavors: the number of selected eigenvectors.

ifaill, *ifailr*

INTEGER.

Arrays, size at least max(1, *mm*) each.

ifaill(*i*) = 0 if the *i*th column of *vl* converged;

ifaill(*i*) = *j* > 0 if the eigenvector stored in the *i*-th column of *vl* (corresponding to the *j*th eigenvalue) failed to converge.

ifailr(*i*) = 0 if the *i*th column of *vr* converged;

ifailr(*i*) = *j* > 0 if the eigenvector stored in the *i*-th column of *vr* (corresponding to the *j*th eigenvalue) failed to converge.

For real flavors: if the *i*th and (*i*+1)th columns of *vl* contain a selected complex eigenvector, then *ifaill*(*i*) and *ifaill*(*i* + 1) are set to the same value. A similar rule holds for *vr* and *ifailr*.

The array *ifaill* is not referenced if *side* = 'R'. The array *ifailr* is not referenced if *side* = 'L'.

info

INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* > 0, then *i* eigenvectors (as indicated by the parameters *ifaill* and/or *ifailr* above) failed to converge. The corresponding columns of *vl* and/or *vr* contain no useful information.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `hsein` interface are the following:

h Holds the matrix *H* of size (*n*,*n*).

wr Holds the vector of length *n*. Used in real flavors only.

wi Holds the vector of length *n*. Used in real flavors only.

w Holds the vector of length *n*. Used in complex flavors only.

select Holds the vector of length *n*.

vl Holds the matrix *VL* of size (*n*,*mm*).

vr Holds the matrix *VR* of size (*n*,*mm*).

ifaill Holds the vector of length (*mm*). Note that there will be an error condition if *ifaill* is present and *vl* is omitted.

ifailr Holds the vector of length (*mm*). Note that there will be an error condition if *ifailr* is present and *vr* is omitted.

initv Must be `'N'` or `'U'`. The default value is `'N'`.

eigsrc Must be `'N'` or `'Q'`. The default value is `'N'`.

side Restored based on the presence of arguments *vl* and *vr* as follows:

side = `'B'`, if both *vl* and *vr* are present,

side = `'L'`, if *vl* is present and *vr* omitted,

side = `'R'`, if *vl* is omitted and *vr* present,

Note that there will be an error condition if both *vl* and *vr* are omitted.

Application Notes

Each computed right eigenvector *x* i is the exact eigenvector of a nearby matrix $A + E_i$, such that $||E_i|| < O(\varepsilon)||A||$. Hence the residual is small:

$||Ax_i - \lambda_i x_i|| = O(\varepsilon)||A||$.

However, eigenvectors corresponding to close or coincident eigenvalues may not accurately span the relevant subspaces.

Similar remarks apply to computed left eigenvectors.

?trevc

Computes selected eigenvectors of an upper (quasi-) triangular matrix computed by ?hseqr.

Syntax

```
call strevc(side, howmny, select, n, t, ldt, vl, ldvl, vr, ldvr, mm, m, work, info)
call dtrevc(side, howmny, select, n, t, ldt, vl, ldvl, vr, ldvr, mm, m, work, info)
call ctrevc(side, howmny, select, n, t, ldt, vl, ldvl, vr, ldvr, mm, m, work, rwork, info)
call ztrevc(side, howmny, select, n, t, ldt, vl, ldvl, vr, ldvr, mm, m, work, rwork, info)
call trevc(t [, howmny] [,select] [,vl] [,vr] [,m] [,info])
```

Include Files

Description

The routine computes some or all of the right and/or left eigenvectors of an upper triangular matrix *T* (or, for real flavors, an upper quasi-triangular matrix *T*). Matrices of this type are produced by the Schur factorization of a general matrix: $A = Q*T*Q^H$, as computed by hseqr.

The right eigenvector *x* and the left eigenvector *y* of *T* corresponding to an eigenvalue *w*, are defined by:

$T*x = w*x$, $y^H*T = w*y^H$, where y^H denotes the conjugate transpose of *y*.

The eigenvalues are not input to this routine, but are read directly from the diagonal blocks of *T*.

This routine returns the matrices *X* and/or *Y* of right and left eigenvectors of *T*, or the products *Q***X* and/or *Q***Y*, where *Q* is an input matrix.

If *Q* is the orthogonal/unitary factor that reduces a matrix *A* to Schur form *T*, then *Q***X* and *Q***Y* are the matrices of right and left eigenvectors of *A*.

Input Parameters

side

CHARACTER*1. Must be 'R' or 'L' or 'B'.

If *side* = 'R', then only right eigenvectors are computed.

If *side* = 'L', then only left eigenvectors are computed.

If *side* = 'B', then all eigenvectors are computed.

howmny

CHARACTER*1. Must be 'A' or 'B' or 'S'.

If *howmny* = 'A', then all eigenvectors (as specified by *side*) are computed.

If *howmny* = 'B', then all eigenvectors (as specified by *side*) are computed and backtransformed by the matrices supplied in *vl* and *vr*.

If *howmny* = 'S', then selected eigenvectors (as specified by *side* and *select*) are computed.

select

LOGICAL.

Array, size at least max (1, *n*).

If *howmny* = 'S', *select* specifies which eigenvectors are to be computed.

If *howmny* = 'A' or 'B', *select* is not referenced.

For real flavors:

If *omega*(*j*) is a real eigenvalue, the corresponding real eigenvector is computed if *select*(*j*) is .TRUE..

If *omega*(*j*) and *omega*(*j* + 1) are the real and imaginary parts of a complex eigenvalue, the corresponding complex eigenvector is computed if either *select*(*j*) or *select*(*j* + 1) is .TRUE., and on exit *select*(*j*) is set to .TRUE.and *select*(*j* + 1) is set to .FALSE..

For complex flavors:

The eigenvector corresponding to the *j*-th eigenvalue is computed if *select*(*j*) is .TRUE..

n — INTEGER. The order of the matrix *T* (*n*≥ 0).

t, *vl*, *vr* — REAL for strevc

DOUBLE PRECISION for dtrevc

COMPLEX for ctrevc

DOUBLE COMPLEX for ztrevc.

Arrays:

t(*ldt*,*) contains the *n*-by-*n* matrix *T* in Schur canonical form. For complex flavors ctrevc and ztrevc, contains the upper triangular matrix *T*.

The second dimension of *t* must be at least max(1, *n*).

vl(*ldvl*,*)

If *howmny* = 'B' and *side* = 'L' or 'B', then *vl* must contain an *n*-by-*n* matrix *Q* (usually the matrix of Schur vectors returned by ?hseqr).

If *howmny* = 'A' or 'S', then *vl* need not be set.

The second dimension of *vl* must be at least max(1, *mm*) if *side* = 'L' or 'B' and at least 1 if *side* = 'R'.

The array *vl* is not referenced if *side* = 'R'.

vr(*ldvr*,*)

If *howmny* = 'B' and *side* = 'R' or 'B', then *vr* must contain an *n*-by-*n* matrix *Q* (usually the matrix of Schur vectors returned by ?hseqr). .

If *howmny* = 'A' or 'S', then *vr* need not be set.

The second dimension of *vr* must be at least max(1, *mm*) if *side* = 'R' or 'B' and at least 1 if *side* = 'L'.

The array *vr* is not referenced if *side* = 'L'.

work(*) is a workspace array.

size at least max (1, 3**n*) for real flavors and at least max (1, 2**n*) for complex flavors.

ldt — INTEGER. The leading dimension of *t*; at least max(1, *n*).

ldvl INTEGER. The leading dimension of *vl*.

If *side* = 'L' or 'B', *ldvl*≥*n*.

If *side* = 'R', *ldvl*≥ 1.

ldvr INTEGER. The leading dimension of *vr*.

If *side* = 'R' or 'B', *ldvr*≥*n*.

If *side* = 'L', *ldvr*≥ 1.

mm INTEGER. The number of columns in the arrays *vl* and/or *vr*. Must be at least *m* (the precise number of columns required).

If *howmny* = 'A' or 'B', *mm* = *n*.

If *howmny* = 'S': *for real flavors*, *mm* is obtained by counting 1 for each selected real eigenvector and 2 for each selected complex eigenvector;

for complex flavors, *mm* is the number of selected eigenvectors (see *select*).

Constraint: 0 ≤*mm*≤*n*.

rwork REAL for ctrevc

DOUBLE PRECISION for ztrevc.

Workspace array, size at least max (1, *n*).

Output Parameters

select If a complex eigenvector of a real matrix was selected as specified above, then *select*(*j*) is set to .TRUE. and *select*(*j* + 1) to .FALSE.

t COMPLEX for ctrevc

DOUBLE COMPLEX for ztrevc.

ctrevc/ztrevc modify the *t*(*ldt*,*) array, which is restored on exit.

vl, *vr* If *side* = 'L' or 'B', *vl* contains the computed left eigenvectors (as specified by *howmny* and *select*).

If *side* = 'R' or 'B', *vr* contains the computed right eigenvectors (as specified by *howmny* and *select*).

The eigenvectors treated column-wise form a rectangular *n*-by-*mm* matrix.

For real flavors: a real eigenvector corresponding to a real eigenvalue occupies one column of the matrix; a complex eigenvector corresponding to a complex eigenvalue occupies two columns: the first column holds the real part of the eigenvector and the second column holds the imaginary part of the eigenvector. The matrix is stored in a one-dimensional array as described by *matrix_layout* (using either column major or row major layout).

m INTEGER.

For complex flavors: the number of selected eigenvectors.

If *howmny* = 'A' or 'B', *m* is set to *n*.

For real flavors: the number of columns of *vl* and/or *vr* actually used to store the selected eigenvectors.

If *howmny* = 'A' or 'B', *m* is set to *n*.

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine trevc interface are the following:

t — Holds the matrix *T* of size (*n*,*n*).

select — Holds the vector of length *n*.

vl — Holds the matrix *VL* of size (*n*,*mm*).

vr — Holds the matrix *VR* of size (*n*,*mm*).

side — If omitted, this argument is restored based on the presence of arguments *vl* and *vr* as follows:

side = 'B', if both *vl* and *vr* are present,

side = 'L', if *vr* is omitted,

side = 'R', if *vl* is omitted.

Note that there will be an error condition if both *vl* and *vr* are omitted.

howmny — If omitted, this argument is restored based on the presence of argument *select* as follows:

howmny = 'V', if *q* is present,

howmny = 'N', if *q* is omitted.

If present, *vect* = 'V' or 'U' and the argument *q* must also be present.

Note that there will be an error condition if both *select* and *howmny* are present.

Application Notes

If x_i is an exact right eigenvector and y_i is the corresponding computed eigenvector, then the angle $\theta(y_i, x_i)$ between them is bounded as follows: $\theta(y_i, x_i) \leq (c(n)\varepsilon ||T||_2)/\text{sep}_i$ where sep_i is the reciprocal condition number of x_i. The condition number sep_i may be computed by calling ?trsna.

?trevc3
Computes selected eigenvectors of an upper (quasi-) triangular matrix computed by ?hseqr using Level 3 BLAS

Syntax

```

Description

This routine computes some or all of the right and left eigenvectors of an upper triangular matrix *T* (or, for real flavors, an upper quasi-triangular matrix *T*) using Level 3 BLAS. Matrices of this type are produced by the Schur factorization of a general matrix: `A =Q*T*QH`, as computed by `hseqr`.

The right eigenvector *x* and the left eigenvector *y* of *T* corresponding to an eigenvalue *w* are defined by the following:

$T*x = w*x, y^H*T = w*y^H$

where y^H denotes the conjugate transpose of *y*.

The eigenvalues are not passed to this routine but are read directly from the diagonal blocks of *T*.

This routine returns one or both of the matrices *X* and *Y* of the right and left eigenvectors of *T*, or one or both of the products `Q*X` and `Q*Y`, where *Q* is an input matrix.

If *Q* is the orthogonal/unitary factor that reduces a matrix *A* to Schur form *T*, then `Q*X` and `Q*Y` are the matrices of the right and left eigenvectors of *A*.

Input Parameters

side

`CHARACTER*1`

Must be `'R'`, `'L'`, or `'B'`.

- If *side* = `'R'`, only right eigenvectors are computed.
- If *side* = `'L'`, only left eigenvectors are computed.
- If *side* = `'B'`, all eigenvectors are computed.

howmny

`CHARACTER*1`

Must be `'A'`, `'B'`, or `'S'`.

- If *howmny* = `'A'`, all eigenvectors (as specified by *side*) are computed.
- If *howmny* = `'B'`, all eigenvectors (as specified by *side*) are computed and back-transformed by the matrices supplied in *vl* and *vr*.
- If *howmny* = `'S'`, selected eigenvectors (as specified by *side* and *select*) are computed.

select

Array with a size of at least `max (1, n)`

If *howmny* = `'S'`, *select* specifies which eigenvectors are to be computed. If *howmny* = `'A'` or *howmny* = `'B'`, *select* is not referenced.

For real flavors:

- If `omega(j)` is a real eigenvalue and `select(j)` is `.TRUE.`, the corresponding real eigenvector is computed.
- If `omega(j)` and `omega(j + 1)` are the real and imaginary parts of a complex eigenvalue and either `select(j)` or `select(j + 1)` is `.TRUE.`, the corresponding complex eigenvector is computed, and on exit `select(j)` is set to `.TRUE.` and `select(j + 1)` is set to `.FALSE.`.

For complex flavors:

- If `select(j)` is `.TRUE.`, the eigenvector corresponding to the j^{th} eigenvalue is computed.

n

`INTEGER`

The order of the matrix `T` ($n \geq 0$).

t, *vl*, *vr*, *work*

- `REAL` for `strevc3`
- `DOUBLE PRECISION` for `dtrevc3`
- `COMPLEX` for `ctrevc3`
- `DOUBLE COMPLEX` for `ztrevc3`

Arrays:

- `t(ldt,*)` contains the *n*-by-*n* matrix *T* in Schur canonical form. For complex flavors `ctrevc3` and `ztrevc3`, the array contains the upper triangular matrix *T*.

  The second dimension of *t* must be at least `max(1, n)`.
- `vl(ldvl,*)`

  If *howmny* = `'B'` and *side* = `'L'` or `'B'`, then *vl* must contain an *n*-by-*n* matrix *Q* (usually the matrix of Schur vectors returned by `?hseqr`).

  If *howmny* = `'A'` or `'S'`, *vl* need not be set.

  The second dimension of *vl* must be at least `max(1, mm)` if *side* = `'L'` or `'B'`, and at least `1` if *side* = `'R'`.

  The array *vl* is not referenced if *side* = `'R'`.
- `vr(ldvr,*)`

  If *howmny* = `'B'` and *side* = `'R'` or `'B'`, *vr* must contain an *n*-by-*n* matrix *Q* (usually the matrix of Schur vectors returned by `?hseqr`).

  If *howmny* = `'A'` or `'S'`, *vr* need not be set.

  The second dimension of *vr* must be at least `max(1, mm)` if *side* = `'R'` or `'B'`, and at least `1` if *side* = `'L'`.

  The array *vr* is not referenced if *side* = `'L'`.
- `work(*)` is a workspace array, and its dimension is `max (1, lwork)`.

lwork

`INTEGER`

The size of the work array. Must be at least `max(1, 3*n)` for real flavors, and at least `max(1, 2*n)` for complex flavors.

If *lwork* = -1, a workspace query is assumed; the routine calculates only the optimal size of the work array and returns this value as the first entry of the work array, and no error message related to *lwork* is issued by xerbla. For details, see "Application Notes" below.

ldt

INTEGER

The leading dimension of *t*. It is at least max(1, n).

ldvl

INTEGER

The leading dimension of *vl*.

- If *side* = 'L' or 'B', ldvl≥n.
- If *side* = 'R', ldvl≥ 1.

ldvr

INTEGER

The leading dimension of *vr*.

- If *side* = 'R' or 'B', ldvr≥n.
- If *side* = 'L', ldvr≥ 1.

mm

INTEGER

The number of columns in one or both of the arrays *vl* and *vr*. Must be at least *m* (the precise number of columns required).

- If *howmny* = 'A' or 'B', mm = n.
- If *howmny* = 'S': for real flavors, *mm* is obtained by counting 1 for each selected real eigenvector and 2 for each selected complex eigenvector; for complex flavors, *mm* is the number of selected eigenvectors (see *select*).

Constraint: 0 ≤*mm*≤*n*.

rwork

- REAL for ctrevc3
- DOUBLE PRECISION for ztrevc3

The workspace array is used in complex flavors only. Its dimensionis max (1, lrwork).

lrwork

INTEGER

The size of the *rwork* array. It must be at least max(1, n).

If *lrwork* = -1, a workspace query is assumed; the routine calculates only the optimal size of the work array and returns this value as the first entry of the *rwork* array, and no error message related to *lrwork* is issued by xerbla. For details, see "Application Notes" below.

Output Parameters

select

If a complex eigenvector of a real matrix was selected as specified above, then select(j) is set to .TRUE. and select(j + 1) is set to .FALSE..

t

COMPLEX for ctrevc3

DOUBLE COMPLEX for ztrevc3

`ctrevc3` or `ztrevc3` modifies the `t(ldt,*)` array, which is restored on exit.

vl, *vr*

If *side* = `'L'` or `'B'`, *vl* contains the computed left eigenvectors (as specified by *howmny* and *select*).

If *side* = `'R'` or `'B'`, *vr* contains the computed right eigenvectors (as specified by *howmny* and *select*).

Treated column-wise, the eigenvectors form a rectangular *n*-by-*mm* matrix.

For real flavors A real eigenvector corresponding to a real eigenvalue occupies one column of the matrix; a complex eigenvector corresponding to a complex eigenvalue occupies two columns. The first column holds the real part of the eigenvector, and the second column holds the imaginary part of the eigenvector. The matrix is stored in a one-dimensional array as described by `matrix_layout` (using either column major or row major layout).

m

`INTEGER`

For complex flavors The number of selected eigenvectors. If *howmny* = `'A'` or `'B'`, *m* is set to *n*.

For real flavors The number of columns of one or both of *vl* and *vr* actually used to store the selected eigenvectors. If *howmny* = `'A'` or `'B'`, *m* is set to *n*.

work(1)

On exit, if *info* = `0`, *work(1)* returns the required optimal size of *lwork*.

rwork(1)

On exit, if *info* = `0`, then *rwork(1)* returns the required optimal size of *lrwork*.

info

`INTEGER`

If *info* = `0`, the execution is successful.

If *info* = `-i`, the i^{th} parameter contained an illegal value.

Application Notes

If *xi* is an exact right eigenvector and *yi* is the corresponding computed eigenvector, the angle `θ(yi, xi)` between them is bounded as follows:

```
θ(yi,xi)≤(c(n)ε||T||2)/sepi
```

where *sepi* is the reciprocal condition number of *xi*. You can compute the condition number *sepi* by calling `?trsna`.

Matrix Storage Schemes

?trsna

Estimates condition numbers for specified eigenvalues and right eigenvectors of an upper (quasi-) triangular matrix.

Syntax

```
call strsna(job, howmny, select, n, t, ldt, vl, ldvl, vr, ldvr, s, sep, mm, m, work, ldwork, iwork, info)
call dtrsna(job, howmny, select, n, t, ldt, vl, ldvl, vr, ldvr, s, sep, mm, m, work, ldwork, iwork, info)
call ctrsna(job, howmny, select, n, t, ldt, vl, ldvl, vr, ldvr, s, sep, mm, m, work, ldwork, rwork, info)
call ztrsna(job, howmny, select, n, t, ldt, vl, ldvl, vr, ldvr, s, sep, mm, m, work, ldwork, rwork, info)
call trsna(t [, s] [,sep] [,vl] [,vr] [,select] [,m] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine estimates condition numbers for specified eigenvalues and/or right eigenvectors of an upper triangular matrix T (or, for real flavors, upper quasi-triangular matrix T in canonical Schur form). These are the same as the condition numbers of the eigenvalues and right eigenvectors of an original matrix $A = Z*T*Z^H$ (with unitary or, for real flavors, orthogonal Z), from which T may have been derived.

The routine computes the reciprocal of the condition number of an eigenvalue λ_i as $s_i = |v^T*u|/(||u||_E||v||_E)$ for real flavors and $s_i = |v^H*u|/(||u||_E||v||_E)$ for complex flavors,

where:

- u and v are the right and left eigenvectors of T, respectively, corresponding to λ_i.
- v^T/v^H denote transpose/conjugate transpose of v, respectively.

This reciprocal condition number always lies between zero (ill-conditioned) and one (well-conditioned).

An approximate error estimate for a computed eigenvalue λ_i is then given by $\varepsilon*||T||/s_i$, where ε is the *machine precision*.

To estimate the reciprocal of the condition number of the right eigenvector corresponding to λ_i, the routine first calls trexc to reorder the diagonal elements of matrix T so that λ_i is in the leading position:

$$T = Q \begin{bmatrix} \lambda_i & C^H \\ 0 & T_{22} \end{bmatrix} Q^H$$

The reciprocal condition number of the eigenvector is then estimated as sep_i, the smallest singular value of the matrix T_{22} - λ_i*I.

An approximate error estimate for a computed right eigenvector u corresponding to λ_i is then given by ε*||T||/sep_i.

Input Parameters

job

CHARACTER*1. Must be 'E' or 'V' or 'B'.

If *job* = 'E', then condition numbers for eigenvalues only are computed.

If *job* = 'V', then condition numbers for eigenvectors only are computed.

If *job* = 'B', then condition numbers for both eigenvalues and eigenvectors are computed.

howmny

CHARACTER*1. Must be 'A' or 'S'.

If *howmny* = 'A', then the condition numbers for all eigenpairs are computed.

If *howmny* = 'S', then condition numbers for selected eigenpairs (as specified by *select*) are computed.

select

LOGICAL.

Array, size at least max (1, *n*) if *howmny* = 'S' and at least 1 otherwise.

Specifies the eigenpairs for which condition numbers are to be computed if *howmny*= 'S'.

For real flavors:

To select condition numbers for the eigenpair corresponding to the real eigenvalue λ_j, *select*(*j*) must be set .TRUE.;

to select condition numbers for the eigenpair corresponding to a complex conjugate pair of eigenvalues λ_j and λ_{j+1}), *select*(*j*) and/or *select*(*j* + 1) must be set .TRUE.

For complex flavors

To select condition numbers for the eigenpair corresponding to the eigenvalue λ_j, *select*(*j*) must be set .TRUE.*select* is not referenced if *howmny* = 'A'.

n

INTEGER. The order of the matrix *T* (*n*≥ 0).

t, *vl*, *vr*, *work*

REAL for strsna

DOUBLE PRECISION for dtrsna

COMPLEX for ctrsna

DOUBLE COMPLEX for ztrsna.

Arrays:

t(*ldt*,*) contains the *n*-by-*n* matrix *T*.

The second dimension of *t* must be at least max(1, *n*).

vl(*ldvl*,*)

If *job* = 'E' or 'B', then *vl* must contain the left eigenvectors of *T* (or of any matrix $Q*T*Q^H$ with *Q* unitary or orthogonal) corresponding to the eigenpairs specified by *howmny* and *select*. The eigenvectors must be stored in consecutive columns of *vl*, as returned by trevc or hsein.

The second dimension of *vl* must be at least max(1, *mm*) if *job* = 'E' or 'B' and at least 1 if *job* = 'V'.

The array *vl* is not referenced if *job* = 'V'.

vr(*ldvr*,*)

If *job* = 'E' or 'B', then *vr* must contain the right eigenvectors of *T* (or of any matrix $Q*T*Q^H$ with *Q* unitary or orthogonal) corresponding to the eigenpairs specified by *howmny* and *select*. The eigenvectors must be stored in consecutive columns of *vr*, as returned by trevc or hsein.

The second dimension of *vr* must be at least max(1, *mm*) if *job* = 'E' or 'B' and at least 1 if *job* = 'V'.

The array *vr* is not referenced if *job* = 'V'.

work is a workspace array, its dimension (*ldwork*,*n*+6).

The array *work* is not referenced if *job* = 'E'.

ldt — INTEGER. The leading dimension of *t*; at least max(1, *n*).

ldvl — INTEGER. The leading dimension of *vl*.

If *job* = 'E' or 'B', *ldvl* ≥ max(1,*n*) .

If *job* = 'V', *ldvl* ≥ 1.

ldvr — INTEGER. The leading dimension of *vr*.

If *job* = 'E' or 'B', *ldvr* ≥ max(1,*n*) .

If *job* = 'R', *ldvr* ≥ 1.

mm — INTEGER. The number of elements in the arrays *s* and *sep*, and the number of columns in *vl* and *vr* (if used). Must be at least *m* (the precise number required).

If *howmny* = 'A', *mm* = *n*;

if *howmny* = 'S', *for real flavorsmm* is obtained by counting 1 for each selected real eigenvalue and 2 for each selected complex conjugate pair of eigenvalues.

for complex flavorsmm is the number of selected eigenpairs (see *select*). Constraint:

0 ≤*mm*≤*n*.

ldwork — INTEGER. The leading dimension of *work*.

If *job* = 'V' or 'B', *ldwork* ≥ max(1,*n*).

If *job* = 'E', *ldwork* ≥ 1.

rwork — REAL for ctrsna, ztrsna.

Array, size at least max (1, *n*). The array is not referenced if *job* = 'E'.

iwork INTEGER for strsna, dtrsna.

Array, size at least max (1, 2*(*n* - 1)). The array is not referenced if *job* = 'E'.

Output Parameters

s REAL for single-precision flavors

DOUBLE PRECISION for double-precision flavors.

Array, size at least max(1, *mm*) if *job* = 'E' or 'B' and at least 1 if *job* = 'V'.

Contains the reciprocal condition numbers of the selected eigenvalues if *job* = 'E' or 'B', stored in consecutive elements of the array. Thus *s*(*j*), *sep*(*j*) and the *j*-th columns of *vl* and *vr* all correspond to the same eigenpair (but not in general the *j* th eigenpair unless all eigenpairs have been selected).

For real flavors: for a complex conjugate pair of eigenvalues, two consecutive elements of *s* are set to the same value. The array *s* is not referenced if *job* = 'V'.

sep REAL for single-precision flavors

DOUBLE PRECISION for double-precision flavors.

Array, size at least max(1, *mm*) if *job* = 'V' or 'B' and at least 1 if *job* = 'E'. Contains the estimated reciprocal condition numbers of the selected right eigenvectors if *job* = 'V' or 'B', stored in consecutive elements of the array.

For real flavors: for a complex eigenvector, two consecutive elements of *sep* are set to the same value; if the eigenvalues cannot be reordered to compute *sep*(*j*), then *sep*(*j*) is set to zero; this can only occur when the true value would be very small anyway. The array *sep* is not referenced if *job* = 'E'.

m INTEGER.

For complex flavors: the number of selected eigenpairs.

If *howmny* = 'A', *m* is set to *n*.

For real flavors: the number of elements of *s* and/or *sep* actually used to store the estimated condition numbers.

If *howmny* = 'A', *m* is set to *n*.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine trsna interface are the following:

t	Holds the matrix *T* of size (*n*,*n*).
s	Holds the vector of length (*mm*).
sep	Holds the vector of length (*mm*).
vl	Holds the matrix *VL* of size (*n*,*mm*).
vr	Holds the matrix *VR* of size (*n*,*mm*).
select	Holds the vector of length *n*.
job	Restored based on the presence of arguments *s* and sep as follows: *job* = 'B', if both *s* and *sep* are present, *job* = 'E', if *s* is present and *sep* omitted, *job* = 'V', if *s* is omitted and *sep* present. Note an error condition if both *s* and *sep* are omitted.
howmny	Restored based on the presence of the argument *select* as follows: *howmny* = 'S', if *select* is present, *howmny* = 'A', if *select* is omitted.

Note that the arguments *s*, *vl*, and *vr* must either be all present or all omitted.

Otherwise, an error condition is observed.

Application Notes

The computed values sep_i may overestimate the true value, but seldom by a factor of more than 3.

?trexc
Reorders the Schur factorization of a general matrix.

Syntax

```
call strexc(compq, n, t, ldt, q, ldq, ifst, ilst, work, info)
call dtrexc(compq, n, t, ldt, q, ldq, ifst, ilst, work, info)
call ctrexc(compq, n, t, ldt, q, ldq, ifst, ilst, info)
call ztrexc(compq, n, t, ldt, q, ldq, ifst, ilst, info)
call trexc(t, ifst, ilst [,q] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine reorders the Schur factorization of a general matrix $A = Q*T*Q^H$, so that the diagonal element or block of *T* with row index *ifst* is moved to row *ilst*.

The reordered Schur form *S* is computed by an unitary (or, for real flavors, orthogonal) similarity transformation: $S = Z^H*T*Z$. Optionally the updated matrix *P* of Schur vectors is computed as $P = Q*Z$, giving $A = P*S*P^H$.

Input Parameters

compq	CHARACTER*1. Must be 'V' or 'N'. If *compq* = 'V', then the Schur vectors (*Q*) are updated. If *compq* = 'N', then no Schur vectors are updated.
n	INTEGER. The order of the matrix *T* ($n \geq 0$).
t, *q*	REAL for strexc DOUBLE PRECISION for dtrexc COMPLEX for ctrexc DOUBLE COMPLEX for ztrexc. Arrays: *t*(*ldt*,*) contains the *n*-by-*n* matrix *T*. The second dimension of *t* must be at least max(1, *n*). *q*(*ldq*,*) If *compq* = 'V', then *q* must contain *Q* (Schur vectors). If *compq* = 'N', then *q* is not referenced. The second dimension of *q* must be at least max(1, *n*) if *compq* = 'V' and at least 1 if *compq* = 'N'.
ldt	INTEGER. The leading dimension of *t*; at least max(1, *n*).
ldq	INTEGER. The leading dimension of *q*; If *compq* = 'N', then $ldq \geq 1$. If *compq* = 'V', then $ldq \geq \max(1, n)$.
ifst, *ilst*	INTEGER. $1 \leq ifst \leq n$; $1 \leq ilst \leq n$. Must specify the reordering of the diagonal elements (or blocks, which is possible for real flavors) of the matrix *T*. The element (or block) with row index *ifst* is moved to row *ilst* by a sequence of exchanges between adjacent elements (or blocks).
work	REAL for strexc DOUBLE PRECISION for dtrexc. Array, size at least max (1, *n*).

Output Parameters

t	Overwritten by the updated matrix *S*.
q	If *compq* = 'V', *q* contains the updated matrix of Schur vectors.
ifst, *ilst*	Overwritten for real flavors only. If *ifst* pointed to the second row of a 2 by 2 block on entry, it is changed to point to the first row; *ilst* always points to the first row of the block in its final position (which may differ from its input value by ±1).

info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine trexc interface are the following:

t	Holds the matrix *T* of size (*n*,*n*).
q	Holds the matrix *Q* of size (*n*,*n*).
compq	Restored based on the presence of the argument *q* as follows: *compq* = 'V', if *q* is present, *compq* = 'N', if *q* is omitted.

Application Notes

The computed matrix *S* is exactly similar to a matrix $T+E$, where $||E||_2 = O(\varepsilon)*||T||_2$, and ε is the machine precision.

Note that if a 2 by 2 diagonal block is involved in the re-ordering, its off-diagonal elements are in general changed; the diagonal elements and the eigenvalues of the block are unchanged unless the block is sufficiently ill-conditioned, in which case they may be noticeably altered. It is possible for a 2 by 2 block to break into two 1 by 1 blocks, that is, for a pair of complex eigenvalues to become purely real.

The approximate number of floating-point operations is

for real flavors:	$6n(ifst-ilst)$ if *compq* = 'N'; $12n(ifst-ilst)$ if *compq* = 'V';
for complex flavors:	$20n(ifst-ilst)$ if *compq* = 'N'; $40n(ifst-ilst)$ if *compq* = 'V'.

?trsen

Reorders the Schur factorization of a matrix and (optionally) computes the reciprocal condition numbers for the selected cluster of eigenvalues and respective invariant subspace.

Syntax

call strsen(*job*, *compq*, *select*, *n*, *t*, *ldt*, *q*, *ldq*, *wr*, *wi*, *m*, *s*, *sep*, *work*, *lwork*, *iwork*, *liwork*, *info*)

call dtrsen(*job*, *compq*, *select*, *n*, *t*, *ldt*, *q*, *ldq*, *wr*, *wi*, *m*, *s*, *sep*, *work*, *lwork*, *iwork*, *liwork*, *info*)

call ctrsen(*job*, *compq*, *select*, *n*, *t*, *ldt*, *q*, *ldq*, *w*, *m*, *s*, *sep*, *work*, *lwork*, *info*)

call ztrsen(*job*, *compq*, *select*, *n*, *t*, *ldt*, *q*, *ldq*, *w*, *m*, *s*, *sep*, *work*, *lwork*, *info*)

call trsen(*t*, *select* [,*wr*] [,*wi*] [,*m*] [,*s*] [,*sep*] [,*q*] [,*info*])

```
call trsen(t, select [,w] [,m] [,s] [,sep] [,q] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine reorders the Schur factorization of a general matrix $A = Q*T*Q^T$ (for real flavors) or $A = Q*T*Q^H$ (for complex flavors) so that a selected cluster of eigenvalues appears in the leading diagonal elements (or, for real flavors, diagonal blocks) of the Schur form. The reordered Schur form R is computed by a unitary (orthogonal) similarity transformation: $R = Z^H*T*Z$. Optionally the updated matrix P of Schur vectors is computed as $P = Q*Z$, giving $A = P*R*P^H$.

Let

$$R = \begin{bmatrix} T_{11} & T_{12} \\ 0 & T_{13} \end{bmatrix}$$

where the selected eigenvalues are precisely the eigenvalues of the leading m-by-m submatrix T_{11}. Let P be correspondingly partitioned as (Q_1Q_2) where Q_1 consists of the first m columns of Q. Then $A*Q_1 = Q_1*T_{11}$, and so the m columns of Q_1 form an orthonormal basis for the invariant subspace corresponding to the selected cluster of eigenvalues.

Optionally the routine also computes estimates of the reciprocal condition numbers of the average of the cluster of eigenvalues and of the invariant subspace.

Input Parameters

job

CHARACTER*1. Must be 'N' or 'E' or 'V' or 'B'.

If *job* = 'N', then no condition numbers are required.

If *job* = 'E', then only the condition number for the cluster of eigenvalues is computed.

If *job* = 'V', then only the condition number for the invariant subspace is computed.

If *job* = 'B', then condition numbers for both the cluster and the invariant subspace are computed.

compq

CHARACTER*1. Must be 'V' or 'N'.

If *compq* = 'V', then Q of the Schur vectors is updated.

If *compq* = 'N', then no Schur vectors are updated.

select — LOGICAL.

Array, size at least max (1, *n*).

Specifies the eigenvalues in the selected cluster. To select an eigenvalue λ_j, *select*(*j*) must be .TRUE.

For real flavors: to select a complex conjugate pair of eigenvalues λ_j and λ_{j+1} (corresponding 2 by 2 diagonal block), *select*(*j*) and/or *select*(*j* + 1) must be .TRUE.; the complex conjugate $\lambda_j$and λ_{j+1} must be either both included in the cluster or both excluded.

n — INTEGER. The order of the matrix *T* (*n*≥ 0).

t, *q*, *work* — REAL for strsen

DOUBLE PRECISION for dtrsen

COMPLEX for ctrsen

DOUBLE COMPLEX for ztrsen.

Arrays:

t(*ldt*,*) Theupper quasi-triangular *n*-by-*n* matrix *T*, in Schur canonical form.

The second dimension of *t* must be at least max(1, *n*).

q(*ldq*,*)

If *compq* = 'V', then *q* must contain the matrix *Q* of Schur vectors.

If *compq* = 'N', then *q* is not referenced.

The second dimension of *q* must be at least max(1, *n*) if *compq* = 'V' and at least 1 if *compq* = 'N'.

work is a workspace array, its dimension max(1, *lwork*).

ldt — INTEGER. The leading dimension of *t*; at least max(1, *n*).

ldq — INTEGER. The leading dimension of *q*;

If *compq* = 'N', then *ldq*≥ 1.

If *compq* = 'V', then *ldq*≥ max(1, *n*).

lwork — INTEGER. The dimension of the array *work*.

If *job* = 'V' or 'B', *lwork*≥ max(1,2*m*(*n*−*m*)).

If *job* = 'E', then *lwork*≥ max(1, *m*(*n*−*m*))

If *job* = 'N', then *lwork*≥ 1 for complex flavors and *lwork*≥ max(1,*n*) for real flavors.

If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for details.

iwork — INTEGER.*iwork*(*liwork*) is a workspace array. The array *iwork* is not referenced if *job* = 'N' or 'E'.

The actual amount of workspace required cannot exceed $n^2/2$ if *job* = 'V' or 'B'.

liwork

INTEGER.

The dimension of the array *iwork*.

If *job* = 'V' or 'B', *liwork* ≥ max(1,2*m*(*n*-*m*)).

If *job* = 'E' or 'E', *liwork* ≥ 1.

If *liwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *iwork* array, returns this value as the first entry of the *iwork* array, and no error message related to *liwork* is issued by xerbla. See *Application Notes* for details.

Output Parameters

t

Overwritten by the reordered matrix *R* in Schur canonical form with the selected eigenvalues in the leading diagonal blocks.

q

If *compq* = 'V', *q* contains the updated matrix of Schur vectors; the first m columns of the *Q* form an orthogonal basis for the specified invariant subspace.

w

COMPLEX for ctrsen

DOUBLE COMPLEX for ztrsen.

Array, size at least max(1, *n*). The recorded eigenvalues of *R*. The eigenvalues are stored in the same order as on the diagonal of *R*.

wr, *wi*

REAL for strsen

DOUBLE PRECISION for dtrsen

Arrays, size at least max(1, *n*). Contain the real and imaginary parts, respectively, of the reordered eigenvalues of *R*. The eigenvalues are stored in the same order as on the diagonal of *R*. Note that if a complex eigenvalue is sufficiently ill-conditioned, then its value may differ significantly from its value before reordering.

m

INTEGER.

For complex flavors: the dimension of the specified invariant subspaces, which is the same as the number of selected eigenvalues (see *select*).

For real flavors: the dimension of the specified invariant subspace. The value of *m* is obtained by counting 1 for each selected real eigenvalue and 2 for each selected complex conjugate pair of eigenvalues (see *select*).

Constraint: 0 ≤*m*≤*n*.

s

REAL for single-precision flavors

DOUBLE PRECISION for double-precision flavors.

If *job* = 'E' or 'B', *s* is a lower bound on the reciprocal condition number of the average of the selected cluster of eigenvalues.

If *m* = 0 or *n*, then *s* = 1.

For real flavors: if *info* = 1, then *s* is set to zero.*s* is not referenced if *job* = 'N' or 'V'.

sep — REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors.

If *job* = 'V' or 'B', *sep* is the estimated reciprocal condition number of the specified invariant subspace.

If *m* = 0 or *n*, then *sep* = |*T*|.

For real flavors: if *info* = 1, then *sep* is set to zero.

sep is not referenced if *job* = 'N' or 'E'.

work(1) — On exit, if *info* = 0, then *work*(1) returns the optimal size of *lwork*.

iwork(1) — On exit, if *info* = 0, then *iwork*(1) returns the optimal size of *liwork*.

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = 1, the reordering of *T* failed because some eigenvalues are too close to separate (the problem is very ill-conditioned); *T* may have been partially reordered, and *wr* and *wi* contain the eigenvalues in the same order as in *T*; *s* and *sep* (if requested) are set to zero.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine trsen interface are the following:

t — Holds the matrix *T* of size (*n*,*n*).

select — Holds the vector of length *n*.

wr — Holds the vector of length *n*. Used in real flavors only.

wi — Holds the vector of length *n*. Used in real flavors only.

w — Holds the vector of length *n*. Used in complex flavors only.

q — Holds the matrix *Q* of size (*n*,*n*).

compq — Restored based on the presence of the argument *q* as follows: *compq* = 'V', if *q* is present, *compq* = 'N', if *q* is omitted.

job — Restored based on the presence of arguments *s* and sep as follows:

job = 'B', if both *s* and *sep* are present,

job = 'E', if *s* is present and *sep* omitted,

job = 'V', if *s* is omitted and *sep* present,

job = 'N', if both *s* and *sep* are omitted.

Application Notes

The computed matrix *R* is exactly similar to a matrix $T+E$, where $||E||_2 = O(\varepsilon)*||T||_2$, and ε is the machine precision. The computed *s* cannot underestimate the true reciprocal condition number by more than a factor of $(\min(m, n-m))_{1/2}$; *sep* may differ from the true value by $(m*n-m^2)_{1/2}$. The angle between the computed invariant subspace and the true subspace is $O(\varepsilon)*||A||_2/sep$. Note that if a 2-by-2 diagonal block is involved in the re-ordering, its off-diagonal elements are in general changed; the diagonal elements and the eigenvalues of the block are unchanged unless the block is sufficiently ill-conditioned, in which case they may be noticeably altered. It is possible for a 2-by-2 block to break into two 1-by-1 blocks, that is, for a pair of complex eigenvalues to become purely real.

If it is not clear how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run or set $lwork = -1$ ($liwork = -1$).

If *lwork* (or *liwork*) has any of admissible sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value ($work(1)$, $iwork(1)$) for subsequent runs.

If $lwork = -1$ ($liwork = -1$), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if *lwork* (*liwork*) is less than the minimal required value and is not equal to -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?trsyl

Solves Sylvester equation for real quasi-triangular or complex triangular matrices.

Syntax

```
call strsyl(trana, tranb, isgn, m, n, a, lda, b, ldb, c, ldc, scale, info)
call dtrsyl(trana, tranb, isgn, m, n, a, lda, b, ldb, c, ldc, scale, info)
call ctrsyl(trana, tranb, isgn, m, n, a, lda, b, ldb, c, ldc, scale, info)
call ztrsyl(trana, tranb, isgn, m, n, a, lda, b, ldb, c, ldc, scale, info)
call trsyl(a, b, c, scale [, trana] [,tranb] [,isgn] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine solves the Sylvester matrix equation $op(A)*X \pm X*op(B) = \alpha*C$, where $op(A) = A$ or A^H, and the matrices *A* and *B* are upper triangular (or, for real flavors, upper quasi-triangular in canonical Schur form); $\alpha \leq 1$ is a scale factor determined by the routine to avoid overflow in *X*; *A* is *m*-by-*m*, *B* is *n*-by-*n*, and *C* and *X* are both *m*-by-*n*. The matrix *X* is obtained by a straightforward process of back substitution.

The equation has a unique solution if and only if $\alpha_i \pm \beta_i \neq 0$, where $\{\alpha_i\}$ and $\{\beta_i\}$ are the eigenvalues of *A* and *B*, respectively, and the sign (+ or -) is the same as that used in the equation to be solved.

Input Parameters

trana

CHARACTER*1. Must be 'N' or 'T' or 'C'.

If $trana = 'N'$, then $op(A) = A$.

If *trana* = 'T', then op(*A*) = A^T (real flavors only).

If *trana* = 'C' then op(*A*) = A^H.

tranb CHARACTER*1. Must be 'N' or 'T' or 'C'.

If *tranb* = 'N', then op(*B*) = *B*.

If *tranb* = 'T', then op(*B*) = B^T (real flavors only).

If *tranb* = 'C', then op(*B*) = B^H.

isgn INTEGER. Indicates the form of the Sylvester equation.

If *isgn* = +1, op(*A*)***X* + *X**op(*B*) = alpha**C*.

If *isgn* = -1, op(*A*)***X* - *X**op(*B*) = alpha**C*.

m INTEGER. The order of *A*, and the number of rows in *X* and *C* (*m*≥ 0).

n INTEGER. The order of *B*, and the number of columns in *X* and *C* (*n*≥ 0).

a, *b*, *c* REAL for strsyl

DOUBLE PRECISION for dtrsyl

COMPLEX for ctrsyl

DOUBLE COMPLEX for ztrsyl.

Arrays:

a(*lda*,*) contains the matrix *A*.

The second dimension of *a* must be at least max(1, *m*).

b(*ldb*,*) contains the matrix *B*.

The second dimension of *b* must be at least max(1, *n*).

c(*ldc*,*) contains the matrix *C*.

The second dimension of *c* must be at least max(1, *n*).

lda INTEGER. The leading dimension of *a*; at least max(1, *m*).

ldb INTEGER. The leading dimension of *b*; at least max(1, *n*).

ldc INTEGER. The leading dimension of *c*; at least max(1, *m*) .

Output Parameters

c Overwritten by the solution matrix *X*.

scale REAL for single-precision flavors

DOUBLE PRECISION for double-precision flavors.

The value of the scale factor α.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = 1, *A* and *B* have common or close eigenvalues; perturbed values were used to solve the equation.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `trsyl` interface are the following:

a	Holds the matrix *A* of size (*m*,*m*).
b	Holds the matrix *B* of size (*n*,*n*).
c	Holds the matrix *C* of size (*m*,*n*).
trana	Must be 'N', 'C', or 'T'. The default value is 'N'.
tranb	Must be 'N', 'C', or 'T'. The default value is 'N'.
isgn	Must be +1 or -1. The default value is +1.

Application Notes

Let *X* be the exact, *Y* the corresponding computed solution, and *R* the residual matrix: $R = C - (AY \pm YB)$. Then the residual is always small:

$||R||_F = O(\varepsilon) * (||A||_F + ||B||_F) * ||Y||_F$.

However, *Y* is not necessarily the exact solution of a slightly perturbed equation; in other words, the solution is not backwards stable.

For the forward error, the following bound holds:

$||Y - X||_F \leq ||R||_F / \mathrm{sep}(A, B)$

but this may be a considerable overestimate. See [Golub96] for a definition of sep(*A*, *B*).

The approximate number of floating-point operations for real flavors is $m*n*(m + n)$. For complex flavors it is 4 times greater.

Generalized Nonsymmetric Eigenvalue Problems: LAPACK Computational Routines

This topic describes LAPACK routines for solving generalized nonsymmetric eigenvalue problems, reordering the generalized Schur factorization of a pair of matrices, as well as performing a number of related computational tasks.

A *generalized nonsymmetric eigenvalue problem* is as follows: given a pair of nonsymmetric (or non-Hermitian) *n*-by-*n* matrices *A* and *B*, find the *generalized eigenvalues*λ and the corresponding *generalized eigenvectors* *x* and *y* that satisfy the equations

$Ax = \lambda Bx$ (right generalized eigenvectors *x*)

and

$y^H A = \lambda y^H B$ (left generalized eigenvectors *y*).

Table "Computational Routines for Solving Generalized Nonsymmetric Eigenvalue Problems" lists LAPACK routines (FORTRAN 77 interface) used to solve the generalized nonsymmetric eigenvalue problems and the generalized Sylvester equation. The corresponding routine names in the Fortran 95 interface are without the first symbol.

Computational Routines for Solving Generalized Nonsymmetric Eigenvalue Problems

Routine name	Operation performed
gghrd	Reduces a pair of matrices to generalized upper Hessenberg form using orthogonal/unitary transformations.
ggbal	Balances a pair of general real or complex matrices.
ggbak	Forms the right or left eigenvectors of a generalized eigenvalue problem.
gghd3	Reduces a pair of matrices to generalized upper Hessenberg form.
hgeqz	Implements the QZ method for finding the generalized eigenvalues of the matrix pair (H,T).
tgevc	Computes some or all of the right and/or left generalized eigenvectors of a pair of upper triangular matrices
tgexc	Reorders the generalized Schur decomposition of a pair of matrices (A,B) so that one diagonal block of (A,B) moves to another row index.
tgsen	Reorders the *generalized* Schur decomposition of a pair of matrices (A,B) so that a selected cluster of eigenvalues appears in the leading diagonal blocks of (A,B).
tgsyl	Solves the generalized Sylvester equation.
tgsyl	Estimates reciprocal condition numbers for specified eigenvalues and/or eigenvectors of a pair of matrices in generalized real Schur canonical form.

?gghrd
Reduces a pair of matrices to generalized upper Hessenberg form using orthogonal/unitary transformations.

Syntax

```
call sgghrd(compq, compz, n, ilo, ihi, a, lda, b, ldb, q, ldq, z, ldz, info)
call dgghrd(compq, compz, n, ilo, ihi, a, lda, b, ldb, q, ldq, z, ldz, info)
call cgghrd(compq, compz, n, ilo, ihi, a, lda, b, ldb, q, ldq, z, ldz, info)
call zgghrd(compq, compz, n, ilo, ihi, a, lda, b, ldb, q, ldq, z, ldz, info)
call gghrd(a, b [,ilo] [,ihi] [,q] [,z] [,compq] [,compz] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine reduces a pair of real/complex matrices (*A*,*B*) to generalized upper Hessenberg form using orthogonal/unitary transformations, where *A* is a general matrix and *B* is upper triangular. The form of the generalized eigenvalue problem is $A*x = \lambda*B*x$, and *B* is typically made upper triangular by computing its *QR* factorization and moving the orthogonal matrix *Q* to the left side of the equation.

This routine simultaneously reduces *A* to a Hessenberg matrix *H*:

$Q^H*A*Z = H$

and transforms *B* to another upper triangular matrix *T*:

$Q^H*B*Z = T$

in order to reduce the problem to its standard form $H*y = \lambda*T*y$, where $y = Z^H*x$.

The orthogonal/unitary matrices Q and Z are determined as products of Givens rotations. They may either be formed explicitly, or they may be postmultiplied into input matrices Q_1 and Z_1, so that

$Q_1*A*Z_1^H = (Q_1*Q)*H*(Z_1*Z)^H$

$Q_1*B*Z_1^H = (Q_1*Q)*T*(Z_1*Z)^H$

If Q_1 is the orthogonal/unitary matrix from the QR factorization of B in the original equation $A*x = \lambda*B*x$, then the routine ?gghrd reduces the original problem to generalized Hessenberg form.

Input Parameters

compq

CHARACTER*1. Must be 'N', 'I', or 'V'.

If *compq* = 'N', matrix Q is not computed.

If *compq* = 'I', Q is initialized to the unit matrix, and the orthogonal/unitary matrix Q is returned;

If *compq* = 'V', Q must contain an orthogonal/unitary matrix Q_1 on entry, and the product Q_1*Q is returned.

compz

CHARACTER*1. Must be 'N', 'I', or 'V'.

If *compz* = 'N', matrix Z is not computed.

If *compz* = 'I', Z is initialized to the unit matrix, and the orthogonal/unitary matrix Z is returned;

If *compz* = 'V', Z must contain an orthogonal/unitary matrix Z_1 on entry, and the product Z_1*Z is returned.

n

INTEGER. The order of the matrices A and B ($n \geq 0$).

ilo, *ihi*

INTEGER. *ilo* and *ihi* mark the rows and columns of A which are to be reduced. It is assumed that A is already upper triangular in rows and columns 1:*ilo*-1 and *ihi*+1:*n*. Values of *ilo* and *ihi* are normally set by a previous call to ggbal; otherwise they should be set to 1 and *n* respectively.

Constraint:

If $n > 0$, then $1 \leq ilo \leq ihi \leq n$;

if $n = 0$, then $ilo = 1$ and $ihi = 0$.

a, *b*, *q*, *z*

REAL for sgghrd

DOUBLE PRECISION for dgghrd

COMPLEX for cgghrd

DOUBLE COMPLEX for zgghrd.

Arrays:

a(*lda*,*) contains the *n*-by-*n* general matrix A.

The second dimension of *a* must be at least max(1, *n*).

b(*ldb*,*) contains the *n*-by-*n* upper triangular matrix B.

The second dimension of *b* must be at least max(1, *n*).

q(*ldq*,*)

If *compq* = 'N', then *q* is not referenced.

If *compq* = 'V', then *q* must contain the orthogonal/unitary matrix Q_1, typically from the *QR* factorization of *B*.

The second dimension of *q* must be at least max(1, *n*).

z(*ldz*,*)

If *compz* = 'N', then *z* is not referenced.

If *compz* = 'V', then *z* must contain the orthogonal/unitary matrix Z_1.

The second dimension of *z* must be at least max(1, *n*).

lda INTEGER. The leading dimension of *a*; at least max(1, *n*).

ldb INTEGER. The leading dimension of *b*; at least max(1, *n*).

ldq INTEGER. The leading dimension of *q*;

If *compq* = 'N', then *ldq*≥ 1.

If *compq* = 'I'or 'V', then *ldq*≥ max(1, *n*).

ldz INTEGER. The leading dimension of *z*;

If *compz* = 'N', then *ldz*≥ 1.

If *compz* = 'I'or 'V', then *ldz*≥ max(1, *n*).

Output Parameters

a On exit, the upper triangle and the first subdiagonal of *A* are overwritten with the upper Hessenberg matrix *H*, and the rest is set to zero.

b On exit, overwritten by the upper triangular matrix $T = Q^H*B*Z$. The elements below the diagonal are set to zero.

q If *compq* = 'I', then *q* contains the orthogonal/unitary matrix *Q*, ;

If *compq* = 'V', then *q* is overwritten by the product Q_1*Q.

z If *compz* = 'I', then *z* contains the orthogonal/unitary matrix *Z*;

If *compz* = 'V', then *z* is overwritten by the product Z_1*Z.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine gghrd interface are the following:

a Holds the matrix *A* of size (*n*,*n*).

b	Holds the matrix *B* of size (*n*,*n*).
q	Holds the matrix *Q* of size (*n*,*n*).
z	Holds the matrix *Z* of size (*n*,*n*).
ilo	Default value for this argument is *ilo* = 1.
ihi	Default value for this argument is *ihi* = *n*.
compq	If omitted, this argument is restored based on the presence of argument *q* as follows: *compq* = 'I', if *q* is present, *compq* = 'N', if *q* is omitted. If present, *compq* must be equal to 'I' or 'V' and the argument *q* must also be present. Note that there will be an error condition if *compq* is present and *q* omitted.
compz	If omitted, this argument is restored based on the presence of argument *z* as follows: *compz* = 'I', if *z* is present, *compz* = 'N', if *z* is omitted. If present, *compz* must be equal to 'I' or 'V' and the argument *z* must also be present. Note that there will be an error condition if *compz* is present and *z* omitted.

?ggbal

Balances a pair of general real or complex matrices.

Syntax

```
call sggbal(job, n, a, lda, b, ldb, ilo, ihi, lscale, rscale, work, info)
call dggbal(job, n, a, lda, b, ldb, ilo, ihi, lscale, rscale, work, info)
call cggbal(job, n, a, lda, b, ldb, ilo, ihi, lscale, rscale, work, info)
call zggbal(job, n, a, lda, b, ldb, ilo, ihi, lscale, rscale, work, info)
call ggbal(a, b [,ilo] [,ihi] [,lscale] [,rscale] [,job] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine balances a pair of general real/complex matrices (*A*,*B*). This involves, first, permuting *A* and *B* by similarity transformations to isolate eigenvalues in the first 1 to *ilo*-1 and last *ihi*+1 to *n* elements on the diagonal;and second, applying a diagonal similarity transformation to rows and columns *ilo* to *ihi* to make the rows and columns as close in norm as possible. Both steps are optional. Balancing may reduce the 1-norm of the matrices, and improve the accuracy of the computed eigenvalues and/or eigenvectors in the generalized eigenvalue problem *A*x* = λ*B*x*.

Input Parameters

job	CHARACTER*1. Specifies the operations to be performed on *A* and *B*. Must be 'N' or 'P' or 'S' or 'B'. If *job* = 'N ', then no operations are done; simply set *ilo* =1, *ihi*=*n*, *lscale*(*i*) =1.0 and *rscale*(*i*)=1.0 for

	i = 1,..., *n*.
	If *job* = 'P', then permute only.
	If *job* = 'S', then scale only.
	If *job* = 'B', then both permute and scale.
n	INTEGER. The order of the matrices *A* and *B* ($n \geq 0$).
a, *b*	REAL for sggbal
	DOUBLE PRECISION for dggbal
	COMPLEX for cggbal
	DOUBLE COMPLEX for zggbal.
	Arrays:
	a(*lda*,*) contains the matrix *A*. The second dimension of *a* must be at least max(1, *n*).
	b(*ldb*,*) contains the matrix *B*. The second dimension of *b* must be at least max(1, *n*).
	If *job* = 'N', *a* and *b* are not referenced.
lda	INTEGER. The leading dimension of *a*; at least max(1, *n*).
ldb	INTEGER. The leading dimension of *b*; at least max(1, *n*).
work	REAL for single precision flavors
	DOUBLE PRECISION for double precision flavors.
	Workspace array, size at least max(1, 6*n*) when *job* = 'S'or 'B', or at least 1 when *job* = 'N'or 'P'.

Output Parameters

a, *b*	Overwritten by the balanced matrices *A* and *B*, respectively.
ilo, *ihi*	INTEGER. *ilo* and *ihi* are set to integers such that on exit $A_{i,j} = 0$ and $B_{i,j} = 0$ if *i*>*j* and *j*=1,...,*ilo*-1 or *i*=*ihi*+1,..., *n*.
	If *job* = 'N'or 'S', then *ilo* = 1 and *ihi* = *n*.
lscale, *rscale*	REAL for single precision flavors
	DOUBLE PRECISION for double precision flavors.
	Arrays, size at least max(1, *n*).
	lscale contains details of the permutations and scaling factors applied to the left side of *A* and *B*.
	If P_j is the index of the row interchanged with row *j*, and D_j is the scaling factor applied to row *j*, then
	lscale(*j*) = P_j, for *j* = 1,..., *ilo*-1
	= D_j, for *j* = *ilo*,...,*ihi*
	= P_j, for *j* = *ihi*+1,..., *n*.

rscale contains details of the permutations and scaling factors applied to the right side of *A* and *B*.

If P_j is the index of the column interchanged with column *j*, and D_j is the scaling factor applied to column *j*, then

`rscale(j) =` P_j, for `j = 1,..., ilo-1`

`=` D_j, for `j = ilo,...,ihi`

`=` P_j, for `j = ihi+1,..., n`

The order in which the interchanges are made is *n* to *ihi*+1, then 1 to *ilo*-1.

info — INTEGER.

If `info = 0`, the execution is successful.

If *info* = *-i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `ggbal` interface are the following:

a — Holds the matrix *A* of size (*n*,*n*).

b — Holds the matrix *B* of size (*n*,*n*).

lscale — Holds the vector of length (*n*).

rscale — Holds the vector of length (*n*).

ilo — Default value for this argument is `ilo = 1`.

ihi — Default value for this argument is `ihi = n`.

job — Must be `'B'`, `'S'`, `'P'`, or `'N'`. The default value is `'B'`.

?ggbak

Forms the right or left eigenvectors of a generalized eigenvalue problem.

Syntax

```
call sggbak(job, side, n, ilo, ihi, lscale, rscale, m, v, ldv, info)
call dggbak(job, side, n, ilo, ihi, lscale, rscale, m, v, ldv, info)
call cggbak(job, side, n, ilo, ihi, lscale, rscale, m, v, ldv, info)
call zggbak(job, side, n, ilo, ihi, lscale, rscale, m, v, ldv, info)
call ggbak(v [, ilo] [,ihi] [,lscale] [,rscale] [,job] [,info])
```

Include Files

- `mkl.fi, lapack.f90`

Description

The routine forms the right or left eigenvectors of a real/complex generalized eigenvalue problem

$A*x = \lambda*B*x$

by backward transformation on the computed eigenvectors of the balanced pair of matrices output by ggbal.

Input Parameters

job

CHARACTER*1. Specifies the type of backward transformation required. Must be 'N', 'P', 'S', or 'B'.

If *job* = 'N', then no operations are done; return.

If *job* = 'P', then do backward transformation for permutation only.

If *job* = 'S', then do backward transformation for scaling only.

If *job* = 'B', then do backward transformation for both permutation and scaling. This argument must be the same as the argument *job* supplied to ?ggbal.

side

CHARACTER*1. Must be 'L' or 'R'.

If *side* = 'L', then *v* contains left eigenvectors.

If *side* = 'R', then *v* contains right eigenvectors.

n

INTEGER. The number of rows of the matrix *V* ($n \geq 0$).

ilo, *ihi*

INTEGER. The integers *ilo* and *ihi* determined by ?gebal. Constraint:

If $n > 0$, then $1 \leq ilo \leq ihi \leq n$;

if $n = 0$, then $ilo = 1$ and $ihi = 0$.

lscale, *rscale*

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Arrays, size at least max(1, *n*).

The array *lscale* contains details of the permutations and/or scaling factors applied to the left side of *A* and *B*, as returned by ?ggbal.

The array *rscale* contains details of the permutations and/or scaling factors applied to the right side of *A* and *B*, as returned by ?ggbal.

m

INTEGER. The number of columns of the matrix *V*

($m \geq 0$).

v

REAL for sggbak

DOUBLE PRECISION for dggbak

COMPLEX for cggbak

DOUBLE COMPLEX for zggbak.

Array *v*(*ldv*,*) . Contains the matrix of right or left eigenvectors to be transformed, as returned by tgevc.

The second dimension of *v* must be at least max(1, *m*).

ldv

INTEGER. The leading dimension of *v*; at least max(1, *n*) .

Output Parameters

v	Overwritten by the transformed eigenvectors
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine ggbak interface are the following:

v	Holds the matrix *V* of size (*n*,*m*).
lscale	Holds the vector of length *n*.
rscale	Holds the vector of length *n*.
ilo	Default value for this argument is *ilo* = 1.
ihi	Default value for this argument is *ihi* = *n*.
job	Must be 'B', 'S', 'P', or 'N'. The default value is 'B'.
side	If omitted, this argument is restored based on the presence of arguments *lscale* and *rscale* as follows: *side* = 'L', if *lscale* is present and *rscale* omitted, *side* = 'R', if *lscale* is omitted and *rscale* present. Note that there will be an error condition if both *lscale* and *rscale* are present or if they both are omitted.

?gghd3

Reduces a pair of matrices to generalized upper Hessenberg form.

Syntax

```
call sgghd3 (compq, compz, n, ilo, ihi, a, lda, b, ldb, q, ldq, z, ldz, work, lwork, info )
call dgghd3 (compq, compz, n, ilo, ihi, a, lda, b, ldb, q, ldq, z, ldz, work, lwork, info )
call cgghd3 (compq, compz, n, ilo, ihi, a, lda, b, ldb, q, ldq, z, ldz, work, lwork, info )
call zgghd3 (compq, compz, n, ilo, ihi, a, lda, b, ldb, q, ldq, z, ldz, work, lwork, info )
```

Include Files

- mkl.fi

Description

?gghd3 reduces a pair of real or complex matrices (*A*, *B*) to generalized upper Hessenberg form using orthogonal/unitary transformations, where *A* is a general matrix and *B* is upper triangular. The form of the generalized eigenvalue problem is

$A*x = \lambda*B*x$,

and *B* is typically made upper triangular by computing its QR factorization and moving the orthogonal/unitary matrix *Q* to the left side of the equation.

This subroutine simultaneously reduces *A* to a Hessenberg matrix *H*:

$Q^T*A*Z = H$ for real flavors

or

$Q^T*A*Z = H$ for complex flavors

and transforms *B* to another upper triangular matrix *T*:

$Q^T*B*Z = T$ for real flavors

or

$Q^T*B*Z = T$ for complex flavors

in order to reduce the problem to its standard form

$H*y = \lambda*T*y$

where $y = Z^T*x$ for real flavors

or

$y = Z^T*x$ for complex flavors.

The orthogonal/unitary matrices *Q* and *Z* are determined as products of Givens rotations. They may either be formed explicitly, or they may be postmultiplied into input matrices Q_1 and Z_1, so that

for real flavors:

$Q_1 * A * Z_1^T = (Q_1*Q) * H * (Z_1*Z)^T$

$Q_1 * B * Z_1^T = (Q_1*Q) * T * (Z_1*Z)^T$

for complex flavors:

$Q_1 * A * Z_1^H = (Q_1*Q) * H * (Z_1*Z)^T$

$Q_1 * B * Z_1^T = (Q_1*Q) * T * (Z_1*Z)^T$

If Q_1 is the orthogonal/unitary matrix from the QR factorization of *B* in the original equation $A*x = \lambda*B*x$, then ?gghd3 reduces the original problem to generalized Hessenberg form.

This is a blocked variant of ?gghrd, using matrix-matrix multiplications for parts of the computation to enhance performance.

Input Parameters

compq

CHARACTER*1. = 'N': do not compute *q*;

= 'I': *q* is initialized to the unit matrix, and the orthogonal/unitary matrix *Q* is returned;

= 'V': *q* must contain an orthogonal/unitary matrix Q_1 on entry, and the product Q_1*q is returned.

compz

CHARACTER*1. = 'N': do not compute *z*;

= 'I': *z* is initialized to the unit matrix, and the orthogonal/unitary matrix *Z* is returned;

= 'V': *z* must contain an orthogonal/unitary matrix Z_1 on entry, and the product Z_1*z is returned.

n

INTEGER. The order of the matrices *A* and *B*.

n≥ 0.

ilo, *ihi*

INTEGER. *ilo* and *ihi* mark the rows and columns of *a* which are to be reduced. It is assumed that *a* is already upper triangular in rows and columns 1:*ilo* - 1 and *ihi* + 1:*n*. *ilo* and *ihi* are normally set by a previous call to ?ggbal; otherwise they should be set to 1 and *n*, respectively.

1 ≤*ilo*≤*ihi*≤*n*, if *n* > 0; *ilo*=1 and *ihi*=0, if *n*=0.

a

REAL for sgghd3

DOUBLE PRECISION for dgghd3

COMPLEX for cgghd3

DOUBLE COMPLEX for zgghd3

Array, size (*lda*, *n*).

On entry, the *n*-by-*n* general matrix to be reduced.

lda

INTEGER. The leading dimension of the array *a*.

lda≥ max(1,*n*).

b

REAL for sgghd3

DOUBLE PRECISION for dgghd3

COMPLEX for cgghd3

DOUBLE COMPLEX for zgghd3

Array, (*ldb*, *n*).

On entry, the*n*-by-*n* upper triangular matrix *B*.

ldb

INTEGER. The leading dimension of the array *b*.

ldb≥ max(1,*n*).

q

REAL for sgghd3

DOUBLE PRECISION for dgghd3

COMPLEX for cgghd3

DOUBLE COMPLEX for zgghd3

Array, size (*ldq*, *n*).

On entry, if *compq* = 'V', the orthogonal/unitary matrix Q_1, typically from the QR factorization of *b*.

ldq

INTEGER. The leading dimension of the array *q*.

ldq≥*n* if *compq*='V' or 'I'; *ldq*≥ 1 otherwise.

z

REAL for sgghd3

DOUBLE PRECISION for dgghd3

COMPLEX for cgghd3

DOUBLE COMPLEX for zgghd3

Array, size (*ldz*, *n*).

On entry, if *compz* = 'V', the orthogonal/unitary matrix Z_1.

Not referenced if *compz*='N'.

ldz

INTEGER. The leading dimension of the array *z*. *ldz*≥*n* if *compz*='V' or 'I'; *ldz*≥ 1 otherwise.

work

REAL for sgghd3

DOUBLE PRECISION for dgghd3

COMPLEX for cgghd3

DOUBLE COMPLEX for zgghd3

Array, size (*lwork*)

lwork

INTEGER. The length of the array work.

lwork≥ 1.

For optimum performance *lwork*≥ 6**n***NB*, where *NB* is the optimal blocksize.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

Output Parameters

a

On exit, the upper triangle and the first subdiagonal of *a* are overwritten with the upper Hessenberg matrix *H*, and the rest is set to zero.

b

On exit, the upper triangular matrix $T = Q^T BZ$ for real flavors or $T = Q^H BZ$ for complex flavors. The elements below the diagonal are set to zero.

q

On exit, if *compq*='I', the orthogonal/unitary matrix *Q*, and if *compq* = 'V', the product Q_1**Q*.

Not referenced if *compq*='N'.

z

On exit, if *compz*='I', the orthogonal/unitary matrix *Z*, and if *compz* = 'V', the product Z_1**Z*.

Not referenced if *compz*='N'.

work

On exit, if *info* = 0, *work*(1) returns the optimal *lwork*.

info

INTEGER. = 0: successful exit.

< 0: if *info* = -*i*, the *i*-th argument had an illegal value.

Application Notes

This routine reduces *A* to Hessenberg form and maintains *B* in using a blocked variant of Moler and Stewart's original algorithm, as described by Kagstrom, Kressner, Quintana-Orti, and Quintana-Orti (BIT 2008).

?hgeqz
Implements the QZ method for finding the generalized eigenvalues of the matrix pair (H,T).

Syntax

`call shgeqz(job, compq, compz, n, ilo, ihi, h, ldh, t, ldt, alphar, alphai, beta, q, ldq, z, ldz, work, lwork, info)`

`call dhgeqz(job, compq, compz, n, ilo, ihi, h, ldh, t, ldt, alphar, alphai, beta, q, ldq, z, ldz, work, lwork, info)`

`call chgeqz(job, compq, compz, n, ilo, ihi, h, ldh, t, ldt, alpha, beta, q, ldq, z, ldz, work, lwork, rwork, info)`

`call zhgeqz(job, compq, compz, n, ilo, ihi, h, ldh, t, ldt, alpha, beta, q, ldq, z, ldz, work, lwork, rwork, info)`

`call hgeqz(h, t [,ilo] [,ihi] [,alphar] [,alphai] [,beta] [,q] [,z] [,job] [,compq] [,compz] [,info])`

`call hgeqz(h, t [,ilo] [,ihi] [,alpha] [,beta] [,q] [,z] [,job] [,compq] [, compz] [,info])`

Description

The routine computes the eigenvalues of a real/complex matrix pair (*H*,*T*), where *H* is an upper Hessenberg matrix and *T* is upper triangular, using the double-shift version (for real flavors) or single-shift version (for complex flavors) of the *QZ* method. Matrix pairs of this type are produced by the reduction to generalized upper Hessenberg form of a real/complex matrix pair (*A*,*B*):

$A = Q_1 * H * Z_1^H$, $B = Q_1 * T * Z_1^H$,

as computed by `?gghrd`.

For real flavors:

If *job* = `'S'`, then the Hessenberg-triangular pair (*H*,*T*) is reduced to generalized Schur form,

$H = Q * S * Z^T$, $T = Q * P * Z^T$,

where *Q* and *Z* are orthogonal matrices, *P* is an upper triangular matrix, and *S* is a quasi-triangular matrix with 1-by-1 and 2-by-2 diagonal blocks. The 1-by-1 blocks correspond to real eigenvalues of the matrix pair (*H*,*T*) and the 2-by-2 blocks correspond to complex conjugate pairs of eigenvalues.

Additionally, the 2-by-2 upper triangular diagonal blocks of *P* corresponding to 2-by-2 blocks of *S* are reduced to positive diagonal form, that is, if $S_{j+1,j}$ is non-zero, then $P_{j+1,\,j} = P_{j,\,j+1} = 0$, $P_{j,\,j} > 0$, and $P_{j+1,\,j+1} > 0$.

For complex flavors:

If *job* = `'S'`, then the Hessenberg-triangular pair (*H*,*T*) is reduced to generalized Schur form,

$H = Q^* S^* Z^H$, $T = Q^* P^* Z^H$,

where Q and Z are unitary matrices, and S and P are upper triangular.

For all function flavors:

Optionally, the orthogonal/unitary matrix Q from the generalized Schur factorization may be post-multiplied by an input matrix Q_1, and the orthogonal/unitary matrix Z may be post-multiplied by an input matrix Z_1.

If Q_1 and Z_1 are the orthogonal/unitary matrices from `?gghrd` that reduced the matrix pair (A,B) to generalized upper Hessenberg form, then the output matrices Q_1Q and Z_1Z are the orthogonal/unitary factors from the generalized Schur factorization of (A,B):

$A = (Q_1Q)^* S^* (Z_1Z)^H$, $B = (Q_1Q)^* P^* (Z_1Z)^H$.

To avoid overflow, eigenvalues of the matrix pair (H,T) (equivalently, of (A,B)) are computed as a pair of values (*alpha*,*beta*). For `chgeqz`/`zhgeqz`, *alpha* and *beta* are complex, and for `shgeqz`/`dhgeqz`, *alpha* is complex and *beta* real. If *beta* is nonzero, $\lambda = alpha/beta$ is an eigenvalue of the generalized nonsymmetric eigenvalue problem (GNEP)

$A^*x = \lambda^*B^*x$

and if *alpha* is nonzero, $\mu = beta/alpha$ is an eigenvalue of the alternate form of the GNEP

$\mu^*A^*y = B^*y$.

Real eigenvalues (for real flavors) or the values of *alpha* and *beta* for the i-th eigenvalue (for complex flavors) can be read directly from the generalized Schur form:

$alpha = S_{i,\,i}$, $beta = P_{i,\,i}$.

Input Parameters

job

`CHARACTER*1`. Specifies the operations to be performed. Must be `'E'` or `'S'`.

If *job* = `'E'`, then compute eigenvalues only;

If *job* = `'S'`, then compute eigenvalues and the Schur form.

compq

`CHARACTER*1`. Must be `'N'`, `'I'`, or `'V'`.

If *compq* = `'N'`, left Schur vectors (q) are not computed;

If *compq* = `'I'`, q is initialized to the unit matrix and the matrix of left Schur vectors of (H,T) is returned;

If *compq* = `'V'`, q must contain an orthogonal/unitary matrix Q_1 on entry and the product Q_1*Q is returned.

compz

`CHARACTER*1`. Must be `'N'`, `'I'`, or `'V'`.

If *compz* = `'N'`, right Schur vectors (z) are not computed;

If *compz* = `'I'`, z is initialized to the unit matrix and the matrix of right Schur vectors of (H,T) is returned;

If *compz* = `'V'`, z must contain an orthogonal/unitary matrix Z_1 on entry and the product Z_1*Z is returned.

n

`INTEGER`. The order of the matrices H, T, Q, and Z

($n \geq 0$).

ilo, *ihi*

INTEGER. *ilo* and *ihi* mark the rows and columns of *H* which are in Hessenberg form. It is assumed that *H* is already upper triangular in rows and columns 1:*ilo*-1 and *ihi*+1:*n*.

Constraint:

If $n > 0$, then $1 \le ilo \le ihi \le n$;

if $n = 0$, then $ilo = 1$ and $ihi = 0$.

h, *t*, *q*, *z*, *work*

REAL for shgeqz

DOUBLE PRECISION for dhgeqz

COMPLEX for chgeqz

DOUBLE COMPLEX for zhgeqz.

Arrays:

On entry, *h*(*ldh*,*) contains the *n*-by-*n* upper Hessenberg matrix *H*.

The second dimension of *h* must be at least max(1, *n*).

On entry, *t*(*ldt*,*) contains the *n*-by-*n* upper triangular matrix *T*.

The second dimension of *t* must be at least max(1, *n*).

q(*ldq*,*) :

On entry, if *compq* = 'V', this array contains the orthogonal/unitary matrix Q_1 used in the reduction of (*A*,*B*) to generalized Hessenberg form.

If *compq* = 'N', then *q* is not referenced.

The second dimension of *q* must be at least max(1, *n*).

z(*ldz*,*) :

On entry, if *compz* = 'V', this array contains the orthogonal/unitary matrix Z_1 used in the reduction of (*A*,*B*) to generalized Hessenberg form.

If *compz* = 'N', then *z* is not referenced.

The second dimension of *z* must be at least max(1, *n*).

work is a workspace array, its dimension max(1, *lwork*).

ldh

INTEGER. The leading dimension of *h*; at least max(1, *n*).

ldt

INTEGER. The leading dimension of *t*; at least max(1, *n*).

ldq

INTEGER. The leading dimension of *q*;

If *compq* = 'N', then $ldq \ge 1$.

If *compq* = 'I' or 'V', then $ldq \ge \max(1, n)$.

ldz

INTEGER. The leading dimension of *z*;

If *compq* = 'N', then $ldz \ge 1$.

If *compq* = 'I' or 'V', then $ldz \ge \max(1, n)$.

lwork

INTEGER. The dimension of the array *work*.

$lwork \ge \max(1, n)$.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for details.

rwork

REAL for chgeqz

DOUBLE PRECISION for zhgeqz.

Workspace array, size at least max(1, *n*). Used in complex flavors only.

Output Parameters

h

For real flavors:

If *job* = 'S', then on exit *h* contains the upper quasi-triangular matrix *S* from the generalized Schur factorization.

If *job* = 'E', then on exit the diagonal blocks of *h* match those of *S*, but the rest of *h* is unspecified.

For complex flavors:

If *job* = 'S', then, on exit, *h* contains the upper triangular matrix *S* from the generalized Schur factorization.

If *job* = 'E', then on exit the diagonal of *h* matches that of *S*, but the rest of *h* is unspecified.

t

If *job* = 'S', then, on exit, *t* contains the upper triangular matrix *P* from the generalized Schur factorization.

For real flavors:

2-by-2 diagonal blocks of *P* corresponding to 2-by-2 blocks of *S* are reduced to positive diagonal form, that is, if *h*(j+1,j) is non-zero, then *t*(j+1,j)=*t*(j,j+1)=0 and *t*(j,j) and *t*(j+1,j+1) will be positive.

If *job* = 'E', then on exit the diagonal blocks of *t* match those of *P*, but the rest of *t* is unspecified.

For complex flavors:

if *job* = 'E', then on exit the diagonal of *t* matches that of *P*, but the rest of *t* is unspecified.

alphar, *alphai*

REAL for shgeqz;

DOUBLE PRECISION for dhgeqz.

Arrays, size at least max(1, *n*). The real and imaginary parts, respectively, of each scalar *alpha* defining an eigenvalue of GNEP.

If *alphai*(*j*) is zero, then the *j*-th eigenvalue is real; if positive, then the *j*-th and (*j*+1)-th eigenvalues are a complex conjugate pair, with

alphai(*j*+1) = -*alphai*(*j*).

alpha

COMPLEX for chgeqz;

DOUBLE COMPLEX for zhgeqz.

Array, size at least max(1, *n*).

The complex scalars *alpha* that define the eigenvalues of GNEP. `alphai(i) = S_i, i` in the generalized Schur factorization.

beta

`REAL` for `shgeqz`

`DOUBLE PRECISION` for `dhgeqz`

`COMPLEX` for `chgeqz`

`DOUBLE COMPLEX` for `zhgeqz`.

Array, size at least max(1, *n*).

For real flavors:

The scalars *beta* that define the eigenvalues of GNEP.

Together, the quantities `alpha = (alphar(j), alphai(j))` and `beta = beta(j)` represent the *j*-th eigenvalue of the matrix pair (*A*,*B*), in one of the forms `lambda = alpha/beta` or `mu = beta/alpha`. Since either *lambda* or *mu* may overflow, they should not, in general, be computed.

For complex flavors:

The real non-negative scalars *beta* that define the eigenvalues of GNEP.

`beta(i) = P_i, i` in the generalized Schur factorization. Together, the quantities `alpha = alpha(j)` and `beta = beta(j)` represent the *j*-th eigenvalue of the matrix pair (*A*,*B*), in one of the forms `lambda = alpha/beta` or `mu = beta/alpha`. Since either *lambda* or *mu* may overflow, they should not, in general, be computed.

q

On exit, if `compq = 'I'`, *q* is overwritten by the orthogonal/unitary matrix of left Schur vectors of the pair (*H*,*T*), and if `compq = 'V'`, *q* is overwritten by the orthogonal/unitary matrix of left Schur vectors of (*A*,*B*).

z

On exit, if `compz = 'I'`, *z* is overwritten by the orthogonal/unitary matrix of right Schur vectors of the pair (*H*,*T*), and if `compz = 'V'`, *z* is overwritten by the orthogonal/unitary matrix of right Schur vectors of (*A*,*B*).

work(1)

If `info`≥ 0, on exit, `work(1)` contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info

`INTEGER`.

If `info = 0`, the execution is successful.

If `info = -i`, the *i*-th parameter had an illegal value.

If `info = 1,..., n`, the *QZ* iteration did not converge.

(*H*,*T*) is not in Schur form, but *alphar*(*i*), *alphai*(*i*) (for real flavors), *alpha*(*i*) (for complex flavors), and *beta*(*i*), `i=info+1,..., n` should be correct.

If `info = n+1,...,2n`, the shift calculation failed.

(*H*,*T*) is not in Schur form, but *alphar*(*i*), *alphai*(*i*) (for real flavors), *alpha*(*i*) (for complex flavors), and *beta*(*i*), `i =info-n+1,..., n` should be correct.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `hgeqz` interface are the following:

h	Holds the matrix *H* of size (*n*,*n*).
t	Holds the matrix *T* of size (*n*,*n*).
alphar	Holds the vector of length *n*. Used in real flavors only.
alphai	Holds the vector of length *n*. Used in real flavors only.
alpha	Holds the vector of length *n*. Used in complex flavors only.
beta	Holds the vector of length *n*.
q	Holds the matrix *Q* of size (*n*,*n*).
z	Holds the matrix *Z* of size (*n*,*n*).
ilo	Default value for this argument is *ilo* = 1.
ihi	Default value for this argument is *ihi* = *n*.
job	Must be 'E' or 'S'. The default value is 'E'.
compq	If omitted, this argument is restored based on the presence of argument *q* as follows: *compq* = 'I', if *q* is present, *compq* = 'N', if *q* is omitted. If present, *compq* must be equal to 'I' or 'V' and the argument *q* must also be present. Note that there will be an error condition if *compq* is present and *q* omitted.
compz	If omitted, this argument is restored based on the presence of argument *z* as follows: *compz* = 'I', if *z* is present, *compz* = 'N', if *z* is omitted. If present, *compz* must be equal to 'I' or 'V' and the argument *z* must also be present. Note an error condition if *compz* is present and *z* is omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?tgevc

Computes some or all of the right and/or left generalized eigenvectors of a pair of upper triangular matrices.

Syntax

```
call stgevc(side, howmny, select, n, s, lds, p, ldp, vl, ldvl, vr, ldvr, mm, m, work, info)
call dtgevc(side, howmny, select, n, s, lds, p, ldp, vl, ldvl, vr, ldvr, mm, m, work, info)
call ctgevc(side, howmny, select, n, s, lds, p, ldp, vl, ldvl, vr, ldvr, mm, m, work, rwork, info)
call ztgevc(side, howmny, select, n, s, lds, p, ldp, vl, ldvl, vr, ldvr, mm, m, work, rwork, info)
call tgevc(s, p [,howmny] [,select] [,vl] [,vr] [,m] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes some or all of the right and/or left eigenvectors of a pair of real/complex matrices (*S*,*P*), where *S* is quasi-triangular (for real flavors) or upper triangular (for complex flavors) and *P* is upper triangular.

Matrix pairs of this type are produced by the generalized Schur factorization of a real/complex matrix pair (*A*,*B*):

$A = Q*S*Z^H$, $B = Q*P*Z^H$

as computed by ?gghrd plus ?hgeqz.

The right eigenvector *x* and the left eigenvector *y* of (*S*,*P*) corresponding to an eigenvalue *w* are defined by:

$S*x = w*P*x$, $y^H*S = w*y^H*P$

The eigenvalues are not input to this routine, but are computed directly from the diagonal blocks or diagonal elements of *S* and *P*.

This routine returns the matrices *X* and/or *Y* of right and left eigenvectors of (*S*,*P*), or the products *Z***X* and/or *Q***Y*, where *Z* and *Q* are input matrices.

If *Q* and *Z* are the orthogonal/unitary factors from the generalized Schur factorization of a matrix pair (*A*,*B*), then *Z***X* and *Q***Y* are the matrices of right and left eigenvectors of (*A*,*B*).

Input Parameters

side

CHARACTER*1. Must be 'R', 'L', or 'B'.

If *side* = 'R', compute right eigenvectors only.

If *side* = 'L', compute left eigenvectors only.

If *side* = 'B', compute both right and left eigenvectors.

howmny — CHARACTER*1. Must be 'A', 'B', or 'S'.

If *howmny* = 'A', compute all right and/or left eigenvectors.

If *howmny* = 'B', compute all right and/or left eigenvectors, backtransformed by the matrices in *vr* and/or *vl*.

If *howmny* = 'S', compute selected right and/or left eigenvectors, specified by the logical array *select*.

select — LOGICAL.

Array, size at least max (1, *n*).

If *howmny* = 'S', *select* specifies the eigenvectors to be computed.

If *howmny* = 'A'or 'B', *select* is not referenced.

For real flavors:

If *w*(*j*) is a real eigenvalue, the corresponding real eigenvector is computed if *select*(*j*) is .TRUE..

If *w*(*j*) and *omega*(*j* + 1) are the real and imaginary parts of a complex eigenvalue, the corresponding complex eigenvector is computed if either *select*(*j*) or *select*(*j* + 1) is .TRUE., and on exit *select*(*j*) is set to .TRUE.and *select*(*j* + 1) is set to .FALSE..

For complex flavors:

The eigenvector corresponding to the *j*-th eigenvalue is computed if *select*(*j*) is .TRUE..

n — INTEGER. The order of the matrices *S* and *P* (*n*≥ 0).

s, *p*, *vl*, *vr*, *work* — REAL for stgevc

DOUBLE PRECISION for dtgevc

COMPLEX for ctgevc

DOUBLE COMPLEX for ztgevc.

Arrays:

s(*lds*,*) contains the matrix *S* from a generalized Schur factorization as computed by ?hgeqz. This matrix is upper quasi-triangular for real flavors, and upper triangular for complex flavors.

The second dimension of *s* must be at least max(1, *n*).

p(*ldp*,*) contains the upper triangular matrix *P* from a generalized Schur factorization as computed by ?hgeqz.

For real flavors, 2-by-2 diagonal blocks of *P* corresponding to 2-by-2 blocks of *S* must be in positive diagonal form.

For complex flavors, *P* must have real diagonal elements. The second dimension of *p* must be at least max(1, *n*).

If *side* = 'L' or 'B' and *howmny* = 'B', *vl*(*ldvl*,*) must contain an *n*-by-*n* matrix *Q* (usually the orthogonal/unitary matrix *Q* of left Schur vectors returned by ?hgeqz). The second dimension of *vl* must be at least max(1, *mm*).

If *side* = 'R', *vl* is not referenced.

If *side* = 'R' or 'B' and *howmny* = 'B', *vr*(*ldvr*,*) must contain an *n*-by-*n* matrix *Z* (usually the orthogonal/unitary matrix *Z* of right Schur vectors returned by ?hgeqz). The second dimension of *vr* must be at least max(1, *mm*).

If *side* = 'L', *vr* is not referenced.

work(*) is a workspace array.

size at least max (1, 6**n*) for real flavors and at least max (1, 2**n*) for complex flavors.

lds INTEGER. The leading dimension of *s*; at least max(1, *n*).

ldp INTEGER. The leading dimension of *p*; at least max(1, *n*).

ldvl INTEGER. The leading dimension of *vl*;

If *side* = 'L' or 'B', then *ldvl*≥*n*.

If *side* = 'R', then *ldvl*≥ 1 .

ldvr INTEGER. The leading dimension of *vr*;

If *side* = 'R' or 'B', then *ldvr*≥*n*.

If *side* = 'L', then *ldvr*≥ 1.

mm INTEGER. The number of columns in the arrays *vl* and/or *vr* (*mm*≥*m*).

rwork REAL for ctgevc DOUBLE PRECISION for ztgevc. Workspace array, size at least max (1, 2**n*). Used in complex flavors only.

Output Parameters

vl On exit, if *side* = 'L' or 'B', *vl* contains:

if *howmny* = 'A', the matrix *Y* of left eigenvectors of (*S*,*P*);

if *howmny* = 'B', the matrix *Q***Y*;

if *howmny* = 'S', the left eigenvectors of (*S*,*P*) specified by *select*, stored consecutively in the columns of *vl*, in the same order as their eigenvalues.

For real flavors:

A complex eigenvector corresponding to a complex eigenvalue is stored in two consecutive columns, the first holding the real part, and the second the imaginary part.

vr On exit, if *side* = 'R' or 'B', *vr* contains:

if *howmny* = 'A', the matrix *X* of right eigenvectors of (*S*,*P*);

if *howmny* = 'B', the matrix *Z***X*;

if *howmny* = 'S', the right eigenvectors of (*S*,*P*) specified by *select*, stored consecutively in the columns of *vr*, in the same order as their eigenvalues.

For real flavors:

A complex eigenvector corresponding to a complex eigenvalue is stored in two consecutive columns, the first holding the real part, and the second the imaginary part.

m INTEGER. The number of columns in the arrays *vl* and/or *vr* actually used to store the eigenvectors.

If *howmny* = 'A' or 'B', *m* is set to *n*.

For real flavors:

Each selected real eigenvector occupies one column and each selected complex eigenvector occupies two columns.

For complex flavors:

Each selected eigenvector occupies one column.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = –*i*, the *i*-th parameter had an illegal value.

For real flavors:

if *info* = *i*>0, the 2-by-2 block (*i*:*i*+1) does not have a complex eigenvalue.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine tgevc interface are the following:

s Holds the matrix *S* of size (*n*,*n*).

p Holds the matrix *P* of size (*n*,*n*).

select Holds the vector of length *n*.

vl Holds the matrix *VL* of size (*n*,*mm*).

vr Holds the matrix *VR* of size (*n*,*mm*).

side Restored based on the presence of arguments *vl* and *vr* as follows:

side = 'B', if both *vl* and *vr* are present,

side = 'L', if *vl* is present and *vr* omitted,

side = 'R', if *vl* is omitted and *vr* present,

Note that there will be an error condition if both *vl* and *vr* are omitted.

howmny If omitted, this argument is restored based on the presence of argument *select* as follows:

howmny = 'S', if *select* is present,

howmny = 'A', if *select* is omitted.

If present, *howmny* must be equal to 'A' or 'B' and the argument *select* must be omitted.

Note that there will be an error condition if both *howmny* and *select* are present.

?tgexc
Reorders the generalized Schur decomposition of a pair of matrices (A,B) so that one diagonal block of (A,B) moves to another row index.

Syntax

```
call stgexc(wantq, wantz, n, a, lda, b, ldb, q, ldq, z, ldz, ifst, ilst, work, lwork, info)
call dtgexc(wantq, wantz, n, a, lda, b, ldb, q, ldq, z, ldz, ifst, ilst, work, lwork, info)
call ctgexc(wantq, wantz, n, a, lda, b, ldb, q, ldq, z, ldz, ifst, ilst, info)
call ztgexc(wantq, wantz, n, a, lda, b, ldb, q, ldq, z, ldz, ifst, ilst, info)
call tgexc(a, b [,ifst] [,ilst] [,z] [,q] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine reorders the generalized real-Schur/Schur decomposition of a real/complex matrix pair (*A*,*B*) using an orthogonal/unitary equivalence transformation

$(A,B) = Q*(A,B)*Z^H$,

so that the diagonal block of (*A*, *B*) with row index *ifst* is moved to row *ilst*. Matrix pair (*A*, *B*) must be in a generalized real-Schur/Schur canonical form (as returned by gges), that is, *A* is block upper triangular with 1-by-1 and 2-by-2 diagonal blocks and *B* is upper triangular. Optionally, the matrices *Q* and *Z* of generalized Schur vectors are updated.

$Q_{in}*A_{in}*Z_{in}^T = Q_{out}*A_{out}*Z_{out}^T$

$Q_{in}*B_{in}*Z_{in}^T = Q_{out}*B_{out}*Z_{out}^T$.

Input Parameters

wantq, *wantz*	LOGICAL. If *wantq* = .TRUE., update the left transformation matrix *Q*; If *wantq* = .FALSE., do not update *Q*; If *wantz* = .TRUE., update the right transformation matrix *Z*; If *wantz* = .FALSE., do not update *Z*.
n	INTEGER. The order of the matrices *A* and *B* ($n \geq 0$).
a, *b*, *q*, *z*	REAL for stgexc

`DOUBLE PRECISION` for `dtgexc`

`COMPLEX` for `ctgexc`

`DOUBLE COMPLEX` for `ztgexc`.

Arrays:

a(*lda*,*) contains the matrix *A*.

The second dimension of *a* must be at least max(1, *n*).

b(*ldb*,*) contains the matrix *B*. The second dimension of *b* must be at least max(1, *n*).

q(*ldq*,*)

If *wantq* = .FALSE., then *q* is not referenced.

If *wantq* = .TRUE., then *q* must contain the orthogonal/unitary matrix *Q*.

The second dimension of *q* must be at least max(1, *n*).

z(*ldz*,*)

If *wantz* = .FALSE., then *z* is not referenced.

If *wantz* = .TRUE., then *z* must contain the orthogonal/unitary matrix *Z*.

The second dimension of *z* must be at least max(1, *n*).

lda — `INTEGER`. The leading dimension of *a*; at least max(1, *n*).

ldb — `INTEGER`. The leading dimension of *b*; at least max(1, *n*).

ldq — `INTEGER`. The leading dimension of *q*;

If *wantq* = .FALSE., then *ldq*≥ 1.

If *wantq* = .TRUE., then *ldq*≥ max(1, *n*).

ldz — `INTEGER`. The leading dimension of *z*;

If *wantz* = .FALSE., then *ldz*≥ 1.

If *wantz* = .TRUE., then *ldz*≥ max(1, *n*).

ifst, *ilst* — `INTEGER`. Specify the reordering of the diagonal blocks of (*A*, *B*). The block with row index *ifst* is moved to row *ilst*, by a sequence of swapping between adjacent blocks. Constraint: 1 ≤*ifst*, *ilst*≤*n*.

work — `REAL` for `stgexc`;

`DOUBLE PRECISION` for `dtgexc`.

Workspace array, size (*lwork*). Used in real flavors only.

lwork — `INTEGER`. The dimension of *work*; must be at least 4*n* +16.

If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for details.

Output Parameters

a, *b*, *q*, *z*	Overwritten by the updated matrices *A*,*B*, *Q*, and *Z* respectively.
ifst, *ilst*	Overwritten for real flavors only. If *ifst* pointed to the second row of a 2 by 2 block on entry, it is changed to point to the first row; *ilst* always points to the first row of the block in its final position (which may differ from its input value by ±1).
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = 1, the transformed matrix pair (*A*, *B*) would be too far from generalized Schur form; the problem is ill-conditioned. (*A*, *B*) may have been partially reordered, and *ilst* points to the first row of the current position of the block being moved.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine tgexc interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
b	Holds the matrix *B* of size (*n*,*n*).
z	Holds the matrix *Z* of size (*n*,*n*).
q	Holds the matrix *Q* of size (*n*,*n*).
wantq	Restored based on the presence of the argument *q* as follows: *wantq* = .TRUE., if *q* is present, *wantq* = .FALSE., if *q* is omitted.
wantz	Restored based on the presence of the argument *z* as follows: *wantz* = .TRUE., if *z* is present, *wantz* = .FALSE., if z is omitted.

Application Notes

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?tgsen
Reorders the generalized Schur decomposition of a pair of matrices (A,B) so that a selected cluster of eigenvalues appears in the leading diagonal blocks of (A,B).

Syntax

`call stgsen(ijob, wantq, wantz, select, n, a, lda, b, ldb, alphar, alphai, beta, q, ldq, z, ldz, m, pl, pr, dif, work, lwork, iwork, liwork, info)`

`call dtgsen(ijob, wantq, wantz, select, n, a, lda, b, ldb, alphar, alphai, beta, q, ldq, z, ldz, m, pl, pr, dif, work, lwork, iwork, liwork, info)`

`call ctgsen(ijob, wantq, wantz, select, n, a, lda, b, ldb, alpha, beta, q, ldq, z, ldz, m, pl, pr, dif, work, lwork, iwork, liwork, info)`

`call ztgsen(ijob, wantq, wantz, select, n, a, lda, b, ldb, alpha, beta, q, ldq, z, ldz, m, pl, pr, dif, work, lwork, iwork, liwork, info)`

`call tgsen(a, b, select [,alphar] [,alphai] [,beta] [,ijob] [,q] [,z] [,pl] [,pr] [,dif] [,m] [,info])`

`call tgsen(a, b, select [,alpha] [,beta] [,ijob] [,q] [,z] [,pl] [,pr] [, dif] [,m] [,info])`

Include Files

- `mkl.fi, lapack.f90`

Description

The routine reorders the generalized real-Schur/Schur decomposition of a real/complex matrix pair (*A*, *B*) (in terms of an orthogonal/unitary equivalence transformation $Q^T*(A,B)*Z$ for real flavors or $Q^H*(A,B)*Z$ for complex flavors), so that a selected cluster of eigenvalues appears in the leading diagonal blocks of the pair (*A*, *B*). The leading columns of *Q* and *Z* form orthonormal/unitary bases of the corresponding left and right eigenspaces (deflating subspaces).

(*A*, *B*) must be in generalized real-Schur/Schur canonical form (as returned by gges), that is, *A* and *B* are both upper triangular.

`?tgsen` also computes the generalized eigenvalues

ω_j = (*alphar*(j) + *alphai*(j)*i)/*beta*(j) (for real flavors)

ω_j = *alpha*(j)/*beta*(j) (for complex flavors)

of the reordered matrix pair (*A*, *B*).

Optionally, the routine computes the estimates of reciprocal condition numbers for eigenvalues and eigenspaces. These are `Difu[(`A_{11}`, `B_{11}`), (`A_{22}`, `B_{22}`)]` and `Difl[(`A_{11}`, `B_{11}`), (`A_{22}`, `B_{22}`)]`, that is, the separation(s) between the matrix pairs (A_{11}, B_{11}) and (A_{22}, B_{22}) that correspond to the selected cluster and the eigenvalues outside the cluster, respectively, and norms of "projections" onto left and right eigenspaces with respect to the selected cluster in the (1,1)-block.

Input Parameters

ijob — `INTEGER`. Specifies whether condition numbers are required for the cluster of eigenvalues (*pl* and *pr*) or the deflating subspaces `Difu` and `Difl`.

If *ijob* =0, only reorder with respect to *select*;

If *ijob* =1, reciprocal of norms of "projections" onto left and right eigenspaces with respect to the selected cluster (*pl* and *pr*);

If *ijob* =2, compute upper bounds on Difu and Difl, using F-norm-based estimate (*dif* (1:2));

If *ijob* =3, compute estimate of Difu and Difl, using 1-norm-based estimate (*dif* (1:2)). This option is about 5 times as expensive as *ijob* =2;

If *ijob* =4,>compute *pl*, *pr* and *dif* (i.e., options 0, 1 and 2 above). This is an economic version to get it all;

If *ijob* =5, compute *pl*, *pr* and *dif* (i.e., options 0, 1 and 3 above).

wantq, *wantz*

LOGICAL.

If *wantq* = .TRUE., update the left transformation matrix *Q*;

If *wantq* = .FALSE., do not update *Q*;

If *wantz* = .TRUE., update the right transformation matrix *Z*;

If *wantz* = .FALSE., do not update *Z*.

select

LOGICAL.

Array, size at least max (1, *n*). Specifies the eigenvalues in the selected cluster.

To select an eigenvalue ω_j, *select*(*j*) must be .TRUE.*For real flavors*: to select a complex conjugate pair of eigenvalues ω_j and ω_{j+1} (corresponding 2 by 2 diagonal block), *select*(*j*) and/or *select*(*j* + 1) must be set to .TRUE.; the complex conjugate ω_j and ω_{j+1} must be either both included in the cluster or both excluded.

n

INTEGER. The order of the matrices *A* and *B* ($n \geq 0$).

a, *b*, *q*, *z*, *work*

REAL for stgsen

DOUBLE PRECISION for dtgsen

COMPLEX for ctgsen

DOUBLE COMPLEX for ztgsen.

Arrays:

a(*lda*,*) contains the matrix *A*.

For real flavors: *A* is upper quasi-triangular, with (*A*, *B*) in generalized real Schur canonical form.

For complex flavors: *A* is upper triangular, in generalized Schur canonical form.

The second dimension of *a* must be at least max(1, *n*).

b(*ldb*,*) contains the matrix *B*.

For real flavors: *B* is upper triangular, with (*A*, *B*) in generalized real Schur canonical form.

For complex flavors: *B* is upper triangular, in generalized Schur canonical form. The second dimension of *b* must be at least max(1, *n*).

q(*ldq*,*)

If *wantq* = .TRUE., then *q* is an *n*-by-*n* matrix;

If *wantq* = .FALSE., then *q* is not referenced.

The second dimension of *q* must be at least max(1, *n*).

z(*ldz*,*)

If *wantz* = .TRUE., then *z* is an *n*-by-*n* matrix;

If *wantz* = .FALSE., then *z* is not referenced.

The second dimension of *z* must be at least max(1, *n*).

work is a workspace array, its dimension max(1, *lwork*).

lda INTEGER. The leading dimension of *a*; at least max(1, *n*).

ldb INTEGER. The leading dimension of *b*; at least max(1, *n*).

ldq INTEGER. The leading dimension of *q*; *ldq*≥ 1.

If *wantq* = .TRUE., then *ldq*≥ max(1, *n*).

ldz INTEGER. The leading dimension of *z*; *ldz*≥ 1.

If *wantz* = .TRUE., then *ldz*≥ max(1, *n*).

lwork INTEGER. The dimension of the array *work*.

For real flavors:

If *ijob* = 1, 2, or 4, *lwork*≥ max(4*n*+16, 2*m*(*n*-*m*)).

If *ijob* = 3 or 5, *lwork*≥ max(4*n*+16, 4*m*(*n*-*m*)).

For complex flavors:

If *ijob* = 1, 2, or 4, *lwork*≥ max(1, 2*m*(*n*-*m*)).

If *ijob* = 3 or 5, *lwork*≥ max(1, 4*m*(*n*-*m*)).

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for details.

iwork INTEGER. Workspace array, its dimension max(1, *liwork*).

liwork INTEGER. The dimension of the array *iwork*.

For real flavors:

If *ijob* = 1, 2, or 4, *liwork*≥*n*+6.

If *ijob* = 3 or 5, *liwork*≥ max(*n*+6, 2*m*(*n*-*m*)).

For complex flavors:

If *ijob* = 1, 2, or 4, *liwork*≥*n*+2.

If *ijob* = 3 or 5, *liwork*≥ max(*n*+2, 2*m*(*n*-*m*)).

If *liwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *iwork* array, returns this value as the first entry of the *iwork* array, and no error message related to *liwork* is issued by xerbla. See *Application Notes* for details.

Output Parameters

a, *b*

Overwritten by the reordered matrices *A* and *B*, respectively.

alphar, *alphai*

`REAL` for `stgsen`;

`DOUBLE PRECISION` for `dtgsen`.

Arrays, size at least max(1, *n*). Contain values that form generalized eigenvalues in real flavors.

See *beta*.

alpha

`COMPLEX` for `ctgsen`;

`DOUBLE COMPLEX` for `ztgsen`.

Array, size at least max(1, *n*). Contain values that form generalized eigenvalues in complex flavors.

See *beta*.

beta

`REAL` for `stgsen`

`DOUBLE PRECISION` for `dtgsen`

`COMPLEX` for `ctgsen`

`DOUBLE COMPLEX` for `ztgsen`.

Array, size at least max(1, *n*).

For real flavors:

On exit, `(alphar(j) + alphai(j)*i)/beta(j)`, *j*=1,..., *n*, will be the generalized eigenvalues.

`alphar(j) + alphai(j)*i` and `beta(j)`, *j*=1,..., *n* are the diagonals of the complex Schur form (*S*,*T*) that would result if the 2-by-2 diagonal blocks of the real generalized Schur form of (*A*,*B*) were further reduced to triangular form using complex unitary transformations.

If `alphai(j)` is zero, then the *j*-th eigenvalue is real; if positive, then the *j*-th and (*j* + 1)-st eigenvalues are a complex conjugate pair, with `alphai(j + 1)` negative.

For complex flavors:

The diagonal elements of *A* and *B*, respectively, when the pair (*A*,*B*) has been reduced to generalized Schur form. `alpha(i)/beta(i)`,*i*=1,..., *n* are the generalized eigenvalues.

q

If *wantq* = `.TRUE.`, then, on exit, *Q* has been postmultiplied by the left orthogonal transformation matrix which reorder (*A*, *B*). The leading *m* columns of *Q* form orthonormal bases for the specified pair of left eigenspaces (deflating subspaces).

z

If *wantz* = `.TRUE.`, then, on exit, *Z* has been postmultiplied by the left orthogonal transformation matrix which reorder (*A*, *B*). The leading *m* columns of *Z* form orthonormal bases for the specified pair of left eigenspaces (deflating subspaces).

m

`INTEGER`.

The dimension of the specified pair of left and right eigen-spaces (deflating subspaces); $0 \le m \le n$.

pl, *pr*

`REAL` for single precision flavors;

`DOUBLE PRECISION` for double precision flavors.

If *ijob* = 1, 4, or 5, *pl* and *pr* are lower bounds on the reciprocal of the norm of "projections" onto left and right eigenspaces with respect to the selected cluster.

$0 < pl, pr \le 1$. If $m = 0$ or $m = n$, $pl = pr = 1$.

If *ijob* = 0, 2 or 3, *pl* and *pr* are not referenced

dif

`REAL` for single precision flavors;`DOUBLE PRECISION` for double precision flavors.

Array, size (2).

If $ijob \ge 2$, *dif*(1:2) store the estimates of `Difu` and `Difl`.

If *ijob* = 2 or 4, *dif*(1:2) are F-norm-based upper bounds on `Difu` and `Difl`.

If *ijob* = 3 or 5, *dif*(1:2) are 1-norm-based estimates of `Difu` and `Difl`.

If $m = 0$ or $m = n$, *dif*(1:2) = F-norm([*A*, *B*]).

If *ijob* = 0 or 1, *dif* is not referenced.

work(1)

If *ijob* is not 0 and *info* = 0, on exit, *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

iwork(1)

If *ijob* is not 0 and *info* = 0, on exit, *iwork*(1) contains the minimum value of *liwork* required for optimum performance. Use this *liwork* for subsequent runs.

info

`INTEGER`.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = 1, Reordering of (*A*, *B*) failed because the transformed matrix pair (*A*, *B*) would be too far from generalized Schur form; the problem is very ill-conditioned. (*A*, *B*) may have been partially reordered.

If *ijob* > 0, 0 is returned in *dif*, *pl* and *pr*.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `tgsen` interface are the following:

a

Holds the matrix *A* of size (*n*,*n*).

b

Holds the matrix *B* of size (*n*,*n*).

select

Holds the vector of length *n*.

alphar	Holds the vector of length *n*. Used in real flavors only.
alphai	Holds the vector of length *n*. Used in real flavors only.
alpha	Holds the vector of length *n*. Used in complex flavors only.
beta	Holds the vector of length *n*.
q	Holds the matrix *Q* of size (*n*,*n*).
z	Holds the matrix *Z* of size (*n*,*n*).
dif	Holds the vector of length (2).
ijob	Must be 0, 1, 2, 3, 4, or 5. The default value is 0.
wantq	Restored based on the presence of the argument *q* as follows: *wantq* = .TRUE., if *q* is present, *wantq* = .FALSE., if *q* is omitted.
wantz	Restored based on the presence of the argument *z* as follows: *wantz* = .TRUE., if *z* is present, *wantz* = .FALSE., if z is omitted.

Application Notes

If it is not clear how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run or set *lwork* = -1 (*liwork* = -1).

If *lwork* (or *liwork*) has any of admissible sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If *lwork* = -1 (*liwork* = -1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if *lwork* (*liwork*) is less than the minimal required value and is not equal to -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?tgsyl
Solves the generalized Sylvester equation.

Syntax

```
call stgsyl(trans, ijob, m, n, a, lda, b, ldb, c, ldc, d, ldd, e, lde, f, ldf, scale,
dif, work, lwork, iwork, info)

call dtgsyl(trans, ijob, m, n, a, lda, b, ldb, c, ldc, d, ldd, e, lde, f, ldf, scale,
dif, work, lwork, iwork, info)

call ctgsyl(trans, ijob, m, n, a, lda, b, ldb, c, ldc, d, ldd, e, lde, f, ldf, scale,
dif, work, lwork, iwork, info)

call ztgsyl(trans, ijob, m, n, a, lda, b, ldb, c, ldc, d, ldd, e, lde, f, ldf, scale,
dif, work, lwork, iwork, info)

call tgsyl(a, b, c, d, e, f [,ijob] [,trans] [,scale] [,dif] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine solves the generalized Sylvester equation:

*A*R-L*B = scale*C*

*D*R-L*E = scale*F*

where *R* and *L* are unknown *m*-by-*n* matrices, (*A*, *D*), (*B*, *E*) and (*C*, *F*) are given matrix pairs of size *m*-by-*m*, *n*-by-*n* and *m*-by-*n*, respectively, with real/complex entries. (*A*, *D*) and (*B*, *E*) must be in generalized real-Schur/Schur canonical form, that is, *A*, *B* are upper quasi-triangular/triangular and *D*, *E* are upper triangular.

The solution (*R*, *L*) overwrites (*C*, *F*). The factor *scale*, $0 \le scale \le 1$, is an output scaling factor chosen to avoid overflow.

In matrix notation the above equation is equivalent to the following: solve *Z*x = scale*b*, where *Z* is defined as

$$Z = \begin{pmatrix} kron(I_n, A) & -kron(B^T, I_m) \\ kron(I_n, D) & -kron(E^T, I_m) \end{pmatrix}$$

Here I_k is the identity matrix of size *k* and X^T is the transpose/conjugate-transpose of *X*. *kron(X, Y)* is the Kronecker product between the matrices *X* and *Y*.

If *trans = 'T'* (for real flavors), or *trans = 'C'* (for complex flavors), the routine ?tgsyl solves the transposed/conjugate-transposed system $Z^T*y = scale*b$, which is equivalent to solve for *R* and *L* in

$A^T*R+D^T*L = scale*C$

$R*B^T+L*E^T = scale*(-F)$

This case (*trans = 'T'* for stgsyl/dtgsyl or *trans = 'C'* for ctgsyl/ztgsyl) is used to compute an one-norm-based estimate of Dif[(*A*, *D*), (*B*, *E*)], the separation between the matrix pairs (*A*,*D*) and (*B*,*E*), using lacon/lacon.

If *ijob* ≥ 1, ?tgsyl computes a Frobenius norm-based estimate of Dif[(*A*, *D*), (*B*,*E*)]. That is, the reciprocal of a lower bound on the reciprocal of the smallest singular value of *Z*. This is a level 3 BLAS algorithm.

Input Parameters

trans

CHARACTER*1. Must be 'N', 'T', or 'C'.

If *trans = 'N'*, solve the generalized Sylvester equation.

If *trans = 'T'*, solve the 'transposed' system (for real flavors only).

If *trans = 'C'*, solve the ' conjugate transposed' system (for complex flavors only).

ijob

INTEGER. Specifies what kind of functionality to be performed:

If *ijob* =0, solve the generalized Sylvester equation only;

If *ijob* =1, perform the functionality of *ijob* =0 and *ijob* =3;

If *ijob* =2, perform the functionality of *ijob* =0 and *ijob* =4;

If *ijob* =3, only an estimate of Dif[(*A*, *D*), (*B*, *E*)] is computed (look ahead strategy is used);

If *ijob* =4, only an estimate of Dif[(*A*, *D*), (*B*,*E*)] is computed (?gecon on sub-systems is used). If *trans* = 'T' or 'C', *ijob* is not referenced.

m — INTEGER. The order of the matrices *A* and *D*, and the row dimension of the matrices *C*, *F*, *R* and *L*.

n — INTEGER. The order of the matrices *B* and *E*, and the column dimension of the matrices *C*, *F*, *R* and *L*.

a, *b*, *c*, *d*, *e*, *f*, *work* — REAL for stgsyl

DOUBLE PRECISION for dtgsyl

COMPLEX for ctgsyl

DOUBLE COMPLEX for ztgsyl.

Arrays:

a(*lda*,*) contains the upper quasi-triangular (for real flavors) or upper triangular (for complex flavors) matrix *A*.

The second dimension of *a* must be at least max(1, *m*).

b(*ldb*,*) contains the upper quasi-triangular (for real flavors) or upper triangular (for complex flavors) matrix *B*. The second dimension of *b* must be at least max(1, *n*).

c(*ldc*,*) contains the right-hand-side of the first matrix equation in the generalized Sylvester equation (as defined by *trans*)

The second dimension of *c* must be at least max(1, *n*).

d(*ldd*,*) contains the upper triangular matrix *D*.

The second dimension of *d* must be at least max(1, *m*).

e(*lde*,*) contains the upper triangular matrix *E*.

The second dimension of *e* must be at least max(1, *n*).

f(*ldf*,*) contains the right-hand-side of the second matrix equation in the generalized Sylvester equation (as defined by *trans*)

The second dimension of *f* must be at least max(1, *n*).

work is a workspace array, its dimension max(1, *lwork*).

lda — INTEGER. The leading dimension of *a*; at least max(1, *m*).

ldb — INTEGER. The leading dimension of *b*; at least max(1, *n*).

ldc — INTEGER. The leading dimension of *c*; at least max(1, *m*) .

ldd — INTEGER. The leading dimension of *d*; at least max(1, *m*).

lde — INTEGER. The leading dimension of *e*; at least max(1, *n*).

ldf — INTEGER. The leading dimension of *f*; at least max(1, *m*) .

lwork INTEGER.

The dimension of the array *work*. *lwork* ≥ 1.

If *ijob* = 1 or 2 and *trans* = 'N', *lwork* ≥ max(1, 2**m***n*).

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for details.

iwork INTEGER. Workspace array, size at least (*m*+*n*+6) for real flavors, and at least (*m*+*n*+2) for complex flavors.

Output Parameters

c If *ijob*=0, 1, or 2, overwritten by the solution *R*.

If *ijob*=3 or 4 and *trans* = 'N', *c* holds *R*, the solution achieved during the computation of the Dif-estimate.

f If *ijob*=0, 1, or 2, overwritten by the solution *L*.

If *ijob*=3 or 4 and *trans* = 'N', *f* holds *L*, the solution achieved during the computation of the Dif-estimate.

dif REAL for single-precision flavors

DOUBLE PRECISION for double-precision flavors.

On exit, *dif* is the reciprocal of a lower bound of the reciprocal of the Dif-function, that is, *dif* is an upper bound of Dif[(*A*, *D*), (*B*, *E*)] = sigma_min(*Z*), where *Z* as defined in the description.

If *ijob* = 0, or *trans* = 'T' (for real flavors), or *trans* = 'C' (for complex flavors), *dif* is not touched.

scale REAL for single-precision flavors

DOUBLE PRECISION for double-precision flavors.

On exit, *scale* is the scaling factor in the generalized Sylvester equation.

If 0 < *scale* < 1, *c* and *f* hold the solutions *R* and *L*, respectively, to a slightly perturbed system but the input matrices *A*, *B*, *D* and *E* have not been changed.

If *scale* = 0, *c* and *f* hold the solutions *R* and *L*, respectively, to the homogeneous system with *C* = *F* = 0. Normally, *scale* = 1.

work(1) If *info* = 0, *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* > 0, (*A*, *D*) and (*B*, *E*) have common or close eigenvalues.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `tgsyl` interface are the following:

a	Holds the matrix *A* of size (*m*,*m*).
b	Holds the matrix *B* of size (*n*,*n*).
c	Holds the matrix *C* of size (*m*,*n*).
d	Holds the matrix *D* of size (*m*,*m*).
e	Holds the matrix *E* of size (*n*,*n*).
f	Holds the matrix *F* of size (*m*,*n*).
ijob	Must be 0, 1, 2, 3, or 4. The default value is 0.
trans	Must be `'N'` or `'T'`. The default value is `'N'`.

Application Notes

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?tgsna

Estimates reciprocal condition numbers for specified eigenvalues and/or eigenvectors of a pair of matrices in generalized real Schur canonical form.

Syntax

```
call stgsna(job, howmny, select, n, a, lda, b, ldb, vl, ldvl, vr, ldvr, s, dif, mm, m,
work, lwork, iwork, info)
```

```
call dtgsna(job, howmny, select, n, a, lda, b, ldb, vl, ldvl, vr, ldvr, s, dif, mm, m,
work, lwork, iwork, info)
```

```
call ctgsna(job, howmny, select, n, a, lda, b, ldb, vl, ldvl, vr, ldvr, s, dif, mm, m,
work, lwork, iwork, info)
```

```
call ztgsna(job, howmny, select, n, a, lda, b, ldb, vl, ldvl, vr, ldvr, s, dif, mm, m,
work, lwork, iwork, info)
```

```
call tgsna(a, b [,s] [,dif] [,vl] [,vr] [,select] [,m] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The real flavors stgsna/dtgsna of this routine estimate reciprocal condition numbers for specified eigenvalues and/or eigenvectors of a matrix pair (*A*, *B*) in generalized real Schur canonical form (or of any matrix pair ($Q*A*Z^T$, $Q*B*Z^T$) with orthogonal matrices *Q* and *Z*.

(*A*, *B*) must be in generalized real Schur form (as returned by gges/gges), that is, *A* is block upper triangular with 1-by-1 and 2-by-2 diagonal blocks. B is upper triangular.

The complex flavors ctgsna/ztgsna estimate reciprocal condition numbers for specified eigenvalues and/or eigenvectors of a matrix pair (*A*, *B*). (*A*, *B*) must be in generalized Schur canonical form, that is, *A* and *B* are both upper triangular.

Input Parameters

job

CHARACTER*1. Specifies whether condition numbers are required for eigenvalues or eigenvectors. Must be 'E' or 'V' or 'B'.

If *job* = 'E', for eigenvalues only (compute *s*).

If *job* = 'V', for eigenvectors only (compute *dif*).

If *job* = 'B', for both eigenvalues and eigenvectors (compute both *s* and *dif*).

howmny

CHARACTER*1. Must be 'A' or 'S'.

If *howmny* = 'A', compute condition numbers for all eigenpairs.

If *howmny* = 'S', compute condition numbers for selected eigenpairs specified by the logical array *select*.

select

LOGICAL.

Array, size at least max (1, *n*).

If *howmny* = 'S', *select* specifies the eigenpairs for which condition numbers are required.

If *howmny* = 'A', *select* is not referenced.

For real flavors:

To select condition numbers for the eigenpair corresponding to a real eigenvalue ω_j, *select*(*j*) must be set to .TRUE.; to select condition numbers corresponding to a complex conjugate pair of eigenvalues ω_j and ω_{j+1}, either *select*(*j*) or *select*(*j* + 1) must be set to .TRUE.

For complex flavors:

To select condition numbers for the corresponding *j*-th eigenvalue and/or eigenvector, *select*(*j*) must be set to .TRUE..

n

INTEGER. The order of the square matrix pair (*A*, *B*)

($n \geq 0$).

a, *b*, *vl*, *vr*, *work*

REAL for stgsna

`DOUBLE PRECISION` for `dtgsna`

`COMPLEX` for `ctgsna`

`DOUBLE COMPLEX` for `ztgsna`.

Arrays:

a(*lda*,*) contains the upper quasi-triangular (for real flavors) or upper triangular (for complex flavors) matrix *A* in the pair (*A*, *B*).

The second dimension of *a* must be at least max(1, *n*).

b(*ldb*,*) contains the upper triangular matrix *B* in the pair (*A*, *B*). The second dimension of *b* must be at least max(1, *n*).

If *job* = `'E'` or `'B'`, *vl*(*ldvl*,*) must contain left eigenvectors of (*A*, *B*), corresponding to the eigenpairs specified by *howmny* and *select*. The eigenvectors must be stored in consecutive columns of *vl*, as returned by `?tgevc`.

If *job* = `'V'`, *vl* is not referenced. The second dimension of *vl* must be at least max(1, *m*).

If *job* = `'E'` or `'B'`, *vr*(*ldvr*,*) must contain right eigenvectors of (*A*, *B*), corresponding to the eigenpairs specified by *howmny* and *select*. The eigenvectors must be stored in consecutive columns of *vr*, as returned by `?tgevc`.

If *job* = `'V'`, *vr* is not referenced. The second dimension of *vr* must be at least max(1, *m*).

work is a workspace array, its dimension `max(1, lwork)`.

If *job* = `'E'`, *work* is not referenced.

lda — `INTEGER`. The leading dimension of *a*; at least max(1, *n*).

ldb — `INTEGER`. The leading dimension of *b*; at least max(1, *n*).

ldvl — `INTEGER`. The leading dimension of *vl*; *ldvl*≥ 1.

If *job* = `'E'` or `'B'`, then *ldvl*≥ max(1, *n*) .

ldvr — `INTEGER`. The leading dimension of *vr*; *ldvr*≥ 1.

If *job* = `'E'` or `'B'`, then *ldvr*≥ `max(1, n)`.

mm — `INTEGER`. The number of elements in the arrays *s* and *dif* (*mm*≥*m*).

lwork — `INTEGER`. The dimension of the array *work*.

lwork≥ `max(1, n)`.

If *job* = `'V'` or `'B'`, *lwork*≥ `2*n*(n+2)+16` for real flavors, and *lwork*≥ `max(1, 2*n*n)` for complex flavors.

If *lwork* = –1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for details.

iwork — `INTEGER`. Workspace array, size at least (*n*+6) for real flavors, and at least (*n*+2) for complex flavors.

If *job* = 'E', *iwork* is not referenced.

Output Parameters

s

REAL for single-precision flavors

DOUBLE PRECISION for double-precision flavors.

Array, size (*mm*).

If *job* = 'E' or 'B', contains the reciprocal condition numbers of the selected eigenvalues, stored in consecutive elements of the array.

If *job* = 'V', *s* is not referenced.

For real flavors:

For a complex conjugate pair of eigenvalues two consecutive elements of *s* are set to the same value. Thus, *s*(*j*), *dif*(*j*), and the *j*-th columns of *vl* and *vr* all correspond to the same eigenpair (but not in general the *j*-th eigenpair, unless all eigenpairs are selected).

dif

REAL for single-precision flavors

DOUBLE PRECISION for double-precision flavors.

Array, size (*mm*).

If *job* = 'V' or 'B', contains the estimated reciprocal condition numbers of the selected eigenvectors, stored in consecutive elements of the array.

If the eigenvalues cannot be reordered to compute *dif*(*j*), *dif*(*j*) is set to 0; this can only occur when the true value would be very small anyway.

If *job* = 'E', *dif* is not referenced.

For real flavors:

For a complex eigenvector, two consecutive elements of *dif* are set to the same value.

For complex flavors:

For each eigenvalue/vector specified by *select*, *dif* stores a Frobenius norm-based estimate of Difl.

m

INTEGER. The number of elements in the arrays *s* and *dif* used to store the specified condition numbers; for each selected eigenvalue one element is used.

If *howmny* = 'A', *m* is set to *n*.

work(1)

work(1)

If *job* is not 'E' and *info* = 0, on exit, *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info

INTEGER.

If *info* = 0, the execution is successful.

If *info* = –*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `tgsna` interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
b	Holds the matrix *B* of size (*n*,*n*).
s	Holds the vector of length (*mm*).
dif	Holds the vector of length (*mm*).
vl	Holds the matrix *VL* of size (*n*,*mm*).
vr	Holds the matrix *VR* of size (*n*,*mm*).
select	Holds the vector of length *n*.
howmny	Restored based on the presence of the argument *select* as follows: *howmny* = 'S', if *select* is present, *howmny* = 'A', if *select* is omitted.
job	Restored based on the presence of arguments *s* and dif as follows: *job* = 'B', if both *s* and *dif* are present, *job* = 'E', if *s* is present and *dif* omitted, *job* = 'V', if *s* is omitted and *dif* present, Note that there will be an error condition if both *s* and *dif* are omitted.

Application Notes

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

Generalized Singular Value Decomposition: LAPACK Computational Routines

This topic describes LAPACK computational routines used for finding the generalized singular value decomposition (GSVD) of two matrices *A* and *B* as

$U^H A Q = D_1 * (0 \ R)$,

$V^H B Q = D_2 * (0 \ R)$,

where *U*, *V*, and *Q* are orthogonal/unitary matrices, *R* is a nonsingular upper triangular matrix, and D_1, D_2 are "diagonal" matrices of the structure detailed in the routines description section.

Table "Computational Routines for Generalized Singular Value Decomposition" lists LAPACK routines (FORTRAN 77 interface) that perform generalized singular value decomposition of matrices. The corresponding routine names in the Fortran 95 interface are without the first symbol.

Computational Routines for Generalized Singular Value Decomposition

Routine name	Operation performed
ggsvp	Computes the preprocessing decomposition for the generalized SVD
ggsvp3	Performs preprocessing for a generalized SVD.
ggsvd3	Computes generalized SVD.
tgsja	Computes the generalized SVD of two upper triangular or trapezoidal matrices

You can use routines listed in the above table as well as the driver routine ggsvd to find the GSVD of a pair of general rectangular matrices.

?ggsvp
Computes the preprocessing decomposition for the generalized SVD (deprecated).

Syntax

```
call sggsvp(jobu, jobv, jobq, m, p, n, a, lda, b, ldb, tola, tolb, k, l, u, ldu, v, ldv, q, ldq, iwork, tau, work, info)
call dggsvp(jobu, jobv, jobq, m, p, n, a, lda, b, ldb, tola, tolb, k, l, u, ldu, v, ldv, q, ldq, iwork, tau, work, info)
call cggsvp(jobu, jobv, jobq, m, p, n, a, lda, b, ldb, tola, tolb, k, l, u, ldu, v, ldv, q, ldq, iwork, rwork, tau, work, info)
call zggsvp(jobu, jobv, jobq, m, p, n, a, lda, b, ldb, tola, tolb, k, l, u, ldu, v, ldv, q, ldq, iwork, rwork, tau, work, info)
call ggsvp(a, b, tola, tolb [, k] [,l] [,u] [,v] [,q] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

This routine is deprecated; use ggsvp3.

The routine computes orthogonal matrices *U*, *V* and *Q* such that

$$U^H A Q = \begin{array}{c} \\ k \\ l \\ m-k-l \end{array} \begin{array}{c} \begin{array}{ccc} n-k-l & k & l \end{array} \\ \begin{pmatrix} 0 & A_{12} & A_{13} \\ 0 & 0 & A_{23} \\ 0 & 0 & 0 \end{pmatrix} \end{array}, \quad \text{if } m-k-l \geq 0$$

$$= \begin{array}{c} \\ k \\ m-k \end{array} \begin{array}{c} \begin{array}{ccc} n-k-l & k & l \end{array} \\ \begin{pmatrix} 0 & A_{12} & A_{13} \\ 0 & 0 & A_{23} \end{pmatrix} \end{array}, \quad \text{if } m-k-l < 0$$

$$V^H B Q = \begin{array}{c} \\ l \\ p-l \end{array} \begin{array}{c} \begin{array}{ccc} n-k-l & k & l \end{array} \\ \begin{pmatrix} 0 & 0 & B_{13} \\ 0 & 0 & 0 \end{pmatrix} \end{array}$$

where the k-by-k matrix A_{12} and l-by-l matrix B_{13} are nonsingular upper triangular; A_{23} is l-by-l upper triangular if $m-k-l \geq 0$, otherwise A_{23} is $(m-k)$-by-l upper trapezoidal. The sum $k+l$ is equal to the effective numerical rank of the $(m+p)$-by-n matrix $(A^H, B^H)^H$.

This decomposition is the preprocessing step for computing the Generalized Singular Value Decomposition (GSVD), see subroutine ?tgsja.

Input Parameters

jobu

CHARACTER*1. Must be 'U' or 'N'.

If *jobu* = 'U', orthogonal/unitary matrix *U* is computed.

If *jobu* = 'N', *U* is not computed.

jobv

CHARACTER*1. Must be 'V' or 'N'.

If *jobv* = 'V', orthogonal/unitary matrix *V* is computed.

If *jobv* = 'N', *V* is not computed.

jobq

CHARACTER*1. Must be 'Q' or 'N'.

If *jobq* = 'Q', orthogonal/unitary matrix *Q* is computed.

If *jobq* = 'N', *Q* is not computed.

m

INTEGER. The number of rows of the matrix *A* ($m \geq 0$).

p

INTEGER. The number of rows of the matrix *B* ($p \geq 0$).

n

INTEGER. The number of columns of the matrices *A* and *B* ($n \geq 0$).

a, *b*, *tau*, *work*

REAL for sggsvp

DOUBLE PRECISION for dggsvp

COMPLEX for cggsvp

DOUBLE COMPLEX for zggsvp.

Arrays:

a(*lda*,*) contains the *m*-by-*n* matrix *A*.

The second dimension of *a* must be at least max(1, *n*).

b(*ldb*,*) contains the *p*-by-*n* matrix *B*.

The second dimension of *b* must be at least max(1, *n*).

tau(*) is a workspace array.

The dimension of *tau* must be at least max(1, *n*).

work(*) is a workspace array.

The dimension of *work* must be at least max(1, 3*n*, *m*, *p*).

lda INTEGER. The leading dimension of *a*; at least max(1, *m*).

ldb INTEGER. The leading dimension of *b*; at least max(1, *p*).

tola, *tolb* REAL for single-precision flavors

DOUBLE PRECISION for double-precision flavors.

tola and *tolb* are the thresholds to determine the effective numerical rank of matrix *B* and a subblock of *A*. Generally, they are set to

tola = max(*m*, *n*)*||*A*||*MACHEPS,

tolb = max(*p*, *n*)*||*B*||*MACHEPS.

The size of *tola* and *tolb* may affect the size of backward errors of the decomposition.

ldu INTEGER. The leading dimension of the output array *u* . *ldu*≥ max(1, *m*) if *jobu* = 'U'; *ldu*≥ 1 otherwise.

ldv INTEGER. The leading dimension of the output array *v* . *ldv*≥ max(1, *p*) if *jobv* = 'V'; *ldv*≥ 1 otherwise.

ldq INTEGER. The leading dimension of the output array *q* . *ldq*≥ max(1, *n*) if *jobq* = 'Q'; *ldq*≥ 1 otherwise.

iwork INTEGER. Workspace array, size at least max(1, *n*).

rwork REAL for cggsvp

DOUBLE PRECISION for zggsvp.

Workspace array, size at least max(1, 2*n*). Used in complex flavors only.

Output Parameters

a Overwritten by the triangular (or trapezoidal) matrix described in the *Description* section.

b Overwritten by the triangular matrix described in the *Description* section.

k, *l* INTEGER. On exit, *k* and *l* specify the dimension of subblocks. The sum *k* + *l* is equal to effective numerical rank of $(A^H, B^H)^H$.

u, *v*, *q* REAL for sggsvp

DOUBLE PRECISION for dggsvp

COMPLEX for cggsvp

DOUBLE COMPLEX for zggsvp.

Arrays:

If *jobu* = 'U', *u*(*ldu*,*) contains the orthogonal/unitary matrix *U*.

The second dimension of *u* must be at least max(1, *m*).

If *jobu* = 'N', *u* is not referenced.

If *jobv* = 'V', *v*(*ldv*,*) contains the orthogonal/unitary matrix *V*.

The second dimension of *v* must be at least max(1, *m*).

If *jobv* = 'N', *v* is not referenced.

If *jobq* = 'Q', *q*(*ldq*,*) contains the orthogonal/unitary matrix *Q*.

The second dimension of *q* must be at least max(1, *n*).

If *jobq* = 'N', *q* is not referenced.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine ggsvp interface are the following:

a Holds the matrix *A* of size (*m*,*n*).

b Holds the matrix *B* of size (*p*,*n*).

u Holds the matrix *U* of size (*m*,*m*).

v Holds the matrix *V* of size (*p*,*m*).

q Holds the matrix *Q* of size (*n*,*n*).

jobu Restored based on the presence of the argument *u* as follows:

jobu = 'U', if *u* is present,

jobu = 'N', if *u* is omitted.

jobv Restored based on the presence of the argument *v* as follows:

jobz = 'V', if *v* is present,

jobz = 'N', if *v* is omitted.

jobq Restored based on the presence of the argument *q* as follows:

jobz = 'Q', if *q* is present,

jobz = 'N', if *q* is omitted.

?ggsvp3

Performs preprocessing for a generalized SVD.

Syntax

```
call sggsvp3 (jobu, jobv, jobq, m, p, n, a, lda, b, ldb, tola, tolb, k, l, u, ldu, v,
ldv, q, ldq, iwork, tau, work, lwork, info )

Description

?ggsvp3 computes orthogonal or unitary matrices *U*, *V*, and *Q* such that

for real flavors:

$$U^T A Q = \begin{array}{c} \\ k \\ l \\ m-k-l \end{array} \begin{array}{c} \begin{array}{ccc} n-k-l & k & l \end{array} \\ \begin{pmatrix} 0 & A12 & A13 \\ 0 & 0 & A23 \\ 0 & 0 & 0 \end{pmatrix} \end{array}$$ if $m - k - l \geq 0$;

$$U^T A Q = \begin{array}{c} \\ k \\ m-k \end{array} \begin{array}{c} \begin{array}{ccc} n-k-l & k & l \end{array} \\ \begin{pmatrix} 0 & A12 & A13 \\ 0 & 0 & A23 \end{pmatrix} \end{array}$$ if $m - k - l < 0$;

$$V^T B Q = \begin{array}{c} \\ l \\ p-l \end{array} \begin{array}{c} \begin{array}{ccc} n-k-l & k & l \end{array} \\ \begin{pmatrix} 0 & 0 & B13 \\ 0 & 0 & 0 \end{pmatrix} \end{array}$$

for complex flavors:

$$U^H A Q = \begin{array}{c} \\ k \\ l \\ m-k-l \end{array} \begin{array}{c} \begin{array}{ccc} n-k-l & k & l \end{array} \\ \begin{pmatrix} 0 & A12 & A13 \\ 0 & 0 & A23 \\ 0 & 0 & 0 \end{pmatrix} \end{array}$$ if $m - k - l \geq 0$;

$$U^H A Q = \begin{array}{c} \\ k \\ m-k \end{array} \begin{array}{c} \begin{array}{ccc} n-k-l & k & l \end{array} \\ \begin{pmatrix} 0 & A12 & A13 \\ 0 & 0 & A23 \end{pmatrix} \end{array}$$ if $m - k - l < 0$;

$$V^H B Q = \begin{array}{c} \\ l \\ p-l \end{array} \begin{array}{c} \begin{array}{ccc} n-k-l & k & l \end{array} \\ \begin{pmatrix} 0 & 0 & B13 \\ 0 & 0 & 0 \end{pmatrix} \end{array}$$

where the k-by-k matrix *A12* and l-by-l matrix *B13* are nonsingular upper triangular; *A23* is l-by-l upper triangular if $m-k-l \geq 0$, otherwise *A23* is ($m-k$-by-l upper trapezoidal. $k + l$ = the effective numerical rank of the ($m + p$)-by-n matrix $(A^T,B^T)^T$ for real flavors or $(A^H,B^H)^H$ for complex flavors.

This decomposition is the preprocessing step for computing the Generalized Singular Value Decomposition (GSVD), see ?ggsvd3.

Input Parameters

jobu

CHARACTER*1. = 'U': Orthogonal/unitary matrix *U* is computed;

= 'N': *U* is not computed.

jobv CHARACTER*1. = 'V': Orthogonal/unitary matrix *V* is computed;
= 'N': *V* is not computed.

jobq CHARACTER*1. = 'Q': Orthogonal/unitary matrix *Q* is computed;
= 'N': *Q* is not computed.

m INTEGER. The number of rows of the matrix *A*.
m≥ 0.

p INTEGER. The number of rows of the matrix *B*.
p≥ 0.

n INTEGER. The number of columns of the matrices *A* and B.
n≥ 0.

a `REAL` for `sggsvp3`
`DOUBLE PRECISION` for `dggsvp3`
`COMPLEX` for `cggsvp3`
`DOUBLE COMPLEX` for `zggsvp3`
Array, size (*lda*, *n*).
On entry, the *m*-by-*n* matrix *A*.

lda INTEGER. The leading dimension of the array *a*.
lda≥ max(1,*m*).

b `REAL` for `sggsvp3`
`DOUBLE PRECISION` for `dggsvp3`
`COMPLEX` for `cggsvp3`
`DOUBLE COMPLEX` for `zggsvp3`
Array, size (*ldb*, *n*).
On entry, the *p*-by-*n* matrix *B*.

ldb INTEGER. The leading dimension of the array *b*.
ldb≥ max(1,*p*).

tola, *tolb* `REAL` for `sggsvp3`
`DOUBLE PRECISION` for `dggsvp3`
`REAL` for `cggsvp3`
`DOUBLE PRECISION` for `zggsvp3`
tola and *tolb* are the thresholds to determine the effective numerical rank of matrix *B* and a subblock of *A*. Generally, they are set to
tola = max(*m*,*n*)*norm(*a*)**MACHEPS*,
tolb = max(*p*,*n*)*norm(*b*)**MACHEPS*.

The size of *tola* and *tolb* may affect the size of backward errors of the decomposition.

ldu INTEGER. The leading dimension of the array *u*.

ldu≥ max(1,*m*) if *jobu* = 'U'; *ldu*≥ 1 otherwise.

ldv INTEGER. The leading dimension of the array *v*.

ldv≥ max(1,*p*) if *jobv* = 'V'; *ldv*≥ 1 otherwise.

ldq INTEGER. The leading dimension of the array *q*.

ldq≥ max(1,*n*) if *jobq* = 'Q'; *ldq*≥ 1 otherwise.

iwork INTEGER. Array, size (*n*).

rwork for `sggsvp3`

for `dggsvp3`

`REAL` for `cggsvp3`

`DOUBLE PRECISION` for `zggsvp3`

Array, size (2**n*).

tau `REAL` for `sggsvp3`

`DOUBLE PRECISION` for `dggsvp3`

`COMPLEX` for `cggsvp3`

`DOUBLE COMPLEX` for `zggsvp3`

Array, size (*n*).

The scalar factors of the elementary reflectors.

work `REAL` for `sggsvp3`

`DOUBLE PRECISION` for `dggsvp3`

`COMPLEX` for `cggsvp3`

`DOUBLE COMPLEX` for `zggsvp3`

Array, size (MAX(1,*lwork*)).

lwork INTEGER. The dimension of the array *work*.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by `xerbla`.

Output Parameters

a On exit, *a* contains the triangular (or trapezoidal) matrix described in the Description section.

b On exit, *b* contains the triangular matrix described in the Description section.

k, *l*	INTEGER. On exit, *k* and *l* specify the dimension of the subblocks described in Description section. *k* + *l* = effective numerical rank of $(A^T,B^T)^T$ for real flavors or $(A^H,B^H)^H$ for complex flavors.
u	REAL for sggsvp3 DOUBLE PRECISION for dggsvp3 COMPLEX for cggsvp3 DOUBLE COMPLEX for zggsvp3 Array, size (*ldu*, *m*). If *jobu* = 'U', *u* contains the orthogonal/unitary matrix *U*. If *jobu* = 'N', *u* is not referenced.
v	REAL for sggsvp3 DOUBLE PRECISION for dggsvp3 COMPLEX for cggsvp3 DOUBLE COMPLEX for zggsvp3 Array, size (*ldv*, *p*). If *jobv* = 'V', *v* contains the orthogonal/unitary matrix *V*. If *jobv* = 'N', *v* is not referenced.
q	REAL for sggsvp3 DOUBLE PRECISION for dggsvp3 COMPLEX for cggsvp3 DOUBLE COMPLEX for zggsvp3 Array, size (*ldq*, *n*). If *jobq* = 'Q', *q* contains the orthogonal/unitary matrix *Q*. If *jobq* = 'N', *q* is not referenced.
work	On exit, if *info* = 0, *work*(1) returns the optimal *lwork*.
info	INTEGER. = 0: successful exit. < 0: if *info* = -*i*, the *i*-th argument had an illegal value.

Application Notes

The subroutine uses LAPACK subroutine ?geqp3 for the QR factorization with column pivoting to detect the effective numerical rank of the *A* matrix. It may be replaced by a better rank determination strategy.

?ggsvp3 replaces the deprecated subroutine ?ggsvp.

?ggsvd3
Computes generalized SVD.

Description

?ggsvd3 computes the generalized singular value decomposition (GSVD) of an m-by-n real or complex matrix *A* and p-by-n real or complex matrix *B*:

$U^T*A*Q = D_1*(0\ R\ ), V^T*B*Q = D_2*(0\ R\ )$ for real flavors

or

$U^H*A*Q = D_1*(0\ R\ ), V^H*B*Q = D_2*(0\ R\ )$ for complex flavors

where *U*, *V* and *Q* are orthogonal/unitary matrices.

Let $k+l$ = the effective numerical rank of the matrix $(A^TB^T)^T$ for real flavors or the matrix $(A^H,B^H)^H$ for complex flavors, then *R* is a $(k + l)$-by-$(k + l)$ nonsingular upper triangular matrix, D_1 and D_2 are m-by-$(k + l)$ and p-by-$(k + l)$ "diagonal" matrices and of the following structures, respectively:

If $m-k-l \geq 0$,

$$D_1 = \begin{array}{c} \\ k \\ l \\ m-k-l \end{array} \begin{array}{c} \begin{array}{cc} k & l \end{array} \\ \begin{pmatrix} I & 0 \\ 0 & C \\ 0 & 0 \end{pmatrix} \end{array}$$

$$D_2 = \begin{array}{c} \\ l \\ p-l \end{array} \begin{array}{c} \begin{array}{cc} k & l \end{array} \\ \begin{pmatrix} 0 & S \\ 0 & 0 \end{pmatrix} \end{array}$$

$$\begin{pmatrix} 0 & R \end{pmatrix} = \begin{array}{c} \\ k \\ l \end{array} \begin{array}{c} \begin{array}{ccc} n-k-l & k & l \end{array} \\ \begin{pmatrix} 0 & R11 & R12 \\ 0 & 0 & R22 \end{pmatrix} \end{array}$$

where

C = diag($alpha(k+1)$, ... , $alpha(k+l)$),

S = diag($beta(k+1)$, ... , $beta(k+l)$),

$C^2 + S^2 = I$.

If $m - k - l < 0$,

$$D_1 = \begin{array}{c} \\ k \\ m-k \end{array} \begin{array}{c} \begin{array}{ccc} k & m-k & k+l-m \end{array} \\ \begin{pmatrix} I & 0 & 0 \\ 0 & C & 0 \end{pmatrix} \end{array}$$

$$D_2 = \begin{array}{c} \\ m-k \\ k+l-m \\ p-l \end{array} \begin{array}{c} \begin{array}{ccc} k & m-k & k+l-m \end{array} \\ \begin{pmatrix} 0 & S & 0 \\ 0 & 0 & I \\ 0 & 0 & 0 \end{pmatrix} \end{array}$$

$$\begin{pmatrix} 0 & R \end{pmatrix} = \begin{array}{c} \\ k \\ m-k \\ k+l-m \end{array} \begin{array}{c} \begin{array}{ccc} n-k-l & k & m-k & k+l-m \end{array} \\ \begin{pmatrix} 0 & R11 & R12 & R13 \\ 0 & 0 & R22 & R23 \\ 0 & 0 & 0 & R33 \end{pmatrix} \end{array}$$

where

C = diag(*alpha*(*k* + 1), ... , *alpha*(*m*)),

S = diag(*beta*(*k* + 1), ... , *beta*(*m*)),

$C^2 + S^2 = I$.

The routine computes *C*, *S*, *R*, and optionally the orthogonal/unitary transformation matrices *U*, *V* and *Q*.

In particular, if *B* is an n-by-n nonsingular matrix, then the GSVD of *A* and *B* implicitly gives the SVD of *A**inv(*B*):

$A*\text{inv}(B) = U*(D_1*\text{inv}(D_2))*V^T$ for real flavors

or

$A*\text{inv}(B) = U*(D_1*\text{inv}(D_2))*V^H$ for complex flavors.

If $(A^T,B^T)^T$ for real flavors or $(A^H,B^H)^H$ for complex flavors has orthonormal columns, then the GSVD of *A* and *B* is also equal to the CS decomposition of *A* and *B*. Furthermore, the GSVD can be used to derive the solution of the eigenvalue problem:

$A^T*AX = \lambda* B^T*BX$ for real flavors

or

$A^H*AX = \lambda* B^H*BX$ for complex flavors

In some literature, the GSVD of *A* and *B* is presented in the form

$U^T*A*X = (0\ D_1)$, $V^T*B*X = (0\ D_2)$ for real (*A*, *B*)

or

$U^H*A*X = (0\ D_1)$, $V^H*B*X = (0\ D_2)$ for complex (*A*, *B*)

where *U* and *V* are orthogonal and *X* is nonsingular, D_1 and D_2 are "diagonal''. The former GSVD form can be converted to the latter form by taking the nonsingular matrix *X* as

$$X = Q*\begin{pmatrix} I & 0 \\ 0 & inv(R) \end{pmatrix}$$

Input Parameters

jobu
CHARACTER*1. = 'U': Orthogonal/unitary matrix *U* is computed;
= 'N': *U* is not computed.

jobv
CHARACTER*1. = 'V': Orthogonal/unitary matrix *V* is computed;
= 'N': *V* is not computed.

jobq
CHARACTER*1. = 'Q': Orthogonal/unitary matrix *Q* is computed;
= 'N': *Q* is not computed.

m INTEGER. The number of rows of the matrix *A*.
m≥ 0.

n INTEGER. The number of columns of the matrices *A* and *B*.
n≥ 0.

p INTEGER. The number of rows of the matrix *B*.
p≥ 0.

a REAL for sggsvd3
DOUBLE PRECISION for dggsvd3
COMPLEX for cggsvd3
DOUBLE COMPLEX for zggsvd3
Array, size (*lda*, *n*).
On entry, the *m*-by-*n* matrix *A*.

lda INTEGER. The leading dimension of the array *a*.
lda≥ max(1,*m*).

b REAL for sggsvd3
DOUBLE PRECISION for dggsvd3
COMPLEX for cggsvd3
DOUBLE COMPLEX for zggsvd3
Array, size (*ldb*, *n*).
On entry, the *p*-by-*n* matrix *B*.

Include Files

- mkl.fi, lapack.f90

Description

The routine computes the generalized singular value decomposition (GSVD) of two real/complex upper triangular (or trapezoidal) matrices *A* and *B*. On entry, it is assumed that matrices *A* and *B* have the following forms, which may be obtained by the preprocessing subroutine ggsvp from a general *m*-by-*n* matrix *A* and *p*-by-*n* matrix *B*:

$$A = \begin{array}{r} \\ k \\ l \\ m-k-l \end{array} \begin{array}{c} \begin{array}{ccc} n-k-l & k & l \end{array} \\ \begin{pmatrix} 0 & A_{12} & A_{13} \\ 0 & 0 & A_{23} \\ 0 & 0 & 0 \end{pmatrix} \end{array}, \quad \text{if } m-k-l \geq 0$$

$$= \begin{array}{c} \\ k \\ m-k \end{array} \begin{array}{c} \begin{array}{ccc} n-k-l & k & l \end{array} \\ \begin{pmatrix} 0 & A_{12} & A_{13} \\ 0 & 0 & A_{23} \end{pmatrix} \end{array}, \quad \text{if } m-k-l < 0$$

$$B = \begin{array}{c} \\ l \\ p-l \end{array} \begin{array}{c} \begin{array}{ccc} n-k-l & k & l \end{array} \\ \begin{pmatrix} 0 & 0 & B_{13} \\ 0 & 0 & 0 \end{pmatrix} \end{array}$$

where the *k*-by-*k* matrix A_{12} and *l*-by-*l* matrix B_{13} are nonsingular upper triangular; A_{23} is *l*-by-*l* upper triangular if $m-k-l \geq 0$, otherwise A_{23} is (*m*-*k*)-by-*l* upper trapezoidal.

On exit,

$U^H*A*Q = D_1*(0\ R)$, $V^H*B*Q = D_2*(0\ R)$,

where *U*, *V* and *Q* are orthogonal/unitary matrices, *R* is a nonsingular upper triangular matrix, and D_1 and D_2 are "diagonal" matrices, which are of the following structures:

If $m-k-l \geq 0$,

$$D_1 = \begin{array}{c} \\ k \\ l \\ m-k-l \end{array} \begin{array}{c} \begin{array}{cc} k & l \end{array} \\ \begin{pmatrix} I & 0 \\ 0 & C \\ 0 & 0 \end{pmatrix} \end{array}$$

$$D_i = \begin{array}{c} \\ p-l \\ l \end{array} \begin{array}{c} \begin{array}{cc} l & k \end{array} \\ \begin{pmatrix} 0 & S \\ 0 & 0 \end{pmatrix} \end{array}$$

$$(0\ R) = \begin{array}{c} \\ l \\ k \end{array} \begin{array}{c} \begin{array}{ccc} n-k-l & k & l \end{array} \\ \begin{pmatrix} 0 & R_{11} & R_{12} \\ 0 & 0 & R_{22} \end{pmatrix} \end{array}$$

where

$C = \mathrm{diag}(alpha(k+1),...,alpha(k+l))$

$S = \mathrm{diag}(beta(k+1),...,beta(k+l))$

$C^2 + S^2 = I$

R is stored in $a(1{:}k+l,\ n-k-l+1{:}n)$ on exit.

If $m-k-l < 0$,

$$\begin{array}{c} \\ k \\ m-k \end{array} \begin{array}{c} \begin{array}{ccc} k & m-k & k+1-m \end{array} \\ \begin{pmatrix} I & 0 & 0 \\ 0 & C & 0 \end{pmatrix} \end{array}$$

$$D_2 = \begin{array}{c} \\ m-k \\ k+l-m \\ p-l \end{array} \begin{array}{c} \begin{array}{ccc} k & m-k & k+l-m \end{array} \\ \begin{pmatrix} 0 & S & 0 \\ 0 & 0 & I \\ 0 & 0 & 0 \end{pmatrix} \end{array}$$

$$(0\ R) = \begin{array}{c} \\ k \\ m-k \\ k+l-m \end{array} \begin{array}{c} \begin{array}{cccc} n-k-l & k & m-k & k+l-m \end{array} \\ \begin{pmatrix} 0 & R_{11} & R_{12} & R_{13} \\ 0 & 0 & R_{22} & R_{23} \\ 0 & 0 & 0 & R_{33} \end{pmatrix} \end{array}$$

where

C = diag($alpha(k+1),...,alpha(m)$),

S = diag($beta(k+1),...,beta(m)$),

$C^2 + S^2 = I$

On exit,

$$\begin{pmatrix} R_{11} & R_{12} & R_{13} \\ 0 & R_{22} & R_{23} \end{pmatrix}$$

is stored in $a(1{:}m, n{-}k{-}l{+}1{:}n)$ and R_{33} is stored

in $b(m{-}k{+}1{:}l, n{+}m{-}k{-}l{+}1{:}n)$.

The computation of the orthogonal/unitary transformation matrices U, V or Q is optional. These matrices may either be formed explicitly, or they *may* be postmultiplied into input matrices U_1, V_1, or Q_1.

Input Parameters

jobu

CHARACTER*1. Must be 'U', 'I', or 'N'.

If *jobu* = 'U', *u* must contain an orthogonal/unitary matrix U_1 on entry.

If *jobu* = 'I', *u* is initialized to the unit matrix.

If *jobu* = 'N', *u* is not computed.

jobv

CHARACTER*1. Must be 'V', 'I', or 'N'.

If *jobv* = 'V', *v* must contain an orthogonal/unitary matrix V_1 on entry.

If *jobv* = 'I', *v* is initialized to the unit matrix.

If *jobv* = 'N', *v* is not computed.

jobq

CHARACTER*1. Must be 'Q', 'I', or 'N'.

If *jobq* = 'Q', *q* must contain an orthogonal/unitary matrix Q_1 on entry.

If *jobq* = 'I', *q* is initialized to the unit matrix.

If *jobq* = 'N', *q* is not computed.

m — INTEGER. The number of rows of the matrix *A* (*m*≥ 0).

p — INTEGER. The number of rows of the matrix *B* (*p*≥ 0).

n — INTEGER. The number of columns of the matrices *A* and *B* (*n*≥ 0).

k, *l* — INTEGER. Specify the subblocks in the input matrices *A* and *B*, whose GSVD is computed.

a, *b*, *u*, *v*, *q*, *work* — REAL for stgsja

DOUBLE PRECISION for dtgsja

COMPLEX for ctgsja

DOUBLE COMPLEX for ztgsja.

Arrays:

a(*lda*,*) contains the *m*-by-*n* matrix *A*.

The second dimension of *a* must be at least max(1, *n*).

b(*ldb*,*) contains the *p*-by-*n* matrix *B*.

The second dimension of *b* must be at least max(1, *n*).

If *jobu* = 'U', *u*(*ldu*,*) must contain a matrix U_1 (usually the orthogonal/unitary matrix returned by ?ggsvp).

The second dimension of *u* must be at least max(1, *m*).

If *jobv* = 'V', *v*(*ldv*,*) must contain a matrix V_1 (usually the orthogonal/unitary matrix returned by ?ggsvp).

The second dimension of *v* must be at least max(1, *p*).

If *jobq* = 'Q', *q*(*ldq*,*) must contain a matrix Q_1 (usually the orthogonal/unitary matrix returned by ?ggsvp).

The second dimension of *q* must be at least max(1, *n*).

work(*) is a workspace array.

The dimension of *work* must be at least max(1, 2*n*).

lda — INTEGER. The leading dimension of *a*; at least max(1, *m*).

ldb — INTEGER. The leading dimension of *b*; at least max(1, *p*).

ldu — INTEGER. The leading dimension of the array *u* .

ldu≥ max(1, *m*) if *jobu* = 'U'; *ldu*≥ 1 otherwise.

ldv — INTEGER. The leading dimension of the array *v* .

ldv≥ max(1, *p*) if *jobv* = 'V'; *ldv*≥ 1 otherwise.

ldq — INTEGER. The leading dimension of the array *q* .

ldq≥ max(1, *n*) if *jobq* = 'Q'; *ldq*≥ 1 otherwise.

tola, *tolb*

`REAL` for single-precision flavors

`DOUBLE PRECISION` for double-precision flavors.

tola and *tolb* are the convergence criteria for the Jacobi-Kogbetliantz iteration procedure. Generally, they are the same as used in `?ggsvp`:

tola = max(*m*, *n*)*|*A*|*MACHEPS,

tolb = max(*p*, *n*)*|*B*|*MACHEPS.

Output Parameters

a

On exit, *a*(*n*-*k*+1:*n*, 1:min(*k*+*l*, *m*)) contains the triangular matrix *R* or part of *R*.

b

On exit, if necessary, *b*(*m*-*k*+1: *l*, *n*+*m*-*k*-*l*+1: *n*)) contains a part of *R*.

alpha, *beta*

`REAL` for single-precision flavors

`DOUBLE PRECISION` for double-precision flavors.

Arrays, size at least max(1, *n*). Contain the generalized singular value pairs of *A* and *B*:

alpha(1:*k*) = 1,

beta(1:*k*) = 0,

and if *m*-*k*-*l* ≥ 0,

alpha(*k*+1:*k*+*l*) = diag(*C*),

beta(*k*+1:*k*+*l*) = diag(*S*),

or if *m*-*k*-*l* < 0,

alpha(*k*+1:*m*)= diag(*C*), *alpha*(*m*+1:*k*+*l*)=0

beta(*k*+1:*m*) = diag(*S*),

beta(*m*+1:*k*+*l*) = 1.

Furthermore, if *k*+*l* < *n*,

alpha(*k*+*l*+1:*n*)= 0 and

beta(*k*+*l*+1:*n*) = 0.

u

If *jobu* = 'I', *u* contains the orthogonal/unitary matrix *U*.

If *jobu* = 'U', *u* contains the product U_1*U.

If *jobu* = 'N', *u* is not referenced.

v

If *jobv* = 'I', *v* contains the orthogonal/unitary matrix *U*.

If *jobv* = 'V', *v* contains the product V_1*V.

If *jobv* = 'N', *v* is not referenced.

q

If *jobq* = 'I', *q* contains the orthogonal/unitary matrix *U*.

If *jobq* = 'Q', *q* contains the product Q_1*Q.

If *jobq* = 'N', *q* is not referenced.

ncycle INTEGER. The number of cycles required for convergence.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = 1, the procedure does not converge after MAXIT cycles.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine tgsja interface are the following:

a Holds the matrix *A* of size (*m*,*n*).

b Holds the matrix *B* of size (*p*,*n*).

u Holds the matrix *U* of size (*m*,*m*).

v Holds the matrix *V* of size (*p*,*p*).

q Holds the matrix *Q* of size (*n*,*n*).

alpha Holds the vector of length *n*.

beta Holds the vector of length *n*.

jobu If omitted, this argument is restored based on the presence of argument *u* as follows:

jobu = 'U', if *u* is present,

jobu = 'N', if *u* is omitted.

If present, *jobu* must be equal to 'I' or 'U' and the argument *u* must also be present.

Note that there will be an error condition if *jobu* is present and *u* omitted.

jobv If omitted, this argument is restored based on the presence of argument *v* as follows:

jobv = 'V', if *v* is present,

jobv = 'N', if *v* is omitted.

If present, *jobv* must be equal to 'I' or 'V' and the argument *v* must also be present.

Note that there will be an error condition if *jobv* is present and *v* omitted.

jobq If omitted, this argument is restored based on the presence of argument *q* as follows:

jobq = 'Q', if *q* is present,

jobq = 'N', if *q* is omitted.

If present, *jobq* must be equal to 'I' or 'Q' and the argument *q* must also be present.

Note that there will be an error condition if *jobq* is present and *q* omitted.

Cosine-Sine Decomposition: LAPACK Computational Routines

This topic describes LAPACK computational routines for computing the *cosine-sine decomposition* (CS decomposition) of a partitioned unitary/orthogonal matrix. The algorithm computes a complete 2-by-2 CS decomposition, which requires simultaneous diagonalization of all the four blocks of a unitary/orthogonal matrix partitioned into a 2-by-2 block structure.

The computation has the following phases:

1. The matrix is reduced to a bidiagonal block form.
2. The blocks are simultaneously diagonalized using techniques from the bidiagonal SVD algorithms.

Table "Computational Routines for Cosine-Sine Decomposition (CSD)" lists LAPACK routines that perform CS decomposition of matrices. The corresponding routine names in the Fortran 95 interface are without the first symbol.

Computational Routines for Cosine-Sine Decomposition (CSD)

Operation	Real matrices	Complex matrices
Compute the CS decomposition of an orthogonal/unitary matrix in bidiagonal-block form	bbcsd/bbcsd	bbcsd/bbcsd
Simultaneously bidiagonalize the blocks of a partitioned orthogonal matrix	orbdb unbdb

- mkl.fi, lapack.f90

Description

mkl_lapack.fiThe routine ?bbcsd computes the CS decomposition of an orthogonal or unitary matrix in bidiagonal-block form:

$$X=\begin{pmatrix} b_{11} & b_{12} & 0 & 0 \\ 0 & 0 & -I & 0 \\ \hline b_{21} & b_{22} & 0 & 0 \\ 0 & 0 & 0 & I \end{pmatrix}=\begin{pmatrix} u_1 & \\ & u_2 \end{pmatrix}\begin{pmatrix} C & -S & 0 & 0 \\ 0 & 0 & -I & 0 \\ \hline S & C & 0 & 0 \\ 0 & 0 & 0 & I \end{pmatrix}\begin{pmatrix} v_1 & \\ & v_2 \end{pmatrix}^T$$

or

$$X=\begin{pmatrix} b_{11} & b_{12} & 0 & 0 \\ 0 & 0 & -I & 0 \\ \hline b_{21} & b_{22} & 0 & 0 \\ 0 & 0 & 0 & I \end{pmatrix}=\begin{pmatrix} u_1 & \\ & u_2 \end{pmatrix}\begin{pmatrix} C & -S & 0 & 0 \\ 0 & 0 & -I & 0 \\ \hline S & C & 0 & 0 \\ 0 & 0 & 0 & I \end{pmatrix}\begin{pmatrix} v_1 & \\ & v_2 \end{pmatrix}^H$$

respectively.

x is *m*-by-*m* with the top-left block *p*-by-*q*. Note that *q* must not be larger than *p*, *m*-*p*, or *m*-*q*. If *q* is not the smallest index, *x* must be transposed and/or permuted in constant time using the *trans* option. See ?orcsd/?uncsd for details.

The bidiagonal matrices b_{11}, b_{12}, b_{21}, and b_{22} are represented implicitly by angles *theta*(1:*q*) and *phi*(1:*q*-1).

The orthogonal/unitary matrices u_1, u_2, v_1^t, and v_2^t are input/output. The input matrices are pre- or post-multiplied by the appropriate singular vector matrices.

Input Parameters

jobu1 — CHARACTER. If equals *Y*, then u_1 is updated. Otherwise, u_1 is not updated.

jobu2 — CHARACTER. If equals *Y*, then u_2 is updated. Otherwise, u_2 is not updated.

jobv1t — CHARACTER. If equals *Y*, then v_1^t is updated. Otherwise, v_1^t is not updated.

jobv2t — CHARACTER. If equals *Y*, then v_2^t is updated. Otherwise, v_2^t is not updated.

trans — CHARACTER

= 'T':	*x*, u_1, u_2, v_1^t, v_2^t are stored in row-major order.
otherwise	*x*, u_1, u_2, v_1^t, v_2^t are stored in column-major order.

m — INTEGER. The number of rows and columns of the orthogonal/unitary matrix *X* in bidiagonal-block form.

p — INTEGER. The number of rows in the top-left block of *x*. 0 ≤*p*≤*m*.

≤

q INTEGER. The number of columns in the top-left block of *x*. $0 \le q \le \min(p, m-p, m-q)$.

theta REAL for sbbcsd

DOUBLE PRECISION for dbbcsd

COMPLEX for cbbcsd

DOUBLE COMPLEX for zbbcsd

Array, size (*q*).

On entry, the angles *theta*(1), ..., *theta*(*q*) that, along with *phi*(1), ..., *phi*(*q*-1), define the matrix in bidiagonal-block form as returned by orbdb/unbdb.

phi REAL for sbbcsd

DOUBLE PRECISION for dbbcsd

COMPLEX for cbbcsd

DOUBLE COMPLEX for zbbcsd

Array, size (*q*-1).

The angles *phi*(1), ..., *phi*(*q*-1) that, along with *theta*(1), ..., *theta*(*q*), define the matrix in bidiagonal-block form as returned by orbdb/unbdb.

u1 REAL for sbbcsd

DOUBLE PRECISION for dbbcsd

COMPLEX for cbbcsd

DOUBLE COMPLEX for zbbcsd

Array, size (*ldu1*,*p*).

On entry, a *p*-by-*p* matrix.

ldu1 INTEGER. The leading dimension of the array u_1, $ldu1 \le \max(1, p)$.

u2 REAL for sbbcsd

DOUBLE PRECISION for dbbcsd

COMPLEX for cbbcsd

DOUBLE COMPLEX for zbbcsd

Array, size (*ldu2*,*m*-*p*).

On entry, an (*m*-*p*)-by-(*m*-*p*) matrix.

ldu2 INTEGER. The leading dimension of the array u_2, $ldu2 \le \max(1, m-p)$.

v1t REAL for sbbcsd

DOUBLE PRECISION for dbbcsd

COMPLEX for cbbcsd

DOUBLE COMPLEX for zbbcsd

Array, size (*ldv1t*,*q*).

On entry, a *q*-by-*q* matrix.

ldv1t INTEGER. The leading dimension of the array *v1t*, *ldv1t*≤ max(1, *q*).

v2t REAL for sbbcsd

DOUBLE PRECISION for dbbcsd

COMPLEX for cbbcsd

DOUBLE COMPLEX for zbbcsd

Array, size (*ldv2t*,*m*-*q*).

On entry, an (*m*-*q*)-by-(*m*-*q*) matrix.

ldv2t INTEGER. The leading dimension of the array *v2t*, *ldv2t*≤ max(1, *m*-*q*).

work REAL for sbbcsd

DOUBLE PRECISION for dbbcsd

COMPLEX for cbbcsd

DOUBLE COMPLEX for zbbcsd

Workspace array, size (max(1,*lwork*)).

lwork INTEGER. The size of the *work* array. *lwork*≥ max(1,8*q)

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

Output Parameters

theta REAL for sbbcsd

DOUBLE PRECISION for dbbcsd

COMPLEX for cbbcsd

DOUBLE COMPLEX for zbbcsd

On exit, the angles whose cosines and sines define the diagonal blocks in the CS decomposition.

u1 REAL for sbbcsd

DOUBLE PRECISION for dbbcsd

COMPLEX for cbbcsd

DOUBLE COMPLEX for zbbcsd

On exit, *u1* is postmultiplied by the left singular vector matrix common to [b11 ; 0] and [b12 0 0 ; 0 -I 0].

u2 REAL for sbbcsd

DOUBLE PRECISION for dbbcsd

COMPLEX for cbbcsd

DOUBLE COMPLEX for zbbcsd

On exit, *u2* is postmultiplied by the left singular vector matrix common to [b21 ; 0] and [b22 0 0 ; 0 0 I].

v1t

REAL for sbbcsd

DOUBLE PRECISION for dbbcsd

COMPLEX for cbbcsd

DOUBLE COMPLEX for zbbcsd

Array, size (*q*).

On exit, *v1t* is premultiplied by the transpose of the right singular vector matrix common to [b11 ; 0] and [b21 ; 0].

v2t

REAL for sbbcsd

DOUBLE PRECISION for dbbcsd

COMPLEX for cbbcsd

DOUBLE COMPLEX for zbbcsd

On exit, *v2t* is premultiplied by the transpose of the right singular vector matrix common to [b12 0 0 ; 0 -I 0] and [b22 0 0 ; 0 0 I].

b11d

REAL for sbbcsd

DOUBLE PRECISION for dbbcsd

COMPLEX for cbbcsd

DOUBLE COMPLEX for zbbcsd

Array, size (*q*).

When ?bbcsd converges, *b11d* contains the cosines of *theta*(1), ..., *theta*(*q*). If ?bbcsd fails to converge, *b11d* contains the diagonal of the partially reduced top left block.

b11e

REAL for sbbcsd

DOUBLE PRECISION for dbbcsd

COMPLEX for cbbcsd

DOUBLE COMPLEX for zbbcsd

Array, size (*q*-1).

When ?bbcsd converges, *b11e* contains zeros. If ?bbcsd fails to converge, *b11e* contains the superdiagonal of the partially reduced top left block.

b12d

REAL for sbbcsd

DOUBLE PRECISION for dbbcsd

COMPLEX for cbbcsd

DOUBLE COMPLEX for zbbcsd

Array, size (*q*).

When ?bbcsd converges, *b12d* contains the negative sines of *theta*(1), ..., *theta*(*q*). If ?bbcsd fails to converge, *b12d* contains the diagonal of the partially reduced top right block.

b12e

REAL for sbbcsd

DOUBLE PRECISION for dbbcsd

COMPLEX for cbbcsd

DOUBLE COMPLEX for zbbcsd

Array, size (*q*-1).

When ?bbcsd converges, *b12e* contains zeros. If ?bbcsd fails to converge, *b11e* contains the superdiagonal of the partially reduced top right block.

info

INTEGER.

= 0: successful exit

< 0: if *info* = -*i*, the *i*-th argument has an illegal value

> 0: if ?bbcsd did not converge, *info* specifies the number of nonzero entries in *phi*, and *b11d*, *b11e*, etc. contain the partially reduced matrix.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine ?bbcsd interface are as follows:

theta Holds the vector of length *q*.

phi Holds the vector of length *q*-1.

u1 Holds the matrix of size (*p*,*p*).

u2 Holds the matrix of size (*m*-*p*,*m*-*p*).

v1t Holds the matrix of size (*q*,*q*).

v2t Holds the matrix of size (*m*-*q*,*m*-*q*).

b11d Holds the vector of length *q*.

b11e Holds the vector of length *q*-1.

b12d Holds the vector of length *q*.

b12e Holds the vector of length *q*-1.

b21d Holds the vector of length *q*.

b21e Holds the vector of length *q*-1.

b22d Holds the vector of length *q*.

b22e Holds the vector of length *q*-1.

jobsu1 Indicates whether u_1 is computed. Must be 'Y' or 'O'.

jobsu2	Indicates whether u_2 is computed. Must be `'Y'` or `'O'`.
jobv1t	Indicates whether v_1^t is computed. Must be `'Y'` or `'O'`.
jobv2t	Indicates whether v_2^t is computed. Must be `'Y'` or `'O'`.
trans	Must be `'N'` or `'T'`.

Description

The routines ?orbdb/?unbdb simultaneously bidiagonalizes the blocks of an *m*-by-*m* partitioned orthogonal matrix *X*:

$$X=\left(\begin{array}{c|c} x_{11} & x_{12} \\ \hline x_{21} & x_{22} \end{array}\right)=\left(\begin{array}{c|c} p_1 & \\ \hline & p_2 \end{array}\right)\left(\begin{array}{c|c|c|c} b_{11} & b_{12} & 0 & 0 \\ \hline 0 & 0 & -I & 0 \\ \hline b_{21} & b_{22} & 0 & 0 \\ \hline 0 & 0 & 0 & I \end{array}\right)\left(\begin{array}{c|c} q_1 & \\ \hline & q_2 \end{array}\right)^T$$

or unitary matrix:

$$X=\left(\begin{array}{c|c} x_{11} & x_{12} \\ \hline x_{21} & x_{22} \end{array}\right)=\left(\begin{array}{c|c} p_1 & \\ \hline & p_2 \end{array}\right)\left(\begin{array}{c|c|c|c} b_{11} & b_{12} & 0 & 0 \\ \hline 0 & 0 & -I & 0 \\ \hline b_{21} & b_{22} & 0 & 0 \\ \hline 0 & 0 & 0 & I \end{array}\right)\left(\begin{array}{c|c} q_1 & \\ \hline & q_2 \end{array}\right)^H$$

x_{11} is p-by-q. q must not be larger than p, m-p, or m-q. Otherwise, x must be transposed and/or permuted in constant time using the *trans* and *signs* options.

The orthogonal/unitary matrices p_1, p_2, q_1, and q_2 are p-by-p, $(m-p)$-by-$(m-p)$, q-by-q, $(m-q)$-by-$(m-q)$, respectively. They are represented implicitly by Housholder vectors.

The bidiagonal matrices b_{11}, b_{12}, b_{21}, and b_{22} are q-by-q bidiagonal matrices represented implicitly by angles *theta*(1), ..., *theta*(q) and *phi*(1), ..., *phi*(q-1). b_{11} and b_{12} are upper bidiagonal, while b_{21} and b_{22} are lower bidiagonal. Every entry in each bidiagonal band is a product of a sine or cosine of *theta* with a sine or cosine of *phi*. See [Sutton09] for details.

p_1, p_2, q_1, and q_2 are represented as products of elementary reflectors. .

Input Parameters

trans

CHARACTER

= 'T':	x, u_1, u_2, v_1^t, v_2^t are stored in row-major order.
otherwise	x, u_1, u_2, v_1^t, v_2^t are stored in column-major order.

signs

CHARACTER

= 'O':	The lower-left block is made nonpositive (the "other" convention).
otherwise	The upper-right block is made nonpositive (the "default" convention).

m

INTEGER. The number of rows and columns of the matrix X.

p

INTEGER. The number of rows in x_{11} and x_{12}. $0 \le p \le m$.

q

INTEGER. The number of columns in x_{11} and x_{21}. $0 \le q \le \min(p, m-p, m-q)$.

x11

REAL for sorbdb

DOUBLE PRECISION for dorbdb

COMPLEX for cunbdb

DOUBLE COMPLEX for zunbdb

Array, size (*ldx11*,*) .

On entry, the top-left block of the orthogonal/unitary matrix to be reduced.

ldx11

INTEGER. The leading dimension of the array X_{11}. If *trans* = 'T', $ldx11 \ge p$. Otherwise, $ldx11 \ge q$.

x12

REAL for sorbdb

DOUBLE PRECISION for dorbdb

COMPLEX for cunbdb

DOUBLE COMPLEX for zunbdb

Array, size (*ldx12*,*m*-*q*).

On entry, the top-right block of the orthogonal/unitary matrix to be reduced.

ldx12 INTEGER. The leading dimension of the array X_{12}. If *trans* = 'N', *ldx12*≥*p*. Otherwise, *ldx12*≥*m*-*q*.

x21 REAL for sorbdb

DOUBLE PRECISION for dorbdb

COMPLEX for cunbdb

DOUBLE COMPLEX for zunbdb

Array, size (*ldx21*,*q*).

On entry, the bottom-left block of the orthogonal/unitary matrix to be reduced.

ldx21 INTEGER. The leading dimension of the array X_{21}. If *trans* = 'N', *ldx21*≥*m*-*p*. Otherwise, *ldx21*≥*q*.

x22 REAL for sorbdb

DOUBLE PRECISION for dorbdb

COMPLEX for cunbdb

DOUBLE COMPLEX for zunbdb

Array, size (*ldx22*,*m*-*q*).

On entry, the bottom-right block of the orthogonal/unitary matrix to be reduced.

ldx22 INTEGER. The leading dimension of the array X_{21}. If *trans* = 'N', *ldx22*≥*m*-*p*. Otherwise, *ldx22*≥*m*-*q*.

work REAL for sorbdb

DOUBLE PRECISION for dorbdb

COMPLEX for cunbdb

DOUBLE COMPLEX for zunbdb

Workspace array, size (*lwork*).

lwork INTEGER. The size of the *work* array. *lwork*≥*m*-*q*

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

Output Parameters

x11 On exit, the form depends on *trans*:

If *trans*='N',	the columns of the lower triangle of *x11* specify reflectors for p_1, the rows of the upper triangle of *x11*(1:*q* - 1, *q*:q - 1) specify reflectors for q_1
otherwise *trans*='T',	the rows of the upper triangle of *x11* specify reflectors for p_1, the columns of the lower triangle of *x11*(1:*q* - 1, *q*:q - 1) specify reflectors for q_1

x12

On exit, the form depends on *trans*:

If *trans*='T',	the columns of the upper triangle of *x12* specify the first *p* reflectors for q_2
otherwise *trans*='T',	the columns of the lower triangle of *x12* specify the first *p* reflectors for q_2

x21

On exit, the form depends on *trans*:

If *trans*='T',	the columns of the lower triangle of *x21* specify the reflectors for p_2
otherwise *trans*='T',	the columns of the upper triangle of *x21* specify the reflectors for p_2

x22

On exit, the form depends on *trans*:

If *trans*='T',	the rows of the upper triangle of *x22*(*q*+1:*m*-*p*,*p*+1:*m*-*q*) specify the last *m*-*p*-*q* reflectors for q_2
otherwise *trans*='T',	the columns of the lower triangle of *x22*(*p*+1:*m*-*q*,*q*+1:*m*-*p*) specify the last *m*-*p*-*q* reflectors for p_2

theta

REAL for sorbdb

DOUBLE PRECISION for dorbdb

COMPLEX for cunbdb

DOUBLE COMPLEX for zunbdb

Array, size (*q*). The entries of bidiagonal blocks b_{11}, b_{12}, b_{21}, and b_{22} can be computed from the angles *theta* and *phi*. See the Description section for details.

phi

REAL for sorbdb

DOUBLE PRECISION for dorbdb

COMPLEX for cunbdb

DOUBLE COMPLEX for zunbdb

Array, size (*q*-1). The entries of bidiagonal blocks b_{11}, b_{12}, b_{21}, and b_{22} can be computed from the angles *theta* and *phi*. See the Description section for details.

taup1

REAL for sorbdb

DOUBLE PRECISION for dorbdb

COMPLEX for cunbdb

DOUBLE COMPLEX for zunbdb

Array, size (*p*).

Scalar factors of the elementary reflectors that define p_1.

taup2

REAL for sorbdb

DOUBLE PRECISION for dorbdb

COMPLEX for cunbdb

DOUBLE COMPLEX for zunbdb

Array, size (*m*-*p*).

Scalar factors of the elementary reflectors that define p_2.

tauq1

REAL for sorbdb

DOUBLE PRECISION for dorbdb

COMPLEX for cunbdb

DOUBLE COMPLEX for zunbdb

Array, size (*q*).

Scalar factors of the elementary reflectors that define q_1.

tauq2

REAL for sorbdb

DOUBLE PRECISION for dorbdb

COMPLEX for cunbdb

DOUBLE COMPLEX for zunbdb

Array, size (*m*-*q*).

Scalar factors of the elementary reflectors that define q_2.

info

INTEGER.

= 0: successful exit

< 0: if *info* = -*i*, the *i*-th argument has an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine ?orbdb/?unbdb interface are as follows:

x11 Holds the block of matrix *X* of size (*p*, *q*).

x12 Holds the block of matrix *X* of size (*p*, *m*-*q*).

x21 Holds the block of matrix *X* of size (*m*-*p*, *q*).

x22 Holds the block of matrix *X* of size (*m*-*p*, *m*-*q*).

theta Holds the vector of length *q*.

phi Holds the vector of length *q*-1.

taup1 Holds the vector of length *p*.

taup2 Holds the vector of length *m*-*p*.

tauq1 Holds the vector of length *q*.

taupq2 Holds the vector of length *m*-*q*.

trans Must be 'N' or 'T'.

signs Must be 'O' or 'D'.

LAPACK Least Squares and Eigenvalue Problem Driver Routines

Each of the LAPACK driver routines solves a complete problem. To arrive at the solution, driver routines typically call a sequence of appropriate computational routines.

Driver routines are described in the following topics :

Linear Least Squares (LLS) Problems

Generalized LLS Problems

Symmetric Eigenproblems

Nonsymmetric Eigenproblems

Singular Value Decomposition

Cosine-Sine Decomposition

Generalized Symmetric Definite Eigenproblems

Generalized Nonsymmetric Eigenproblems

Linear Least Squares (LLS) Problems: LAPACK Driver Routines

This topic describes LAPACK driver routines used for solving linear least squares problems. Table "Driver Routines for Solving LLS Problems" lists all such routines for the FORTRAN 77 interface. The corresponding routine names in the Fortran 95 interface are without the first symbol.

Driver Routines for Solving LLS Problems

Routine Name	Operation performed
gels	Uses QR or LQ factorization to solve a overdetermined or underdetermined linear system with full rank matrix.
gelsy	Computes the minimum-norm solution to a linear least squares problem using a complete orthogonal factorization of A.
gelss	Computes the minimum-norm solution to a linear least squares problem using the singular value decomposition of A.
gelsd	Computes the minimum-norm solution to a linear least squares problem using the singular value decomposition of A and a divide and conquer method.
getsls	Solves overdetermined or underdetermined real linear systems involving a matrix or its transpose using a tall skinny QR or short wide LQ factorization.

?gels
Uses QR or LQ factorization to solve a overdetermined or underdetermined linear system with full rank matrix.

Syntax

```
call sgels(trans, m, n, nrhs, a, lda, b, ldb, work, lwork, info)
```

```
call dgels(trans, m, n, nrhs, a, lda, b, ldb, work, lwork, info)

call zgels(trans, m, n, nrhs, a, lda, b, ldb, work, lwork, info)
call gels(a, b [,trans] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine solves overdetermined or underdetermined real/ complex linear systems involving an *m*-by-*n* matrix *A*, or its transpose/ conjugate-transpose, using a *QR* or *LQ* factorization of *A*. It is assumed that *A* has full rank.

The following options are provided:

1. If *trans* = 'N' and $m \geq n$: find the least squares solution of an overdetermined system, that is, solve the least squares problem

minimize $||b - A*x||_2$

2. If *trans* = 'N' and $m < n$: find the minimum norm solution of an underdetermined system $A*X = B$.

3. If *trans* = 'T' or 'C' and $m \geq n$: find the minimum norm solution of an undetermined system $A^H*X = B$.

4. If *trans* = 'T' or 'C' and $m < n$: find the least squares solution of an overdetermined system, that is, solve the least squares problem

minimize $||b - A^H*x||_2$

Several right hand side vectors *b* and solution vectors *x* can be handled in a single call; they are formed by the columns of the right hand side matrix *B* and the solution matrix *X* (when coefficient matrix is *A*, *B* is *m*-by-*nrhs* and *X* is *n*-by-*nrhs*; if the coefficient matrix is A^T or A^H, *B* is*n*-by-*nrhs* and *X* is *m*-by-*nrhs*.

Input Parameters

trans	CHARACTER*1. Must be 'N', 'T', or 'C'. If *trans* = 'N', the linear system involves matrix *A*; If *trans* = 'T', the linear system involves the transposed matrix A^T (for real flavors only); If *trans* = 'C', the linear system involves the conjugate-transposed matrix A^H (for complex flavors only).
m	INTEGER. The number of rows of the matrix *A* ($m \geq 0$).
n	INTEGER. The number of columns of the matrix *A* ($n \geq 0$).
nrhs	INTEGER. The number of right-hand sides; the number of columns in *B* ($nrhs \geq 0$).
a, *b*, *work*	REAL for sgels DOUBLE PRECISION for dgels COMPLEX for cgels

DOUBLE COMPLEX for zgels.

Arrays:

a(*lda*,*) contains the *m*-by-*n* matrix *A*.

The second dimension of *a* must be at least max(1, *n*).

b(*ldb*,*) contains the matrix *B* of right hand side vectors.

The second dimension of *b* must be at least max(1, *nrhs*).

work is a workspace array, its dimension max(1, *lwork*).

lda INTEGER. The leading dimension of *a*; at least max(1, *m*).

ldb INTEGER. The leading dimension of *b*; must be at least max(1, *m*, *n*).

lwork INTEGER. The size of the *work* array; must be at least min (*m*, *n*)+max(1, *m*, *n*, *nrhs*).

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a On exit, overwritten by the factorization data as follows:

if *m*≥*n*, array *a* contains the details of the *QR* factorization of the matrix *A* as returned by ?geqrf;

if *m* < *n*, array *a* contains the details of the *LQ* factorization of the matrix *A* as returned by ?gelqf.

b If *info* = 0, *b* overwritten by the solution vectors, stored columnwise:

if *trans* = 'N' and *m*≥*n*, rows 1 to *n* of *b* contain the least squares solution vectors; the residual sum of squares for the solution in each column is given by the sum of squares of modulus of elements *n*+1 to *m* in that column;

if *trans* = 'N' and *m* < *n*, rows 1 to *n* of *b* contain the minimum norm solution vectors;

if *trans* = 'T' or 'C' and *m*≥*n*, rows 1 to *m* of *b* contain the minimum norm solution vectors;

if *trans* = 'T' or 'C' and *m* < *n*, rows 1 to *m* of *b* contain the least squares solution vectors; the residual sum of squares for the solution in each column is given by the sum of squares of modulus of elements *m*+1 to *n* in that column.

work(1) If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, the *i*-th diagonal element of the triangular factor of *A* is zero, so that *A* does not have full rank; the least squares solution could not be computed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `gels` interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
b	Holds the matrix of size max(*m*,*n*)-by-*nrhs*. If *trans* = 'N', then, on entry, the size of *b* is *m*-by-*nrhs*, If *trans* = 'T', then, on entry, the size of *b* is *n*-by-*nrhs*,
trans	Must be 'N' or 'T'. The default value is 'N'.

Application Notes

For better performance, try using *lwork* = min (*m*, *n*)+max(1, *m*, *n*, *nrhs*)***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?gelsy

Computes the minimum-norm solution to a linear least squares problem using a complete orthogonal factorization of A.

Syntax

```
call sgelsy(m, n, nrhs, a, lda, b, ldb, jpvt, rcond, rank, work, lwork, info)
call dgelsy(m, n, nrhs, a, lda, b, ldb, jpvt, rcond, rank, work, lwork, info)
call cgelsy(m, n, nrhs, a, lda, b, ldb, jpvt, rcond, rank, work, lwork, rwork, info)
call zgelsy(m, n, nrhs, a, lda, b, ldb, jpvt, rcond, rank, work, lwork, rwork, info)
call gelsy(a, b [,rank] [,jpvt] [,rcond] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The `?gelsy` routine computes the minimum-norm solution to a real/complex linear least squares problem:

`minimize ||b - A*x||`$_2$

using a complete orthogonal factorization of *A*. *A* is an *m*-by-*n* matrix which may be rank-deficient. Several right hand side vectors *b* and solution vectors *x* can be handled in a single call; they are stored as the columns of the *m*-by-*nrhs* right hand side matrix *B* and the *n*-by-*nrhs* solution matrix *X*.

The routine first computes a *QR* factorization with column pivoting:

$$AP = Q \begin{pmatrix} R_{11} & R_{12} \\ 0 & R_{22} \end{pmatrix}$$

with R_{11} defined as the largest leading submatrix whose estimated condition number is less than 1/*rcond*. The order of R_{11}, *rank*, is the effective rank of *A*. Then, R_{22} is considered to be negligible, and R_{12} is annihilated by orthogonal/unitary transformations from the right, arriving at the complete orthogonal factorization:

$$AP = Q \begin{pmatrix} T_{11} & 0 \\ 0 & 0 \end{pmatrix} Z$$

The minimum-norm solution is then

$$X = PZ^{T} \begin{pmatrix} T_{11}^{-1} Q_1^{T} B \\ 0 \end{pmatrix}$$

for real flavors and

$$X = PZ^{H} \begin{pmatrix} T_{11}^{-1} Q_1^{H} B \\ 0 \end{pmatrix}$$

for complex flavors,

where Q_1 consists of the first *rank* columns of *Q*.

The ?gelsy routine is identical to the original deprecated ?gelsx routine except for the following differences:

- The call to the subroutine ?geqpf has been substituted by the call to the subroutine ?geqp3, which is a BLAS-3 version of the *QR* factorization with column pivoting.
- The matrix *B* (the right hand side) is updated with BLAS-3.
- The permutation of the matrix *B* (the right hand side) is faster and more simple.

Input Parameters

m	INTEGER. The number of rows of the matrix *A* (*m*≥ 0).
n	INTEGER. The number of columns of the matrix *A* (*n*≥ 0).
nrhs	INTEGER. The number of right-hand sides; the number of columns in *B* (*nrhs*≥ 0).
a, *b*, *work*	REAL for sgelsy DOUBLE PRECISION for dgelsy COMPLEX for cgelsy DOUBLE COMPLEX for zgelsy. Arrays: *a*(*lda*,*) contains the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) contains the *m*-by-*nrhs* right hand side matrix *B*. The second dimension of *b* must be at least max(1, *nrhs*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The leading dimension of *a*; at least max(1, *m*).
ldb	INTEGER. The leading dimension of *b*; must be at least max(1, *m*, *n*).
jpvt	INTEGER. Array, size at least max(1, *n*). On entry, if *jpvt*(*i*)≠ 0, the *i*-th column of *A* is permuted to the front of *AP*, otherwise the *i*-th column of *A* is a free column.
rcond	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. *rcond* is used to determine the effective rank of *A*, which is defined as the order of the largest leading triangular submatrix R_{11} in the *QR* factorization with pivoting of *A*, whose estimated condition number < 1/*rcond*.
lwork	INTEGER. The size of the *work* array. If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

rwork — REAL for cgelsy DOUBLE PRECISION for zgelsy. Workspace array, size at least max(1, 2*n*). Used in complex flavors only.

Output Parameters

a — On exit, overwritten by the details of the complete orthogonal factorization of *A*.

b — Overwritten by the *n*-by-*nrhs* solution matrix *X*.

jpvt — On exit, if *jpvt*(*i*)= *k*, then the *i*-th column of *AP* was the *k*-th column of *A*.

rank — INTEGER. The effective rank of *A*, that is, the order of the submatrix R_{11}. This is the same as the order of the submatrix T_{11} in the complete orthogonal factorization of *A*.

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine gelsy interface are the following:

a — Holds the matrix *A* of size (*m*,*n*).

b — Holds the matrix of size max(*m*,*n*)-by-*nrhs*. On entry, contains the *m*-by-*nrhs* right hand side matrix *B*, On exit, overwritten by the *n*-by-*nrhs* solution matrix *X*.

jpvt — Holds the vector of length *n*. Default value for this element is *jpvt*(*i*) = 0.

rcond — Default value for this element is *rcond* = 100*EPSILON(1.0_WP).

Application Notes

For real flavors:

The unblocked strategy requires that:

lwork≥ max(*mn*+3*n*+1, 2**mn* + *nrhs*),

where *mn* = min(*m*, *n*).

The block algorithm requires that:

lwork≥ max(*mn*+2*n*+*nb**(*n*+1), 2**mn*+*nb***nrhs*),

where *nb* is an upper bound on the blocksize returned by ilaenv for the routines sgeqp3/dgeqp3, stzrzf/dtzrzf, stzrqf/dtzrqf, sormqr/dormqr, and sormrz/dormrz.

For complex flavors:

The unblocked strategy requires that:

lwork≥*mn* + max(2**mn*, *n*+1, *mn* + *nrhs*),

where *mn* = min(*m*, *n*).

The block algorithm requires that:

lwork < *mn* + max(2**mn*, *nb**(*n*+1), *mn*+*mn***nb*, *mn*+ *nb***nrhs*),

where *nb* is an upper bound on the blocksize returned by ilaenv for the routines cgeqp3/zgeqp3, ctzrzf/ztzrzf, ctzrqf/ztzrqf, cunmqr/zunmqr, and cunmrz/zunmrz.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?gelss

Computes the minimum-norm solution to a linear least squares problem using the singular value decomposition of A.

Syntax

call sgelss(*m*, *n*, *nrhs*, *a*, *lda*, *b*, *ldb*, *s*, *rcond*, *rank*, *work*, *lwork*, *info*)

call dgelss(*m*, *n*, *nrhs*, *a*, *lda*, *b*, *ldb*, *s*, *rcond*, *rank*, *work*, *lwork*, *info*)

call cgelss(*m*, *n*, *nrhs*, *a*, *lda*, *b*, *ldb*, *s*, *rcond*, *rank*, *work*, *lwork*, *rwork*, *info*)

call zgelss(*m*, *n*, *nrhs*, *a*, *lda*, *b*, *ldb*, *s*, *rcond*, *rank*, *work*, *lwork*, *rwork*, *info*)

call gelss(*a*, *b* [,*rank*] [,*s*] [,*rcond*] [,*info*])

Include Files

- mkl.fi, lapack.f90

Description

The routine computes the minimum norm solution to a real linear least squares problem:

minimize $||b - A*x||_2$

using the singular value decomposition (SVD) of *A*. *A* is an *m*-by-*n* matrix which may be rank-deficient. Several right hand side vectors *b* and solution vectors *x* can be handled in a single call; they are stored as the columns of the *m*-by-*nrhs* right hand side matrix *B* and the *n*-by-*nrhs* solution matrix *X*. The effective rank of *A* is determined by treating as zero those singular values which are less than *rcond* times the largest singular value.

Input Parameters

m — INTEGER. The number of rows of the matrix *A* (*m*≥ 0).

n — INTEGER. The number of columns of the matrix *A* (*n*≥ 0).

nrhs	INTEGER. The number of right-hand sides; the number of columns in *B* (*nrhs*≥ 0).
a, *b*, *work*	REAL for sgelss DOUBLE PRECISION for dgelss COMPLEX for cgelss DOUBLE COMPLEX for zgelss. Arrays: *a*(*lda*,*) contains the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) contains the *m*-by-*nrhs* right hand side matrix *B*. The second dimension of *b* must be at least max(1, *nrhs*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The leading dimension of *a*; at least max(1, *m*).
ldb	INTEGER. The leading dimension of *b*; must be at least max(1, *m*, *n*).
rcond	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. *rcond* is used to determine the effective rank of *A*. Singular values *s*(*i*) ≤*rcond* **s*(1) are treated as zero. If *rcond* <0, machine precision is used instead.
lwork	INTEGER. The size of the *work* array; *lwork*≥ 1. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.
rwork	REAL for cgelss DOUBLE PRECISION for zgelss. Workspace array used in complex flavors only. size at least max(1, 5*min(*m*, *n*)).

Output Parameters

a	On exit, the first min(*m*, *n*) rows of *a* are overwritten with the matrix of right singular vectors of *A*, stored row-wise.
b	Overwritten by the *n*-by-*nrhs* solution matrix *X*. If *m*≥*n* and *rank* = *n*, the residual sum-of-squares for the solution in the *i*-th column is given by the sum of squares of modulus of elements *n*+1:*m* in that column.
s	REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size at least max(1, min(*m*, *n*)). The singular values of *A* in decreasing order. The condition number of *A* in the 2-norm is

$k_2(A) = s(1) / s(\min(m, n))$.

rank — INTEGER. The effective rank of *A*, that is, the number of singular values which are greater than *rcond* **s*(1).

work(1) — If *info* = 0, on exit, *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = –*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, then the algorithm for computing the SVD failed to converge; *i* indicates the number of off-diagonal elements of an intermediate bidiagonal form which did not converge to zero.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine gelss interface are the following:

a — Holds the matrix *A* of size (*m*,*n*).

b — Holds the matrix of size max(*m*,*n*)-by-*nrhs*. On entry, contains the *m*-by-*nrhs* right hand side matrix *B*, On exit, overwritten by the *n*-by-*nrhs* solution matrix *X*.

s — Holds the vector of length min(*m*,*n*).

rcond — Default value for this element is *rcond* = 100*EPSILON(1.0_WP).

Application Notes

For real flavors:

lwork≥ 3*min(*m*, *n*)+ max(2*min(*m*, *n*), max(*m*, *n*), *nrhs*)

For complex flavors:

lwork≥ 2*min(*m*, *n*)+ max(*m*, *n*, *nrhs*)

For good performance, *lwork* should generally be larger.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = –1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = –1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?gelsd

Computes the minimum-norm solution to a linear least squares problem using the singular value decomposition of A and a divide and conquer method.

Syntax

```
call sgelsd(m, n, nrhs, a, lda, b, ldb, s, rcond, rank, work, lwork, iwork, info)
call dgelsd(m, n, nrhs, a, lda, b, ldb, s, rcond, rank, work, lwork, iwork, info)
call cgelsd(m, n, nrhs, a, lda, b, ldb, s, rcond, rank, work, lwork, rwork, iwork, info)
call zgelsd(m, n, nrhs, a, lda, b, ldb, s, rcond, rank, work, lwork, rwork, iwork, info)
call gelsd(a, b [,rank] [,s] [,rcond] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes the minimum-norm solution to a real linear least squares problem:

$\text{minimize } ||b - A*x||_2$

using the singular value decomposition (SVD) of *A*. *A* is an *m*-by-*n* matrix which may be rank-deficient.

Several right hand side vectors *b* and solution vectors *x* can be handled in a single call; they are stored as the columns of the *m*-by-*nrhs* right hand side matrix *B* and the *n*-by-*nrhs* solution matrix *X*.

The problem is solved in three steps:

1. Reduce the coefficient matrix A to bidiagonal form with Householder transformations, reducing the original problem into a "bidiagonal least squares problem" (BLS).
2. Solve the BLS using a divide and conquer approach.
3. Apply back all the Householder transformations to solve the original least squares problem.

The effective rank of *A* is determined by treating as zero those singular values which are less than *rcond* times the largest singular value.

The routine uses auxiliary routines lals0 and lalsa.

Input Parameters

m	INTEGER. The number of rows of the matrix *A* (*m*≥ 0).
n	INTEGER. The number of columns of the matrix *A* (*n*≥ 0).
nrhs	INTEGER. The number of right-hand sides; the number of columns in *B* (*nrhs*≥ 0).
a, *b*, *work*	REAL for sgelsd DOUBLE PRECISION for dgelsd COMPLEX for cgelsd

DOUBLE COMPLEX for zgelsd.

Arrays:

a(*lda*,*) contains the *m*-by-*n* matrix *A*.

The second dimension of *a* must be at least max(1, *n*).

b(*ldb*,*) contains the *m*-by-*nrhs* right hand side matrix *B*.

The second dimension of *b* must be at least max(1, *nrhs*).

work is a workspace array, its dimension max(1, *lwork*).

lda — INTEGER. The leading dimension of *a*; at least max(1, *m*).

ldb — INTEGER. The leading dimension of *b*; must be at least max(1, *m*, *n*).

rcond — REAL for single-precision flavors

DOUBLE PRECISION for double-precision flavors.

rcond is used to determine the effective rank of *A*. Singular values $s(i) \leq rcond * s(1)$ are treated as zero. If $rcond \leq 0$, machine precision is used instead.

lwork — INTEGER. The size of the *work* array; $lwork \geq 1$.

If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the array *work* and the minimum sizes of the arrays *rwork* and *iwork*, and returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

iwork — INTEGER. Workspace array. See *Application Notes* for the suggested dimension of *iwork*.

rwork — REAL for cgelsd

DOUBLE PRECISION for zgelsd.

Workspace array, used in complex flavors only. See *Application Notes* for the suggested dimension of *rwork*.

Output Parameters

a — On exit, *A* has been overwritten.

b — Overwritten by the *n*-by-*nrhs* solution matrix *X*.

If $m \geq n$ and $rank = n$, the residual sum-of-squares for the solution in the *i*-th column is given by the sum of squares of modulus of elements *n*+1:*m* in that column.

s — REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size at least max(1, min(*m*, *n*)). The singular values of *A* in decreasing order. The condition number of *A* in the 2-norm is

$k_2(A) = s(1) / s(\min(m, n))$.

rank	INTEGER. The effective rank of *A*, that is, the number of singular values which are greater than *rcond* **s*(1).
work(1)	If *info* = 0, on exit, *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
rwork(1)	If *info* = 0, on exit, *rwork*(1) returns the minimum size of the workspace array *iwork* required for optimum performance.
iwork(1)	If *info* = 0, on exit, *iwork*(1) returns the minimum size of the workspace array *iwork* required for optimum performance.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, then the algorithm for computing the SVD failed to converge; *i* indicates the number of off-diagonal elements of an intermediate bidiagonal form that did not converge to zero.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine gelsd interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
b	Holds the matrix of size max(*m*,*n*)-by-*nrhs*. On entry, contains the *m*-by-*nrhs* right hand side matrix *B*, On exit, overwritten by the *n*-by-*nrhs* solution matrix *X*.
s	Holds the vector of length min(*m*,*n*).
rcond	Default value for this element is *rcond* = 100*EPSILON(1.0_WP).

Application Notes

The divide and conquer algorithm makes very mild assumptions about floating point arithmetic. It will work on machines with a guard digit in add/subtract. It could conceivably fail on hexadecimal or decimal machines without guard digits, but we know of none.

The exact minimum amount of workspace needed depends on *m*, *n* and *nrhs*. The size *lwork* of the workspace array *work* must be as given below.

For real flavors:

If $m \geq n$,

$lwork \geq 12n + 2n*smlsiz + 8n*nlvl + n*nrhs + (smlsiz+1)^2$;

If $m < n$,

$lwork \geq 12m + 2m*smlsiz + 8m*nlvl + m*nrhs + (smlsiz+1)^2$;

For complex flavors:

If $m \geq n$,

$lwork < 2n + n*nrhs$;

If $m < n$,

$lwork \geq 2m + m*nrhs$;

where *smlsiz* is returned by `ilaenv` and is equal to the maximum size of the subproblems at the bottom of the computation tree (usually about 25), and

$nlvl = \mathrm{INT}(\log_2(\min(m, n)/(smlsiz+1))) + 1$.

For good performance, *lwork* should generally be larger.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set $lwork = -1$.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (`work(1)`) for subsequent runs.

If you set $lwork = -1$, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The dimension of the workspace array *iwork* must be at least

$3*\min(m, n)*nlvl + 11*\min(m, n)$.

The dimension of the workspace array *iwork* (for complex flavors) must be at least $\max(1, lrwork)$.

$lrwork \geq 10n + 2n*smlsiz + 8n*nlvl + 3*smlsiz*nrhs + (smlsiz+1)^2$ if $m \geq n$, and

$lrwork \geq 10m + 2m*smlsiz + 8m*nlvl + 3*smlsiz*nrhs + (smlsiz+1)^2$ if $m < n$.

?getsls
Uses QR or LQ factorization to solve an overdetermined or underdetermined linear system with full rank matrix, with best performance for tall and skinny matrices.

```
call sgetsls(trans, m, n, nrhs, a, lda, b, ldb, work, lwork, info)
call dgetsls(trans, m, n, nrhs, a, lda, b, ldb, work, lwork, info)
call cgetsls(trans, m, n, nrhs, a, lda, b, ldb, work, lwork, info)
call zgetsls(trans, m, n, nrhs, a, lda, b, ldb, work, lwork, info)
```

Description

The routine solves overdetermined or underdetermined real/ complex linear systems involving an *m*-by-*n* matrix *A*, or its transpose/conjugate-transpose, using a `?geqr` or `?gelq` factorization of *A*. It is assumed that *A* has full rank.

The following options are provided:

1. If $trans = \texttt{'N'}$ and $m \geq n$: find the least squares solution of an overdetermined system, that is, solve the least squares problem

$\text{minimize } ||b - A*x||_2$

2. If $trans = \texttt{'N'}$ and $m < n$: find the minimum norm solution of an underdetermined system $A*X = B$.

3. If $trans = \texttt{'T'}$ or `'C'` and $m \geq n$: find the minimum norm solution of an undetermined system $A^H*X = B$.

4. If *trans* = 'T' or 'C' and *m* < *n*: find the least squares solution of an overdetermined system, that is, solve the least squares problem

minimize $||b - A^H * x||_2$

Several right hand side vectors *b* and solution vectors *x* can be handled in a single call; they are formed by the columns of the right hand side matrix *B* and the solution matrix *X* (when coefficient matrix is *A*, *B* is *m*-by-*nrhs* and *X* is *n*-by-*nrhs*; if the coefficient matrix is A^T or A^H, *B* is*n*-by-*nrhs* and *X* is *m*-by-*nrhs*.

Input Parameters

trans

CHARACTER*1. Must be 'N', 'T', or 'C'.

If *trans* = 'N', the linear system involves matrix *A*;

If *trans* = 'T', the linear system involves the transposed matrix A^T (for real flavors only);

If *trans* = 'C', the linear system involves the conjugate-transposed matrix A^H (for complex flavors only).

m

INTEGER. The number of rows of the matrix *A*. *m*≥ 0.

n

INTEGER. The number of columns of the matrix *A*. *n*≥ 0.

nrhs

INTEGER. The number of right-hand sides; the number of columns in *B* (*nrhs*≥ 0).

a

REAL for sgetsls

DOUBLE PRECISION for dgetsls

COMPLEX for cgetsls

COMPLEX*16 for zgetsls

Array *a*(*lda*,*) contains the *m*-by-*n* matrix *A*.

The second dimension of *a* must be at least max(1, *n*).

lda

INTEGER. The leading dimension of the array *a*. *lda*≥max(1,*m*).

b

REAL for sgetsls

DOUBLE PRECISION for dgetsls

COMPLEX for cgetsls

COMPLEX*16 for zgetsls

Array *b*(*ldb*,*) contains the matrix *B* of right hand side vectors.

The second dimension of *b* must be at least max(1, *nrhs*).

ldb

INTEGER. The leading dimension of the array *b*. *ldb*≥max(1,*m*,*n*).

lwork

INTEGER. The size of the *work* array; must be at least min (*m*, *n*)+max(1, *m*, *n*, *nrhs*).

If *lwork* = –1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a	On exit, overwritten by the factorization data as follows: if *m*≥*n*, array *a* contains the details of the *QR* factorization of the matrix *A* as returned by ?geqr; if *m* < *n*, array *a* contains the details of the *LQ* factorization of the matrix *A* as returned by ?gelq.
b	If *info* = 0, *b* overwritten by the solution vectors, stored columnwise: if *trans* = 'N' and *m*≥*n*, rows 1 to *n* of *b* contain the least squares solution vectors; the residual sum of squares for the solution in each column is given by the sum of squares of modulus of elements *n*+1 to *m* in that column; if *trans* = 'N' and *m* < *n*, rows 1 to *n* of *b* contain the minimum norm solution vectors; if *trans* = 'T' or 'C' and *m*≥*n*, rows 1 to *m* of *b* contain the minimum norm solution vectors; if *trans* = 'T' or 'C' and *m* < *n*, rows 1 to *m* of *b* contain the least squares solution vectors; the residual sum of squares for the solution in each column is given by the sum of squares of modulus of elements *m*+1 to *n* in that column.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the *i*-th diagonal element of the triangular factor of *A* is zero, so that *A* does not have full rank; the least squares solution could not be computed.

Generalized Linear Least Squares (LLS) Problems: LAPACK Driver Routines

This topic describes LAPACK driver routines used for solving generalized linear least squares problems. Table "Driver Routines for Solving Generalized LLS Problems" lists all such routines. The corresponding routine names in the Fortran 95 interface are without the first symbol.

Driver Routines for Solving Generalized LLS Problems

Routine Name	Operation performed
gglse	Solves the linear equality-constrained least squares problem using a generalized RQ factorization.
ggglm	Solves a general Gauss-Markov linear model problem using a generalized QR factorization.

?gglse
Solves the linear equality-constrained least squares problem using a generalized RQ factorization.

Syntax

```
call sgglse(m, n, p, a, lda, b, ldb, c, d, x, work, lwork, info)
call dgglse(m, n, p, a, lda, b, ldb, c, d, x, work, lwork, info)
call cgglse(m, n, p, a, lda, b, ldb, c, d, x, work, lwork, info)
call zgglse(m, n, p, a, lda, b, ldb, c, d, x, work, lwork, info)
call gglse(a, b, c, d, x [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine solves the linear equality-constrained least squares (LSE) problem:

minimize $||c - A*x||^2$ subject to $B*x = d$

where *A* is an *m*-by-*n* matrix, *B* is a *p*-by-*n* matrix, *c* is a given *m*-vector, and*d* is a given *p*-vector. It is assumed that $p \le n \le m+p$, and

$$\mathrm{rank}(B) = p \quad \text{and} \quad \mathrm{rank}\begin{pmatrix} A \\ B \end{pmatrix} = n .$$

These conditions ensure that the LSE problem has a unique solution, which is obtained using a generalized *RQ* factorization of the matrices (B, A) given by

```
B=(0 R)*Q, A=Z*T*Q
```

Input Parameters

m	INTEGER. The number of rows of the matrix *A* ($m \ge 0$).
n	INTEGER. The number of columns of the matrices *A* and *B* ($n \ge 0$).
p	INTEGER. The number of rows of the matrix *B* ($0 \le p \le n \le m+p$).
a, *b*, *c*, *d*, *work*	REAL for sgglse DOUBLE PRECISION for dgglse COMPLEX for cgglse DOUBLE COMPLEX for zgglse. Arrays: *a*(*lda*,*) contains the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) contains the *p*-by-*n*matrix *B*.

The second dimension of *b* must be at least max(1, *n*).

c(*), size at least max(1, *m*), contains the right hand side vector for the least squares part of the LSE problem.

d(*),, size at least max(1, *p*), contains the right hand side vector for the constrained equation.

work is a workspace array, its dimension `max(1, lwork)`.

lda — `INTEGER`. The leading dimension of *a*; at least max(1, *m*).

ldb — `INTEGER`. The leading dimension of *b*; at least max(1, *p*).

lwork — `INTEGER`. The size of the *work* array;

lwork≥ `max(1, m+n+p)`.

If *lwork* = –1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a — The elements on and above the diagonal contain the min(*m*, *n*)-by-*n* upper trapezoidal matrix *T* as returned by `?ggrqf`.

x — `REAL` for `sgglse`

The solution of the LSE problem.

b — On exit, the upper right triangle of the subarray `b(1:p, n-p+1:n)` contains the *p*-by-*p* upper triangular matrix *R* as returned by `?ggrqf`.

d — On exit, *d* is destroyed.

c — On exit, the residual sum-of-squares for the solution is given by the sum of squares of elements *n*-*p*+1 to *m* of vector *c*.

work(1) — If *info* = 0, on exit, *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

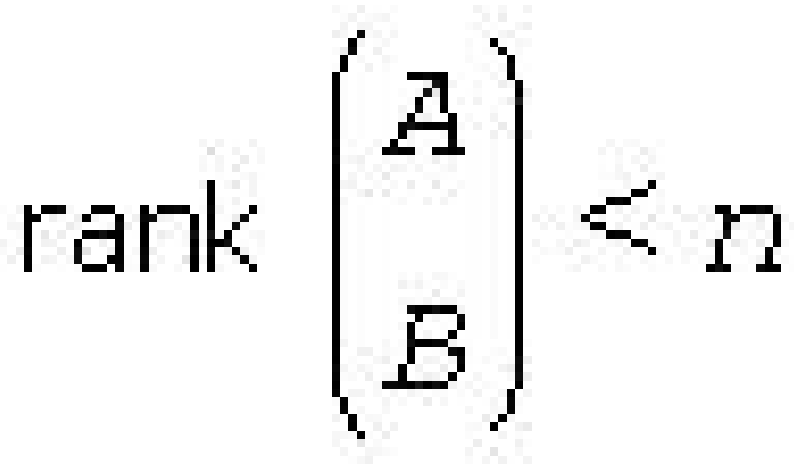
info — `INTEGER`.

If *info* = 0, the execution is successful.

If *info* = –*i*, the *i*-th parameter had an illegal value.

If *info* = 1, the upper triangular factor *R* associated with *B* in the generalized RQ factorization of the pair (*B*, *A*) is singular, so that `rank(B)` < *p*; the least squares solution could not be computed.

If *info* = 2, the (*n*–*p*)-by-(*n*–*p*) part of the upper trapezoidal factor *T* associated with *A* in the generalized RQ factorization of the pair (*B*, *A*) is singular, so that



; the least squares solution could not be computed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `gglse` interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
b	Holds the matrix *B* of size (*p*,*n*).
c	Holds the vector of length (*m*).
d	Holds the vector of length (*p*).
x	Holds the vector of length *n*.

Application Notes

For optimum performance, use

lwork≥*p* + min(*m*, *n*) + max(*m*, *n*)**nb*,

where *nb* is an upper bound for the optimal blocksizes for `?geqrf`, `?gerqf`, `?ormqr`/`?unmqr` and `?ormrq`/`?unmrq`.

You may set *lwork* to -1. The routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?ggglm
Solves a general Gauss-Markov linear model problem using a generalized QR factorization.

Syntax

```
call sggglm(n, m, p, a, lda, b, ldb, d, x, y, work, lwork, info)
call dggglm(n, m, p, a, lda, b, ldb, d, x, y, work, lwork, info)
call cggglm(n, m, p, a, lda, b, ldb, d, x, y, work, lwork, info)
```

```
call zggglm(n, m, p, a, lda, b, ldb, d, x, y, work, lwork, info)
call ggglm(a, b, d, x, y [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine solves a general Gauss-Markov linear model (GLM) problem:

$\text{minimize}_x \; ||y||_2$ subject to $d = A*x + B*y$

where *A* is an *n*-by-*m* matrix, *B* is an *n*-by-*p* matrix, and *d* is a given *n*-vector. It is assumed that $m \le n \le m+p$, and $\text{rank}(A) = m$ and $\text{rank}(AB) = n$.

Under these assumptions, the constrained equation is always consistent, and there is a unique solution *x* and a minimal 2-norm solution *y*, which is obtained using a generalized *QR* factorization of the matrices (A, B) given by

$$A = Q \begin{pmatrix} R \\ 0 \end{pmatrix}; \qquad B = Q * T * Z.$$

In particular, if matrix *B* is square nonsingular, then the problem GLM is equivalent to the following weighted linear least squares problem

$\text{minimize}_x \; ||B^{-1}(d-A*x)||_2$.

Input Parameters

n	INTEGER. The number of rows of the matrices *A* and *B* ($n \ge 0$).
m	INTEGER. The number of columns in *A* ($m \ge 0$).
p	INTEGER. The number of columns in *B* ($p \ge n - m$).
a, *b*, *d*, *work*	REAL for sggglm DOUBLE PRECISION for dggglm COMPLEX for cggglm DOUBLE COMPLEX for zggglm. Arrays: *a*(*lda*,*) contains the *n*-by-*m* matrix *A*. The second dimension of *a* must be at least max(1, *m*). *b*(*ldb*,*) contains the *n*-by-*p* matrix *B*. The second dimension of *b* must be at least max(1, *p*). *d*(*), size at least max(1, *n*), contains the left hand side of the GLM equation. *work* is a workspace array, its dimension max(1, *lwork*).

lda — INTEGER. The leading dimension of *a*; at least max(1, *n*).

ldb — INTEGER. The leading dimension of *b*; at least max(1, *n*).

lwork — INTEGER. The size of the *work* array; *lwork*≥ max(1, *n*+*m*+*p*).

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

x, *y* — REAL for sggglm

DOUBLE PRECISION for dggglm

COMPLEX for cggglm

DOUBLE COMPLEX for zggglm.

Arrays *x*(*), *y*(*). size at least max(1, *m*) for *x* and at least max(1, *p*) for *y*.

On exit, *x* and *y* are the solutions of the GLM problem.

a — On exit, the upper triangular part of the array *a* contains the *m*-by-*m* upper triangular matrix *R*.

b — On exit, if *n* ≤ *p*, the upper right triangle of the subarray *b*(1:*n*, *p*-*n*+1:*p*) contains the *n*-by-*n* upper triangular matrix *T* as returned by ?ggrqf; if *n* > *p*, the elements on and above the (*n*-*p*)-th subdiagonal contain the *n*-by-*p* upper trapezoidal matrix *T*.

d — On exit, *d* is destroyed

work(1) — If *info* = 0, on exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = 1, the upper triangular factor *R* associated with *A* in the generalized QR factorization of the pair (*A*, *B*) is singular, so that rank(*A*) < *m*; the least squares solution could not be computed.

If *info* = 2, the bottom (*n*-*m*)-by-(*n*-*m*) part of the upper trapezoidal factor *T* associated with *B* in the generalized QR factorization of the pair (*A*, *B*) is singular, so that rank(*AB*) < *n*; the least squares solution could not be computed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine ggglm interface are the following:

a	Holds the matrix *A* of size (*n*,*m*).
b	Holds the matrix *B* of size (*n*,*p*).
d	Holds the vector of length *n*.
x	Holds the vector of length (*m*).
y	Holds the vector of length (*p*).

Application Notes

For optimum performance, use

lwork≥*m* + min(*n*, *p*) + max(*n*, *p*)**nb*,

where *nb* is an upper bound for the optimal blocksizes for ?geqrf, ?gerqf, ?ormqr/?unmqr and ?ormrq/?unmrq.

You may set *lwork* to -1. The routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

Symmetric Eigenvalue Problems: LAPACK Driver Routines

This topic describes LAPACK driver routines used for solving symmetric eigenvalue problems. See also computational routines that can be called to solve these problems. Table "Driver Routines for Solving Symmetric Eigenproblems" lists all such driver routines for the FORTRAN 77 interface. The corresponding routine names in the Fortran 95 interface are without the first symbol.

Driver Routines for Solving Symmetric Eigenproblems

Routine Name	Operation performed
syev/heev	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric / Hermitian matrix.
syevd/heevd	Computes all eigenvalues and (optionally) all eigenvectors of a real symmetric / Hermitian matrix using divide and conquer algorithm.
syevx/heevx	Computes selected eigenvalues and, optionally, eigenvectors of a symmetric / Hermitian matrix.
syevr/heevr	Computes selected eigenvalues and, optionally, eigenvectors of a real symmetric / Hermitian matrix using the Relatively Robust Representations.
spev/hpev	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric / Hermitian matrix in packed storage.
spevd/hpevd	Uses divide and conquer algorithm to compute all eigenvalues and (optionally) all eigenvectors of a real symmetric / Hermitian matrix held in packed storage.
spevx/hpevx	Computes selected eigenvalues and, optionally, eigenvectors of a real symmetric / Hermitian matrix in packed storage.
sbev /hbev	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric / Hermitian band matrix.
sbevd/hbevd	Computes all eigenvalues and (optionally) all eigenvectors of a real symmetric / Hermitian band matrix using divide and conquer algorithm.

Routine Name	Operation performed
sbevx/hbevx	Computes selected eigenvalues and, optionally, eigenvectors of a real symmetric / Hermitian band matrix.
stev	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix.
stevd	Computes all eigenvalues and (optionally) all eigenvectors of a real symmetric tridiagonal matrix using divide and conquer algorithm.
stevx	Computes selected eigenvalues and eigenvectors of a real symmetric tridiagonal matrix.
stevr	Computes selected eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix using the Relatively Robust Representations.

?syev
Computes all eigenvalues and, optionally, eigenvectors of a real symmetric matrix.

Syntax

```
call ssyev(jobz, uplo, n, a, lda, w, work, lwork, info)
call dsyev(jobz, uplo, n, a, lda, w, work, lwork, info)
call syev(a, w [,jobz] [,uplo] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes all eigenvalues and, optionally, eigenvectors of a real symmetric matrix *A*.

Note that for most cases of real symmetric eigenvalue problems the default choice should be syevr function as its underlying algorithm is faster and uses less workspace.

Input Parameters

jobz

CHARACTER*1. Must be 'N' or 'V'.

If *jobz* = 'N', then only eigenvalues are computed.

If *jobz* = 'V', then eigenvalues and eigenvectors are computed.

uplo

CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', *a* stores the upper triangular part of *A*.

If *uplo* = 'L', *a* stores the lower triangular part of *A*.

n

INTEGER. The order of the matrix *A* ($n \geq 0$).

a, *work*

REAL for ssyev

DOUBLE PRECISION for dsyev

a(*lda*,*) is an array containing either upper or lower triangular part of the symmetric matrix *A*, as specified by *uplo*.

The second dimension of *a* must be at least max(1, *n*).

work is a workspace array, its dimension `max(1, lwork)`.

lda — `INTEGER`. The leading dimension of the array *a*.

Must be at least max(1, *n*).

lwork — `INTEGER`.

The dimension of the array *work*.

Constraint: *lwork* ≥ `max(1, 3n-1)`.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a — On exit, if *jobz* = 'V', then if *info* = 0, array *a* contains the orthonormal eigenvectors of the matrix *A*.

If *jobz* = 'N', then on exit the lower triangle

(if *uplo* = 'L') or the upper triangle (if *uplo* = 'U') of *A*, including the diagonal, is overwritten.

w — `REAL` for `ssyev`

`DOUBLE PRECISION` for `dsyev`

Array, size at least max(1, *n*).

If *info* = 0, contains the eigenvalues of the matrix *A* in ascending order.

work(1) — On exit, if *lwork* > 0, then *work(1)* returns the required minimal size of *lwork*.

info — `INTEGER`.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, then the algorithm failed to converge; *i* indicates the number of elements of an intermediate tridiagonal form which did not converge to zero.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `syev` interface are the following:

a — Holds the matrix *A* of size (*n*, *n*).

w — Holds the vector of length *n*.

job	Must be 'N' or 'V'. The default value is 'N'.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For optimum performance set *lwork*≥ (*nb*+2)***n*, where *nb* is the blocksize for ?sytrd returned by ilaenv.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

If *lwork* has any of admissible sizes, which is no less than the minimal value described, then the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array *work*. This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?heev

Computes all eigenvalues and, optionally, eigenvectors of a Hermitian matrix.

Syntax

```
call cheev(jobz, uplo, n, a, lda, w, work, lwork, rwork, info)
call zheev(jobz, uplo, n, a, lda, w, work, lwork, rwork, info)
call heev(a, w [,jobz] [,uplo] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes all eigenvalues and, optionally, eigenvectors of a complex Hermitian matrix *A*.

Note that for most cases of complex Hermitian eigenvalue problems the default choice should be heevr function as its underlying algorithm is faster and uses less workspace.

Input Parameters

jobz

CHARACTER*1. Must be 'N' or 'V'.

If *jobz* = 'N', then only eigenvalues are computed.

If *jobz* = 'V', then eigenvalues and eigenvectors are computed.

uplo

CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', *a* stores the upper triangular part of *A*.

If *uplo* = 'L', *a* stores the lower triangular part of *A*.

n

INTEGER. The order of the matrix *A* ($n \geq 0$).

a, *work*

COMPLEX for cheev

DOUBLE COMPLEX for zheev

Arrays:

a(*lda*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *A*, as specified by *uplo*.

The second dimension of *a* must be at least max(1, *n*).

work is a workspace array, its dimension max(1, *lwork*).

lda

INTEGER. The leading dimension of the array *a*. Must be at least max(1, *n*).

lwork

INTEGER.

The dimension of the array *work*. C

onstraint: $lwork \geq \max(1, 2n-1)$.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

rwork

REAL for cheev

DOUBLE PRECISION for zheev.

Workspace array, size at least max(1, 3*n*-2).

Output Parameters

a

On exit, if *jobz* = 'V', then if *info* = 0, array *a* contains the orthonormal eigenvectors of the matrix *A*.

If *jobz* = 'N', then on exit the lower triangle

(if *uplo* = 'L') or the upper triangle (if *uplo* = 'U') of *A*, including the diagonal, is overwritten.

w

REAL for cheev

DOUBLE PRECISION for zheev

Array, size at least max(1, *n*).

	If *info* = 0, contains the eigenvalues of the matrix *A* in ascending order.
work(1)	On exit, if *lwork* > 0, then *work(1)* returns the required minimal size of *lwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, then the algorithm failed to converge; *i* indicates the number of elements of an intermediate tridiagonal form which did not converge to zero.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine heev interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
w	Holds the vector of length *n*.
job	Must be 'N' or 'V'. The default value is 'N'.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For optimum performance use

lwork≥ (*nb*+1)**n*,

where *nb* is the blocksize for ?hetrd returned by ilaenv.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?syevd

Computes all eigenvalues and, optionally, all eigenvectors of a real symmetric matrix using divide and conquer algorithm.

Syntax

```
call ssyevd(jobz, uplo, n, a, lda, w, work, lwork, iwork, liwork, info)
call dsyevd(jobz, uplo, n, a, lda, w, work, lwork, iwork, liwork, info)
```

```
call syevd(a, w [,jobz] [,uplo] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes all the eigenvalues, and optionally all the eigenvectors, of a real symmetric matrix *A*. In other words, it can compute the spectral factorization of *A* as: $A = Z*\Lambda*Z^T$.

Here Λ is a diagonal matrix whose diagonal elements are the eigenvalues λ_i, and *Z* is the orthogonal matrix whose columns are the eigenvectors z_i. Thus,

$A*z_i = \lambda_i*z_i$ for $i = 1, 2, ..., n$.

If the eigenvectors are requested, then this routine uses a divide and conquer algorithm to compute eigenvalues and eigenvectors. However, if only eigenvalues are required, then it uses the Pal-Walker-Kahan variant of the *QL* or *QR* algorithm.

Note that for most cases of real symmetric eigenvalue problems the default choice should be syevr function as its underlying algorithm is faster and uses less workspace. ?syevd requires more workspace but is faster in some cases, especially for large matrices.

Input Parameters

jobz

CHARACTER*1. Must be 'N' or 'V'.

If *jobz* = 'N', then only eigenvalues are computed.

If *jobz* = 'V', then eigenvalues and eigenvectors are computed.

uplo

CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', *a* stores the upper triangular part of *A*.

If *uplo* = 'L', *a* stores the lower triangular part of *A*.

n

INTEGER. The order of the matrix *A* ($n \geq 0$).

a

REAL for ssyevd

DOUBLE PRECISION for dsyevd

Array, size (*lda*, *).

a(*lda*,*) is an array containing either upper or lower triangular part of the symmetric matrix *A*, as specified by *uplo*.

The second dimension of *a* must be at least max(1, *n*).

lda

INTEGER. The leading dimension of the array *a*.

Must be at least max(1, *n*).

work

REAL for ssyevd

DOUBLE PRECISION for dsyevd.

Workspace array, size at least *lwork*.

lwork

INTEGER.

The dimension of the array *work*.

Constraints:

if $n \leq 1$, then $lwork \geq 1$;

if *jobz* = 'N' and $n > 1$, then $lwork \geq 2*n + 1$;

if *jobz* = 'V' and $n > 1$, then $lwork \geq 2*n^2 + 6*n + 1$.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the required sizes of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

iwork

INTEGER.

Workspace array, its dimension max(1, *liwork*).

liwork

INTEGER.

The dimension of the array *iwork*.

Constraints:

if $n \leq 1$, then $liwork \geq 1$;

if *jobz* = 'N' and $n > 1$, then $liwork \geq 1$;

if *jobz* = 'V' and $n > 1$, then $liwork \geq 5*n + 3$.

If *liwork* = -1, then a workspace query is assumed; the routine only calculates the required sizes of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

Output Parameters

w

REAL for ssyevd

DOUBLE PRECISION for dsyevd

Array, size at least max(1, *n*).

If *info* = 0, contains the eigenvalues of the matrix *A* in ascending order. See also *info*.

a

If *jobz* = 'V', then on exit this array is overwritten by the orthogonal matrix *Z* which contains the eigenvectors of *A*.

work(1)

On exit, if *lwork* > 0, then *work(1)* returns the required minimal size of *lwork*.

iwork(1)

On exit, if *liwork* > 0, then *iwork(1)* returns the required minimal size of *liwork*.

info

INTEGER.

If *info* = 0, the execution is successful.

If *info* = *i*, and *jobz* = 'N', then the algorithm failed to converge; *i* indicates the number of off-diagonal elements of an intermediate tridiagonal form which did not converge to zero.

If *info* = *i*, and *jobz* = 'V', then the algorithm failed to compute an eigenvalue while working on the submatrix lying in rows and columns *info*/(*n*+1) through mod(*info*,*n*+1).

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine syevd interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
w	Holds the vector of length *n*.
jobz	Must be 'N' or 'V'. The default value is 'N'.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed eigenvalues and eigenvectors are exact for a matrix $A+E$ such that $||E||_2 = O(\varepsilon)*||A||_2$, where ε is the machine precision.

If it is not clear how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run, or set *lwork* = -1 (*liwork* = -1).

If *lwork* (or *liwork*) has any of admissible sizes, which is no less than the minimal value described, then the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If *lwork* = -1 (*liwork* = -1), then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if *lwork* (*liwork*) is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The complex analogue of this routine is heevd

?heevd
Computes all eigenvalues and, optionally, all eigenvectors of a complex Hermitian matrix using divide and conquer algorithm.

Syntax

```
call cheevd(jobz, uplo, n, a, lda, w, work, lwork, rwork, lrwork, iwork, liwork, info)
call zheevd(jobz, uplo, n, a, lda, w, work, lwork, rwork, lrwork, iwork, liwork, info)
call heevd(a, w [,job] [,uplo] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes all the eigenvalues, and optionally all the eigenvectors, of a complex Hermitian matrix *A*. In other words, it can compute the spectral factorization of *A* as: $A = Z*\Lambda*Z^H$.

Here Λ is a real diagonal matrix whose diagonal elements are the eigenvalues λ_i, and *Z* is the (complex) unitary matrix whose columns are the eigenvectors z_i. Thus,

$A*z_i = \lambda_i*z_i$ for $i = 1, 2, ..., n$.

If the eigenvectors are requested, then this routine uses a divide and conquer algorithm to compute eigenvalues and eigenvectors. However, if only eigenvalues are required, then it uses the Pal-Walker-Kahan variant of the *QL* or *QR* algorithm.

Note that for most cases of complex Hermetian eigenvalue problems the default choice should be heevr function as its underlying algorithm is faster and uses less workspace. `?heevd` requires more workspace but is faster in some cases, especially for large matrices.

Input Parameters

jobz

`CHARACTER*1`. Must be `'N'` or `'V'`.

If *jobz* = `'N'`, then only eigenvalues are computed.

If *jobz* = `'V'`, then eigenvalues and eigenvectors are computed.

uplo

`CHARACTER*1`. Must be `'U'` or `'L'`.

If *uplo* = `'U'`, *a* stores the upper triangular part of *A*.

If *uplo* = `'L'`, *a* stores the lower triangular part of *A*.

n

`INTEGER`. The order of the matrix *A* ($n \geq 0$).

a

`COMPLEX` for `cheevd`

`DOUBLE COMPLEX` for `zheevd`

Array, size (*lda*, *).

a(*lda*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *A*, as specified by *uplo*.

The second dimension of *a* must be at least max(1, *n*).

lda

`INTEGER`. The leading dimension of the array *a*. Must be at least max(1, *n*).

work

`COMPLEX` for `cheevd`

`DOUBLE COMPLEX` for `zheevd`.

Workspace array, size `max(1, lwork)`.

lwork

`INTEGER`.

The dimension of the array *work*. Constraints:

if $n \leq 1$, then $lwork \geq 1$;

if *jobz* = `'N'` and *n* > 1, then $lwork \geq n+1$;

if *jobz* = `'V'` and *n* > 1, then $lwork \geq n^2+2*n$.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

rwork

REAL for cheevd

DOUBLE PRECISION for zheevd

Workspace array, size at least *lrwork*.

lrwork

INTEGER.

The dimension of the array *rwork*. Constraints:

if $n \leq 1$, then *lrwork* ≥ 1;

if *job* = 'N' and $n > 1$, then *lrwork* $\geq n$;

if *job* = 'V' and $n > 1$, then *lrwork* $\geq 2*n^2 + 5*n + 1$.

If *lrwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

iwork

INTEGER. Workspace array, its dimension max(1, *liwork*).

liwork

INTEGER.

The dimension of the array *iwork*. Constraints: if $n \leq 1$, then *liwork* ≥ 1;

if *jobz* = 'N' and $n > 1$, then *liwork* ≥ 1;

if *jobz* = 'V' and $n > 1$, then *liwork* $\geq 5*n+3$.

If *liwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

Output Parameters

w

REAL for cheevd

DOUBLE PRECISION for zheevd

Array, size at least max(1, *n*).

If *info* = 0, contains the eigenvalues of the matrix *A* in ascending order. See also *info*.

a

If *jobz* = 'V', then on exit this array is overwritten by the unitary matrix *Z* which contains the eigenvectors of *A*.

work(1)

On exit, if *lwork* > 0, then the real part of *work*(1) returns the required minimal size of *lwork*.

rwork(1)	On exit, if *lrwork* > 0, then *rwork*(1) returns the required minimal size of *lrwork*.
iwork(1)	On exit, if *liwork* > 0, then *iwork*(1) returns the required minimal size of *liwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = *i*, and *jobz* = 'N', then the algorithm failed to converge; *i* off-diagonal elements of an intermediate tridiagonal form did not converge to zero; if *info* = *i*, and *jobz* = 'V', then the algorithm failed to compute an eigenvalue while working on the submatrix lying in rows and columns *info*/(*n*+1) through mod(*info*, *n*+1). If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine heevd interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
w	Holds the vector of length (*n*).
jobz	Must be 'N' or 'V'. The default value is 'N'.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed eigenvalues and eigenvectors are exact for a matrix $A + E$ such that $||E||_2 = O(\varepsilon)*||A||_2$, where ε is the machine precision.

If you are in doubt how much workspace to supply, use a generous value of *lwork* (*liwork* or *lrwork*) for the first run or set *lwork* = -1 (*liwork* = -1, *lrwork* = -1).

If you choose the first option and set any of admissible *lwork* (*liwork* or *lrwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*) on exit. Use this value (*work*(1), *iwork*(1), *rwork*(1)) for subsequent runs.

If you set *lwork* = -1 (*liwork* = -1, *lrwork* = -1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*, *lrwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The real analogue of this routine is syevd. See also hpevd for matrices held in packed storage, and hbevd for banded matrices.

?syevx
Computes selected eigenvalues and, optionally, eigenvectors of a symmetric matrix.

Syntax

```
call ssyevx(jobz, range, uplo, n, a, lda, vl, vu, il, iu, abstol, m, w, z, ldz, work, lwork, iwork, ifail, info)
```

```
call dsyevx(jobz, range, uplo, n, a, lda, vl, vu, il, iu, abstol, m, w, z, ldz, work, lwork, iwork, ifail, info)
```

```
call syevx(a, w [,uplo] [,z] [,vl] [,vu] [,il] [,iu] [,m] [,ifail] [,abstol] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes selected eigenvalues and, optionally, eigenvectors of a real symmetric matrix *A*. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Note that for most cases of real symmetric eigenvalue problems the default choice should be syevr function as its underlying algorithm is faster and uses less workspace. ?syevx is faster for a few selected eigenvalues.

Input Parameters

jobz

CHARACTER*1. Must be 'N' or 'V'.

If *jobz* = 'N', then only eigenvalues are computed.

If *jobz* = 'V', then eigenvalues and eigenvectors are computed.

range

CHARACTER*1. Must be 'A', 'V', or 'I'.

If *range* = 'A', all eigenvalues will be found.

If *range* = 'V', all eigenvalues in the half-open interval (*vl*, *vu*] will be found.

If *range* = 'I', the eigenvalues with indices *il* through *iu* will be found.

uplo

CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', *a* stores the upper triangular part of *A*.

If *uplo* = 'L', *a* stores the lower triangular part of *A*.

n

INTEGER. The order of the matrix *A* ($n \geq 0$).

a, *work*

REAL for ssyevx

DOUBLE PRECISION for dsyevx.

Arrays:

a(*lda*,*) is an array containing either upper or lower triangular part of the symmetric matrix *A*, as specified by *uplo*.

The second dimension of *a* must be at least max(1, *n*).

work is a workspace array, its dimension `max(1, lwork)`.

lda — `INTEGER`. The leading dimension of the array *a*. Must be at least max(1, *n*) .

vl, *vu* — `REAL` for `ssyevx`

`DOUBLE PRECISION` for `dsyevx`.

If `range = 'V'`, the lower and upper bounds of the interval to be searched for eigenvalues; *vl*≤*vu*. Not referenced if `range = 'A'` or `'I'`.

il, *iu* — `INTEGER`.

If `range = 'I'`, the indices of the smallest and largest eigenvalues to be returned.

Constraints: `1 ≤il≤iu≤n`, if `n > 0`;

`il = 1` and `iu = 0`, if `n = 0`.

Not referenced if `range = 'A'` or `'V'`.

abstol — `REAL` for `ssyevx`

`DOUBLE PRECISION` for `dsyevx`.

The absolute error tolerance for the eigenvalues. See *Application Notes* for more information.

ldz — `INTEGER`. The leading dimension of the output array *z*; `ldz≥ 1`.

If `jobz = 'V'`, then `ldz≥ max(1, n)` .

lwork — `INTEGER`.

The dimension of the array *work*.

If `n≤ 1` then `lwork≥ 1`, otherwise `lwork=8*n`.

If `lwork = -1`, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

iwork — `INTEGER`. Workspace array, size at least max(1, 5*n*).

Output Parameters

a — On exit, the lower triangle (if `uplo = 'L'`) or the upper triangle (if `uplo = 'U'`) of *A*, including the diagonal, is overwritten.

m — `INTEGER`. The total number of eigenvalues found;

`0 ≤m≤n`.

If `range = 'A'`, `m = n`, and if `range = 'I'`, `m = iu-il+1`.

w — `REAL` for `ssyevx`

`DOUBLE PRECISION` for `dsyevx`

Array, size at least max(1, *n*). The first *m* elements contain the selected eigenvalues of the matrix *A* in ascending order.

z

`REAL` for `ssyevx`

`DOUBLE PRECISION` for `dsyevx`.

Array *z*(*ldz*,*) contains eigenvectors.

The second dimension of *z* must be at least max(1, *m*).

If *jobz* = `'V'`, then if *info* = `0`, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *A* corresponding to the selected eigenvalues, with the i-th column of *z* holding the eigenvector associated with *w*(i).

If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*.

If *jobz* = `'N'`, then *z* is not referenced.

Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = `'V'`, the exact value of *m* is not known in advance and an upper bound must be used.

work(1)

On exit, if *lwork* > `0`, then *work*(1) returns the required minimal size of *lwork*.

ifail

`INTEGER`.

Array, size at least max(1, *n*).

If *jobz* = `'V'`, then if *info* = `0`, the first *m* elements of *ifail* are zero; if *info* > `0`, then *ifail* contains the indices of the eigenvectors that failed to converge.

If *jobz* = `'V'`, then *ifail* is not referenced.

info

`INTEGER`.

If *info* = `0`, the execution is successful.

If *info* = `-i`, the *i*-th parameter had an illegal value.

If *info* = *i*, then *i* eigenvectors failed to converge; their indices are stored in the array *ifail*.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `syevx` interface are the following:

a

Holds the matrix *A* of size (*n*, *n*).

w

Holds the vector of length *n*.

a

Holds the matrix *A* of size (*m*, *n*).

ifail

Holds the vector of length *n*.

uplo	Must be 'U' or 'L'. The default value is 'U'.
vl	Default value for this element is *vl* = -HUGE(*vl*).
vu	Default value for this element is *vu* = HUGE(*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this element is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted Note that there will be an error condition if *ifail* is present and *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

For optimum performance use *lwork*≥ (*nb*+3)*n, where *nb* is the maximum of the blocksize for ?sytrd and ?ormtr returned by ilaenv.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If *lwork* has any of admissible sizes, which is no less than the minimal value described, then the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array *work*. This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a,b] of width less than or equal to *abstol*+ε*max(|a|,|b|), where ε is the machine precision.

If *abstol* is less than or equal to zero, then ε*||*T*|| is used as tolerance, where ||*T*|| is the 1-norm of the tridiagonal matrix obtained by reducing *A* to tridiagonal form. Eigenvalues are computed most accurately when *abstol* is set to twice the underflow threshold 2*?lamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, try setting *abstol* to 2*?lamch('S').

?heevx
Computes selected eigenvalues and, optionally, eigenvectors of a Hermitian matrix.

Syntax

```
call cheevx(jobz, range, uplo, n, a, lda, vl, vu, il, iu, abstol, m, w, z, ldz, work,
lwork, rwork, iwork, ifail, info)
```

```
call zheevx(jobz, range, uplo, n, a, lda, vl, vu, il, iu, abstol, m, w, z, ldz, work,
lwork, rwork, iwork, ifail, info)
```

```
call heevx(a, w [,uplo] [,z] [,vl] [,vu] [,il] [,iu] [,m] [,ifail] [,abstol] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes selected eigenvalues and, optionally, eigenvectors of a complex Hermitian matrix *A*. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Note that for most cases of complex Hermetian eigenvalue problems the default choice should be heevr function as its underlying algorithm is faster and uses less workspace. ?heevx is faster for a few selected eigenvalues.

Input Parameters

jobz

CHARACTER*1. Must be 'N' or 'V'.

If *jobz* = 'N', then only eigenvalues are computed.

If *jobz* = 'V', then eigenvalues and eigenvectors are computed.

range

CHARACTER*1. Must be 'A', 'V', or 'I'.

If *range* = 'A', all eigenvalues will be found.

If *range* = 'V', all eigenvalues in the half-open interval (*vl*, *vu*] will be found.

If *range* = 'I', the eigenvalues with indices *il* through *iu* will be found.

uplo

CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', *a* stores the upper triangular part of *A*.

If *uplo* = 'L', *a* stores the lower triangular part of *A*.

n

INTEGER. The order of the matrix *A* ($n \geq 0$).

a, *work*

COMPLEX for cheevx

DOUBLE COMPLEX for zheevx.

Arrays:

a(*lda*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *A*, as specified by *uplo*.

The second dimension of *a* must be at least max(1, *n*).

work is a workspace array, its dimension max(1, *lwork*).

lda

INTEGER. The leading dimension of the array *a*. Must be at least max(1, *n*).

vl, *vu*

REAL for cheevx

DOUBLE PRECISION for zheevx.

If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues; *vl*≤*vu*. Not referenced if *range* = 'A'or 'I'.

il, *iu*

INTEGER.

If *range* = 'I', the indices of the smallest and largest eigenvalues to be returned. Constraints:

1 ≤*il*≤*iu*≤*n*, if *n* > 0;*il* = 1 and *iu* = 0, if *n* = 0. Not referenced if *range* = 'A'or 'V'.

abstol

REAL for cheevx

DOUBLE PRECISION for zheevx. The absolute error tolerance for the eigenvalues. See *Application Notes* for more information.

ldz

INTEGER. The leading dimension of the output array *z*; *ldz*≥ 1.

If *jobz* = 'V', then *ldz*≥max(1, *n*).

lwork

INTEGER.

The dimension of the array *work*.

lwork≥ 1 if *n*≤1; otherwise at least 2**n*.

If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

rwork

REAL for cheevx

DOUBLE PRECISION for zheevx.

Workspace array, size at least max(1, 7*n*).

iwork

INTEGER. Workspace array, size at least max(1, 5*n*).

Output Parameters

a

On exit, the lower triangle (if *uplo* = 'L') or the upper triangle (if *uplo* = 'U') of *A*, including the diagonal, is overwritten.

m

INTEGER. The total number of eigenvalues found; 0 ≤*m*≤*n*.

If *range* = 'A', *m* = *n*, and if *range* = 'I', *m* = *iu*-*il*+*1*.

w

REAL for cheevx

DOUBLE PRECISION for zheevx

Array, size max(1, *n*). The first *m* elements contain the selected eigenvalues of the matrix *A* in ascending order.

z

COMPLEX for cheevx

DOUBLE COMPLEX for zheevx.

Array *z*(*ldz*,*) contains eigenvectors.

The second dimension of *z* must be at least max(1, *m*).

If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *A* corresponding to the selected eigenvalues, with the i-th column of *z* holding the eigenvector associated with *w*(i).

If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*.

If *jobz* = 'N', then *z* is not referenced. Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.

work(1) On exit, if *lwork* > 0, then *work(1)* returns the required minimal size of *lwork*.

ifail INTEGER.

Array, size at least max(1, *n*).

If *jobz* = 'V', then if *info* = 0, the first *m* elements of *ifail* are zero; if *info* > 0, then *ifail* contains the indices of the eigenvectors that failed to converge.

If *jobz* = 'V', then *ifail* is not referenced.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, then *i* eigenvectors failed to converge; their indices are stored in the array *ifail*.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine heevx interface are the following:

a Holds the matrix *A* of size (*n*, *n*).

w Holds the vector of length *n*.

z Holds the matrix *Z* of size (*n*, *n*).

ifail Holds the vector of length *n*.

uplo Must be 'U' or 'L'. The default value is 'U'.

vl Default value for this element is *vl* = -HUGE(*vl*).

vu Default value for this element is *vu* = HUGE(*vl*).

il Default value for this argument is *il* = 1.

iu Default value for this argument is *iu* = *n*.

abstol	Default value for this element is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted Note that there will be an error condition if *ifail* is present and *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

For optimum performance use *lwork*≥ (*nb*+1)*n, where *nb* is the maximum of the blocksize for ?hetrd and ?unmtr returned by ilaenv.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a,b] of width less than or equal to *abstol*+ε*max(|a|,|b|), where ε is the machine precision.

If *abstol* is less than or equal to zero, then ε*||*T*|| will be used in its place, where ||*T*|| is the 1-norm of the tridiagonal matrix obtained by reducing *A* to tridiagonal form. Eigenvalues will be computed most accurately when *abstol* is set to twice the underflow threshold 2*?lamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, try setting *abstol* to 2*?lamch('S').

?syevr
Computes selected eigenvalues and, optionally, eigenvectors of a real symmetric matrix using the Relatively Robust Representations.

Syntax

```
call ssyevr(jobz, range, uplo, n, a, lda, vl, vu, il, iu, abstol, m, w, z, ldz, isuppz, work, lwork, iwork, liwork, info)
```

```
call dsyevr(jobz, range, uplo, n, a, lda, vl, vu, il, iu, abstol, m, w, z, ldz, isuppz, work, lwork, iwork, liwork, info)
```

```
call syevr(a, w [,uplo] [,z] [,vl] [,vu] [,il] [,iu] [,m] [,isuppz] [,abstol] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes selected eigenvalues and, optionally, eigenvectors of a real symmetric matrix *A*. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

The routine first reduces the matrix *A* to tridiagonal form *T*. Then, whenever possible, `?syevr` calls stemr to compute the eigenspectrum using Relatively Robust Representations. stemr computes eigenvalues by the *dqds* algorithm, while orthogonal eigenvectors are computed from various "good" $L*D*L^T$ representations (also known as Relatively Robust Representations). Gram-Schmidt orthogonalization is avoided as far as possible. More specifically, the various steps of the algorithm are as follows. For the each unreduced block of *T*:

a. Compute $T - \sigma*I = L*D*L^T$, so that *L* and *D* define all the wanted eigenvalues to high relative accuracy. This means that small relative changes in the entries of *D* and *L* cause only small relative changes in the eigenvalues and eigenvectors. The standard (unfactored) representation of the tridiagonal matrix *T* does not have this property in general.

b. Compute the eigenvalues to suitable accuracy. If the eigenvectors are desired, the algorithm attains full accuracy of the computed eigenvalues only right before the corresponding vectors have to be computed, see Steps c) and d).

c. For each cluster of close eigenvalues, select a new shift close to the cluster, find a new factorization, and refine the shifted eigenvalues to suitable accuracy.

d. For each eigenvalue with a large enough relative separation, compute the corresponding eigenvector by forming a rank revealing twisted factorization. Go back to Step c) for any clusters that remain.

The desired accuracy of the output can be specified by the input parameter *abstol*.

The routine `?syevr` calls stemr when the full spectrum is requested on machines that conform to the IEEE-754 floating point standard. `?syevr` calls stebz and stein on non-IEEE machines and when partial spectrum requests are made.

Normal execution of `?dsyevr` may create NaNs and infinities and may abort due to a floating point exception in environments that do not handle NaNs and infinities in the IEEE standard default manner.

Note that `?syevr` is preferable for most cases of real symmetric eigenvalue problems as its underlying algorithm is fast and uses less workspace.

Input Parameters

jobz

`CHARACTER*1`. Must be `'N'` or `'V'`.

If *jobz* = `'N'`, then only eigenvalues are computed.

If *jobz* = `'V'`, then eigenvalues and eigenvectors are computed.

range

`CHARACTER*1`. Must be `'A'` or `'V'` or `'I'`.

If *range* = `'A'`, the routine computes all eigenvalues.

If *range* = `'V'`, the routine computes eigenvalues *w*(*i*) in the half-open interval:

vl < *w*(*i*)≤*vu*.

If *range* = `'I'`, the routine computes eigenvalues with indices *il* to *iu*.

For *range* = `'V'`or `'I'` and *iu*-*il* < *n*-1, sstebz/dstebz and sstein/dstein are called.

uplo

`CHARACTER*1`. Must be `'U'` or `'L'`.

If *uplo* = 'U', *a* stores the upper triangular part of *A*.

If *uplo* = 'L', *a* stores the lower triangular part of *A*.

n — INTEGER. The order of the matrix *A* (*n* ≥ 0).

a, *work* — REAL for ssyevr

DOUBLE PRECISION for dsyevr.

Arrays:

a(*lda*,*) is an array containing either upper or lower triangular part of the symmetric matrix *A*, as specified by *uplo*.

The second dimension of *a* must be at least max(1, *n*).

work is a workspace array, its dimension max(1, *lwork*).

lda — INTEGER. The leading dimension of the array *a*. Must be at least max(1, *n*).

vl, *vu* — REAL for ssyevr

DOUBLE PRECISION for dsyevr.

If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.

Constraint: *vl* < *vu*.

If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, *iu* — INTEGER.

If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.

Constraint:

1 ≤ *il* ≤ *iu* ≤ *n*, if *n* > 0;

il = 1 and *iu* = 0, if *n* = 0.

If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol — REAL for ssyevr

DOUBLE PRECISION for dsyevr. The absolute error tolerance to which each eigenvalue/eigenvector is required.

If *jobz* = 'V', the eigenvalues and eigenvectors output have residual norms bounded by *abstol*, and the dot products between different eigenvectors are bounded by *abstol*.

If *abstol* < *n* *eps*||*T*||, then *n* *eps*||*T*|| is used instead, where eps is the machine precision, and ||*T*|| is the 1-norm of the matrix *T*. The eigenvalues are computed to an accuracy of eps*||*T*|| irrespective of *abstol*.

If high relative accuracy is important, set *abstol* to ?lamch('S').

ldz — INTEGER. The leading dimension of the output array *z*.

Constraints:

ldz ≥ 1 if *jobz* = 'N' and

ldz ≥ max(1, *n*) if *jobz* = 'V'.

lwork INTEGER.

The dimension of the array *work*.

Constraint: *lwork* ≥ max(1, 26*n*).

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

iwork INTEGER. Workspace array, its dimension max(1, *liwork*).

liwork INTEGER.

The dimension of the array *iwork*, *lwork* ≥ max(1, 10*n*).

If *liwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *iwork* array, returns this value as the first entry of the *iwork* array, and no error message related to *liwork* is issued by xerbla.

Output Parameters

a On exit, the lower triangle (if *uplo* = 'L') or the upper triangle (if *uplo* = 'U') of *A*, including the diagonal, is overwritten.

m INTEGER. The total number of eigenvalues found, 0 ≤ *m* ≤ *n*.

If *range* = 'A', *m* = *n*, if *range* = 'I', *m* = *iu*-*il*+1, and if *range* = 'V' the exact value of *m* is not known in advance.

w, *z* REAL for ssyevr

DOUBLE PRECISION for dsyevr.

Arrays:

w(*), size at least max(1, *n*), contains the selected eigenvalues in ascending order, stored in *w*(1) to *w*(*m*);

z(*ldz*,*), the second dimension of *z* must be at least max(1, *m*).

If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *A* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*).

If *jobz* = 'N', then *z* is not referenced. Note that you must ensure that at least max(1, *m*) columns are supplied in the array *z* ; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.

isuppz INTEGER.

Array, size at least 2 *max(1, *m*).

	The support of the eigenvectors in *z*, i.e., the indices indicating the nonzero elements in *z*. The *i*-th eigenvector is nonzero only in elements *isuppz*(2*i*-1) through *isuppz*(2*i*). Referenced only if eigenvectors are needed (*jobz* = 'V') and all eigenvalues are needed, that is, *range* = 'A' or *range* = 'I' and *il* = 1 and *iu* = *n*.
work(1)	On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.
iwork(1)	On exit, if *info* = 0, then *iwork(1)* returns the required minimal size of *liwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, an internal error has occurred.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine syevr interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
w	Holds the vector of length *n*.
z	Holds the matrix *Z* of size (*n*, *n*), where the values *n* and *m* are significant.
isuppz	Holds the vector of length (2**m*), where the values (2**m*) are significant.
uplo	Must be 'U' or 'L'. The default value is 'U'.
vl	Default value for this element is *vl* = -HUGE(*vl*).
vu	Default value for this element is *vu* = HUGE(*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this element is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted Note that there will be an error condition if *isuppz* is present and *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

For optimum performance use *lwork*≥ (*nb*+6)**n*, where *nb* is the maximum of the blocksize for ?sytrd and ?ormtr returned by ilaenv.

If it is not clear how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run or set *lwork* = -1 (*liwork* = -1).

If *lwork* (or *liwork*) has any of admissible sizes, which is no less than the minimal value described, then the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If *lwork* = -1 (*liwork* = -1), then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if *lwork* (*liwork*) is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?heevr
Computes selected eigenvalues and, optionally, eigenvectors of a Hermitian matrix using the Relatively Robust Representations.

Syntax

call cheevr(*jobz*, *range*, *uplo*, *n*, *a*, *lda*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *w*, *z*, *ldz*, *isuppz*, *work*, *lwork*, *rwork*, *lrwork*, *iwork*, *liwork*, *info*)

call zheevr(*jobz*, *range*, *uplo*, *n*, *a*, *lda*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *w*, *z*, *ldz*, *isuppz*, *work*, *lwork*, *rwork*, *lrwork*, *iwork*, *liwork*, *info*)

call heevr(*a*, *w* [,*uplo*] [,*z*] [,*vl*] [,*vu*] [,*il*] [,*iu*] [,*m*] [,*isuppz*] [,*abstol*] [,*info*])

Include Files

Description

The routine computes selected eigenvalues and, optionally, eigenvectors of a complex Hermitian matrix *A*. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

The routine first reduces the matrix *A* to tridiagonal form *T* with a call to hetrd. Then, whenever possible, ?heevr calls stegr to compute the eigenspectrum using Relatively Robust Representations. ?stegr computes eigenvalues by the *dqds* algorithm, while orthogonal eigenvectors are computed from various "good" $L*D*L^T$ representations (also known as Relatively Robust Representations). Gram-Schmidt orthogonalization is avoided as far as possible. More specifically, the various steps of the algorithm are as follows. For each unreduced block (submatrix) of *T*:

a. Compute $T - \sigma*I = L*D*L^T$, so that *L* and *D* define all the wanted eigenvalues to high relative accuracy. This means that small relative changes in the entries of *D* and *L* cause only small relative changes in the eigenvalues and eigenvectors. The standard (unfactored) representation of the tridiagonal matrix *T* does not have this property in general.

b. Compute the eigenvalues to suitable accuracy. If the eigenvectors are desired, the algorithm attains full accuracy of the computed eigenvalues only right before the corresponding vectors have to be computed, see Steps c) and d).

c. For each cluster of close eigenvalues, select a new shift close to the cluster, find a new factorization, and refine the shifted eigenvalues to suitable accuracy.

d. For each eigenvalue with a large enough relative separation, compute the corresponding eigenvector by forming a rank revealing twisted factorization. Go back to Step c) for any clusters that remain.

The desired accuracy of the output can be specified by the input parameter *abstol*.

The routine `?heevr` calls stemr when the full spectrum is requested on machines which conform to the IEEE-754 floating point standard, or stebz and stein on non-IEEE machines and when partial spectrum requests are made.

Note that the routine `?heevr` is preferable for most cases of complex Hermitian eigenvalue problems as its underlying algorithm is fast and uses less workspace.

Input Parameters

jobz

`CHARACTER*1`. Must be `'N'` or `'V'`.

If *job* = `'N'`, then only eigenvalues are computed.

If *job* = `'V'`, then eigenvalues and eigenvectors are computed.

range

`CHARACTER*1`. Must be `'A'` or `'V'` or `'I'`.

If *range* = `'A'`, the routine computes all eigenvalues.

If *range* = `'V'`, the routine computes eigenvalues *lambda*`(i)` in the half-open interval: *vl*< *lambda*`(i)`≤*vu*.

If *range* = `'I'`, the routine computes eigenvalues with indices *il* to *iu*.

For *range* = `'V'`or `'I'`, `sstebz`/`dstebz` and `cstein`/`zstein` are called.

uplo

`CHARACTER*1`. Must be `'U'` or `'L'`.

If *uplo* = `'U'`, *a* stores the upper triangular part of *A*.

If *uplo* = `'L'`, *a* stores the lower triangular part of *A*.

n

`INTEGER`. The order of the matrix *A* (*n*≥ `0`).

a, *work*

`COMPLEX` for `cheevr`

`DOUBLE COMPLEX` for `zheevr`.

Arrays:

a(*lda*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *A*, as specified by *uplo*.

The second dimension of *a* must be at least max(1, *n*).

work is a workspace array, its dimension `max(1, lwork)`.

lda

`INTEGER`. The leading dimension of the array *a*.

Must be at least max(1, *n*).

vl, *vu*

`REAL` for `cheevr`

`DOUBLE PRECISION` for `zheevr`.

If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.

Constraint: *vl*< *vu*.

If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, *iu*

INTEGER.

If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.

Constraint: 1 ≤*il*≤*iu*≤*n*, if *n* > 0; *il*=1 and *iu*=0 if *n* = 0.

If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol

REAL for cheevr

DOUBLE PRECISION for zheevr.

The absolute error tolerance to which each eigenvalue/eigenvector is required.

If *jobz* = 'V', the eigenvalues and eigenvectors output have residual norms bounded by *abstol*, and the dot products between different eigenvectors are bounded by *abstol*.

If *abstol* < *n* *eps*||*T*||, then *n* *eps*||*T*|| is used instead, where eps is the machine precision, and ||*T*|| is the 1-norm of the matrix *T*. The eigenvalues are computed to an accuracy of eps*||*T*|| irrespective of *abstol*.

If high relative accuracy is important, set *abstol* to ?lamch('S').

ldz

INTEGER. The leading dimension of the output array *z*. Constraints:

ldz≥ 1 if *jobz* = 'N';

ldz≥ max(1, *n*) if *jobz* = 'V'.

lwork

INTEGER.

The dimension of the array *work*.

Constraint: *lwork*≥ max(1, 2*n*).

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

rwork

REAL for cheevr

DOUBLE PRECISION for zheevr.

Workspace array, size max(1, *lwork*).

lrwork

INTEGER.

The dimension of the array *rwork*;

lwork≥ max(1, 24*n*).

If *lrwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla.

iwork INTEGER. Workspace array, its dimension max(1, *liwork*).

liwork INTEGER.

The dimension of the array *iwork*,

lwork≥ max(1, 10*n*).

If *liwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla.

Output Parameters

a On exit, the lower triangle (if *uplo* = 'L') or the upper triangle (if *uplo* = 'U') of *A*, including the diagonal, is overwritten.

m INTEGER. The total number of eigenvalues found,

0 ≤*m*≤*n*.

If *range* = 'A', *m* = *n*, if *range* = 'I', *m* = *iu*-*il*+1, and if *range* = 'V' the exact value of *m* is not known in advance.

w REAL for cheevr

DOUBLE PRECISION for zheevr.

Array, size at least max(1, *n*), contains the selected eigenvalues in ascending order, stored in *w*(1) to *w*(*m*).

z COMPLEX for cheevr

DOUBLE COMPLEX for zheevr.

Array *z*(*ldz*,*), the second dimension of *z* must be at least max(1, *m*).

If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *A* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*).

If *jobz* = 'N', then *z* is not referenced.

Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.

isuppz INTEGER.

Array, size at least 2 *max(1, *m*).

	The support of the eigenvectors in *z*, i.e., the indices indicating the nonzero elements in *z*. The *i*-th eigenvector is nonzero only in elements *isuppz*(2*i*-1) through *isuppz*(2*i*). Referenced only if eigenvectors are needed (*jobz* = 'V') and all eigenvalues are needed, that is, *range* = 'A' or *range* = 'I' and *il* = 1 and *iu* = *n*.
work(1)	On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.
rwork(1)	On exit, if *info* = 0, then *rwork(1)* returns the required minimal size of *lrwork*.
iwork(1)	On exit, if *info* = 0, then *iwork(1)* returns the required minimal size of *liwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, an internal error has occurred.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine heevr interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
w	Holds the vector of length *n*.
z	Holds the matrix *Z* of size (*n*, *n*), where the values *n* and *m* are significant.
isuppz	Holds the vector of length (2**n*), where the values (2**m*) are significant.
uplo	Must be 'U' or 'L'. The default value is 'U'.
vl	Default value for this element is *vl* = -HUGE(*vl*).
vu	Default value for this element is *vu* = HUGE(*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this element is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted Note that there will be an error condition if *isuppz* is present and *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

For optimum performance use *lwork*≥ (*nb*+1)***n*, where *nb* is the maximum of the blocksize for ?hetrd and ?unmtr returned by ilaenv.

If you are in doubt how much workspace to supply, use a generous value of *lwork* (or *lrwork*, or *liwork*) for the first run or set *lwork* = -1 (*lrwork* = -1, *liwork* = -1).

If you choose the first option and set any of admissible *lwork* (or *lrwork*, *liwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *rwork*, *iwork*) on exit. Use this value (*work*(1), *rwork*(1), *iwork*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *rwork*, *iwork*). This operation is called a workspace query.

Note that if you set *lwork* (*lrwork*, *liwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

Normal execution of ?stemr may create NaNs and infinities and hence may abort due to a floating point exception in environments which do not handle NaNs and infinities in the IEEE standard default manner.

?spev
Computes all eigenvalues and, optionally, eigenvectors of a real symmetric matrix in packed storage.

Syntax

```
call sspev(jobz, uplo, n, ap, w, z, ldz, work, info)
call dspev(jobz, uplo, n, ap, w, z, ldz, work, info)
call spev(ap, w [,uplo] [,z] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix *A* in packed storage.

Input Parameters

jobz — CHARACTER*1. Must be 'N' or 'V'.

If *job* = 'N', then only eigenvalues are computed.

If *job* = 'V', then eigenvalues and eigenvectors are computed.

uplo — CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', *ap* stores the packed upper triangular part of *A*.

If *uplo* = 'L', *ap* stores the packed lower triangular part of *A*.

n — INTEGER. The order of the matrix *A* (*n* ≥ 0).

ap, *work* — REAL for sspev

DOUBLE PRECISION for dspev

Arrays:

Array *ap*(*) contains the packed upper or lower triangle of symmetric matrix *A*, as specified by *uplo*.

The size of *ap* must be at least max(1, *n**(*n*+1)/2).

work(*) is a workspace array, size at least max(1, 3*n*).

ldz — INTEGER. The leading dimension of the output array *z*. Constraints:

if *jobz* = 'N', then *ldz* ≥ 1;

if *jobz* = 'V', then *ldz* ≥ max(1, *n*).

Output Parameters

w, *z* — REAL for sspev

DOUBLE PRECISION for dspev

Arrays:

w(*), size at least max(1, *n*).

If *info* = 0, *w* contains the eigenvalues of the matrix *A* in ascending order.

z(*ldz*,*). The second dimension of *z* must be at least max(1, *n*).

If *jobz* = 'V', then if *info* = 0, *z* contains the orthonormal eigenvectors of the matrix *A*, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*).

If *jobz* = 'N', then *z* is not referenced.

ap — On exit, this array is overwritten by the values generated during the reduction to tridiagonal form. The elements of the diagonal and the off-diagonal of the tridiagonal matrix overwrite the corresponding elements of *A*.

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, then the algorithm failed to converge; *i* indicates the number of elements of an intermediate tridiagonal form which did not converge to zero.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `spev` interface are the following:

ap	Holds the array *A* of size (*n*(n+1)/2*).
w	Holds the vector with the number of elements *n*.
z	Holds the matrix *Z* of size (*n*, *n*).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = `'V'`, if *z* is present, *jobz* = `'N'`, if *z* is omitted.

?hpev
Computes all eigenvalues and, optionally, eigenvectors of a Hermitian matrix in packed storage.

Syntax

```
call chpev(jobz, uplo, n, ap, w, z, ldz, work, rwork, info)
call zhpev(jobz, uplo, n, ap, w, z, ldz, work, rwork, info)
call hpev(ap, w [,uplo] [,z] [,info])
```

Include Files

Description

The routine computes all the eigenvalues and, optionally, eigenvectors of a complex Hermitian matrix *A* in packed storage.

Input Parameters

jobz	`CHARACTER*1`. Must be `'N'` or `'V'`. If *job* = `'N'`, then only eigenvalues are computed. If *job* = `'V'`, then eigenvalues and eigenvectors are computed.
uplo	`CHARACTER*1`. Must be `'U'` or `'L'`. If *uplo* = `'U'`, *ap* stores the packed upper triangular part of *A*. If *uplo* = `'L'`, *ap* stores the packed lower triangular part of *A*.
n	`INTEGER`. The order of the matrix *A* (*n* ≥ 0).
ap	`COMPLEX` for `chpev` `DOUBLE COMPLEX` for `zhpev`.

Array *ap*(*) contains the packed upper or lower triangle of Hermitian matrix A, as specified by *uplo*.

The size of *ap* must be at least max(1, *n**(*n*+1)/2).

work

COMPLEX for chpev

DOUBLE COMPLEX for zhpev.

(*) is a workspace array, size at least max(1, 2*n*-1).

ldz

INTEGER. The leading dimension of the output array *z*.

Constraints:

if *jobz* = 'N', then *ldz*≥ 1;

if *jobz* = 'V', then *ldz*≥ max(1, *n*) .

rwork

REAL for chpev

DOUBLE PRECISION for zhpev.

Workspace array, size at least max(1, 3*n*-2).

Output Parameters

w

REAL for chpev

DOUBLE PRECISION for zhpev.

Array, size at least max(1, *n*).

If *info* = 0, *w* contains the eigenvalues of the matrix *A* in ascending order.

z

COMPLEX for chpev

DOUBLE COMPLEX for zhpev.

Array z(*ldz*,*).

The second dimension of *z* must be at least max(1, *n*).

If *jobz* = 'V', then if *info* = 0, *z* contains the orthonormal eigenvectors of the matrix *A*, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*).

If *jobz* = 'N', then *z* is not referenced.

ap

On exit, this array is overwritten by the values generated during the reduction to tridiagonal form. The elements of the diagonal and the off-diagonal of the tridiagonal matrix overwrite the corresponding elements of A.

info

INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, then the algorithm failed to converge; *i* indicates the number of elements of an intermediate tridiagonal form which did not converge to zero.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `hpev` interface are the following:

ap	Holds the array *A* of size (*n*(n+1)/2*).
w	Holds the vector with the number of elements *n*.
z	Holds the matrix *Z* of size (*n*, *n*).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = `'V'`, if *z* is present, *jobz* = `'N'`, if *z* is omitted.

?spevd

Uses divide and conquer algorithm to compute all eigenvalues and (optionally) all eigenvectors of a real symmetric matrix held in packed storage.

Syntax

```
call sspevd(jobz, uplo, n, ap, w, z, ldz, work, lwork, iwork, liwork, info)
call dspevd(jobz, uplo, n, ap, w, z, ldz, work, lwork, iwork, liwork, info)
call spevd(ap, w [,uplo] [,z] [,info])
```

Include Files

- `mkl.fi, lapack.f90`

Description

The routine computes all the eigenvalues, and optionally all the eigenvectors, of a real symmetric matrix *A* (held in packed storage). In other words, it can compute the spectral factorization of *A* as:

$A = Z*\Lambda*Z^T$.

Here Λ is a diagonal matrix whose diagonal elements are the eigenvalues λ_i, and *Z* is the orthogonal matrix whose columns are the eigenvectors z_i. Thus,

$A*z_i = \lambda_i*z_i$ for $i = 1, 2, ..., n$.

If the eigenvectors are requested, then this routine uses a divide and conquer algorithm to compute eigenvalues and eigenvectors. However, if only eigenvalues are required, then it uses the Pal-Walker-Kahan variant of the *QL* or *QR* algorithm.

Input Parameters

jobz	`CHARACTER*1`. Must be `'N'` or `'V'`. If *jobz* = `'N'`, then only eigenvalues are computed. If *jobz* = `'V'`, then eigenvalues and eigenvectors are computed.

uplo

CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', *ap* stores the packed upper triangular part of *A*.

If *uplo* = 'L', *ap* stores the packed lower triangular part of *A*.

n

INTEGER. The order of the matrix *A* ($n \geq 0$).

ap, *work*

REAL for sspevd

DOUBLE PRECISION for dspevd

Arrays:

ap(*) contains the packed upper or lower triangle of symmetric matrix *A*, as specified by *uplo*.

The dimension of *ap* must be max(1, $n*(n+1)/2$)

work is a workspace array, its dimension max(1, *lwork*).

ldz

INTEGER. The leading dimension of the output array *z*.

Constraints:

if *jobz* = 'N', then $ldz \geq 1$;

if *jobz* = 'V', then *ldz* ≥ max(1, *n*).

lwork

INTEGER.

The dimension of the array *work*.

Constraints:

if $n \leq 1$, then $lwork \geq 1$;

if *jobz* = 'N' and $n > 1$, then $lwork \geq 2*n$;

if *jobz* = 'V' and $n > 1$, then

$lwork \geq n^2 + 6*n + 1$.

If *lwork* = −1, then a workspace query is assumed; the routine only calculates the required sizes of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

iwork

INTEGER. Workspace array, its dimension max(1, *liwork*).

liwork

INTEGER.

The dimension of the array *iwork*.

Constraints:

if $n \leq 1$, then $liwork \geq 1$;

if *jobz* = 'N' and $n > 1$, then $liwork \geq 1$;

if *jobz* = 'V' and $n > 1$, then $liwork \geq 5*n+3$.

If *liwork* = -1, then a workspace query is assumed; the routine only calculates the required sizes of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

Output Parameters

w, *z*

REAL for sspevd

DOUBLE PRECISION for dspevd

Arrays:

w(*), size at least max(1, *n*).

If *info* = 0, contains the eigenvalues of the matrix *A* in ascending order. See also *info*.

z(*ldz*,*).

The second dimension of *z* must be: at least 1 if *jobz* = 'N';at least max(1, *n*) if *jobz* = 'V'.

If *jobz* = 'V', then this array is overwritten by the orthogonal matrix *Z* which contains the eigenvectors of *A*. If *jobz* = 'N', then *z* is not referenced.

ap

On exit, this array is overwritten by the values generated during the reduction to tridiagonal form. The elements of the diagonal and the off-diagonal of the tridiagonal matrix overwrite the corresponding elements of A.

work(1)

On exit, if *info* = 0, then *work*(1) returns the required *lwork*.

iwork(1)

On exit, if *info* = 0, then *iwork*(1) returns the required *liwork*.

info

INTEGER.

If *info* = 0, the execution is successful.

If *info* = *i*, then the algorithm failed to converge; *i* indicates the number of elements of an intermediate tridiagonal form which did not converge to zero.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine spevd interface are the following:

ap

Holds the array *A* of size (*n**(*n*+1)/2).

w

Holds the vector with the number of elements *n*.

z

Holds the matrix *Z* of size (*n*, *n*).

uplo

Must be 'U' or 'L'. The default value is 'U'.

jobz Restored based on the presence of the argument *z* as follows:

jobz = 'V', if *z* is present,

jobz = 'N', if *z* is omitted.

Application Notes

The computed eigenvalues and eigenvectors are exact for a matrix $A+E$ such that $||E||_2 = O(\varepsilon)*||A||_2$, where ε is the machine precision.

If it is not clear how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run or set *lwork* = -1 (*liwork* = -1).

If *lwork* (or *liwork*) has any of admissible sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If *lwork* = -1 (*liwork* = -1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if *lwork* (*liwork*) is less than the minimal required value and is not equal to -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The complex analogue of this routine is hpevd.

See also syevd for matrices held in full storage, and sbevd for banded matrices.

?hpevd

Uses divide and conquer algorithm to compute all eigenvalues and, optionally, all eigenvectors of a complex Hermitian matrix held in packed storage.

Syntax

```
call chpevd(jobz, uplo, n, ap, w, z, ldz, work, lwork, rwork, lrwork, iwork, liwork, info)
```

```
call zhpevd(jobz, uplo, n, ap, w, z, ldz, work, lwork, rwork, lrwork, iwork, liwork, info)
```

```
call hpevd(ap, w [,uplo] [,z] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes all the eigenvalues, and optionally all the eigenvectors, of a complex Hermitian matrix *A* (held in packed storage). In other words, it can compute the spectral factorization of *A* as: $A = Z*\Lambda*Z^H$.

Here Λ is a real diagonal matrix whose diagonal elements are the eigenvalues λ_i, and *Z* is the (complex) unitary matrix whose columns are the eigenvectors z_i. Thus,

$A*z_i = \lambda_i*z_i$ for $i = 1, 2, ..., n$.

If the eigenvectors are requested, then this routine uses a divide and conquer algorithm to compute eigenvalues and eigenvectors. However, if only eigenvalues are required, then it uses the Pal-Walker-Kahan variant of the *QL* or *QR* algorithm.

Input Parameters

jobz

CHARACTER*1. Must be 'N' or 'V'.

If *jobz* = 'N', then only eigenvalues are computed.

If *jobz* = 'V', then eigenvalues and eigenvectors are computed.

uplo

CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', *ap* stores the packed upper triangular part of *A*.

If *uplo* = 'L', *ap* stores the packed lower triangular part of *A*.

n

INTEGER. The order of the matrix *A* ($n \geq 0$).

ap, *work*

COMPLEX for chpevd

DOUBLE COMPLEX for zhpevd

Arrays:

ap(*) contains the packed upper or lower triangle of Hermitian matrix *A*, as specified by *uplo*.

The dimension of *ap* must be at least max(1, $n*(n+1)/2$).

work is a workspace array, its dimension max(1, *lwork*).

ldz

INTEGER. The leading dimension of the output array *z*.

Constraints:

if *jobz* = 'N', then $ldz \geq 1$;

if *jobz* = 'V', then $ldz \geq \max(1, n)$.

lwork

INTEGER.

The dimension of the array *work*.

Constraints:

if $n \leq 1$, then $lwork \geq 1$;

if *jobz* = 'N' and $n > 1$, then $lwork \geq n$;

if *jobz* = 'V' and $n > 1$, then $lwork \geq 2*n$.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

rwork

REAL for chpevd

DOUBLE PRECISION for zhpevd

Workspace array, its dimension max(1, *lrwork*).

lrwork

INTEGER.

The dimension of the array *rwork*. Constraints:

if $n \leq 1$, then $lrwork \geq 1$;

if *jobz* = 'N' and $n > 1$, then $lrwork \geq n$;

if *jobz* = 'V' and *n* > 1, then *lrwork* ≥ 2*n^2 + 5*n + 1.

If *lrwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

iwork INTEGER. Workspace array, its dimension max(1, *liwork*).

liwork INTEGER.

The dimension of the array *iwork*.

Constraints:

if *n* ≤ 1, then *liwork* ≥ 1;

if *jobz* = 'N' and *n* > 1, then *liwork* ≥ 1;

if *jobz* = 'V' and *n* > 1, then *liwork* ≥ 5*n+3.

If *liwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

Output Parameters

w REAL for chpevd

DOUBLE PRECISION for zhpevd

Array, size at least max(1, *n*).

If *info* = 0, contains the eigenvalues of the matrix *A* in ascending order. See also *info*.

z COMPLEX for chpevd

DOUBLE COMPLEX for zhpevd

Array, size (*ldz*,*).

The second dimension of *z* must be:

at least 1 if *jobz* = 'N';

at least max(1, *n*) if *jobz* = 'V'.

If *jobz* = 'V', then this array is overwritten by the unitary matrix *Z* which contains the eigenvectors of *A*.

If *jobz* = 'N', then *z* is not referenced.

ap On exit, this array is overwritten by the values generated during the reduction to tridiagonal form. The elements of the diagonal and the off-diagonal of the tridiagonal matrix overwrite the corresponding elements of A.

work(1) On exit, if *info* = 0, then *work*(1) returns the required minimal size of *lwork*.

rwork(1)	On exit, if *info* = 0, then *rwork*(1) returns the required minimal size of *lrwork*.
iwork(1)	On exit, if *info* = 0, then *iwork(1)* returns the required minimal size of *liwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = *i*, then the algorithm failed to converge; *i* indicates the number of elements of an intermediate tridiagonal form which did not converge to zero. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine hpevd interface are the following:

ap	Holds the array *A* of size (*n*(n+1)/2*).
w	Holds the vector with the number of elements *n*.
z	Holds the matrix *Z* of size (*n*, *n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted.

Application Notes

The computed eigenvalues and eigenvectors are exact for a matrix $A + E$ such that $||E||_2 = O(\varepsilon)*||A||_2$, where ε is the machine precision.

If you are in doubt how much workspace to supply, use a generous value of *lwork* (*liwork* or *lrwork*) for the first run or set *lwork* = -1 (*liwork* = -1, *lrwork* = -1).

If you choose the first option and set any of admissible *lwork* (*liwork* or *lrwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*) on exit. Use this value (*work*(1), *iwork*(1), *rwork*(1)) for subsequent runs.

If you set *lwork* = -1 (*liwork* = -1, *lrwork* = -1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*, *lrwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The real analogue of this routine is spevd.

See also heevd for matrices held in full storage, and hbevd for banded matrices.

?spevx
Computes selected eigenvalues and, optionally, eigenvectors of a real symmetric matrix in packed storage.

Syntax

```
call sspevx(jobz, range, uplo, n, ap, vl, vu, il, iu, abstol, m, w, z, ldz, work, iwork, ifail, info)

```

```
call spevx(ap, w [,uplo] [,z] [,vl] [,vu] [,il] [,iu] [,m] [,ifail] [,abstol] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes selected eigenvalues and, optionally, eigenvectors of a real symmetric matrix *A* in packed storage. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *job* = 'N', then only eigenvalues are computed. If *job* = 'V', then eigenvalues and eigenvectors are computed.
range	CHARACTER*1. Must be 'A' or 'V' or 'I'. If *range* = 'A', the routine computes all eigenvalues. If *range* = 'V', the routine computes eigenvalues *w(i)* in the half-open interval: $vl < w(i) \le vu$. If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *ap* stores the packed upper triangular part of *A*. If *uplo* = 'L', *ap* stores the packed lower triangular part of *A*.
n	INTEGER. The order of the matrix *A* ($n \ge 0$).
ap, *work*	REAL for sspevx DOUBLE PRECISION for dspevx Arrays: Array *ap*(*) contains the packed upper or lower triangle of the symmetric matrix *A*, as specified by *uplo*. The size of *ap* must be at least max(1, *n**(*n*+1)/2). *work(*)* is a workspace array, size at least max(1, 8*n*).
vl, *vu*	REAL for sspevx

DOUBLE PRECISION for dspevx

If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.

Constraint: *vl* < *vu*.

If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, *iu*

INTEGER.

If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.

Constraint: 1 ≤*il*≤*iu*≤*n*, if *n* > 0; *il*=1 and *iu*=0

if *n* = 0.

If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol

REAL for sspevx

DOUBLE PRECISION for dspevx

The absolute error tolerance to which each eigenvalue is required. See *Application notes* for details on error tolerance.

ldz

INTEGER. The leading dimension of the output array *z*.

Constraints:

if *jobz* = 'N', then *ldz*≥ 1;

if *jobz* = 'V', then *ldz*≥ max(1, *n*).

iwork

INTEGER. Workspace array, size at least max(1, 5*n*).

Output Parameters

ap

On exit, this array is overwritten by the values generated during the reduction to tridiagonal form. The elements of the diagonal and the off-diagonal of the tridiagonal matrix overwrite the corresponding elements of *A*.

m

INTEGER. The total number of eigenvalues found,

0 ≤*m*≤*n*. If *range* = 'A', *m* = *n*, if *range* = 'I', *m* = *iu*-*il*+1, and if *range* = 'V' the exact value of *m* is not known in advance..

w, *z*

REAL for sspevx

DOUBLE PRECISION for dspevx

Arrays:

w(*), size at least max(1, *n*).

If *info* = 0, contains the selected eigenvalues of the matrix *A* in ascending order.

z(*ldz*,*).

The second dimension of *z* must be at least max(1, *m*).

If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *A* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*).

If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*.

If *jobz* = 'N', then *z* is not referenced.

Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.

ifail INTEGER.

Array, size at least max(1, *n*).

If *jobz* = 'V', then if *info* = 0, the first *m* elements of *ifail* are zero; if *info* > 0, the *ifail* contains the indices the eigenvectors that failed to converge.

If *jobz* = 'N', then *ifail* is not referenced.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, then *i* eigenvectors failed to converge; their indices are stored in the array *ifail*.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine spevx interface are the following:

ap Holds the array *A* of size (*n**(*n*+1)/2).

w Holds the vector with the number of elements *n*.

z Holds the matrix *Z* of size (*n*, *n*), where the values *n* and *m* are significant.

ifail Holds the vector with the number of elements *n*.

uplo Must be 'U' or 'L'. The default value is 'U'.

vl Default value for this element is *vl* = -HUGE(*vl*).

vu Default value for this element is *vu* = HUGE(*vl*).

il Default value for this argument is *il* = 1.

iu Default value for this argument is *iu* = *n*.

abstol Default value for this element is *abstol* = 0.0_WP.

jobz Restored based on the presence of the argument *z* as follows:

jobz = 'V', if *z* is present,

jobz = 'N', if *z* is omitted

Note that there will be an error condition if *ifail* is present and *z* is omitted.

range Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows:

range = 'V', if one of or both *vl* and *vu* are present,

range = 'I', if one of or both *il* and *iu* are present,

range = 'A', if none of *vl*, *vu*, *il*, *iu* is present,

Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a,b] of width less than or equal to *abstol*+ε*max(|a|,|b|), where ε is the machine precision.

If *abstol* is less than or equal to zero, then ε*||*T*||$_1$ will be used in its place, where *T* is the tridiagonal matrix obtained by reducing *A* to tridiagonal form. Eigenvalues will be computed most accurately when *abstol* is set to twice the underflow threshold 2*?lamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, try setting *abstol* to 2*?lamch('S').

?hpevx
Computes selected eigenvalues and, optionally, eigenvectors of a Hermitian matrix in packed storage.

Syntax

```
call chpevx(jobz, range, uplo, n, ap, vl, vu, il, iu, abstol, m, w, z, ldz, work, rwork, iwork, ifail, info)
```

```
call zhpevx(jobz, range, uplo, n, ap, vl, vu, il, iu, abstol, m, w, z, ldz, work, rwork, iwork, ifail, info)
```

```
call hpevx(ap, w [,uplo] [,z] [,vl] [,vu] [,il] [,iu] [,m] [,ifail] [,abstol] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes selected eigenvalues and, optionally, eigenvectors of a complex Hermitian matrix *A* in packed storage. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Input Parameters

jobz CHARACTER*1. Must be 'N' or 'V'.

If *job* = 'N', then only eigenvalues are computed.

If *job* = 'V', then eigenvalues and eigenvectors are computed.

range CHARACTER*1. Must be 'A' or 'V' or 'I'.

If *range* = 'A', the routine computes all eigenvalues.

If *range* = 'V', the routine computes eigenvalues *w(i)* in the half-open interval: *vl*< *w(i)*≤*vu*.

If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.

uplo CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', *ap* stores the packed upper triangular part of *A*.

If *uplo* = 'L', *ap* stores the packed lower triangular part of *A*.

n INTEGER. The order of the matrix *A* (*n*≥ 0).

ap, *work* COMPLEX for chpevx

DOUBLE COMPLEX for zhpevx

Arrays:

Array *ap*(*) contains the packed upper or lower triangle of the Hermitian matrix *A*, as specified by *uplo*.

The size of *ap* must be at least max(1, *n**(*n*+1)/2).

work(*) is a workspace array, size at least max(1, 2*n*).

vl, *vu* REAL for chpevx

DOUBLE PRECISION for zhpevx

If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.

Constraint: *vl*< *vu*.

If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, *iu* INTEGER.

If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.

Constraint: 1 ≤*il*≤*iu*≤*n*, if *n* > 0; *il*=1 and *iu*=0 if *n* = 0.

If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol REAL for chpevx

DOUBLE PRECISION for zhpevx

The absolute error tolerance to which each eigenvalue is required. See *Application notes* for details on error tolerance.

ldz INTEGER. The leading dimension of the output array *z*.

Constraints:

if *jobz* = 'N', then *ldz*≥ 1;

if *jobz* = 'V', then *ldz*≥ max(1, *n*).

rwork REAL for chpevx

DOUBLE PRECISION for zhpevx

Workspace array, size at least max(1, 7*n*).

iwork INTEGER. Workspace array, size at least max(1, 5*n*).

Output Parameters

ap On exit, this array is overwritten by the values generated during the reduction to tridiagonal form. The elements of the diagonal and the off-diagonal of the tridiagonal matrix overwrite the corresponding elements of *A*.

m INTEGER. The total number of eigenvalues found, $0 \le m \le n$.

$0 \le m \le n$. If *range* = 'A', *m* = *n*, if *range* = 'I', *m* = *iu*-*il*+1, and if *range* = 'V' the exact value of *m* is not known in advance..

w REAL for chpevx

DOUBLE PRECISION for zhpevx

Array, size at least max(1, *n*).

If *info* = 0, contains the selected eigenvalues of the matrix *A* in ascending order.

z COMPLEX for chpevx

DOUBLE COMPLEX for zhpevx

Array z(*ldz*,*).

The second dimension of *z* must be at least max(1, *m*).

If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *A* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*).

If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*.

If *jobz* = 'N', then *z* is not referenced.

Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.

ifail INTEGER.

Array, size at least max(1, *n*).

If *jobz* = 'V', then if *info* = 0, the first *m* elements of *ifail* are zero; if *info* > 0, the *ifail* contains the indices the eigenvectors that failed to converge.

If *jobz* = 'N', then *ifail* is not referenced.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, then *i* eigenvectors failed to converge; their indices are stored in the array *ifail*.

LAPACK 95 Interface Notes

jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted.

?sbevd

Computes all eigenvalues and, optionally, all eigenvectors of a real symmetric band matrix using divide and conquer algorithm.

Syntax

call ssbevd(*jobz*, *uplo*, *n*, *kd*, *ab*, *ldab*, *w*, *z*, *ldz*, *work*, *lwork*, *iwork*, *liwork*, *info*)

call dsbevd(*jobz*, *uplo*, *n*, *kd*, *ab*, *ldab*, *w*, *z*, *ldz*, *work*, *lwork*, *iwork*, *liwork*, *info*)

call sbevd(*ab*, *w* [,*uplo*] [,*z*] [,*info*])

Include Files

- mkl.fi, lapack.f90

Description

The routine computes all the eigenvalues, and optionally all the eigenvectors, of a real symmetric band matrix *A*. In other words, it can compute the spectral factorization of *A* as:

$A = Z*\Lambda*Z^T$

Here Λ is a diagonal matrix whose diagonal elements are the eigenvalues λ_i, and *Z* is the orthogonal matrix whose columns are the eigenvectors z_i. Thus,

$A*z_i = \lambda_i*z_i$ for $i = 1, 2, ..., n$.

If the eigenvectors are requested, then this routine uses a divide and conquer algorithm to compute eigenvalues and eigenvectors. However, if only eigenvalues are required, then it uses the Pal-Walker-Kahan variant of the *QL* or *QR* algorithm.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then only eigenvalues are computed. If *jobz* = 'V', then eigenvalues and eigenvectors are computed.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *ab* stores the upper triangular part of *A*. If *uplo* = 'L', *ab* stores the lower triangular part of *A*.
n	INTEGER. The order of the matrix *A* (*n*≥ 0).
kd	INTEGER. The number of super- or sub-diagonals in *A* (*kd*≥ 0).
ab, *work*	REAL for ssbevd DOUBLE PRECISION for dsbevd. Arrays: *ab*(*lda*,*) is an array containing either upper or lower triangular part of the symmetric matrix *A* (as specified by *uplo*) in band storage format. The second dimension of *ab* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
ldab	INTEGER. The leading dimension of *ab*; must be at least *kd*+1.
ldz	INTEGER. The leading dimension of the output array *z*.

Constraints:

if *jobz* = 'N', then *ldz* ≥ 1;

if *jobz* = 'V', then *ldz* ≥ max(1, *n*) .

lwork INTEGER.

The dimension of the array *work*.

Constraints:

if *n* ≤ 1, then *lwork* ≥ 1;

if *jobz* = 'N' and *n* > 1, then *lwork* ≥ 2*n*;

if *jobz* = 'V' and *n* > 1, then *lwork* ≥ $2*n^2 + 5*n + 1$.

If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

iwork INTEGER. Workspace array, its dimension max(1, *liwork*).

liwork INTEGER.

The dimension of the array *iwork*. Constraints: if *n* ≤ 1, then *liwork* < 1; if *job* = 'N' and *n* > 1, then *liwork* < 1; if *job* = 'V' and *n* > 1, then *liwork* < 5*n*+3.

If *liwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

Output Parameters

w, *z* REAL for ssbevd

DOUBLE PRECISION for dsbevd

Arrays:

w(*), size at least max(1, *n*).

If *info* = 0, contains the eigenvalues of the matrix *A* in ascending order. See also *info*.

z(*ldz*,*).

The second dimension of *z* must be:

at least 1 if *job* = 'N';

at least max(1, *n*) if *job* = 'V'.

If *job* = 'V', then this array is overwritten by the orthogonal matrix *Z* which contains the eigenvectors of *A*. The *i*-th column of *Z* contains the eigenvector which corresponds to the eigenvalue *w*(*i*).

If *job* = 'N', then *z* is not referenced.

ab	On exit, this array is overwritten by the values generated during the reduction to tridiagonal form.
work(1)	On exit, if *lwork* > 0, then *work*(1) returns the required minimal size of *lwork*.
iwork(1)	On exit, if *liwork* > 0, then *iwork*(1) returns the required minimal size of *liwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = *i*, then the algorithm failed to converge; *i* indicates the number of elements of an intermediate tridiagonal form which did not converge to zero. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine sbevd interface are the following:

ab	Holds the array *A* of size (*kd*+1,*n*).
w	Holds the vector with the number of elements *n*.
z	Holds the matrix *Z* of size (*n*, *n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted.

Application Notes

The computed eigenvalues and eigenvectors are exact for a matrix $A+E$ such that $||E||_2=O(\varepsilon)*||A||_2$, where ε is the machine precision.

If it is not clear how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run or set *lwork* = -1 (*liwork* = -1).

If any of admissible *lwork* (or *liwork*) has any of admissible sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If *lwork* = -1 (*liwork* = -1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if *work* (*liwork*) is less than the minimal required value and is not equal to -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The complex analogue of this routine is hbevd.

See also syevd for matrices held in full storage, and spevd for matrices held in packed storage.

?hbevd
Computes all eigenvalues and, optionally, all eigenvectors of a complex Hermitian band matrix using divide and conquer algorithm.

Syntax

`call chbevd(jobz, uplo, n, kd, ab, ldab, w, z, ldz, work, lwork, rwork, lrwork, iwork, liwork, info)`

`call zhbevd(jobz, uplo, n, kd, ab, ldab, w, z, ldz, work, lwork, rwork, lrwork, iwork, liwork, info)`

`call hbevd(ab, w [,uplo] [,z] [,info])`

Include Files

- `mkl.fi, lapack.f90`

Description

The routine computes all the eigenvalues, and optionally all the eigenvectors, of a complex Hermitian band matrix *A*. In other words, it can compute the spectral factorization of *A* as: $A = Z*\Lambda*Z^H$.

Here Λ is a real diagonal matrix whose diagonal elements are the eigenvalues λ_i, and *Z* is the (complex) unitary matrix whose columns are the eigenvectors z_i. Thus,

$A*z_i = \lambda_i*z_i$ for $i = 1, 2, ..., n$.

If the eigenvectors are requested, then this routine uses a divide and conquer algorithm to compute eigenvalues and eigenvectors. However, if only eigenvalues are required, then it uses the Pal-Walker-Kahan variant of the *QL* or *QR* algorithm.

Input Parameters

jobz	`CHARACTER*1`. Must be `'N'` or `'V'`. If *jobz* = `'N'`, then only eigenvalues are computed. If *jobz* = `'V'`, then eigenvalues and eigenvectors are computed.
uplo	`CHARACTER*1`. Must be `'U'` or `'L'`. If *uplo* = `'U'`, *ab* stores the upper triangular part of *A*. If *uplo* = `'L'`, *ab* stores the lower triangular part of *A*.
n	`INTEGER`. The order of the matrix *A* (*n* ≥ 0).
kd	`INTEGER`. The number of super- or sub-diagonals in *A* (*kd* ≥ 0).
ab, *work*	`COMPLEX` for `chbevd` `DOUBLE COMPLEX` for `zhbevd`. Arrays: *ab*(*lda*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *A* (as specified by *uplo*) in band storage format. The second dimension of *ab* must be at least max(1, *n*).

work (*) is a workspace array, its dimension `max(1, lwork)`.

ldab `INTEGER`. The leading dimension of *ab*; must be at least *kd*+1.

ldz `INTEGER`. The leading dimension of the output array *z*.

Constraints:

if *jobz* = 'N', then *ldz* ≥ 1;

if *jobz* = 'V', then *ldz* ≥ max(1, *n*) .

lwork `INTEGER`.

The dimension of the array *work*.

Constraints:

if *n* ≤ 1, then *lwork* ≥ 1;

if *jobz* = 'N' and *n* > 1, then *lwork* ≥ *n*;

if *jobz* = 'V' and *n* > 1, then *lwork* ≥ $2*n^2$.

If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

rwork `REAL` for `chbevd`

`DOUBLE PRECISION` for `zhbevd`

Workspace array, size at least *lrwork*.

lrwork `INTEGER`.

The dimension of the array *rwork*.

Constraints:

if *n* ≤ 1, then *lrwork* ≥ 1;

if *jobz* = 'N' and *n* > 1, then *lrwork* ≥ *n*;

if *jobz* = 'V' and *n* > 1, then *lrwork* ≥ $2*n^2 + 5*n + 1$.

If *lrwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

iwork `INTEGER`. Workspace array, size `max(1, liwork)`.

liwork `INTEGER`.

The dimension of the array *iwork*.

Constraints:

if *jobz* = 'N' or *n* ≤ 1, then *liwork* ≥ 1;

if *jobz* = 'V' and *n* > 1, then *liwork* ≥ 5*n+3.

If *liwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

Output Parameters

w

REAL for chbevd

DOUBLE PRECISION for zhbevd

Array, size at least max(1, *n*).

If *info* = 0, contains the eigenvalues of the matrix *A* in ascending order. See also *info*.

z

COMPLEX for chbevd

DOUBLE COMPLEX for zhbevd

Array, size (*ldz*,*).

The second dimension of *z* must be:

at least 1 if *jobz* = 'N';

at least max(1, *n*) if *jobz* = 'V'.

If *jobz* = 'V', then this array is overwritten by the unitary matrix *Z* which contains the eigenvectors of *A*. The *i*-th column of *Z* contains the eigenvector which corresponds to the eigenvalue *w*(*i*).

If *jobz* = 'N', then *z* is not referenced.

ab

On exit, this array is overwritten by the values generated during the reduction to tridiagonal form.

work(1)

On exit, if *lwork* > 0, then the real part of *work*(1) returns the required minimal size of *lwork*.

rwork(1)

On exit, if *lrwork* > 0, then *rwork*(1) returns the required minimal size of *lrwork*.

iwork(1)

On exit, if *liwork* > 0, then *iwork*(1) returns the required minimal size of *liwork*.

info

INTEGER.

If *info* = 0, the execution is successful.

If *info* = *i*, then the algorithm failed to converge; *i* indicates the number of elements of an intermediate tridiagonal form which did not converge to zero.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `hbevd` interface are the following:

ab	Holds the array *A* of size (*kd+1,n*).
w	Holds the vector with the number of elements *n*.
z	Holds the matrix *Z* of size (*n*, *n*).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = `'V'`, if *z* is present, *jobz* = `'N'`, if *z* is omitted.

Application Notes

The computed eigenvalues and eigenvectors are exact for a matrix $A + E$ such that $||E||_2 = O(\varepsilon)||A||_2$, where ε is the machine precision.

If you are in doubt how much workspace to supply, use a generous value of *lwork* (*liwork* or *lrwork*) for the first run or set $lwork = -1$ ($liwork = -1$, $lrwork = -1$).

If you choose the first option and set any of admissible *lwork* (*liwork* or *lrwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*) on exit. Use this value (*work*(1), *iwork*(1), *rwork*(1)) for subsequent runs.

If you set $lwork = -1$ ($liwork = -1$, $lrwork = -1$), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*, *lrwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The real analogue of this routine is sbevd.

See also heevd for matrices held in full storage, and hpevd for matrices held in packed storage.

?sbevx

Computes selected eigenvalues and, optionally, eigenvectors of a real symmetric band matrix.

Syntax

```
call ssbevx(jobz, range, uplo, n, kd, ab, ldab, q, ldq, vl, vu, il, iu, abstol, m, w, z, ldz, work, iwork, ifail, info)
```

```
call dsbevx(jobz, range, uplo, n, kd, ab, ldab, q, ldq, vl, vu, il, iu, abstol, m, w, z, ldz, work, iwork, ifail, info)
```

```
call sbevx(ab, w [,uplo] [,z] [,vl] [,vu] [,il] [,iu] [,m] [,ifail] [,q] [,abstol] [,info])
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine computes selected eigenvalues and, optionally, eigenvectors of a real symmetric band matrix *A*. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Input Parameters

jobz

CHARACTER*1. Must be 'N' or 'V'.

If *jobz* = 'N', then only eigenvalues are computed.

If *jobz* = 'V', then eigenvalues and eigenvectors are computed.

range

CHARACTER*1. Must be 'A' or 'V' or 'I'.

If *range* = 'A', the routine computes all eigenvalues.

If *range* = 'V', the routine computes eigenvalues *w(i)* in the half-open interval: $vl < w(i) \le vu$.

If *range* = 'I', the routine computes eigenvalues with indices in range *il* to *iu*.

uplo

CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', *ab* stores the upper triangular part of *A*.

If *uplo* = 'L', *ab* stores the lower triangular part of *A*.

n

INTEGER. The order of the matrix *A* ($n \ge 0$).

kd

INTEGER. The number of super- or sub-diagonals in *A*

($kd \ge 0$).

ab, *work*

REAL for ssbevx

DOUBLE PRECISION for dsbevx.

Arrays:

Arrays:

Array *ab*(*lda*,*) contains either upper or lower triangular part of the symmetric matrix *A* (as specified by *uplo*) in band storage format.

The second dimension of *ab* must be at least max(1, *n*).

work (*) is a workspace array.

The dimension of *work* must be at least max(1, 7*n*).

ldab

INTEGER. The leading dimension of *ab*; must be at least *kd* +1.

vl, *vu*

REAL for ssbevx

DOUBLE PRECISION for dsbevx.

If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.

Constraint: $vl < vu$.

If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, *iu*

INTEGER.

If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.

Constraint: $1 \le il \le iu \le n$, if $n > 0$; $il=1$ and $iu=0$

if $n = 0$.

If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol

REAL for chpevx

DOUBLE PRECISION for zhpevx

The absolute error tolerance to which each eigenvalue is required. See *Application notes* for details on error tolerance.

ldq, *ldz*

INTEGER. The leading dimensions of the output arrays *q* and *z*, respectively.

Constraints:

$ldq \ge 1$, $ldz \ge 1$;

If *jobz* = 'V', then $ldq \ge \max(1, n)$ and $ldz \ge \max(1, n)$.

iwork

INTEGER. Workspace array, size at least max(1, 5*n*).

Output Parameters

q

REAL for ssbevxDOUBLE PRECISION for dsbevx.

Array, size (*ldz*,*n*).

If *jobz* = 'V', the *n*-by-*n* orthogonal matrix is used in the reduction to tridiagonal form.

If *jobz* = 'N', the array *q* is not referenced.

m

INTEGER. The total number of eigenvalues found, $0 \le m \le n$.

If *range* = 'A', $m = n$, if *range* = 'I', $m = iu-il+1$, and if *range* = 'V', the exact value of *m* is not known in advance.

w, *z*

REAL for ssbevx

DOUBLE PRECISION for dsbevx

Arrays:

w(*), size at least max(1, *n*). The first *m* elements of *w* contain the selected eigenvalues of the matrix *A* in ascending order.

z(*ldz*,*).

The second dimension of *z* must be at least max(1, *m*).

If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *A* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*).

If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*.

If *jobz* = 'N', then *z* is not referenced.

Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if `range = 'V'`, the exact value of *m* is not known in advance and an upper bound must be used.

ab — On exit, this array is overwritten by the values generated during the reduction to tridiagonal form.

If `uplo = 'U'`, the first superdiagonal and the diagonal of the tridiagonal matrix *T* are returned in rows *kd* and *kd*+1 of *ab*, and if `uplo = 'L'`, the diagonal and first subdiagonal of *T* are returned in the first two rows of *ab*.

ifail — `INTEGER`.

Array, size at least max(1, *n*).

If `jobz = 'V'`, then if `info = 0`, the first *m* elements of *ifail* are zero; if `info > 0`, the *ifail* contains the indices the eigenvectors that failed to converge.

If `jobz = 'N'`, then *ifail* is not referenced.

info — `INTEGER`.

If `info = 0`, the execution is successful.

If `info = -i`, the *i*-th parameter had an illegal value.

If `info = i`, then *i* eigenvectors failed to converge; their indices are stored in the array *ifail*.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `sbevx` interface are the following:

ab — Holds the array *A* of size (*kd*+*1*,*n*).

w — Holds the vector with the number of elements *n*.

z — Holds the matrix *Z* of size (*n*, *n*), where the values *n* and *m* are significant.

ifail — Holds the vector with the number of elements *n*.

q — Holds the matrix *Q* of size (*n*, *n*).

uplo — Must be `'U'` or `'L'`. The default value is `'U'`.

vl — Default value for this element is *vl* = `-HUGE`(*vl*).

vu — Default value for this element is *vu* = `HUGE`(*vl*).

il — Default value for this argument is `il = 1`.

iu — Default value for this argument is `iu = n`.

abstol — Default value for this element is `abstol = 0.0_WP`.

jobz — Restored based on the presence of the argument *z* as follows:

`jobz = 'V'`, if *z* is present,

jobz = 'N', if *z* is omitted

Note that there will be an error condition if either *ifail* or *q* is present and *z* is omitted.

range Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows:

range = 'V', if one of or both *vl* and *vu* are present,

range = 'I', if one of or both *il* and *iu* are present,

range = 'A', if none of *vl*, *vu*, *il*, *iu* is present,

Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a,b] of width less than or equal to *abstol*+ε*max(|a|,|b|), where ε is the machine precision.

If *abstol* is less than or equal to zero, then ε*||*T*||$_1$ is used as tolerance, where *T* is the tridiagonal matrix obtained by reducing *A* to tridiagonal form. Eigenvalues will be computed most accurately when *abstol* is set to twice the underflow threshold 2*?lamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, try setting *abstol* to 2*?lamch('S').

?hbevx

Computes selected eigenvalues and, optionally, eigenvectors of a Hermitian band matrix.

Syntax

```
call chbevx(jobz, range, uplo, n, kd, ab, ldab, q, ldq, vl, vu, il, iu, abstol, m, w, z, ldz, work, rwork, iwork, ifail, info)
```

```
call zhbevx(jobz, range, uplo, n, kd, ab, ldab, q, ldq, vl, vu, il, iu, abstol, m, w, z, ldz, work, rwork, iwork, ifail, info)
```

```
call hbevx(ab, w [,uplo] [,z] [,vl] [,vu] [,il] [,iu] [,m] [,ifail] [,q] [,abstol] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes selected eigenvalues and, optionally, eigenvectors of a complex Hermitian band matrix *A*. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Input Parameters

jobz CHARACTER*1. Must be 'N' or 'V'.

If *job* = 'N', then only eigenvalues are computed.

If *job* = 'V', then eigenvalues and eigenvectors are computed.

range CHARACTER*1. Must be 'A' or 'V' or 'I'.

If *range* = 'A', the routine computes all eigenvalues.

If *range* = 'V', the routine computes eigenvalues *w*(*i*) in the half-open interval: *vl* < *w*(*i*) ≤ *vu*.

If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.

uplo CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', *ab* stores the upper triangular part of *A*.

If *uplo* = 'L', *ab* stores the lower triangular part of *A*.

n INTEGER. The order of the matrix *A* (*n* ≥ 0).

kd INTEGER. The number of super- or sub-diagonals in *A*

(*kd* ≥ 0).

ab, *work* COMPLEX for chbevx

DOUBLE COMPLEX for zhbevx.

Arrays:

ab(*lda*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *A* (as specified by *uplo*) in band storage format.

The second dimension of *ab* must be at least max(1, *n*).

work (*) is a workspace array.

The dimension of *work* must be at least max(1, *n*).

ldab INTEGER. The leading dimension of *ab*; must be at least *kd* +1.

vl, *vu* REAL for chbevx

DOUBLE PRECISION for zhbevx.

If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.

Constraint: *vl* < *vu*.

If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, *iu* INTEGER.

If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.

Constraint: 1 ≤ *il* ≤ *iu* ≤ *n*, if *n* > 0; *il*=1 and *iu*=0 if *n* = 0.

If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol REAL for chbevx

DOUBLE PRECISION for zhbevx.

The absolute error tolerance to which each eigenvalue is required. See *Application notes* for details on error tolerance.

ldq, *ldz* INTEGER. The leading dimensions of the output arrays *q* and *z*, respectively.

Constraints:

ldq≥ 1, *ldz*≥ 1;

If *jobz* = 'V', then *ldq*≥ max(1, *n*) and *ldz*≥ max(1, *n*).

rwork

REAL for chbevx

DOUBLE PRECISION for zhbevx

Workspace array, size at least max(1, 7*n*).

iwork

INTEGER. Workspace array, size at least max(1, 5*n*).

Output Parameters

q

COMPLEX for chbevxDOUBLE COMPLEX for zhbevx.

Array, size (*ldz*,*n*).

If *jobz* = 'V', the *n*-by-*n* unitary matrix is used in the reduction to tridiagonal form.

If *jobz* = 'N', the array *q* is not referenced.

m

INTEGER. The total number of eigenvalues found,

0 ≤*m*≤*n*.

If *range* = 'A', *m* = *n*, if *range* = 'I', *m* = *iu*-*il*+1, and if *range* = 'V', the exact value of *m* is not known in advance..

w

REAL for chbevx

DOUBLE PRECISION for zhbevx

Array, size at least max(1, *n*). The first *m* elements contain the selected eigenvalues of the matrix *A* in ascending order.

z

COMPLEX for chbevx

DOUBLE COMPLEX for zhbevx.

Array z(*ldz*,*).

The second dimension of *z* must be at least max(1, *m*).

If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *A* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*).

If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*.

If *jobz* = 'N', then *z* is not referenced.

Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.

ab

On exit, this array is overwritten by the values generated during the reduction to tridiagonal form.

If *uplo* = 'U', the first superdiagonal and the diagonal of the tridiagonal matrix *T* are returned in rows *kd* and *kd*+1 of *ab*, and if *uplo* = 'L', the diagonal and first subdiagonal of *T* are returned in the first two rows of *ab*.

ifail INTEGER.

Array, size at least max(1, *n*).

If *jobz* = 'V', then if *info* = 0, the first *m* elements of *ifail* are zero; if *info* > 0, the *ifail* contains the indices of the eigenvectors that failed to converge.

If *jobz* = 'N', then *ifail* is not referenced.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = –*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, then *i* eigenvectors failed to converge; their indices are stored in the array *ifail*.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine hbevx interface are the following:

ab Holds the array *A* of size (*kd*+1,*n*).

w Holds the vector with the number of elements *n*.

z Holds the matrix *Z* of size (*n*, *n*), where the values *n* and *m* are significant.

ifail Holds the vector with the number of elements *n*.

q Holds the matrix *Q* of size (*n*, *n*).

uplo Must be 'U' or 'L'. The default value is 'U'.

vl Default value for this element is *vl* = –HUGE(*vl*).

vu Default value for this element is *vu* = HUGE(*vl*).

il Default value for this argument is *il* = 1.

iu Default value for this argument is *iu* = *n*.

abstol Default value for this element is *abstol* = 0.0_WP.

jobz Restored based on the presence of the argument *z* as follows:

jobz = 'V', if *z* is present,

jobz = 'N', if *z* is omitted

Note that there will be an error condition if either *ifail* or *q* is present and *z* is omitted.

range Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows:

range = 'V', if one of or both *vl* and *vu* are present,

range = 'I', if one of or both *il* and *iu* are present,

range = 'A', if none of *vl*, *vu*, *il*, *iu* is present,

Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a,b] of width less than or equal to *abstol* + ε * max(|a|,|b|), where ε is the machine precision.

If *abstol* is less than or equal to zero, then $\varepsilon*||T||_1$ will be used in its place, where *T* is the tridiagonal matrix obtained by reducing *A* to tridiagonal form. Eigenvalues will be computed most accurately when *abstol* is set to twice the underflow threshold 2*?lamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, try setting *abstol* to 2*?lamch('S').

?stev

Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix.

Syntax

```
call sstev(jobz, n, d, e, z, ldz, work, info)
call dstev(jobz, n, d, e, z, ldz, work, info)
call stev(d, e [,z] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix *A*.

Input Parameters

jobz

CHARACTER*1. Must be 'N' or 'V'.

If *jobz* = 'N', then only eigenvalues are computed.

If *jobz* = 'V', then eigenvalues and eigenvectors are computed.

n

INTEGER. The order of the matrix *A* ($n \geq 0$).

d, *e*, *work*

REAL for sstev

DOUBLE PRECISION for dstev.

Arrays:

Array *d*(*) contains the *n* diagonal elements of the tridiagonal matrix *A*.

The size of *d* must be at least max(1, *n*).

Array `e(*)` contains the *n*-1 subdiagonal elements of the tridiagonal matrix *A*.

The size of *e* must be at least max(1, *n*). The *n*-th element of this array is used as workspace.

work(*) is a workspace array.

The dimension of *work* must be at least max(1, 2*n*-2).

If *jobz* = 'N', *work* is not referenced.

ldz — INTEGER. The leading dimension of the output array *z*; *ldz*≥ 1. If *jobz* = 'V' then *ldz*≥ max(1, *n*).

Output Parameters

d — On exit, if *info* = 0, contains the eigenvalues of the matrix *A* in ascending order.

z — REAL for sstev

DOUBLE PRECISION for dstev

Array, size (*ldz*,*).

The second dimension of *z* must be at least max(1, *n*).

If *jobz* = 'V', then if *info* = 0, *z* contains the orthonormal eigenvectors of the matrix *A*, with the *i*-th column of *z* holding the eigenvector associated with the eigenvalue returned in *d*(*i*).

If *job* = 'N', then *z* is not referenced.

e — On exit, this array is overwritten with intermediate results.

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, then the algorithm failed to converge;

i elements of *e* did not converge to zero.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine stev interface are the following:

d — Holds the vector of length *n*.

e — Holds the vector of length *n*.

z — Holds the matrix *Z* of size (*n*, *n*).

jobz — Restored based on the presence of the argument *z* as follows:

jobz = 'V', if *z* is present,

jobz = 'N', if *z* is omitted.

?stevd
Computes all eigenvalues and, optionally, all eigenvectors of a real symmetric tridiagonal matrix using divide and conquer algorithm.

Syntax

```
call sstevd(jobz, n, d, e, z, ldz, work, lwork, iwork, liwork, info)
call dstevd(jobz, n, d, e, z, ldz, work, lwork, iwork, liwork, info)
call stevd(d, e [,z] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes all the eigenvalues, and optionally all the eigenvectors, of a real symmetric tridiagonal matrix *T*. In other words, the routine can compute the spectral factorization of *T* as: $T = Z*\Lambda*Z^T$.

Here Λ is a diagonal matrix whose diagonal elements are the eigenvalues λ_i, and *Z* is the orthogonal matrix whose columns are the eigenvectors z_i. Thus,

$T*z_i = \lambda_i*z_i$ for $i = 1, 2, ..., n$.

If the eigenvectors are requested, then this routine uses a divide and conquer algorithm to compute eigenvalues and eigenvectors. However, if only eigenvalues are required, then it uses the Pal-Walker-Kahan variant of the *QL* or *QR* algorithm.

There is no complex analogue of this routine.

Input Parameters

jobz
CHARACTER*1. Must be 'N' or 'V'.
If *jobz* = 'N', then only eigenvalues are computed.
If *jobz* = 'V', then eigenvalues and eigenvectors are computed.

n
INTEGER. The order of the matrix *T* ($n \geq 0$).

d, *e*, *work*
REAL for sstevd
DOUBLE PRECISION for dstevd.
Arrays:
d(*) contains the *n* diagonal elements of the tridiagonal matrix *T*.
The dimension of *d* must be at least max(1, *n*).
e(*) contains the *n*-1 off-diagonal elements of *T*.
The dimension of *e* must be at least max(1, *n*). The *n*-th element of this array is used as workspace.
work(*) is a workspace array.

The dimension of *work* must be at least *lwork*.

ldz INTEGER. The leading dimension of the output array *z*. Constraints:

ldz≥ 1 if *job* = 'N';

ldz≥ max(1, *n*) if *job* = 'V'.

lwork INTEGER.

The dimension of the array *work*.

Constraints:

if *jobz* = 'N' or $n \leq 1$, then *lwork* ≥ 1;

if *jobz* = 'V' and $n > 1$, then *lwork* ≥$n^2 + 4*n + 1$.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the required sizes of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

iwork INTEGER. Workspace array, its dimension max(1, *liwork*).

liwork INTEGER.

The dimension of the array *iwork*.

Constraints:

if *jobz* = 'N' or $n \leq 1$, then *liwork* ≥ 1;

if *jobz* = 'V' and $n > 1$, then *liwork* ≥ 5*n+3.

If *liwork* = -1, then a workspace query is assumed; the routine only calculates the required sizes of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

Output Parameters

d On exit, if *info* = 0, contains the eigenvalues of the matrix *T* in ascending order.

See also *info*.

z REAL for sstevd

DOUBLE PRECISION for dstevd

Array, size (*ldz*,*) .

The second dimension of *z* must be:

at least 1 if *jobz* = 'N';

at least max(1, *n*) if *jobz* = 'V'.

If *jobz* = 'V', then this array is overwritten by the orthogonal matrix *Z* which contains the eigenvectors of *T*.

If *jobz* = 'N', then *z* is not referenced.

e	On exit, this array is overwritten with intermediate results.
work(1)	On exit, if *lwork* > 0, then *work*(1) returns the required minimal size of *lwork*.
iwork(1)	On exit, if *liwork* > 0, then *iwork*(1) returns the required minimal size of *liwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = *i*, then the algorithm failed to converge; *i* indicates the number of elements of an intermediate tridiagonal form which did not converge to zero. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine stevd interface are the following:

d	Holds the vector of length *n*.
e	Holds the vector of length *n*.
z	Holds the matrix *Z* of size (*n*, *n*).
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted.

Application Notes

The computed eigenvalues and eigenvectors are exact for a matrix $T+E$ such that $||E||_2 = O(\varepsilon)*||T||_2$, where ε is the machine precision.

If λ_i is an exact eigenvalue, and μ_i is the corresponding computed value, then

$|\mu_i - \lambda_i| \leq c(n)*\varepsilon*||T||_2$

where $c(n)$ is a modestly increasing function of *n*.

If z_i is the corresponding exact eigenvector, and w_i is the corresponding computed vector, then the angle $\theta(z_i, w_i)$ between them is bounded as follows:

$\theta(z_i, w_i) \leq c(n)*\varepsilon*||T||_2 / \min_{i \neq j}|\lambda_i - \lambda_j|$.

Thus the accuracy of a computed eigenvector depends on the gap between its eigenvalue and all the other eigenvalues.

If it is not clear how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run, or set *lwork* = -1 (*liwork* = -1).

If *lwork* (or *liwork*) has any of admissible sizes, which is no less than the minimal value described, then the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If *lwork* = -1 (*liwork* = -1), then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if *lwork* (*liwork*) is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?stevx

Computes selected eigenvalues and eigenvectors of a real symmetric tridiagonal matrix.

Syntax

```
call sstevx(jobz, range, n, d, e, vl, vu, il, iu, abstol, m, w, z, ldz, work, iwork, ifail, info)
```

```
call dstevx(jobz, range, n, d, e, vl, vu, il, iu, abstol, m, w, z, ldz, work, iwork, ifail, info)
```

```
call stevx(d, e, w [, z] [,vl] [,vu] [,il] [,iu] [,m] [,ifail] [,abstol] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes selected eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix *A*. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Input Parameters

jobz

CHARACTER*1. Must be 'N' or 'V'.

If *job* = 'N', then only eigenvalues are computed.

If *job* = 'V', then eigenvalues and eigenvectors are computed.

range

CHARACTER*1. Must be 'A' or 'V' or 'I'.

If *range* = 'A', the routine computes all eigenvalues.

If *range* = 'V', the routine computes eigenvalues *w(i)* in the half-open interval: $vl < w(i) \le vu$.

If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.

n

INTEGER. The order of the matrix *A* ($n \ge 0$).

d, *e*, *work*

REAL for sstevx

DOUBLE PRECISION for dstevx.

Arrays:

d(*) contains the *n* diagonal elements of the tridiagonal matrix *A*.

The dimension of *d* must be at least max(1, *n*).

e(*) contains the *n*-1 subdiagonal elements of *A*.

The dimension of *e* must be at least max(1, *n*-1). The *n*-th element of this array is used as workspace.

work(*) is a workspace array.

The dimension of *work* must be at least max(1, 5*n*).

vl, *vu*

REAL for sstevx

DOUBLE PRECISION for dstevx.

If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.

Constraint: *vl*< *vu*.

If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, *iu*

INTEGER.

If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.

Constraint: 1 ≤*il*≤*iu*≤*n*, if *n* > 0; *il*=1 and *iu*=0 if *n* = 0.

If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol

REAL for sstevx

DOUBLE PRECISION for dstevx. The absolute error tolerance to which each eigenvalue is required. See *Application notes* for details on error tolerance.

ldz

INTEGER. The leading dimensions of the output array *z*; *ldz*≥ 1. If *jobz* = 'V', then *ldz*≥ max(1, *n*).

iwork

INTEGER. Workspace array, size at least max(1, 5*n*).

Output Parameters

m

INTEGER. The total number of eigenvalues found,

0 ≤*m*≤*n*.

If *range* = 'A', *m* = *n*, if *range* = 'I', *m* = *iu*-*il*+1, and if *range* = 'V' the exact value of *m* is unknown.

w, *z*

REAL for sstevx

DOUBLE PRECISION for dstevx.

Arrays:

w(*), size at least max(1, *n*).

The first *m* elements of *w* contain the selected eigenvalues of the matrix *A* in ascending order.

z(*ldz*,*) .

The second dimension of *z* must be at least max(1, *m*).

If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *A* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*).

If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*.

If *jobz* = 'N', then *z* is not referenced.

Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.

d, *e*

On exit, these arrays may be multiplied by a constant factor chosen to avoid overflow or underflow in computing the eigenvalues.

ifail

INTEGER.

Array, size at least max(1, *n*).

If *jobz* = 'V', then if *info* = 0, the first *m* elements of *ifail* are zero; if *info* > 0, the *ifail* contains the indices of the eigenvectors that failed to converge.

If *jobz* = 'N', then *ifail* is not referenced.

info

INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, then *i* eigenvectors failed to converge; their indices are stored in the array *ifail*.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine stevx interface are the following:

d

Holds the vector of length *n*.

e

Holds the vector of length *n*.

w

Holds the vector of length *n*.

z

Holds the matrix *Z* of size (*n*, *n*), where the values *n* and *m* are significant.

ifail

Holds the vector of length *n*.

vl

Default value for this element is *vl* = -HUGE(*vl*).

vu

Default value for this element is *vu* = HUGE(*vl*).

il

Default value for this argument is *il* = 1.

iu

Default value for this argument is *iu* = *n*.

abstol

Default value for this element is *abstol* = 0.0_WP.

jobz

Restored based on the presence of the argument *z* as follows:

jobz = 'V', if *z* is present,

jobz = 'N', if *z* is omitted

Note that there will be an error condition if *ifail* is present and *z* is omitted.

range

Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows:

range = 'V', if one of or both *vl* and *vu* are present,

range = 'I', if one of or both *il* and *iu* are present,

range = 'A', if none of *vl*, *vu*, *il*, *iu* is present,

Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a,b] of width less than or equal to *abstol*+ε*max(|a|,|b|), where ε is the machine precision.

If *abstol* is less than or equal to zero, then ε*$|A|_1$ is used instead. Eigenvalues are computed most accurately when *abstol* is set to twice the underflow threshold 2*?lamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, set *abstol* to 2*?lamch('S').

?stevr
Computes selected eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix using the Relatively Robust Representations.

Syntax

call sstevr(*jobz*, *range*, *n*, *d*, *e*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *w*, *z*, *ldz*, *isuppz*, *work*, *lwork*, *iwork*, *liwork*, *info*)

call dstevr(*jobz*, *range*, *n*, *d*, *e*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *w*, *z*, *ldz*, *isuppz*, *work*, *lwork*, *iwork*, *liwork*, *info*)

call stevr(*d*, *e*, *w* [, *z*] [,*vl*] [,*vu*] [,*il*] [,*iu*] [,*m*] [,*isuppz*] [,*abstol*] [,*info*])

Include Files

- mkl.fi, lapack.f90

Description

The routine computes selected eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix *T*. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Whenever possible, the routine calls stemr to compute the eigenspectrum using Relatively Robust Representations. stegr computes eigenvalues by the *dqds* algorithm, while orthogonal eigenvectors are computed from various "good" $L*D*L^T$ representations (also known as Relatively Robust Representations). Gram-Schmidt orthogonalization is avoided as far as possible. More specifically, the various steps of the algorithm are as follows. For the i-th unreduced block of *T*:

a. Compute $T - \sigma_i = L_i*D_i*L_i^T$, such that $L_i*D_i*L_i^T$ is a relatively robust representation.
b. Compute the eigenvalues, λ_j, of $L_i*D_i*L_i^T$ to high relative accuracy by the *dqds* algorithm.
c. If there is a cluster of close eigenvalues, "choose" σ_i close to the cluster, and go to Step (a).

d. Given the approximate eigenvalue λ_j of $L_i*D_i*L_i^T$, compute the corresponding eigenvector by forming a rank-revealing twisted factorization.

The desired accuracy of the output can be specified by the input parameter *abstol*.

The routine `?stevr` calls stemr when the full spectrum is requested on machines which conform to the IEEE-754 floating point standard. `?stevr` calls stebz and stein on non-IEEE machines and when partial spectrum requests are made.

Input Parameters

jobz

`CHARACTER*1`. Must be `'N'` or `'V'`.

If *jobz* = `'N'`, then only eigenvalues are computed.

If *jobz* = `'V'`, then eigenvalues and eigenvectors are computed.

range

`CHARACTER*1`. Must be `'A'` or `'V'` or `'I'`.

If *range* = `'A'`, the routine computes all eigenvalues.

If *range* = `'V'`, the routine computes eigenvalues *w*(*i*) in the half-open interval:

vl<*w*(*i*)≤*vu*.

If *range* = `'I'`, the routine computes eigenvalues with indices *il* to *iu*.

For *range* = `'V'` or `'I'` and *iu*-*il* < *n*–1, `sstebz`/`dstebz` and `sstein`/`dstein` are called.

n

`INTEGER`. The order of the matrix *T* (*n*≥ 0).

d, *e*, *work*

`REAL` for `sstevr`

`DOUBLE PRECISION` for `dstevr`.

Arrays:

d(*) contains the *n* diagonal elements of the tridiagonal matrix *T*.

The dimension of *d* must be at least max(1, *n*).

e(*) contains the *n*-1 subdiagonal elements of *A*.

The dimension of *e* must be at least max(1, *n*-1). The *n*-th element of this array is used as workspace.

work is a workspace array, its dimension max(1, *lwork*).

vl, *vu*

`REAL` for `sstevr`

`DOUBLE PRECISION` for `dstevr`.

If *range* = `'V'`, the lower and upper bounds of the interval to be searched for eigenvalues.

Constraint: *vl*< *vu*.

If *range* = `'A'` or `'I'`, *vl* and *vu* are not referenced.

il, *iu*

`INTEGER`.

If *range* = `'I'`, the indices in ascending order of the smallest and largest eigenvalues to be returned.

Constraint: 1 ≤*il*≤*iu*≤*n*, if *n* > 0; *il*=1 and *iu*=0 if *n* = 0.

If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol

REAL for sstevr

DOUBLE PRECISION for dstevr.

The absolute error tolerance to which each eigenvalue/eigenvector is required.

If *jobz* = 'V', the eigenvalues and eigenvectors output have residual norms bounded by *abstol*, and the dot products between different eigenvectors are bounded by *abstol*. If *abstol* < *n* *eps*||*T*||, then *n* *eps*||*T*|| will be used in its place, where eps is the machine precision, and ||*T*|| is the 1-norm of the matrix *T*. The eigenvalues are computed to an accuracy of eps*||*T*|| irrespective of *abstol*.

If high relative accuracy is important, set *abstol* to ?lamch('S').

ldz

INTEGER. The leading dimension of the output array *z*.

Constraints:

ldz≥ 1 if *jobz* = 'N';

ldz≥ max(1, *n*) if *jobz* = 'V'.

lwork

INTEGER.

The dimension of the array *work*. Constraint:

lwork≥ max(1, 20**n*).

If *lwork* = −1, then a workspace query is assumed; the routine only calculates the required sizes of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

iwork

INTEGER.

Workspace array, its dimension max(1, *liwork*).

liwork

INTEGER.

The dimension of the array *iwork*,

lwork≥ max(1, 10**n*).

If *liwork* = −1, then a workspace query is assumed; the routine only calculates the required sizes of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

Output Parameters

m

INTEGER. The total number of eigenvalues found,

0 ≤*m*≤*n*. If *range* = 'A', *m* = *n*, if *range* = 'I', *m* = *iu*−*il*+1, and if *range* = 'V' the exact value of *m* is unknown..

w, *z*

REAL for sstevr

DOUBLE PRECISION for dstevr.

Arrays:

w(*), size at least max(1, *n*).

The first *m* elements of *w* contain the selected eigenvalues of the matrix *T* in ascending order.

z(*ldz*,*).

The second dimension of *z* must be at least max(1, *m*).

If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *T* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*).

If *jobz* = 'N', then *z* is not referenced.

Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.

d, *e*

On exit, these arrays may be multiplied by a constant factor chosen to avoid overflow or underflow in computing the eigenvalues.

isuppz

INTEGER.

Array, size at least 2 *max(1, *m*).

The support of the eigenvectors in *z*, i.e., the indices indicating the nonzero elements in *z*. The *i*-th eigenvector is nonzero only in elements *isuppz*(2*i*-1) through *isuppz*(2*i*).

Implemented only for *range* = 'A' or 'I' and *iu*-*il* = *n*-1.

work(1)

On exit, if *info* = 0, then *work*(1) returns the required minimal size of *lwork*.

iwork(1)

On exit, if *info* = 0, then *iwork*(1) returns the required minimal size of *liwork*.

info

INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, an internal error has occurred.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine stevr interface are the following:

d

Holds the vector of length *n*.

e

Holds the vector of length *n*.

w

Holds the vector of length *n*.

z	Holds the matrix *Z* of size (*n*, *n*), where the values *n* and *m* are significant.
isuppz	Holds the vector of length (2**n*), where the values (2**m*) are significant.
vl	Default value for this element is *vl* = –HUGE(*vl*).
vu	Default value for this element is *vu* = HUGE(*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this element is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted Note that there will be an error condition if *ifail* is present and *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

Normal execution of the routine ?stegr may create NaNs and infinities and hence may abort due to a floating point exception in environments which do not handle NaNs and infinities in the IEEE standard default manner.

If it is not clear how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run, or set *lwork* = –1 (*liwork* = –1).

If *lwork* (or *liwork*) has any of admissible sizes, which is no less than the minimal value described, then the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If *lwork* = –1 (*liwork* = –1), then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if *lwork* (*liwork*) is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

Nonsymmetric Eigenvalue Problems: LAPACK Driver Routines

This topic describes LAPACK driver routines used for solving nonsymmetric eigenproblems. See also computational routines that can be called to solve these problems.

Table "Driver Routines for Solving Nonsymmetric Eigenproblems" lists all such driver routines for the FORTRAN 77 interface. The corresponding routine names in the Fortran 95 interface are without the first symbol.

Driver Routines for Solving Nonsymmetric Eigenproblems

Routine Name	Operation performed
gees	Computes the eigenvalues and Schur factorization of a general matrix, and orders the factorization so that selected eigenvalues are at the top left of the Schur form.
geesx	Computes the eigenvalues and Schur factorization of a general matrix, orders the factorization and computes reciprocal condition numbers.
geev	Computes the eigenvalues and left and right eigenvectors of a general matrix.
geevx	Computes the eigenvalues and left and right eigenvectors of a general matrix, with preliminary matrix balancing, and computes reciprocal condition numbers for the eigenvalues and right eigenvectors.

?gees
Computes the eigenvalues and Schur factorization of a general matrix, and orders the factorization so that selected eigenvalues are at the top left of the Schur form.

Syntax

```
call sgees(jobvs, sort, select, n, a, lda, sdim, wr, wi, vs, ldvs, work, lwork, bwork, info)
call dgees(jobvs, sort, select, n, a, lda, sdim, wr, wi, vs, ldvs, work, lwork, bwork, info)
call cgees(jobvs, sort, select, n, a, lda, sdim, w, vs, ldvs, work, lwork, rwork, bwork, info)
call zgees(jobvs, sort, select, n, a, lda, sdim, w, vs, ldvs, work, lwork, rwork, bwork, info)

call gees(a, w [,vs] [,select] [,sdim] [,info])
```

Include Files

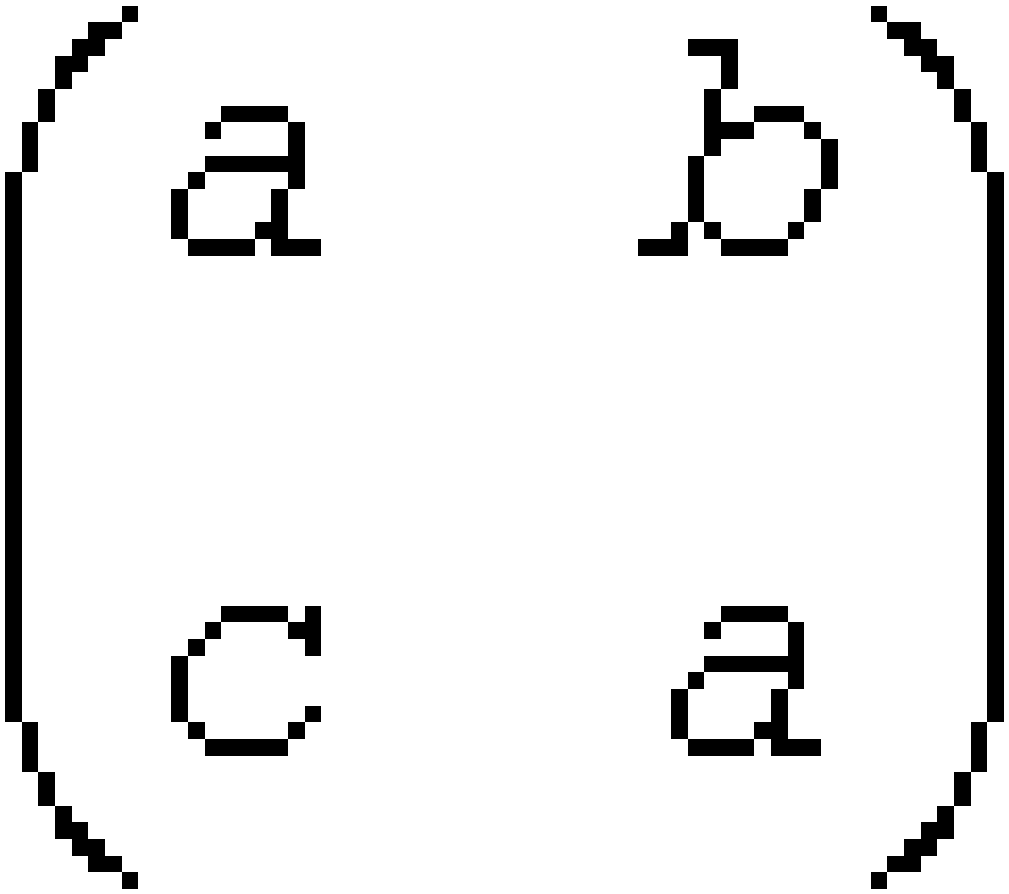
- mkl.fi, lapack.f90

Description

The routine computes for an *n*-by-*n* real/complex nonsymmetric matrix *A*, the eigenvalues, the real Schur form *T*, and, optionally, the matrix of Schur vectors *Z*. This gives the Schur factorization $A = Z*T*Z^H$.

Optionally, it also orders the eigenvalues on the diagonal of the real-Schur/Schur form so that selected eigenvalues are at the top left. The leading columns of *Z* then form an orthonormal basis for the invariant subspace corresponding to the selected eigenvalues.

A real matrix is in real-Schur form if it is upper quasi-triangular with 1-by-1 and 2-by-2 blocks. 2-by-2 blocks will be standardized in the form



where *b*c* < 0. The eigenvalues of such a block are

$$a \pm i\sqrt{bc}$$

A complex matrix is in Schur form if it is upper triangular.

Input Parameters

jobvs

CHARACTER*1. Must be 'N' or 'V'.

If *jobvs* = 'N', then Schur vectors are not computed.

If *jobvs* = 'V', then Schur vectors are computed.

sort

CHARACTER*1. Must be 'N' or 'S'. Specifies whether or not to order the eigenvalues on the diagonal of the Schur form.

If *sort* = 'N', then eigenvalues are not ordered.

If *sort* = 'S', eigenvalues are ordered (see *select*).

select

LOGICAL FUNCTION of two REAL arguments for real flavors.

LOGICAL FUNCTION of one COMPLEX argument for complex flavors.

select must be declared EXTERNAL in the calling subroutine.

If *sort* = 'S', *select* is used to select eigenvalues to sort to the top left of the Schur form.

If *sort* = 'N', *select* is not referenced.

For real flavors:

An eigenvalue *wr*(j)+sqrt(-1)**wi*(j) is selected if *select*(*wr*(j), *wi*(j)) is true; that is, if either one of a complex conjugate pair of eigenvalues is selected, then both complex eigenvalues are selected.

For complex flavors:

An eigenvalue *w*(j) is selected if *select*(*w*(j) is true.

Note that a selected complex eigenvalue may no longer satisfy *select*(*wr*(j), *wi*(j))= .TRUE. after ordering, since ordering may change the value of complex eigenvalues (especially if the eigenvalue is ill-conditioned); in this case *info* may be set to *n*+2 (see *info* below).

n

INTEGER. The order of the matrix *A* (*n*≥ 0).

a, *work*

REAL for sgees

DOUBLE PRECISION for dgees

COMPLEX for cgees

DOUBLE COMPLEX for zgees.

Arrays:

a(*lda*,*) is an array containing the *n*-by-*n* matrix *A*.

The second dimension of *a* must be at least max(1, *n*).

work is a workspace array, its dimension max(1, *lwork*).

lda

INTEGER. The leading dimension of the array *a*. Must be at least max(1, *n*).

ldvs

INTEGER. The leading dimension of the output array *vs*. Constraints:

ldvs≥ 1;

ldvs≥ max(1, *n*) if *jobvs* = 'V'.

lwork

INTEGER.

The dimension of the array *work*.

Constraint:

lwork≥ max(1, 3*n*) for real flavors;

lwork≥ max(1, 2*n*) for complex flavors.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

rwork

REAL for cgees

DOUBLE PRECISION for zgees

Workspace array, size at least max(1, *n*). Used in complex flavors only.

bwork LOGICAL. Workspace array, size at least max(1, *n*). Not referenced if *sort* = 'N'.

Output Parameters

a On exit, this array is overwritten by the real-Schur/Schur form *T*.

sdim INTEGER.

If *sort* = 'N', *sdim*= 0.

If *sort* = 'S', *sdim* is equal to the number of eigenvalues (after sorting) for which *select* is true.

Note that for real flavors complex conjugate pairs for which *select* is true for either eigenvalue count as 2.

wr, *wi* REAL for sgees

DOUBLE PRECISION for dgees

Arrays, size at least max (1, *n*) each. Contain the real and imaginary parts, respectively, of the computed eigenvalues, in the same order that they appear on the diagonal of the output real-Schur form *T*. Complex conjugate pairs of eigenvalues appear consecutively with the eigenvalue having positive imaginary part first.

w COMPLEX for cgees

DOUBLE COMPLEX for zgees.

Array, size at least max(1, *n*). Contains the computed eigenvalues. The eigenvalues are stored in the same order as they appear on the diagonal of the output Schur form *T*.

vs REAL for sgees

DOUBLE PRECISION for dgees

COMPLEX for cgees

DOUBLE COMPLEX for zgees.

Array *vs*(*ldvs*,*);the second dimension of *vs* must be at least max(1, *n*).

If *jobvs* = 'V', *vs* contains the orthogonal/unitary matrix *Z* of Schur vectors.

If *jobvs* = 'N', *vs* is not referenced.

work(1) On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*th parameter had an illegal value.

If *info* = *i*, and

i≤*n*:

the *QR* algorithm failed to compute all the eigenvalues; elements 1:*ilo*-1 and *i*+1:*n* of *wr* and *wi* (for real flavors) or *w* (for complex flavors) contain those eigenvalues which have converged; if `jobvs = 'V'`, *vs* contains the matrix which reduces *A* to its partially converged Schur form;

`i = n+1`:

the eigenvalues could not be reordered because some eigenvalues were too close to separate (the problem is very ill-conditioned);

i = *n*+2:

after reordering, round-off changed values of some complex eigenvalues so that leading eigenvalues in the Schur form no longer satisfy `select = .TRUE.`. This could also be caused by underflow due to scaling.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `gees` interface are the following:

`a`	Holds the matrix *A* of size (*n*, *n*).
`wr`	Holds the vector of length *n*. Used in real flavors only.
`wi`	Holds the vector of length *n*. Used in real flavors only.
`w`	Holds the vector of length *n*. Used in complex flavors only.
`vs`	Holds the matrix *VS* of size (*n*, *n*).
`jobvs`	Restored based on the presence of the argument *vs* as follows: `jobvs = 'V'`, if *vs* is present, `jobvs = 'N'`, if *vs* is omitted.
`sort`	Restored based on the presence of the argument *select* as follows: `sort = 'S'`, if *select* is present, `sort = 'N'`, if *select* is omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set `lwork = -1`.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (`work(1)`) for subsequent runs.

If you set `lwork = -1`, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?geesx
Computes the eigenvalues and Schur factorization of a general matrix, orders the factorization and computes reciprocal condition numbers.

Syntax

`call sgeesx(jobvs, sort, select, sense, n, a, lda, sdim, wr, wi, vs, ldvs, rconde, rcondv, work, lwork, iwork, liwork, bwork, info)`

`call dgeesx(jobvs, sort, select, sense, n, a, lda, sdim, wr, wi, vs, ldvs, rconde, rcondv, work, lwork, iwork, liwork, bwork, info)`

`call cgeesx(jobvs, sort, select, sense, n, a, lda, sdim, w, vs, ldvs, rconde, rcondv, work, lwork, rwork, bwork, info)`

`call zgeesx(jobvs, sort, select, sense, n, a, lda, sdim, w, vs, ldvs, rconde, rcondv, work, lwork, rwork, bwork, info)`

`call geesx(a, wr, wi [,vs] [,select] [,sdim] [,rconde] [,rcondev] [,info])`

`call geesx(a, w [,vs] [,select] [,sdim] [,rconde] [,rcondev] [,info])`

Include Files

- `mkl.fi, lapack.f90`

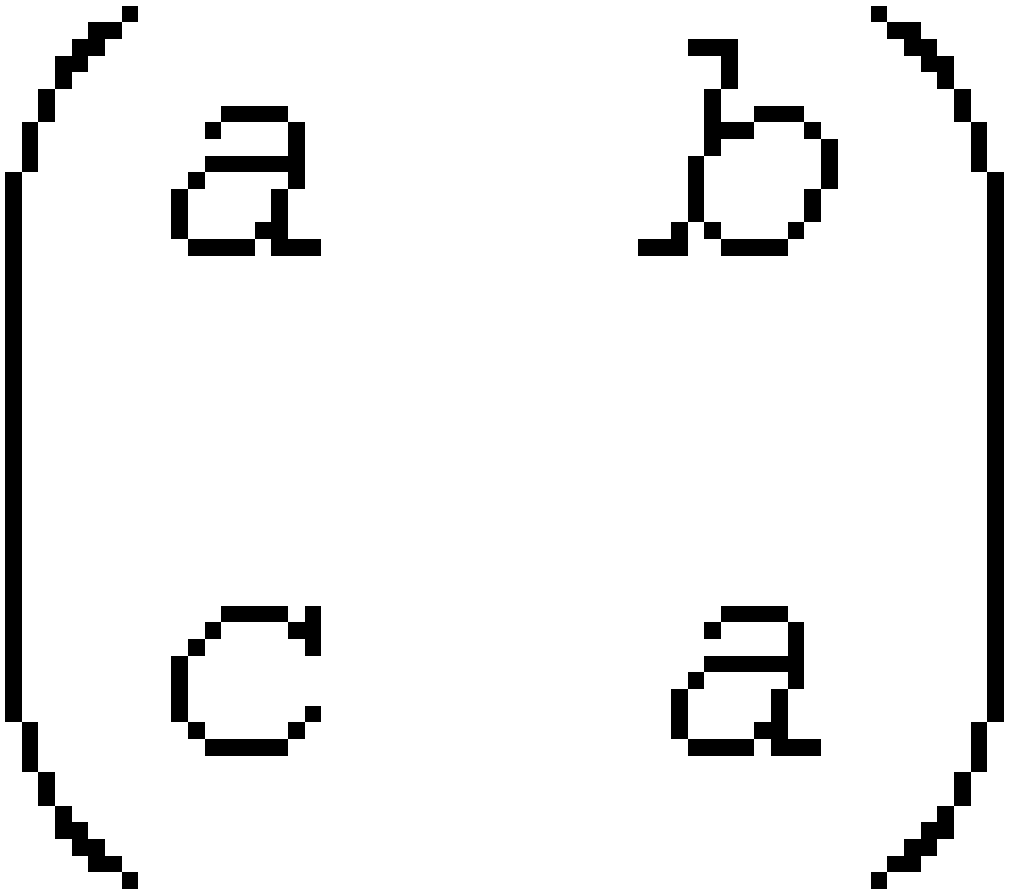
Description

The routine computes for an *n*-by-*n* real/complex nonsymmetric matrix *A*, the eigenvalues, the real-Schur/Schur form *T*, and, optionally, the matrix of Schur vectors *Z*. This gives the Schur factorization $A = Z*T*Z^H$.

Optionally, it also orders the eigenvalues on the diagonal of the real-Schur/Schur form so that selected eigenvalues are at the top left; computes a reciprocal condition number for the average of the selected eigenvalues (*rconde*); and computes a reciprocal condition number for the right invariant subspace corresponding to the selected eigenvalues (*rcondv*). The leading columns of *Z* form an orthonormal basis for this invariant subspace.

For further explanation of the reciprocal condition numbers *rconde* and *rcondv*, see [LUG], Section 4.10 (where these quantities are called *s* and *sep* respectively).

A real matrix is in real-Schur form if it is upper quasi-triangular with 1-by-1 and 2-by-2 blocks. 2-by-2 blocks will be standardized in the form



where *b*c* < 0. The eigenvalues of such a block are

$$a \pm i\sqrt{bc}$$

A complex matrix is in Schur form if it is upper triangular.

Input Parameters

jobvs

CHARACTER*1. Must be 'N' or 'V'.

If *jobvs* = 'N', then Schur vectors are not computed.

If *jobvs* = 'V', then Schur vectors are computed.

sort

CHARACTER*1. Must be 'N' or 'S'. Specifies whether or not to order the eigenvalues on the diagonal of the Schur form.

If *sort* = 'N', then eigenvalues are not ordered.

If *sort* = 'S', eigenvalues are ordered (see *select*).

select

LOGICAL FUNCTION of two REAL arguments for real flavors.

LOGICAL FUNCTION of one COMPLEX argument for complex flavors.

select must be declared EXTERNAL in the calling subroutine.

If *sort* = 'S', *select* is used to select eigenvalues to sort to the top left of the Schur form.

If *sort* = 'N', *select* is not referenced.

For real flavors:

An eigenvalue *wr*(j)+sqrt(-1)**wi*(j) is selected if *select*(*wr*(j), *wi*(j)) is true; that is, if either one of a complex conjugate pair of eigenvalues is selected, then both complex eigenvalues are selected.

For complex flavors:

An eigenvalue *w*(j) is selected if *select*(*w*(j)) is true.

Note that a selected complex eigenvalue may no longer satisfy *select*(*wr*(j), *wi*(j))= .TRUE. after ordering, since ordering may change the value of complex eigenvalues (especially if the eigenvalue is ill-conditioned); in this case *info* may be set to *n*+2 (see *info* below).

sense — CHARACTER*1. Must be 'N', 'E', 'V', or 'B'. Determines which reciprocal condition number are computed.

If *sense* = 'N', none are computed;

If *sense* = 'E', computed for average of selected eigenvalues only;

If *sense* = 'V', computed for selected right invariant subspace only;

If *sense* = 'B', computed for both.

If *sense* is 'E', 'V', or 'B', then *sort* must equal 'S'.

n — INTEGER. The order of the matrix *A* (*n*≥ 0).

a, *work* — REAL for sgeesx

DOUBLE PRECISION for dgeesx

COMPLEX for cgeesx

DOUBLE COMPLEX for zgeesx.

Arrays:

a(*lda*,*) is an array containing the *n*-by-*n* matrix *A*.

The second dimension of *a* must be at least max(1, *n*).

work is a workspace array, its dimension max(1, *lwork*).

lda — INTEGER. The leading dimension of the array *a*. Must be at least max(1, *n*).

ldvs — INTEGER. The leading dimension of the output array *vs*. Constraints:

ldvs≥ 1;

ldvs≥ max(1, *n*) if *jobvs* = 'V'.

lwork — INTEGER.

The dimension of the array *work*. Constraint:

lwork≥ max(1, 3*n*) for real flavors;

lwork≥ max(1, 2*n*) for complex flavors.

Also, if *sense* = 'E', 'V', or 'B', then

lwork≥*n*+2**sdim***(*n*-*sdim*) for real flavors;

lwork≥ 2**sdim***(*n*-*sdim*) for complex flavors;

where *sdim* is the number of selected eigenvalues computed by this routine.

Note that 2**sdim***(*n*-*sdim*) ≤*n***n*/2. Note also that an error is only returned if *lwork*<max(1, 2**n*), but if *sense* = 'E', or 'V', or 'B' this may not be large enough.

For good performance, *lwork* must generally be larger.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates upper bound on the optimal size of the array *work*, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

iwork INTEGER.

Workspace array, size (*liwork*). Used in real flavors only. Not referenced if *sense* = 'N' or 'E'.

liwork INTEGER.

The dimension of the array *iwork*. Used in real flavors only.

Constraint:

liwork≥ 1;

if *sense* = 'V' or 'B', *liwork*≥*sdim***(*n*-*sdim*).

rwork REAL for cgeesx

DOUBLE PRECISION for zgeesx

Workspace array, size at least max(1, *n*). Used in complex flavors only.

bwork LOGICAL. Workspace array, size at least max(1, *n*). Not referenced if *sort* = 'N'.

Output Parameters

a On exit, this array is overwritten by the real-Schur/Schur form *T*.

sdim INTEGER.

If *sort* = 'N', *sdim*= 0.

If *sort* = 'S', *sdim* is equal to the number of eigenvalues (after sorting) for which *select* is true.

Note that for real flavors complex conjugate pairs for which *select* is true for either eigenvalue count as 2.

wr, *wi* REAL for sgeesx

DOUBLE PRECISION for dgeesx

Arrays, size at least max (1, *n*) each. Contain the real and imaginary parts, respectively, of the computed eigenvalues, in the same order that they appear on the diagonal of the output real-Schur form *T*. Complex conjugate pairs of eigenvalues appear consecutively with the eigenvalue having positive imaginary part first.

w

COMPLEX for cgeesx

DOUBLE COMPLEX for zgeesx.

Array, size at least max(1, *n*). Contains the computed eigenvalues. The eigenvalues are stored in the same order as they appear on the diagonal of the output Schur form *T*.

vs

REAL for sgeesx

DOUBLE PRECISION for dgeesx

COMPLEX for cgeesx

DOUBLE COMPLEX for zgeesx.

Array *vs*(*ldvs*,*); the second dimension of *vs* must be at least max(1, *n*).

If *jobvs* = 'V', *vs* contains the orthogonal/unitary matrix *Z* of Schur vectors.

If *jobvs* = 'N', *vs* is not referenced.

rconde, *rcondv*

REAL for single precision flavors DOUBLE PRECISION for double precision flavors.

If *sense* = 'E' or 'B', *rconde* contains the reciprocal condition number for the average of the selected eigenvalues.

If *sense* = 'N' or 'V', *rconde* is not referenced.

If *sense* = 'V' or 'B', *rcondv* contains the reciprocal condition number for the selected right invariant subspace.

If *sense* = 'N' or 'E', *rcondv* is not referenced.

work(1)

On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.

info

INTEGER.

If *info* = 0, the execution is successful.

If *info* = –*i*, the *i*th parameter had an illegal value.

If *info* = *i*, and

i≤*n*:

the *QR* algorithm failed to compute all the eigenvalues; elements 1:*ilo*-1 and *i*+1:*n* of *wr* and *wi* (for real flavors) or *w* (for complex flavors) contain those eigenvalues which have converged; if *jobvs* = 'V', *vs* contains the transformation which reduces *A* to its partially converged Schur form;

i = *n*+1:

the eigenvalues could not be reordered because some eigenvalues were too close to separate (the problem is very ill-conditioned);

i = *n*+2:

after reordering, roundoff changed values of some complex eigenvalues so that leading eigenvalues in the Schur form no longer satisfy *select* = .TRUE.. This could also be caused by underflow due to scaling.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `geesx` interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
wr	Holds the vector of length (*n*). Used in real flavors only.
wi	Holds the vector of length (*n*). Used in real flavors only.
w	Holds the vector of length (*n*). Used in complex flavors only.
vs	Holds the matrix *VS* of size (*n*, *n*).
jobvs	Restored based on the presence of the argument *vs* as follows: *jobvs* = 'V', if *vs* is present, *jobvs* = 'N', if *vs* is omitted.
sort	Restored based on the presence of the argument *select* as follows: *sort* = 'S', if *select* is present, *sort* = 'N', if *select* is omitted.
sense	Restored based on the presence of arguments *rconde* and `rcondv` as follows: *sense* = 'B', if both *rconde* and *rcondv* are present, *sense* = 'E', if *rconde* is present and *rcondv* omitted, *sense* = 'V', if *rconde* is omitted and *rcondv* present, *sense* = 'N', if both *rconde* and *rcondv* are omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run or set *lwork* = –1 (*liwork* = –1).

If you choose the first option and set any of admissible *lwork* (or *liwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If you set *lwork* = –1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?geev
Computes the eigenvalues and left and right eigenvectors of a general matrix.

Syntax

```
call sgeev(jobvl, jobvr, n, a, lda, wr, wi, vl, ldvl, vr, ldvr, work, lwork, info)
call dgeev(jobvl, jobvr, n, a, lda, wr, wi, vl, ldvl, vr, ldvr, work, lwork, info)

Description

The routine computes for an n-by-n real/complex nonsymmetric matrix A, the eigenvalues and, optionally, the left and/or right eigenvectors. The right eigenvector v of A satisfies

$A*v = \lambda*v$

where λ is its eigenvalue.

The left eigenvector u of A satisfies

$u^H*A = \lambda*u^H$

where u^H denotes the conjugate transpose of u. The computed eigenvectors are normalized to have Euclidean norm equal to 1 and largest component real.

Input Parameters

jobvl	CHARACTER*1. Must be 'N' or 'V'. If *jobvl* = 'N', then left eigenvectors of *A* are not computed. If *jobvl* = 'V', then left eigenvectors of *A* are computed.
jobvr	CHARACTER*1. Must be 'N' or 'V'. If *jobvr* = 'N', then right eigenvectors of *A* are not computed. If *jobvr* = 'V', then right eigenvectors of *A* are computed.
n	INTEGER. The order of the matrix *A* ($n \geq 0$).
a, *work*	REAL for sgeev DOUBLE PRECISION for dgeev COMPLEX for cgeev DOUBLE COMPLEX for zgeev. Arrays: *a*(*lda*,*) is an array containing the n-by-n matrix *A*. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The leading dimension of the array *a*. Must be at least max(1, *n*).
ldvl, *ldvr*	INTEGER. The leading dimensions of the output arrays *vl* and *vr*, respectively.

Constraints:

ldvl≥ 1; *ldvr*≥ 1.

If *jobvl* = 'V', *ldvl*≥ max(1, *n*);

If *jobvr* = 'V', *ldvr*≥ max(1, *n*).

lwork

INTEGER.

The dimension of the array *work*.

Constraint for real flavors:	*lwork*≥ max(1, 3*n*). If computing eigenvectors (*jobvl* = 'V' or *jobvr* = 'V'), *lwork*≥ max(1, 4*n*).
Constraint for complex flavors:	*lwork*≥ max(1, 2*n*).

For good performance, *lwork* must generally be larger.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

rwork

REAL for cgeev

DOUBLE PRECISION for zgeev

Workspace array, size at least max(1, 2*n*). Used in complex flavors only.

Output Parameters

a

On exit, this array is overwritten.

wr, *wi*

REAL for sgeev

DOUBLE PRECISION for dgeev

Arrays, size at least max (1, *n*) each.

Contain the real and imaginary parts, respectively, of the computed eigenvalues. Complex conjugate pairs of eigenvalues appear consecutively with the eigenvalue having positive imaginary part first.

w

COMPLEX for cgeev

DOUBLE COMPLEX for zgeev.

Array, size at least max(1, *n*).

Contains the computed eigenvalues.

vl, *vr*

REAL for sgeev

DOUBLE PRECISION for dgeev

COMPLEX for cgeev

DOUBLE COMPLEX for zgeev.

Arrays:

vl(*ldvl*,*); the second dimension of *vl* must be at least max(1, *n*).

If *jobvl* = 'N', *vl* is not referenced.

For real flavors:

If the *j*-th eigenvalue is real, then u_j = *vl*(:,*j*), the *j*-th column of *vl*.

If the *j*-th and (*j*+1)-st eigenvalues form a complex conjugate pair, then for i = sqrt(-1), u_j = *vl*(:,*j*) + i**vl*(:,*j*+1) and u_{j+1} = *vl*(:,*j*)- i**vl*(:,*j*+1).

For complex flavors:

u_j = *vl*(:,*j*), the *j*-th column of *vl*.

vr(*ldvr*,*); the second dimension of *vr* must be at least max(1, *n*).

If *jobvr* = 'N', *vr* is not referenced.

For real flavors:

If the *j*-th eigenvalue is real, then v_j = *vr*(:,*j*), the *j*-th column of *vr*.

If the *j*-th and (*j*+1)-st eigenvalues form a complex conjugate pair, then for *i* = sqrt(-1), v_j = *vr*(:,*j*) + i**vr*(:,*j*+1) and v_{j+1} = *vr*(:,*j*) - i**vr*(:,*j*+1).

For complex flavors:

v_j = *vr*(:,*j*), the *j*-th column of *vr*.

work(1) On exit, if *info* = 0, then *work*(1) returns the required minimal size of *lwork*.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*th parameter had an illegal value.

If *info* = *i*, the QR algorithm failed to compute all the eigenvalues, and no eigenvectors have been computed; elements *i*+1:*n* of *wr* and *wi* (for real flavors) or *w* (for complex flavors) contain those eigenvalues which have converged.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine geev interface are the following:

a Holds the matrix *A* of size (*n*, *n*).

wr Holds the vector of length *n*. Used in real flavors only.

wi Holds the vector of length *n*. Used in real flavors only.

w Holds the vector of length *n*. Used in complex flavors only.

vl Holds the matrix *VL* of size (*n*, *n*).

vr Holds the matrix *VR* of size (*n*, *n*).

jobvl	Restored based on the presence of the argument *vl* as follows: *jobvl* = 'V', if *vl* is present, *jobvl* = 'N', if *vl* is omitted.
jobvr	Restored based on the presence of the argument *vr* as follows: *jobvr* = 'V', if *vr* is present, *jobvr* = 'N', if *vr* is omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine exits immediately with an error and does not provide any information on the recommended workspace.

?geevx

Computes the eigenvalues and left and right eigenvectors of a general matrix, with preliminary matrix balancing, and computes reciprocal condition numbers for the eigenvalues and right eigenvectors.

Syntax

call sgeevx(*balanc*, *jobvl*, *jobvr*, *sense*, *n*, *a*, *lda*, *wr*, *wi*, *vl*, *ldvl*, *vr*, *ldvr*, *ilo*, *ihi*, *scale*, *abnrm*, *rconde*, *rcondv*, *work*, *lwork*, *iwork*, *info*)

call dgeevx(*balanc*, *jobvl*, *jobvr*, *sense*, *n*, *a*, *lda*, *wr*, *wi*, *vl*, *ldvl*, *vr*, *ldvr*, *ilo*, *ihi*, *scale*, *abnrm*, *rconde*, *rcondv*, *work*, *lwork*, *iwork*, *info*)

call cgeevx(*balanc*, *jobvl*, *jobvr*, *sense*, *n*, *a*, *lda*, *w*, *vl*, *ldvl*, *vr*, *ldvr*, *ilo*, *ihi*, *scale*, *abnrm*, *rconde*, *rcondv*, *work*, *lwork*, *rwork*, *info*)

call zgeevx(*balanc*, *jobvl*, *jobvr*, *sense*, *n*, *a*, *lda*, *w*, *vl*, *ldvl*, *vr*, *ldvr*, *ilo*, *ihi*, *scale*, *abnrm*, *rconde*, *rcondv*, *work*, *lwork*, *rwork*, *info*)

call geevx(*a*, *wr*, *wi* [,*vl*] [,*vr*] [,*balanc*] [,*ilo*] [,*ihi*] [,*scale*] [,*abnrm*] [, *rconde*] [,*rcondv*] [,*info*])

call geevx(*a*, *w* [,*vl*] [,*vr*] [,*balanc*] [,*ilo*] [,*ihi*] [,*scale*] [,*abnrm*] [,*rconde*] [, *rcondv*] [,*info*])

Include Files

- mkl.fi, lapack.f90

Description

The routine computes for an *n*-by-*n* real/complex nonsymmetric matrix *A*, the eigenvalues and, optionally, the left and/or right eigenvectors.

Optionally also, it computes a balancing transformation to improve the conditioning of the eigenvalues and eigenvectors (*ilo*, *ihi*, *scale*, and *abnrm*), reciprocal condition numbers for the eigenvalues (*rconde*), and reciprocal condition numbers for the right eigenvectors (*rcondv*).

The right eigenvector v of *A* satisfies

$A \cdot v = \lambda \cdot v$

where λ is its eigenvalue.

The left eigenvector u of *A* satisfies

$u^H A = \lambda u^H$

where u^H denotes the conjugate transpose of u. The computed eigenvectors are normalized to have Euclidean norm equal to 1 and largest component real.

Balancing a matrix means permuting the rows and columns to make it more nearly upper triangular, and applying a diagonal similarity transformation *D***A**inv(*D*), where *D* is a diagonal matrix, to make its rows and columns closer in norm and the condition numbers of its eigenvalues and eigenvectors smaller. The computed reciprocal condition numbers correspond to the balanced matrix. Permuting rows and columns will not change the condition numbers in exact arithmetic) but diagonal scaling will. For further explanation of balancing, see [LUG], Section 4.10.

Input Parameters

balanc

CHARACTER*1. Must be 'N', 'P', 'S', or 'B'. Indicates how the input matrix should be diagonally scaled and/or permuted to improve the conditioning of its eigenvalues.

If *balanc* = 'N', do not diagonally scale or permute;

If *balanc* = 'P', perform permutations to make the matrix more nearly upper triangular. Do not diagonally scale;

If *balanc* = 'S', diagonally scale the matrix, i.e. replace *A* by *D***A**inv(*D*), where *D* is a diagonal matrix chosen to make the rows and columns of *A* more equal in norm. Do not permute;

If *balanc* = 'B', both diagonally scale and permute *A*.

Computed reciprocal condition numbers will be for the matrix after balancing and/or permuting. Permuting does not change condition numbers (in exact arithmetic), but balancing does.

jobvl

CHARACTER*1. Must be 'N' or 'V'.

If *jobvl* = 'N', left eigenvectors of *A* are not computed;

If *jobvl* = 'V', left eigenvectors of *A* are computed.

If *sense* = 'E' or 'B', then *jobvl* must be 'V'.

jobvr

CHARACTER*1. Must be 'N' or 'V'.

If *jobvr* = 'N', right eigenvectors of *A* are not computed;

If *jobvr* = 'V', right eigenvectors of *A* are computed.

If *sense* = 'E' or 'B', then *jobvr* must be 'V'.

sense — CHARACTER*1. Must be 'N', 'E', 'V', or 'B'. Determines which reciprocal condition number are computed.

If *sense* = 'N', none are computed;

If *sense* = 'E', computed for eigenvalues only;

If *sense* = 'V', computed for right eigenvectors only;

If *sense* = 'B', computed for eigenvalues and right eigenvectors.

If *sense* is 'E' or 'B', both left and right eigenvectors must also be computed (*jobvl* = 'V' and *jobvr* = 'V').

n — INTEGER. The order of the matrix *A* ($n \geq 0$).

a, *work* — REAL for sgeevx

DOUBLE PRECISION for dgeevx

COMPLEX for cgeevx

DOUBLE COMPLEX for zgeevx.

Arrays:

a(*lda*,*) is an array containing the *n*-by-*n* matrix *A*.

The second dimension of *a* must be at least max(1, *n*).

work is a workspace array, its dimension max(1, *lwork*).

lda — INTEGER. The leading dimension of the array *a*. Must be at least max(1, *n*).

ldvl, *ldvr* — INTEGER. The leading dimensions of the output arrays *vl* and *vr*, respectively.

Constraints:

ldvl ≥ 1; *ldvr* ≥ 1.

If *jobvl* = 'V', *ldvl* $\geq$ max(1, *n*);

If *jobvr* = 'V', *ldvr* $\geq$ max(1, *n*).

lwork — INTEGER.

The dimension of the array *work*.

For real flavors:

If *sense* = 'N' or 'E', *lwork* $\geq$ max(1, $2n$), and if *jobvl* = 'V' or *jobvr* = 'V', *lwork* $\geq 3n$;

If *sense* = 'V' or 'B', *lwork* $\geq n*(n+6)$.

For good performance, *lwork* must generally be larger.

For complex flavors:

If *sense* = 'N'or 'E', *lwork* $\geq$ max(1, $2n$);

If *sense* = 'V' or 'B', *lwork* $\geq n^2+2n$. For good performance, *lwork* must generally be larger.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

rwork

REAL for cgeevx

DOUBLE PRECISION for zgeevx

Workspace array, size at least max(1, 2*n*). Used in complex flavors only.

iwork

INTEGER.

Workspace array, size at least max(1, 2*n*-2). Used in real flavors only. Not referenced if *sense* = 'N' or 'E'.

Output Parameters

a

On exit, this array is overwritten.

If *jobvl* = 'V' or *jobvr* = 'V', it contains the real-Schur/Schur form of the balanced version of the input matrix *A*.

wr, *wi*

REAL for sgeevx

DOUBLE PRECISION for dgeevx

Arrays, size at least max (1, *n*) each. Contain the real and imaginary parts, respectively, of the computed eigenvalues. Complex conjugate pairs of eigenvalues appear consecutively with the eigenvalue having positive imaginary part first.

w

COMPLEX for cgeevx

DOUBLE COMPLEX for zgeevx.

Array, size at least max(1, *n*). Contains the computed eigenvalues.

vl, *vr*

REAL for sgeevx

DOUBLE PRECISION for dgeevx

COMPLEX for cgeevx

DOUBLE COMPLEX for zgeevx.

Arrays:

vl(*ldvl*,*); the second dimension of *vl* must be at least max(1, *n*).

If *jobvl* = 'N', *vl* is not referenced.

For real flavors:

If the *j*-th eigenvalue is real, then u_j = *vl*(:,*j*), the *j*-th column of *vl*.

If the *j*-th and (*j*+1)-st eigenvalues form a complex conjugate pair, then for i = sqrt(-1), u_j = *vl*(:,*j*) + *i***vl*(:,*j*+1) and u_{j+1} = *vl*(:,*j*)- *i***vl*(:,*j*+1).

For complex flavors:

u_j = *vl*(:,*j*), the *j*-th column of *vl*.

vr(*ldvr*,*); the second dimension of *vr* must be at least max(1, *n*).

If *jobvr* = 'N', *vr* is not referenced.

For real flavors:

If the *j*-th eigenvalue is real, then v_j = *vr*(:,*j*), the *j*-th column of *vr*.

If the *j*-th and (*j*+1)-st eigenvalues form a complex conjugate pair, then for *i* = sqrt(-1), v_j = *vr*(:,*j*) + *i***vr*(:,*j*+1) and v_{j+1} = *vr*(:,*j*) - *i***vr*(:,*j*+1).

For complex flavors:

v_j = *vr*(:,*j*), the *j*-th column of *vr*.

ilo, *ihi*

INTEGER. *ilo* and *ihi* are integer values determined when *A* was balanced.

The balanced *A*(i,j) = 0 if i > j and j = 1,..., *ilo*-1 or i = *ihi*+1,..., *n*.

If *balanc* = 'N' or 'S', *ilo* = 1 and *ihi* = *n*.

scale

REAL for single-precision flavors

DOUBLE PRECISION for double-precision flavors.

Array, size at least max(1, *n*). Details of the permutations and scaling factors applied when balancing *A*.

If *P*(*j*) is the index of the row and column interchanged with row and column *j*, and *D*(*j*) is the scaling factor applied to row and column *j*, then

scale(*j*) = *P*(*j*), for *j* = 1,...,*ilo*-1

= *D*(*j*), for *j* = *ilo*,...,*ihi*

= *P*(*j*) for *j* = *ihi*+1,..., *n*.

The order in which the interchanges are made is *n* to *ihi*+1, then 1 to *ilo*-1.

abnrm

REAL for single-precision flavors

DOUBLE PRECISION for double-precision flavors.

The one-norm of the balanced matrix (the maximum of the sum of absolute values of elements of any column).

rconde, *rcondv*

REAL for single precision flavors DOUBLE PRECISION for double precision flavors.

Arrays, size at least max(1, *n*) each.

rconde(*j*) is the reciprocal condition number of the *j*-th eigenvalue.

rcondv(*j*) is the reciprocal condition number of the *j*-th right eigenvector.

work(1)

On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.

info

INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*th parameter had an illegal value.

If *info* = *i*, the *QR* algorithm failed to compute all the eigenvalues, and no eigenvectors or condition numbers have been computed; elements 1:*ilo*-1 and *i*+1:*n* of *wr* and *wi* (for real flavors) or *w* (for complex flavors) contain eigenvalues which have converged.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `geevx` interface are the following:

a Holds the matrix *A* of size (*n*, *n*).

wr Holds the vector of length *n*. Used in real flavors only.

wi Holds the vector of length *n*. Used in real flavors only.

w Holds the vector of length *n*. Used in complex flavors only.

vl Holds the matrix *VL* of size (*n*, *n*).

vr Holds the matrix *VR* of size (*n*, *n*).

scale Holds the vector of length *n*.

rconde Holds the vector of length *n*.

rcondv Holds the vector of length *n*.

balanc Must be `'N'`, `'B'`, `'P'` or `'S'`. The default value is `'N'`.

jobvl Restored based on the presence of the argument *vl* as follows:

jobvl = `'V'`, if *vl* is present,

jobvl = `'N'`, if *vl* is omitted.

jobvr Restored based on the presence of the argument *vr* as follows:

jobvr = `'V'`, if *vr* is present,

jobvr = `'N'`, if *vr* is omitted.

sense Restored based on the presence of arguments *rconde* and `rcondv` as follows:

sense = `'B'`, if both *rconde* and *rcondv* are present,

sense = `'E'`, if *rconde* is present and *rcondv* omitted,

sense = `'V'`, if *rconde* is omitted and *rcondv* present,

sense = `'N'`, if both *rconde* and *rcondv* are omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork = -1*, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

Singular Value Decomposition: LAPACK Driver Routines

Table "Driver Routines for Singular Value Decomposition" lists the LAPACK driver routines that perform singular value decomposition for the FORTRAN 77 interface. The corresponding routine names in the Fortran 95 interface are the same except that the first character is removed.

Driver Routines for Singular Value Decomposition

Routine Name	Operation performed
?gesvd	Computes the singular value decomposition of a general rectangular matrix.
?gesdd	Computes the singular value decomposition of a general rectangular matrix using a divide and conquer method.
?gejsv	Computes the singular value decomposition of a real matrix using a preconditioned Jacobi SVD method.
?gesvj	Computes the singular value decomposition of a real matrix using Jacobi plane rotations.
?ggsvd	Computes the generalized singular value decomposition of a pair of general rectangular matrices.
?gesvdx	Computes the SVD and left and right singular vectors for a matrix.
?bdsvdx	Computes the SVD of a bidiagonal matrix.

Singular Value Decomposition - LAPACK Computational Routines

?gesvd
Computes the singular value decomposition of a general rectangular matrix.

Syntax

```
call sgesvd(jobu, jobvt, m, n, a, lda, s, u, ldu, vt, ldvt, work, lwork, info)
call dgesvd(jobu, jobvt, m, n, a, lda, s, u, ldu, vt, ldvt, work, lwork, info)
call cgesvd(jobu, jobvt, m, n, a, lda, s, u, ldu, vt, ldvt, work, lwork, rwork, info)
call zgesvd(jobu, jobvt, m, n, a, lda, s, u, ldu, vt, ldvt, work, lwork, rwork, info)
call gesvd(a, s [,u] [,vt] [,ww] [,job] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes the singular value decomposition (SVD) of a real/complex *m*-by-*n* matrix *A*, optionally computing the left and/or right singular vectors. The SVD is written as

$A = U*\Sigma*V^T$ for real routines

$A = U*\Sigma*V^H$ for complex routines

where Σ is an *m*-by-*n* matrix which is zero except for its min(*m*,*n*) diagonal elements, *U* is an *m*-by-*m* orthogonal/unitary matrix, and *V* is an *n*-by-*n* orthogonal/unitary matrix. The diagonal elements of Σ are the singular values of *A*; they are real and non-negative, and are returned in descending order. The first min(*m*, *n*) columns of *U* and *V* are the left and right singular vectors of *A*.

The routine returns V^T (for real flavors) or V^H (for complex flavors), not *V*.

Input Parameters

jobu

`CHARACTER*1`. Must be `'A'`, `'S'`, `'O'`, or `'N'`. Specifies options for computing all or part of the matrix *U*.

If *jobu* = `'A'`, all *m* columns of *U* are returned in the array *u*;

if *jobu* = `'S'`, the first min(*m*, *n*) columns of *U* (the left singular vectors) are returned in the array *u*;

if *jobu* = `'O'`, the first min(*m*, *n*) columns of *U* (the left singular vectors) are overwritten on the array *a*;

if *jobu* = `'N'`, no columns of *U* (no left singular vectors) are computed.

jobvt

`CHARACTER*1`. Must be `'A'`, `'S'`, `'O'`, or `'N'`. Specifies options for computing all or part of the matrix V^T/V^H.

If *jobvt* = `'A'`, all *n* rows of V^T/V^H are returned in the array *vt*;

if *jobvt* = `'S'`, the first min(*m*,*n*) rows of V^T/V^H (the right singular vectors) are returned in the array *vt*;

if *jobvt* = `'O'`, the first min(*m*,*n*) rows of V^T/V^H) (the right singular vectors) are overwritten on the array *a*;

if *jobvt* = `'N'`, no rows of V^T/V^H (no right singular vectors) are computed.

jobvt and *jobu* cannot both be `'O'`.

m

`INTEGER`. The number of rows of the matrix *A* (*m*≥ 0).

n

`INTEGER`. The number of columns in *A* (*n*≥ 0).

a, *work*

`REAL` for `sgesvd`

`DOUBLE PRECISION` for `dgesvd`

`COMPLEX` for `cgesvd`

`DOUBLE COMPLEX` for `zgesvd`.

Arrays:

a(*lda*,*) is an array containing the *m*-by-*n* matrix *A*.

The second dimension of *a* must be at least max(1, *n*).

work is a workspace array, its dimension `max(1, lwork)`.

lda

`INTEGER`. The leading dimension of the array *a*.

Must be at least max(1, *m*) .

ldu, *ldvt*

`INTEGER`. The leading dimensions of the output arrays *u* and *vt*, respectively.

Constraints:

ldu≥ 1; *ldvt*≥ 1.

If *jobu* = 'A'or 'S', *ldu*≥*m*;

If *jobvt* = 'A', *ldvt*≥*n*;

If *jobvt* = 'S', *ldvt*≥ min(*m*, *n*) .

lwork

INTEGER.

The dimension of the array *work*.

Constraints:

lwork≥ 1

lwork≥ max(3*min(*m*, *n*)+max(*m*, *n*), 5*min(*m*,*n*)) (for real flavors);

lwork≥ 2*min(*m*, *n*)+max(*m*, *n*) (for complex flavors).

For good performance, *lwork* must generally be larger.

If *lwork* = –1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for details.

rwork

REAL for cgesvd

DOUBLE PRECISION for zgesvd

Workspace array, size at least max(1, 5*min(*m*, *n*)). Used in complex flavors only.

Output Parameters

a

On exit,

If *jobu* = 'O', *a* is overwritten with the first min(*m*,*n*) columns of *U* (the left singular vectors stored columnwise);

If *jobvt* = 'O', *a* is overwritten with the first min(*m*, *n*) rows of V^T/V^H (the right singular vectors stored rowwise);

If *jobu*≠'O' and *jobvt*≠'O', the contents of *a* are destroyed.

s

REAL for single precision flavors DOUBLE PRECISION for double precision flavors.

Array, size at least max(1, min(*m*,*n*)). Contains the singular values of *A* sorted so that *s*(*i*) ≥ *s*(*i*+1).

u, *vt*

REAL for sgesvd

DOUBLE PRECISION for dgesvd

COMPLEX for cgesvd

DOUBLE COMPLEX for zgesvd.

Arrays:

u(*ldu*,*); the second dimension of *u* must be at least max(1, *m*) if *jobu* = 'A', and at least max(1, min(*m*, *n*)) if *jobu* = 'S'.

If *jobu* = 'A', *u* contains the *m*-by-*m* orthogonal/unitary matrix *U*.

If *jobu* = 'S', *u* contains the first min(*m*, *n*) columns of *U* (the left singular vectors stored column-wise).

If *jobu* = 'N' or 'O', *u* is not referenced.

vt(*ldvt*,*); the second dimension of *vt* must be at least max(1, *n*).

If *jobvt* = 'A', *vt* contains the *n*-by-*n* orthogonal/unitary matrix V^T/V^H.

If *jobvt* = 'S', *vt* contains the first min(*m*, *n*) rows of V^T/V^H (the right singular vectors stored row-wise).

If *jobvt* = 'N'or 'O', *vt* is not referenced.

work — On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.

For real flavors:

If *info* > 0, *work*(2:min(*m*,*n*)) contains the unconverged superdiagonal elements of an upper bidiagonal matrix *B* whose diagonal is in *s* (not necessarily sorted). *B* satisfies *A*=*u***B***vt*, so it has the same singular values as *A*, and singular vectors related by *u* and *vt*.

rwork — On exit (for complex flavors), if *info* > 0, *rwork*(1:min(*m*,*n*)-1) contains the unconverged superdiagonal elements of an upper bidiagonal matrix *B* whose diagonal is in *s* (not necessarily sorted). *B* satisfies *A* = *u***B***vt*, so it has the same singular values as *A*, and singular vectors related by *u* and *vt*.

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, then if ?bdsqr did not converge, *i* specifies how many superdiagonals of the intermediate bidiagonal form *B* did not converge to zero (see the description of the *work* and *rwork* parameters for details).

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine gesvd interface are the following:

a — Holds the matrix *A* of size (*m*, *n*).

s — Holds the vector of length min(*m*, *n*).

u — If present and is a square *m*-by-*m* matrix, on exit contains the *m*-by-*m* orthogonal/unitary matrix *U*.

Otherwise, if present, on exit contains the first min(*m*,*n*) columns of the matrix *U* (left singular vectors stored column-wise).

vt — If present and is a square *n*-by-*n* matrix, on exit contains the *n*-by-*n* orthogonal/unitary matrix V'^T/V'^H.

Otherwise, if present, on exit contains the first min(*m*,*n*) rows of the matrix V'^T/V'^H (right singular vectors stored row-wise).

ww	Holds the vector of length min(*m*, *n*)-1. *ww* contains the unconverged superdiagonal elements of an upper bidiagonal matrix *B* whose diagonal is in *s* (not necessarily sorted). *B* satisfies *A = U*B*VT*, so it has the same singular values as *A*, and singular vectors related by *U* and *VT*.
job	Must be either 'N', or 'U', or 'V'. The default value is 'N'. If *job = 'U'*, and *u* is not present, then *u* is returned in the array *a*. If *job = 'V'*, and *vt* is not present, then *vt* is returned in the array *a*.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork = -1*.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work(1)*) for subsequent runs.

If you set *lwork = -1*, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?gesdd

Computes the singular value decomposition of a general rectangular matrix using a divide and conquer method.

Syntax

```
call sgesdd(jobz, m, n, a, lda, s, u, ldu, vt, ldvt, work, lwork, iwork, info)
call dgesdd(jobz, m, n, a, lda, s, u, ldu, vt, ldvt, work, lwork, iwork, info)
call cgesdd(jobz, m, n, a, lda, s, u, ldu, vt, ldvt, work, lwork, rwork, iwork, info)
call zgesdd(jobz, m, n, a, lda, s, u, ldu, vt, ldvt, work, lwork, rwork, iwork, info)
call gesdd(a, s [,u] [,vt] [,jobz] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes the singular value decomposition (SVD) of a real/complex *m*-by-*n* matrix *A*, optionally computing the left and/or right singular vectors.

If singular vectors are desired, it uses a divide-and-conquer algorithm. The SVD is written

$A = U*\Sigma*V^{T}$ for real routines,

$A = U*\Sigma*V^{H}$ for complex routines,

where Σ is an *m*-by-*n* matrix which is zero except for its min(*m*,*n*) diagonal elements, *U* is an *m*-by-*m* orthogonal/unitary matrix, and *V* is an *n*-by-*n* orthogonal/unitary matrix. The diagonal elements of Σ are the singular values of *A*; they are real and non-negative, and are returned in descending order. The first min(*m*, *n*) columns of *U* and *V* are the left and right singular vectors of *A*.

Note that the routine returns $vt = V^T$ (for real flavors) or $vt = V^H$ (for complex flavors), not *V*.

Input Parameters

jobz

`CHARACTER*1`. Must be `'A'`, `'S'`, `'O'`, or `'N'`.

Specifies options for computing all or part of the matrices *U* and *V*.

If *jobz* = `'A'`, all *m* columns of *U* and all *n* rows of V^T or V^H are returned in the arrays *u* and *vt*;

if *jobz* = `'S'`, the first min(*m*, *n*) columns of *U* and the first min(*m*, *n*) rows of V^T or V^H are returned in the arrays *u* and *vt*;

if *jobz* = `'O'`, then

if $m \geq n$, the first *n* columns of *U* are overwritten in the array *a* and all rows of V^T or V^H are returned in the array *vt*;

if $m < n$, all columns of *U* are returned in the array *u* and the first *m* rows of V^T or V^H are overwritten in the array *a*;

if *jobz* = `'N'`, no columns of *U* or rows of V^T or V^H are computed.

m

`INTEGER`. The number of rows of the matrix *A* ($m \geq 0$).

n

`INTEGER`. The number of columns in *A* ($n \geq 0$).

a, *work*

`REAL` for `sgesdd`

`DOUBLE PRECISION` for `dgesdd`

`COMPLEX` for `cgesdd`

`DOUBLE COMPLEX` for `zgesdd`.

Arrays:

a(*lda*,*) is an array containing the *m*-by-*n* matrix *A*.

The second dimension of *a* must be at least max(1, *n*).

work is a workspace array, its dimension `max(1, lwork)`.

lda

`INTEGER`. The leading dimension of the array *a*. Must be at least max(1, *m*).

ldu, *ldvt*

`INTEGER`. The leading dimensions of the output arrays *u* and *vt*, respectively.

Constraints:

$ldu \geq 1$; $ldvt \geq 1$.

If *jobz* = `'S'` or `'A'`, or *jobz* = `'O'` and $m < n$,

then $ldu \geq m$;

If *jobz* = `'A'` or *jobz* = `'O'` and $m \geq n$,

then $ldvt \geq n$;

If *jobz* = `'S'`, $ldvt \geq \min(m, n)$.

lwork INTEGER.

The dimension of the array *work*; *lwork* ≥ 1.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the *work*(1), and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the theoretical minimum value of *lwork* when a workspace query is not performed.

rwork REAL for cgesdd

DOUBLE PRECISION for zgesdd

Workspace array, size at least max(1, 7*min(*m*,*n*)) if *jobz* = 'N'.

Otherwise, the dimension of *rwork* must be at least max(1,min(*m*,*n*)*max(5*min(*m*,*n*)+7,2*max(*m*,*n*)+2*min(*m*,*n*)+1)). This array is used in complex flavors only.

iwork INTEGER. Workspace array, size at least max(1, 8 *min(*m*, *n*)).

Output Parameters

a On exit:

If *jobz* = 'O', then if *m* ≥ *n*, *a* is overwritten with the first *n* columns of *U* (the left singular vectors, stored columnwise). If *m* < *n*, *a* is overwritten with the first *m* rows of V^T (the right singular vectors, stored rowwise);

If *jobz* ≠ 'O', the contents of *a* are destroyed.

s REAL for single precision flavors DOUBLE PRECISION for double precision flavors.

Array, size at least max(1, min(*m*,*n*)). Contains the singular values of *A* sorted so that *s*(i) ≥ *s*(i+1).

u, *vt* REAL for sgesdd

DOUBLE PRECISION for dgesdd

COMPLEX for cgesdd

DOUBLE COMPLEX for zgesdd.

Arrays:

u(*ldu*,*); the second dimension of *u* must be at least max(1, *m*) if *jobz* = 'A' or *jobz* = 'O' and *m* < *n*.

If *jobz* = 'S', the second dimension of *u* must be at least max(1, min(*m*, *n*)).

If *jobz* = 'A'or *jobz* = 'O' and *m* < *n*, *u* contains the *m*-by-*m* orthogonal/unitary matrix *U*.

If *jobz* = 'S', *u* contains the first min(*m*, *n*) columns of *U* (the left singular vectors, stored columnwise).

If *jobz* = 'O' and *m* ≥ *n*, or *jobz* = 'N', *u* is not referenced.

vt(*ldvt*,*); the second dimension of *vt* must be at least max(1, *n*).

If *jobz* = 'A' or *jobz* = 'O' and *m*≥*n*, *vt* contains the *n*-by-*n* orthogonal/unitary matrix V^T.

If *jobz* = 'S', *vt* contains the first min(*m*, *n*) rows of V^T (the right singular vectors, stored rowwise).

If *jobz* = 'O' and *m* < *n*, or *jobz* = 'N', *vt* is not referenced.

work(1) — On exit, if *info* = 0, then *work(1)* returns the optimal size of *lwork*.

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = -4, *A* had a NAN entry.

If *info* = *i*, then ?bdsdc did not converge, updating process failed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine gesdd interface are the following:

a — Holds the matrix *A* of size (*m*, *n*).

s — Holds the vector of length min(*m*, *n*).

u — Holds the matrix *U* of size

- (*m*,*m*) if *jobz*='A' or *jobz*='O' and *m* < *n*
- (*m*,min(*m*, *n*)) if *jobz*='S'

u is not referenced if *jobz* is not supplied or if *jobz*='N' or *jobz*='O' and *m*≥*n*.

vt — Holds the matrix *VT* of size

- (*n*,*n*) if *jobz*='A' or *jobz*='O' and *m*≥*n*
- (min(*m*, *n*), *n*) if *jobz*='S'

vt is not referenced if *jobz* is not supplied or if *jobz*='N' or *jobz*='O' and *m* < *n*.

job — Must be 'N', 'A', 'S', or 'O'. The default value is 'N'.

Application Notes

The theoretical minimum value for *lwork* depends on the flavor of the routine.

For real flavors:

If *jobz* = 'N', *lwork*= 3*min(*m*, *n*) + max (max(*m*,*n*), 6*min(*m*, *n*));

If *jobz* = 'O', *lwork*= 3*(min(*m*, *n*))^2 + max (max(*m*, *n*), 5*(min(*m*, *n*))^2 + 4*min(*m*, *n*));

If *jobz* = 'S' or 'A', *lwork*= min(*m*, *n*)*(6 + 4*min(*m*, *n*)) + max(*m*, *n*);

For complex flavors:

If *jobz* = 'N', *lwork*= 2*min(*m*, *n*) + max(*m*, *n*);

If *jobz* = 'O', *lwork*= 2*(min(*m*, *n*))^2 + max(*m*, *n*) + 2*min(*m*, *n*);

If *jobz* = 'S' or 'A', *lwork*= (min(*m*, *n*))^2 + max(*m*, *n*) + 2*min(*m*, *n*);

The optimal value of *lwork* returned by a workspace query generally provides better performance than the theoretical minimum value.The value of *lwork* returned by a workspace query is generally larger than the theoretical minimum value, but for very small matrices it can be smaller. The absolute minimum value of *lwork* is the minimum of the workspace query result and the theoretical minimum.

If you set *lwork* to a value less than the absolute minimum value and not equal to -1, the routine returns immediately with an error exit and does not provide information on the recommended workspace size.

?gejsv
Computes the singular value decomposition using a preconditioned Jacobi SVD method.

Syntax

```
call sgejsv(joba, jobu, jobv, jobr, jobt, jobp, m, n, a, lda, sva, u, ldu, v, ldv, work, lwork, iwork, info)
```

```
call dgejsv(joba, jobu, jobv, jobr, jobt, jobp, m, n, a, lda, sva, u, ldu, v, ldv, work, lwork, iwork, info)
```

```
call cgejsv (joba, jobu, jobv, jobr, jobt, jobp, m, n, a, lda, sva, u, ldu, v, ldv, cwork, lwork, rwork, lrwork, iwork, info )
```

```
call zgejsv (joba, jobu, jobv, jobr, jobt, jobp, m, n, a, lda, sva, u, ldu, v, ldv, cwork, lwork, rwork, lrwork, iwork, info )
```

Include Files

- mkl.fi

Description

The routine computes the singular value decomposition (SVD) of a real/complex *m*-by-*n* matrix *A*, where *m*≥*n*.

The SVD is written as

A = *U**Σ**V*^{T}, for real routines

A = *U**Σ**V*^{H}, for complex routines

where Σ is an *m*-by-*n* matrix which is zero except for its *n* diagonal elements, *U* is an *m*-by-*n* (or *m*-by-*m*) orthonormal matrix, and *V* is an *n*-by-*n* orthogonal matrix. The diagonal elements of Σ are the singular values of *A*; the columns of *U* and *V* are the left and right singular vectors of *A*, respectively. The matrices *U* and *V* are computed and stored in the arrays *u* and *v*, respectively. The diagonal of Σ is computed and stored in the array *sva*.

The ?gejsv routine can sometimes compute tiny singular values and their singular vectors much more accurately than other SVD routines.

The routine implements a preconditioned Jacobi SVD algorithm. It uses ?geqp3, ?geqrf, and ?gelqf as preprocessors and preconditioners. Optionally, an additional row pivoting can be used as a preprocessor, which in some cases results in much higher accuracy. An example is matrix *A* with the structure A = D1 * C * D2, where D1, D2 are arbitrarily ill-conditioned diagonal matrices and C is a well-conditioned matrix. In that case, complete pivoting in the first QR factorizations provides accuracy dependent on the condition number of C, and independent of D1, D2. Such higher accuracy is not completely understood theoretically, but it works well in practice.

If *A* can be written as `A = B*D`, with well-conditioned *B* and some diagonal *D*, then the high accuracy is guaranteed, both theoretically and in software, independent of *D*. For more details see [Drmac08-1], [Drmac08-2].

The computational range for the singular values can be the full range (`UNDERFLOW`,`OVERFLOW`), provided that the machine arithmetic and the BLAS and LAPACK routines called by `?gejsv` are implemented to work in that range. If that is not the case, the restriction for safe computation with the singular values in the range of normalized IEEE numbers is that the spectral condition number `kappa(A)=sigma_max(A)/sigma_min(A)` does not overflow. This code (`?gejsv`) is best used in this restricted range, meaning that singular values of magnitude below `||A||_2 / slamch('O')` (for single precision) or `||A||_2 / dlamch('O')` (for double precision) are returned as zeros. See *jobr* for details on this.

This implementation is slower than the one described in [Drmac08-1], [Drmac08-2] due to replacement of some non-LAPACK components, and because the choice of some tuning parameters in the iterative part (`?gesvj`) is left to the implementer on a particular machine.

The rank revealing QR factorization (in this code: `?geqp3`) should be implemented as in [Drmac08-3].

If *m* is much larger than *n*, it is obvious that the inital QRF with column pivoting can be preprocessed by the QRF without pivoting. That well known trick is not used in `?gejsv` because in some cases heavy row weighting can be treated with complete pivoting. The overhead in cases *m* much larger than *n* is then only due to pivoting, but the benefits in accuracy have prevailed. You can incorporate this extra QRF step easily and also improve data movement (matrix transpose, matrix copy, matrix transposed copy) - this implementation of `?gejsv` uses only the simplest, naive data movement.

Input Parameters

joba

`CHARACTER*1`. Must be `'C'`, `'E'`, `'F'`, `'G'`, `'A'`, or `'R'`.

Specifies the level of accuracy:

If *joba* `= 'C'`, high relative accuracy is achieved if *A* `= B*D` with well-conditioned *B* and arbitrary diagonal matrix *D*. The accuracy cannot be spoiled by column scaling. The accuracy of the computed output depends on the condition of *B*, and the procedure aims at the best theoretical accuracy. The relative error `max_{i=1:N}|d sigma_i| / sigma_i` is bounded by `f(M,N)*epsilon* cond(B)`, independent of *D*. The input matrix is preprocessed with the QRF with column pivoting. This initial preprocessing and preconditioning by a rank revealing QR factorization is common for all values of *joba*. Additional actions are specified as follows:

If *joba* `= 'E'`, computation as with `'C'` with an additional estimate of the condition number of *B*. It provides a realistic error bound.

If *joba* `= 'F'`, accuracy higher than in the `'C'` option is achieved, if *A* `= D1*C*D2` with ill-conditioned diagonal scalings *D1*, *D2*, and a well-conditioned matrix *C*. This option is advisable, if the structure of the input matrix is not known and relative accuracy is desirable. The input matrix *A* is preprocessed with QR factorization with full (row and column) pivoting.

If *joba* = 'G', computation as with 'F' with an additional estimate of the condition number of *B*, where *A* = *B***D*. If *A* has heavily weighted rows, using this condition number gives too pessimistic error bound.

If *joba* = 'A', small singular values are the noise and the matrix is treated as numerically rank defficient. The error in the computed singular values is bounded by f(m,n)*epsilon*||A||. The computed SVD A = U*S*V**t (for real flavors) or A = U*S*V**H (for complex flavors) restores *A* up to f(m,n)*epsilon*||A||. This enables the procedure to set all singular values below n*epsilon*||A|| to zero.

If *joba* = 'R', the procedure is similar to the 'A' option. Rank revealing property of the initial QR factorization is used to reveal (using triangular factor) a gap sigma_{r+1} < epsilon * sigma_r, in which case the numerical rank is declared to be *r*. The SVD is computed with absolute error bounds, but more accurately than with 'A'.

jobu CHARACTER*1. Must be 'U', 'F', 'W', or 'N'.

Specifies whether to compute the columns of the matrix *U*:

If *jobu* = 'U', *n* columns of *U* are returned in the array *u*

If *jobu* = 'F', a full set of *m* left singular vectors is returned in the array *u*.

If *jobu* = 'W', *u* may be used as workspace of length *m***n*. See the description of *u*.

If *jobu* = 'N', *u* is not computed.

jobv CHARACTER*1. Must be 'V', 'J', 'W', or 'N'.

Specifies whether to compute the matrix *V*:

If *jobv* = 'V', *n* columns of *V* are returned in the array *v*; Jacobi rotations are not explicitly accumulated.

If *jobv* = 'J', *n* columns of *V* are returned in the array *v* but they are computed as the product of Jacobi rotations. This option is allowed only if *jobu*≠'N'

If *jobv* = 'W', *v* may be used as workspace of length *n***n*. See the description of *v*.

If *jobv* = 'N', *v* is not computed.

jobr CHARACTER*1. Must be 'N' or 'R'.

Specifies the range for the singular values. If small positive singular values are outside the specified range, they may be set to zero. If *A* is scaled so that the largest singular value of the scaled matrix is around sqrt(big), big = ?lamch('O'), the function can remove columns of *A* whose norm in the scaled matrix is less than sqrt(?lamch('S')) (for *jobr* = 'R'), or less than small = ?lamch('S')/?lamch('E').

If *jobr* = 'N', the function does not remove small columns of the scaled matrix. This option assumes that BLAS and QR factorizations and triangular solvers are implemented to work in that range. If the condition of *A* if greater that big, use ?gesvj.

If *jobr* = 'R', restricted range for singular values of the scaled matrix *A* is [sqrt(?lamch('S'), sqrt(big)], roughly as described above. This option is recommended.

For computing the singular values in the full range [?lamch('S'),big], use ?gesvj.

jobt CHARACTER*1. Must be 'T' or 'N'.

If the matrix is square, the procedure may determine to use a transposed *A* if A^T (for real flavors) or A^H (for complex flavors) seems to be better with respect to convergence. If the matrix is not square, *jobt* is ignored.

The decision is based on two values of entropy over the adjoint orbit of A^T * *A* (for real flavors) or A^H * *A* (for complex flavors). See the descriptions of *work(6)* and *work(7)*.

If *jobt* = 'T', the function performs transposition if the entropy test indicates possibly faster convergence of the Jacobi process, if *A* is taken as input. If *A* is replaced with A^T or A^H, the row pivoting is included automatically.

If *jobt* = 'N', the functions attempts no speculations. This option can be used to compute only the singular values, or the full SVD (*u*, *sigma*, and *v*). For only one set of singular vectors (*u* or *v*), the caller should provide both *u* and *v*, as one of the arrays is used as workspace if the matrix *A* is transposed. The implementer can easily remove this constraint and make the code more complicated. See the descriptions of *u* and *v*.

Caution
The *jobt* = 'T' option is experimental and its effect might not be the same in subsequent releases. Consider using the *jobt* = 'N' instead.

jobp CHARACTER*1. Must be 'P' or 'N'.

Enables structured perturbations of denormalized numbers. This option should be active if the denormals are poorly implemented, causing slow computation, especially in cases of fast convergence. For details, see [Drmac08-1], [Drmac08-2] . For simplicity, such perturbations are included only when the full SVD or only the singular values are requested. You can add the perturbation for the cases of computing one set of singular vectors.

If *jobp* = 'P', the function introduces perturbation.

If *jobp* = 'N', the function introduces no perturbation.

m INTEGER. The number of rows of the input matrix *A*; $m \geq 0$.

n INTEGER. The number of columns in the input matrix *A*; $m \geq n \geq 0$.

a, *u*, *v* REAL for sgejsv

DOUBLE PRECISION for dgejsv.

COMPLEX for cgejsv

DOUBLE COMPLEX for zgejsv

Array *a*(*lda*,*n*) is an array containing the *m*-by-*n* matrix *A*.

u is a workspace array, its size is (*ldu*,*); the second dimension of *u* must be *m* if *jobu* = 'F' and *n* otherwise, . When *jobt* = 'T' and *m* = *n*, *u* must be provided even though *jobu* = 'N'.

v is a workspace array, its size is (*ldv*,*n*). When *jobt* = 'T' and *m* = *n*, *v* must be provided even though *jobv* = 'N'.

lda INTEGER. The leading dimension of the array *a*. Must be at least max(1, *m*) .

sva REAL for sgejsv

DOUBLE PRECISION for dgejsv.

REAL for cgejsv

DOUBLE PRECISION for zgejsv

sva is a workspace array, its size is *n*.

ldu INTEGER. The leading dimension of the array *u*; *ldu*≥ 1.

jobu = 'U' or 'F' or 'W', *ldu*≥*m* for column major layout.

ldv INTEGER. The leading dimension of the array *v*; *ldv*≥ 1.

jobv = 'V' or 'J' or 'W', *ldv*≥*n*.

work REAL for sgejsv

DOUBLE PRECISION for dgejsv.

work is a workspace array, its dimension max(7, *lwork*).

lwork INTEGER.

For real flavors:

Length of *work* to confirm proper allocation of work space. *lwork* depends on the task performed:

If only *sigma* is needed (*jobu* = 'N', *jobv* = 'N') and

- no scaled condition estimate is required, then *lwork*≥ max(2*m+n,4*n+1,7). This is the minimal requirement. For optimal performance (blocked code) the optimal value is *lwork*≥ max(2*m+n,3*n+(n+1)*nb,7). Here *nb* is the optimal block size for ?geqp3/?geqrf.

  In general, the optimal length *lwork* is computed as

  lwork≥ max(2*m+n,n+*lwork*(sgeqp3),n+*lwork*(sgeqrf),7) for sgejsv

  lwork≥ max(2*m+n,n+*lwork*(dgeqp3),n+*lwork*(dgeqrf),7) for dgejsv
- ... an estimate of the scaled condition number of *A* is required (*joba* = 'E', 'G'). In this case, *lwork* is the maximum of the above and *n*n+4*n*, that is, *lwork*≥ max(2*m+n,n*n+4*n,7). For optimal performance (blocked code) the optimal value is *lwork*≥ max(2*m+n,3*n+(n+1)*nb, n*n+4*n, 7).

In general, the optimal length *lwork* is computed as

lwork≥ max(2*m*+*n*,*n*+*lwork*(sgeqp3),*n*+*lwork*(sgeqrf),*n*+*n***n* +*lwork*(spocon, 7) for sgejsv

lwork≥ max(2*m*+*n*,*n*+*lwork*(dgeqp3),*n*+*lwork*(dgeqrf),*n*+*n***n* +*lwork*(dpocon, 7) for dgejsv

If *sigma* and the right singular vectors are needed (*jobv* = 'V'),

- the minimal requirement is *lwork*≥ max(2*m*+*n*,4*n*+1,7).
- for optimal performance, *lwork*≥ max(2*m*+*n*,3*n*+(*n*+1)**nb*,7), where *nb* is the optimal block size for ?geqp3, ?geqrf, ?gelqf, ?ormlq. In general, the optimal length *lwork* is computed as

  lwork≥ max(2*m*+*n*, *n*+*lwork*(sgeqp3), *n*+*lwork*(spocon), *n* +*lwork*(sgelqf), 2*n*+*lwork*(sgeqrf), *n*+*lwork*(sormlq) for sgejsv

  lwork≥ max(2*m*+*n*, *n*+*lwork*(dgeqp3), *n*+*lwork*(dpocon), *n* +*lwork*(dgelqf), 2*n*+*lwork*(dgeqrf), *n*+*lwork*(dormlq) for dgejsv

If *sigma* and the left singular vectors are needed

- the minimal requirement is *lwork*≥ max(2*n*+*m*,4*n*+1,7).
- for optimal performance,

  if *jobu* = 'U' :: *lwork*≥ max(2*m*+*n*,3*n*+(*n*+1)**nb*, 7),

  if *jobu* = 'F' :: *lwork*≥ max(2*m*+*n*,3*n*+(*n*+1)**nb*, *n*+*m***nb*, 7),

  where *nb* is the optimal block size for ?geqp3, ?geqrf, ?ormlq . In general, the optimal length *lwork* is computed as

  lwork≥ max(2*m*+*n*, *n*+*lwork*(sgeqp3), *n*+*lwork*(spocon), 2**n* +*lwork*(sgeqrf), *n*+*lwork*(sormlq) for sgejsv

  lwork≥ max(2*m*+*n*, *n*+*lwork*(dgeqp3), *n*+*lwork*(dpocon), 2**n* +*lwork*(dgeqrf), *n*+*lwork*(dormlq) for dgejsv

  Here *lwork*(?ormlq) equals *n***nb* (for *jobu* = 'U') or *m***nb* (for *jobu* = 'F')

If full SVD is needed (*jobu* = 'U' or 'F') and

- if *jobv* = 'V',

  the minimal requirement is *lwork*≥ max(2*m*+*n*, 6*n*+2*n***n*)
- if *jobv* = 'J',

  the minimal requirement is *lwork*≥ max(2*m*+*n*, 4*n*+*n***n*, 2*n*+*n***n* +6)
- For optimal performance, *lwork* should be additionally larger than *n* +*m***nb*, where *nb* is the optimal block size for ?ormlq.

For complex flavors:

Length of *cwork* to confirm proper allocation of workspace. The value of *lwork* depends on the job:

- If only *sigma* is needed (*jobu*.EQ.'N', *jobv*.EQ.'N') and

- no scaled condition estimate is required: *lwork*≥ 2*n+1. This is the minimal requirement. For optimal performance (blocked code) the optimal value is *lwork*≥*n* + (*n*+1)*nb*. Here *nb* is the optimal block size for ?geqp3 and ?geqrf. In general, optimal *lwork* is computed as *lwork*≥ max(*n*+*lwork*(?geqp3), *n*+*lwork*(?geqrf), *lwork*(?gesvj)).
- an estimate of the scaled condition number of *a* is required (*joba*='E' or 'G'). In this case, the minimal requirement is *lwork*≥*n***n* + 2**n*. For optimal performance (blocked code) the optimal value is *lwork*≥ max(*n*+(*n*+1)**nb*, *n***n*+3**n*) = n^2 + 2**n*. In general, the optimal length *lwork* is computed as *lwork*≥ max(*n* +*lwork*(?geqp3),*n*+*lwork*(?geqrf), *lwork*(?gesvj), *n*+*n***n* +*lwork*(?pocon)).

- If *sigma* and the right singular vectors are needed (*jobv*.EQ.'V' or *jobu*.EQ.'N') and
  - no scaled condition estimate is requested (*jobe* .EQ.'N'), then the minimal requirement is *lwork*≥ 3**n*. For optimal performance, *lwork*≥ max(*n*+(*n*+1)**nb*, 2**n*+*n***nb*) = 2**n*+*n***nb*, where *nb* is the optimal block size for ?geqp3, ?geqrf, ?gelq, ?unmlq.

    In general, the optimal length *lwork* is computed as *lwork*≥ max(*n* +*lwork*(?geqp3), *n*+*lwork*(?gesvj), *n*+*lwork*(?gelqf), 2**n* +*lwork*(?geqrf), *n*+*lwork*(?unmlq)).
  - an estimate of the scaled condition number of *a* is required (*joba*='E' or 'G'), then the minimal requirement is *lwork*≥ 3**n*. For optimal performance, *lwork*≥ max(*n*+(*n*+1)**nb*, 2**n*, 2**n* +*n***nb*) = 2**n*+*n***nb*, where *nb* is the optimal block size for ?geqp3, ?geqrf, ?gelq, ?unmlq

    In general, the optimal length *lwork* is computed as *lwork*≥ max(*n* +*lwork*(?geqp3), *n*+*lwork*(?pocon), *n*+*lwork*(?gesvj), *n* +*lwork*(?gelqf), 2**n*+*lwork*(?geqrf), *n*+*lwork*(?unmlq))
- If *sigma* and the left singular vectors are needed and
  - no scaled condition estimate is requested (*jobe* .EQ.'N'), then the minimal requirement is *lwork*≥ 3**n*.

    For optimal performance: if *jobu*.EQ.'U' :: *lwork*≥ max(3**n*, *n* +(*n*+1)**nb*, 2**n*+*n***nb*) = 2**n*+*n***nb*, where *nb* is the optimal block size for ?geqp3, ?geqrf, ?unmqr. In general, the optimal length *lwork* is computed as *lwork*≥ max(*n*+*lwork*(?geqp3),2**n* +*lwork*(?geqrf), *n*+*lwork*(?unmqr)).
  - an estimate of the scaled condition number of *a* is required (*joba*='E' or 'G'), then the minimal requirement is *lwork*≥ 3**n*.

    For optimal performance: if *jobu*.EQ.'U' :: *lwork*≥ max(3**n*, *n* +(*n*+1)**nb*, 2**n*+*n***nb*) = 2**n*+*n***nb*, where *nb* is the optimal block size for ?geqp3, ?geqrf, ?unmqr. In general, the optimal length *lwork* is computed as *lwork*≥ max(*n*+*lwork*(?geqp3),*n* +*lwork*(?pocon), 2**n*+*lwork*(?geqrf), *n*+*lwork*(?unmqr)).

then the minimal requirement is *lwork*≥ 3**n*. For optimal performance: if *jobu*.EQ.'U' :: *lwork*≥ max(3**n*, *n*+(*n*+1)**nb*, 2**n*+*n***nb*), where *nb* is the optimal block size for ?geqp3, ?geqrf, ?unmqr. In general, the optimal length *lwork* is computed as *lwork*≥ max(*n* +*lwork*(?geqp3),*n*+*lwork*(?pocon), 2**n*+*lwork*(?geqrf), *n* +*lwork*(?unmqr)).

- If the full SVD is needed: (*jobu*.EQ.'U' or *jobu*.EQ.'F') and
  - if *jobv*.EQ.'V' the minimal requirement is *lwork*≥ 5**n*+2**n***n*.
  - if *jobv*.EQ.'J' the minimal requirement is *lwork*≥ 4**n*+*n***n*. In both cases, the allocated *cwork* can accommodate blocked runs of ?geqp3, ?geqrf, ?gelqf, ?unmqr, ?unmlq.

If the call to ?gejsv is a workspace query (indicated by *lwork* = -1 or *lrwork* = -1), then on exit *cwork*(1) contains the required length of *cwork* for the job parameters used in the call.

cwork

COMPLEX for cgejsv

DOUBLE COMPLEX for zgejsv

cwork is a workspace array of size max(2, *lwork*).

If the call to ?gejsv is a workspace query (indicated by *lwork* = -1 or *lrwork* = -1), then on exit *cwork*(1) contains the required length of *cwork* for the job parameters used in the call.

rwork

REAL for cgejsv

DOUBLE PRECISION for zgejsv

rwork is an array of size at least max(7, *lrwork*) for real flavors and at least max(7, *lwork*) for complex flavors.

lrwork

INTEGER. Length of *rwork* to confirm proper allocation of workspace. *lrwork* depends on the job:

1. If only singular values are requested i.e. if lsame(*jobu*,'N') .AND. lsame(*jobv*,'N') then:

- If lsame(*jobt*,'T') .OR. lsame(*joba*,'F') .OR. lsame(*joba*,'G'), then *lrwork* = max(7, 2 * *m*).
- Otherwise, *lrwork* = max(7, *n*).

2. If singular values with the right singular vectors are requested i.e. if (lsame(*jobv*,'V').OR.lsame(*jobv*,'J')) .AND. .NOT. (lsame(*jobu*,'U').OR.lsame(*jobu*,'F')) then:

- If lsame(*jobt*,'T') .OR. lsame(*joba*,'F') .OR. lsame(*joba*,'G'), then *lrwork* = max(7, 2 * *m*).
- Otherwise, *lrwork* = max(7, *n*).

3. If singular values with the left singular vectors are requested, i.e. if (lsame(*jobu*,'U').OR.lsame(*jobu*,'F')) .AND. .NOT. (lsame(*jobv*,'V').OR.lsame(*jobv*,'J')) then:

- If lsame(*jobt*,'T') .OR. lsame(*joba*,'F') .OR. lsame(*joba*,'G'), then *lrwork* = max(7, 2 * *m*).
- Otherwise, *lrwork* = max(7, *n*).

4. If singular values with both the left and the right singular vectors are requested, i.e. if `(lsame(jobu,'U').OR.lsame(jobu,'F')) .AND. (lsame(jobv,'V').OR.lsame(jobv,'J'))` then:

- If `lsame(jobt,'T') .OR. lsame(joba,'F') .OR. lsame(joba,'G')`, then `lrwork = max( 7, 2 * m )`.
- Otherwise, `lrwork = max( 7, n )`.

For complex flavors, if the call to `?gejsv` is a workspace query (indicated by `lwork` = -1 or `lrwork` = -1), then on exit `rwork(1)` contains the required length of `rwork` for the job parameters used in the call.

iwork

`INTEGER`. Workspace array, of size

For real flavors:

).

max(3, *m*+3**n*max(3, 2 * *n* + *m*).

For complex flavors, the size depends on the job but is at least 4:

- If only the singular values are requested and `lsame(jobt,'T') .OR. lsame(joba,'F') .OR. lsame(joba,'G')`, then the length of *iwork* is *n* + *m*; otherwise the length of *iwork* is *n*.
- If the singular values and the right singular vectors are requested and `lsame(jobt,'T') .OR. lsame(joba,'F') .OR. lsame(joba,'G')`, then the length of *iwork* is *n* + *m*; otherwise the length of *iwork* is *n*.
- If the singular values and the left singular vectors are requested and `lsame(jobt,'T') .OR. lsame(joba,'F') .OR. lsame(joba,'G')`, then the length of *iwork* is *n* + *m*; otherwise the length of *iwork* is *n*.
- If the singular values and both the left and the right singular vectors are requested and
  - if `lsame(jobv,'J')`, if `lsame(jobt,'T') .OR. lsame(joba,'F') .OR. lsame(joba,'G')`, then the length of *iwork* is *n* + *m*; otherwise the length of *iwork* is *n*.
  - if `lsame(jobv,'V')` , if `lsame(jobt,'T') .OR. lsame(joba,'F') .OR. lsame(joba,'G')`, then the length of *iwork* is 2**n* + *m*; otherwise the length of *iwork* is 2**n*.

  and `lsame(jobt,'T') .OR. lsame(joba,'F') .OR. lsame(joba,'G')`, then the length of *iwork* is *n* + *m*; otherwise the length of *iwork* is *n*.

Output Parameters

sva

On exit:

For `work(1)/work(2) = one`: the singular values of *A*. During the computation *sva* contains Euclidean column norms of the iterated matrices in the array *a*.

For *work(1)≠work(2)*: the singular values of *A* are `(work(1)/work(2)) * sva(1:n)`. This factored form is used if *sigma_max(A)* overflows or if small singular values have been saved from underflow by scaling the input matrix *A*.

jobr = 'R', some of the singular values may be returned as exact zeros obtained by 'setting to zero' because they are below the numerical rank threshold or are denormalized numbers.

u On exit:

If *jobu* = 'U', contains the *m*-by-*n* matrix of the left singular vectors.

If *jobu* = 'F', contains the *m*-by-*m* matrix of the left singular vectors, including an orthonormal basis of the orthogonal complement of the range of *A*.

If *jobu* = 'W' and *jobv* = 'V', *jobt* = 'T', and *m* = *n*, then *u* is used as workspace if the procedure replaces *A* with A^T (for real flavors) or A^H (for complex flavors). In that case, *v* is computed in *u* as left singular vectors of A^T or A^H and copied back to the *v* array. This 'W' option is just a reminder to the caller that in this case *u* is reserved as workspace of length *n***n*.

If *jobu* = 'N', *u* is not referenced.

v On exit:

If *jobv* = 'V' or 'J', contains the *n*-by-*n* matrix of the right singular vectors.

If *jobv* = 'W' and *jobu* = 'U', *jobt* = 'T', and *m* = *n*, then *v* is used as workspace if the procedure replaces *A* with A^T (for real flavors) or A^H (for complex flavors). In that case, *u* is computed in *v* as right singular vectors of A^T or A^H and copied back to the *u* array. This 'W' option is just a reminder to the caller that in this case *v* is reserved as workspace of length *n***n*.

If *jobv* = 'N', *v* is not referenced.

work On exit,

work(1) = *scale* = *work(2)*/*work(1)* is the scaling factor such that *scale***sva*(1:*n*) are the computed singular values of *A*. See the description of *sva()*.

work(2) = see the description of *work(1)*.

work(3) = *sconda* is an estimate for the condition number of column equilibrated *A*. If *joba* = 'E' or 'G', *sconda* is an estimate of sqrt(|| (R**t * R)**(-1)||_1). It is computed using ?pocon. It holds *n***(-1/4) * *sconda*≤ ||R**(-1)||_2 ≤*n***(1/4) * *sconda*, where R is the triangular factor from the QRF of *A*. However, if R is truncated and the numerical rank is determined to be strictly smaller than *n*, *sconda* is returned as -1, indicating that the smallest singular values might be lost.

If full SVD is needed, the following two condition numbers are useful for the analysis of the algorithm. They are provided for a user who is familiar with the details of the method.

work(4) = an estimate of the scaled condition number of the triangular factor in the first QR factorization.

work(5) = an estimate of the scaled condition number of the triangular factor in the second QR factorization.

The following two parameters are computed if *jobt* = 'T'. They are provided for a user who is familiar with the details of the method.

work(6) = the entropy of *A**t**A* :: this is the Shannon entropy of diag(*A**t**A*) / Trace(*A**t**A*) taken as point in the probability simplex.

work(7) = the entropy of *A***A**t.

rwork

On exit,

rwork(1) determines the scaling factor *scale* = *rwork(2)* / *rwork(1)* such that *scale***sva*(1:*n*) are the computed singular values of *a*. (See the description of *sva()*.)

rwork(2) = see the description of *rwork(1)*.

rwork(3) = *sconda* is an estimate for the condition number of column equilibrated *A*. If *joba* = 'E' or 'G', *sconda* is an estimate of SQRT(||(R^* * R)^(-1)||_1). It is computed using ?pocon. It holds *n*^(-1/4) * *sconda*≤ ||R^(-1)||_2 ≤*n*^(1/4) * *sconda* where R is the triangular factor from the QRF of *A*. However, if R is truncated and the numerical rank is determined to be strictly smaller than *n*, *sconda* is returned as -1, thus indicating that the smallest singular values might be lost.

If full SVD is needed, the following two condition numbers are useful for the analysis of the algorithm. They are provided for a user who is familiar with the details of the method.

rwork(4) = an estimate of the scaled condition number of the triangular factor in the first QR factorization.

rwork(5) = an estimate of the scaled condition number of the triangular factor in the second QR factorization.

The following two parameters are computed if *jobt* = 'T'. They are provided for a user who is familiar with the details of the method.

rwork(6) = the entropy of *A*^* * *A* :: this is the Shannon entropy of diag(*A*^* * *A*) / Trace(*A*^* * *A*) taken as point in the probability simplex.

rwork(7) = the entropy of *A* * *A*^*. (See the description of *rwork(6)*.)

For complex flavors, if the call to ?gejsv is a workspace query (indicated by *lwork* = -1 or *lrwork* = -1), then on exit *rwork*(1) contains the required length of *rwork* for the job parameters used in the call.

iwork

INTEGER. On exit,

iwork(1) = the numerical rank determined after the initial QR factorization with pivoting. See the descriptions of *joba* and *jobr*.

iwork(2) = the number of the computed nonzero singular value.

iwork(3) = if nonzero, a warning message. If *iwork(3)*=1, some of the column norms of *A* were denormalized floats. The requested high accuracy is not warranted by the data.

For complex flavors, *iwork(4)* = 1 or -1. If *iwork(4)* = 1, then the procedure used A^H to do the job as specified by the *job* parameters.

For complex flavors, if the call to ?gejsv is a workspace query (indicated by *lwork* = -1 or *lrwork* = -1), then on exit *iwork*(1) contains the required length of *iwork* for the job parameters used in the call.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* > 0, the function did not converge in the maximal number of sweeps. The computed values may be inaccurate.

Description

The routine computes the singular value decomposition (SVD) of a real or complex m-by-n matrix A, where $m \geq n$.

The SVD of A is written as

$A = U * \Sigma * V^T$ for real flavors, or

$A = U * \Sigma * V^H$ for complex flavors,

where Σ is an m-by-n diagonal matrix, U is an m-by-n orthonormal matrix, and V is an n-by-n orthogonal/unitary matrix. The diagonal elements of Σ are the singular values of A; the columns of U and V are the left and right singular vectors of A, respectively. The matrices U and V are computed and stored in the arrays u and v, respectively. The diagonal of Σ is computed and stored in the array *sva*.

The ?gesvj routine can sometimes compute tiny singular values and their singular vectors much more accurately than other SVD routines.

The n-by-n orthogonal matrix V is obtained as a product of Jacobi plane rotations. The rotations are implemented as fast scaled rotations of Anda and Park [AndaPark94]. In the case of underflow of the Jacobi angle, a modified Jacobi transformation of Drmac ([Drmac08-4]) is used. Pivot strategy uses column interchanges of de Rijk ([deRijk98]). The relative accuracy of the computed singular values and the accuracy of the computed singular vectors (in angle metric) is as guaranteed by the theory of Demmel and Veselic [Demmel92]. The condition number that determines the accuracy in the full rank case is essentially

$$\left(\min_{i} d_{ii}\right) \cdot \kappa(A \cdot D)$$

where $\kappa(.)$ is the spectral condition number. The best performance of this Jacobi SVD procedure is achieved if used in an accelerated version of Drmac and Veselic [Drmac08-1], [Drmac08-2].

The computational range for the nonzero singular values is the machine number interval (`UNDERFLOW`,`OVERFLOW`). In extreme cases, even denormalized singular values can be computed with the corresponding gradual loss of accurate digit.

Input Parameters

joba

`CHARACTER*1`. Must be `'L'`, `'U'` or `'G'`.

Specifies the structure of *A*:

If *joba* = `'L'`, the input matrix *A* is lower triangular.

If *joba* = `'U'`, the input matrix *A* is upper triangular.

If *joba* = `'G'`, the input matrix *A* is a general m-by-n, $m \geq n$.

jobu

`CHARACTER*1`. Must be `'U'`, `'C'` or `'N'`.

Specifies whether to compute the left singular vectors (columns of *U*):

If *jobu* = `'U'`, the left singular vectors corresponding to the nonzero singular values are computed and returned in the leading columns of *A*. See more details in the description of *a*. The default numerical orthogonality threshold is set to approximately `TOL=CTOL*EPS, CTOL=sqrt(m), EPS = ?lamch('E')`

If *jobu* = `'C'`, analogous to *jobu* = `'U'`, except that you can control the level of numerical orthogonality of the computed left singular vectors. `TOL` can be set to `TOL=CTOL*EPS`, where `CTOL` is given on input in the array *work*. No `CTOL` smaller than ONE is allowed. `CTOL` greater than `1 / EPS` is meaningless. The option `'C'` can be used if *m*`*EPS` is satisfactory orthogonality of the computed left singular vectors, so `CTOL=`*m* could save a few sweeps of Jacobi rotations. See the descriptions of *a* and *work(1)*.

If *jobu* = `'N'`, *u* is not computed. However, see the description of *a*.

jobv

`CHARACTER*1`. Must be `'V'`, `'A'` or `'N'`.

Specifies whether to compute the right singular vectors, that is, the matrix *V*:

If *jobv* = `'V'`, the matrix *V* is computed and returned in the array *v*.

If *jobv* = 'A', the Jacobi rotations are applied to the *mv*-by-*n* array *v*. In other words, the right singular vector matrix *V* is not computed explicitly, instead it is applied to an *mv*-by-*n* matrix initially stored in the first *mv* rows of *V*.

If *jobv* = 'N', the matrix *V* is not computed and the array *v* is not referenced.

m

INTEGER. The number of rows of the input matrix *A*.

1/slamch('E')> *m*≥ 0 for sgesvj.

1/dlamch('E')> *m*≥ 0 for dgesvj.

n

INTEGER. The number of columns in the input matrix *A*; *m*≥*n*≥ 0.

a, *v*

REAL for sgesvj

DOUBLE PRECISION for dgesvj.

COMPLEX for cgesvj

DOUBLE COMPLEX for zgesvj

Array *a*(*lda*,*n*) is an array containing the *m*-by-*n* matrix *A*.

Array *v* is a workspace array, its dimension is (*ldv*,*); the second dimension of *v* must be at least max(1, *n*).

lda

INTEGER. The leading dimension of the array *a*. Must be at least max(1, *m*) .

mv

INTEGER.

If*jobv* = 'A', the product of Jacobi rotations in ?gesvj is applied to the first *mv* rows of *v*. See the description of *jobv*. 0 ≤*mv*≤*ldv*.

ldv

INTEGER. The leading dimension of the array *v*; *ldv*≥ 1.

jobv = 'V', *ldv*≥ max(1, *n*).

jobv = 'A', *ldv*≥ max(1, *mv*).

work

REAL for sgesvj

DOUBLE PRECISION for dgesvj.

work is a workspace array, its dimension max(4, *m*+*n*).

If *jobu* = 'C', *work(1)*=CTOL, where CTOL defines the threshold for convergence. The process stops if all columns of *A* are mutually orthogonal up to CTOL*EPS, EPS=?lamch('E'). It is required that CTOL ≥ 1, that is, it is not allowed to force the routine to obtain orthogonality below ε.

cwork

COMPLEX for cgesvj

DOUBLE COMPLEX for zgesvj

cwork is a workspace array, its dimension *m*+*n*.

lwork

INTEGER.

Length of *work* for real flavors or *cwork* for complex flavors, *lwork*≥ max(6,*m*+*n*).

rwork

REAL for cgesvj

DOUBLE PRECISION for zgesvj

rwork is a workspace array, its dimension max(6,*m*+*n*).

If *jobu* = 'C', *rwork(1)* = CTOL, where CTOL defines the threshold for convergence. The process stops if all columns of *a* are mutually orthogonal up to CTOL*EPS, EPS=?lamch('E'). It is required that CTOL≥ 1, that is, it is not allowed to force the routine to obtain orthogonality below ε.

lrwork

INTEGER for cgesvj

INTEGER for zgesvj

Length of *rwork*, *lrwork*≥ max(6,*n*).

Output Parameters

a

On exit:

If *jobu* = 'U' or *jobu* = 'C':

- if *info* = 0, the leading columns of *A* contain left singular vectors corresponding to the computed singular values of *a* that are above the underflow threshold ?lamch('S'), that is, non-zero singular values. The number of the computed non-zero singular values is returned in *work(2)* for real flavors or *rwork(2)* for complex flavors. Also see the descriptions of *sva* and *work* for real flavors or *rwork* for complex flavors. The computed columns of *u* are mutually numerically orthogonal up to approximately TOL=sqrt(*m*)*EPS (default); or TOL=CTOL*EPS*jobu* = 'C', see the description of *jobu*.
- if *info* > 0, the procedure ?gesvj did not converge in the given number of iterations (sweeps). In that case, the computed columns of *u* may not be orthogonal up to TOL. The output *u* (stored in *a*), *sigma* (given by the computed singular values in *sva*(1:n)) and *v* is still a decomposition of the input matrix *A* in the sense that the residual $||A-scale*U*sigma*V^{T}||_2 / ||A||_2$ for real flavors or $||A-scale*U*sigma*V^{H}||_2 / ||A||_2$ for complex flavors (where scale = *stat*[0]) is small.

If *jobu* = 'N':

- if *info* = 0, note that the left singular vectors are 'for free' in the one-sided Jacobi SVD algorithm. However, if only the singular values are needed, the level of numerical orthogonality of *u* is not an issue and iterations are stopped when the columns of the iterated matrix are numerically orthogonal up to approximately *m**EPS. Thus, on exit, *a* contains the columns of *u* scaled with the corresponding singular values.
- if *info* > 0, the procedure ?gesvj did not converge in the given number of iterations (sweeps).

sva

REAL for sgesvj

DOUBLE PRECISION for dgesvj.

REAL for cgesvj

DOUBLE PRECISION for zgesvj

Array size *n*.

If *info* = 0, depending on the value *scale* =*work(1)* for real flavors or *rwork(1)* for complex flavors, where *scale* is the scaling factor:

- if *scale* = 1, *sva*(1:n) contains the computed singular values of *a*.

  During the computation, *sva* contains the Euclidean column norms of the iterated matrices in the array *a*.
- if *scale*≠ 1, the singular values of *a* are *scale***sva*(1:n), and this factored representation is due to the fact that some of the singular values of *a* might underflow or overflow.

If *info* > 0, the procedure ?gesvj did not converge in the given number of iterations (sweeps) and *scale***sva*(1:n) may not be accurate.

v

On exit:

If *jobv* = 'V', contains the *n*-by-*n* matrix of the right singular vectors.

If *jobv* = 'A', then *v* contains the product of the computed right singular vector matrix and the initial matrix in the array *v*.

If *jobv* = 'N', *v* is not referenced.

work

On exit,

work(1) = *scale* is the scaling factor such that *scale***sva*(1:*n*) are the computed singular values of *A*. See the description of *sva*().

work(2) is the number of the computed nonzero singular values.

work(3) is the number of the computed singular values that are larger than the underflow threshold.

work(4) is the number of sweeps of Jacobi rotations needed for numerical convergence.

work(5) = max_{i≠j} |COS(A(:,i),A(:,j))| in the last sweep. This is useful information in cases when ?gesvj did not converge, as it can be used to estimate whether the output is still useful and for post festum analysis.

work(6) is the largest absolute value over all sines of the Jacobi rotation angles in the last sweep. It can be useful in a post festum analysis.

rwork

On exit,

rwork(1) = *scale* is the scaling factor such that *scale***sva*(1:*n*) are the computed singular values of *A*. See description of *sva()*.

rwork(2) is the number of the computed nonzero singular values.

rwork(3) is the number of the computed singular values that are larger than the underflow threshold.

rwork(4) is the number of sweeps of Jacobi rotations needed for numerical convergence.

rwork(5) = max_{i≠j} |COS(A(:,i),A(:,j))| in the last sweep. This is useful information in cases when ?gesvj did not converge, as it can be used to estimate whether the output is still useful and for post festum analysis.

rwork(6) is the largest absolute value over all sines of the Jacobi rotation angles in the last sweep. It can be useful for a post festum analysis.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* > 0, the function did not converge in the maximal number (30) of sweeps. The output may still be useful. See the description of *work* or *rwork*.

Description

This routine is deprecated; use ggsvd3.

The routine computes the generalized singular value decomposition (GSVD) of an *m*-by-*n* real/complex matrix *A* and *p*-by-*n* real/complex matrix *B*:

$U'*A*Q = D_1*(0\ R), V'*B*Q = D_2*(0\ R),$

where *U*, *V* and *Q* are orthogonal/unitary matrices and *U*', *V*' mean transpose/conjugate transpose of *U* and *V* respectively.

Let *k*+*l* = the effective numerical rank of the matrix (*A*', *B*')', then *R* is a (*k*+*l*)-by-(*k*+*l*) nonsingular upper triangular matrix, D_1 and D_2 are *m*-by-(*k*+*l*) and *p*-by-(*k*+*l*) "diagonal" matrices and of the following structures, respectively:

If *m*-*k*-*l*≥0,

$$D_1 = \begin{array}{c} \\ k \\ l \\ m-k-l \end{array} \begin{array}{c} \begin{array}{cc} k & l \end{array} \\ \begin{pmatrix} I & 0 \\ 0 & C \\ 0 & 0 \end{pmatrix} \end{array}$$

$$D_2 = \begin{array}{c} \\ l \\ p-l \end{array} \begin{array}{c} \begin{array}{cc} k & l \end{array} \\ \begin{pmatrix} 0 & S \\ 0 & 0 \end{pmatrix} \end{array}$$

$$(0 \quad R) = \begin{array}{c} \\ k \\ l \end{array} \begin{array}{c} \begin{array}{ccc} n-k-l & k & l \end{array} \\ \begin{pmatrix} 0 & R_{11} & R_{12} \\ 0 & 0 & R_{22} \end{pmatrix} \end{array},$$

where

C = diag($alpha(K+1)$,..., $alpha(K+l)$)

S = diag($beta(K+1)$,...,$beta(K+l)$)

$C^2 + S^2 = I$

R is stored in $a(1{:}k+l, n-k-l+1{:}n)$ on exit.

If $m-k-l < 0$,

$$D_1 = \begin{array}{c} \\ k \\ m-k \end{array} \begin{array}{c} \begin{array}{ccc} k & m-k & k+l-m \end{array} \\ \begin{pmatrix} I & 0 & 0 \\ 0 & C & 0 \end{pmatrix} \end{array}$$

$$D_2 = \begin{array}{r} \\ m-k \\ k+l-m \\ p-l \end{array} \begin{array}{c} \begin{array}{ccc} k & m-k & k+l-m \end{array} \\ \begin{pmatrix} 0 & S & 0 \\ 0 & 0 & I \\ 0 & 0 & 0 \end{pmatrix} \end{array}$$

$$(0 \quad R) = \begin{array}{r} \\ k \\ m-k \\ k+l-m \end{array} \begin{array}{c} \begin{array}{cccc} n-k-l & k & m-k & k+l-m \end{array} \\ \begin{pmatrix} 0 & R_{11} & R_{12} & R_{13} \\ 0 & 0 & R_{22} & R_{23} \\ 0 & 0 & 0 & R_{33} \end{pmatrix} \end{array}$$

where

C = diag($alpha(K+1)$,..., $alpha(m)$),

S = diag($beta(K+1)$,...,$beta(m)$),

$C_2 + S_2 = I$

On exit,

$$\begin{pmatrix} R_{11} & R_{12} & R_{13} \\ 0 & R_{22} & R_{23} \end{pmatrix}$$

is stored in $a(1{:}m, n{-}k{-}l{+}1{:}n)$ and R_{33} is stored in $b(m{-}k{+}1{:}l, n{+}m{-}k{-}l{+}1{:}n)$.

The routine computes *C*, *S*, *R*, and optionally the orthogonal/unitary transformation matrices *U*, *V* and *Q*.

In particular, if *B* is an *n*-by-*n* nonsingular matrix, then the GSVD of *A* and *B* implicitly gives the SVD of $A*B^{-1}$:

$A*B^{-1} = U*(D_1*D_2^{-1})*V'$.

If (*A*', *B*')' has orthonormal columns, then the GSVD of *A* and *B* is also equal to the CS decomposition of *A* and *B*. Furthermore, the GSVD can be used to derive the solution of the eigenvalue problem:

$A'*A*x = \lambda*B'*B*x$.

Input Parameters

jobu — CHARACTER*1. Must be 'U' or 'N'.
If *jobu* = 'U', orthogonal/unitary matrix *U* is computed.
If *jobu* = 'N', *U* is not computed.

jobv — CHARACTER*1. Must be 'V' or 'N'.
If *jobv* = 'V', orthogonal/unitary matrix *V* is computed.
If *jobv* = 'N', *V* is not computed.

jobq — CHARACTER*1. Must be 'Q' or 'N'.
If *jobq* = 'Q', orthogonal/unitary matrix *Q* is computed.
If *jobq* = 'N', *Q* is not computed.

m — INTEGER. The number of rows of the matrix *A* (*m*≥ 0).

n — INTEGER. The number of columns of the matrices *A* and *B* (*n*≥ 0).

p — INTEGER. The number of rows of the matrix *B* (*p*≥ 0).

a, *b*, *work* — REAL for sggsvd
DOUBLE PRECISION for dggsvd
COMPLEX for cggsvd
DOUBLE COMPLEX for zggsvd.
Arrays:
a(*lda*,*) contains the *m*-by-*n* matrix *A*.
The second dimension of *a* must be at least max(1, *n*).
b(*ldb*,*) contains the *p*-by-*n* matrix *B*.
The second dimension of *b* must be at least max(1, *n*).
work(*) is a workspace array.
The dimension of *work* must be at least max(3*n*, *m*, *p*)+*n*.

lda — INTEGER. The leading dimension of *a*; at least max(1, *m*).

ldb — INTEGER. The leading dimension of *b*; at least max(1, *p*).

ldu — INTEGER. The leading dimension of the array *u* .
ldu≥ max(1, *m*) if *jobu* = 'U'; *ldu*≥ 1 otherwise.

ldv — INTEGER. The leading dimension of the array *v* .
ldv≥ max(1, *p*) if *jobv* = 'V'; *ldv*≥ 1 otherwise.

ldq — INTEGER. The leading dimension of the array *q* .
ldq≥ max(1, *n*) if *jobq* = 'Q'; *ldq*≥ 1 otherwise.

iwork — INTEGER.
Workspace array, size at least max(1, *n*).

rwork

REAL for cggsvd DOUBLE PRECISION for zggsvd.

Workspace array, size at least max(1, 2*n*). Used in complex flavors only.

Output Parameters

k, *l*

INTEGER. On exit, *k* and *l* specify the dimension of the subblocks. The sum *k*+*l* is equal to the effective numerical rank of (*A*', *B*')'.

a

On exit, *a* contains the triangular matrix *R* or part of *R*.

b

On exit, *b* contains part of the triangular matrix R if *m*-*k*-*l* < 0.

alpha, *beta*

REAL for single-precision flavors

DOUBLE PRECISION for double-precision flavors.

Arrays, size at least max(1, *n*) each.

Contain the generalized singular value pairs of *A* and *B*:

alpha(1:*k*) = 1,

beta(1:*k*) = 0,

and if *m*-*k*-*l*≥ 0,

alpha(*k*+1:*k*+*l*) = *C*,

beta(*k*+1:*k*+*l*) = *S*,

or if *m*-*k*-*l* < 0,

alpha(*k*+1:*m*)= *C*, *alpha*(*m*+1:*k*+*l*)=0

beta(*k*+1:*m*) = *S*, *beta*(*m*+1:*k*+*l*) = 1

and

alpha(*k*+*l*+1:*n*) = 0

beta(*k*+*l*+1:*n*) = 0.

u, *v*, *q*

REAL for sggsvd

DOUBLE PRECISION for dggsvd

COMPLEX for cggsvd

DOUBLE COMPLEX for zggsvd.

Arrays:

u(*ldu*,*); the second dimension of *u* must be at least max(1, *m*).

If *jobu* = 'U', *u* contains the *m*-by-*m* orthogonal/unitary matrix *U*.

If *jobu* = 'N', *u* is not referenced.

v(*ldv*,*); the second dimension of *v* must be at least max(1, *p*).

If *jobv* = 'V', *v* contains the *p*-by-*p* orthogonal/unitary matrix *V*.

If *jobv* = 'N', *v* is not referenced.

q(*ldq*,*); the second dimension of *q* must be at least max(1, *n*).

If *jobq* = 'Q', *q* contains the *n*-by-*n* orthogonal/unitary matrix *Q*.

If *jobq* = 'N', *q* is not referenced.

iwork — On exit, *iwork* stores the sorting information.

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = 1, the Jacobi-type procedure failed to converge. For further details, see subroutine tgsja.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine ggsvd interface are the following:

a — Holds the matrix *A* of size (*m*, *n*).

b — Holds the matrix *B* of size (*p*, *n*).

alpha — Holds the vector of length *n*.

beta — Holds the vector of length *n*.

u — Holds the matrix *U* of size (*m*, *m*).

v — Holds the matrix *V* of size (*p*, *p*).

q — Holds the matrix *Q* of size (*n*, *n*).

iwork — Holds the vector of length *n*.

jobu — Restored based on the presence of the argument *u* as follows:

jobu = 'U', if *u* is present, *jobu* = 'N', if *u* is omitted.

jobv — Restored based on the presence of the argument *v* as follows:

jobz = 'V', if *v* is present,

jobz = 'N', if *v* is omitted.

jobq — Restored based on the presence of the argument *q* as follows:

jobz = 'Q', if *q* is present,

jobz = 'N', if *q* is omitted.

Include Files

- mkl.fi

Description

?gesvdx computes the singular value decomposition (SVD) of a real or complex m-by-n matrix *A*, optionally computing the left and right singular vectors. The SVD is written

A = *U* * *Σ* * transpose(*V*)

where *Σ* is an *m*-by-*n* matrix which is zero except for its min(*m*,*n*) diagonal elements, *U* is an *m*-by-*m* matrix, and *V* is an *n*-by-*n* matrix. The matrices *U* and *V* are orthogonal for real *A*, and unitary for complex *A*. The diagonal elements of *Σ* are the singular values of *A*; they are real and non-negative, and are returned in descending order. The first min(*m*,*n*) columns of *U* and *V* are the left and right singular vectors of *A*.

?gesvdx uses an eigenvalue problem for obtaining the SVD, which allows for the computation of a subset of singular values and vectors. See ?bdsvdx for details.

Note that the routine returns V^T, not *V*.

Input Parameters

jobu

CHARACTER*1. Specifies options for computing all or part of the matrix *U*:

= 'V': the first min(*m*,*n*) columns of *U* (the left singular vectors) or as specified by *range* are returned in the array *u*;

= 'N': no columns of *U* (no left singular vectors) are computed.

jobvt

CHARACTER*1. Specifies options for computing all or part of the matrix V^T:

= 'V': the first min(*m*,*n*) rows of V^T (the right singular vectors) or as specified by *range* are returned in the array *vt*;

= 'N': no rows of V^T (no right singular vectors) are computed.

range

CHARACTER*1. = 'A': find all singular values.

= 'V': all singular values in the half-open interval (*vl*,*vu*] are found.

= 'I': the *il*-th through *iu*-th singular values are found.

m

INTEGER. The number of rows of the input matrix *A*. $m \geq 0$.

n

INTEGER. The number of columns of the input matrix *A*. $n \geq 0$.

a

REAL for sgesvdx

DOUBLE PRECISION for dgesvdx

COMPLEX for cgesvdx

DOUBLE COMPLEX for zgesvdx

Array, size (*lda*,*n*)

On entry, the *m*-by-*n* matrix *A*.

lda INTEGER. The leading dimension of the array *a*.

lda≥ max(1,*m*).

vl REAL for sgesvdx

DOUBLE PRECISION for dgesvdx

REAL for cgesvdx

DOUBLE PRECISION for zgesvdx

vl≥0.

vu REAL for sgesvdx

DOUBLE PRECISION for dgesvdx

REAL for cgesvdx

DOUBLE PRECISION for zgesvdx

If *range*='V', the lower and upper bounds of the interval to be searched for singular values. *vu* > *vl*. Not referenced if *range* = 'A' or 'I'.

il INTEGER.

iu INTEGER. If *range*='I', the indices (in ascending order) of the smallest and largest singular values to be returned. 1 ≤*il*≤*iu*≤ min(*m*,*n*), if min(*m*,*n*) > 0. Not referenced if *range* = 'A' or 'V'.

ldu INTEGER. The leading dimension of the array *u*. *ldu*≥ 1; if *jobu* = 'V', *ldu*≥*m*.

ldvt INTEGER. The leading dimension of the array *vt*. *ldvt*≥ 1; if *jobvt* = 'V', *ldvt*≥*ns* (see above).

work REAL for sgesvdx

DOUBLE PRECISION for dgesvdx

COMPLEX for cgesvdx

DOUBLE COMPLEX for zgesvdx

Array, size (max(1,*lwork*)).

On exit, if info = 0, *work*(1) returns the optimal *lwork*;

lwork INTEGER. The size of the array *work*.

lwork≥ max(1, min(*m*, *n*)*(min(*m*, *n*) + 4)) for the paths (see comments inside the code):

- PATH 1 (*m* much larger than *n*)
- PATH 1t (*n* much larger than *m*)

lwork≥ max(1, min(*m*, *n*)*2 + max(*m*, *n*)) for the other paths. For good performance, *lwork* should generally be larger.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

rwork

REAL for cgesvdx

DOUBLE PRECISION for zgesvdx

Array, size (max(1, *lrwork*)).

lrwork≥ min(*m*, *n*)*(min(*m*, *n*)*2 + 15*min(*m*, *n*)).

Output Parameters

a

On exit, the contents of *a* are destroyed.

ns

INTEGER. The total number of singular values found,

0 ≤*ns*≤ min(*m*, *n*).

If *range* = 'A', *ns* = min(*m*, *n*); if *range* = 'I', *ns* = *iu* - *il* + 1.

s

REAL for sgesvdx

DOUBLE PRECISION for dgesvdx

REAL for cgesvdx

DOUBLE PRECISION for zgesvdx

Array, size (min(*m*,*n*))

The singular values of *A*, sorted so that *s*(*i*)≥*s*(*i* + 1).

u

REAL for sgesvdx

DOUBLE PRECISION for dgesvdx

COMPLEX for cgesvdx

DOUBLE COMPLEX for zgesvdx

If *jobu* = 'V', *u* contains columns of *U* (the left singular vectors, stored columnwise) as specified by *range*; if *jobu* = 'N', *u* is not referenced.

NOTE
Make sure that *ucol*≥*ns*; if *range* = 'V', the exact value of *ns* is not known in advance and an upper bound must be used.

vt

REAL for sgesvdx

DOUBLE PRECISION for dgesvdx

COMPLEX for cgesvdx

DOUBLE COMPLEX for zgesvdx

Array, size (*ldvt*,*n*)

If *jobvt* = 'V', *vt* contains the rows of V^T (the right singular vectors, stored rowwise) as specified by *range*; if *jobvt* = 'N', *vt* is not referenced.

NOTE
Make sure that *ldvt*≥*ns*; if *range* = 'V', the exact value of *ns* is not known in advance and an upper bound must be used.

iwork INTEGER. Array, size (12*min(*m*, *n*)).

If *info* = 0, the first *ns* elements of *superb* are zero. If *info* > 0, then *superb* contains the indices of the eigenvectors that failed to converge in ?bdsvdx/?stevx.

info INTEGER.

= 0: successful exit.

< 0: if info = -*i*, the *i*-th argument had an illegal value.

> 0: if info = *i*, then *i* eigenvectors failed to converge in ?bdsvdx/?stevx. if info = *n**2 + 1, an internal error occurred in ?bdsvdx.

?bdsvdx
Computes the SVD of a bidiagonal matrix.

Syntax

```
call sbdsvdx (uplo, jobz, range, n, d, e, vl, vu, il, iu, ns, s, z, ldz, work, iwork, info )
```

```
call dbdsvdx (uplo, jobz, range, n, d, e, vl, vu, il, iu, ns, s, z, ldz, work, iwork, info )
```

Include Files

- mkl.fi

Description

?bdsvdx computes the singular value decomposition (SVD) of a real *n*-by-*n* (upper or lower) bidiagonal matrix *B*, *B* = *U* * *S* * *VT*, where *S* is a diagonal matrix with non-negative diagonal elements (the singular values of *B*), and *U* and *VT* are orthogonal matrices of left and right singular vectors, respectively.

Given an upper bidiagonal *B* with diagonal *d* = [$d_1 d_2$ ... d_n] and superdiagonal *e* = [$e_1 e_2$ ... e_{n-1}], ?bdsvdx computes the singular value decompositon of *B* through the eigenvalues and eigenvectors of the *n**2-by-*n**2 tridiagonal matrix

$$TGK = \begin{pmatrix} 0 & d_1 & & & \\ d_1 & 0 & e_1 & & \\ & e_1 & 0 & d_2 & \\ & & d_2 & \ddots & \ddots \\ & & & \ddots & \ddots \end{pmatrix}$$

If (*s*,*u*,*v*) is a singular triplet of *B* with ||*u*|| = ||*v*|| = 1, then (±*s*,*q*), ||*q*|| = 1, are eigenpairs of TGK, with $q = P * \frac{(u' \pm v')}{\sqrt{2}} = \frac{\begin{pmatrix} v_1 & u_1 & v_2 & u_2 & \cdots & v_n & u_n \end{pmatrix}}{\sqrt{2}}$, and $P = \begin{pmatrix} e_{n+1} & e_1 & e_{n+2} & e_2 & \cdots \end{pmatrix}$.

Given a TGK matrix, one can either

1. compute *-s*, *-v* and change signs so that the singular values (and corresponding vectors) are already in descending order (as in ?gesvd/?gesdd) or
2. compute *s*, *v* and reorder the values (and corresponding vectors).

?bdsvdx implements (1) by calling ?stevx (bisection plus inverse iteration, to be replaced with a version of the Multiple Relative Robust Representation algorithm. (See P. Willems and B. Lang, A framework for the MR^3 algorithm: theory and implementation, SIAM J. Sci. Comput., 35:740-766, 2013.)

Input Parameters

uplo

CHARACTER*1. = 'U': *B* is upper bidiagonal;

= 'L': B is lower bidiagonal.

jobz

CHARACTER*1. = 'N': Compute singular values only;

= 'V': Compute singular values and singular vectors.

range

CHARACTER*1. = 'A': Find all singular values.

= 'V': all singular values in the half-open interval [*vl*,*vu*) are found.

= 'I': the *il*-th through *iu*-th singular values are found.

n

INTEGER. The order of the bidiagonal matrix.

n >= 0.

d

REAL for sbdsvdx

DOUBLE PRECISION for dbdsvdx

Array, size *n*.

The *n* diagonal elements of the bidiagonal matrix *B*.

e

REAL for sbdsvdx

DOUBLE PRECISION for dbdsvdx

Array, size (max(1,*n* - 1))

The (*n* - 1) superdiagonal elements of the bidiagonal matrix *B* in elements 1 to *n* - 1.

vl

REAL for sbdsvdx

DOUBLE PRECISION for dbdsvdx

vl≥ 0.

vu

REAL for sbdsvdx

DOUBLE PRECISION for dbdsvdx

If *range*='V', the lower and upper bounds of the interval to be searched for singular values. *vu* > *vl*.

Not referenced if *range* = 'A' or 'I'.

il, *iu*

INTEGER. If *range*='I', the indices (in ascending order) of the smallest and largest singular values to be returned.

1 ≤*il*≤*iu*≤ min(*m*,*n*), if min(*m*,*n*) > 0.

Not referenced if *range* = 'A' or 'V'.

ldz INTEGER. The leading dimension of the array *z*.

ldz ≥ 1, and if *jobz* = 'V', *ldz* ≥ max(2,*n**2).

Output Parameters

ns INTEGER. The total number of singular values found. 0 ≤*ns*≤*n*.

If *range* = 'A', *ns* = *n*, and if *range* = 'I', *ns* = *iu* - *il* + 1.

s REAL for sbdsvdx

DOUBLE PRECISION for dbdsvdx

Array, size (*n*)

The first *ns* elements contain the selected singular values in ascending order.

z REAL for sbdsvdx

DOUBLE PRECISION for dbdsvdx

Array, size (2**n*, *k*)

If *jobz* = 'V', then if *info* = 0 the first *ns* columns of *z* contain the singular vectors of the matrix *B* corresponding to the selected singular values, with *U* in rows 1 to *n* and *V* in rows *n*+1 to *n**2, i.e.

$$z = \begin{pmatrix} U \\ V \end{pmatrix}$$

If *jobz* = 'N', then *z* is not referenced.

NOTE
Make sure that at least *k* = *ns*+1 columns are supplied in the array *z*; if *range* = 'V', the exact value of *ns* is not known in advance and an upper bound must be used.

work REAL for sbdsvdx

DOUBLE PRECISION for dbdsvdx

Array, size (14**n*)

iwork INTEGER. Array, size (12**n*).

If *jobz* = 'V', then if *info* = 0, the first *ns* elements of *iwork* are zero. If *info* > 0, then *iwork* contains the indices of the eigenvectors that failed to converge in ?stevx.

info INTEGER. = 0: successful exit.

< 0: if *info* = -*i*, the *i*-th argument had an illegal value.

> 0:

if *info* = *i*, then *i* eigenvectors failed to converge in ?stevx. The indices of the eigenvectors (as returned by ?stevx) are stored in the array *iwork*.

if *info* = *n**2 + 1, an internal error occurred.

Cosine-Sine Decomposition: LAPACK Driver Routines

This topic describes LAPACK driver routines for computing the *cosine-sine decomposition* (CS decomposition). You can also call the corresponding computational routines to perform the same task.

The computation has the following phases:

1. The matrix is reduced to a bidiagonal block form.
2. The blocks are simultaneously diagonalized using techniques from the bidiagonal SVD algorithms.

Table "Driver Routines for Cosine-Sine Decomposition (CSD)" lists LAPACK routines (FORTRAN 77 interface) that perform CS decomposition of matrices. The corresponding routine names in the Fortran 95 interface are without the first symbol.

Computational Routines for Cosine-Sine Decomposition (CSD)

Operation	Real matrices	Complex matrices
Compute the CS decomposition of a block-partitioned orthogonal matrix	orcsd uncsd orcsd2by1 uncsd2by1	
Compute the CS decomposition of a block-partitioned unitary matrix		orcsd uncsd

Description

The routines `?orcsd`/`?uncsd` compute the CS decomposition of an *m*-by-*m* partitioned orthogonal matrix *X*:

$$X=\left(\begin{array}{c|c} x_{11} & x_{12} \\ \hline x_{21} & x_{22} \end{array}\right)=\left(\begin{array}{c|c} u_1 & \\ \hline & u_2 \end{array}\right)\left(\begin{array}{ccc|ccc} I & 0 & 0 & 0 & 0 \\ 0 & C & 0 & -S & 0 \\ 0 & 0 & 0 & 0 & -I \\ \hline 0 & 0 & 0 & I & 0 & 0 \\ 0 & S & 0 & 0 & C & 0 \\ 0 & 0 & I & 0 & 0 & 0 \end{array}\right)\left(\begin{array}{c|c} v_1 & \\ \hline & v_2 \end{array}\right)^T$$

or unitary matrix:

$$X=\left(\begin{array}{c|c} x_{11} & x_{12} \\ \hline x_{21} & x_{22} \end{array}\right)=\left(\begin{array}{c|c} u_1 & \\ \hline & u_2 \end{array}\right)\left(\begin{array}{ccc|ccc} I & 0 & 0 & 0 & 0 \\ 0 & C & 0 & -S & 0 \\ 0 & 0 & 0 & 0 & -I \\ \hline 0 & 0 & 0 & I & 0 & 0 \\ 0 & S & 0 & 0 & C & 0 \\ 0 & 0 & I & 0 & 0 & 0 \end{array}\right)\left(\begin{array}{c|c} v_1 & \\ \hline & v_2 \end{array}\right)^H$$

x_{11} is *p*-by-*q*. The orthogonal/unitary matrices u_1, u_2, v_1, and v_2 are *p*-by-*p*, *(m-p)*-by-*(m-p)*, *q*-by-*q*, *(m-q)*-by-*(m-q)*, respectively. *C* and *S* are *r*-by-*r* nonnegative diagonal matrices satisfying $C^2 + S^2 = I$, in which $r = \min(p, m-p, q, m-q)$.

Input Parameters

jobu1
: `CHARACTER`. If equals *Y*, then u_1 is computed. Otherwise, u_1 is not computed.

jobu2
: `CHARACTER`. If equals *Y*, then u_2 is computed. Otherwise, u_2 is not computed.

jobv1t
: `CHARACTER`. If equals *Y*, then v_1^t is computed. Otherwise, v_1^t is not computed.

jobv2t
: `CHARACTER`. If equals *Y*, then v_2^t is computed. Otherwise, v_2^t is not computed.

trans
: `CHARACTER`

  = 'T': *x*, u_1, u_2, v_1^t, v_2^t are stored in row-major order.

  otherwise: *x*, u_1, u_2, v_1^t, v_2^t are stored in column-major order.

signs
: `CHARACTER`

  = 'O': The lower-left block is made nonpositive (the "other" convention).

  otherwise: The upper-right block is made nonpositive (the "default" convention).

m	INTEGER. The number of rows and columns of the matrix *X*.
p	INTEGER. The number of rows in x_{11} and x_{12}. $0 \le p \le m$.
q	INTEGER. The number of columns in x_{11} and x_{21}. $0 \le q \le m$.
x11, *x12*, *x21*, *x22*	REAL for sorcsd DOUBLE PRECISION for dorcsd COMPLEX for cuncsd DOUBLE COMPLEX for zuncsd Arrays of size *x11* (*ldx11*,*q*), *x12* (*ldx12*,*m* - *q*), *x21* (*ldx21*,*q*), and *x22* (*ldx22*,*m* - *q*). Contain the parts of the orthogonal/unitary matrix whose CSD is desired.
ldx11, *ldx12*, *ldx21*, *ldx22*	INTEGER. The leading dimensions of the parts of array *X*. *ldx11* ≥ max(1, *p*), *ldx12* ≥ max(1, *p*), *ldx21* ≥ max(1, *m* - *p*), *ldx22* ≥ max(1, *m* - *p*).
ldu1	INTEGER. The leading dimension of the array u_1. If *jobu1* = '*Y*', *ldu1* ≥ max(1,*p*).
ldu2	INTEGER. The leading dimension of the array u_2. If *jobu2* = '*Y*', *ldu2* ≥ max(1,*m*-*p*).
ldv1t	INTEGER. The leading dimension of the array *v1t*. If *jobv1t* = '*Y*', *ldv1t* ≥ max(1,*q*).
ldv2t	INTEGER. The leading dimension of the array *v2t*. If *jobv2t* = '*Y*', *ldv2t* ≥ max(1,*m*-*q*).
work	REAL for sorcsd DOUBLE PRECISION for dorcsd COMPLEX for cuncsd DOUBLE COMPLEX for zuncsd Workspace array, size (max(1,*lwork*)).
lwork	INTEGER. The size of the *work* array. Constraints: If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.
rwork	REAL for cuncsd DOUBLE PRECISION for zuncsd Workspace array, size (max(1,*lrwork*)).
lrwork	INTEGER. The size of the *rwork* array. Constraints:

If *lrwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *rwork* array, returns this value as the first entry of the *rwork* array, and no error message related to *lrwork* is issued by xerbla.

iwork INTEGER. Workspace array, dimension *m*.

Output Parameters

theta REAL for sorcsd

DOUBLE PRECISION for dorcsd

COMPLEX for cuncsd

DOUBLE COMPLEX for zuncsd

Array, size (*r*), in which *r* = min(*p*,*m*-*p*,*q*,*m*-*q*).

C = diag(cos(*theta*(1)), ..., cos(*theta*(r))), and

S = diag(sin(*theta*(1)), ..., sin(*theta*(r))).

u1 REAL for sorcsd

DOUBLE PRECISION for dorcsd

COMPLEX for cuncsd

DOUBLE COMPLEX for zuncsd

Array, size (*p*).

If *jobu1* = 'Y', *u1* contains the *p*-by-*p* orthogonal/unitary matrix u_1.

u2 REAL for sorcsd

DOUBLE PRECISION for dorcsd

COMPLEX for cuncsd

DOUBLE COMPLEX for zuncsd

Array, size (*ldu2*,*m*-*p*).

If *jobu2* = 'Y', *u2* contains the (*m*-*p*)-by-(*m*-*p*) orthogonal/unitary matrix u_2.

v1t REAL for sorcsd

DOUBLE PRECISION for dorcsd

COMPLEX for cuncsd

DOUBLE COMPLEX for zuncsd

Array, size (*ldv1t*,*) .

If *jobv1t* = 'Y', *v1t* contains the *q*-by-*q* orthogonal matrix v_1^T or unitary matrix v_1^H.

v2t REAL for sorcsd

DOUBLE PRECISION for dorcsd

COMPLEX for cuncsd

DOUBLE COMPLEX for zuncsd

Array, size (*ldv2t*,*m*-*q*).

If *jobv2t* = 'Y', *v2t* contains the (*m*-*q*)-by-(*m*-*q*) orthogonal matrix v_2^T or unitary matrix v_2^H.

work On exit,

If *info* = 0, *work(1)* returns the optimal *lwork*.

If *info* > 0, For ?orcsd, *work(2:r)* contains the values *phi(1), ..., phi(r-1)* that, together with *theta(1), ..., theta(r)* define the matrix in intermediate bidiagonal-block form remaining after nonconvergence. *info* specifies the number of nonzero *phi*'s.

rwork On exit,

If *info* = 0, *rwork(1)* returns the optimal *lrwork*.

If *info* > 0, For ?uncsd, *rwork(2:r)* contains the values *phi(1), ..., phi(r-1)* that, together with *theta(1), ..., theta(r)* define the matrix in intermediate bidiagonal-block form remaining after nonconvergence. *info* specifies the number of nonzero *phi*'s.

info INTEGER.

= 0: successful exit

< 0: if *info* = -*i*, the *i*-th argument has an illegal value

> 0: ?orcsd/?uncsd did not converge. See the description of *work* above for details.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine ?orcsd/?uncsd interface are as follows:

x11 Holds the block of matrix *X* of size (*p*, *q*).

x12 Holds the block of matrix *X* of size (*p*, *m*-*q*).

x21 Holds the block of matrix *X* of size (*m*-*p*, *q*).

x22 Holds the block of matrix *X* of size (*m*-*p*, *m*-*q*).

theta Holds the vector of length *r* = min(*p*,*m*-*p*,*q*,*m*-*q*).

u1 Holds the matrix of size (*p*,*p*).

u2 Holds the matrix of size (*m*-*p*,*m*-*p*).

v1t Holds the matrix of size (*q*,*q*).

v2t	Holds the matrix of size (*m-q*,*m-q*).
jobsu1	Indicates whether u_1 is computed. Must be 'Y' or 'O'.
jobsu2	Indicates whether u_2 is computed. Must be 'Y' or 'O'.
jobv1t	Indicates whether v_1^t is computed. Must be 'Y' or 'O'.
jobv2t	Indicates whether v_2^t is computed. Must be 'Y' or 'O'.
trans	Must be 'N' or 'T'.
signs	Must be 'O' or 'D'.

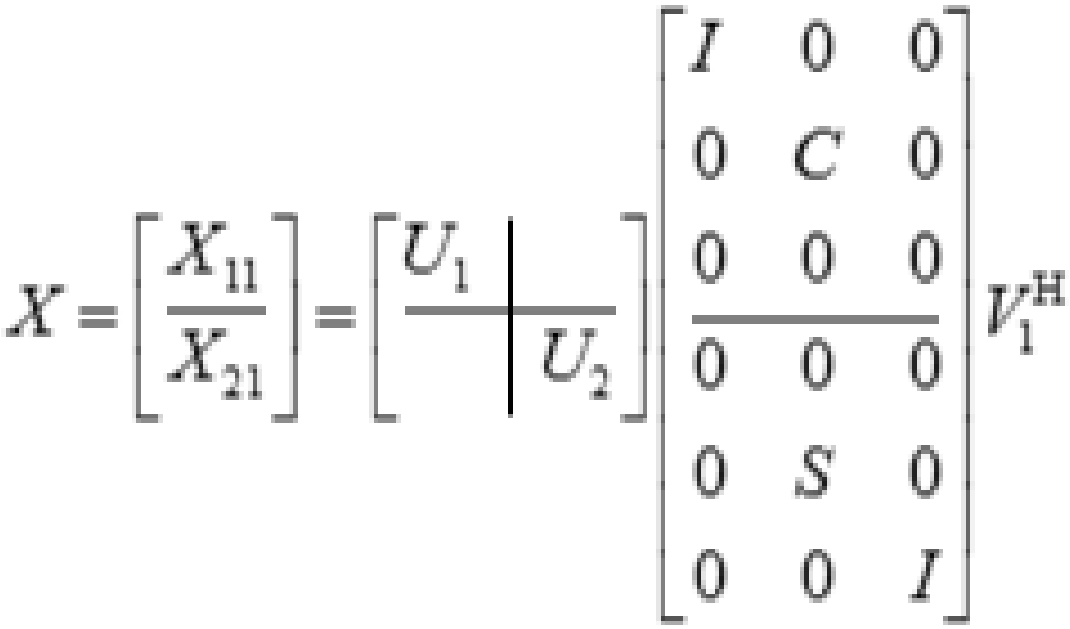
Description

The routines ?orcsd2by1/?uncsd2by1 compute the CS decomposition of an *m*-by-*q* matrix *X* with orthonormal columns that has been partitioned into a 2-by-1 block structure:



x_{11} is p-by-q. The orthogonal/unitary matrices u_1, u_2, v_1, and v_2 are p-by-p, $(m-p)$-by-$(m-p)$, q-by-q, $(m-q)$-by-$(m-q)$, respectively. C and S are r-by-r nonnegative diagonal matrices satisfying $C^2 + S^2 = I$, in which $r = \min(p, m-p, q, m-q)$.

Input Parameters

jobu1	CHARACTER. If equal to 'Y', then u_1 is computed. Otherwise, u_1 is not computed.
jobu2	CHARACTER. If equal to 'Y', then u_2 is computed. Otherwise, u_2 is not computed.
jobv1t	CHARACTER. If equal to 'Y', then v_1^t is computed. Otherwise, v_1^t is not computed.
m	INTEGER. The number of rows and columns of the matrix X.
p	INTEGER. The number of rows in x_{11}. $0 \le p \le m$.
q	INTEGER. The number of columns in x_{11} . $0 \le q \le m$.
x11	REAL for sorcsd2by1 DOUBLE PRECISION for dorcsd2by1 COMPLEX for cuncsd2by1 DOUBLE COMPLEX for zuncsd2by1 Array, size (*ldx11*,*q*). On entry, the part of the orthogonal matrix whose CSD is desired.
ldx11	INTEGER. The leading dimension of the array *x11*. *ldx11* $\ge \max(1, p)$.
x21	REAL for sorcsd2by1 DOUBLE PRECISION for dorcsd2by1

COMPLEX for cuncsd2by1

DOUBLE COMPLEX for zuncsd2by1

Array, size (*ldx21*,*q*).

On entry, the part of the orthogonal matrix whose CSD is desired.

ldx21 INTEGER. The leading dimension of the array *X*. *ldx21* ≥ max(1,*m* - *p*).

ldu1 INTEGER. The leading dimension of the array u_1. If *jobu1* = '*Y*', *ldu1* ≥ max(1,*p*).

ldu2 INTEGER. The leading dimension of the array u_2. If *jobu2* = '*Y*', *ldu2* ≥ max(1,*m*-*p*).

ldv1t INTEGER. The leading dimension of the array *v1t*. If *jobv1t* = '*Y*', *ldv1t* ≥ max(1,*q*).

work REAL for sorcsd2by1

DOUBLE PRECISION for dorcsd2by1

COMPLEX for cuncsd2by1

DOUBLE COMPLEX for zuncsd2by1

Workspace array, size (max(1,*lwork*)).

lwork INTEGER. The size of the *work* array. Constraints:

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

rwork REAL for cuncsd2by1

DOUBLE PRECISION for zuncsd2by1

Workspace array, size (max(1,*lrwork*)).

lrwork INTEGER. The size of the *rwork* array. Constraints:

If *lrwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *rwork* array, returns this value as the first entry of the *rwork* array, and no error message related to *lrwork* is issued by xerbla.

iwork INTEGER. Workspace array, dimension *m* - min(*p*, *m* - *p*, *q*, *m* - *q*).

Output Parameters

theta REAL for sorcsd2by1

DOUBLE PRECISION for dorcsd2by1

COMPLEX for cuncsd2by1

DOUBLE COMPLEX for zuncsd2by1

Array, size (*r*), in which *r* = min(*p*,*m*-*p*,*q*,*m*-*q*).

C = diag(cos(*theta*(1)), ..., cos(*theta*(r))), and

S = diag(sin(*theta*(1)), ..., sin(*theta*(r))).

u1

REAL for sorcsd2by1

DOUBLE PRECISION for dorcsd2by1

COMPLEX for cuncsd2by1

DOUBLE COMPLEX for zuncsd2by1

Array, size (*ldu1*,*p*) .

If *jobu1* = '*Y*', *u1* contains the *p*-by-*p* orthogonal/unitary matrix u_1.

u2

REAL for sorcsd2by1

DOUBLE PRECISION for dorcsd2by1

COMPLEX for cuncsd2by1

DOUBLE COMPLEX for zuncsd2by1

Array, size (*ldu2*,*m* - *p*) .

If *jobu2* = '*Y*', *u2* contains the (*m*-*p*)-by-(*m*-*p*) orthogonal/unitary matrix u_2.

v1t

REAL for sorcsd2by1

DOUBLE PRECISION for dorcsd2by1

COMPLEX for cuncsd2by1

DOUBLE COMPLEX for zuncsd2by1

Array, size (*ldv1t*,*q*) .

If *jobv1t* = '*Y*', *v1t* contains the *q*-by-*q* orthogonal matrix v_1^T or unitary matrix v_1^H.

work

On exit,

If *info* = 0, *work(1)* returns the optimal *lwork*.

If *info* > 0, *work(2:r)* contains the values *phi(1)*, ..., *phi(r-1)* that, together with *theta(1)*, ..., *theta(r)* define the matrix in intermediate bidiagonal-block form remaining after nonconvergence. *info* specifies the number of nonzero *phi*'s.

rwork

On exit,

If *info* = 0, *rwork(1)* returns the optimal *lrwork*.

If *info* > 0, *rwork(2:r)* contains the values *phi(1)*, ..., *phi(r-1)* that, together with *theta(1)*, ..., *theta(r)* define the matrix in intermediate bidiagonal-block form remaining after nonconvergence. *info* specifies the number of nonzero *phi*'s.

info

INTEGER.

= 0: successful exit

< 0: if *info* = -*i*, the *i*-th argument has an illegal value

> 0: ?orcsd2by1/?uncsd2by1 did not converge. See the description of *work* above for details.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine ?orcsd2by1/?orcsd2by1 interface are as follows:

x11 Holds the block of matrix X_{11} of size (p, q).

x21 Holds the block of matrix X_{21} of size (m-p, q).

theta Holds the vector of length $r = \min(p, m-p, q, m-q)$.

u1 Holds the matrix u_1 of size (p,p).

u2 Holds the matrix u_2 of size (m-p,m-p).

v1t Holds the matrix v_1^T or v_1^H of size (q,q).

jobu1 Indicates whether u_1 is computed. Must be 'Y' or 'O'.

jobu2 Indicates whether u_2 is computed. Must be 'Y' or 'O'.

jobv1t Indicates whether v_1^t is computed. Must be 'Y' or 'O'.

Generalized Symmetric Definite Eigenvalue Problems: LAPACK Driver Routines

This topic describes LAPACK driver routines used for solving generalized symmetric definite eigenproblems. See also computational routines that can be called to solve these problems. Table "Driver Routines for Solving Generalized Symmetric Definite Eigenproblems" lists all such driver routines for the FORTRAN 77 interface. The corresponding routine names in the Fortran 95 interface are without the first symbol.

Driver Routines for Solving Generalized Symmetric Definite Eigenproblems

Routine Name	Operation performed
sygv/hegv	Computes all eigenvalues and, optionally, eigenvectors of a real / complex generalized symmetric /Hermitian positive-definite eigenproblem.
sygvd/hegvd	Computes all eigenvalues and, optionally, eigenvectors of a real / complex generalized symmetric /Hermitian positive-definite eigenproblem. If eigenvectors are desired, it uses a divide and conquer method.
sygvx/hegvx	Computes selected eigenvalues and, optionally, eigenvectors of a real / complex generalized symmetric /Hermitian positive-definite eigenproblem.
spgv/hpgv	Computes all eigenvalues and, optionally, eigenvectors of a real / complex generalized symmetric /Hermitian positive-definite eigenproblem with matrices in packed storage.

Routine Name	Operation performed
spgvd/hpgvd	Computes all eigenvalues and, optionally, eigenvectors of a real / complex generalized symmetric /Hermitian positive-definite eigenproblem with matrices in packed storage. If eigenvectors are desired, it uses a divide and conquer method.
spgvx/hpgvx	Computes selected eigenvalues and, optionally, eigenvectors of a real / complex generalized symmetric /Hermitian positive-definite eigenproblem with matrices in packed storage.
sbgv/hbgv	Computes all eigenvalues and, optionally, eigenvectors of a real / complex generalized symmetric /Hermitian positive-definite eigenproblem with banded matrices.
sbgvd/hbgvd	Computes all eigenvalues and, optionally, eigenvectors of a real / complex generalized symmetric /Hermitian positive-definite eigenproblem with banded matrices. If eigenvectors are desired, it uses a divide and conquer method.
sbgvx/hbgvx	Computes selected eigenvalues and, optionally, eigenvectors of a real / complex generalized symmetric /Hermitian positive-definite eigenproblem with banded matrices.

?sygv
Computes all eigenvalues and, optionally, eigenvectors of a real generalized symmetric definite eigenproblem.

Syntax

```
call ssygv(itype, jobz, uplo, n, a, lda, b, ldb, w, work, lwork, info)
call dsygv(itype, jobz, uplo, n, a, lda, b, ldb, w, work, lwork, info)
call sygv(a, b, w [,itype] [,jobz] [,uplo] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes all the eigenvalues, and optionally, the eigenvectors of a real generalized symmetric-definite eigenproblem, of the form

$A*x = \lambda*B*x$, $A*B*x = \lambda*x$, or $B*A*x = \lambda*x$.

Here *A* and *B* are assumed to be symmetric and *B* is also positive definite.

Input Parameters

itype
INTEGER. Must be 1 or 2 or 3.
Specifies the problem type to be solved:
if *itype* = 1, the problem type is *A*x = lambda*B*x*;
if *itype* = 2, the problem type is *A*B*x = lambda*x*;
if *itype* = 3, the problem type is *B*A*x = lambda*x*.

jobz
CHARACTER*1. Must be 'N' or 'V'.

If *jobz* = 'N', then compute eigenvalues only.

If *jobz* = 'V', then compute eigenvalues and eigenvectors.

uplo — CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', arrays *a* and *b* store the upper triangles of *A* and *B*;

If *uplo* = 'L', arrays *a* and *b* store the lower triangles of *A* and *B*.

n — INTEGER. The order of the matrices *A* and *B* (*n*≥ 0).

a, *b*, *work* — REAL for ssygv

DOUBLE PRECISION for dsygv.

Arrays:

a(*lda*,*) contains the upper or lower triangle of the symmetric matrix *A*, as specified by *uplo*.

The second dimension of *a* must be at least max(1, *n*).

b(*ldb*,*) contains the upper or lower triangle of the symmetric positive definite matrix *B*, as specified by *uplo*.

The second dimension of *b* must be at least max(1, *n*).

work is a workspace array, its dimension max(1, *lwork*).

lda — INTEGER. The leading dimension of *a*; at least max(1, *n*).

ldb — INTEGER. The leading dimension of *b*; at least max(1, *n*).

lwork — INTEGER.

The dimension of the array *work*;

lwork≥ max(1, 3*n*-1).

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a

On exit, if *jobz* = 'V', then if *info* = 0, *a* contains the matrix *Z* of eigenvectors. The eigenvectors are normalized as follows:

if *itype* = 1 or 2, $Z^T*B*Z = I$;

if *itype* = 3, $Z^T*\text{inv}(B)*Z = I$;

If *jobz* = 'N', then on exit the upper triangle (if *uplo* = 'U') or the lower triangle (if *uplo* = 'L') of *A*, including the diagonal, is destroyed.

b

On exit, if *info*≤*n*, the part of *b* containing the matrix is overwritten by the triangular factor *U* or *L* from the Cholesky factorization $B = U^T*U$ or $B = L*L^T$.

w — REAL for ssygv

DOUBLE PRECISION for dsygv.

Array, size at least max(1, *n*).

If *info* = 0, contains the eigenvalues in ascending order.

work(1) — On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th argument had an illegal value.

If *info* > 0, spotrf/dpotrf or ssyev/dsyev returned an error code:

If *info* = *i*≤*n*, ssyev/dsyev failed to converge, and *i* off-diagonal elements of an intermediate tridiagonal did not converge to zero;

If *info* = *n* + *i*, for 1 ≤*i*≤*n*, then the leading minor of order *i* of *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine sygv interface are the following:

a — Holds the matrix *A* of size (*n*, *n*).

b — Holds the matrix *B* of size (*n*, *n*).

w — Holds the vector of length *n*.

itype — Must be 1, 2, or 3. The default value is 1.

jobz — Must be 'N' or 'V'. The default value is 'N'.

uplo — Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For optimum performance use *lwork*≥ (*nb*+2)*n, where *nb* is the blocksize for ssytrd/dsytrd returned by ilaenv.

If it is not clear how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run or set *lwork* = -1 (*liwork* = -1).

If *lwork* (or *liwork*) has any of admissible sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If *lwork* = -1 (*liwork* = -1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if *work* (*liwork*) is less than the minimal required value and is not equal to -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?hegv
Computes all eigenvalues and, optionally, eigenvectors of a complex generalized Hermitian positive-definite eigenproblem.

Syntax

```
call chegv(itype, jobz, uplo, n, a, lda, b, ldb, w, work, lwork, rwork, info)
call zhegv(itype, jobz, uplo, n, a, lda, b, ldb, w, work, lwork, rwork, info)
call hegv(a, b, w [,itype] [,jobz] [,uplo] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes all the eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitian positive-definite eigenproblem, of the form

*A*x* = λ**B*x*, *A*B*x* = λ**x*, or *B*A*x* = λ**x*.

Here *A* and *B* are assumed to be Hermitian and *B* is also positive definite.

Input Parameters

itype

INTEGER. Must be 1 or 2 or 3. Specifies the problem type to be solved:

if *itype* = 1, the problem type is *A*x = lambda*B*x*;

if *itype* = 2, the problem type is *A*B*x = lambda*x*;

if *itype* = 3, the problem type is *B*A*x = lambda*x*.

jobz

CHARACTER*1. Must be 'N' or 'V'.

If *jobz* = 'N', then compute eigenvalues only.

If *jobz* = 'V', then compute eigenvalues and eigenvectors.

uplo

CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', arrays *a* and *b* store the upper triangles of *A* and *B*;

If *uplo* = 'L', arrays *a* and *b* store the lower triangles of *A* and *B*.

n

INTEGER. The order of the matrices *A* and *B* (*n*≥ 0).

a, *b*, *work*

COMPLEX for chegv

DOUBLE COMPLEX for zhegv.

Arrays:

a(*lda*,*) contains the upper or lower triangle of the Hermitian matrix *A*, as specified by *uplo*.

The second dimension of *a* must be at least max(1, *n*).

b(*ldb*,*) contains the upper or lower triangle of the Hermitian positive definite matrix *B*, as specified by *uplo*.

The second dimension of *b* must be at least max(1, *n*).

work is a workspace array, its dimension `max(1, lwork)`.

lda — `INTEGER`. The leading dimension of *a*; at least max(1, *n*).

ldb — `INTEGER`. The leading dimension of *b*; at least max(1, *n*).

lwork — `INTEGER`.

The dimension of the array *work*; $lwork \geq \max(1, 2n-1)$.

If `lwork = -1`, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

rwork — `REAL` for `chegv`

`DOUBLE PRECISION` for `zhegv`.

Workspace array, size at least max(1, 3*n*-2).

Output Parameters

a — On exit, if `jobz = 'V'`, then if `info = 0`, *a* contains the matrix *Z* of eigenvectors. The eigenvectors are normalized as follows:

if `itype = 1` or 2, $Z^H*B*Z = I$;

if `itype = 3`, $Z^H*\text{inv}(B)*Z = I$;

If `jobz = 'N'`, then on exit the upper triangle (if `uplo = 'U'`) or the lower triangle (if `uplo = 'L'`) of *A*, including the diagonal, is destroyed.

b — On exit, if $info \leq n$, the part of *b* containing the matrix is overwritten by the triangular factor *U* or *L* from the Cholesky factorization $B = U^H*U$ or $B = L*L^H$.

w — `REAL` for `chegv`

`DOUBLE PRECISION` for `zhegv`.

Array, size at least max(1, *n*).

If `info = 0`, contains the eigenvalues in ascending order.

work(1) — On exit, if `info = 0`, then *work(1)* returns the required minimal size of *lwork*.

info — `INTEGER`.

If `info = 0`, the execution is successful.

If `info = -i`, the *i*-th argument has an illegal value.

If `info > 0`, `cpotrf`/`zpotrf` or `cheev`/`zheev` return an error code:

If $info = i \leq n$, `cheev`/`zheev` fails to converge, and *i* off-diagonal elements of an intermediate tridiagonal do not converge to zero;

If *info* = *n* + *i*, for 1 ≤*i*≤*n*, then the leading minor of order *i* of *B* is not positive-definite. The factorization of *B* can not be completed and no eigenvalues or eigenvectors are computed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `hegv` interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *n*).
w	Holds the vector of length *n*.
itype	Must be 1, 2, or 3. The default value is 1.
jobz	Must be `'N'` or `'V'`. The default value is `'N'`.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

For optimum performance use *lwork*≥ (*nb*+1)**n*, where *nb* is the blocksize for `chetrd`/`zhetrd` returned by ilaenv.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = –1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = –1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?sygvd

Computes all eigenvalues and, optionally, eigenvectors of a real generalized symmetric definite eigenproblem using a divide and conquer method.

Syntax

```
call ssygvd(itype, jobz, uplo, n, a, lda, b, ldb, w, work, lwork, iwork, liwork, info)
call dsygvd(itype, jobz, uplo, n, a, lda, b, ldb, w, work, lwork, iwork, liwork, info)
call sygvd(a, b, w [,itype] [,jobz] [,uplo] [,info])
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine computes all the eigenvalues, and optionally, the eigenvectors of a real generalized symmetric-definite eigenproblem, of the form

*A*x = λ*B*x*, *A*B*x = λ*x*, or *B*A*x = λ*x*.

Here *A* and *B* are assumed to be symmetric and *B* is also positive definite.

It uses a divide and conquer algorithm.

Input Parameters

itype

INTEGER. Must be 1 or 2 or 3. Specifies the problem type to be solved:

if *itype* = 1, the problem type is *A*x = lambda*B*x*;

if *itype* = 2, the problem type is *A*B*x = lambda*x*;

if *itype* = 3, the problem type is *B*A*x = lambda*x*.

jobz

CHARACTER*1. Must be 'N' or 'V'.

If *jobz* = 'N', then compute eigenvalues only.

If *jobz* = 'V', then compute eigenvalues and eigenvectors.

uplo

CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', arrays *a* and *b* store the upper triangles of *A* and *B*;

If *uplo* = 'L', arrays *a* and *b* store the lower triangles of *A* and *B*.

n

INTEGER. The order of the matrices *A* and *B* (*n*≥ 0).

a, *b*, *work*

REAL for ssygvd

DOUBLE PRECISION for dsygvd.

Arrays:

a(*lda*,*) contains the upper or lower triangle of the symmetric matrix *A*, as specified by *uplo*.

The second dimension of *a* must be at least max(1, *n*).

b(*ldb*,*) contains the upper or lower triangle of the symmetric positive definite matrix *B*, as specified by *uplo*.

The second dimension of *b* must be at least max(1, *n*).

work is a workspace array, its dimension max(1, *lwork*).

lda

INTEGER. The leading dimension of *a*; at least max(1, *n*).

ldb

INTEGER. The leading dimension of *b*; at least max(1, *n*).

lwork

INTEGER.

The dimension of the array *work*.

Constraints:

If *n*≤ 1, *lwork*≥ 1;

If *jobz* = 'N' and *n*>1, *lwork* < 2*n*+1;

If *jobz* = 'V' and *n*>1, *lwork* < $2n^2+6n+1$.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the required sizes of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

iwork

INTEGER.

Workspace array, its dimension max(1, *lwork*).

liwork

INTEGER.

The dimension of the array *iwork*.

Constraints:

If *n*≤ 1, *liwork*≥ 1;

If *jobz* = 'N' and *n*>1, *liwork*≥ 1;

If *jobz* = 'V' and *n*>1, *liwork*≥ 5*n*+3.

If *liwork* = -1, then a workspace query is assumed; the routine only calculates the required sizes of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

Output Parameters

a

On exit, if *jobz* = 'V', then if *info* = 0, *a* contains the matrix *Z* of eigenvectors. The eigenvectors are normalized as follows:

if *itype* = 1 or 2, $Z^T*B*Z = I$;

if *itype* = 3, $Z^T*\text{inv}(B)*Z = I$;

If *jobz* = 'N', then on exit the upper triangle (if *uplo* = 'U') or the lower triangle (if *uplo* = 'L') of *A*, including the diagonal, is destroyed.

b

On exit, if *info*≤*n*, the part of *b* containing the matrix is overwritten by the triangular factor *U* or *L* from the Cholesky factorization $B = U^T*U$ or $B = L*L^T$.

w

REAL for ssygvd

DOUBLE PRECISION for dsygvd.

Array, size at least max(1, *n*).

If *info* = 0, contains the eigenvalues in ascending order.

work(1)

On exit, if *info* = 0, then *work*(1) returns the required minimal size of *lwork*.

iwork(1)

On exit, if *info* = 0, then *iwork*(1) returns the required minimal size of *liwork*.

info

INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th argument had an illegal value.

If *info* > 0, an error code is returned as specified below.

- For *info*≤*n*:
  - If *info* = *i* and *jobz* = 'N', then the algorithm failed to converge; *i* off-diagonal elements of an intermediate tridiagonal form did not converge to zero.
  - If *jobz* = 'V', then the algorithm failed to compute an eigenvalue while working on the submatrix lying in rows and columns *info*/(*n* +1) through mod(*info*,*n*+1).
- For *info* > *n*:
  - If *info* = *n* + *i*, for 1 ≤*i*≤*n*, then the leading minor of order *i* of *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine sygvd interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *n*).
w	Holds the vector of length *n*.
itype	Must be 1, 2, or 3. The default value is 1.
jobz	Must be 'N' or 'V'. The default value is 'N'.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

If it is not clear how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run or set *lwork* = -1 (*liwork* = -1).

If *lwork* (or *liwork*) has any of admissible sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If *lwork* = -1 (*liwork* = -1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if *work* (*liwork*) is less than the minimal required value and is not equal to -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?hegvd
Computes all the eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitian positive-definite eigenproblem using a divide and conquer method.

Syntax

call chegvd(*itype*, *jobz*, *uplo*, *n*, *a*, *lda*, *b*, *ldb*, *w*, *work*, *lwork*, *rwork*, *lrwork*, *iwork*, *liwork*, *info*)

call zhegvd(*itype*, *jobz*, *uplo*, *n*, *a*, *lda*, *b*, *ldb*, *w*, *work*, *lwork*, *rwork*, *lrwork*, *iwork*, *liwork*, *info*)

call hegvd(*a*, *b*, *w* [,*itype*] [,*jobz*] [,*uplo*] [,*info*])

Include Files

- mkl.fi, lapack.f90

Description

The routine computes all the eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitian positive-definite eigenproblem, of the form

*A*x* = λ*B*x*, *A*B*x* = λ*x*, or *B*A*x* = λ*x*.

Here *A* and *B* are assumed to be Hermitian and *B* is also positive definite.

It uses a divide and conquer algorithm.

Input Parameters

itype

INTEGER. Must be 1 or 2 or 3. Specifies the problem type to be solved:

if *itype* = 1, the problem type is *A*x = lambda*B*x*;

if *itype* = 2, the problem type is *A*B*x = lambda*x*;

if *itype* = 3, the problem type is *B*A*x = lambda*x*.

jobz

CHARACTER*1. Must be 'N' or 'V'.

If *jobz* = 'N', then compute eigenvalues only.

If *jobz* = 'V', then compute eigenvalues and eigenvectors.

uplo

CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', arrays *a* and *b* store the upper triangles of *A* and *B*;

If *uplo* = 'L', arrays *a* and *b* store the lower triangles of *A* and *B*.

n

INTEGER. The order of the matrices *A* and *B* (*n*≥ 0).

a, *b*, *work*

COMPLEX for chegvd

DOUBLE COMPLEX for zhegvd.

Arrays:

a(*lda*,*) contains the upper or lower triangle of the Hermitian matrix *A*, as specified by *uplo*.

The second dimension of *a* must be at least max(1, *n*).

b(*ldb*,*) contains the upper or lower triangle of the Hermitian positive definite matrix *B*, as specified by *uplo*.

The second dimension of *b* must be at least max(1, *n*).

work is a workspace array, its dimension `max(1, lwork)`.

lda `INTEGER`. The leading dimension of *a*; at least max(1, *n*).

ldb `INTEGER`. The leading dimension of *b*; at least max(1, *n*).

lwork `INTEGER`.

The dimension of the array *work*.

Constraints:

If $n \leq 1$, $lwork \geq 1$;

If *jobz* = 'N' and $n>1$, $lwork \geq n+1$;

If *jobz* = 'V' and $n>1$, $lwork \geq n^2+2n$.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

rwork `REAL` for `chegvd`

`DOUBLE PRECISION` for `zhegvd`.

Workspace array, size `max(1, lrwork)`.

lrwork `INTEGER`.

The dimension of the array *rwork*.

Constraints:

If $n \leq 1$, $lrwork \geq 1$;

If *jobz* = 'N' and $n>1$, $lrwork \geq n$;

If *jobz* = 'V' and $n>1$, $lrwork \geq 2n^2+5n+1$.

If *lrwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

iwork `INTEGER`.

Workspace array, size `max(1, liwork)`.

liwork `INTEGER`.

The dimension of the array *iwork*.

Constraints:

If $n \leq 1$, $liwork \geq 1$;

If *jobz* = 'N' and $n>1$, $liwork \geq 1$;

If *jobz* = 'V' and $n>1$, $liwork \geq 5n+3$.

If *liwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

Output Parameters

a

On exit, if *jobz* = 'V', then if *info* = 0, *a* contains the matrix *Z* of eigenvectors. The eigenvectors are normalized as follows:

if *itype* = 1 or 2, $Z^H * B * Z = I$;

if *itype* = 3, $Z^H * \mathrm{inv}(B) * Z = I$;

If *jobz* = 'N', then on exit the upper triangle (if *uplo* = 'U') or the lower triangle (if *uplo* = 'L') of *A*, including the diagonal, is destroyed.

b

On exit, if *info*≤*n*, the part of *b* containing the matrix is overwritten by the triangular factor *U* or *L* from the Cholesky factorization $B = U^H * U$ or $B = L * L^H$.

w

REAL for chegvd

DOUBLE PRECISION for zhegvd.

Array, size at least max(1, *n*).

If *info* = 0, contains the eigenvalues in ascending order.

work(1)

On exit, if *info* = 0, then *work*(1) returns the required minimal size of *lwork*.

rwork(1)

On exit, if *info* = 0, then *rwork*(1) returns the required minimal size of *lrwork*.

iwork(1)

On exit, if *info* = 0, then *iwork*(1) returns the required minimal size of *liwork*.

info

INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th argument had an illegal value.

If *info* = *i*, and *jobz* = 'N', then the algorithm failed to converge; *i* off-diagonal elements of an intermediate tridiagonal form did not converge to zero;

if *info* = *i*, and *jobz* = 'V', then the algorithm failed to compute an eigenvalue while working on the submatrix lying in rows and columns *info*/(*n*+1) through mod(*info*, *n*+1).

If *info* = *n* + *i*, for 1 ≤*i*≤*n*, then the leading minor of order *i* of *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `hegvd` interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *n*).
w	Holds the vector of length *n*.
itype	Must be 1, 2, or 3. The default value is 1.
jobz	Must be `'N'` or `'V'`. The default value is `'N'`.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* (*liwork* or *lrwork*) for the first run or set *lwork* = -1 (*liwork* = -1, *lrwork* = -1).

If you choose the first option and set any of admissible *lwork* (*liwork* or *lrwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*) on exit. Use this value (*work*(1), *iwork*(1), *rwork*(1)) for subsequent runs.

If you set *lwork* = -1 (*liwork* = -1, *lrwork* = -1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*, *lrwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?sygvx

Computes selected eigenvalues and, optionally, eigenvectors of a real generalized symmetric definite eigenproblem.

Syntax

```
call ssygvx(itype, jobz, range, uplo, n, a, lda, b, ldb, vl, vu, il, iu, abstol, m, w, z, ldz, work, lwork, iwork, ifail, info)
```

```
call dsygvx(itype, jobz, range, uplo, n, a, lda, b, ldb, vl, vu, il, iu, abstol, m, w, z, ldz, work, lwork, iwork, ifail, info)
```

```
call sygvx(a, b, w [,itype] [,uplo] [,z] [,vl] [,vu] [,il] [,iu] [,m] [,ifail] [,abstol] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes selected eigenvalues, and optionally, the eigenvectors of a real generalized symmetric-definite eigenproblem, of the form

*A*x* = λ**B*x*, *A*B*x* = λ**x*, or *B*A*x* = λ**x*.

Here *A* and *B* are assumed to be symmetric and *B* is also positive definite. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Input Parameters

itype

INTEGER. Must be 1 or 2 or 3. Specifies the problem type to be solved:

if *itype* = 1, the problem type is *A*x* = λ**B*x*;

if *itype* = 2, the problem type is *A*B*x* = λ**x*;

if *itype* = 3, the problem type is *B*A*x* = λ**x*.

jobz

CHARACTER*1. Must be 'N' or 'V'.

If *jobz* = 'N', then compute eigenvalues only.

If *jobz* = 'V', then compute eigenvalues and eigenvectors.

range

CHARACTER*1. Must be 'A' or 'V' or 'I'.

If *range* = 'A', the routine computes all eigenvalues.

If *range* = 'V', the routine computes eigenvalues *lambda*(i) in the half-open interval:

vl<*lambda*(i)≤*vu*.

If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.

uplo

CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', arrays *a* and *b* store the upper triangles of *A* and *B*;

If *uplo* = 'L', arrays *a* and *b* store the lower triangles of *A* and *B*.

n

INTEGER. The order of the matrices *A* and *B* (*n*≥ 0).

a, *b*, *work*

REAL for ssygvx

DOUBLE PRECISION for dsygvx.

Arrays:

a(*lda*,*) contains the upper or lower triangle of the symmetric matrix *A*, as specified by *uplo*.

The second dimension of *a* must be at least max(1, *n*).

b(*ldb*,*) contains the upper or lower triangle of the symmetric positive definite matrix *B*, as specified by *uplo*.

The second dimension of *b* must be at least max(1, *n*).

work is a workspace array, its dimension max(1, *lwork*).

lda

INTEGER. The leading dimension of *a*; at least max(1, *n*).

ldb

INTEGER. The leading dimension of *b*; at least max(1, *n*).

vl, *vu*

REAL for ssygvx

DOUBLE PRECISION for dsygvx.

If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.

Constraint: *vl*< *vu*.

If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, *iu*

INTEGER.

If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.

Constraint: 1 ≤*il*≤*iu*≤*n*, if *n* > 0; *il*=1 and *iu*=0

if *n* = 0.

If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol

REAL for ssygvx

DOUBLE PRECISION for dsygvx. The absolute error tolerance for the eigenvalues. See *Application Notes* for more information.

ldz

INTEGER. The leading dimension of the output array *z*. Constraints:

ldz≥ 1; if *jobz* = 'V', *ldz*≥ max(1, *n*) .

lwork

INTEGER.

The dimension of the array *work*;

lwork < max(1, 8*n*).

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

iwork

INTEGER.

Workspace array, size at least max(1, 5*n*).

Output Parameters

a

On exit, the upper triangle (if *uplo* = 'U') or the lower triangle (if *uplo* = 'L') of *A*, including the diagonal, is overwritten.

b

On exit, if *info*≤*n*, the part of *b* containing the matrix is overwritten by the triangular factor *U* or *L* from the Cholesky factorization $B = U^T*U$ or $B = L*L^T$.

m

INTEGER. The total number of eigenvalues found,

0 ≤*m*≤*n*. If *range* = 'A', *m* = *n*, and if *range* = 'I',

m = *iu*-*il*+1.

w, *z*

REAL for ssygvx

DOUBLE PRECISION for dsygvx.

Arrays:

w(*), size at least max(1, *n*).

The first *m* elements of *w* contain the selected eigenvalues in ascending order.

`z`(*ldz*,*) .

The second dimension of *z* must be at least max(1, *m*).

If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *A* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). The eigenvectors are normalized as follows:

if *itype* = 1 or 2, $Z^T*B*Z = I$;

if *itype* = 3, $Z^T*\mathrm{inv}(B)*Z = I$;

If *jobz* = 'N', then *z* is not referenced.

If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*.

Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.

work(1)

On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.

ifail

INTEGER.

Array, size at least max(1, *n*).

If *jobz* = 'V', then if *info* = 0, the first *m* elements of *ifail* are zero; if *info* > 0, the *ifail* contains the indices of the eigenvectors that failed to converge.

If *jobz* = 'N', then *ifail* is not referenced.

info

INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*th argument had an illegal value.

If *info* > 0, `spotrf`/`dpotrf` and `ssyevx`/`dsyevx` returned an error code:

If *info* = *i*≤*n*, `ssyevx`/`dsyevx` failed to converge, and *i* eigenvectors failed to converge. Their indices are stored in the array *ifail*;

If *info* = *n* + *i*, for 1 ≤*i*≤*n*, then the leading minor of order *i* of *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `sygvx` interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *n*).
w	Holds the vector of length *n*.
z	Holds the matrix *Z* of size (*n*, *n*), where the values *n* and *m* are significant.
ifail	Holds the vector of length *n*.
itype	Must be 1, 2, or 3. The default value is 1.
uplo	Must be 'U' or 'L'. The default value is 'U'.
vl	Default value for this element is *vl* = -HUGE(*vl*).
vu	Default value for this element is *vu* = HUGE(*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this element is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted. Note that there will be an error condition if *ifail* is present and *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a,b] of width less than or equal to *abstol*+ε*max(|a|,|b|), where ε is the machine precision.

If *abstol* is less than or equal to zero, then ε*$||T||_1$ is used as tolerance, where *T* is the tridiagonal matrix obtained by reducing *C* to tridiagonal form, where *C* is the symmetric matrix of the standard symmetric problem to which the generalized problem is transformed. Eigenvalues will be computed most accurately when *abstol* is set to twice the underflow threshold 2*?lamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, set *abstol* to 2*?lamch('S').

For optimum performance use *lwork*≥ (*nb*+3)*n, where *nb* is the blocksize for ssytrd/dsytrd returned by ilaenv.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?hegvx
Computes selected eigenvalues and, optionally, eigenvectors of a complex generalized Hermitian positive-definite eigenproblem.

Syntax

call chegvx(*itype*, *jobz*, *range*, *uplo*, *n*, *a*, *lda*, *b*, *ldb*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *w*, *z*, *ldz*, *work*, *lwork*, *rwork*, *iwork*, *ifail*, *info*)

call zhegvx(*itype*, *jobz*, *range*, *uplo*, *n*, *a*, *lda*, *b*, *ldb*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *w*, *z*, *ldz*, *work*, *lwork*, *rwork*, *iwork*, *ifail*, *info*)

call hegvx(*a*, *b*, *w* [,*itype*] [,*uplo*] [,*z*] [,*vl*] [,*vu*] [,*il*] [,*iu*] [,*m*] [,*ifail*] [,*abstol*] [,*info*])

Include Files

- mkl.fi, lapack.f90

Description

The routine computes selected eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitian positive-definite eigenproblem, of the form

*A*x* = λ*B*x*, *A*B*x* = λ*x*, or *B*A*x* = λ*x*.

Here *A* and *B* are assumed to be Hermitian and *B* is also positive definite. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Input Parameters

itype

INTEGER. Must be 1 or 2 or 3. Specifies the problem type to be solved:

if *itype* = 1, the problem type is *A*x* = λ*B*x*;

if *itype* = 2, the problem type is *A*B*x* = λ*x*;

if *itype* = 3, the problem type is *B*A*x* = λ*x*.

jobz

CHARACTER*1. Must be 'N' or 'V'.

If *jobz* = 'N', then compute eigenvalues only.

If *jobz* = 'V', then compute eigenvalues and eigenvectors.

range

CHARACTER*1. Must be 'A' or 'V' or 'I'.

If *range* = 'A', the routine computes all eigenvalues.

If *range* = 'V', the routine computes eigenvalues *lambda*(i) in the half-open interval:

	vl<*lambda*(i)≤*vu*.
	If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.
uplo	CHARACTER*1. Must be 'U' or 'L'.
	If *uplo* = 'U', arrays *a* and *b* store the upper triangles of *A* and *B*;
	If *uplo* = 'L', arrays *a* and *b* store the lower triangles of *A* and *B*.
n	INTEGER. The order of the matrices *A* and *B* (*n*≥ 0).
a, *b*, *work*	COMPLEX for chegvx
	DOUBLE COMPLEX for zhegvx.
	Arrays:
	a(*lda*,*) contains the upper or lower triangle of the Hermitian matrix *A*, as specified by *uplo*.
	The second dimension of *a* must be at least max(1, *n*).
	b(*ldb*,*) contains the upper or lower triangle of the Hermitian positive definite matrix *B*, as specified by *uplo*.
	The second dimension of *b* must be at least max(1, *n*).
	work is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The leading dimension of *a*; at least max(1, *n*).
ldb	INTEGER. The leading dimension of *b*; at least max(1, *n*).
vl, *vu*	REAL for chegvx
	DOUBLE PRECISION for zhegvx.
	If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.
	Constraint: *vl*< *vu*.
	If *range* = 'A' or 'I', *vl* and *vu* are not referenced.
il, *iu*	INTEGER.
	If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.
	Constraint: 1 ≤*il*≤*iu*≤*n*, if *n* > 0; *il*=1 and *iu*=0
	if *n* = 0.
	If *range* = 'A' or 'V', *il* and *iu* are not referenced.
abstol	REAL for chegvx
	DOUBLE PRECISION for zhegvx.
	The absolute error tolerance for the eigenvalues. See *Application Notes* for more information.
ldz	INTEGER. The leading dimension of the output array *z*. Constraints:
	ldz≥ 1; if *jobz* = 'V', *ldz*≥ max(1, *n*).

lwork INTEGER.

The dimension of the array *work*; *lwork* ≥ max(1, 2*n*).

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

rwork REAL for chegvx

DOUBLE PRECISION for zhegvx.

Workspace array, size at least max(1, 7*n*).

iwork INTEGER.

Workspace array, size at least max(1, 5*n*).

Output Parameters

a On exit, the upper triangle (if *uplo* = 'U') or the lower triangle (if *uplo* = 'L') of *A*, including the diagonal, is overwritten.

b On exit, if *info*≤*n*, the part of *b* containing the matrix is overwritten by the triangular factor *U* or *L* from the Cholesky factorization $B = U^H*U$ or $B = L*L^H$.

m INTEGER. The total number of eigenvalues found,

0 ≤*m*≤*n*. If *range* = 'A', *m* = *n*, and if *range* = 'I',

m = *iu*-*il*+1.

w REAL for chegvx

DOUBLE PRECISION for zhegvx.

Array, size at least max(1, *n*).

The first *m* elements of *w* contain the selected eigenvalues in ascending order.

z COMPLEX for chegvx

DOUBLE COMPLEX for zhegvx.

Array z(*ldz*,*). The second dimension of *z* must be at least max(1, *m*).

If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *A* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). The eigenvectors are normalized as follows:

if *itype* = 1 or 2, Z^H*B*Z = I;

if *itype* = 3, Z^H*inv(*B*)*Z* = I;

If *jobz* = 'N', then *z* is not referenced.

If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*.

Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if `range = 'V'`, the exact value of *m* is not known in advance and an upper bound must be used.

work(1) On exit, if `info = 0`, then *work(1)* returns the required minimal size of *lwork*.

ifail `INTEGER`.

Array, size at least max(1, *n*).

If `jobz = 'V'`, then if `info = 0`, the first *m* elements of *ifail* are zero; if `info > 0`, the *ifail* contains the indices of the eigenvectors that failed to converge.

If `jobz = 'N'`, then *ifail* is not referenced.

info `INTEGER`.

If `info = 0`, the execution is successful.

If `info = -i`, the *i*th argument had an illegal value.

If `info > 0`, `cpotrf`/`zpotrf` and `cheevx`/`zheevx` returned an error code:

If `info = i≤n`, `cheevx`/`zheevx` failed to converge, and *i* eigenvectors failed to converge. Their indices are stored in the array *ifail*;

If `info = n + i`, for `1 ≤i≤n`, then the leading minor of order *i* of *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `hegvx` interface are the following:

a Holds the matrix *A* of size (*n*, *n*).

b Holds the matrix *B* of size (*n*, *n*).

w Holds the vector of length *n*.

z Holds the matrix *Z* of size (*n*, *n*), where the values *n* and *m* are significant.

ifail Holds the vector of length *n*.

itype Must be 1, 2, or 3. The default value is 1.

uplo Must be `'U'` or `'L'`. The default value is `'U'`.

vl Default value for this element is *vl* = `-HUGE`(*vl*).

vu Default value for this element is *vu* = `HUGE`(*vl*).

il Default value for this argument is `il = 1`.

iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this element is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted. Note that there will be an error condition if *ifail* is present and *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a,b] of width less than or equal to *abstol*+ε*max(|a|,|b|), where ε is the machine precision.

If *abstol* is less than or equal to zero, then ε*$||T||_1$ will be used in its place, where *T* is the tridiagonal matrix obtained by reducing *C* to tridiagonal form, where *C* is the symmetric matrix of the standard symmetric problem to which the generalized problem is transformed. Eigenvalues will be computed most accurately when *abstol* is set to twice the underflow threshold 2*?lamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, try setting *abstol* to 2*?lamch('S').

For optimum performance use *lwork*≥ (*nb*+1)**n*, where *nb* is the blocksize for chetrd/zhetrd returned by ilaenv.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?spgv
Computes all eigenvalues and, optionally, eigenvectors of a real generalized symmetric definite eigenproblem with matrices in packed storage.

Syntax

```
call sspgv(itype, jobz, uplo, n, ap, bp, w, z, ldz, work, info)
call dspgv(itype, jobz, uplo, n, ap, bp, w, z, ldz, work, info)
```

```
call spgv(ap, bp, w [,itype] [,uplo] [,z] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes all the eigenvalues, and optionally, the eigenvectors of a real generalized symmetric-definite eigenproblem, of the form

*A*x* = λ**B*x*, *A*B*x* = λ**x*, or *B*A*x* = λ**x*.

Here *A* and *B* are assumed to be symmetric, stored in packed format, and *B* is also positive definite.

Input Parameters

itype	INTEGER. Must be 1 or 2 or 3. Specifies the problem type to be solved: if *itype* = 1, the problem type is *A*x = lambda*B*x*; if *itype* = 2, the problem type is *A*B*x = lambda*x*; if *itype* = 3, the problem type is *B*A*x = lambda*x*.
jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then compute eigenvalues only. If *jobz* = 'V', then compute eigenvalues and eigenvectors.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', arrays *ap* and *bp* store the upper triangles of *A* and *B*; If *uplo* = 'L', arrays *ap* and *bp* store the lower triangles of *A* and *B*.
n	INTEGER. The order of the matrices *A* and *B* (*n*≥ 0).
ap, *bp*, *work*	REAL for sspgv DOUBLE PRECISION for dspgv. Arrays: *ap*(*) contains the packed upper or lower triangle of the symmetric matrix *A*, as specified by *uplo*. The dimension of *ap* must be at least max(1, *n**(*n*+1)/2). *bp*(*) contains the packed upper or lower triangle of the symmetric matrix *B*, as specified by *uplo*. The dimension of *bp* must be at least max(1, *n**(*n*+1)/2). *work(*)* is a workspace array, size at least max(1, 3*n*).
ldz	INTEGER. The leading dimension of the output array *z*; *ldz*≥ 1. If *jobz* = 'V', *ldz*≥ max(1, *n*).

Output Parameters

ap	On exit, the contents of *ap* are overwritten.

bp — On exit, contains the triangular factor *U* or *L* from the Cholesky factorization $B = U^T*U$ or $B = L*L^T$, in the same storage format as *B*.

w, *z* — REAL for sspgv

DOUBLE PRECISION for dspgv.

Arrays:

w(*), size at least max(1, *n*).

If *info* = 0, contains the eigenvalues in ascending order.

z(*ldz*,*) .

The second dimension of *z* must be at least max(1, *n*).

If *jobz* = 'V', then if *info* = 0, *z* contains the matrix *Z* of eigenvectors. The eigenvectors are normalized as follows:

if *itype* = 1 or 2, $Z^T*B*Z = I$;

if *itype* = 3, $Z^T*\text{inv}(B)*Z = I$;

If *jobz* = 'N', then *z* is not referenced.

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th argument had an illegal value.

If *info* > 0, spptrf/dpptrf and sspev/dspev returned an error code:

If *info* = *i*≤*n*, sspev/dspev failed to converge, and *i* off-diagonal elements of an intermediate tridiagonal did not converge to zero;

If *info* = *n* + *i*, for 1 ≤*i*≤*n*, then the leading minor of order *i* of *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine spgv interface are the following:

ap — Holds the array *A* of size (*n**(*n*+1)/2).

bp — Holds the array *B* of size (*n**(*n*+1)/2).

w — Holds the vector with the number of elements *n*.

z — Holds the matrix *Z* of size (*n*, *n*).

itype — Must be 1, 2, or 3. The default value is 1.

uplo — Must be 'U' or 'L'. The default value is 'U'.

jobz — Restored based on the presence of the argument *z* as follows:

jobz = 'V', if *z* is present,

jobz = 'N', if *z* is omitted.

?hpgv
Computes all eigenvalues and, optionally, eigenvectors of a complex generalized Hermitian positive-definite eigenproblem with matrices in packed storage.

Syntax

```
call chpgv(itype, jobz, uplo, n, ap, bp, w, z, ldz, work, rwork, info)
call zhpgv(itype, jobz, uplo, n, ap, bp, w, z, ldz, work, rwork, info)
call hpgv(ap, bp, w [,itype] [,uplo] [,z] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes all the eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitian positive-definite eigenproblem, of the form

$A*x = \lambda*B*x$, $A*B*x = \lambda*x$, or $B*A*x = \lambda*x$.

Here *A* and *B* are assumed to be Hermitian, stored in packed format, and *B* is also positive definite.

Input Parameters

itype

INTEGER. Must be 1 or 2 or 3. Specifies the problem type to be solved:

if *itype* = 1, the problem type is *A*x = lambda*B*x*;

if *itype* = 2, the problem type is *A*B*x = lambda*x*;

if *itype* = 3, the problem type is *B*A*x = lambda*x*.

jobz

CHARACTER*1. Must be 'N' or 'V'.

If *jobz* = 'N', then compute eigenvalues only.

If *jobz* = 'V', then compute eigenvalues and eigenvectors.

uplo

CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', arrays *ap* and *bp* store the upper triangles of *A* and *B*;

If *uplo* = 'L', arrays *ap* and *bp* store the lower triangles of *A* and *B*.

n

INTEGER. The order of the matrices *A* and *B* ($n \geq 0$).

ap, *bp*, *work*

COMPLEX for chpgv

DOUBLE COMPLEX for zhpgv.

Arrays:

ap(*) contains the packed upper or lower triangle of the Hermitian matrix *A*, as specified by *uplo*.

The dimension of *ap* must be at least max(1, *n**(*n*+1)/2).

bp(*) contains the packed upper or lower triangle of the Hermitian matrix *B*, as specified by *uplo*.

The dimension of *bp* must be at least max(1, *n**(*n*+1)/2).

work(*) is a workspace array, size at least max(1, 2*n*-1).

ldz — INTEGER. The leading dimension of the output array *z*; *ldz* ≥ 1. If *jobz* = 'V', *ldz* ≥ max(1, *n*).

rwork — REAL for chpgv

DOUBLE PRECISION for zhpgv.

Workspace array, size at least max(1, 3*n*-2).

Output Parameters

ap — On exit, the contents of *ap* are overwritten.

bp — On exit, contains the triangular factor *U* or *L* from the Cholesky factorization $B = U^H*U$ or $B = L*L^H$, in the same storage format as *B*.

w — REAL for chpgv

DOUBLE PRECISION for zhpgv.

Array, size at least max(1, *n*).

If *info* = 0, contains the eigenvalues in ascending order.

z — COMPLEX for chpgv

DOUBLE COMPLEX for zhpgv.

Array z(*ldz*,*).

The second dimension of *z* must be at least max(1, *n*).

If *jobz* = 'V', then if *info* = 0, *z* contains the matrix *Z* of eigenvectors. The eigenvectors are normalized as follows:

if *itype* = 1 or 2, $Z^H*B*Z = I$;

if *itype* = 3, $Z^H*\text{inv}(B)*Z = I$;

If *jobz* = 'N', then *z* is not referenced.

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th argument had an illegal value.

If *info* > 0, cpptrf/zpptrf and chpev/zhpev returned an error code:

If *info* = *i*≤*n*, chpev/zhpev failed to converge, and *i* off-diagonal elements of an intermediate tridiagonal did not converge to zero;

If *info* = *n* + *i*, for 1 ≤*i*≤*n*, then the leading minor of order *i* of *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `hpgv` interface are the following:

ap	Holds the array *A* of size (*n*(n+1)/2*).
bp	Holds the array *B* of size (*n*(n+1)/2*).
w	Holds the vector with the number of elements *n*.
z	Holds the matrix *Z* of size (*n*, *n*).
itype	Must be 1, 2, or 3. The default value is 1.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = `'V'`, if *z* is present, *jobz* = `'N'`, if *z* is omitted.

?spgvd

Computes all eigenvalues and, optionally, eigenvectors of a real generalized symmetric definite eigenproblem with matrices in packed storage using a divide and conquer method.

Syntax

```
call sspgvd(itype, jobz, uplo, n, ap, bp, w, z, ldz, work, lwork, iwork, liwork, info)
call dspgvd(itype, jobz, uplo, n, ap, bp, w, z, ldz, work, lwork, iwork, liwork, info)
call spgvd(ap, bp, w [,itype] [,uplo] [,z] [,info])
```

Include Files

- `mkl.fi, lapack.f90`

Description

The routine computes all the eigenvalues, and optionally, the eigenvectors of a real generalized symmetric-definite eigenproblem, of the form

*A*x* = λ**B*x*, *A*B*x* = λ**x*, or *B*A*x* = λ**x*.

Here *A* and *B* are assumed to be symmetric, stored in packed format, and *B* is also positive definite.

If eigenvectors are desired, it uses a divide and conquer algorithm.

Input Parameters

itype	`INTEGER`. Must be 1 or 2 or 3. Specifies the problem type to be solved: if *itype* = 1, the problem type is *A*x = lambda*B*x*; if *itype* = 2, the problem type is *A*B*x = lambda*x*; if *itype* = 3, the problem type is *B*A*x = lambda*x*.
jobz	`CHARACTER*1`. Must be `'N'` or `'V'`. If *jobz* = `'N'`, then compute eigenvalues only.

If *jobz* = 'V', then compute eigenvalues and eigenvectors.

uplo

CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', arrays *ap* and *bp* store the upper triangles of *A* and *B*;

If *uplo* = 'L', arrays *ap* and *bp* store the lower triangles of *A* and *B*.

n

INTEGER. The order of the matrices *A* and *B* ($n \geq 0$).

ap, *bp*, *work*

REAL for sspgvd

DOUBLE PRECISION for dspgvd.

Arrays:

ap(*) contains the packed upper or lower triangle of the symmetric matrix *A*, as specified by *uplo*.

The dimension of *ap* must be at least max(1, *n**(*n*+1)/2).

bp(*) contains the packed upper or lower triangle of the symmetric matrix *B*, as specified by *uplo*.

The dimension of *bp* must be at least max(1, *n**(*n*+1)/2).

work is a workspace array, its dimension max(1, *lwork*).

ldz

INTEGER. The leading dimension of the output array *z*; $ldz \geq 1$. If *jobz* = 'V', $ldz \geq \max(1, n)$.

lwork

INTEGER.

The dimension of the array *work*.

Constraints:

If $n \leq 1$, $lwork \geq 1$;

If *jobz* = 'N' and $n > 1$, $lwork \geq 2n$;

If *jobz* = 'V' and $n > 1$, $lwork \geq 2n^2+6n+1$.

If *lwork* = −1, then a workspace query is assumed; the routine only calculates the required sizes of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

iwork

INTEGER.

Workspace array, dimension max(1, *lwork*).

liwork

INTEGER.

The dimension of the array *iwork*.

Constraints:

If $n \leq 1$, $liwork \geq 1$;

If *jobz* = 'N' and $n > 1$, $liwork \geq 1$;

If *jobz* = 'V' and $n > 1$, $liwork \geq 5n+3$.

If *liwork* = -1, then a workspace query is assumed; the routine only calculates the required sizes of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

Output Parameters

ap

On exit, the contents of *ap* are overwritten.

bp

On exit, contains the triangular factor *U* or *L* from the Cholesky factorization $B = U^T*U$ or $B = L*L^T$, in the same storage format as *B*.

w, *z*

REAL for sspgv

DOUBLE PRECISION for dspgv.

Arrays:

w(*), size at least max(1, *n*).

If *info* = 0, contains the eigenvalues in ascending order.

z(*ldz*,*).

The second dimension of *z* must be at least max(1, *n*).

If *jobz* = 'V', then if *info* = 0, *z* contains the matrix *Z* of eigenvectors. The eigenvectors are normalized as follows:

if *itype* = 1 or 2, $Z^T*B*Z = I$;

if *itype* = 3, $Z^T*\mathrm{inv}(B)*Z = I$;

If *jobz* = 'N', then *z* is not referenced.

work(1)

On exit, if *info* = 0, then *work*(1) returns the required minimal size of *lwork*.

iwork(1)

On exit, if *info* = 0, then *iwork*(1) returns the required minimal size of *liwork*.

info

INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th argument had an illegal value.

If *info* > 0, spptrf/dpptrf and sspevd/dspevd returned an error code:

If *info* = *i*≤*n*, sspevd/dspevd failed to converge, and *i* off-diagonal elements of an intermediate tridiagonal did not converge to zero;

If *info* = *n* + *i*, for 1 ≤*i*≤*n*, then the leading minor of order *i* of *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine spgvd interface are the following:

ap	Holds the array *A* of size (*n*(n+1)/2*).
bp	Holds the array *B* of size (*n*(n+1)/2*).
w	Holds the vector with the number of elements *n*.
z	Holds the matrix *Z* of size (*n*, *n*).
itype	Must be 1, 2, or 3. The default value is 1.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = `'V'`, if *z* is present, *jobz* = `'N'`, if *z* is omitted.

Application Notes

If it is not clear how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run, or set *lwork* = -1 (*liwork* = -1).

If *lwork* (or *liwork*) has any of admissible sizes, which is no less than the minimal value described, then the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If *lwork* = -1 (*liwork* = -1), then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if *lwork* (*liwork*) is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?hpgvd

Computes all eigenvalues and, optionally, eigenvectors of a complex generalized Hermitian positive-definite eigenproblem with matrices in packed storage using a divide and conquer method.

Syntax

```
call chpgvd(itype, jobz, uplo, n, ap, bp, w, z, ldz, work, lwork, rwork, lrwork, iwork, liwork, info)
```

```
call zhpgvd(itype, jobz, uplo, n, ap, bp, w, z, ldz, work, lwork, rwork, lrwork, iwork, liwork, info)
```

```
call hpgvd(ap, bp, w [,itype] [,uplo] [,z] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes all the eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitian positive-definite eigenproblem, of the form

*A*x* = λ**B*x*, *A*B*x* = λ**x*, or *B*A*x* = λ**x*.

Here *A* and *B* are assumed to be Hermitian, stored in packed format, and *B* is also positive definite.

If eigenvectors are desired, it uses a divide and conquer algorithm.

Input Parameters

itype

INTEGER. Must be 1 or 2 or 3. Specifies the problem type to be solved:

if *itype* = 1, the problem type is *A*x = lambda*B*x*;

if *itype* = 2, the problem type is *A*B*x = lambda*x*;

if *itype* = 3, the problem type is *B*A*x = lambda*x*.

jobz

CHARACTER*1. Must be 'N' or 'V'.

If *jobz* = 'N', then compute eigenvalues only.

If *jobz* = 'V', then compute eigenvalues and eigenvectors.

uplo

CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', arrays *ap* and *bp* store the upper triangles of *A* and *B*;

If *uplo* = 'L', arrays *ap* and *bp* store the lower triangles of *A* and *B*.

n

INTEGER. The order of the matrices *A* and *B* (*n*≥ 0).

ap, *bp*, *work*

COMPLEX for chpgvd

DOUBLE COMPLEX for zhpgvd.

Arrays:

ap(*) contains the packed upper or lower triangle of the Hermitian matrix *A*, as specified by *uplo*.

The dimension of *ap* must be at least max(1, *n**(*n*+1)/2).

bp(*) contains the packed upper or lower triangle of the Hermitian matrix *B*, as specified by *uplo*.

The dimension of *bp* must be at least max(1, *n**(*n*+1)/2).

work is a workspace array, its dimension max(1, *lwork*).

ldz

INTEGER. The leading dimension of the output array *z*; *ldz*≥ 1. If *jobz* = 'V', *ldz*≥ max(1, *n*).

lwork

INTEGER.

The dimension of the array *work*.

Constraints:

If *n*≤ 1, *lwork*≥ 1;

If *jobz* = 'N' and *n*>1, *lwork*≥*n*;

If *jobz* = 'V' and *n*>1, *lwork*≥ 2*n*.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

rwork

REAL for chpgvd

DOUBLE PRECISION for zhpgvd.

Workspace array, its dimension max(1, *lrwork*).

lrwork

INTEGER.

The dimension of the array *rwork*.

Constraints:

If $n \leq 1$, $lrwork \geq 1$;

If *jobz* = 'N' and $n>1$, $lrwork \geq n$;

If *jobz* = 'V' and $n>1$, $lrwork \geq 2n^2+5n+1$.

If *lrwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

iwork

INTEGER.

Workspace array, its dimension max(1, *liwork*).

liwork

INTEGER.

The dimension of the array *iwork*.

Constraints:

If $n \leq 1$, $liwork \geq 1$;

If *jobz* = 'N' and $n>1$, $liwork \geq 1$;

If *jobz* = 'V' and $n>1$, $liwork \geq 5n+3$.

If *liwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

Output Parameters

ap

On exit, the contents of *ap* are overwritten.

bp

On exit, contains the triangular factor *U* or *L* from the Cholesky factorization $B = U^H*U$ or $B = L*L^H$, in the same storage format as *B*.

w

REAL for chpgvd

DOUBLE PRECISION for zhpgvd.

Array, size at least max(1, *n*).

If *info* = 0, contains the eigenvalues in ascending order.

z

COMPLEX for chpgvd

DOUBLE COMPLEX for zhpgvd.

Array z(*ldz*,*).

The second dimension of *z* must be at least max(1, *n*).

If *jobz* = 'V', then if *info* = 0, *z* contains the matrix *Z* of eigenvectors. The eigenvectors are normalized as follows:

if *itype* = 1 or 2, $Z^H*B*Z = I$;

if *itype* = 3, $Z^H*\mathrm{inv}(B)*Z = I$;

If *jobz* = 'N', then *z* is not referenced.

work(1)

On exit, if *info* = 0, then *work*(1) returns the required minimal size of *lwork*.

rwork(1)

On exit, if *info* = 0, then *rwork*(1) returns the required minimal size of *lrwork*.

iwork(1)

On exit, if *info* = 0, then *iwork*(1) returns the required minimal size of *liwork*.

info

INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th argument had an illegal value.

If *info* > 0, cpptrf/zpptrf and chpevd/zhpevd returned an error code:

If *info* = *i*≤*n*, chpevd/zhpevd failed to converge, and *i* off-diagonal elements of an intermediate tridiagonal did not converge to zero;

If *info* = *n* + *i*, for 1 ≤*i*≤*n*, then the leading minor of order *i* of *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine hpgvd interface are the following:

ap

Holds the array *A* of size (*n**(*n*+1)/2).

bp

Holds the array *B* of size (*n**(*n*+1)/2).

w

Holds the vector with the number of elements *n*.

z

Holds the matrix *Z* of size (*n*, *n*).

itype

Must be 1, 2, or 3. The default value is 1.

uplo

Must be 'U' or 'L'. The default value is 'U'.

jobz

Restored based on the presence of the argument *z* as follows:

jobz = 'V', if *z* is present,

jobz = 'N', if *z* is omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* (*liwork* or *lrwork*) for the first run or set *lwork* = -1 (*liwork* = -1, *lrwork* = -1).

If you choose the first option and set any of admissible *lwork* (*liwork* or *lrwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*) on exit. Use this value (*work*(1), *iwork*(1), *rwork*(1)) for subsequent runs.

If you set *lwork* = -1 (*liwork* = -1, *lrwork* = -1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*, *lrwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?spgvx

Computes selected eigenvalues and, optionally, eigenvectors of a real generalized symmetric definite eigenproblem with matrices in packed storage.

Syntax

```
call sspgvx(itype, jobz, range, uplo, n, ap, bp, vl, vu, il, iu, abstol, m, w, z, ldz, work, iwork, ifail, info)
```

```
call dspgvx(itype, jobz, range, uplo, n, ap, bp, vl, vu, il, iu, abstol, m, w, z, ldz, work, iwork, ifail, info)
```

```
call spgvx(ap, bp, w [,itype] [,uplo] [,z] [,vl] [,vu] [,il] [,iu] [,m] [,ifail] [,abstol] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes selected eigenvalues, and optionally, the eigenvectors of a real generalized symmetric-definite eigenproblem, of the form

*A*x* = λ*B*x*, *A*B*x* = λ*x*, or *B*A*x* = λ*x*.

Here *A* and *B* are assumed to be symmetric, stored in packed format, and *B* is also positive definite. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Input Parameters

itype INTEGER. Must be 1 or 2 or 3. Specifies the problem type to be solved:

if *itype* = 1, the problem type is *A*x = lambda*B*x*;

if *itype* = 2, the problem type is *A*B*x = lambda*x*;

if *itype* = 3, the problem type is *B*A*x = lambda*x*.

jobz — CHARACTER*1. Must be 'N' or 'V'.

If *jobz* = 'N', then compute eigenvalues only.

If *jobz* = 'V', then compute eigenvalues and eigenvectors.

range — CHARACTER*1. Must be 'A' or 'V' or 'I'.

If *range* = 'A', the routine computes all eigenvalues.

If *range* = 'V', the routine computes eigenvalues *lambda(i)* in the half-open interval:

vl<*lambda*(*i*)≤*vu*.

If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.

uplo — CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', arrays *ap* and *bp* store the upper triangles of *A* and *B*;

If *uplo* = 'L', arrays *ap* and *bp* store the lower triangles of *A* and *B*.

n — INTEGER. The order of the matrices *A* and *B* (*n*≥ 0).

ap, *bp*, *work* — REAL for sspgvx

DOUBLE PRECISION for dspgvx.

Arrays:

ap(*) contains the packed upper or lower triangle of the symmetric matrix *A*, as specified by *uplo*.

The size of *ap* must be at least max(1, *n**(*n*+1)/2).

bp(*) contains the packed upper or lower triangle of the symmetric matrix *B*, as specified by *uplo*.

The size of *bp* must be at least max(1, *n**(*n*+1)/2).

work(*) is a workspace array, size at least max(1, 8*n*).

vl, *vu* — REAL for sspgvx

DOUBLE PRECISION for dspgvx.

If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.

Constraint: *vl*< *vu*.

If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, *iu* — INTEGER.

If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.

Constraint: 1 ≤*il*≤*iu*≤*n*, if *n* > 0; *il*=1 and *iu*=0

if *n* = 0.

If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol

REAL for sspgvx

DOUBLE PRECISION for dspgvx.

The absolute error tolerance for the eigenvalues. See *Application Notes* for more information.

ldz

INTEGER. The leading dimension of the output array *z*. Constraints:

ldz≥ 1; if *jobz* = 'V', *ldz*≥ max(1, *n*) .

iwork

INTEGER.

Workspace array, size at least max(1, 5*n*).

Output Parameters

ap

On exit, the contents of *ap* are overwritten.

bp

On exit, contains the triangular factor *U* or *L* from the Cholesky factorization $B = U^T*U$ or $B = L*L^T$, in the same storage format as *B*.

m

INTEGER. The total number of eigenvalues found,

$0 \le m \le n$. If *range* = 'A', *m* = *n*, and if *range* = 'I',

m = *iu*-*il*+1.

w, *z*

REAL for sspgvx

DOUBLE PRECISION for dspgvx.

Arrays:

w(*), size at least max(1, *n*).

If *info* = 0, contains the eigenvalues in ascending order.

z(*ldz*,*) .

The second dimension of *z* must be at least max(1, *n*).

If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *A* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). The eigenvectors are normalized as follows:

if *itype* = 1 or 2, Z^T*B*Z = I;

if *itype* = 3, Z^T*inv(*B*)*Z = I;

If *jobz* = 'N', then *z* is not referenced.

If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*.

Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.

ifail

INTEGER.

Array, size at least max(1, *n*).

If *jobz* = 'V', then if *info* = 0, the first *m* elements of *ifail* are zero; if *info* > 0, the *ifail* contains the indices of the eigenvectors that failed to converge.

If *jobz* = 'N', then *ifail* is not referenced.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th argument had an illegal value.

If *info* > 0, spptrf/dpptrf and sspevx/dspevx returned an error code:

If *info* = *i*≤*n*, sspevx/dspevx failed to converge, and *i* eigenvectors failed to converge. Their indices are stored in the array *ifail*;

If *info* = *n* + *i*, for 1 ≤*i*≤*n*, then the leading minor of order *i* of *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine spgvx interface are the following:

ap Holds the array *A* of size (*n**(*n*+1)/2).

bp Holds the array *B* of size (*n**(*n*+1)/2).

w Holds the vector with the number of elements *n*.

z Holds the matrix *Z* of size (*n*, *n*), where the values *n* and *m* are significant.

ifail Holds the vector with the number of elements *n*.

itype Must be 1, 2, or 3. The default value is 1.

uplo Must be 'U' or 'L'. The default value is 'U'.

vl Default value for this element is *vl* = -HUGE(*vl*).

vu Default value for this element is *vu* = HUGE(*vl*).

il Default value for this argument is *il* = 1.

iu Default value for this argument is *iu* = *n*.

abstol Default value for this element is *abstol* = 0.0_WP.

jobz Restored based on the presence of the argument *z* as follows:

jobz = 'V', if *z* is present,

jobz = 'N', if *z* is omitted.

Note that there will be an error condition if *ifail* is present and *z* is omitted.

range Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows:

range = 'V', if one of or both *vl* and *vu* are present,

range = 'I', if one of or both *il* and *iu* are present,

range = 'A', if none of *vl*, *vu*, *il*, *iu* is present,

Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a,b] of width less than or equal to *abstol*+ε*max(|a|,|b|), where ε is the machine precision.

If *abstol* is less than or equal to zero, then ε*||*T*||$_1$ is used instead, where *T* is the tridiagonal matrix obtained by reducing *A* to tridiagonal form. Eigenvalues are computed most accurately when *abstol* is set to twice the underflow threshold 2*?lamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, set *abstol* to 2*?lamch('S').

?hpgvx

Computes selected eigenvalues and, optionally, eigenvectors of a generalized Hermitian positive-definite eigenproblem with matrices in packed storage.

Syntax

```
call chpgvx(itype, jobz, range, uplo, n, ap, bp, vl, vu, il, iu, abstol, m, w, z, ldz, work, rwork, iwork, ifail, info)
```

```
call zhpgvx(itype, jobz, range, uplo, n, ap, bp, vl, vu, il, iu, abstol, m, w, z, ldz, work, rwork, iwork, ifail, info)
```

```
call hpgvx(ap, bp, w [,itype] [,uplo] [,z] [,vl] [,vu] [,il] [,iu] [,m] [,ifail] [,abstol] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes selected eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitian positive-definite eigenproblem, of the form

*A*x* = λ*B*x*, *A*B*x* = λ*x*, or *B*A*x* = λ*x*.

Here *A* and *B* are assumed to be Hermitian, stored in packed format, and *B* is also positive definite. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Input Parameters

itype INTEGER. Must be 1 or 2 or 3. Specifies the problem type to be solved:

if *itype* = 1, the problem type is *A*x = lambda*B*x*;

if *itype* = 2, the problem type is *A*B*x = lambda*x*;

if *itype* = 3, the problem type is *B*A*x = lambda*x*.

jobz CHARACTER*1. Must be 'N' or 'V'.

If *jobz* = 'N', then compute eigenvalues only.

If *jobz* = 'V', then compute eigenvalues and eigenvectors.

range CHARACTER*1. Must be 'A' or 'V' or 'I'.

If *range* = 'A', the routine computes all eigenvalues.

If *range* = 'V', the routine computes eigenvalues *lambda(i)* in the half-open interval:

$vl < lambda(i) \leq vu$.

If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.

uplo CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', arrays *ap* and *bp* store the upper triangles of *A* and *B*;

If *uplo* = 'L', arrays *ap* and *bp* store the lower triangles of *A* and *B*.

n INTEGER. The order of the matrices *A* and *B* ($n \geq 0$).

ap, *bp*, *work* COMPLEX for chpgvx

DOUBLE COMPLEX for zhpgvx.

Arrays:

ap(*) contains the packed upper or lower triangle of the Hermitian matrix *A*, as specified by *uplo*.

The dimension of *ap* must be at least max(1, $n*(n+1)/2$).

bp(*) contains the packed upper or lower triangle of the Hermitian matrix *B*, as specified by *uplo*.

The dimension of *bp* must be at least max(1, $n*(n+1)/2$).

work(*) is a workspace array, size at least max(1, 2*n*).

vl, *vu* REAL for chpgvx

DOUBLE PRECISION for zhpgvx.

If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.

Constraint: $vl < vu$.

If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, *iu* INTEGER.

If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.

Constraint: $1 \leq il \leq iu \leq n$, if $n > 0$; $il=1$ and $iu=0$

if $n = 0$.

If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol REAL for chpgvx

DOUBLE PRECISION for zhpgvx.

The absolute error tolerance for the eigenvalues.

See *Application Notes* for more information.

ldz INTEGER. The leading dimension of the output array *z*; *ldz*≥ 1. If *jobz* = 'V', *ldz*≥ max(1, *n*).

rwork REAL for chpgvx

DOUBLE PRECISION for zhpgvx.

Workspace array, size at least max(1, 7*n*).

iwork INTEGER.

Workspace array, size at least max(1, 5*n*).

Output Parameters

ap On exit, the contents of *ap* are overwritten.

bp On exit, contains the triangular factor *U* or *L* from the Cholesky factorization $B = U^H*U$ or $B = L*L^H$, in the same storage format as *B*.

m INTEGER. The total number of eigenvalues found,

$0 \le m \le n$. If *range* = 'A', *m* = *n*, and if *range* = 'I',

m = *iu*-*il*+1.

w REAL for chpgvx

DOUBLE PRECISION for zhpgvx.

Array, size at least max(1, *n*).

If *info* = 0, contains the eigenvalues in ascending order.

z COMPLEX for chpgvx

DOUBLE COMPLEX for zhpgvx.

Array z(*ldz*,*).

The second dimension of *z* must be at least max(1, *n*).

If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *A* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). The eigenvectors are normalized as follows:

if *itype* = 1 or 2, Z^H*B*Z = I;

if *itype* = 3, Z^H*inv(*B*)*Z = I;

If *jobz* = 'N', then *z* is not referenced.

If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*.

Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.

ifail INTEGER.

Array, size at least max(1, *n*).

If *jobz* = 'V', then if *info* = 0, the first *m* elements of *ifail* are zero; if *info* > 0, the *ifail* contains the indices of the eigenvectors that failed to converge.

If *jobz* = 'N', then *ifail* is not referenced.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th argument had an illegal value.

If *info* > 0, cpptrf/zpptrf and chpevx/zhpevx returned an error code:

If *info* = *i*≤*n*, chpevx/zhpevx failed to converge, and *i* eigenvectors failed to converge. Their indices are stored in the array *ifail*;

If *info* = *n* + *i*, for 1 ≤*i*≤*n*, then the leading minor of order *i* of *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

LAPACK 95 Interface Notes

If *abstol* is less than or equal to zero, then ε*||*T*||$_1$ is used as tolerance, where *T* is the tridiagonal matrix obtained by reducing *A* to tridiagonal form. Eigenvalues will be computed most accurately when *abstol* is set to twice the underflow threshold 2*?lamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, try setting *abstol* to 2*?lamch('S').

?sbgv

Computes all eigenvalues and, optionally, eigenvectors of a real generalized symmetric definite eigenproblem with banded matrices.

Syntax

```
call ssbgv(jobz, uplo, n, ka, kb, ab, ldab, bb, ldbb, w, z, ldz, work, info)
call dsbgv(jobz, uplo, n, ka, kb, ab, ldab, bb, ldbb, w, z, ldz, work, info)
call sbgv(ab, bb, w [,uplo] [,z] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes all the eigenvalues, and optionally, the eigenvectors of a real generalized symmetric-definite banded eigenproblem, of the form *A*x* = λ*B*x*. Here *A* and *B* are assumed to be symmetric and banded, and *B* is also positive definite.

Input Parameters

jobz CHARACTER*1. Must be 'N' or 'V'.

If *jobz* = 'N', then compute eigenvalues only.

If *jobz* = 'V', then compute eigenvalues and eigenvectors.

uplo CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', arrays *ab* and *bb* store the upper triangles of *A* and *B*;

If *uplo* = 'L', arrays *ab* and *bb* store the lower triangles of *A* and *B*.

n INTEGER. The order of the matrices *A* and *B* (*n*≥ 0).

ka INTEGER. The number of super- or sub-diagonals in *A* (*ka*≥ 0).

kb INTEGER. The number of super- or sub-diagonals in *B* (*kb*≥ 0).

ab, *bb*, *work* REAL for ssbgv

DOUBLE PRECISION for dsbgv

Arrays:

ab(*ldab*,*) is an array containing either upper or lower triangular part of the symmetric matrix *A* (as specified by *uplo*) in band storage format.

The second dimension of the array *ab* must be at least max(1, *n*).

bb(*ldbb*,*) is an array containing either upper or lower triangular part of the symmetric matrix *B* (as specified by *uplo*) in band storage format.

The second dimension of the array *bb* must be at least max(1, *n*).

work(*) is a workspace array, dimension at least max(1, 3*n*)

ldab INTEGER. The leading dimension of the array *ab*; must be at least *ka*+1 .

ldbb INTEGER. The leading dimension of the array *bb*; must be at least *kb*+1.

ldz INTEGER. The leading dimension of the output array *z*; *ldz*≥ 1. If *jobz* = 'V', *ldz*≥ max(1, *n*).

Output Parameters

ab On exit, the contents of *ab* are overwritten.

bb On exit, contains the factor *S* from the split Cholesky factorization $B = S^T*S$, as returned by pbstf/pbstf.

w, *z* REAL for ssbgv

DOUBLE PRECISION for dsbgv

Arrays:

w(*), size at least max(1, *n*).

If *info* = 0, contains the eigenvalues in ascending order.

z(*ldz*,*) .

The second dimension of *z* must be at least max(1, *n*).

If *jobz* = 'V', then if *info* = 0, *z* contains the matrix *Z* of eigenvectors, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). The eigenvectors are normalized so that $Z^T*B*Z = I$.

If *jobz* = 'N', then *z* is not referenced.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th argument had an illegal value.

If *info* > 0, and

if *i*≤*n*, the algorithm failed to converge, and *i* off-diagonal elements of an intermediate tridiagonal did not converge to zero;

if *info* = *n* + *i*, for 1 ≤*i*≤*n*, then pbstf/pbstf returned *info* = *i* and *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

If eigenvectors are desired, it uses a divide and conquer algorithm.

Input Parameters

jobz

CHARACTER*1. Must be 'N' or 'V'.

If *jobz* = 'N', then compute eigenvalues only.

If *jobz* = 'V', then compute eigenvalues and eigenvectors.

uplo

CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', arrays *ab* and *bb* store the upper triangles of *A* and *B*;

If *uplo* = 'L', arrays *ab* and *bb* store the lower triangles of *A* and *B*.

n

INTEGER. The order of the matrices *A* and *B* (*n*≥ 0).

ka

INTEGER. The number of super- or sub-diagonals in *A*

(*ka*≥ 0).

kb

INTEGER. The number of super- or sub-diagonals in *B* (*kb*≥ 0).

ab, *bb*, *work*

REAL for ssbgvd

DOUBLE PRECISION for dsbgvd

Arrays:

ab(*ldab*,*) is an array containing either upper or lower triangular part of the symmetric matrix *A* (as specified by *uplo*) in band storage format.

The second dimension of the array *ab* must be at least max(1, *n*).

bb(*ldbb*,*) is an array containing either upper or lower triangular part of the symmetric matrix *B* (as specified by *uplo*) in band storage format.

The second dimension of the array *bb* must be at least max(1, *n*).

work is a workspace array, its dimension max(1, *lwork*).

ldab

INTEGER. The leading dimension of the array *ab*; must be at least *ka*+1.

ldbb

INTEGER. The leading dimension of the array *bb*; must be at least *kb*+1.

ldz

INTEGER. The leading dimension of the output array *z*; *ldz*≥ 1. If *jobz* = 'V', *ldz*≥ max(1, *n*).

lwork

INTEGER.

The dimension of the array *work*.

Constraints:

If *n*≤ 1, *lwork*≥ 1;

If *jobz* = 'N' and *n*>1, *lwork*≥ 3*n*;

If *jobz* = 'V' and *n*>1, *lwork*≥ $2n^2+5n+1$.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

iwork

INTEGER.

Workspace array, its dimension max(1, *liwork*).

liwork

INTEGER.

The dimension of the array *iwork*.

Constraints:

If *n*≤ 1, *liwork*≥ 1;

If *jobz* = 'N' and *n*>1, *liwork*≥ 1;

If *jobz* = 'V' and *n*>1, *liwork*≥ 5*n*+3.

If *liwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

Output Parameters

ab

On exit, the contents of *ab* are overwritten.

bb

On exit, contains the factor *S* from the split Cholesky factorization $B = S^T*S$, as returned by pbstf/pbstf.

w, *z*

REAL for ssbgvd

DOUBLE PRECISION for dsbgvd

Arrays:

w(*), size at least max(1, *n*).

If *info* = 0, contains the eigenvalues in ascending order.

z(*ldz*,*).

The second dimension of *z* must be at least max(1, *n*).

If *jobz* = 'V', then if *info* = 0, *z* contains the matrix *Z* of eigenvectors, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). The eigenvectors are normalized so that $Z^T*B*Z = I$.

If *jobz* = 'N', then *z* is not referenced.

work(1)

On exit, if *info* = 0, then *work*(1) returns the required minimal size of *lwork*.

iwork(1)	On exit, if *info* = 0, then *iwork*(1) returns the required minimal size of *liwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th argument had an illegal value. If *info* > 0, and if *i*≤*n*, the algorithm failed to converge, and *i* off-diagonal elements of an intermediate tridiagonal did not converge to zero; if *info* = *n* + *i*, for 1 ≤*i*≤*n*, then pbstf/pbstf returned *info* = *i* and *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine sbgvd interface are the following:

ab	Holds the array *A* of size (*ka+1,n*).
bb	Holds the array *B* of size (*kb+1,n*).
w	Holds the vector with the number of elements *n*.
z	Holds the matrix *Z* of size (*n*, *n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted.

Application Notes

If it is not clear how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run or set *lwork* = -1 (*liwork* = -1).

If *lwork* (or *liwork*) has any of admissible sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If *lwork* = -1 (*liwork* = -1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if *work* (*liwork*) is less than the minimal required value and is not equal to -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?hbgvd
Computes all eigenvalues and, optionally, eigenvectors of a complex generalized Hermitian positive-definite eigenproblem with banded matrices. If eigenvectors are desired, it uses a divide and conquer method.

Syntax

`call chbgvd(jobz, uplo, n, ka, kb, ab, ldab, bb, ldbb, w, z, ldz, work, lwork, rwork, lrwork, iwork, liwork, info)`

`call zhbgvd(jobz, uplo, n, ka, kb, ab, ldab, bb, ldbb, w, z, ldz, work, lwork, rwork, lrwork, iwork, liwork, info)`

`call hbgvd(ab, bb, w [,uplo] [,z] [,info])`

Include Files

- `mkl.fi, lapack.f90`

Description

The routine computes all the eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitian positive-definite banded eigenproblem, of the form $A*x = \lambda*B*x$. Here *A* and *B* are assumed to be Hermitian and banded, and *B* is also positive definite.

If eigenvectors are desired, it uses a divide and conquer algorithm.

Input Parameters

jobz
`CHARACTER*1`. Must be `'N'` or `'V'`.
If *jobz* = `'N'`, then compute eigenvalues only.
If *jobz* = `'V'`, then compute eigenvalues and eigenvectors.

uplo
`CHARACTER*1`. Must be `'U'` or `'L'`.
If *uplo* = `'U'`, arrays *ab* and *bb* store the upper triangles of *A* and *B*;
If *uplo* = `'L'`, arrays *ab* and *bb* store the lower triangles of *A* and *B*.

n
`INTEGER`. The order of the matrices *A* and *B* ($n \geq 0$).

ka
`INTEGER`. The number of super- or sub-diagonals in *A* ($ka \geq 0$).

kb
`INTEGER`. The number of super- or sub-diagonals in *B* ($kb \geq 0$).

ab, *bb*, *work*
`COMPLEX` for `chbgvd`
`DOUBLE COMPLEX` for `zhbgvd`
Arrays:
ab(*ldab*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *A* (as specified by *uplo*) in band storage format.
The second dimension of the array *ab* must be at least max(1, *n*).
bb(*ldbb*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *B* (as specified by *uplo*) in band storage format.

The second dimension of the array *bb* must be at least max(1, *n*).

work is a workspace array, its dimension `max(1, lwork)`.

ldab — `INTEGER`. The leading dimension of the array *ab*; must be at least *ka*+1.

ldbb — `INTEGER`. The leading dimension of the array *bb*; must be at least *kb*+1.

ldz — `INTEGER`. The leading dimension of the output array *z*; $ldz \geq 1$. If *jobz* = 'V', $ldz \geq \max(1, n)$.

lwork — `INTEGER`.

The dimension of the array *work*.

Constraints:

If $n \leq 1$, $lwork \geq 1$;

If *jobz* = 'N' and $n > 1$, $lwork \geq n$;

If *jobz* = 'V' and $n > 1$, $lwork \geq 2n^2$.

If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

rwork — `REAL` for `chbgvd`

`DOUBLE PRECISION` for `zhbgvd`.

Workspace array, size `max(1, lrwork)`.

lrwork — `INTEGER`.

The dimension of the array *rwork*.

Constraints:

If $n \leq 1$, $lrwork \geq 1$;

If *jobz* = 'N' and $n > 1$, $lrwork \geq n$;

If *jobz* = 'V' and $n > 1$, $lrwork \geq 2n^2+5n+1$.

If *lrwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

iwork — `INTEGER`.

Workspace array, size `max(1, liwork)`.

liwork — `INTEGER`.

The dimension of the array *iwork*.

Constraints:

If $n \leq 1$, $lwork \geq 1$;

If *jobz* = 'N' and $n > 1$, $liwork \geq 1$;

If *jobz* = 'V' and *n*>1, *liwork*≥ 5*n*+3.

If *liwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

Output Parameters

ab

On exit, the contents of *ab* are overwritten.

bb

On exit, contains the factor *S* from the split Cholesky factorization $B = S^H*S$, as returned by pbstf/pbstf.

w

REAL for chbgvd

DOUBLE PRECISION for zhbgvd.

Array, size at least max(1, *n*) .

If *info* = 0, contains the eigenvalues in ascending order.

z

COMPLEX for chbgvd

DOUBLE COMPLEX for zhbgvd

Array z(*ldz*,*).

The second dimension of *z* must be at least max(1, *n*).

If *jobz* = 'V', then if *info* = 0, *z* contains the matrix *Z* of eigenvectors, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). The eigenvectors are normalized so that $Z^H*B*Z = I$.

If *jobz* = 'N', then *z* is not referenced.

work(1)

On exit, if *info* = 0, then *work*(1) returns the required minimal size of *lwork*.

rwork(1)

On exit, if *info* = 0, then *rwork*(1) returns the required minimal size of *lrwork*.

iwork(1)

On exit, if *info* = 0, then *iwork*(1) returns the required minimal size of *liwork*.

info

INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th argument had an illegal value.

If *info* > 0, and

if *i*≤*n*, the algorithm failed to converge, and *i* off-diagonal elements of an intermediate tridiagonal did not converge to zero;

if *info* = *n* + *i*, for 1 ≤*i*≤*n*, then pbstf/pbstf returned *info* = *i* and *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `hbgvd` interface are the following:

ab	Holds the array *A* of size (*ka*+*1*,*n*).
bb	Holds the array *B* of size (*kb*+*1*,*n*).
w	Holds the vector with the number of elements *n*.
z	Holds the matrix *Z* of size (*n*, *n*).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = `'V'`, if *z* is present, *jobz* = `'N'`, if *z* is omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* (*liwork* or *lrwork*) for the first run or set *lwork* = -1 (*liwork* = -1, *lrwork* = -1).

If you choose the first option and set any of admissible *lwork* (*liwork* or *lrwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*) on exit. Use this value (*work*(1), *iwork*(1), *rwork*(1)) for subsequent runs.

If you set *lwork* = -1 (*liwork* = -1, *lrwork* = -1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*, *lrwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?sbgvx
Computes selected eigenvalues and, optionally, eigenvectors of a real generalized symmetric definite eigenproblem with banded matrices.

Syntax

```
call ssbgvx(jobz, range, uplo, n, ka, kb, ab, ldab, bb, ldbb, q, ldq, vl, vu, il, iu, abstol, m, w, z, ldz, work, iwork, ifail, info)
```

```
call dsbgvx(jobz, range, uplo, n, ka, kb, ab, ldab, bb, ldbb, q, ldq, vl, vu, il, iu, abstol, m, w, z, ldz, work, iwork, ifail, info)
```

```
call sbgvx(ab, bb, w [,uplo] [,z] [,vl] [,vu] [,il] [,iu] [,m] [,ifail] [,q] [,abstol] [,info])
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine computes selected eigenvalues, and optionally, the eigenvectors of a real generalized symmetric-definite banded eigenproblem, of the form $A*x = \lambda*B*x$. Here *A* and *B* are assumed to be symmetric and banded, and *B* is also positive definite. Eigenvalues and eigenvectors can be selected by specifying either all eigenvalues, a range of values or a range of indices for the desired eigenvalues.

Input Parameters

jobz

CHARACTER*1. Must be 'N' or 'V'.

If *jobz* = 'N', then compute eigenvalues only.

If *jobz* = 'V', then compute eigenvalues and eigenvectors.

range

CHARACTER*1. Must be 'A' or 'V' or 'I'.

If *range* = 'A', the routine computes all eigenvalues.

If *range* = 'V', the routine computes eigenvalues *lambda*(*i*) in the half-open interval:

$vl < lambda(i) \le vu$.

If *range* = 'I', the routine computes eigenvalues in range *il* to *iu*.

uplo

CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', arrays *ab* and *bb* store the upper triangles of *A* and *B*;

If *uplo* = 'L', arrays *ab* and *bb* store the lower triangles of *A* and *B*.

n

INTEGER. The order of the matrices *A* and *B* ($n \ge 0$).

ka

INTEGER. The number of super- or sub-diagonals in *A*

($ka \ge 0$).

kb

INTEGER. The number of super- or sub-diagonals in *B* ($kb \ge 0$).

ab, *bb*, *work*

REAL for ssbgvx

DOUBLE PRECISION for dsbgvx

Arrays:

ab(*ldab*,*) is an array containing either upper or lower triangular part of the symmetric matrix *A* (as specified by *uplo*) in band storage format.

The second dimension of the array *ab* must be at least max(1, *n*).

bb(*ldbb*,*) is an array containing either upper or lower triangular part of the symmetric matrix *B* (as specified by *uplo*) in band storage format.

The second dimension of the array *bb* must be at least max(1, *n*).

work(*) is a workspace array, size (7**n*).

ldab

INTEGER. The leading dimension of the array *ab*; must be at least *ka*+1.

ldbb

INTEGER. The leading dimension of the array *bb*; must be at least *kb*+1.

vl, *vu*

REAL for ssbgvx

DOUBLE PRECISION for dsbgvx.

If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.

Constraint: *vl*< *vu*.

If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, *iu*

INTEGER.

If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.

Constraint: 1 ≤*il*≤*iu*≤*n*, if *n* > 0; *il*=1 and *iu*=0

if *n* = 0.

If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol

REAL for ssbgvx

DOUBLE PRECISION for dsbgvx.

The absolute error tolerance for the eigenvalues. See *Application Notes* for more information.

ldz

INTEGER. The leading dimension of the output array *z*; *ldz*≥ 1. If *jobz* = 'V', *ldz*≥ max(1, *n*).

ldq

INTEGER. The leading dimension of the output array *q*; *ldq* < 1.

If *jobz* = 'V', *ldq* < max(1, *n*).

iwork

INTEGER.

Workspace array, size (5**n*).

Output Parameters

ab

On exit, the contents of *ab* are overwritten.

bb

On exit, contains the factor *S* from the split Cholesky factorization $B = S^T*S$, as returned by pbstf/pbstf.

m

INTEGER. The total number of eigenvalues found,

0 ≤*m*≤*n*. If *range* = 'A', *m* = *n*, and if *range* = 'I',

m = *iu*-*il*+1.

w, *z*, *q*

REAL for ssbgvx

DOUBLE PRECISION for dsbgvx

Arrays:

w(*), size at least max(1, *n*) .

If *info* = 0, contains the eigenvalues in ascending order.

z(*ldz*,*) .

The second dimension of *z* must be at least max(1, *n*).

If *jobz* = 'V', then if *info* = 0, *z* contains the matrix *Z* of eigenvectors, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). The eigenvectors are normalized so that $Z^T*B*Z = I$.

If *jobz* = 'N', then *z* is not referenced.

q(*ldq*,*) .

The second dimension of *q* must be at least max(1, *n*).

If *jobz* = 'V', then *q* contains the *n*-by-*n* matrix used in the reduction of *A*x = lambda*B*x* to standard form, that is, *C*x= lambda*x* and consequently *C* to tridiagonal form.

If *jobz* = 'N', then *q* is not referenced.

ifail INTEGER.

Array, size (*m*).

If *jobz* = 'V', then if *info* = 0, the first *m* elements of *ifail* are zero; if *info* > 0, the *ifail* contains the indices of the eigenvectors that failed to converge.

If *jobz* = 'N', then *ifail* is not referenced.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th argument had an illegal value.

If *info* > 0, and

if $i \le n$, the algorithm failed to converge, and *i* off-diagonal elements of an intermediate tridiagonal did not converge to zero;

if *info* = *n* + *i*, for $1 \le i \le n$, then pbstf/pbstf returned *info* = *i* and *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine sbgvx interface are the following:

ab Holds the array *A* of size (*ka*+1,*n*).

bb Holds the array *B* of size (*kb*+1,*n*).

w Holds the vector with the number of elements *n*.

z Holds the matrix *Z* of size (*n*, *n*).

ifail Holds the vector with the number of elements *n*.

q Holds the matrix *Q* of size (*n*, *n*).

uplo Must be 'U' or 'L'. The default value is 'U'.

vl Default value for this element is *vl* = -HUGE(*vl*).

vu	Default value for this element is *vu* = HUGE(*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this element is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted. Note that there will be an error condition if *ifail* or *q* is present and *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a,b] of width less than or equal to *abstol*+ε*max(|a|,|b|), where ε is the machine precision.

If *abstol* is less than or equal to zero, then ε*||*T*||$_1$ is used as tolerance, where *T* is the tridiagonal matrix obtained by reducing *A* to tridiagonal form. Eigenvalues will be computed most accurately when *abstol* is set to twice the underflow threshold 2*?lamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, try setting *abstol* to 2*?lamch('S').

?hbgvx
Computes selected eigenvalues and, optionally, eigenvectors of a complex generalized Hermitian positive-definite eigenproblem with banded matrices.

Syntax

call chbgvx(*jobz*, *range*, *uplo*, *n*, *ka*, *kb*, *ab*, *ldab*, *bb*, *ldbb*, *q*, *ldq*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *w*, *z*, *ldz*, *work*, *rwork*, *iwork*, *ifail*, *info*)

call zhbgvx(*jobz*, *range*, *uplo*, *n*, *ka*, *kb*, *ab*, *ldab*, *bb*, *ldbb*, *q*, *ldq*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *w*, *z*, *ldz*, *work*, *rwork*, *iwork*, *ifail*, *info*)

call hbgvx(*ab*, *bb*, *w* [,*uplo*] [,*z*] [,*vl*] [,*vu*] [,*il*] [,*iu*] [,*m*] [,*ifail*] [,*q*] [,*abstol*] [,*info*])

Include Files

- mkl.fi, lapack.f90

Description

The routine computes selected eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitian positive-definite banded eigenproblem, of the form $A*x = \lambda*B*x$. Here A and B are assumed to be Hermitian and banded, and B is also positive definite. Eigenvalues and eigenvectors can be selected by specifying either all eigenvalues, a range of values or a range of indices for the desired eigenvalues.

Input Parameters

jobz

CHARACTER*1. Must be 'N' or 'V'.

If *jobz* = 'N', then compute eigenvalues only.

If *jobz* = 'V', then compute eigenvalues and eigenvectors.

range

CHARACTER*1. Must be 'A' or 'V' or 'I'.

If *range* = 'A', the routine computes all eigenvalues.

If *range* = 'V', the routine computes eigenvalues *lambda*(*i*) in the half-open interval:

$vl < lambda(i) \le vu$.

If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.

uplo

CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', arrays *ab* and *bb* store the upper triangles of *A* and *B*;

If *uplo* = 'L', arrays *ab* and *bb* store the lower triangles of *A* and *B*.

n

INTEGER. The order of the matrices *A* and *B* ($n \ge 0$).

ka

INTEGER. The number of super- or sub-diagonals in *A*

($ka \ge 0$).

kb

INTEGER. The number of super- or sub-diagonals in *B* ($kb \ge 0$).

ab, *bb*, *work*

COMPLEX for chbgvx

DOUBLE COMPLEX for zhbgvx

Arrays:

ab(*ldab*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *A* (as specified by *uplo*) in band storage format.

The second dimension of the array *ab* must be at least max(1, *n*).

bb(*ldbb*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *B* (as specified by *uplo*) in band storage format.

The second dimension of the array *bb* must be at least max(1, *n*).

work(*) is a workspace array, size at least max(1, *n*).

ldab

INTEGER. The leading dimension of the array *ab*; must be at least *ka*+1.

ldbb

INTEGER. The leading dimension of the array *bb*; must be at least *kb*+1.

vl, *vu*

REAL for chbgvx

DOUBLE PRECISION for zhbgvx.

If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.

Constraint: *vl*< *vu*.

If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, *iu*

INTEGER.

If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.

Constraint: 1 ≤*il*≤*iu*≤*n*, if *n* > 0; *il*=1 and *iu*=0

if *n* = 0.

If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol

REAL for chbgvx

DOUBLE PRECISION for zhbgvx.

The absolute error tolerance for the eigenvalues. See *Application Notes* for more information.

ldz

INTEGER. The leading dimension of the output array *z*; *ldz*≥ 1. If *jobz* = 'V', *ldz*≥ max(1, *n*).

ldq

INTEGER. The leading dimension of the output array *q*; *ldq*≥ 1. If *jobz* = 'V', *ldq*≥ max(1, *n*).

rwork

REAL for chbgvx

DOUBLE PRECISION for zhbgvx.

Workspace array, size at least max(1, 7*n*).

iwork

INTEGER.

Workspace array, size at least max(1, 5*n*).

Output Parameters

ab

On exit, the contents of *ab* are overwritten.

bb

On exit, contains the factor *S* from the split Cholesky factorization $B = S^H*S$, as returned by pbstf/pbstf.

m

INTEGER. The total number of eigenvalues found,

0 ≤*m*≤*n*. If *range* = 'A', *m* = *n*, and if *range* = 'I',

m = *iu*-*il*+1.

w

REAL for chbgvx

DOUBLE PRECISION for zhbgvx.

Array *w*(*), size at least max(1, *n*).

If *info* = 0, contains the eigenvalues in ascending order.

z, *q*

COMPLEX for chbgvx

DOUBLE COMPLEX for zhbgvx

Arrays:

z(*ldz*,*).

The second dimension of *z* must be at least max(1, *n*).

If *jobz* = 'V', then if *info* = 0, *z* contains the matrix *Z* of eigenvectors, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). The eigenvectors are normalized so that $Z^H*B*Z = I$.

If *jobz* = 'N', then *z* is not referenced.

q(*ldq*,*).

The second dimension of *q* must be at least max(1, *n*).

If *jobz* = 'V', then *q* contains the *n*-by-*n* matrix used in the reduction of $Ax = \lambda Bx$ to standard form, that is, $Cx = \lambda x$ and consequently *C* to tridiagonal form.

If *jobz* = 'N', then *q* is not referenced.

ifail INTEGER.

Array, size at least max(1, *n*).

If *jobz* = 'V', then if *info* = 0, the first *m* elements of *ifail* are zero; if *info* > 0, the *ifail* contains the indices of the eigenvectors that failed to converge.

If *jobz* = 'N', then *ifail* is not referenced.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th argument had an illegal value.

If *info* > 0, and

if $i \le n$, the algorithm failed to converge, and *i* off-diagonal elements of an intermediate tridiagonal did not converge to zero;

if *info* = *n* + *i*, for $1 \le i \le n$, then pbstf/pbstf returned *info* = *i* and *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine hbgvx interface are the following:

ab Holds the array *A* of size (*ka*+1,*n*).

bb Holds the array *B* of size (*kb*+1,*n*).

w Holds the vector with the number of elements *n*.

z Holds the matrix *Z* of size (*n*, *n*).

ifail Holds the vector with the number of elements *n*.

q Holds the matrix *Q* of size (*n*, *n*).

uplo	Must be 'U' or 'L'. The default value is 'U'.
vl	Default value for this element is *vl* = -HUGE(*vl*).
vu	Default value for this element is *vu* = HUGE(*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this element is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted. Note that there will be an error condition if *ifail* or *q* is present and *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a,b] of width less than or equal to *abstol*+ε*max(|a|,|b|), where ε is the machine precision.

If *abstol* is less than or equal to zero, then ε*||*T*||$_1$ will be used in its place, where *T* is the tridiagonal matrix obtained by reducing *A* to tridiagonal form. Eigenvalues will be computed most accurately when *abstol* is set to twice the underflow threshold 2*?lamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, try setting *abstol* to 2*?lamch('S').

Generalized Nonsymmetric Eigenvalue Problems: LAPACK Driver Routines

This topic describes LAPACK driver routines used for solving generalized nonsymmetric eigenproblems. See also computational routines that can be called to solve these problems. Table "Driver Routines for Solving Generalized Nonsymmetric Eigenproblems" lists all such driver routines for the FORTRAN 77 interface. The corresponding routine names in the Fortran 95 interface are without the first symbol.

Driver Routines for Solving Generalized Nonsymmetric Eigenproblems

Routine Name	Operation performed
gges	Computes the generalized eigenvalues, Schur form, and the left and/or right Schur vectors for a pair of nonsymmetric matrices.
ggesx	Computes the generalized eigenvalues, Schur form, and, optionally, the left and/or right matrices of Schur vectors.
gges3	Computes generalized Schur factorization for a pair of matrices.
ggev	Computes the generalized eigenvalues, and the left and/or right generalized eigenvectors for a pair of nonsymmetric matrices.

Routine Name	Operation performed
ggevx	Computes the generalized eigenvalues, and, optionally, the left and/or right generalized eigenvectors.
ggev3	Computes generalized Schur factorization for a pair of matrices.

?gges
Computes the generalized eigenvalues, Schur form, and the left and/or right Schur vectors for a pair of nonsymmetric matrices.

Syntax

```
call sgges(jobvsl, jobvsr, sort, selctg, n, a, lda, b, ldb, sdim, alphar, alphai, beta, vsl, ldvsl, vsr, ldvsr, work, lwork, bwork, info)
call dgges(jobvsl, jobvsr, sort, selctg, n, a, lda, b, ldb, sdim, alphar, alphai, beta, vsl, ldvsl, vsr, ldvsr, work, lwork, bwork, info)
call cgges(jobvsl, jobvsr, sort, selctg, n, a, lda, b, ldb, sdim, alpha, beta, vsl, ldvsl, vsr, ldvsr, work, lwork, rwork, bwork, info)
call zgges(jobvsl, jobvsr, sort, selctg, n, a, lda, b, ldb, sdim, alpha, beta, vsl, ldvsl, vsr, ldvsr, work, lwork, rwork, bwork, info)
call gges(a, b, alphar, alphai, beta [,vsl] [,vsr] [,select] [,sdim] [,info])
call gges(a, b, alpha, beta [, vsl] [,vsr] [,select] [,sdim] [,info])
```

Description

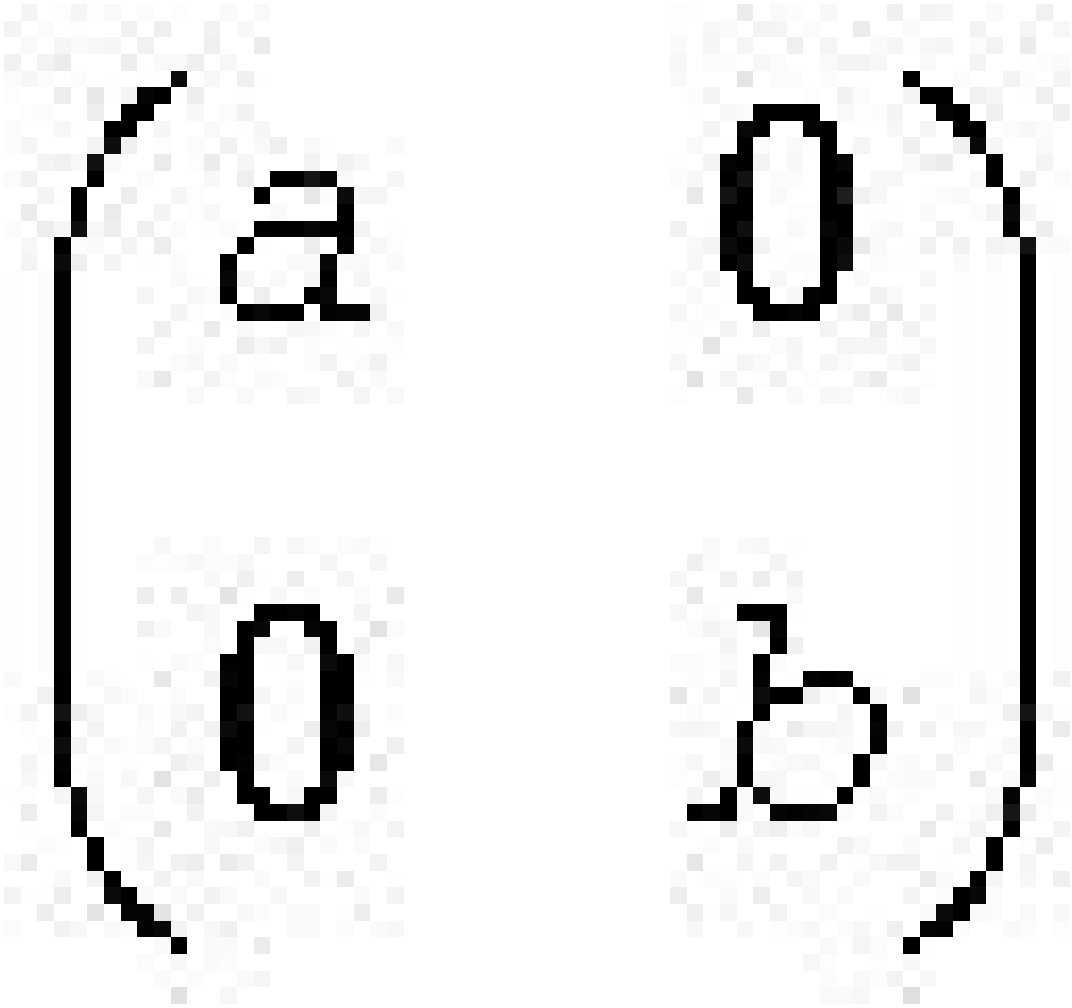
The ?gges routine computes the generalized eigenvalues, the generalized real/complex Schur form (*S*,*T*), optionally, the left and/or right matrices of Schur vectors (*vsl* and *vsr*) for a pair of *n*-by-*n* real/complex nonsymmetric matrices (*A*,*B*). This gives the generalized Schur factorization

$(A,B) = (vsl*S*vsr^H, vsl*T*vsr^H)$

Optionally, it also orders the eigenvalues so that a selected cluster of eigenvalues appears in the leading diagonal blocks of the upper quasi-triangular matrix *S* and the upper triangular matrix *T*. The leading columns of *vsl* and *vsr* then form an orthonormal/unitary basis for the corresponding left and right eigenspaces (deflating subspaces).

If only the generalized eigenvalues are needed, use the driver ggev instead, which is faster.

A generalized eigenvalue for a pair of matrices (*A*,*B*) is a scalar *w* or a ratio *alpha* / *beta* = *w*, such that *A* - *w*B* is singular. It is usually represented as the pair (*alpha*, *beta*), as there is a reasonable interpretation for *beta*=0 or for both being zero. A pair of matrices (*S*,*T*) is in the generalized real Schur form if *T* is upper triangular with non-negative diagonal and *S* is block upper triangular with 1-by-1 and 2-by-2 blocks. 1-by-1 blocks correspond to real generalized eigenvalues, while 2-by-2 blocks of *S* are "standardized" by making the corresponding elements of *T* have the form:



and the pair of corresponding 2-by-2 blocks in *S* and *T* will have a complex conjugate pair of generalized eigenvalues. A pair of matrices (*S*,*T*) is in generalized complex Schur form if *S* and *T* are upper triangular and, in addition, the diagonal of *T* are non-negative real numbers.

The `?gges` routine replaces the deprecated `?gegs` routine.

Input Parameters

jobvsl

`CHARACTER*1`. Must be `'N'` or `'V'`.

If *jobvsl* = `'N'`, then the left Schur vectors are not computed.

If *jobvsl* = `'V'`, then the left Schur vectors are computed.

jobvsr

`CHARACTER*1`. Must be `'N'` or `'V'`.

If *jobvsr* = `'N'`, then the right Schur vectors are not computed.

If *jobvsr* = `'V'`, then the right Schur vectors are computed.

sort

`CHARACTER*1`. Must be `'N'` or `'S'`. Specifies whether or not to order the eigenvalues on the diagonal of the generalized Schur form.

If *sort* = `'N'`, then eigenvalues are not ordered.

If *sort* = `'S'`, eigenvalues are ordered (see *selctg*).

selctg

LOGICAL FUNCTION of three REAL arguments for real flavors.

LOGICAL FUNCTION of two COMPLEX arguments for complex flavors.

selctg must be declared EXTERNAL in the calling subroutine.

If *sort* = 'S', *selctg* is used to select eigenvalues to sort to the top left of the Schur form.

If *sort* = 'N', *selctg* is not referenced.

For real flavors:

An eigenvalue (*alphar*(j) + *alphai*(j))/*beta*(j) is selected if *selctg*(*alphar*(j), *alphai*(j), *beta*(j)) is true; that is, if either one of a complex conjugate pair of eigenvalues is selected, then both complex eigenvalues are selected.

Note that in the ill-conditioned case, a selected complex eigenvalue may no longer satisfy *selctg*(*alphar*(j), *alphai*(j), *beta*(j)) = .TRUE. after ordering. In this case *info* is set to *n*+2 .

For complex flavors:

An eigenvalue *alpha*(j) / *beta*(j) is selected if *selctg*(*alpha*(j), *beta*(j)) is true.

Note that a selected complex eigenvalue may no longer satisfy *selctg*(*alpha*(j), *beta*(j)) = .TRUE. after ordering, since ordering may change the value of complex eigenvalues (especially if the eigenvalue is ill-conditioned); in this case *info* is set to *n*+2 (see *info* below).

n

INTEGER. The order of the matrices *A*, *B*, *vsl*, and *vsr* (*n*≥ 0).

a, *b*, *work*

REAL for sgges

DOUBLE PRECISION for dgges

COMPLEX for cgges

DOUBLE COMPLEX for zgges.

Arrays:

a(*lda*,*) is an array containing the *n*-by-*n* matrix *A* (first of the pair of matrices).

The second dimension of *a* must be at least max(1, *n*).

b(*ldb*,*) is an array containing the *n*-by-*n* matrix *B* (second of the pair of matrices).

The second dimension of *b* must be at least max(1, *n*).

work is a workspace array, its dimension max(1, *lwork*).

lda

INTEGER. The leading dimension of the array *a*. Must be at least max(1, *n*).

ldb

INTEGER. The leading dimension of the array *b*. Must be at least max(1, *n*).

ldvsl, *ldvsr*

INTEGER. The leading dimensions of the output matrices *vsl* and *vsr*, respectively. Constraints:

ldvsl≥ 1. If *jobvsl* = 'V', *ldvsl*≥ max(1, *n*).

ldvsr≥ 1. If *jobvsr* = 'V', *ldvsr*≥ max(1, *n*).

lwork INTEGER.

The dimension of the array *work*.

lwork≥ max(1, 8*n*+16) for real flavors;

lwork≥ max(1, 2*n*) for complex flavors.

For good performance, *lwork* must generally be larger.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

rwork REAL for cgges

DOUBLE PRECISION for zgges

Workspace array, size at least max(1, 8*n*).

This array is used in complex flavors only.

bwork LOGICAL.

Workspace array, size at least max(1, *n*).

Not referenced if *sort* = 'N'.

Output Parameters

a On exit, this array has been overwritten by its generalized Schur form *S*.

b On exit, this array has been overwritten by its generalized Schur form *T*.

sdim INTEGER.

If *sort* = 'N', *sdim*= 0.

If *sort* = 'S', *sdim* is equal to the number of eigenvalues (after sorting) for which *selctg* is true.

Note that for real flavors complex conjugate pairs for which *selctg* is true for either eigenvalue count as 2.

alphar, *alphai* REAL for sgges;

DOUBLE PRECISION for dgges.

Arrays, size at least max(1, *n*) each. Contain values that form generalized eigenvalues in real flavors.

See *beta*.

alpha COMPLEX for cgges;

DOUBLE COMPLEX for zgges.

Array, size at least max(1, *n*). Contain values that form generalized eigenvalues in complex flavors. See *beta*.

beta REAL for sgges

DOUBLE PRECISION for dgges

COMPLEX for cgges

`DOUBLE COMPLEX` for `zgges`.

Array, size at least max(1, *n*).

For real flavors:

On exit, (*alphar*(j) + *alphai*(j)*i)/*beta*(j), j=1,..., *n*, will be the generalized eigenvalues.

alphar(j) + *alphai*(j)*i and *beta*(j), j=1,..., *n* are the diagonals of the complex Schur form (*S*,*T*) that would result if the 2-by-2 diagonal blocks of the real generalized Schur form of (*A*,*B*) were further reduced to triangular form using complex unitary transformations. If *alphai*(j) is zero, then the *j*-th eigenvalue is real; if positive, then the *j*-th and (*j*+1)-st eigenvalues are a complex conjugate pair, with *alphai*(j+1) negative.

For complex flavors:

On exit, *alpha*(j)/*beta*(j), j=1,..., *n*, will be the generalized eigenvalues. *alphaalpha*(j) and *beta*(j), j=1,..., *n* are the diagonals of the complex Schur form (*S*,*T*) output by `cgges`/`zgges`. The *beta*(j) will be non-negative real.

See also *Application Notes* below.

vsl, *vsr*

`REAL` for `sgges`

`DOUBLE PRECISION` for `dgges`

`COMPLEX` for `cgges`

`DOUBLE COMPLEX` for `zgges`.

Arrays:

vsl(*ldvsl*,*), the second dimension of *vsl* must be at least max(1, *n*).

If *jobvsl* = 'V', this array will contain the left Schur vectors.

If *jobvsl* = 'N', *vsl* is not referenced.

vsr(*ldvsr*,*), the second dimension of *vsr* must be at least max(1, *n*).

If *jobvsr* = 'V', this array will contain the right Schur vectors.

If *jobvsr* = 'N', *vsr* is not referenced.

work(1)

On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.

info

`INTEGER`.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*th parameter had an illegal value.

If *info* = *i*, and

i≤*n*:

the *QZ* iteration failed. (*A*, *B*) is not in Schur form, but *alphar*(j), *alphai*(j) (for real flavors), or *alpha*(j) (for complex flavors), and *beta*(j), j=*info* +1,..., *n* should be correct.

i > *n*: errors that usually indicate LAPACK problems:

i = *n*+1: other than *QZ* iteration failed in hgeqz;

`i = n+2`: after reordering, roundoff changed values of some complex eigenvalues so that leading eigenvalues in the generalized Schur form no longer satisfy `selctg = .TRUE.`. This could also be caused due to scaling;

`i = n+3`: reordering failed in tgsen.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `gges` interface are the following:

`a`	Holds the matrix *A* of size (*n*, *n*).
`b`	Holds the matrix *B* of size (*n*, *n*).
`alphar`	Holds the vector of length *n*. Used in real flavors only.
`alphai`	Holds the vector of length *n*. Used in real flavors only.
`alpha`	Holds the vector of length *n*. Used in complex flavors only.
`beta`	Holds the vector of length *n*.
`vsl`	Holds the matrix *VSL* of size (*n*, *n*).
`vsr`	Holds the matrix *VSR* of size (*n*, *n*).
`jobvsl`	Restored based on the presence of the argument *vsl* as follows: `jobvsl = 'V'`, if *vsl* is present, `jobvsl = 'N'`, if *vsl* is omitted.
`jobvsr`	Restored based on the presence of the argument *vsr* as follows: `jobvsr = 'V'`, if *vsr* is present, `jobvsr = 'N'`, if *vsr* is omitted.
`sort`	Restored based on the presence of the argument *select* as follows: `sort = 'S'`, if *select* is present, `sort = 'N'`, if *select* is omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set `lwork = -1`.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (`work(1)`) for subsequent runs.

If you set `lwork = -1`, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The quotients *alphar*(j)/*beta*(j) and *alphai*(j)/*beta*(j) may easily over- or underflow, and *beta*(j) may even be zero. Thus, you should avoid simply computing the ratio. However, *alphar* and *alphai* will be always less than and usually comparable with norm(*A*) in magnitude, and *beta* always less than and usually comparable with norm(*B*).

?ggesx

Computes the generalized eigenvalues, Schur form, and, optionally, the left and/or right matrices of Schur vectors.

Syntax

```
call sggesx (jobvsl, jobvsr, sort, selctg, sense, n, a, lda, b, ldb, sdim, alphar, alphai, beta, vsl, ldvsl, vsr, ldvsr, rconde, rcondv, work, lwork, iwork, liwork, bwork, info)
```

```
call dggesx (jobvsl, jobvsr, sort, selctg, sense, n, a, lda, b, ldb, sdim, alphar, alphai, beta, vsl, ldvsl, vsr, ldvsr, rconde, rcondv, work, lwork, iwork, liwork, bwork, info)
```

```
call cggesx (jobvsl, jobvsr, sort, selctg, sense, n, a, lda, b, ldb, sdim, alpha, beta, vsl, ldvsl, vsr, ldvsr, rconde, rcondv, work, lwork, rwork, iwork, liwork, bwork, info)
```

```
call zggesx (jobvsl, jobvsr, sort, selctg, sense, n, a, lda, b, ldb, sdim, alpha, beta, vsl, ldvsl, vsr, ldvsr, rconde, rcondv, work, lwork, rwork, iwork, liwork, bwork, info)
```

```
call ggesx(a, b, alphar, alphai, beta [,vsl] [,vsr] [,select] [,sdim] [,rconde] [,rcondv] [,info])
```

```
call ggesx(a, b, alpha, beta [, vsl] [,vsr] [,select] [,sdim] [,rconde] [,rcondv] [,info])
```

Include Files

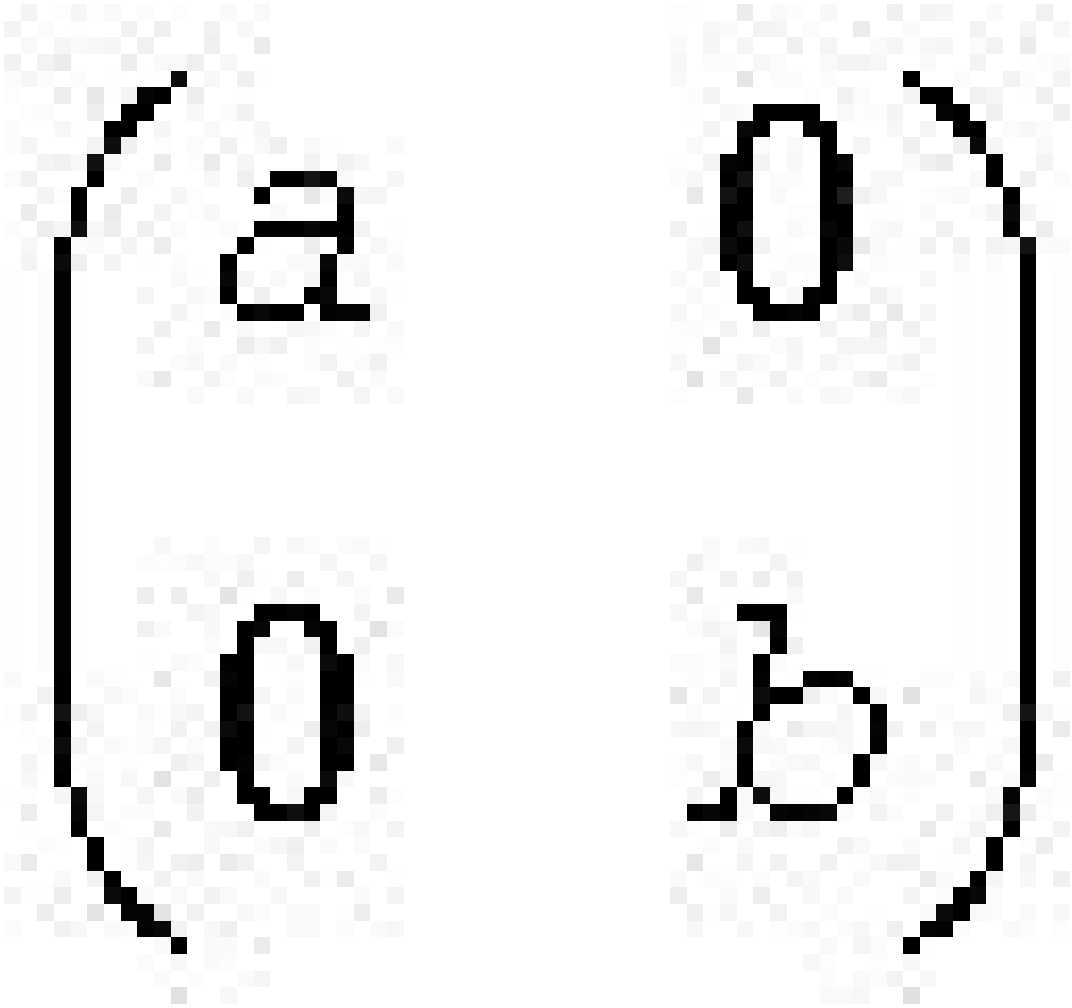
Description

The routine computes for a pair of *n*-by-*n* real/complex nonsymmetric matrices (*A*,*B*), the generalized eigenvalues, the generalized real/complex Schur form (*S*,*T*), optionally, the left and/or right matrices of Schur vectors (*vsl* and *vsr*). This gives the generalized Schur factorization

$(A,B) = (vsl*S*vsr^H, vsl*T*vsr^H)$

Optionally, it also orders the eigenvalues so that a selected cluster of eigenvalues appears in the leading diagonal blocks of the upper quasi-triangular matrix *S* and the upper triangular matrix *T*; computes a reciprocal condition number for the average of the selected eigenvalues (*rconde*); and computes a reciprocal condition number for the right and left deflating subspaces corresponding to the selected eigenvalues (*rcondv*). The leading columns of *vsl* and *vsr* then form an orthonormal/unitary basis for the corresponding left and right eigenspaces (deflating subspaces).

A generalized eigenvalue for a pair of matrices (*A*,*B*) is a scalar *w* or a ratio $alpha / beta = w$, such that $A - w*B$ is singular. It is usually represented as the pair (*alpha*, *beta*), as there is a reasonable interpretation for $beta=0$ or for both being zero. A pair of matrices (*S*,*T*) is in generalized real Schur form if *T* is upper triangular with non-negative diagonal and *S* is block upper triangular with 1-by-1 and 2-by-2 blocks. 1-by-1 blocks correspond to real generalized eigenvalues, while 2-by-2 blocks of *S* will be "standardized" by making the corresponding elements of *T* have the form:



and the pair of corresponding 2-by-2 blocks in *S* and *T* will have a complex conjugate pair of generalized eigenvalues. A pair of matrices (*S*,*T*) is in generalized complex Schur form if *S* and *T* are upper triangular and, in addition, the diagonal of *T* are non-negative real numbers.

Input Parameters

jobvsl

`CHARACTER*1`. Must be `'N'` or `'V'`.

If *jobvsl* = `'N'`, then the left Schur vectors are not computed.

If *jobvsl* = `'V'`, then the left Schur vectors are computed.

jobvsr

`CHARACTER*1`. Must be `'N'` or `'V'`.

If *jobvsr* = `'N'`, then the right Schur vectors are not computed.

If *jobvsr* = `'V'`, then the right Schur vectors are computed.

sort

`CHARACTER*1`. Must be `'N'` or `'S'`. Specifies whether or not to order the eigenvalues on the diagonal of the generalized Schur form.

If *sort* = `'N'`, then eigenvalues are not ordered.

If *sort* = `'S'`, eigenvalues are ordered (see *selctg*).

selctg

`LOGICAL FUNCTION` of three `REAL` arguments for real flavors.

LOGICAL FUNCTION of two COMPLEX arguments for complex flavors.

selctg must be declared EXTERNAL in the calling subroutine.

If *sort* = 'S', *selctg* is used to select eigenvalues to sort to the top left of the Schur form.

If *sort* = 'N', *selctg* is not referenced.

For real flavors:

An eigenvalue (*alphar*(j) + *alphai*(j))/*beta*(j) is selected if *selctg*(*alphar*(j), *alphai*(j), *beta*(j)) is true; that is, if either one of a complex conjugate pair of eigenvalues is selected, then both complex eigenvalues are selected.

Note that in the ill-conditioned case, a selected complex eigenvalue may no longer satisfy *selctg*(*alphar*(j), *alphai*(j), *beta*(j)) = .TRUE. after ordering. In this case *info* is set to *n*+2.

For complex flavors:

An eigenvalue *alpha*(j) / *beta*(j) is selected if *selctg*(*alpha*(j), *beta*(j)) is true.

Note that a selected complex eigenvalue may no longer satisfy *selctg*(*alpha*(j), *beta*(j)) = .TRUE. after ordering, since ordering may change the value of complex eigenvalues (especially if the eigenvalue is ill-conditioned); in this case *info* is set to *n*+2 (see *info* below).

sense — CHARACTER*1. Must be 'N', 'E', 'V', or 'B'. Determines which reciprocal condition number are computed.

If *sense* = 'N', none are computed;

If *sense* = 'E', computed for average of selected eigenvalues only;

If *sense* = 'V', computed for selected deflating subspaces only;

If *sense* = 'B', computed for both.

If *sense* is 'E', 'V', or 'B', then *sort* must equal 'S'.

n — INTEGER. The order of the matrices *A*, *B*, *vsl*, and *vsr* (*n*≥ 0).

a, *b*, *work* — REAL for sggesx

DOUBLE PRECISION for dggesx

COMPLEX for cggesx

DOUBLE COMPLEX for zggesx.

Arrays:

a(*lda*,*) is an array containing the *n*-by-*n* matrix *A* (first of the pair of matrices).

The second dimension of *a* must be at least max(1, *n*).

b(*ldb*,*) is an array containing the *n*-by-*n* matrix *B* (second of the pair of matrices).

The second dimension of *b* must be at least max(1, *n*).

work is a workspace array, its dimension max(1, *lwork*).

lda — INTEGER. The leading dimension of the array *a*.

Must be at least max(1, *n*).

ldb — INTEGER. The leading dimension of the array *b*.

Must be at least max(1, *n*).

ldvsl, *ldvsr* — INTEGER. The leading dimensions of the output matrices *vsl* and *vsr*, respectively. Constraints:

ldvsl≥ 1. If *jobvsl* = 'V', *ldvsl*≥ max(1, *n*).

ldvsr≥ 1. If *jobvsr* = 'V', *ldvsr*≥ max(1, *n*).

lwork — INTEGER.

The dimension of the array *work*.

For real flavors:

If *n*=0 then *lwork*≥1.

If *n*>0 and *sense* = 'N', then *lwork*≥ max(8*n, 6*n+16).

If *n*>0 and *sense* = 'E', 'V', or 'B', then *lwork*≥ max(8*n, 6*n+16, 2**sdim**(n-sdim));

For complex flavors:

If *n*=0 then *lwork*≥1.

If *n*>0 and *sense* = 'N', then *lwork*≥ max(1, 2*n);

If *n*>0 and *sense* = 'E', 'V', or 'B', then *lwork*≥ max(1, 2*n, 2**sdim**(n-sdim)).

Note that 2**sdim**(n-sdim) ≤ n*n/2.

An error is only returned if *lwork*< max(8*n, 6*n+16) for real flavors, and *lwork*< max(1, 2*n) for complex flavors, but if *sense* = 'E', 'V', or 'B', this may not be large enough.

If *lwork*=-1, then a workspace query is assumed; the routine only calculates the bound on the optimal size of the *work* array and the minimum size of the *iwork* array, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla.

rwork — REAL for cggesx

DOUBLE PRECISION for zggesx

Workspace array, size at least max(1, 8*n*).

This array is used in complex flavors only.

iwork — INTEGER.

Workspace array, size max(1, *liwork*).

liwork — INTEGER.

The dimension of the array *iwork*.

If *sense* = 'N', or *n*=0, then *liwork*≥1,

otherwise *liwork*≥ (*n*+6) for real flavors, and *liwork*≥ (*n*+2) for complex flavors.

If *liwork*=-1, then a workspace query is assumed; the routine only calculates the bound on the optimal size of the *work* array and the minimum size of the *iwork* array, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla.

bwork

LOGICAL.

Workspace array, size at least max(1, *n*).

Not referenced if *sort* = 'N'.

Output Parameters

a

On exit, this array has been overwritten by its generalized Schur form *S*.

b

On exit, this array has been overwritten by its generalized Schur form *T*.

sdim

INTEGER.

If *sort* = 'N', *sdim*= 0.

If *sort* = 'S', *sdim* is equal to the number of eigenvalues (after sorting) for which *selctg* is true.

Note that for real flavors complex conjugate pairs for which *selctg* is true for either eigenvalue count as 2.

alphar, *alphai*

REAL for sggesx;

DOUBLE PRECISION for dggesx.

Arrays, size at least max(1, *n*) each. Contain values that form generalized eigenvalues in real flavors.

See *beta*.

alpha

COMPLEX for cggesx;

DOUBLE COMPLEX for zggesx.

Array, size at least max(1, *n*). Contain values that form generalized eigenvalues in complex flavors. See *beta*.

beta

REAL for sggesx

DOUBLE PRECISION for dggesx

COMPLEX for cggesx

DOUBLE COMPLEX for zggesx.

Array, size at least max(1, *n*).

For real flavors:

On exit, (*alphar*(j) + *alphai*(j)*i)/*beta*(j), j=1,..., *n* will be the generalized eigenvalues.

alphar(j) + *alphai*(j)*i and *beta*(j), j=1,..., *n* are the diagonals of the complex Schur form (*S*,*T*) that would result if the 2-by-2 diagonal blocks of the real generalized Schur form of (*A*,*B*) were further reduced to triangular form using complex unitary transformations. If *alphai*(j) is zero, then the *j*-th eigenvalue is real; if positive, then the *j*-th and (*j*+1)-st eigenvalues are a complex conjugate pair, with *alphai*(j+1) negative.

For complex flavors:

On exit, *alpha*(j)/*beta*(j), j=1,..., *n* will be the generalized eigenvalues. *alpha*(j) and *beta*(j), j=1,..., *n* are the diagonals of the complex Schur form (*S*,*T*) output by `cggesx`/`zggesx`. The *beta*(j) will be non-negative real.

See also *Application Notes* below.

vsl, *vsr*

`REAL` for `sggesx`

`DOUBLE PRECISION` for `dggesx`

`COMPLEX` for `cggesx`

`DOUBLE COMPLEX` for `zggesx`.

Arrays:

vsl(*ldvsl*,*), the second dimension of *vsl* must be at least max(1, *n*).

If *jobvsl* = `'V'`, this array will contain the left Schur vectors.

If *jobvsl* = `'N'`, *vsl* is not referenced.

vsr(*ldvsr*,*), the second dimension of *vsr* must be at least max(1, *n*).

If *jobvsr* = `'V'`, this array will contain the right Schur vectors.

If *jobvsr* = `'N'`, *vsr* is not referenced.

rconde, *rcondv*

`REAL` for single precision flavors

`DOUBLE PRECISION` for double precision flavors.

Arrays, size (2) each

If *sense* = `'E'` or `'B'`, *rconde*[0] and *rconde*[1] contain the reciprocal condition numbers for the average of the selected eigenvalues.

Not referenced if *sense* = `'N'` or `'V'`.

If *sense* = `'V'` or `'B'`, *rcondv*(1) and *rcondv*(2) contain the reciprocal condition numbers for the selected deflating subspaces.

Not referenced if *sense* = `'N'` or `'E'`.

work(1)

On exit, if *info* = `0`, then *work(1)* returns the required minimal size of *lwork*.

iwork(1)

On exit, if *info* = `0`, then *iwork(1)* returns the required minimal size of *liwork*.

info

`INTEGER`.

If *info* = `0`, the execution is successful.

If *info* = `-i`, the *i*th parameter had an illegal value.

If *info* = *i*, and

i≤*n*:

the *QZ* iteration failed. (*A*, *B*) is not in Schur form, but *alphar*(j), *alphai*(j) (for real flavors), or *alpha*(j) (for complex flavors), and *beta*(j), j=*info* +1,..., *n* should be correct.

i > *n*: errors that usually indicate LAPACK problems:

i = *n*+1: other than *QZ* iteration failed in ?hgeqz;

i = *n*+2: after reordering, roundoff changed values of some complex eigenvalues so that leading eigenvalues in the generalized Schur form no longer satisfy *selctg* = .TRUE.. This could also be caused due to scaling;

i = *n*+3: reordering failed in tgsen.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine ggesx interface are the following:

a Holds the matrix *A* of size (*n*, *n*).

b Holds the matrix *B* of size (*n*, *n*).

alphar Holds the vector of length *n*. Used in real flavors only.

alphai Holds the vector of length *n*. Used in real flavors only.

alpha Holds the vector of length *n*. Used in complex flavors only.

beta Holds the vector of length *n*.

vsl Holds the matrix *VSL* of size (*n*, *n*).

vsr Holds the matrix *VSR* of size (*n*, *n*).

rconde Holds the vector of length (2).

rcondv Holds the vector of length (2).

jobvsl Restored based on the presence of the argument *vsl* as follows:

jobvsl = 'V', if *vsl* is present,

jobvsl = 'N', if *vsl* is omitted.

jobvsr Restored based on the presence of the argument *vsr* as follows:

jobvsr = 'V', if *vsr* is present,

jobvsr = 'N', if *vsr* is omitted.

sort Restored based on the presence of the argument *select* as follows:

sort = 'S', if *select* is present,

sort = 'N', if *select* is omitted.

sense Restored based on the presence of arguments *rconde* and rcondv as follows:

sense = 'B', if both *rconde* and *rcondv* are present,

sense = 'E', if *rconde* is present and *rcondv* omitted,

sense = 'V', if *rconde* is omitted and *rcondv* present,

sense = 'N', if both *rconde* and *rcondv* are omitted.

Note that there will be an error condition if *rconde* or *rcondv* are present and *select* is omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run or set *lwork* = -1 (*liwork* = -1).

If you choose the first option and set any of admissible *lwork* (or *liwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The quotients *alphar*(j)/*beta*(j) and *alphai*(j)/*beta*(j) may easily over- or underflow, and *beta*(j) may even be zero. Thus, you should avoid simply computing the ratio. However, *alphar* and *alphai* will be always less than and usually comparable with norm(*A*) in magnitude, and *beta* always less than and usually comparable with norm(*B*).

?gges3
Computes generalized Schur factorization for a pair of matrices.

Syntax

```
call sgges3 (jobvsl, jobvsr, sort, selctg, n, a, lda, b, ldb, sdim, alphar, alphai,
beta, vsl, ldvsl, vsr, ldvsr, work, lwork, bwork, info )
```

```
call dgges3 (jobvsl, jobvsr, sort, selctg, n, a, lda, b, ldb, sdim, alphar, alphai,
beta, vsl, ldvsl, vsr, ldvsr, work, lwork, bwork, info )
```

```
call cgges3 (jobvsl, jobvsr, sort, selctg, n, a, lda, b, ldb, sdim, alpha, beta, vsl,
ldvsl, vsr, ldvsr, work, lwork, rwork, bwork, info )
```

```
call zgges3 (jobvsl, jobvsr, sort, selctg, n, a, lda, b, ldb, sdim, alpha, beta, vsl,
ldvsl, vsr, ldvsr, work, lwork, rwork, bwork, info )
```

Description

For a pair of *n*-by-*n* real or complex nonsymmetric matrices (*A*,*B*), ?gges3 computes the generalized eigenvalues, the generalized real or complex Schur form (*S*,*T*), and optionally the left or right matrices of Schur vectors (*VSL* and *VSR*). This gives the generalized Schur factorization

(*A*,*B*) = ((*VSL*)**S**(*VSR*)^T, (*VSL*)**T**(*VSR*)^T) for real (*A*,*B*)

or

(*A*,*B*) = ((*VSL*)**S**(*VSR*)^H, (*VSL*)**T**(*VSR*)^H) for complex (*A*,*B*)

where (*VSR*)^H is the conjugate-transpose of *VSR*.

Optionally, it also orders the eigenvalues so that a selected cluster of eigenvalues appears in the leading diagonal blocks of the upper quasi-triangular matrix *S* and the upper triangular matrix *T*. The leading columns of *VSL* and *VSR* then form an orthonormal basis for the corresponding left and right eigenspaces (deflating subspaces).

NOTE
If only the generalized eigenvalues are needed, use the driver `?ggev` instead, which is faster.

A generalized eigenvalue for a pair of matrices (*A*,*B*) is a scalar *w* or a ratio *alpha*/*beta* = *w*, such that A - *w**B is singular. It is usually represented as the pair (*alpha*,*beta*), as there is a reasonable interpretation for *beta*=0 or both being zero.

For real flavors:

A pair of matrices (*S*,*T*) is in generalized real Schur form if *T* is upper triangular with non-negative diagonal and *S* is block upper triangular with 1-by-1 and 2-by-2 blocks. 1-by-1 blocks correspond to real generalized eigenvalues, while 2-by-2 blocks of *S* will be "standardized" by making the corresponding elements of *T* have the form:

$$\begin{pmatrix} a & 0 \\ 0 & b \end{pmatrix}$$

and the pair of corresponding 2-by-2 blocks in *S* and *T* have a complex conjugate pair of generalized eigenvalues.

For complex flavors:

A pair of matrices (*S*,*T*) is in generalized complex Schur form if *S* and *T* are upper triangular and, in addition, the diagonal elements of *T* are non-negative real numbers.

Input Parameters

jobvsl — CHARACTER*1. = 'N': do not compute the left Schur vectors;

jobvsr — CHARACTER*1. = 'N': do not compute the right Schur vectors;

= 'V': compute the right Schur vectors.

sort — CHARACTER*1. Specifies whether or not to order the eigenvalues on the diagonal of the generalized Schur form.

= 'N': Eigenvalues are not ordered;

= 'S': Eigenvalues are ordered (see *selctg*).

selctg — LOGICAL. *selctg* is a function of three arguments for real flavors or two arguments for complex flavors. *selctg* must be declared EXTERNAL in the calling subroutine. If *sort* = 'N', *selctg* is not referenced. If *sort* = 'S', *selctg* is used to select eigenvalues to sort to the top left of the Schur form.

For real flavors:

An eigenvalue (*alphar(j)* + *alphai(j)*)/*beta(j)* is selected if *selctg*(*alphar(j)*,*alphai(j)*,*beta(j)*) is true. In other words, if either one of a complex conjugate pair of eigenvalues is selected, then both complex eigenvalues are selected.

Note that in the ill-conditioned case, a selected complex eigenvalue may no longer satisfy *selctg*(*alphar(j)*,*alphai(j)*, *beta(j)*) = .TRUE. after ordering. *info* is to be set to *n*+2 in this case.

For complex flavors:

An eigenvalue *alpha*(*j*)/*beta*(*j*) is selected if *selctg*(*alpha*(*j*),*beta*(*j*)) is true.

Note that a selected complex eigenvalue may no longer satisfy *selctg*(*alpha*(*j*),*beta*(*j*))= .TRUE. after ordering, since ordering may change the value of complex eigenvalues (especially if the eigenvalue is ill-conditioned), in this case *info* is set to *n* + 2 (See *info* below)..

n INTEGER. The order of the matrices *A*, *B*, *VSL*, and *VSR*. *n*≥ 0.

a REAL for sgges3

DOUBLE PRECISION for dgges3

COMPLEX for cgges3

DOUBLE COMPLEX for zgges3

Array, size (*lda*, *n*). On entry, the first of the pair of matrices.

lda INTEGER. The leading dimension of *a*. *lda*≥ max(1,*n*).

b REAL for sgges3

DOUBLE PRECISION for dgges3

COMPLEX for cgges3

DOUBLE COMPLEX for zgges3

Array, size (*ldb*, *n*). On entry, the second of the pair of matrices.

ldb INTEGER. The leading dimension of *b*. *ldb*≥ max(1,*n*).

ldvsl INTEGER. The leading dimension of the matrix *VSL*. *ldvsl*≥ 1, and if *jobvsl* = 'V', *ldvsl*≥ n.

ldvsr INTEGER. The leading dimension of the matrix *VSR*. *ldvsr*≥ 1, and if *jobvsr* = 'V', *ldvsr*≥ n.

lwork INTEGER. The size of the array *work*. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

work REAL for sgges3

DOUBLE PRECISION for dgges3

COMPLEX for cgges3

DOUBLE COMPLEX for zgges3

Array, size (MAX(1,*lwork*)).

On exit, if *info* = 0, *work*(1) returns the optimal lwork.

rwork REAL for cgges3

DOUBLE PRECISION for zgges3

Array, size (8**n*).

bwork LOGICAL. Array, size (*n*). Not referenced if *sort* = 'N'.

Output Parameters

a On exit, *a* is overwritten by its generalized Schur form S.

b On exit, *b* is overwritten by its generalized Schur form T.

sdim INTEGER. If *sort* = 'N', *sdim* = 0. If *sort* = 'S', *sdim* = number of eigenvalues (after sorting) for which *selctg* is true.

alpha `COMPLEX` for `cgges3`

`DOUBLE COMPLEX` for `zgges3`

Array, size (*n*).

alphar `REAL` for `sgges3`

`DOUBLE PRECISION` for `dgges3`

Array, size (*n*).

alphai `REAL` for `sgges3`

`DOUBLE PRECISION` for `dgges3`

Array, size (*n*).

beta `REAL` for `sgges3`

`DOUBLE PRECISION` for `dgges3`

`COMPLEX` for `cgges3`

`DOUBLE COMPLEX` for `zgges3`

Array, size (*n*).

For real flavors:

On exit, (*alphar*(*j*) + *alphai*(*j*)*i)/*beta*(*j*), j=1,...,*n*, are the generalized eigenvalues. *alphar*(*j*) + *alphai*(*j*)*i, and *beta*(*j*),j=1,...,*n* are the diagonals of the complex Schur form (*S*,*T*) that would result if the 2-by-2 diagonal blocks of the real Schur form of (*a*,*b*) were further reduced to triangular form using 2-by-2 complex unitary transformations. If *alphai*(*j*) is zero, then the *j*-th eigenvalue is real; if positive, then the *j*-th and (*j*+1)-st eigenvalues are a complex conjugate pair, with *alphai*(*j* + 1) negative.

Note: the quotients *alphar*(*j*)/*beta*(*j*) and *alphai*(*j*)/*beta*(*j*) can easily over- or underflow, and *beta*(*j*) might even be zero. Thus, you should avoid computing the ratio *alpha*/*beta* by simply dividing *alpha* by *beta*. However, *alphar* and *alphai* is always less than and usually comparable with norm(*a*) in magnitude, and *beta* is always less than and usually comparable with norm(*b*).

For complex flavors:

On exit, *alpha*(*j*)(*j*)/*beta*(*j*), j=1,...,*n*, are the generalized eigenvalues. *alpha*(*j*), j=1,...,*n* and *beta*(*j*), j=1,...,*n* are the diagonals of the complex Schur form (*a*,*b*) output by ?gges3. The *beta*(*j*) is non-negative real.

Note: the quotient *alpha*(*j*)/*beta*(*j*) can easily over- or underflow, and *beta*(*j*) might even be zero. Thus, you should avoid computing the ratio *alpha*/*beta* by simply dividing *alpha* by *beta*. However, *alpha* is always less than and usually comparable with norm(*a*) in magnitude, and *beta* is always less than and usually comparable with norm(*b*).

vsl

REAL for sgges3

DOUBLE PRECISION for dgges3

COMPLEX for cgges3

DOUBLE COMPLEX for zgges3

Array, size (*ldvsl*, *n*).

If *jobvsl* = 'V', *vsl* contains the left Schur vectors. Not referenced if *jobvsl* = 'N'.

vsr

REAL for sgges3

DOUBLE PRECISION for dgges3

COMPLEX for cgges3

DOUBLE COMPLEX for zgges3

Array, size (*ldvsr*, *n*).

If *jobvsr* = 'V', *vsr* contains the right Schur vectors. Not referenced if *jobvsr* = 'N'.

info

INTEGER. = 0: successful exit < 0: if *info* = -*i*, the *i*-th argument had an illegal value.

=1,...,*n*:

- for real flavors:

  The QZ iteration failed. (*a*,*b*) are not in Schur form, but *alphar*(*j*), *alphai*(*j*) and *beta*(*j*) should be correct for *j*=*info* +1,...,*n*.
- for complex flavors:

  The QZ iteration failed. (*a*,*b*) are not in Schur form, but *alpha*(*j*) and *beta*(*j*) should be correct for *j*=*info*+1,...,*n*.

> *n*:

- =*n*+1: other than QZ iteration failed in ?hgeqz.
- =*n*+2: after reordering, roundoff changed values of some complex eigenvalues so that leading eigenvalues in the Generalized Schur form no longer satisfy *selctg*= .TRUE. This could also be caused due to scaling.
- =*n*+3: reordering failed in ?tgsen.

?ggev

Computes the generalized eigenvalues, and the left and/or right generalized eigenvectors for a pair of nonsymmetric matrices.

Syntax

```
call sggev(jobvl, jobvr, n, a, lda, b, ldb, alphar, alphai, beta, vl, ldvl, vr, ldvr, work, lwork, info)
```

```
call dggev(jobvl, jobvr, n, a, lda, b, ldb, alphar, alphai, beta, vl, ldvl, vr, ldvr, work, lwork, info)
```

```
call cggev(jobvl, jobvr, n, a, lda, b, ldb, alpha, beta, vl, ldvl, vr, ldvr, work, lwork, rwork, info)
```

```
call zggev(jobvl, jobvr, n, a, lda, b, ldb, alpha, beta, vl, ldvl, vr, ldvr, work, lwork, rwork, info)
```

```
call ggev(a, b, alphar, alphai, beta [,vl] [,vr] [,info])
```

```
call ggev(a, b, alpha, beta [, vl] [,vr] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The ?ggev routine computes the generalized eigenvalues, and optionally, the left and/or right generalized eigenvectors for a pair of *n*-by-*n* real/complex nonsymmetric matrices (*A*,*B*).

A generalized eigenvalue for a pair of matrices (*A*,*B*) is a scalar λ or a ratio *alpha* / *beta* = λ, such that *A* – λ**B* is singular. It is usually represented as the pair (*alpha*, *beta*), as there is a reasonable interpretation for *beta* =0 and even for both being zero.

The right generalized eigenvector *v*(j) corresponding to the generalized eigenvalue λ(j) of (*A*,*B*) satisfies

*A***v*(j) = λ(j)**B***v*(j).

The left generalized eigenvector *u*(j) corresponding to the generalized eigenvalue λ(j) of (*A*,*B*) satisfies

$u(j)^H * A = \lambda(j) * u(j)^H * B$

where $u(j)^H$ denotes the conjugate transpose of *u*(j).

The ?ggev routine replaces the deprecated ?gegv routine.

Input Parameters

jobvl
: CHARACTER*1. Must be 'N' or 'V'.
If *jobvl* = 'N', the left generalized eigenvectors are not computed;
If *jobvl* = 'V', the left generalized eigenvectors are computed.

jobvr
: CHARACTER*1. Must be 'N' or 'V'.
If *jobvr* = 'N', the right generalized eigenvectors are not computed;
If *jobvr* = 'V', the right generalized eigenvectors are computed.

n
: INTEGER. The order of the matrices *A*, *B*, *vl*, and *vr* (*n*≥ 0).

a, *b*, *work*

REAL for sggev

DOUBLE PRECISION for dggev

COMPLEX for cggev

DOUBLE COMPLEX for zggev.

Arrays:

a(*lda*,*) is an array containing the *n*-by-*n* matrix *A* (first of the pair of matrices).

The second dimension of *a* must be at least max(1, *n*).

b(*ldb*,*) is an array containing the *n*-by-*n* matrix *B* (second of the pair of matrices).

The second dimension of *b* must be at least max(1, *n*).

work is a workspace array, its dimension max(1, *lwork*).

lda

INTEGER. The leading dimension of the array *a*. Must be at least max(1, *n*).

ldb

INTEGER. The leading dimension of the array *b*. Must be at least max(1, *n*).

ldvl, *ldvr*

INTEGER. The leading dimensions of the output matrices *vl* and *vr*, respectively.

Constraints:

ldvl ≥ 1. If *jobvl* = 'V', *ldvl* ≥ max(1, *n*).

ldvr ≥ 1. If *jobvr* = 'V', *ldvr* ≥ max(1, *n*).

lwork

INTEGER.

The dimension of the array *work*.

lwork ≥ max(1, 8*n*+16) for real flavors;

lwork ≥ max(1, 2*n*) for complex flavors.

For good performance, *lwork* must generally be larger.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

rwork

REAL for cggev

DOUBLE PRECISION for zggev

Workspace array, size at least max(1, 8*n*).

This array is used in complex flavors only.

Output Parameters

a, *b*

On exit, these arrays have been overwritten.

alphar, *alphai*

REAL for sggev;

DOUBLE PRECISION for dggev.

Arrays, size at least max(1, *n*) each. Contain values that form generalized eigenvalues in real flavors.

See *beta*.

alpha

`COMPLEX` for `cggev`;

`DOUBLE COMPLEX` for `zggev`.

Array, size at least max(1, *n*). Contain values that form generalized eigenvalues in complex flavors. See *beta*.

beta

`REAL` for `sggev`

`DOUBLE PRECISION` for `dggev`

`COMPLEX` for `cggev`

`DOUBLE COMPLEX` for `zggev`.

Array, size at least max(1, *n*).

For real flavors:

On exit, (*alphar*(j) + *alphai*(j)*i)/*beta*(j), j=1,..., *n*, are the generalized eigenvalues.

If *alphai*(j) is zero, then the *j*-th eigenvalue is real; if positive, then the *j*-th and (*j*+1)-st eigenvalues are a complex conjugate pair, with *alphai*(j+1) negative.

For complex flavors:

On exit, *alpha*(j)/*beta*(j), j=1,..., *n*, are the generalized eigenvalues.

See also *Application Notes* below.

vl, *vr*

`REAL` for `sggev`

`DOUBLE PRECISION` for `dggev`

`COMPLEX` for `cggev`

`DOUBLE COMPLEX` for `zggev`.

Arrays:

vl(*ldvl*,*); the second dimension of *vl* must be at least max(1, *n*). Contains the matrix of left generalized eigenvectors *VL*.

If $jobvl = 'V'$, the left generalized eigenvectors u_j are stored one after another in the columns of *VL*, in the same order as their eigenvalues. Each eigenvector is scaled so the largest component has `abs(Re) + abs(Im) = 1`.

If $jobvl = 'N'$, *vl* is not referenced.

For real flavors:

If the j-th eigenvalue is real,then $u_j = VL_{*,j}$, the *j*-th column of *VL*.

If the *j*-th and (*j*+1)-st eigenvalues form a complex conjugate pair, then for $i = \text{sqrt}(-1)$, $u_j = VL_{*,j} + i*VL_{*,j+1}$ and $u_{j+1} = VL_{*,j} - i*VL_{*,j+1}$.

For complex flavors:

$u_j = VL_{*,j}$, the *j*-th column of *vl*.

vr(*ldvr*,*); the second dimension of *vr* must be at least max(1, *n*). Contains the matrix of right generalized eigenvectors *VR*.

If *jobvr* = 'V', the right generalized eigenvectors v_j are stored one after another in the columns of *VR*, in the same order as their eigenvalues. Each eigenvector is scaled so the largest component has abs(Re) + abs(Im) = 1.

If *jobvr* = 'N', *vr* is not referenced.

For real flavors:

If the *j*-th eigenvalue is real, then $v_j = VR_{*,j}$, the *j*-th column of *VR*.

If the *j*-th and (*j*+1)-st eigenvalues form a complex conjugate pair, then $v_j = VR_{*,j} + i*VR_{*,j+1}$ and $v_{j+1} = VR_{*,j} - i*VR_{*,j+1}$.

For complex flavors:

$v_j = VR_{*,j}$, the *j*-th column of *VR*.

work(1) On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, and

i≤*n*: the *QZ* iteration failed. No eigenvectors have been calculated, but *alphar*(j), *alphai*(j) (for real flavors), or *alpha*(j) (for complex flavors), and *beta*(j), j=*info*+1, ..., *n* should be correct.

i > *n*: errors that usually indicate LAPACK problems:

i = *n*+1: other than *QZ* iteration failed in hgeqz;

i = *n*+2: error return from tgevc.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine ggev interface are the following:

a Holds the matrix *A* of size (*n*, *n*).

b Holds the matrix *B* of size (*n*, *n*).

alphar Holds the vector of length *n*. Used in real flavors only.

alphai Holds the vector of length *n*. Used in real flavors only.

alpha Holds the vector of length *n*. Used in complex flavors only.

beta Holds the vector of length *n*.

vl Holds the matrix *VL* of size (*n*, *n*).

vr Holds the matrix *VR* of size (*n*, *n*).

jobvl Restored based on the presence of the argument *vl* as follows:

jobvl = 'V', if *vl* is present,

jobvl = 'N', if *vl* is omitted.

jobvr Restored based on the presence of the argument *vr* as follows:

jobvr = 'V', if *vr* is present,

jobvr = 'N', if *vr* is omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The quotients *alphar*(j)/*beta*(j) and *alphai*(j)/*beta*(j) may easily over- or underflow, and *beta*(j) may even be zero. Thus, you should avoid simply computing the ratio. However, *alphar* and *alphai* (for real flavors) or *alpha* (for complex flavors) will be always less than and usually comparable with norm(*A*) in magnitude, and *beta* always less than and usually comparable with norm(*B*).

?ggevx
Computes the generalized eigenvalues, and, optionally, the left and/or right generalized eigenvectors.

Syntax

call sggevx(*balanc*, *jobvl*, *jobvr*, *sense*, *n*, *a*, *lda*, *b*, *ldb*, *alphar*, *alphai*, *beta*, *vl*, *ldvl*, *vr*, *ldvr*, *ilo*, *ihi*, *lscale*, *rscale*, *abnrm*, *bbnrm*, *rconde*, *rcondv*, *work*, *lwork*, *iwork*, *bwork*, *info*)

Description

The routine computes for a pair of *n*-by-*n* real/complex nonsymmetric matrices (*A*,*B*), the generalized eigenvalues, and optionally, the left and/or right generalized eigenvectors.

Optionally also, it computes a balancing transformation to improve the conditioning of the eigenvalues and eigenvectors (*ilo*, *ihi*, *lscale*, *rscale*, *abnrm*, and *bbnrm*), reciprocal condition numbers for the eigenvalues (*rconde*), and reciprocal condition numbers for the right eigenvectors (*rcondv*).

A generalized eigenvalue for a pair of matrices (*A*,*B*) is a scalar λ or a ratio *alpha* / *beta* = λ, such that *A* – λ**B* is singular. It is usually represented as the pair (*alpha*, *beta*), as there is a reasonable interpretation for *beta*=0 and even for both being zero. The right generalized eigenvector *v*(j) corresponding to the generalized eigenvalue λ(j) of (*A*,*B*) satisfies

*A**v*(j) = λ(j)**B***v*(j).

The left generalized eigenvector *u*(j) corresponding to the generalized eigenvalue λ(j) of (*A*,*B*) satisfies

u(j)^H**A* = λ(j)**u*(j)^H**B*

where *u*(j)^H denotes the conjugate transpose of *u*(j).

Input Parameters

balanc

CHARACTER*1. Must be 'N', 'P', 'S', or 'B'. Specifies the balance option to be performed.

If *balanc* = 'N', do not diagonally scale or permute;

If *balanc* = 'P', permute only;

If *balanc* = 'S', scale only;

If *balanc* = 'B', both permute and scale.

Computed reciprocal condition numbers will be for the matrices after balancing and/or permuting. Permuting does not change condition numbers (in exact arithmetic), but balancing does.

jobvl

CHARACTER*1. Must be 'N' or 'V'.

If *jobvl* = 'N', the left generalized eigenvectors are not computed;

If *jobvl* = 'V', the left generalized eigenvectors are computed.

jobvr

CHARACTER*1. Must be 'N' or 'V'.

If *jobvr* = 'N', the right generalized eigenvectors are not computed;

If *jobvr* = 'V', the right generalized eigenvectors are computed.

sense

CHARACTER*1. Must be 'N', 'E', 'V', or 'B'. Determines which reciprocal condition number are computed.

If *sense* = 'N', none are computed;

If *sense* = 'E', computed for eigenvalues only;

If *sense* = 'V', computed for eigenvectors only;

If *sense* = 'B', computed for eigenvalues and eigenvectors.

n

INTEGER. The order of the matrices *A*, *B*, *vl*, and *vr* (*n*≥ 0).

a, *b*, *work*

REAL for sggevx

DOUBLE PRECISION for dggevx

COMPLEX for cggevx

DOUBLE COMPLEX for zggevx.

Arrays:

a(*lda*,*) is an array containing the *n*-by-*n* matrix *A* (first of the pair of matrices).

The second dimension of *a* must be at least max(1, *n*).

b(*ldb*,*) is an array containing the *n*-by-*n* matrix *B* (second of the pair of matrices).

The second dimension of *b* must be at least max(1, *n*).

work is a workspace array, its dimension max(1, *lwork*).

lda

INTEGER. The leading dimension of the array *a*.

Must be at least max(1, *n*).

ldb

INTEGER. The leading dimension of the array *b*.

Must be at least max(1, *n*).

ldvl, *ldvr*

INTEGER. The leading dimensions of the output matrices *vl* and *vr*, respectively.

Constraints:

ldvl≥ 1. If *jobvl* = 'V', *ldvl*≥ max(1, *n*).

ldvr≥ 1. If *jobvr* = 'V', *ldvr*≥ max(1, *n*).

lwork

INTEGER.

The dimension of the array *work*. *lwork*≥ max(1, 2*n*);

For real flavors:

If *balanc* = 'S', or 'B', or *jobvl* = 'V', or *jobvr* = 'V', then *lwork*≥ max(1, 6*n*);

if *sense* = 'E', or 'B', then *lwork*≥ max(1, 10*n*);

if *sense* = 'V', or 'B', *lwork*≥ $(2n^2+ 8*n+16)$.

For complex flavors:

if *sense* = 'E', *lwork*≥ max(1, 4*n*);

if *sense* = 'V', or 'B', *lwork*≥max(1, $2*n^2+ 2*n$).

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

rwork

REAL for cggevx

DOUBLE PRECISION for zggevx

Workspace array, size at least max(1, 6*n) if *balanc* = 'S', or 'B', and at least max(1, 2*n) otherwise.

This array is used in complex flavors only.

iwork

INTEGER.

Workspace array, size at least (*n*+6) for real flavors and at least (*n*+2) for complex flavors.

Not referenced if *sense* = 'E'.

bwork

LOGICAL. Workspace array, size at least max(1, *n*).

Not referenced if *sense* = 'N'.

Output Parameters

a, *b*

On exit, these arrays have been overwritten.

If *jobvl* = 'V' or *jobvr* = 'V' or both, then *a* contains the first part of the real Schur form of the "balanced" versions of the input *A* and *B*, and *b* contains its second part.

alphar, *alphai*

REAL for sggevx;

DOUBLE PRECISION for dggevx.

Arrays, size at least max(1, *n*) each. Contain values that form generalized eigenvalues in real flavors.

See *beta*.

alpha

COMPLEX for cggevx;

DOUBLE COMPLEX for zggevx.

Array, size at least max(1, *n*). Contain values that form generalized eigenvalues in complex flavors. See *beta*.

beta

REAL for sggevx

DOUBLE PRECISION for dggevx

COMPLEX for cggevx

DOUBLE COMPLEX for zggevx.

Array, size at least max(1, *n*).

For real flavors:

On exit, (*alphar*(j) + *alphai*(j)*i)/*beta*(j), j=1,..., *n*, will be the generalized eigenvalues.

If *alphai*(j) is zero, then the *j*-th eigenvalue is real; if positive, then the *j*-th and (*j*+1)-st eigenvalues are a complex conjugate pair, with *alphai*(j+1) negative.

For complex flavors:

On exit, *alpha*(j)/*beta*(j), j=1,..., *n*, will be the generalized eigenvalues.

See also *Application Notes* below.

vl, *vr*

REAL for sggevx

DOUBLE PRECISION for dggevx

COMPLEX for cggevx

DOUBLE COMPLEX for zggevx.

Arrays:

vl(*ldvl*,*); the second dimension of *vl* must be at least max(1, *n*).

If *jobvl* = 'V', the left generalized eigenvectors u(j) are stored one after another in the columns of *vl*, in the same order as their eigenvalues. Each eigenvector will be scaled so the largest component have abs(Re) + abs(Im) = 1.

If *jobvl* = 'N', *vl* is not referenced.

For real flavors:

If the j-th eigenvalue is real, then u(j) = *vl*(:,j), the j-th column of *vl*.

If the j-th and (j+1)-st eigenvalues form a complex conjugate pair, then for *i* = sqrt(–1), u(j) = *vl*(:,j) + *i***vl*(:,j+1) and u(j+1) = *vl*(:,j) – *i***vl*(:,j+1).

For complex flavors:

u(j) = *vl*(:,j), the j-th column of *vl*.

vr(*ldvr*,*); the second dimension of *vr* must be at least max(1, *n*).

If *jobvr* = 'V', the right generalized eigenvectors *v*(j) are stored one after another in the columns of *vr*, in the same order as their eigenvalues. Each eigenvector will be scaled so the largest component have abs(Re) + abs(Im) = 1.

If *jobvr* = 'N', *vr* is not referenced.

For real flavors:

If the j-th eigenvalue is real, then v(j) = *vr*(:,j), the j-th column of *vr*.

If the j-th and (j+1)-st eigenvalues form a complex conjugate pair, then v(j) = *vr*(:,j) + *i***vr*(:,j+1) and v(j+1) = *vr*(:,j) – *i***vr*(:,j+1).

For complex flavors:

v(j) = *vr*(:,j), the j-th column of *vr*.

ilo, *ihi*

INTEGER. *ilo* and *ihi* are integer values such that on exit $A_{i\ j} = 0$ and $B_{i\ j} = 0$ if i > j and j = 1,..., *ilo*–1 or i = *ihi*+1,..., *n*.

If *balanc* = 'N' or 'S', *ilo* = 1 and *ihi* = *n*.

lscale, *rscale*

REAL for single-precision flavors

DOUBLE PRECISION for double-precision flavors.

Arrays, size at least max(1, *n*) each.

lscale contains details of the permutations and scaling factors applied to the left side of *A* and *B*.

If *PL*(j) is the index of the row interchanged with row j, and *DL*(j) is the scaling factor applied to row j, then

lscale(j) = *PL*(j), for j = 1,..., *ilo*-1

= *DL*(j), for j = *ilo*,...,*ihi*

= *PL*(j) for j = *ihi*+1,..., *n*.

The order in which the interchanges are made is *n* to *ihi*+1, then 1 to *ilo*-1.

rscale contains details of the permutations and scaling factors applied to the right side of *A* and *B*.

If *PR*(j) is the index of the column interchanged with column j, and *DR*(j) is the scaling factor applied to column j, then

rscale(j) = *PR*(j), for j = 1,..., *ilo*-1

= *DR*(j), for j = *ilo*,...,*ihi*

= *PR*(j) for j = *ihi*+1,..., *n*.

The order in which the interchanges are made is *n* to *ihi*+1, then 1 to *ilo*-1.

abnrm, *bbnrm*

REAL for single-precision flavors

DOUBLE PRECISION for double-precision flavors.

The one-norms of the balanced matrices *A* and *B*, respectively.

rconde, *rcondv*

REAL for single precision flavors DOUBLE PRECISION for double precision flavors.

Arrays, size at least max(1, *n*) each.

If *sense* = 'E', or 'B', *rconde* contains the reciprocal condition numbers of the eigenvalues, stored in consecutive elements of the array. For a complex conjugate pair of eigenvalues two consecutive elements of *rconde* are set to the same value. Thus *rconde*(j), *rcondv*(j), and the *j*-th columns of *vl* and *vr* all correspond to the same eigenpair (but not in general the *j*-th eigenpair, unless all eigenpairs are selected).

If *sense* = 'N', or 'V', *rconde* is not referenced.

If *sense* = 'V', or 'B', *rcondv* contains the estimated reciprocal condition numbers of the eigenvectors, stored in consecutive elements of the array. For a complex eigenvector two consecutive elements of *rcondv* are set to the same value.

If the eigenvalues cannot be reordered to compute *rcondv*(j)*rconde*[*j*], *rcondv*(j) is set to 0; this can only occur when the true value would be very small anyway.

If *sense* = 'N', or 'E', *rcondv* is not referenced.

work(1)

On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.

info

INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, and

i≤*n*:

the *QZ* iteration failed. No eigenvectors have been calculated, but *alphar*(j), *alphai*(j) (for real flavors), or *alpha*(j) (for complex flavors), and *beta*(j), j=*info*+1,..., *n* should be correct.

i > *n*: errors that usually indicate LAPACK problems:

i = *n*+1: other than *QZ* iteration failed in hgeqz;

i = *n*+2: error return from tgevc.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine ggevx interface are the following:

a Holds the matrix *A* of size (*n*, *n*).

b Holds the matrix *B* of size (*n*, *n*).

alphar Holds the vector of length *n*. Used in real flavors only.

alphai Holds the vector of length *n*. Used in real flavors only.

alpha Holds the vector of length *n*. Used in complex flavors only.

beta Holds the vector of length *n*.

vl Holds the matrix *VL* of size (*n*, *n*).

vr Holds the matrix *VR* of size (*n*, *n*).

lscale Holds the vector of length *n*.

rscale Holds the vector of length *n*.

rconde Holds the vector of length *n*.

rcondv Holds the vector of length *n*.

balanc Must be 'N', 'B', or 'P'. The default value is 'N'.

jobvl Restored based on the presence of the argument *vl* as follows:

jobvl = 'V', if *vl* is present,

jobvl = 'N', if *vl* is omitted.

jobvr Restored based on the presence of the argument *vr* as follows:

jobvr = 'V', if *vr* is present,

jobvr = 'N', if *vr* is omitted.

sense Restored based on the presence of arguments *rconde* and rcondv as follows:

sense = 'B', if both *rconde* and *rcondv* are present,

sense = 'E', if *rconde* is present and *rcondv* omitted,

sense = 'V', if *rconde* is omitted and *rcondv* present,

sense = 'N', if both *rconde* and *rcondv* are omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The quotients *alphar*(j)/*beta*(j) and *alphai*(j)/*beta*(j) may easily over- or underflow, and *beta*(j) may even be zero. Thus, you should avoid simply computing the ratio. However, *alphar* and *alphai* (for real flavors) or *alpha* (for complex flavors) will be always less than and usually comparable with norm(*A*) in magnitude, and *beta* always less than and usually comparable with norm(*B*).

?ggev3

Computes the generalized eigenvalues and the left and right generalized eigenvectors for a pair of matrices.

Syntax

```
call sggev3 (jobvl, jobvr, n, a, lda, b, ldb, alphar, alphai, beta, vl, ldvl, vr, ldvr, work, lwork, info )
```

```

```

Include Files

- mkl.fi

Description

For a pair of *n*-by-*n* real or complex nonsymmetric matrices (*A*, *B*), ?ggev3 computes the generalized eigenvalues, and optionally, the left and right generalized eigenvectors.

A generalized eigenvalue for a pair of matrices (*A*, *B*) is a scalar λ or a ratio *alpha*/*beta* = λ, such that *A* - λ*B* is singular. It is usually represented as the pair (*alpha*,*beta*), as there is a reasonable interpretation for *beta*=0, and even for both being zero.

For real flavors:

The right eigenvector v_j corresponding to the eigenvalue λ_j of (*A*, *B*) satisfies

$A * v_j = \lambda_j * B * v_j$.

The left eigenvector u_j corresponding to the eigenvalue λ_j of (*A*, *B*) satisfies

$u_j^H * A = \lambda_j * u_j^H * B$

where u_j^H is the conjugate-transpose of u_j.

For complex flavors:

The right generalized eigenvector v_j corresponding to the generalized eigenvalue λ_j of (A, B) satisfies

$A * v_j = \lambda_j * B * v_j$.

The left generalized eigenvector u_j corresponding to the generalized eigenvalues λ_j of (A, B) satisfies

$u_j^H * A = \lambda_j * u_j^H * B$

where u_j^H is the conjugate-transpose of u_j.

Input Parameters

jobvl	CHARACTER*1. = 'N': do not compute the left generalized eigenvectors; = 'V': compute the left generalized eigenvectors.
jobvr	CHARACTER*1. = 'N': do not compute the right generalized eigenvectors; = 'V': compute the right generalized eigenvectors.
n	INTEGER. The order of the matrices *A*, *B*, *VL*, and *VR*. *n*≥ 0.
a	REAL for sggev3 DOUBLE PRECISION for dggev3 COMPLEX for cggev3 DOUBLE COMPLEX for zggev3 Array, size (*lda*, *n*). On entry, the matrix *A* in the pair (*A*, *B*).
lda	INTEGER. The leading dimension of *a*. *lda*≥ max(1,*n*).
b	REAL for sggev3 DOUBLE PRECISION for dggev3 COMPLEX for cggev3 DOUBLE COMPLEX for zggev3 Array, size (*ldb*, *n*). On entry, the matrix *B* in the pair (*A*, *B*).
ldb	INTEGER. The leading dimension of *b*. *ldb*≥ max(1,*n*).
ldvl	INTEGER. The leading dimension of the matrix *VL*. *ldvl*≥ 1, and if *jobvl* = 'V', *ldvl*≥*n*.
ldvr	INTEGER. The leading dimension of the matrix *VR*. *ldvr*≥ 1, and if *jobvr* = 'V', *ldvr*≥*n*.

work

REAL for sggev3

DOUBLE PRECISION for dggev3

COMPLEX for cggev3

DOUBLE COMPLEX for zggev3

Array, size (MAX(1,*lwork*))

On exit, if *info* = 0, *work*(1) returns the optimal lwork.

lwork

INTEGER. The dimension of the array *work*.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal (*A*, *B*) of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

rwork

REAL for cggev3

DOUBLE PRECISION for zggev3

Array, size (8*n).

Output Parameters

a

On exit, *a* is overwritten.

b

On exit, *b* is overwritten.

alphar

REAL for sggev3

DOUBLE PRECISION for dggev3

Array, size (n).

alphai

REAL for sggev3

DOUBLE PRECISION for dggev3

Array, size (n).

alpha

COMPLEX for cggev3

DOUBLE COMPLEX for zggev3

Array, size (n).

beta

REAL for sggev3

DOUBLE PRECISION for dggev3

COMPLEX for cggev3

DOUBLE COMPLEX for zggev3

Array, size (n).

For real flavors:

On exit, (*alphar*(j) + *alphai*(j)*i)/*beta*(j), j=1,...,n, are the generalized eigenvalues. If *alphai*(j) is zero, then the j-th eigenvalue is real; if positive, then the j-th and (j+1)-st eigenvalues are a complex conjugate pair, with *alphai*(j + 1) negative.

Note: the quotients *alphar*(*j*)/*beta*(*j*) and *alphai*(*j*)/*beta*(*j*) can easily over- or underflow, and *beta*(*j*) might even be zero. Thus, you should avoid computing the ratio *alpha*/*beta* by simply dividing *alpha* by *beta*. However, *alphar* and *alphai* are always less than and usually comparable with norm(*A*) in magnitude, and *beta* is always less than and usually comparable with norm(*B*).

For complex flavors:

On exit, *alpha*(*j*)/*beta*(*j*), *j*=1,...,*n*, are the generalized eigenvalues.

Note: the quotients *alpha*(*j*)/*beta*(*j*) may easily over- or underflow, and *beta*(*j*) can even be zero. Thus, you should avoid computing the ratio *alpha*/*beta* by simply dividing *alpha* by *beta*. However, *alpha* is always less than and usually comparable with norm(*A*) in magnitude, and *beta*is always less than and usually comparable with norm(*B*).

vl

REAL for sggev3

DOUBLE PRECISION for dggev3

COMPLEX for cggev3

DOUBLE COMPLEX for zggev3

Array, size (*ldvl*, *n*).

For real flavors:

If *jobvl* = 'V', the left eigenvectors u_j are stored one after another in the columns of *vl*, in the same order as their eigenvalues. If the *j*-th eigenvalue is real, then u_j = *vl*(:,*j*), the *j*-th column of *vl*. If the *j*-th and (*j*+1)-st eigenvalues form a complex conjugate pair, then u_j = *vl*(:,*j*)+i**vl*(:,*j*+1) and u_{j+1} = *vl*(:,*j*)-i**vl*(:,*j*+1).

Each eigenvector is scaled so the largest component has abs(real part)+abs(imag. part)=1.

Not referenced if *jobvl* = 'N'.

For complex flavors:

If *jobvl* = 'V', the left generalized eigenvectors u_j are stored one after another in the columns of *vl*, in the same order as their eigenvalues.

Each eigenvector is scaled so the largest component has abs(real part) + abs(imag. part) = 1.

Not referenced if *jobvl* = 'N'.

vr

REAL for sggev3

DOUBLE PRECISION for dggev3

COMPLEX for cggev3

DOUBLE COMPLEX for zggev3

Array, size (*ldvr*, *n*).

For real flavors:

If *jobvr* = 'V', the right eigenvectors v_j are stored one after another in the columns of *vr*, in the same order as their eigenvalues. If the *j*-th eigenvalue is real, then v_j = *vr*(:,*j*), the *j*-th column of *vr*. If the *j*-th and (*j* + 1)-st eigenvalues form a complex conjugate pair, then v_j = *vr*(:,*j*) + i**vr*(:,*j* + 1) and v_{j+1} = *vr*(:,*j*)-i**vr*(:,*j*+1).

Each eigenvector is scaled so the largest component has abs(real part)+abs(imag. part)=1.

Not referenced if *jobvr* = 'N'.

For complex flavors:

If *jobvr* = 'V', the right generalized eigenvectors v_j are stored one after another in the columns of *vr*, in the same order as their eigenvalues. Each eigenvector is scaled so the largest component has abs(real part) + abs(imag. part) = 1.

Not referenced if *jobvr* = 'N'.

info

INTEGER. = 0: successful exit.

< 0: if *info* = -*i*, the *i*-th argument had an illegal value.

=1,...,*n*:

- for real flavors:

  The QZ iteration failed. No eigenvectors have been calculated, but *alphar*(*j*), *alphar*(*j*) and *beta*(*j*) should be correct for *j*=*info* + 1,...,*n*.
- for complex flavors:

  The QZ iteration failed. No eigenvectors have been calculated, but *alpha*(*j*) and *beta*(*j*) should be correct for *j*=*info* + 1,...,*n*.

> *n*:

- =*n* + 1: other than QZ iteration failed in ?hgeqz,
- =*n* + 2: error return from ?tgevc.

LAPACK Auxiliary Routines

Routine naming conventions, mathematical notation, and matrix storage schemes used for LAPACK auxiliary routines are the same as for the driver and computational routines described in previous chapters.

The table below summarizes information about the available LAPACK auxiliary routines.

LAPACK Auxiliary Routines

Routine Name	Data Types	Description
?lacgv	c, z	Conjugates a complex vector.
?lacrm	c, z	Multiplies a complex matrix by a square real matrix.
?lacrt	c, z	Performs a linear transformation of a pair of complex vectors.
?laesy	c, z	Computes the eigenvalues and eigenvectors of a 2-by-2 complex symmetric matrix.

Routine Name	Data Types	Description
?rot	c, z	Applies a plane rotation with real cosine and complex sine to a pair of complex vectors.
?spmv	c, z	Computes a matrix-vector product for complex vectors using a complex symmetric packed matrix
?spr	c, z	Performs the symmetrical rank-1 update of a complex symmetric packed matrix.
?syconv	s, c, d, z	Converts a symmetric matrix given by a triangular matrix factorization into two matrices and vice versa.
?symv	c, z	Computes a matrix-vector product for a complex symmetric matrix.
?syr	c, z	Performs the symmetric rank-1 update of a complex symmetric matrix.
i?max1	c, z	Finds the index of the vector element whose real part has maximum absolute value.
?sum1	sc, dz	Forms the 1-norm of the complex vector using the true absolute value.
?gbtf2	s, d, c, z	Computes the LU factorization of a general band matrix using the unblocked version of the algorithm.
?gebd2	s, d, c, z	Reduces a general matrix to bidiagonal form using an unblocked algorithm.
?gehd2	s, d, c, z	Reduces a general square matrix to upper Hessenberg form using an unblocked algorithm.
?gelq2	s, d, c, z	Computes the LQ factorization of a general rectangular matrix using an unblocked algorithm.
?gelqt3	s, d, c, z	Recursively computes the LQ factorization of a general matrix using the compact WY representation of Q.
?geql2	s, d, c, z	Computes the QL factorization of a general rectangular matrix using an unblocked algorithm.
?geqr2	s, d, c, z	Computes the QR factorization of a general rectangular matrix using an unblocked algorithm.
?geqr2p	s, d, c, z	Computes the QR factorization of a general rectangular matrix with non-negative diagonal elements using an unblocked algorithm.
?geqrt2	s, d, c, z	Computes a QR factorization of a general real or complex matrix using the compact WY representation of Q.
?geqrt3	s, d, c, z	Recursively computes a QR factorization of a general real or complex matrix using the compact WY representation of Q.
?gerq2	s, d, c, z	Computes the RQ factorization of a general rectangular matrix using an unblocked algorithm.
?gesc2	s, d, c, z	Solves a system of linear equations using the LU factorization with complete pivoting computed by ?getc2.

Routine Name	Data Types	Description
?getc2	s, d, c, z	Computes the LU factorization with complete pivoting of the general *n*-by-*n* matrix.
?getf2	s, d, c, z	Computes the LU factorization of a general *m*-by-*n* matrix using partial pivoting with row interchanges (unblocked algorithm).
?gtts2	s, d, c, z	Solves a system of linear equations with a tridiagonal matrix using the LU factorization computed by ?gttrf.
?isnan	s, d,	Tests input for NaN.
?laisnan	s, d,	Tests input for NaN by comparing two arguments for inequality.
?labrd	s, d, c, z	Reduces the first *nb* rows and columns of a general matrix to a bidiagonal form.
?lacn2	s, d, c, z	Estimates the 1-norm of a square matrix, using reverse communication for evaluating matrix-vector products.
?lacon	s, d, c, z	Estimates the 1-norm of a square matrix, using reverse communication for evaluating matrix-vector products.
?lacpy	s, d, c, z	Copies all or part of one two-dimensional array to another.
?ladiv	s, d, c, z	Performs complex division in real arithmetic, avoiding unnecessary overflow.
?lae2	s, d	Computes the eigenvalues of a 2-by-2 symmetric matrix.
?laebz	s, d	Computes the number of eigenvalues of a real symmetric tridiagonal matrix which are less than or equal to a given value, and performs other tasks required by the routine ?stebz.
?laed0	s, d, c, z	Used by ?stedc. Computes all eigenvalues and corresponding eigenvectors of an unreduced symmetric tridiagonal matrix using the divide and conquer method.
?laed1	s, d	Used by sstedc/dstedc. Computes the updated eigensystem of a diagonal matrix after modification by a rank-one symmetric matrix. Used when the original matrix is tridiagonal.
?laed2	s, d	Used by sstedc/dstedc. Merges eigenvalues and deflates secular equation. Used when the original matrix is tridiagonal.
?laed3	s, d	Used by sstedc/dstedc. Finds the roots of the secular equation and updates the eigenvectors. Used when the original matrix is tridiagonal.
?laed4	s, d	Used by sstedc/dstedc. Finds a single root of the secular equation.
?laed5	s, d	Used by sstedc/dstedc. Solves the 2-by-2 secular equation.
?laed6	s, d	Used by sstedc/dstedc. Computes one Newton step in solution of the secular equation.
?laed7	s, d, c, z	Used by ?stedc. Computes the updated eigensystem of a diagonal matrix after modification by a rank-one symmetric matrix. Used when the original matrix is dense.

Routine Name	Data Types	Description
?laed8	s, d, c, z	Used by ?stedc. Merges eigenvalues and deflates secular equation. Used when the original matrix is dense.
?laed9	s, d	Used by sstedc/dstedc. Finds the roots of the secular equation and updates the eigenvectors. Used when the original matrix is dense.
?laeda	s, d	Used by ?stedc. Computes the *Z* vector determining the rank-one modification of the diagonal matrix. Used when the original matrix is dense.
?laein	s, d, c, z	Computes a specified right or left eigenvector of an upper Hessenberg matrix by inverse iteration.
?laev2	s, d, c, z	Computes the eigenvalues and eigenvectors of a 2-by-2 symmetric/Hermitian matrix.
?laexc	s, d	Swaps adjacent diagonal blocks of a real upper quasi-triangular matrix in Schur canonical form, by an orthogonal similarity transformation.
?lag2	s, d	Computes the eigenvalues of a 2-by-2 generalized eigenvalue problem, with scaling as necessary to avoid over-/underflow.
?lags2	s, d	Computes 2-by-2 orthogonal matrices *U*, *V*, and *Q*, and applies them to matrices *A* and *B* such that the rows of the transformed *A* and *B* are parallel.
?lagtf	s, d	Computes an LU factorization of a matrix $T-\lambda I$, where *T* is a general tridiagonal matrix, and λ a scalar, using partial pivoting with row interchanges.
?lagtm	s, d, c, z	Performs a matrix-matrix product of the form $C = \alpha AB+\beta C$, where *A* is a tridiagonal matrix, *B* and *C* are rectangular matrices, and α and β are scalars, which may be 0, 1, or -1.
?lagts	s, d	Solves the system of equations $(T-\lambda I)x = y$ or $(T-\lambda I)^T x = y$,where *T* is a general tridiagonal matrix and λ a scalar, using the LU factorization computed by ?lagtf.
?lagv2	s, d	Computes the Generalized Schur factorization of a real 2-by-2 matrix pencil (*A*,*B*) where *B* is upper triangular.
?lahqr	s, d, c, z	Computes the eigenvalues and Schur factorization of an upper Hessenberg matrix, using the double-shift/single-shift QR algorithm.
?lahrd	s, d, c, z	Reduces the first *nb* columns of a general rectangular matrix *A* so that elements below the *k*-th subdiagonal are zero, and returns auxiliary matrices which are needed to apply the transformation to the unreduced part of *A*.
?lahr2	s, d, c, z	Reduces the specified number of first columns of a general rectangular matrix *A* so that elements below the specified subdiagonal are zero, and returns auxiliary matrices which are needed to apply the transformation to the unreduced part of *A*.
?laic1	s, d, c, z	Applies one step of incremental condition estimation.

Routine Name	Data Types	Description
?lakf2	s, d, c, z	Forms a matrix containing Kronecker products between the given matrices.
?lals0	s, d, c, z	Applies back multiplying factors in solving the least squares problem using divide and conquer SVD approach. Used by ?gelsd.
?lalsa	s, d, c, z	Computes the SVD of the coefficient matrix in compact form. Used by ?gelsd.
?lalsd	s, d, c, z	Uses the singular value decomposition of *A* to solve the least squares problem.
?lamrg	s, d	Creates a permutation list to merge the entries of two independently sorted sets into a single set sorted in ascending order.
?lamswlq	s, d, c, z	Multiplies a general real matrix by a real orthogonal matrix defined as the product of blocked elementary reflectors computed by short wide LQ factorization.
?lamtsqr	s, d, c, z	Multiplies a general matrix by the product of blocked elementary reflectors computed by tall skinny QR factorization.
?laneg	s, d	Computes the Sturm count.
?langb	s, d, c, z	Returns the value of the 1-norm, Frobenius norm, infinity-norm, or the largest absolute value of any element of general band matrix.
?lange	s, d, c, z	Returns the value of the 1-norm, Frobenius norm, infinity-norm, or the largest absolute value of any element of a general rectangular matrix.
?langt	s, d, c, z	Returns the value of the 1-norm, Frobenius norm, infinity-norm, or the largest absolute value of any element of a general tridiagonal matrix.
?lanhs	s, d, c, z	Returns the value of the 1-norm, Frobenius norm, infinity-norm, or the largest absolute value of any element of an upper Hessenberg matrix.
?lansb	s, d, c, z	Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a symmetric band matrix.
?lanhb	c, z	Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a Hermitian band matrix.
?lansp	s, d, c, z	Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a symmetric matrix supplied in packed form.
?lanhp	c, z	Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a complex Hermitian matrix supplied in packed form.
?lanst/?lanht	s, d/c, z	Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a real symmetric or complex Hermitian tridiagonal matrix.

Routine Name	Data Types	Description
?lansy	s, d, c, z	Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a real/ complex symmetric matrix.
?lanhe	c, z	Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a complex Hermitian matrix.
?lantb	s, d, c, z	Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a triangular band matrix.
?lantp	s, d, c, z	Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a triangular matrix supplied in packed form.
?lantr	s, d, c, z	Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a trapezoidal or triangular matrix.
?lanv2	s, d	Computes the Schur factorization of a real 2-by-2 nonsymmetric matrix in standard form.
?lapll	s, d, c, z	Measures the linear dependence of two vectors.
?lapmr	s, d, c, z	Rearranges rows of a matrix as specified by a permutation vector.
?lapmt	s, d, c, z	Performs a forward or backward permutation of the columns of a matrix.
?lapy2	s, d	Returns sqrt(x^2+y^2).
?lapy3	s, d	Returns sqrt($x^2+y^2+z^2$).
?laqgb	s, d, c, z	Scales a general band matrix, using row and column scaling factors computed by ?gbequ.
?laqge	s, d, c, z	Scales a general rectangular matrix, using row and column scaling factors computed by ?geequ.
?laqhb	c, z	Scales a Hermitian band matrix, using scaling factors computed by ?pbequ.
?laqp2	s, d, c, z	Computes a QR factorization with column pivoting of the matrix block.
?laqps	s, d, c, z	Computes a step of QR factorization with column pivoting of a real m-by-n matrix *A* by using BLAS level 3.
?laqr0	s, d, c, z	Computes the eigenvalues of a Hessenberg matrix, and optionally the matrices from the Schur decomposition.
?laqr1	s, d, c, z	Sets a scalar multiple of the first column of the product of 2-by-2 or 3-by-3 matrix *H* and specified shifts.
?laqr2	s, d, c, z	Performs the orthogonal/unitary similarity transformation of a Hessenberg matrix to detect and deflate fully converged eigenvalues from a trailing principal submatrix (aggressive early deflation).

Routine Name	Data Types	Description
?laqr3	s, d, c, z	Performs the orthogonal/unitary similarity transformation of a Hessenberg matrix to detect and deflate fully converged eigenvalues from a trailing principal submatrix (aggressive early deflation).
?laqr4	s, d, c, z	Computes the eigenvalues of a Hessenberg matrix, and optionally the matrices from the Schur decomposition.
?laqr5	s, d, c, z	Performs a single small-bulge multi-shift QR sweep.
?laqsb	s, d, c, z	Scales a symmetric/Hermitian band matrix, using scaling factors computed by ?pbequ.
?laqsp	s, d, c, z	Scales a symmetric/Hermitian matrix in packed storage, using scaling factors computed by ?ppequ.
?laqsy	s, d, c, z	Scales a symmetric/Hermitian matrix, using scaling factors computed by ?poequ.
?laqtr	s, d	Solves a real quasi-triangular system of equations, or a complex quasi-triangular system of special form, in real arithmetic.
?lar1v	s, d, c, z	Computes the (scaled) *r*-th column of the inverse of the submatrix in rows *b1* through *bn* of the tridiagonal matrix $LDL^T - \lambda I$.
?lar2v	s, d, c, z	Applies a vector of plane rotations with real cosines and real/complex sines from both sides to a sequence of 2-by-2 symmetric/Hermitian matrices.
?laran	s, d	Returns a random real number from a uniform distribution.
?larf	s, d, c, z	Applies an elementary reflector to a general rectangular matrix.
?larfb	s, d, c, z	Applies a block reflector or its transpose/conjugate-transpose to a general rectangular matrix.
?larfg	s, d, c, z	Generates an elementary reflector (Householder matrix).
?larfgp	s, d, c, z	Generates an elementary reflector (Householder matrix) with non-negatibe beta.
?larft	s, d, c, z	Forms the triangular factor *T* of a block reflector $H = I - vtv^H$
?larfx	s, d, c, z	Applies an elementary reflector to a general rectangular matrix, with loop unrolling when the reflector has order ≤ 10.
?large	s, d, c, z	Pre- and post-multiplies a real general matrix with a random orthogonal matrix.
?larnd	s, d, c, z	Returns a random real number from a uniform or normal distribution.
?largv	s, d, c, z	Generates a vector of plane rotations with real cosines and real/complex sines.
?larnv	s, d, c, z	Returns a vector of random numbers from a uniform or normal distribution.
?laror	s, d, c, z	Pre- or post-multiplies an *m*-by-*n* matrix by a random orthogonal/unitary matrix.

Routine Name	Data Types	Description
?larot	s, d, c, z	Applies a Givens rotation to two adjacent rows or columns.
?larra	s, d	Computes the splitting points with the specified threshold.
?larrb	s, d	Provides limited bisection to locate eigenvalues for more accuracy.
?larrc	s, d	Computes the number of eigenvalues of the symmetric tridiagonal matrix.
?larrd	s, d	Computes the eigenvalues of a symmetric tridiagonal matrix to suitable accuracy.
?larre	s, d	Given the tridiagonal matrix T, sets small off-diagonal elements to zero and for each unreduced block T_i, finds base representations and eigenvalues.
?larrf	s, d	Finds a new relatively robust representation such that at least one of the eigenvalues is relatively isolated.
?larrj	s, d	Performs refinement of the initial estimates of the eigenvalues of the matrix T.
?larrk	s, d	Computes one eigenvalue of a symmetric tridiagonal matrix T to suitable accuracy.
?larrr	s, d	Performs tests to decide whether the symmetric tridiagonal matrix T warrants expensive computations which guarantee high relative accuracy in the eigenvalues.
?larrv	s, d, c, z	Computes the eigenvectors of the tridiagonal matrix $T = LDL^T$ given L, D and the eigenvalues of LDL^T.
?lartg	s, d, c, z	Generates a plane rotation with real cosine and real/complex sine.
?lartgp	s, d	Generates a plane rotation so that the diagonal is nonnegative.
?lartgs	s, d	Generates a plane rotation designed to introduce a bulge in implicit QR iteration for the bidiagonal SVD problem.
?lartv	s, d, c, z	Applies a vector of plane rotations with real cosines and real/ complex sines to the elements of a pair of vectors.
?laruv	s, d	Returns a vector of n random real numbers from a uniform distribution.
?larz	s, d, c, z	Applies an elementary reflector (as returned by ?tzrzf) to a general matrix.
?larzb	s, d, c, z	Applies a block reflector or its transpose/conjugate-transpose to a general matrix.
?larzt	s, d, c, z	Forms the triangular factor T of a block reflector $H = I - vtv^H$.
?las2	s, d	Computes singular values of a 2-by-2 triangular matrix.
?lascl	s, d, c, z	Multiplies a general rectangular matrix by a real scalar defined as c_{to}/c_{from}.
?lasd0	s, d	Computes the singular values of a real upper bidiagonal n-by-m matrix B with diagonal d and off-diagonal e. Used by ?bdsdc.

Routine Name	Data Types	Description
?lasd1	s, d	Computes the SVD of an upper bidiagonal matrix *B* of the specified size. Used by ?bdsdc.
?lasd2	s, d	Merges the two sets of singular values together into a single sorted set. Used by ?bdsdc.
?lasd3	s, d	Finds all square roots of the roots of the secular equation, as defined by the values in *D* and *Z*, and then updates the singular vectors by matrix multiplication. Used by ?bdsdc.
?lasd4	s, d	Computes the square root of the *i*-th updated eigenvalue of a positive symmetric rank-one modification to a positive diagonal matrix. Used by ?bdsdc.
?lasd5	s, d	Computes the square root of the *i*-th eigenvalue of a positive symmetric rank-one modification of a 2-by-2 diagonal matrix. Used by ?bdsdc.
?lasd6	s, d	Computes the SVD of an updated upper bidiagonal matrix obtained by merging two smaller ones by appending a row. Used by ?bdsdc.
?lasd7	s, d	Merges the two sets of singular values together into a single sorted set. Then it tries to deflate the size of the problem. Used by ?bdsdc.
?lasd8	s, d	Finds the square roots of the roots of the secular equation, and stores, for each element in *D*, the distance to its two nearest poles. Used by ?bdsdc.
?lasda	s, d	Computes the singular value decomposition (SVD) of a real upper bidiagonal matrix with diagonal *d* and off-diagonal *e*. Used by ?bdsdc.
?lasdq	s, d	Computes the SVD of a real bidiagonal matrix with diagonal *d* and off-diagonal *e*. Used by ?bdsdc.
?lasdt	s, d	Creates a tree of subproblems for bidiagonal divide and conquer. Used by ?bdsdc.
?laset	s, d, c, z	Initializes the off-diagonal elements and the diagonal elements of a matrix to given values.
?lasq1	s, d	Computes the singular values of a real square bidiagonal matrix. Used by ?bdsqr.
?lasq2	s, d	Computes all the eigenvalues of the symmetric positive definite tridiagonal matrix associated with the *qd* Array *Z* to high relative accuracy. Used by ?bdsqr and ?stegr.
?lasq3	s, d	Checks for deflation, computes a shift and calls *dqds*. Used by ?bdsqr.
?lasq4	s, d	Computes an approximation to the smallest eigenvalue using values of *d* from the previous transform. Used by ?bdsqr.
?lasq5	s, d	Computes one *dqds* transform in ping-pong form. Used by ?bdsqr and ?stegr.

Routine Name	Data Types	Description
?lasq6	s, d	Computes one *dqd* transform in ping-pong form. Used by ?bdsqr and ?stegr.
?lasr	s, d, c, z	Applies a sequence of plane rotations to a general rectangular matrix.
?lasrt	s, d	Sorts numbers in increasing or decreasing order.
?lassq	s, d, c, z	Updates a sum of squares represented in scaled form.
?lasv2	s, d	Computes the singular value decomposition of a 2-by-2 triangular matrix.
?laswp	s, d, c, z	Performs a series of row interchanges on a general rectangular matrix.
?laswlq	s, d, c, z	Computes blocked short-wide LQ matrix factorization.
?lasy2	s, d	Solves the Sylvester matrix equation where the matrices are of order 1 or 2.
?lasyf	s, d, c, z	Computes a partial factorization of a real/complex symmetric matrix, using the diagonal pivoting method.
?lasyf_aa	s, d, c, z	Factorizes a panel of a symmetric matrix using Aasen's algorithm.
?lasyf_rook	s, d, c, z	Computes a partial factorization of a real/complex symmetric matrix, using the bounded Bunch-Kaufman diagonal pivoting method.
?lahef	c, z	Computes a partial factorization of a complex Hermitian indefinite matrix, using the diagonal pivoting method.
?lahef_rook	c, z	Computes a partial factorization of a complex Hermitian indefinite matrix, using the bounded Bunch-Kaufman diagonal pivoting method.
?lahef_aa	c, z	Computes a partial factorization of a complex Hermitian matrix, using Aasen's algorithm.
?latbs	s, d, c, z	Solves a triangular banded system of equations.
?latdf	s, d, c, z	Uses the LU factorization of the *n*-by-*n* matrix computed by ?getc2 and computes a contribution to the reciprocal Dif-estimate.
?latm1	s, d, c, z	Computes the entries of a matrix as specified.
?latm2	s, d, c, z	Returns an entry of a random matrix.
?latm3	s, d, c, z	Returns set entry of a random matrix.
?latm5	s, d, c, z	Generates matrices involved in the Generalized Sylvester equation.
?latm6	s, d, c, z	Generates test matrices for the generalized eigenvalue problem, their corresponding right and left eigenvector matrices, and also reciprocal condition numbers for all eigenvalues and the reciprocal condition numbers of eigenvectors corresponding to the 1th and 5th eigenvalues.

Routine Name	Data Types	Description
?latme	s, d, c, z	Generates random non-symmetric square matrices with specified eigenvalues.
?latmr	s, d, c, z	Generates random matrices of various types.
?latps	s, d, c, z	Solves a triangular system of equations with the matrix held in packed storage.
?latrd	s, d, c, z	Reduces the first *nb* rows and columns of a symmetric/Hermitian matrix *A* to real tridiagonal form by an orthogonal/unitary similarity transformation.
?latrs	s, d, c, z	Solves a triangular system of equations with the scale factor set to prevent overflow.
?latrz	s, d, c, z	Factors an upper trapezoidal matrix by means of orthogonal/ unitary transformations.
?latsqr	s, d, c, z	Computes a blocked tall-skinny QR matrix factorization.
?lauu2	s, d, c, z	Computes the product UU^H or L^HL, where *U* and *L* are upper or lower triangular matrices (unblocked algorithm).
?lauum	s, d, c, z	Computes the product UU^H or L^HL, where *U* and *L* are upper or lower triangular matrices (blocked algorithm).
?orbdb1/?unbdb1 ?orbdb2/?unbdb2 ?orbdb3/?unbdb3 ?orbdb4/?unbdb4	s, d, c, z	Simultaneously bidiagonalizes the blocks of a tall and skinny matrix with orthonormal columns.
?orbdb5/?unbdb5 ?orbdb6/?unbdb6	s, d, c, z	Orthogonalizes a column vector with respect to the orthonormal basis matrix.
?org2l/?ung2l	s, d/c, z	Generates all or part of the orthogonal/unitary matrix *Q* from a QL factorization determined by ?geqlf (unblocked algorithm).
?org2r/?ung2r	s, d/c, z	Generates all or part of the orthogonal/unitary matrix *Q* from a QR factorization determined by ?geqrf (unblocked algorithm).
?orgl2/?ungl2	s, d/c, z	Generates all or part of the orthogonal/unitary matrix *Q* from an LQ factorization determined by ?gelqf (unblocked algorithm).
?orgr2/?ungr2	s, d/c, z	Generates all or part of the orthogonal/unitary matrix *Q* from an RQ factorization determined by ?gerqf (unblocked algorithm).
?orm2l/?unm2l	s, d/c, z	Multiplies a general matrix by the orthogonal/unitary matrix from a QL factorization determined by ?geqlf (unblocked algorithm).
?orm2r/?unm2r	s, d/c, z	Multiplies a general matrix by the orthogonal/unitary matrix from a QR factorization determined by ?geqrf (unblocked algorithm).
?orml2/?unml2	s, d/c, z	Multiplies a general matrix by the orthogonal/unitary matrix from a LQ factorization determined by ?gelqf (unblocked algorithm).
?ormr2/?unmr2	s, d/c, z	Multiplies a general matrix by the orthogonal/unitary matrix from a RQ factorization determined by ?gerqf (unblocked algorithm).

Routine Name	Data Types	Description
?ormr3/?unmr3	s, d/c, z	Multiplies a general matrix by the orthogonal/unitary matrix from a RZ factorization determined by ?tzrzf (unblocked algorithm).
?pbtf2	s, d, c, z	Computes the Cholesky factorization of a symmetric/ Hermitian positive definite band matrix (unblocked algorithm).
?potf2	s, d, c, z	Computes the Cholesky factorization of a symmetric/Hermitian positive definite matrix (unblocked algorithm).
?ptts2	s, d, c, z	Solves a tridiagonal system of the form $AX=B$ using the LDL^H factorization computed by ?pttrf.
?rscl	s, d, cs, zd	Multiplies a vector by the reciprocal of a real scalar.
?syswapr	s, d, c, z	Applies an elementary permutation on the rows and columns of a symmetric matrix.
?heswapr	c, z	Applies an elementary permutation on the rows and columns of a Hermitian matrix.
?sygs2/?hegs2	s, d/c, z	Reduces a symmetric/Hermitian positive-definite generalized eigenproblem to standard form, using the factorization results obtained from ?potrf (unblocked algorithm).
?sytd2/?hetd2	s, d/c, z	Reduces a symmetric/Hermitian matrix to real symmetric tridiagonal form by an orthogonal/unitary similarity transformation (unblocked algorithm).
?sytf2	s, d, c, z	Computes the factorization of a real/complex symmetric indefinite matrix, using the diagonal pivoting method (unblocked algorithm).
?sytf2_rook	s, d, c, z	Computes the factorization of a real/complex symmetric indefinite matrix, using the bounded Bunch-Kaufman diagonal pivoting method (unblocked algorithm).
?hetf2	c, z	Computes the factorization of a complex Hermitian matrix, using the diagonal pivoting method (unblocked algorithm).
?hetf2_rook	c, z	Computes the factorization of a complex Hermitian matrix, using the bounded Bunch-Kaufman diagonal pivoting method (unblocked algorithm).
?tgex2	s, d, c, z	Swaps adjacent diagonal blocks in an upper (quasi) triangular matrix pair by an orthogonal/unitary equivalence transformation.
?tgsy2	s, d, c, z	Solves the generalized Sylvester equation (unblocked algorithm).
?trti2	s, d, c, z	Computes the inverse of a triangular matrix (unblocked algorithm).
clag2z	c → z	Converts a complex single precision matrix to a complex double precision matrix.
dlag2s	d → s	Converts a double precision matrix to a single precision matrix.
slag2d	s → d	Converts a single precision matrix to a double precision matrix.
zlag2c	z → c	Converts a complex double precision matrix to a complex single precision matrix.

Routine Name	Data Types	Description
?larfp	s, d, c, z	Generates a real or complex elementary reflector.
ila?lc	s, d, c, z	Scans a matrix for its last non-zero column.
ila?lr	s, d, c, z	Scans a matrix for its last non-zero row.
?gsvj0	s, d	Pre-processor for the routine ?gesvj.
?gsvj1	s, d	Pre-processor for the routine ?gesvj, applies Jacobi rotations targeting only particular pivots.
?sfrk	s, d	Performs a symmetric rank-k operation for matrix in RFP format.
?hfrk	c, z	Performs a Hermitian rank-k operation for matrix in RFP format.
?tfsm	s, d, c, z	Solves a matrix equation (one operand is a triangular matrix in RFP format).
?lansf	s, d	Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a symmetric matrix in RFP format.
?lanhf	c, z	Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a Hermitian matrix in RFP format.
?tfttp	s, d, c, z	Copies a triangular matrix from the rectangular full packed format (TF) to the standard packed format (TP).
?tfttr	s, d, c, z	Copies a triangular matrix from the rectangular full packed format (TF) to the standard full format (TR).
?tplqt2	s, d, c, z	Computes an LQ factorization of a triangular-pentagonal matrix using the compact WY representation for Q.
?tpqrt2	s, d, c, z	Computes a QR factorization of a real or complex "triangular-pentagonal" matrix, which is composed of a triangular block and a pentagonal block, using the compact WY representation for Q.
?tprfb	s, d, c, z	Applies a real or complex "triangular-pentagonal" blocked reflector to a real or complex matrix, which is composed of two blocks.
?tpttf	s, d, c, z	Copies a triangular matrix from the standard packed format (TP) to the rectangular full packed format (TF).
?tpttr	s, d, c, z	Copies a triangular matrix from the standard packed format (TP) to the standard full format (TR).
?trttf	s, d, c, z	Copies a triangular matrix from the standard full format (TR) to the rectangular full packed format (TF).
?trttp	s, d, c, z	Copies a triangular matrix from the standard full format (TR) to the standard packed format (TP).
?pstf2	s, d, c, z	Computes the Cholesky factorization with complete pivoting of a real symmetric or complex Hermitian positive semi-definite matrix.
dlat2s	d → s	Converts a double-precision triangular matrix to a single-precision triangular matrix.

Routine Name	Data Types	Description
zlat2c	z → c	Converts a double complex triangular matrix to a complex triangular matrix.
?lacp2	c, z	Copies all or part of a real two-dimensional array to a complex array.
?la_gbamv	s, d, c, z	Performs a matrix-vector operation to calculate error bounds.
?la_gbrcond	s, d	Estimates the Skeel condition number for a general banded matrix.
?la_gbrcond_c	c, z	Computes the infinity norm condition number of op(A)*inv(diag(c)) for general banded matrices.
?la_gbrcond_x	c, z	Computes the infinity norm condition number of op(A)*diag(x) for general banded matrices.
?la_gbrfsx_extended	s, d, c, z	Improves the computed solution to a system of linear equations for general banded matrices by performing extra-precise iterative refinement and provides error bounds and backward error estimates for the solution.
?la_gbrpvgrw	s, d, c, z	Computes the reciprocal pivot growth factor norm(A)/norm(U) for a general banded matrix.
?la_geamv	s, d, c, z	Computes a matrix-vector product using a general matrix to calculate error bounds.
?la_gercond	s, d	Estimates the Skeel condition number for a general matrix.
?la_gercond_c	c, z	Computes the infinity norm condition number of op(A)*inv(diag(c)) for general matrices.
?la_gercond_x	c, z	Computes the infinity norm condition number of op(A)*diag(x) for general matrices.
?la_gerfsx_extended	s, d	Improves the computed solution to a system of linear equations for general matrices by performing extra-precise iterative refinement and provides error bounds and backward error estimates for the solution.
?la_heamv	c, z	Computes a matrix-vector product using a Hermitian indefinite matrix to calculate error bounds.
?la_hercond_c	c, z	Computes the infinity norm condition number of op(A)*inv(diag(c)) for Hermitian indefinite matrices.
?la_hercond_x	c, z	Computes the infinity norm condition number of op(A)*diag(x) for Hermitian indefinite matrices.
?la_herfsx_extended	c, z	Improves the computed solution to a system of linear equations for Hermitian indefinite matrices by performing extra-precise iterative refinement and provides error bounds and backward error estimates for the solution.
?la_lin_berr	s, d, c, z	Computes a component-wise relative backward error.
?la_porcond	s, d	Estimates the Skeel condition number for a symmetric positive-definite matrix.
?la_porcond_c	c, z	Computes the infinity norm condition number of op(A)*inv(diag(c)) for Hermitian positive-definite matrices.

Routine Name	Data Types	Description
?la_porcond_x	c, z	Computes the infinity norm condition number of op(A)*diag(x) for Hermitian positive-definite matrices.
?la_porfsx_extended	s, d, c, z	Improves the computed solution to a system of linear equations for symmetric or Hermitian positive-definite matrices by performing extra-precise iterative refinement and provides error bounds and backward error estimates for the solution.
?la_porpvgrw	s, d, c, z	Computes the reciprocal pivot growth factor norm(A)/norm(U) for a symmetric or Hermitian positive-definite matrix.
?laqhe	c, z	Scales a Hermitian matrix.
?laqhp	c, z	Scales a Hermitian matrix stored in packed form.
?larcm	c, z	Copies all or part of a real two-dimensional array to a complex array.
?la_rpvgrw	c, z	Multiplies a square real matrix by a complex matrix.
?larscl2	s, d, c, z	Performs reciprocal diagonal scaling on a vector.
?lascl2	s, d, c, z	Performs diagonal scaling on a vector.
?la_syamv	s, d, c, z	Computes a matrix-vector product using a symmetric indefinite matrix to calculate error bounds.
?la_syrcond	s, d	Estimates the Skeel condition number for a symmetric indefinite matrix.
?la_syrcond_c	c, z	Computes the infinity norm condition number of op(A)*inv(diag(c)) for symmetric indefinite matrices.
?la_syrcond_x	c, z	Computes the infinity norm condition number of op(A)*diag(x) for symmetric indefinite matrices.
?la_syrfsx_extended	s, d, c, z	Improves the computed solution to a system of linear equations for symmetric indefinite matrices by performing extra-precise iterative refinement and provides error bounds and backward error estimates for the solution.
?la_syrpvgrw	s, d, c, z	Computes the reciprocal pivot growth factor norm(A)/norm(U) for a symmetric indefinite matrix.
?la_wwaddw	s, d, c, z	Adds a vector into a doubled-single vector.
?larfy	s, d, c, z	Applies an elementary reflector, or Householder matrix, H, to an *n* by *n* symmetric or Hermitian matrix C, from both the left and the right.
mkl_?tppack	s, d, c, z	Copies a triangular/symmetric matrix or submatrix from standard full format to standard packed format.
mkl_?tpunpack	s, d, c, z	Copies a triangular/symmetric matrix or submatrix from standard packed format to full format.

?lacgv

Conjugates a complex vector.

Syntax

```
call clacgv( n, x, incx )
call zlacgv( n, x, incx )
```

Include Files

- mkl.fi

Description

The routine conjugates a complex vector *x* of length *n* and increment *incx* (see "Vector Arguments in BLAS" in Appendix B).

Input Parameters

The data types are given for the Fortran interface.

n	INTEGER. The length of the vector *x* (*n*≥ 0).
x	COMPLEX for clacgv DOUBLE COMPLEX for zlacgv. Array, dimension (1+(*n*-1)* |*incx*|). Contains the vector of length *n* to be conjugated.
incx	INTEGER. The spacing between successive elements of *x*.

Output Parameters

x	On exit, overwritten with conjg(*x*).

?lacrm

Multiplies a complex matrix by a square real matrix.

Syntax

```
call clacrm( m, n, a, lda, b, ldb, c, ldc, rwork )
call zlacrm( m, n, a, lda, b, ldb, c, ldc, rwork )
```

Include Files

- mkl.fi

Description

The routine performs a simple matrix-matrix multiplication of the form

*C = A*B*,

where *A* is *m*-by-*n* and complex, *B* is *n*-by-*n* and real, *C* is *m*-by-*n* and complex.

Input Parameters

m	INTEGER. The number of rows of the matrix *A* and of the matrix *C* (*m*≥ 0).

n	INTEGER. The number of columns and rows of the matrix *B* and the number of columns of the matrix *C* (*n*≥ 0).
a	COMPLEX for clacrm DOUBLE COMPLEX for zlacrm Array, DIMENSION(*lda*, *n*). Contains the *m*-by-*n* matrix *A*.
lda	INTEGER. The leading dimension of the array *a*, *lda*≥max(1, *m*).
b	REAL for clacrm DOUBLE PRECISION for zlacrm Array, DIMENSION(*ldb*, *n*). Contains the *n*-by-*n* matrix *B*.
ldb	INTEGER. The leading dimension of the array *b*, *ldb*≥max(1, *n*).
ldc	INTEGER. The leading dimension of the output array *c*, *ldc*≥max(1, *n*).
rwork	REAL for clacrm DOUBLE PRECISION for zlacrm Workspace array, DIMENSION(2*m*n).

Output Parameters

c	COMPLEX for clacrm DOUBLE COMPLEX for zlacrm Array, DIMENSION (*ldc*, *n*). Contains the *m*-by-*n* matrix *C*.

?lacrt

Performs a linear transformation of a pair of complex vectors.

Syntax

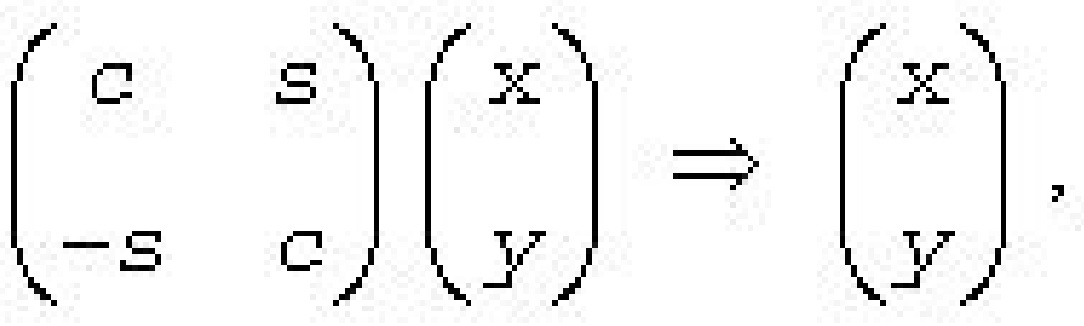
```
call clacrt( n, cx, incx, cy, incy, c, s )
call zlacrt( n, cx, incx, cy, incy, c, s )
```

Include Files

- mkl.fi

Description

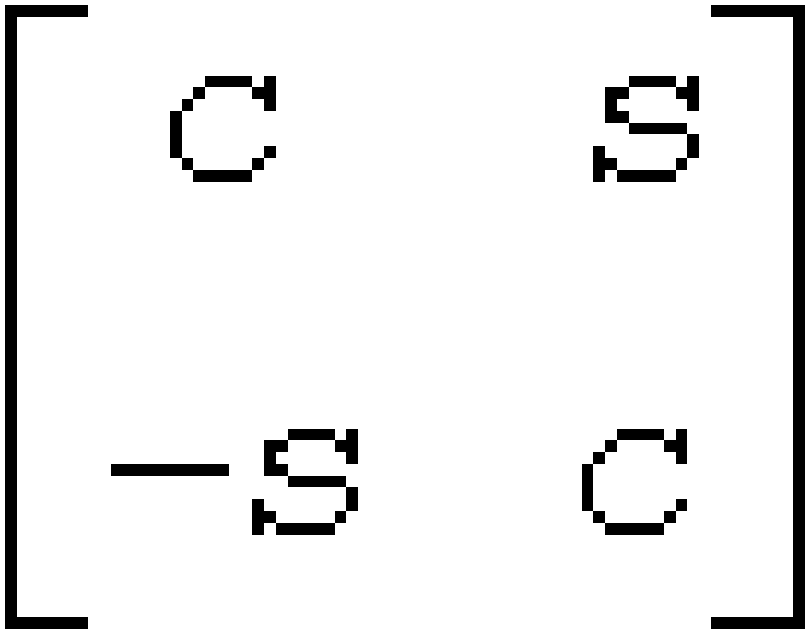
The routine performs the following transformation



where *c*, *s* are complex scalars and *x*, *y* are complex vectors.

Input Parameters

n	INTEGER. The number of elements in the vectors *cx* and *cy* (*n*≥ 0).
cx, *cy*	COMPLEX for clacrt DOUBLE COMPLEX for zlacrt Arrays, dimension (*n*). Contain input vectors *x* and *y*, respectively.
incx	INTEGER. The increment between successive elements of *cx*.
incy	INTEGER. The increment between successive elements of *cy*.
c, *s*	COMPLEX for clacrt DOUBLE COMPLEX for zlacrt Complex scalars that define the transform matrix



Output Parameters

cx	On exit, overwritten with *c*x + s*y*.
cy	On exit, overwritten with *-s*x + c*y*.

?laesy

Computes the eigenvalues and eigenvectors of a 2-by-2 complex symmetric matrix, and checks that the norm of the matrix of eigenvectors is larger than a threshold value.

Syntax

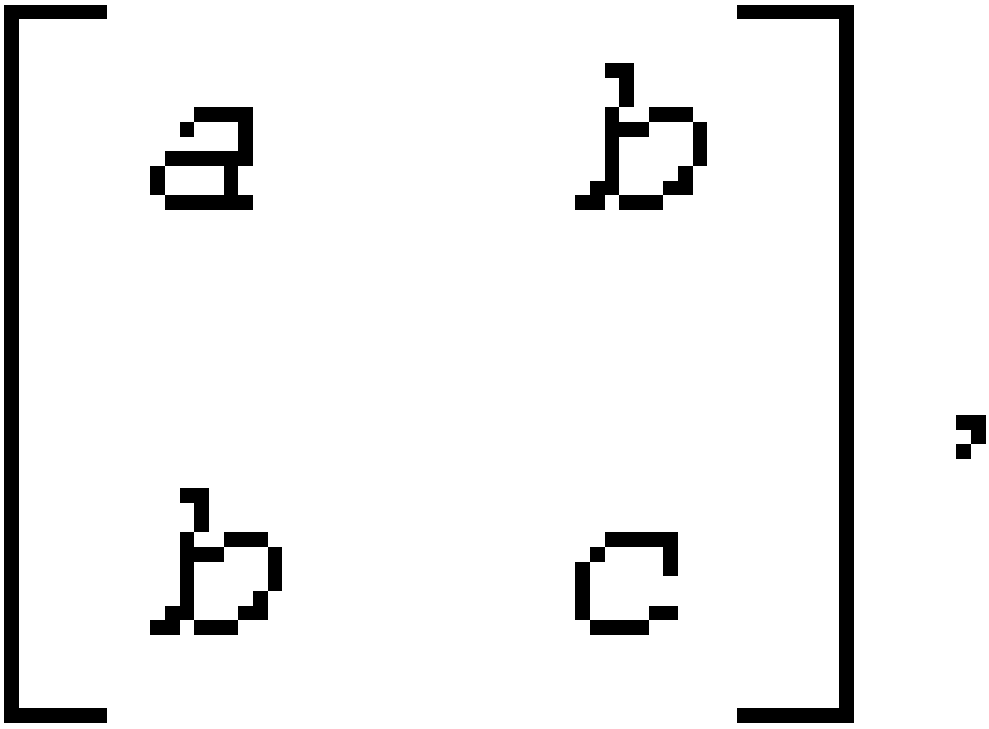
```
call claesy( a, b, c, rt1, rt2, evscal, cs1, sn1 )
call zlaesy( a, b, c, rt1, rt2, evscal, cs1, sn1 )
```

Include Files

- mkl.fi

Description

The routine performs the eigendecomposition of a 2-by-2 symmetric matrix



provided the norm of the matrix of eigenvectors is larger than some threshold value.

rt1 is the eigenvalue of larger absolute value, and *rt2* of smaller absolute value. If the eigenvectors are computed, then on return (*cs1*, *sn1*) is the unit eigenvector for *rt1*, hence

$$\begin{bmatrix} cs1 & sn1 \\ -sn1 & cs1 \end{bmatrix} \cdot \begin{bmatrix} a & b \\ b & c \end{bmatrix} \cdot \begin{bmatrix} cs1 & -sn1 \\ sn1 & cs1 \end{bmatrix} = \begin{bmatrix} rt1 & 0 \\ 0 & rt2 \end{bmatrix}$$

Input Parameters

a, *b*, *c*

`COMPLEX` for `claesy`

`DOUBLE COMPLEX` for `zlaesy`

Elements of the input matrix.

Output Parameters

rt1, *rt2*

`COMPLEX` for `claesy`

`DOUBLE COMPLEX` for `zlaesy`

Eigenvalues of larger and smaller modulus, respectively.

evscal

`COMPLEX` for `claesy`

`DOUBLE COMPLEX` for `zlaesy`

The complex value by which the eigenvector matrix was scaled to make it orthonormal. If *evscal* is zero, the eigenvectors were not computed. This means one of two things: the 2-by-2 matrix could not be diagonalized, or the norm of the matrix of eigenvectors before scaling was larger than the threshold value `thresh` (set to 0.1E0).

cs1, *sn1*

`COMPLEX` for `claesy`

`DOUBLE COMPLEX` for `zlaesy`

If *evscal* is not zero, then (*cs1*, *sn1*) is the unit right eigenvector for *rt1*.

?rot

Applies a plane rotation with real cosine and complex sine to a pair of complex vectors.

Syntax

```
call crot( n, cx, incx, cy, incy, c, s )
call zrot( n, cx, incx, cy, incy, c, s )
```

Include Files

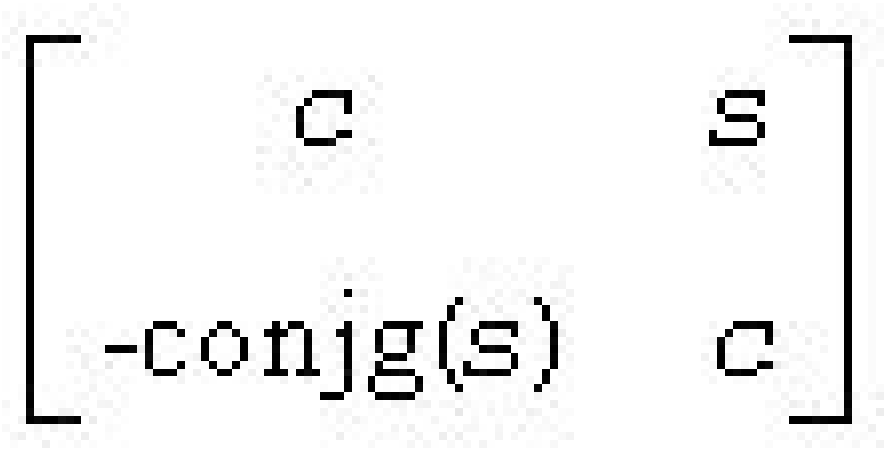
- `mkl.fi`

Description

The routine applies a plane rotation, where the cosine (*c*) is real and the sine (*s*) is complex, and the vectors *cx* and *cy* are complex. This routine has its real equivalents in BLAS (see `?rot` in Chapter "BLAS and Sparse BLAS Routines").

Input Parameters

n	INTEGER. The number of elements in the vectors *cx* and *cy*.
cx, *cy*	REAL for srot DOUBLE PRECISION for drot COMPLEX for crot DOUBLE COMPLEX for zrot Arrays of dimension (*n*), contain input vectors *x* and *y*, respectively.
incx	INTEGER. The increment between successive elements of *cx*.
incy	INTEGER. The increment between successive elements of *cy*.
c	REAL for crot DOUBLE PRECISION for zrot
s	REAL for srot DOUBLE PRECISION for drot COMPLEX for crot DOUBLE COMPLEX for zrot Values that define a rotation



where *c*c + s*conjg(s) = 1.0*.

Output Parameters

cx	On exit, overwritten with *c*x + s*y*.
cy	On exit, overwritten with -conjg(*s*)*x + *c*y*.

?spmv

Computes a matrix-vector product for complex vectors using a complex symmetric packed matrix.

Syntax

call cspmv(*uplo*, *n*, *alpha*, *ap*, *x*, *incx*, *beta*, *y*, *incy*)

```
call zspmv( uplo, n, alpha, ap, x, incx, beta, y, incy )
```

Include Files

- mkl.fi

Description

The ?spmv routines perform a matrix-vector operation defined as

y := *alpha***a***x* + *beta***y*,

where:

alpha and *beta* are complex scalars,

x and *y* are *n*-element complex vectors

a is an *n*-by-*n* complex symmetric matrix, supplied in packed form.

These routines have their real equivalents in BLAS (see ?spmv in Chapter "BLAS and Sparse BLAS Routines").

Input Parameters

uplo

CHARACTER*1. Specifies whether the upper or lower triangular part of the matrix *a* is supplied in the packed array *ap*.

If *uplo* = 'U' or 'u', the upper triangular part of the matrix *a* is supplied in the array *ap*.

If *uplo* = 'L' or 'l', the lower triangular part of the matrix *a* is supplied in the array *ap* .

n

INTEGER.

Specifies the order of the matrix *a*.

The value of *n* must be at least zero.

alpha, *beta*

COMPLEX for cspmv

DOUBLE COMPLEX for zspmv

Specify complex scalars *alpha* and *beta*. When *beta* is supplied as zero, then *y* need not be set on input.

ap

COMPLEX for cspmv

DOUBLE COMPLEX for zspmv

Array, DIMENSION at least ((*n**(*n* + 1))/2). Before entry, with *uplo* = 'U' or 'u', the array *ap* must contain the upper triangular part of the symmetric matrix packed sequentially, column-by-column, so that *ap*(1) contains *A*(1, 1), *ap*(2) and *ap*(3) contain *A*(1, 2) and *A*(2, 2) respectively, and so on. Before entry, with *uplo* = 'L' or 'l', the array *ap* must contain the lower triangular part of the symmetric matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1, 1), *ap*(2) and *ap*(3) contain *a*(2, 1) and *a*(3, 1) respectively, and so on.

x

COMPLEX for cspmv

DOUBLE COMPLEX for zspmv

	Array, DIMENSION at least (1 + (*n* - 1)*abs(*incx*)). Before entry, the incremented array x must contain the *n*-element vector *x*.
incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.
y	COMPLEX for cspmv DOUBLE COMPLEX for zspmv Array, DIMENSION at least (1 + (*n* - 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the *n*-element vector *y*.
incy	INTEGER. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.

Output Parameters

y	Overwritten by the updated vector *y*.

?spr

Performs the symmetrical rank-1 update of a complex symmetric packed matrix.

Syntax

```
call cspr( uplo, n, alpha, x, incx, ap )
call zspr( uplo, n, alpha, x, incx, ap )
```

Include Files

- mkl.fi

Description

The ?spr routines perform a matrix-vector operation defined as

$a := alpha*x*x^H + a$,

where:

alpha is a complex scalar

x is an *n*-element complex vector

a is an *n*-by-*n* complex symmetric matrix, supplied in packed form.

These routines have their real equivalents in BLAS (see ?spr in Chapter "BLAS and Sparse BLAS Routines").

Input Parameters

uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the matrix *a* is supplied in the packed array *ap*, as follows: If *uplo* = 'U' or 'u', the upper triangular part of the matrix *a* is supplied in the array *ap*. If *uplo* = 'L' or 'l', the lower triangular part of the matrix *a* is supplied in the array *ap* .

n INTEGER.

Specifies the order of the matrix *a*.

The value of *n* must be at least zero.

alpha COMPLEX for cspr

DOUBLE COMPLEX for zspr

Specifies the scalar *alpha*.

x COMPLEX for cspr

DOUBLE COMPLEX for zspr

Array, DIMENSION at least (1 + (*n* - 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.

incx INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.

ap COMPLEX for cspr

DOUBLE COMPLEX for zspr

Array, DIMENSION at least ((*n**(*n* + 1))/2). Before entry, with *uplo* = 'U' or 'u', the array *ap* must contain the upper triangular part of the symmetric matrix packed sequentially, column-by-column, so that *ap*(1) contains *A*(1,1), *ap*(2) and *ap*(3) contain *A*(1,2) and *A*(2,2) respectively, and so on.

Before entry, with *uplo* = 'L' or 'l', the array *ap* must contain the lower triangular part of the symmetric matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1,1), *ap*(2) and *ap*(3) contain *a*(2,1) and *a*(3,1) respectively, and so on.

Note that the imaginary parts of the diagonal elements need not be set, they are assumed to be zero, and on exit they are set to zero.

Output Parameters

ap With *uplo* = 'U' or 'u', overwritten by the upper triangular part of the updated matrix.

With *uplo* = 'L' or 'l', overwritten by the lower triangular part of the updated matrix.

?syconv

Converts a symmetric matrix given by a triangular matrix factorization into two matrices and vice versa.

Syntax

```
call ssyconv( uplo, way, n, a, lda, ipiv, e, info )
call dsyconv( uplo, way, n, a, lda, ipiv, e, info )
call csyconv( uplo, way, n, a, lda, ipiv, e, info )
call zsyconv( uplo, way, n, a, lda, ipiv, e, info )
call syconv( a[,uplo][,way][,ipiv][,info][,e] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine converts matrix *A*, which results from a triangular matrix factorization, into matrices *L* and *D* and vice versa. The routine returns non-diagonalized elements of *D* and applies or reverses permutation done with the triangular matrix factorization.

Input Parameters

uplo

CHARACTER*1. Must be 'U' or 'L'.

Indicates whether the details of the factorization are stored as an upper or lower triangular matrix:

If *uplo* = 'U': the upper triangular, $A = U*D*U^T$.

If *uplo* = 'L': the lower triangular, $A = L*D*L^T$.

way

CHARACTER*1. Must be 'C' or 'R'.

n

INTEGER. The order of matrix *A*; $n \geq 0$.

a

REAL for ssyconv

DOUBLE PRECISION for dsyconv

COMPLEX for csyconv

DOUBLE COMPLEX for zsyconv

Array of size *lda* by *n*.

The block diagonal matrix *D* and the multipliers used to obtain the factor U or L as computed by ?sytrf.

lda

INTEGER. The leading dimension of *a*; $lda \geq \max(1, n)$.

ipiv

INTEGER. Array, size at least max(1, *n*).

Details of the interchanges and the block structure of *D*, as returned by ?sytrf.

Output Parameters

e

REAL for ssyconv

DOUBLE PRECISION for dsyconv

COMPLEX for csyconv

DOUBLE COMPLEX for zsyconv

Array of size max(1, *n*) containing the superdiagonal/subdiagonal of the symmetric 1-by-1 or 2-by-2 block diagonal matrix *D* in $L*D*L^T$.

info

INTEGER. If *info* = 0, the execution is successful.

If *info* < 0, the *i*-th parameter had an illegal value.

If *info* = –1011, memory allocation error occurred.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `syconv` interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
uplo	Must be `'U'` or `'L'`.
way	Must be `'C'` or `'R'`.
ipiv	Holds the vector of length *n*.
e	Holds the vector of length *n*.

See Also

?sytrf

?symv

Computes a matrix-vector product for a complex symmetric matrix.

Syntax

```
call csymv( uplo, n, alpha, a, lda, x, incx, beta, y, incy )
call zsymv( uplo, n, alpha, a, lda, x, incx, beta, y, incy )
```

Include Files

- mkl.fi

Description

The routine performs the matrix-vector operation defined as

y := *alpha***a***x* + *beta***y*,

where:

alpha and *beta* are complex scalars

x and *y* are *n*-element complex vectors

a is an *n*-by-*n* symmetric complex matrix.

These routines have their real equivalents in BLAS (see ?symv in Chapter "BLAS and Sparse BLAS Routines").

Input Parameters

uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the array *a* is used: If *uplo* = `'U'` or `'u'`, then the upper triangular part of the array *a* is used. If *uplo* = `'L'` or `'l'`, then the lower triangular part of the array *a* is used.
n	INTEGER. Specifies the order of the matrix *a*. The value of *n* must be at least zero.

alpha, *beta*	COMPLEX for csymv DOUBLE COMPLEX for zsymv Specify the scalars *alpha* and *beta*. When *beta* is supplied as zero, then *y* need not be set on input.
a	COMPLEX for csymv DOUBLE COMPLEX for zsymv Array, DIMENSION (*lda*, *n*). Before entry with *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of *a* is not referenced. Before entry with *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of *a* is not referenced.
lda	INTEGER. Specifies the leading dimension of *A* as declared in the calling (sub)program. The value of *lda* must be at least max(1,*n*).
x	COMPLEX for csymv DOUBLE COMPLEX for zsymv Array, DIMENSION at least (1 + (*n* – 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.
incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.
y	COMPLEX for csymv DOUBLE COMPLEX for zsymv Array, DIMENSION at least (1 + (*n* – 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the *n*-element vector *y*.
incy	INTEGER. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.

Output Parameters

y	Overwritten by the updated vector *y*.

?syr

Performs the symmetric rank-1 update of a complex symmetric matrix.

Syntax

```
call csyr( uplo, n, alpha, x, incx, a, lda )
call zsyr( uplo, n, alpha, x, incx, a, lda )
```

Include Files

- mkl.fi

Description

The routine performs the symmetric rank 1 operation defined as

$a := alpha*x*x^H + a$,

where:

- *alpha* is a complex scalar.
- *x* is an *n*-element complex vector.
- *a* is an *n*-by-*n* complex symmetric matrix.

These routines have their real equivalents in BLAS (see `?syr` in Chapter "BLAS and Sparse BLAS Routines").

Input Parameters

uplo

`CHARACTER*1`. Specifies whether the upper or lower triangular part of the array *a* is used:

If *uplo* = `'U'` or `'u'`, then the upper triangular part of the array *a* is used.

If *uplo* = `'L'` or `'l'`, then the lower triangular part of the array *a* is used.

n

`INTEGER`. Specifies the order of the matrix *a*. The value of *n* must be at least zero.

alpha

`COMPLEX` for `csyr`

`DOUBLE COMPLEX` for `zsyr`

Specifies the scalar *alpha*.

x

`COMPLEX` for `csyr`

`DOUBLE COMPLEX` for `zsyr`

Array, size at least `(1 + (n - 1)*abs(incx))`. Before entry, the incremented array *x* must contain the *n*-element vector `x`.

incx

`INTEGER`. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.

a

`COMPLEX` for `csyr`

`DOUBLE COMPLEX` for `zsyr`

Array, size `(lda, n)`. Before entry with *uplo* = `'U'` or `'u'`, the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of *a* is not referenced.

Before entry with *uplo* = `'L'` or `'l'`, the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of *a* is not referenced.

lda

`INTEGER`. Specifies the leading dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least `max(1,n)`.

Output Parameters

a

With *uplo* = `'U'` or `'u'`, the upper triangular part of the array *a* is overwritten by the upper triangular part of the updated matrix.

With *uplo* = 'L' or 'l', the lower triangular part of the array *a* is overwritten by the lower triangular part of the updated matrix.

info — INTEGER. If *info* = 0, the execution is successful.

If *info* < 0, the *i*-th parameter had an illegal value.

If *info* = -1011, memory allocation error occurred.

i?max1

Finds the index of the vector element whose real part has maximum absolute value.

Syntax

index = icmax1(*n*, *cx*, *incx*)

index = izmax1(*n*, *cx*, *incx*)

Include Files

- mkl.fi

Description

Given a complex vector *cx*, the i?max1 functions return the index of the first vector element of maximum absolute value. These functions are based on the BLAS functions icamax/izamax, but using the absolute value of components. They are designed for use with clacon/zlacon.

Input Parameters

n — INTEGER. Specifies the number of elements in the vector *cx*.

cx — COMPLEX for icmax1

DOUBLE COMPLEX for izmax1

Array, size at least (1+(*n*-1)*abs(*incx*)).

Contains the input vector.

incx — INTEGER. Specifies the spacing between successive elements of *cx*.

Output Parameters

index — INTEGER. Index of the vector element of maximum absolute value.

?sum1

Forms the 1-norm of the complex vector using the true absolute value.

Syntax

res = scsum1(*n*, *cx*, *incx*)

res = dzsum1(*n*, *cx*, *incx*)

Include Files

- mkl.fi

Description

Given a complex vector *cx*, scsum1/dzsum1 functions take the sum of the absolute values of vector elements and return a single/double precision result, respectively. These functions are based on scasum/dzasum from Level 1 BLAS, but use the true absolute value and were designed for use with clacon/zlacon.

Input Parameters

n	INTEGER. Specifies the number of elements in the vector *cx*.
cx	COMPLEX for scsum1 DOUBLE COMPLEX for dzsum1 Array, size at least (1+(*n*-1)*abs(*incx*)). Contains the input vector whose elements will be summed.
incx	INTEGER. Specifies the spacing between successive elements of *cx* (*incx* > 0).

Output Parameters

res	REAL for scsum1 DOUBLE PRECISION for dzsum1 Sum of absolute values.

?gbtf2

Computes the LU factorization of a general band matrix using the unblocked version of the algorithm.

Syntax

```
call sgbtf2( m, n, kl, ku, ab, ldab, ipiv, info )
call dgbtf2( m, n, kl, ku, ab, ldab, ipiv, info )
call cgbtf2( m, n, kl, ku, ab, ldab, ipiv, info )
call zgbtf2( m, n, kl, ku, ab, ldab, ipiv, info )
```

Include Files

- mkl.fi

Description

The routine forms the *LU* factorization of a general real/complex *m*-by-*n* band matrix *A* with *kl* sub-diagonals and *ku* super-diagonals. The routine uses partial pivoting with row interchanges and implements the unblocked version of the algorithm, calling Level 2 BLAS. See also ?gbtrf.

Input Parameters

m	INTEGER. The number of rows of the matrix *A* (*m*≥ 0).
n	INTEGER. The number of columns in *A* (*n*≥ 0).
kl	INTEGER. The number of sub-diagonals within the band of *A* (*kl*≥ 0).
ku	INTEGER. The number of super-diagonals within the band of *A* (*ku*≥ 0).
ab	REAL for sgbtf2 DOUBLE PRECISION for dgbtf2 COMPLEX for cgbtf2 DOUBLE COMPLEX for zgbtf2. Array, DIMENSION (*ldab*,*). The array *ab* contains the matrix *A* in band storage (see Matrix Arguments). The second dimension of *ab* must be at least max(1, *n*).
ldab	INTEGER. The leading dimension of the array *ab*. (*ldab*≥ 2*kl* + *ku* +1)

Output Parameters

ab	Overwritten by details of the factorization. The diagonal and *kl* + *ku* super-diagonals of *U* are stored in the first 1 + *kl* + *ku* rows of *ab*. The multipliers used during the factorization are stored in the next *kl* rows.
ipiv	INTEGER. Array, DIMENSION at least max(1,min(*m*,*n*)). The pivot indices: row *i* was interchanged with row *ipiv*(*i*).
info	INTEGER. If *info* =0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, u_{ii} is 0. The factorization has been completed, but *U* is exactly singular. Division by 0 will occur if you use the factor *U* for solving a system of linear equations.

?gebd2

Reduces a general matrix to bidiagonal form using an unblocked algorithm.

Syntax

```
call sgebd2( m, n, a, lda, d, e, tauq, taup, work, info )
call dgebd2( m, n, a, lda, d, e, tauq, taup, work, info )
call cgebd2( m, n, a, lda, d, e, tauq, taup, work, info )
call zgebd2( m, n, a, lda, d, e, tauq, taup, work, info )
```

Include Files

- mkl.fi

Description

The routine reduces a general *m*-by-*n* matrix *A* to upper or lower bidiagonal form *B* by an orthogonal (unitary) transformation: $Q^T*A*P = B$ (for real flavors) or $Q^H*A*P = B$ (for complex flavors).

If $m \geq n$, *B* is upper bidiagonal; if $m < n$, *B* is lower bidiagonal.

The routine does not form the matrices *Q* and *P* explicitly, but represents them as products of elementary reflectors. if $m \geq n$,

$Q = H(1)*H(2)*...*H(n)$, and $P = G(1)*G(2)*...*G(n-1)$

if $m < n$,

$Q = H(1)*H(2)*...*H(m-1)$, and $P = G(1)*G(2)*...*G(m)$

Each $H(i)$ and $G(i)$ has the form

$H(i) = I - tauq*v*v^T$ and $G(i) = I - taup*u*u^T$ for real flavors, or

$H(i) = I - tauq*v*v^H$ and $G(i) = I - taup*u*u^H$ for complex flavors

where *tauq* and *taup* are scalars (real for sgebd2/dgebd2, complex for cgebd2/zgebd2), and *v* and *u* are vectors (real for sgebd2/dgebd2, complex for cgebd2/zgebd2).

Input Parameters

m	INTEGER. The number of rows in the matrix *A* ($m \geq 0$).
n	INTEGER. The number of columns in *A* ($n \geq 0$).
a, *work*	REAL for sgebd2 DOUBLE PRECISION for dgebd2 COMPLEX for cgebd2 DOUBLE COMPLEX for zgebd2. Arrays: *a*(*lda*,*) contains the *m*-by-*n* general matrix *A* to be reduced. The second dimension of *a* must be at least max(1, *n*). *work*(*) is a workspace array, the dimension of *work* must be at least max(1, *m*, *n*).
lda	INTEGER. The leading dimension of *a*; at least max(1, *m*).

Output Parameters

a	if $m \geq n$, the diagonal and first super-diagonal of *a* are overwritten with the upper bidiagonal matrix *B*. Elements below the diagonal, with the array *tauq*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors, and elements above the first superdiagonal, with the array *taup*, represent the orthogonal/unitary matrix *p* as a product of elementary reflectors.

if *m* < *n*, the diagonal and first sub-diagonal of *a* are overwritten by the lower bidiagonal matrix *B*. Elements below the first subdiagonal, with the array *tauq*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors, and elements above the diagonal, with the array *taup*, represent the orthogonal/unitary matrix *p* as a product of elementary reflectors.

d

REAL for single-precision flavors

DOUBLE PRECISION for double-precision flavors.

Array, DIMENSION at least max(1, min(*m*, *n*)).

Contains the diagonal elements of the bidiagonal matrix *B*: *d*(i) = *a*(i, i).

e

REAL for single-precision flavors

DOUBLE PRECISION for double-precision flavors. Array, DIMENSION at least max(1, min(*m*, *n*) - 1).

Contains the off-diagonal elements of the bidiagonal matrix *B*:

if *m*≥*n*, *e*(i) = *a*(i, i+1) for i = 1,2,..., *n*-1;

if *m* < *n*, *e*(i) = *a*(i+1, i) for i = 1,2,..., *m*-1.

tauq, *taup*

REAL for sgebd2

DOUBLE PRECISION for dgebd2

COMPLEX for cgebd2

DOUBLE COMPLEX for zgebd2.

Arrays, DIMENSION at least max (1, min(*m*, *n*)).

Contain scalar factors of the elementary reflectors which represent orthogonal/unitary matrices *Q* and *p*, respectively.

info

INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*th parameter had an illegal value.

?gehd2

Reduces a general square matrix to upper Hessenberg form using an unblocked algorithm.

Syntax

```
call sgehd2( n, ilo, ihi, a, lda, tau, work, info )
call dgehd2( n, ilo, ihi, a, lda, tau, work, info )
call cgehd2( n, ilo, ihi, a, lda, tau, work, info )
call zgehd2( n, ilo, ihi, a, lda, tau, work, info )
```

Include Files

- mkl.fi

Description

The routine reduces a real/complex general matrix *A* to upper Hessenberg form *H* by an orthogonal or unitary similarity transformation $Q^T*A*Q = H$ (for real flavors) or $Q^H*A*Q = H$ (for complex flavors).

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of *elementary reflectors*.

Input Parameters

n	INTEGER The order of the matrix *A* ($n \geq 0$).
ilo, *ihi*	INTEGER. It is assumed that *A* is already upper triangular in rows and columns 1:*ilo* −1 and *ihi*+1:*n*. If *A* has been output by ?gebal, then *ilo* and *ihi* must contain the values returned by that routine. Otherwise they should be set to $ilo = 1$ and $ihi = n$. Constraint: $1 \leq ilo \leq ihi \leq \max(1, n)$.
a, *work*	REAL for sgehd2 DOUBLE PRECISION for dgehd2 COMPLEX for cgehd2 DOUBLE COMPLEX for zgehd2. Arrays: *a* (*lda*,*) contains the *n*-by-*n* matrix *A* to be reduced. The second dimension of *a* must be at least max(1, *n*). *work* (*n*) is a workspace array.
lda	INTEGER. The leading dimension of *a*; at least max(1, *n*).

Output Parameters

a	On exit, the upper triangle and the first subdiagonal of *A* are overwritten with the upper Hessenberg matrix *H* and the elements below the first subdiagonal, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors. See *Application Notes* below.
tau	REAL for sgehd2 DOUBLE PRECISION for dgehd2 COMPLEX for cgehd2 DOUBLE COMPLEX for zgehd2. Array, DIMENSION at least max (1, *n*−1). Contains the scalar factors of elementary reflectors. See *Application Notes* below.
info	INTEGER. If $info = 0$, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

Application Notes

The matrix *Q* is represented as a product of (*ihi* - *ilo*) elementary reflectors

`Q = H(ilo)*H(ilo +1)*...*H(ihi -1)`

Each *H*(i) has the form

$H(i) = I - tau*v*v^T$ for real flavors, or

$H(i) = I - tau*v*v^H$ for complex flavors

where *tau* is a real/complex scalar, and *v* is a real/complex vector with `v(1:i) = 0`, `v(i+1) = 1` and `v(ihi +1:n) = 0`.

On exit, `v(i+2:ihi)` is stored in `a(i+2:ihi, i)` and *tau* in `tau(i)`.

The contents of *a* are illustrated by the following example, with `n = 7`, `ilo = 2` and `ihi = 6`:

on entry

$$\begin{bmatrix} a & a & a & a & a & a & a \\ & a & a & a & a & a & a \\ & a & a & a & a & a & a \\ & a & a & a & a & a & a \\ & a & a & a & a & a & a \\ & a & a & a & a & a & a \\ & & & & & & a \end{bmatrix}$$

on exit

$$\begin{bmatrix} a & a & h & h & h & h & a \\ & a & h & h & h & h & a \\ & h & h & h & h & h & h \\ & v_2 & h & h & h & h & h \\ & v_2 & v_3 & h & h & h & h \\ & v_2 & v_3 & v_4 & h & h & h \\ & & & & & & a \end{bmatrix}$$

where *a* denotes an element of the original matrix *A*, *h* denotes a modified element of the upper Hessenberg matrix *H*, and v_i denotes an element of the vector defining *H*(i).

?gelq2

Computes the LQ factorization of a general rectangular matrix using an unblocked algorithm.

Syntax

```
call sgelq2( m, n, a, lda, tau, work, info )
call dgelq2( m, n, a, lda, tau, work, info )
call cgelq2( m, n, a, lda, tau, work, info )
call zgelq2( m, n, a, lda, tau, work, info )
```

Include Files

- `mkl.fi`

Description

The routine computes an *LQ* factorization of a real/complex *m*-by-*n* matrix *A* as $A = L*Q$.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of min(*m*, *n*) *elementary reflectors* :

$Q = H(k) \ldots H(2) H(1)$ (or $Q = H(k)^H \ldots H(2)^H H(1)^H$ for complex flavors), where $k = \min(m, n)$

Each *H*(i) has the form

$H(i) = I - tau*v*v^T$ for real flavors, or

$H(i) = I - tau*v*v^H$ for complex flavors,

where *tau* is a real/complex scalar stored in *tau*(i), and *v* is a real/complex vector with $v_{1:i-1} = 0$ and $v_i = 1$.

On exit, $v_{i+1:n}$ (for real functions) and $\mathrm{conjg}(v_{i+1:n})$ (for complex functions) are stored in $a(i, i+1:n)$.

Input Parameters

The data types are given for the Fortran interface.

m
: INTEGER. The number of rows in the matrix *A* ($m \geq 0$).

n
: INTEGER. The number of columns in *A* ($n \geq 0$).

a, *work*
: REAL for sgelq2

  DOUBLE PRECISION for dgelq2

  COMPLEX for cgelq2

  DOUBLE COMPLEX for zgelq2.

  Arrays: *a*(*lda*,*) contains the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least $\max(1, n)$.

  work(*m*) is a workspace array.

lda
: INTEGER. The leading dimension of *a*; at least max(1, *m*) .

Output Parameters

a
: Overwritten by the factorization data as follows:

  on exit, the elements on and below the diagonal of the array *a* contain the *m*-by-min(*n*,*m*) lower trapezoidal matrix *L* (*L* is lower triangular if $n \geq m$); the elements above the diagonal, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of min(*n*,*m*) elementary reflectors.

tau
: REAL for sgelq2

  DOUBLE PRECISION for dgelq2

  COMPLEX for cgelq2

  DOUBLE COMPLEX for zgelq2.

  Array, size at least $\max(1, \min(m, n))$.

  Contains scalar factors of the elementary reflectors.

info
: INTEGER.

  If $info = 0$, the execution is successful.

  If $info = -i$, the *i*-th parameter had an illegal value.

If *info* = -1011, memory allocation error occurred.

?gelqt3

?gelqt3 *recursively computes a LQ factorization of a general real or complex M-by-N matrix A, using the compact WY representation of Q.*

```
call sgelqt3(m, n, a, lda, t, ldt, info)
call dgelqt3(m, n, a, lda, t, ldt, info)
call cgelqt3(m, n, a, lda, t, ldt, info)
call zgelqt3(m, n, a, lda, t, ldt, info)
```

Description

?gelqt3 recursively computes a LQ factorization of a real or complex *m*-by-*n* matrix *A*, using the compact WY representation of *Q*. Based on the algorithm of Elmroth and Gustavson [ELMROTH00].

The matrix *V* stores the elementary reflectors *H*(*i*) in the *i*-th row above the diagonal. For example, if *m*=5 and *n*=3, the matrix *V* is

$$V = \begin{pmatrix} 1 & v_1 & v_1 & v_1 & v_1 \\ & 1 & v_2 & v_2 & v_2 \\ & & 1 & v_3 & v_3 \end{pmatrix}$$

where the v_is represent the vectors which define *H*(*i*), which are returned in the array *a*. The 1 elements along the diagonal of *V* are not stored in *a*. The block reflector *H* is then given by

$H = I - V * T * V^T$ for real matrices, or

$H = I - V * T * V^H$ for complex matrices.

Input Parameters

m	INTEGER. The number of rows of the matrix *A*. $m \le n$.
n	INTEGER. The number of columns of the matrix *A*. $n \ge 0$.
a	REAL for sgelqt3 DOUBLE PRECISION for dgelqt3 COMPLEX for cgelqt3 COMPLEX*16 for zgelqt3 Array of size (*lda*,*n*). On entry, the real or complex *m*-by-*n* matrix *A*.
lda	INTEGER. The leading dimension of the array *a*. $lda \ge \max(1,m)$.
ldt	INTEGER. The leading dimension of the array *t*. $ldt \ge \max(1,n)$.

Output Parameters

a	On exit, the elements on and below the diagonal contain the *n*-by-*n* lower triangular matrix *L*; the elements above the diagonal are the rows of *V*. See Description for further details.
t	REAL for sgelqt3

DOUBLE PRECISION for dgelqt3

COMPLEX for cgelqt3

COMPLEX*16 for zgelqt3

Array of size (*ldt*,*n*). The *n*-by-*n* upper triangular factor of the block reflector. The elements on and above the diagonal contain the block reflector *T*; the elements below the diagonal are not used. See Description for further details.

info — INTEGER.

info = 0: successful exit.

info < 0: if *info* = -*i*, the *i*-th argument had an illegal value.

?geql2

Computes the QL factorization of a general rectangular matrix using an unblocked algorithm.

Syntax

```
call sgeql2( m, n, a, lda, tau, work, info )
call dgeql2( m, n, a, lda, tau, work, info )
call cgeql2( m, n, a, lda, tau, work, info )
call zgeql2( m, n, a, lda, tau, work, info )
```

Include Files

- mkl.fi

Description

The routine computes a *QL* factorization of a real/complex *m*-by-*n* matrix *A* as A = Q*L.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of min(*m*, *n*) *elementary reflectors* :

Q = H(k)* ... *H(2)*H(1), where k = min(m, n).

Each *H*(i) has the form

H(i) = I - tau*v*v^T for real flavors, or

H(i) = I - tau*v*v^H for complex flavors

where *tau* is a real/complex scalar stored in *tau*(i), and *v* is a real/complex vector with v(m-k+i+1:m) = 0 and v(m-k+i) = 1.

On exit, v(1:m-k+i-1) is stored in a(1:m-k+i-1, n-k+i).

Input Parameters

m — INTEGER. The number of rows in the matrix *A* (m≥ 0).

n — INTEGER. The number of columns in *A* (n≥ 0).

a, *work* — REAL for sgeql2

DOUBLE PRECISION for dgeql2

COMPLEX for cgeql2

DOUBLE COMPLEX for zgeql2.

Arrays:

a(*lda*,*) contains the *m*-by-*n* matrix *A*.

The second dimension of *a* must be at least max(1, *n*).

work(*m*) is a workspace array.

lda INTEGER. The leading dimension of *a*; at least max(1, *m*).

Output Parameters

a Overwritten by the factorization data as follows:

on exit, if $m \geq n$, the lower triangle of the subarray *a*(*m*-*n*+1:*m*, 1:*n*) contains the *n*-by-*n* lower triangular matrix *L*; if $m < n$, the elements on and below the (*n*-*m*)th superdiagonal contain the *m*-by-*n* lower trapezoidal matrix *L*; the remaining elements, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors.

tau REAL for sgeql2

DOUBLE PRECISION for dgeql2

COMPLEX for cgeql2

DOUBLE COMPLEX for zgeql2.

Array, DIMENSION at least max(1, min(*m*, *n*)).

Contains scalar factors of the elementary reflectors.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

?geqr2

Computes the QR factorization of a general rectangular matrix using an unblocked algorithm.

Syntax

```
call sgeqr2( m, n, a, lda, tau, work, info )
call dgeqr2( m, n, a, lda, tau, work, info )
call cgeqr2( m, n, a, lda, tau, work, info )
call zgeqr2( m, n, a, lda, tau, work, info )
```

Include Files

- mkl.fi

Description

The routine computes a *QR* factorization of a real/complex *m*-by-*n* matrix *A* as $A = Q*R$.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of min(*m*, *n*) *elementary reflectors* :

$Q = H(1)*H(2)* \ldots *H(k)$, where $k = \min(m, n)$

Each *H*(i) has the form

$H(i) = I - tau*v*v^T$ for real flavors, or

$H(i) = I - tau*v*v^H$ for complex flavors

where *tau* is a real/complex scalar stored in *tau*`(i)`, and *v* is a real/complex vector with $v_{1:i-1} = 0$ and $v_i = 1$.

On exit, $v_{i+1:m}$ is stored in *a*`(i+1:`*m*`, i)`.

Input Parameters

The data types are given for the Fortran interface.

m	INTEGER. The number of rows in the matrix *A* ($m \geq 0$).
n	INTEGER. The number of columns in *A* ($n \geq 0$).
a, *work*	REAL for sgeqr2 DOUBLE PRECISION for dgeqr2 COMPLEX for cgeqr2 DOUBLE COMPLEX for zgeqr2. Arrays: *a*`(lda,*)` contains the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least `max(1, n)`. *work*(*n*) is a workspace array.
lda	INTEGER. The leading dimension of *a*; at least max(1, *m*) .

Output Parameters

a	Overwritten by the factorization data as follows: on exit, the elements on and above the diagonal of the array *a* contain the min(*n*,*m*)-by-*n* upper trapezoidal matrix *R* (*R* is upper triangular if $m \geq n$); the elements below the diagonal, with the array *tau*, represent the orthogonal/ unitary matrix *Q* as a product of elementary reflectors.
tau	REAL for sgeqr2 DOUBLE PRECISION for dgeqr2 COMPLEX for cgeqr2 DOUBLE COMPLEX for zgeqr2. Array, size at least `max(1, min(`*m*`, n))`. Contains scalar factors of the elementary reflectors.
info	INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = -1011, memory allocation error occurred.

?geqr2p

Computes the QR factorization of a general rectangular matrix with non-negative diagonal elements using an unblocked algorithm.

Syntax

```
call sgeqr2p( m, n, a, lda, tau, work, info )
call dgeqr2p( m, n, a, lda, tau, work, info )
call cgeqr2p( m, n, a, lda, tau, work, info )
call zgeqr2p( m, n, a, lda, tau, work, info )
```

Include Files

- mkl.fi

Description

The routine computes a *QR* factorization of a real/complex *m*-by-*n* matrix *A* as *A* = *Q***R*. The diagonal entries of *R* are real and nonnegative.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of min(*m*, *n*) *elementary reflectors* :

Q = *H*(1)**H*(2)* ... **H*(k), where *k* = min(*m*, *n*)

Each *H*(i) has the form

H(i) = *I* - *tau***v***v*^{T} for real flavors, or

H(i) = *I* - *tau***v***v*^{H} for complex flavors

where *tau* is a real/complex scalar stored in *tau*(i), and *v* is a real/complex vector with *v*(1:i-1) = 0 and *v*(i) = 1.

On exit, *v*(i+1:*m*) is stored in *a*(i+1:*m*, i).

Input Parameters

m — INTEGER. The number of rows in the matrix *A* (*m*≥ 0).

n — INTEGER. The number of columns in *A* (*n*≥ 0).

a, *work* — REAL for sgeqr2p

DOUBLE PRECISION for d

COMPLEX for cgeqr2p

DOUBLE COMPLEX for zgeqr2p.

Arrays:

a(*lda*,*) contains the *m*-by-*n* matrix *A*.

The second dimension of *a* must be at least `max(1, n)`.

work(*n*) is a workspace array.

lda — `INTEGER`. The leading dimension of *a*; at least `max(1, m)`.

Output Parameters

a — Overwritten by the factorization data as follows:

on exit, the elements on and above the diagonal of the array *a* contain the min(*n*,*m*)-by-*n* upper trapezoidal matrix *R* (*R* is upper triangular if $m \geq n$). The diagonal entries of *R* are real and nonnegative; the elements below the diagonal, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors.

tau — `REAL` for `sgeqr2p`

`DOUBLE PRECISION` for `dgeqr2p`

`COMPLEX` for `cgeqr2p`

`DOUBLE COMPLEX` for `zgeqr2p`.

Array, `DIMENSION` at least `max(1, min(m, n))`.

Contains scalar factors of the elementary reflectors.

info — `INTEGER`.

If *info* = 0, the execution is successful.

If *info* = *-i*, the *i*-th parameter had an illegal value.

?geqrt2

Computes a QR factorization of a general real or complex matrix using the compact WY representation of Q.

Syntax

```
call sgeqrt2(m, n, a, lda, t, ldt, info)
call dgeqrt2(m, n, a, lda, t, ldt, info)
call cgeqrt2(m, n, a, lda, t, ldt, info)
call zgeqrt2(m, n, a, lda, t, ldt, info)
call geqrt2(a, t, [info])
```

Include Files

- `mkl.fi, lapack.f90`

Description

The strictly lower triangular matrix *V* contains the elementary reflectors *H*(*i*) in the *i*th column below the diagonal. For example, if m=5 and n=3, the matrix *V* is

$$V = \begin{bmatrix} 1 & & \\ v_1 & 1 & \\ v_1 & v_2 & 1 \\ v_1 & v_2 & v_3 \\ v_1 & v_2 & v_3 \end{bmatrix}$$

where v_i represents the vector that defines $H(i)$. The vectors are returned in the lower triangular part of array `a`.

> **NOTE**
> The 1s along the diagonal of V are not stored in `a`.

The block reflector H is then given by

$H = I - V*T*V^T$ for real flavors, and

$H = I - V*T*V^H$ for complex flavors,

where V^T is the transpose and V^H is the conjugate transpose of V.

Input Parameters

`m`	`INTEGER`. The number of rows in the matrix A ($m \geq n$).
`n`	`INTEGER`. The number of columns in A ($n \geq 0$).

`a`	`REAL` for `sgeqrt2`
	`DOUBLE PRECISION` for `dgeqrt2`
	`COMPLEX` for `cgeqrt2`
	`COMPLEX*16` for `zgeqrt2`.
	Array, size `lda` by `n`. Array `a` contains the m-by-n matrix A.

`lda`	`INTEGER`. The leading dimension of `a`; at least max(1, m).
`ldt`	`INTEGER`. The leading dimension of `t`; at least max(1, `n`).

Output Parameters

`a`	Overwritten by the factorization data as follows: The elements on and above the diagonal of the array contain the `n`-by-`n` upper triangular matrix R. The elements below the diagonal are the columns of V.

`t`	`REAL` for `sgeqrt2`
	`DOUBLE PRECISION` for `dgeqrt2`
	`COMPLEX` for `cgeqrt2`
	`COMPLEX*16` for `zgeqrt2`.
	Array, size (`ldt`, min(`m`, `n`)).
	The `n`-by-`n` upper triangular factor of the block reflector. The elements on and above the diagonal contain the block reflector T. The elements below the diagonal are not used.

`info`	`INTEGER`. If `info` = 0, the execution is successful. If `info` < 0 and `info` = -i, the ith argument had an illegal value. `If info = -1011`, memory allocation error occurred.

?geqrt3

Recursively computes a QR factorization of a general real or complex matrix using the compact WY representation of Q.

Syntax

```
call sgeqrt3(m, n, a, lda, t, ldt, info)
call dgeqrt3(m, n, a, lda, t, ldt, info)
call cgeqrt3(m, n, a, lda, t, ldt, info)
call zgeqrt3(m, n, a, lda, t, ldt, info)
call geqrt3(a, t [, info])
```

Include Files

Description

The routine computes a *RQ* factorization of a real/complex *m*-by-*n* matrix *A* as $A = R*Q$.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of min(*m*, *n*) *elementary reflectors* :

$Q = H(1)*H(2)* \ldots *H(k)$ for real flavors, or

$Q = H(1)^H*H(2)^H* \ldots *H(k)^H$ for complex flavors

where $k = \min(m, n)$.

Each *H*(i) has the form

$H(i) = I - tau*v*v^T$ for real flavors, or

$H(i) = I - tau*v*v^H$ for complex flavors

where *tau* is a real/complex scalar stored in *tau*(i), and *v* is a real/complex vector with $v(n-k+i+1:n) = 0$ and $v(n-k+i) = 1$.

On exit, $v(1:n-k+i-1)$ is stored in $a(m-k+i, 1:n-k+i-1)$.

Input Parameters

m	INTEGER. The number of rows in the matrix *A* ($m \geq 0$).
n	INTEGER. The number of columns in *A* ($n \geq 0$).
a, *work*	REAL for sgerq2 DOUBLE PRECISION for dgerq2 COMPLEX for cgerq2 DOUBLE COMPLEX for zgerq2. Arrays: $a(lda,*)$ contains the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least $\max(1, n)$. *work*(*m*) is a workspace array.
lda	INTEGER. The leading dimension of *a*; at least $\max(1, m)$.

Output Parameters

a	Overwritten by the factorization data as follows: on exit, if $m \leq n$, the upper triangle of the subarray $a(1:m, n-m+1:n)$ contains the *m*-by-*m* upper triangular matrix *R*; if $m > n$, the elements on and above the (*m*-*n*)-th subdiagonal contain the *m*-by-*n* upper trapezoidal matrix *R*; the remaining elements, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors.
tau	REAL for sgerq2

DOUBLE PRECISION for dgerq2

COMPLEX for cgerq2

DOUBLE COMPLEX for zgerq2.

Array, DIMENSION at least max(1, min(*m*, *n*)).

Contains scalar factors of the elementary reflectors.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

?gesc2

Solves a system of linear equations using the LU factorization with complete pivoting computed by ?getc2.

Syntax

```
call sgesc2( n, a, lda, rhs, ipiv, jpiv, scale )
call dgesc2( n, a, lda, rhs, ipiv, jpiv, scale )
call cgesc2( n, a, lda, rhs, ipiv, jpiv, scale )
call zgesc2( n, a, lda, rhs, ipiv, jpiv, scale )
```

Include Files

- mkl.fi

Description

The routine solves a system of linear equations

*A*X = scale*RHS*

with a general *n*-by-*n* matrix *A* using the *LU* factorization with complete pivoting computed by ?getc2.

Input Parameters

n INTEGER. The order of the matrix *A*.

a, *rhs* REAL for sgesc2

DOUBLE PRECISION for dgesc2

COMPLEX for cgesc2

DOUBLE COMPLEX for zgesc2.

Arrays:

a(*lda*,*) contains the *LU* part of the factorization of the *n*-by-*n* matrix *A* computed by ?getc2:

*A = P*L*U*Q*.

The second dimension of *a* must be at least max(1, *n*);

rhs(*n*) contains on entry the right hand side vector for the system of equations.

lda INTEGER. The leading dimension of *a*; at least max(1, *n*).

ipiv INTEGER.

Array, DIMENSION at least max(1,*n*).

The pivot indices: for 1 ≤ i ≤ *n*, row i of the matrix has been interchanged with row *ipiv*(i).

jpiv INTEGER.

Array, DIMENSION at least max(1,*n*).

The pivot indices: for 1 ≤ j ≤ *n*, column j of the matrix has been interchanged with column *jpiv*(j).

Output Parameters

rhs On exit, overwritten with the solution vector *X*.

scale REAL for sgesc2/cgesc2

DOUBLE PRECISION for dgesc2/zgesc2

Contains the scale factor. *scale* is chosen in the range 0 ≤ *scale* ≤ 1 to prevent overflow in the solution.

?getc2

Computes the LU factorization with complete pivoting of the general n-by-n matrix.

Syntax

```
call sgetc2( n, a, lda, ipiv, jpiv, info )
call dgetc2( n, a, lda, ipiv, jpiv, info )
call cgetc2( n, a, lda, ipiv, jpiv, info )
call zgetc2( n, a, lda, ipiv, jpiv, info )
```

Include Files

- mkl.fi

Description

The routine computes an *LU* factorization with complete pivoting of the *n*-by-*n* matrix *A*. The factorization has the form *A = P*L*U*Q*, where *P* and *Q* are permutation matrices, *L* is lower triangular with unit diagonal elements and *U* is upper triangular.

The LU factorization computed by this routine is used by ?latdf to compute a contribution to the reciprocal Dif-estimate.

Input Parameters

n	INTEGER. The order of the matrix *A* ($n \geq 0$).
a	REAL for sgetc2 DOUBLE PRECISION for dgetc2 COMPLEX for cgetc2 DOUBLE COMPLEX for zgetc2. Array *a*(*lda*,*) contains the *n*-by-*n* matrix *A* to be factored. The second dimension of *a* must be at least max(1, *n*);
lda	INTEGER. The leading dimension of *a*; at least max(1, *n*).

Output Parameters

a	On exit, the factors *L* and *U* from the factorization *A = P*L*U*Q*; the unit diagonal elements of *L* are not stored. If *U*(*k*, *k*) appears to be less than smin, *U*(*k*, *k*) is given the value of smin, that is giving a nonsingular perturbed system.
ipiv	INTEGER. Array, DIMENSION at least max(1,*n*). The pivot indices: for $1 \leq i \leq n$, row i of the matrix has been interchanged with row *ipiv*(i).
jpiv	INTEGER. Array, DIMENSION at least max(1,*n*). The pivot indices: for $1 \leq j \leq n$, column j of the matrix has been interchanged with column *jpiv*(j).
info	INTEGER. If *info* = 0, the execution is successful. If *info* = *k*>0, *U*(*k*, *k*) is likely to produce overflow if we try to solve for *x* in *A*x = b*. So *U* is perturbed to avoid the overflow.

?getf2

Computes the LU factorization of a general m-by-n matrix using partial pivoting with row interchanges (unblocked algorithm).

Syntax

```
call sgetf2( m, n, a, lda, ipiv, info )
call dgetf2( m, n, a, lda, ipiv, info )
call cgetf2( m, n, a, lda, ipiv, info )
call zgetf2( m, n, a, lda, ipiv, info )
```

Include Files

- mkl.fi

Description

The routine computes the *LU* factorization of a general *m*-by-*n* matrix *A* using partial pivoting with row interchanges. The factorization has the form

*A = P*L*U*

where *p* is a permutation matrix, *L* is lower triangular with unit diagonal elements (lower trapezoidal if *m* > *n*) and *U* is upper triangular (upper trapezoidal if *m* < *n*).

Input Parameters

The data types are given for the Fortran interface.

m	INTEGER. The number of rows in the matrix *A* (*m*≥ 0).
n	INTEGER. The number of columns in *A* (*n*≥ 0).
a	REAL for sgetf2 DOUBLE PRECISION for dgetf2 COMPLEX for cgetf2 DOUBLE COMPLEX for zgetf2. Array, size (*lda*,*). Contains the matrix *A* to be factored. The second dimension of *a* must be at least max(1, *n*).
lda	INTEGER. The leading dimension of *a*; at least max(1, *m*).

Output Parameters

a	Overwritten by *L* and *U*. The unit diagonal elements of *L* are not stored.
ipiv	INTEGER. Array, size at least max(1,min(*m*,*n*)). The pivot indices: for 1 ≤ i ≤ *n*, row *i* was interchanged with row *ipiv*(*i*).
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i* >0, u_{ii} is 0. The factorization has been completed, but *U* is exactly singular. Division by 0 will occur if you use the factor *U* for solving a system of linear equations. If *info* = -1011, memory allocation error occurred.

?gtts2

Solves a system of linear equations with a tridiagonal matrix using the LU factorization computed by ?gttrf.

Syntax

```
call sgtts2( itrans, n, nrhs, dl, d, du, du2, ipiv, b, ldb )
call dgtts2( itrans, n, nrhs, dl, d, du, du2, ipiv, b, ldb )
call cgtts2( itrans, n, nrhs, dl, d, du, du2, ipiv, b, ldb )
call zgtts2( itrans, n, nrhs, dl, d, du, du2, ipiv, b, ldb )
```

Include Files

- mkl.fi

Description

The routine solves for *X* one of the following systems of linear equations with multiple right hand sides:

*A*X = B*, $A^T*X = B$, or $A^H*X = B$ (for complex matrices only), with a tridiagonal matrix A using the *LU* factorization computed by ?gttrf.

Input Parameters

itrans

INTEGER. Must be 0, 1, or 2.

Indicates the form of the equations to be solved:

If *itrans* = 0, then *A*X = B* (no transpose).

If *itrans* = 1, then $A^T*X = B$ (transpose).

If *itrans* = 2, then $A^H*X = B$ (conjugate transpose).

n

INTEGER. The order of the matrix *A* (*n*≥ 0).

nrhs

INTEGER. The number of right-hand sides, i.e., the number of columns in *B* (*nrhs*≥ 0).

dl,*d*,*du*,*du2*,*b*

REAL for sgtts2

DOUBLE PRECISION for dgtts2

COMPLEX for cgtts2

DOUBLE COMPLEX for zgtts2.

Arrays: *dl*(*n* - 1), *d*(*n*), *du*(*n* - 1), *du2*(*n* - 2), *b*(*ldb*,*nrhs*).

The array *dl* contains the (*n* - 1) multipliers that define the matrix *L* from the *LU* factorization of *A*.

The array *d* contains the *n* diagonal elements of the upper triangular matrix *U* from the *LU* factorization of *A*.

The array *du* contains the (*n* - 1) elements of the first super-diagonal of *U*.

The array *du2* contains the (*n* - 2) elements of the second super-diagonal of *U*.

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations.

ldb

INTEGER. The leading dimension of *b*; must be *ldb*≥ max(1, *n*).

ipiv

INTEGER.

Array, DIMENSION (*n*).

The pivot indices array, as returned by ?gttrf.

Output Parameters

b Overwritten by the solution matrix *X*.

?isnan

Tests input for NaN.

Syntax

val = sisnan(*sin*)

val = disnan(*din*)

Include Files

- mkl.fi

Description

This logical routine returns .TRUE. if its argument is NaN, and .FALSE. otherwise.

Input Parameters

sin REAL for sisnan

Input to test for NaN.

din DOUBLE PRECISION for disnan

Input to test for NaN.

Output Parameters

val Logical. Result of the test.

?laisnan

Tests input for NaN.

Syntax

val = slaisnan(*sin1*, *sin2*)

val = dlaisnan(*din1*, *din2*)

Include Files

- mkl.fi

Description

This logical routine checks for NaNs (NaN stands for 'Not A Number') by comparing its two arguments for inequality. NaN is the only floating-point value where NaN ≠ NaN returns .TRUE. To check for NaNs, pass the same variable as both arguments.

This routine is not for general use. It exists solely to avoid over-optimization in ?isnan.

Input Parameters

sin1, *sin2*	REAL for sisnan Two numbers to compare for inequality.
din2, *din2*	DOUBLE PRECISION for disnan Two numbers to compare for inequality.

Output Parameters

val	Logical. Result of the comparison.

?labrd

Reduces the first nb rows and columns of a general matrix to a bidiagonal form.

Syntax

```
call slabrd( m, n, nb, a, lda, d, e, tauq, taup, x, ldx, y, ldy )
call dlabrd( m, n, nb, a, lda, d, e, tauq, taup, x, ldx, y, ldy )
call clabrd( m, n, nb, a, lda, d, e, tauq, taup, x, ldx, y, ldy )
call zlabrd( m, n, nb, a, lda, d, e, tauq, taup, x, ldx, y, ldy )
```

Include Files

- mkl.fi

Description

The routine reduces the first *nb* rows and columns of a general *m*-by-*n* matrix *A* to upper or lower bidiagonal form by an orthogonal/unitary transformation *Q'*A*P*, and returns the matrices *X* and *Y* which are needed to apply the transformation to the unreduced part of *A*.

if $m \geq n$, *A* is reduced to upper bidiagonal form; if $m < n$, to lower bidiagonal form.

The matrices *Q* and *P* are represented as products of elementary reflectors: $Q = H(1)*(2)* \ldots *H(nb)$, and $P = G(1)*G(2)* \ldots *G(nb)$

Each *H*(i) and *G*(i) has the form

$H(i) = I - tauq*v*v'$ and $G(i) = I - taup*u*u'$

where *tauq* and *taup* are scalars, and *v* and *u* are vectors.

The elements of the vectors *v* and *u* together form the *m*-by-*nb* matrix *V* and the *nb*-by-*n* matrix *U'* which are needed, with *X* and *Y*, to apply the transformation to the unreduced part of the matrix, using a block update of the form: $A := A - V*Y' - X*U'$.

This is an auxiliary routine called by ?gebrd.

Input Parameters

m	INTEGER. The number of rows in the matrix *A* ($m \geq 0$).

n INTEGER. The number of columns in *A* (*n*≥ 0).

nb INTEGER. The number of leading rows and columns of *A* to be reduced.

a REAL for slabrd

DOUBLE PRECISION for dlabrd

COMPLEX for clabrd

DOUBLE COMPLEX for zlabrd.

Array *a*(*lda*,*) contains the matrix *A* to be reduced. The second dimension of *a* must be at least max(1, *n*).

lda INTEGER. The leading dimension of *a*; at least max(1, *m*).

ldx INTEGER. The leading dimension of the output array *x*; must beat least max(1, *m*).

ldy INTEGER. The leading dimension of the output array *y*; must beat least max(1, *n*).

Output Parameters

a On exit, the first *nb* rows and columns of the matrix are overwritten; the rest of the array is unchanged.

if *m*≥*n*, elements on and below the diagonal in the first *nb* columns, with the array *tauq*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors; and elements above the diagonal in the first *nb* rows, with the array *taup*, represent the orthogonal/unitary matrix *p* as a product of elementary reflectors.

if *m* < *n*, elements below the diagonal in the first *nb* columns, with the array *tauq*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors, and elements on and above the diagonal in the first *nb* rows, with the array *taup*, represent the orthogonal/unitary matrix *p* as a product of elementary reflectors.

d, *e* REAL for single-precision flavors

DOUBLE PRECISION for double-precision flavors. Arrays, DIMENSION (*nb*) each. The array *d* contains the diagonal elements of the first *nb* rows and columns of the reduced matrix:

d(i) = *a*(i,i).

The array *e* contains the off-diagonal elements of the first *nb* rows and columns of the reduced matrix.

tauq, *taup* REAL for slabrd

DOUBLE PRECISION for dlabrd

COMPLEX for clabrd

DOUBLE COMPLEX for zlabrd.

Arrays, DIMENSION (*nb*) each. Contain scalar factors of the elementary reflectors which represent the orthogonal/unitary matrices *Q* and *P*, respectively.

x, *y*	`REAL` for `slabrd`
	`DOUBLE PRECISION` for `dlabrd`
	`COMPLEX` for `clabrd`
	`DOUBLE COMPLEX` for `zlabrd`.
	Arrays, dimension *x*(*ldx*, *nb*), *y*(*ldy*, *nb*).
	The array *x* contains the *m*-by-*nb* matrix *X* required to update the unreduced part of *A*.
	The array *y* contains the *n*-by-*nb* matrix *Y* required to update the unreduced part of *A*.

Application Notes

if $m \geq n$, then for the elementary reflectors *H*(i) and *G*(i),

`v(1:i-1) = 0`, `v(i) = 1`, and `v(i:m)` is stored on exit in `a(i:m, i)`; `u(1:i) = 0`, `u(i+1) = 1`, and `u(i+1:n)` is stored on exit in `a(i, i+1:n)`;

tauq is stored in *tauq*(i) and *taup* in *taup*(i).

if $m < n$,

`v(1:i) = 0`, `v(i+1) = 1`, and `v(i+1:m)` is stored on exit in `a(i+2:m, i)`; `u(1:i-1) = 0`, `u(i) = 1`, and `u(i:n)` is stored on exit in `a(i, i+1:n)`; *tauq* is stored in *tauq*(i) and *taup* in *taup*(i).

The contents of *a* on exit are illustrated by the following examples with `nb = 2`:

$m = 6,\ n = 5\ (m > n)$

$$\begin{bmatrix} 1 & 1 & u_1 & u_1 & u_1 \\ v_1 & 1 & 1 & u_2 & u_2 \\ v_1 & v_2 & a & a & a \\ v_1 & v_2 & a & a & a \\ v_1 & v_2 & a & a & a \\ v_1 & v_2 & a & a & a \end{bmatrix}$$

$m = 5,\ n = 6\ (m < n)$

$$\begin{bmatrix} 1 & u_1 & u_1 & u_1 & u_1 & u_1 \\ 1 & 1 & u_2 & u_2 & u_2 & u_2 \\ v_1 & 1 & a & a & a & a \\ v_1 & v_2 & a & a & a & a \\ v_1 & v_2 & a & a & a & a \end{bmatrix}$$

where *a* denotes an element of the original matrix which is unchanged, v_i denotes an element of the vector defining *H*(i), and u_i an element of the vector defining *G*(i).

?lacn2

Estimates the 1-norm of a square matrix, using reverse communication for evaluating matrix-vector products.

Syntax

```
call slacn2( n, v, x, isgn, est, kase, isave )
call dlacn2( n, v, x, isgn, est, kase, isave )
call clacn2( n, v, x, est, kase, isave )
```

```
call zlacn2( n, v, x, est, kase, isave )
```

Include Files

- mkl.fi

Description

The routine estimates the 1-norm of a square, real or complex matrix *A*. Reverse communication is used for evaluating matrix-vector products.

Input Parameters

n	INTEGER. The order of the matrix *A* ($n \geq 1$).
v, *x*	REAL for slacn2 DOUBLE PRECISION for dlacn2 COMPLEX for clacn2 DOUBLE COMPLEX for zlacn2. Arrays, size (*n*) each. *v* is a workspace array. *x* is used as input after an intermediate return.
isgn	INTEGER. Workspace array, size (*n*), used with real flavors only.
est	REAL for slacn2/clacn2 DOUBLE PRECISION for dlacn2/zlacn2 On entry with *kase* set to 1 or 2, and *isave*(1) = 1, *est* must be unchanged from the previous call to the routine.
kase	INTEGER. On the initial call to the routine, *kase* must be set to 0.
isave	INTEGER. Array, size (*3*). Contains variables from the previous call to the routine.

Output Parameters

est	An estimate (a lower bound) for norm(*A*).
kase	On an intermediate return, *kase* is set to 1 or 2, indicating whether *x* is overwritten by $A*x$ or A^T*x for real flavors and $A*x$ or A^H*x for complex flavors. On the final return, *kase* is set to 0.
v	On the final return, *v* = *A***w*, where *est* = norm(*v*)/norm(*w*) (*w* is not returned).
x	On an intermediate return, *x* is overwritten by *A***x*, if *kase* = 1,

A^T*x, if *kase* = 2 (for real flavors),

A^H*x, if *kase* = 2 (for complex flavors),

and the routine must be re-called with all the other parameters unchanged.

isave This parameter is used to save variables between calls to the routine.

?lacon

Estimates the 1-norm of a square matrix, using reverse communication for evaluating matrix-vector products.

Syntax

```
call slacon( n, v, x, isgn, est, kase )
call dlacon( n, v, x, isgn, est, kase )
call clacon( n, v, x, est, kase )
call zlacon( n, v, x, est, kase )
```

Include Files

- mkl.fi

Description

The routine estimates the 1-norm of a square, real/complex matrix *A*. Reverse communication is used for evaluating matrix-vector products.

WARNING
The ?lacon routine is not thread-safe. It is deprecated and retained for the backward compatibility only. Use the thread-safe ?lacn2 routine instead.

Input Parameters

n INTEGER. The order of the matrix *A* ($n \geq 1$).

v, *x* REAL for slacon

DOUBLE PRECISION for dlacon

COMPLEX for clacon

DOUBLE COMPLEX for zlacon.

Arrays, DIMENSION (*n*) each.

v is a workspace array.

x is used as input after an intermediate return.

isgn INTEGER.

Workspace array, DIMENSION (*n*), used with real flavors only.

est REAL for slacon/clacon

DOUBLE PRECISION for dlacon/zlacon

An estimate that with *kase*=1 or 2 should be unchanged from the previous call to ?lacon.

kase INTEGER.

On the initial call to ?lacon, *kase* should be 0.

Output Parameters

est REAL for slacon/clacon

DOUBLE PRECISION for dlacon/zlacon

An estimate (a lower bound) for norm(*A*).

kase On an intermediate return, *kase* will be 1 or 2, indicating whether *x* should be overwritten by *A***x* or A^T**x* for real flavors and *A***x* or A^H**x* for complex flavors. On the final return from ?lacon, *kase* will again be 0.

v On the final return, *v* = *A***w*, where *est* = norm(*v*)/norm(*w*) (*w* is not returned).

x On an intermediate return, *x* should be overwritten by

*A***x*, if *kase* = 1,

A^T**x*, if *kase* = 2 (for real flavors),

A^H**x*, if *kase* = 2 (for complex flavors),

and ?lacon must be re-called with all the other parameters unchanged.

?lacpy

Copies all or part of one two-dimensional array to another.

Syntax

```
call slacpy( uplo, m, n, a, lda, b, ldb )
call dlacpy( uplo, m, n, a, lda, b, ldb )
call clacpy( uplo, m, n, a, lda, b, ldb )
call zlacpy( uplo, m, n, a, lda, b, ldb )
```

Include Files

- mkl.fi

Description

The routine copies all or part of a two-dimensional matrix *A* to another matrix *B*.

Input Parameters

The data types are given for the Fortran interface.

uplo CHARACTER*1.

Specifies the part of the matrix *A* to be copied to *B*.

If *uplo* = 'U', the upper triangular part of *A*;

if *uplo* = 'L', the lower triangular part of *A*.

Otherwise, all of the matrix *A* is copied.

m — INTEGER. The number of rows in the matrix *A* (*m*≥ 0).

n — INTEGER. The number of columns in *A* (*n*≥ 0).

a — REAL for slacpy

DOUBLE PRECISION for dlacpy

COMPLEX for clacpy

DOUBLE COMPLEX for zlacpy.

Array *a*(*lda*,*), contains the *m*-by-*n* matrix *A*.

The second dimension of *a* must be at least max(1,*n*).

If *uplo* = 'U', only the upper triangle or trapezoid is accessed; if *uplo* = 'L', only the lower triangle or trapezoid is accessed.

lda — INTEGER. The leading dimension of *a*; *lda*≥max(1,*m*).

ldb — INTEGER. The leading dimension of the output array *b*; *ldb*≥ max(1, *m*).

Output Parameters

b — REAL for slacpy

DOUBLE PRECISION for dlacpy

COMPLEX for clacpy

DOUBLE COMPLEX for zlacpy.

Array *b*(*ldb*,*), contains the *m*-by-*n* matrix *B*.

The second dimension of *b* must be at least max(1,*n*).

On exit, *B* = *A* in the locations specified by *uplo*.

?ladiv

Performs complex division in real arithmetic, avoiding unnecessary overflow.

Syntax

```
call sladiv( a, b, c, d, p, q )
call dladiv( a, b, c, d, p, q )
res = cladiv( x, y )
res = zladiv( x, y )
```

Include Files

- mkl.fi

Description

The routines `sladiv/dladiv` perform complex division in real arithmetic as

$$p + iq = \frac{a + ib}{c + id}$$

Complex functions `cladiv/zladiv` compute the result as

res = *x*/*y*,

where *x* and *y* are complex. The computation of *x* / *y* will not overflow on an intermediary step unless the results overflows.

The algorithm used is due to [Baudin12].

Input Parameters

a, *b*, *c*, *d*	`REAL` for `sladiv`
	`DOUBLE PRECISION` for `dladiv`
	The scalars *a*, *b*, *c*, and *d* in the above expression (for real flavors only).

x, *y*	`COMPLEX` for `cladiv`
	`DOUBLE COMPLEX` for `zladiv`
	The complex scalars *x* and *y* (for complex flavors only).

Output Parameters

p, *q*	`REAL` for `sladiv`
	`DOUBLE PRECISION` for `dladiv`
	The scalars *p* and *q* in the above expression (for real flavors only).

res	`COMPLEX` for `cladiv`
	`DOUBLE COMPLEX` for `zladiv`
	Contains the result of division *x* / *y*.

?lae2

Computes the eigenvalues of a 2-by-2 symmetric matrix.

Syntax

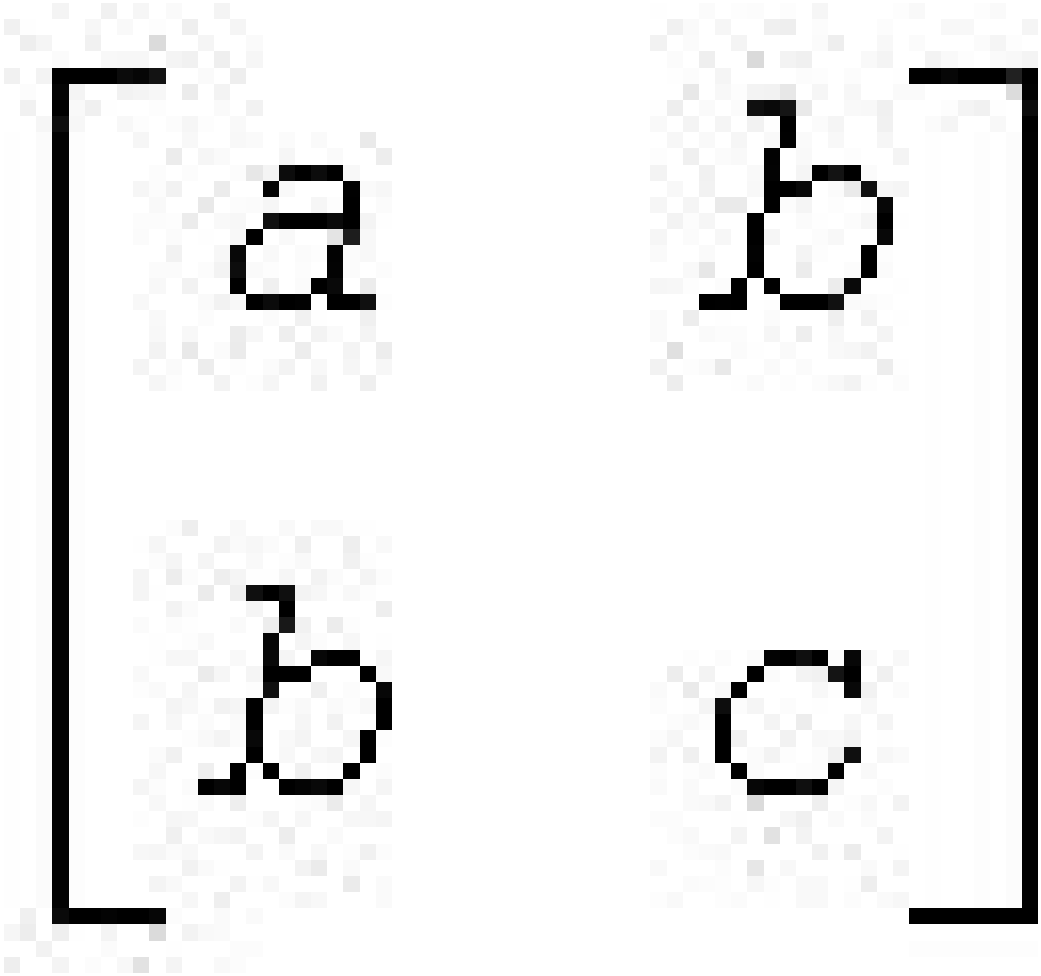
```
call slae2( a, b, c, rt1, rt2 )
call dlae2( a, b, c, rt1, rt2 )
```

Include Files

- mkl.fi

Description

The routines sla2/dlae2 compute the eigenvalues of a 2-by-2 symmetric matrix



On return, *rt1* is the eigenvalue of larger absolute value, and *rt1* is the eigenvalue of smaller absolute value.

Input Parameters

a, *b*, *c*

REAL for slae2

DOUBLE PRECISION for dlae2

The elements *a*, *b*, and *c* of the 2-by-2 matrix above.

Output Parameters

rt1, *rt2*

REAL for slae2

DOUBLE PRECISION for dlae2

The computed eigenvalues of larger and smaller absolute value, respectively.

Application Notes

rt1 is accurate to a few ulps barring over/underflow. *rt2* may be inaccurate if there is massive cancellation in the determinant *a*c-b*b*; higher precision or correctly rounded or correctly truncated arithmetic would be needed to compute *rt2* accurately in all cases.

Overflow is possible only if *rt1* is within a factor of 5 of overflow. Underflow is harmless if the input data is 0 or exceeds

underflow_threshold / `macheps`.

?laebz

Computes the number of eigenvalues of a real symmetric tridiagonal matrix which are less than or equal to a given value, and performs other tasks required by the routine `?stebz`.

Syntax

`call slaebz( ijob, nitmax, n, mmax, minp, nbmin, abstol, reltol, pivmin, d, e, e2, nval, ab, c, mout, nab, work, iwork, info )`

`call dlaebz( ijob, nitmax, n, mmax, minp, nbmin, abstol, reltol, pivmin, d, e, e2, nval, ab, c, mout, nab, work, iwork, info )`

Include Files

- `mkl.fi`

Description

The routine `?laebz` contains the iteration loops which compute and use the function *n*(*w*), which is the count of eigenvalues of a symmetric tridiagonal matrix *T* less than or equal to its argument *w*. It performs a choice of two types of loops:

ijob	=1, followed by
ijob	=2: It takes as input a list of intervals and returns a list of sufficiently small intervals whose union contains the same eigenvalues as the union of the original intervals. The input intervals are `(ab(j,1),ab(j,2)], j=1,...,minp`. The output interval `(ab(j,1),ab(j,2)]` will contain eigenvalues `nab(j,1)+1,...,nab(j,2)`, where `1 ≤ j ≤ mout`.
ijob	=3: It performs a binary search in each input interval `(ab(j,1),ab(j,2)]` for a point *w*(*j*) such that `n(w(j))=nval(j)`, and uses *c*(*j*) as the starting point of the search. If such a *w*(*j*) is found, then on output `ab(j,1)=ab(j,2)=w`. If no such *w*(*j*) is found, then on output `(ab(j,1),ab(j,2)]` will be a small interval containing the point where *n*(*w*) jumps through *nval*(*j*), unless that point lies outside the initial interval.

Note that the intervals are in all cases half-open intervals, that is, of the form `(a,b]`, which includes *b* but not *a* .

To avoid underflow, the matrix should be scaled so that its largest element is no greater than $overflow^{1/2} * overflow^{1/4}$ in absolute value. To assure the most accurate computation of small eigenvalues, the matrix should be scaled to be not much smaller than that, either.

NOTE
In general, the arguments are not checked for unreasonable values.

Input Parameters

ijob

INTEGER. Specifies what is to be done:

= 1: Compute *nab* for the initial intervals.

= 2: Perform bisection iteration to find eigenvalues of *T*.

= 3: Perform bisection iteration to invert *n*(*w*), i.e., to find a point which has a specified number of eigenvalues of *T* to its left. Other values will cause ?laebz to return with *info*=-1.

nitmax

INTEGER. The maximum number of "levels" of bisection to be performed, i.e., an interval of width *W* will not be made smaller than $2^{-nitmax*W}$. If not all intervals have converged after *nitmax* iterations, then *info* is set to the number of non-converged intervals.

n

INTEGER. The dimension *n* of the tridiagonal matrix *T*. It must be at least 1.

mmax

INTEGER. The maximum number of intervals. If more than *mmax* intervals are generated, then ?laebz will quit with *info*=*mmax*+1.

minp

INTEGER. The initial number of intervals. It may not be greater than *mmax*.

nbmin

INTEGER. The smallest number of intervals that should be processed using a vector loop. If zero, then only the scalar loop will be used.

abstol

REAL for slaebz

DOUBLE PRECISION for dlaebz.

The minimum (absolute) width of an interval. When an interval is narrower than *abstol*, or than *reltol* times the larger (in magnitude) endpoint, then it is considered to be sufficiently small, i.e., converged. This must be at least zero.

reltol

REAL for slaebz

DOUBLE PRECISION for dlaebz.

The minimum relative width of an interval. When an interval is narrower than *abstol*, or than *reltol* times the larger (in magnitude) endpoint, then it is considered to be sufficiently small, i.e., converged. Note: this should always be at least *radix***machineepsilon*.

pivmin

REAL for slaebz

DOUBLE PRECISION for dlaebz.

The minimum absolute value of a "pivot" in the Sturm sequence loop. This value **must** be at least (`max |e(j)**2|*safe_min`) and at least *safe_min*, where *safe_min* is at least the smallest number that can divide one without overflow.

d, *e*, *e2*

`REAL` for `slaebz`

`DOUBLE PRECISION` for `dlaebz`.

Arrays, dimension (*n*) each. The array *d* contains the diagonal elements of the tridiagonal matrix *T*.

The array *e* contains the off-diagonal elements of the tridiagonal matrix *T* in positions 1 through *n*-1. *e*(*n*)vis arbitrary.

The array *e2* contains the squares of the off-diagonal elements of the tridiagonal matrix *T*. *e2*(*n*) is ignored.

nval

`INTEGER`.

Array, dimension (*minp*).

If *ijob*=1 or 2, not referenced.

If *ijob*=3, the desired values of *n*(*w*).

ab

`REAL` for `slaebz`

`DOUBLE PRECISION` for `dlaebz`.

Array, dimension (*mmax*,2) The endpoints of the intervals. *ab*(j,1) is *a*(*j*), the left endpoint of the *j*-th interval, and *ab*(j,2) is *b*(*j*), the right endpoint of the *j*-th interval.

c

`REAL` for `slaebz`

`DOUBLE PRECISION` for `dlaebz`.

Array, dimension (*mmax*)

If *ijob*=1, ignored.

If *ijob*=2, workspace.

If *ijob*=3, then on input *c*(*j*) should be initialized to the first search point in the binary search.

nab

`INTEGER`.

Array, dimension (*mmax*,2)

If *ijob*=2, then on input, *nab*(i,j) should be set. It must satisfy the condition:

$n(ab(i,1)) \le nab(i,1) \le nab(i,2) \le n(ab(i,2))$, which means that in interval i only eigenvalues $nab(i,1)+1,\ldots,nab(i,2)$ are considered. Usually, $nab(i,j)=n(ab(i,j))$, from a previous call to `?laebz` with *ijob*=1.

If *ijob*=3, normally, *nab* should be set to some distinctive value(s) before `?laebz` is called.

work

`REAL` for `slaebz`

`DOUBLE PRECISION` for `dlaebz`.

Workspace array, dimension (*mmax*).

iwork INTEGER.

Workspace array, dimension (*mmax*).

Output Parameters

nval The elements of *nval* will be reordered to correspond with the intervals in *ab*. Thus, *nval*(*j*) on output will not, in general be the same as *nval*(*j*) on input, but it will correspond with the interval (*ab*(j,1),*ab*(j,2)] on output.

ab The input intervals will, in general, be modified, split, and reordered by the calculation.

mout INTEGER.

If *ijob*=1, the number of eigenvalues in the intervals.

If *ijob*=2 or 3, the number of intervals output.

If *ijob*=3, *mout* will equal *minp*.

nab If *ijob*=1, then on output *nab*(i,j) will be set to *N*(*ab*(i,j)).

If *ijob*=2, then on output, *nab*(i,j) will contain max(*na*(*k*, min(*nb*(*k*), *N*(*ab*(i,j)))), where *k* is the index of the input interval that the output interval (*ab*(j,1),*ab*(j,2)] came from, and *na*(*k*) and *nb*(*k*) are the input values of *nab*(*k*,1) and *nab*(*k*,2).

If *ijob*=3, then on output, *nab*(i,j) contains *N*(*ab*(i,j)), unless *N*(*w*) > *nval*(i) for all search points *w*, in which case *nab*(i,1) will not be modified, i.e., the output value will be the same as the input value (modulo reorderings, see *nval* and *ab*), or unless *N*(*w*) < *nval*(i) for all search points *w*, in which case *nab*(i,2) will not be modified.

info INTEGER.

If *info* = 0 - all intervals converged

If *info* = 1--*mmax* - the last *info* interval did not converge.

If info = mmax+1 - more than *mmax* intervals were generated

Application Notes

This routine is intended to be called only by other LAPACK routines, thus the interface is less user-friendly. It is intended for two purposes:

(a) finding eigenvalues. In this case, ?laebz should have one or more initial intervals set up in *ab*, and ?laebz should be called with *ijob*=1. This sets up *nab*, and also counts the eigenvalues. Intervals with no eigenvalues would usually be thrown out at this point. Also, if not all the eigenvalues in an interval i are desired, *nab*(i,1) can be increased or *nab*(i,2) decreased. For example, set *nab*(i,1)=*nab*(i,2)-1 to get the largest eigenvalue. ?laebz is then called with *ijob*=2 and *mmax* no smaller than the value of *mout* returned by the call with *ijob*=1. After this (*ijob*=2) call, eigenvalues *nab*(i,1)+1 through *nab*(i,2) are approximately *ab*(i,1) (or *ab*(i,2)) to the tolerance specified by *abstol* and *reltol*.

(b) finding an interval (*a*',*b*'] containing eigenvalues *w*(f),...,*w*(l). In this case, start with a Gershgorin interval (*a*,*b*). Set up *ab* to contain 2 search intervals, both initially (*a*,*b*). One *nval* element should contain f-1 and the other should contain l, while *c* should contain *a* and *b*, respectively. *nab*(i,1) should be -1 and *nab*(i,2) should be *n*+1, to flag an error if the desired interval does not lie in (*a*,*b*). ?laebz is then called with

ijob=3. On exit, if `w(f-1) < w(f)`, then one of the intervals -- j -- will have `ab(j,1)=ab(j,2)` and `nab(j,1)=nab(j,2)=f-1`, while if, to the specified tolerance, `w(f-k)=...=w(f+r), k > 0` and `r ≥ 0`, then the interval will have `n(ab(j,1))=nab(j,1)=f-k` and `n(ab(j,2))=nab(j,2)=f+r`. The cases `w(l) < w(l+1)` and *w*(l-r)=...=*w*(l+k) are handled similarly.

?laed0

Used by `?stedc`. *Computes all eigenvalues and corresponding eigenvectors of an unreduced symmetric tridiagonal matrix using the divide and conquer method.*

Syntax

```
call slaed0( icompq, qsiz, n, d, e, q, ldq, qstore, ldqs, work, iwork, info )
call dlaed0( icompq, qsiz, n, d, e, q, ldq, qstore, ldqs, work, iwork, info )
call claed0( qsiz, n, d, e, q, ldq, qstore, ldqs, rwork, iwork, info )
call zlaed0( qsiz, n, d, e, q, ldq, qstore, ldqs, rwork, iwork, info )
```

Include Files

- `mkl.fi`

Description

Real flavors of this routine compute all eigenvalues and (optionally) corresponding eigenvectors of a symmetric tridiagonal matrix using the divide and conquer method.

Complex flavors `claed0`/`zlaed0` compute all eigenvalues of a symmetric tridiagonal matrix which is one diagonal block of those from reducing a dense or band Hermitian matrix and corresponding eigenvectors of the dense or band matrix.

Input Parameters

icompq

`INTEGER`. Used with real flavors only.

If *icompq* = 0, compute eigenvalues only.

If *icompq* = 1, compute eigenvectors of original dense symmetric matrix also.

On entry, the array *q* must contain the orthogonal matrix used to reduce the original matrix to tridiagonal form.

If *icompq* = 2, compute eigenvalues and eigenvectors of the tridiagonal matrix.

qsiz

`INTEGER`.

The dimension of the orthogonal/unitary matrix used to reduce the full matrix to tridiagonal form; *qsiz*≥*n* (for real flavors, *qsiz*≥*n* if *icompq* = 1).

n

`INTEGER`. The dimension of the symmetric tridiagonal matrix (*n*≥ 0).

d, *e*, *rwork*

`REAL` for single-precision flavors

`DOUBLE PRECISION` for double-precision flavors. Arrays:

d(*) contains the main diagonal of the tridiagonal matrix. The dimension of *d* must be at least max(1, *n*).

e(*) contains the off-diagonal elements of the tridiagonal matrix. The dimension of *e* must be at least max(1, *n*–1).

rwork(*) is a workspace array used in complex flavors only. The dimension of *rwork* must be at least $(1 + 3n + 2n\log_2(n) + 3n^2)$, where $\log_2(n)$ = smallest integer k such that $2^k \geq n$.

q, *qstore*

REAL for slaed0

DOUBLE PRECISION for dlaed0

COMPLEX for claed0

DOUBLE COMPLEX for zlaed0.

Arrays: *q*(*ldq*, *), *qstore*(*ldqs*, *). The second dimension of these arrays must be at least max(1, *n*).

For real flavors:

If *icompq* = 0, array *q* is not referenced.

If *icompq* = 1, on entry, *q* is a subset of the columns of the orthogonal matrix used to reduce the full matrix to tridiagonal form corresponding to the subset of the full matrix which is being decomposed at this time.

If *icompq* = 2, on entry, *q* will be the identity matrix. The array *qstore* is a workspace array referenced only when *icompq* = 1. Used to store parts of the eigenvector matrix when the updating matrix multiplies take place.

For complex flavors:

On entry, *q* must contain an *qsiz*-by-*n* matrix whose columns are unitarily orthonormal. It is a part of the unitary matrix that reduces the full dense Hermitian matrix to a (reducible) symmetric tridiagonal matrix. The array *qstore* is a workspace array used to store parts of the eigenvector matrix when the updating matrix multiplies take place.

ldq

INTEGER. The leading dimension of the array *q*; *ldq* ≥ max(1, *n*).

ldqs

INTEGER. The leading dimension of the array *qstore*; *ldqs* ≥ max(1, *n*).

work

REAL for slaed0

DOUBLE PRECISION for dlaed0.

Workspace array, used in real flavors only.

If *icompq* = 0 or 1, the dimension of *work* must be at least $(1 + 3n + 2n\log_2(n) + 3n^2)$, where $\log_2(n)$ = smallest integer k such that $2^k \geq n$.

If *icompq* = 2, the dimension of *work* must be at least $(4n + n^2)$.

iwork

INTEGER.

Workspace array.

For real flavors, if *icompq* = 0 or 1, and for complex flavors, the dimension of *iwork* must be at least $(6 + 6n + 5n\log_2(n))$.

For real flavors, if *icompq* = 2, the dimension of *iwork* must be at least (3+5*n*).

Output Parameters

d — On exit, contains eigenvalues in ascending order.

e — On exit, the array is destroyed.

q — If *icompq* = 2, on exit, *q* contains the eigenvectors of the tridiagonal matrix.

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i* >0, the algorithm failed to compute an eigenvalue while working on the submatrix lying in rows and columns *i*/(*n*+1) through mod(*i*, *n*+1).

?laed1

Used by sstedc/dstedc*. Computes the updated eigensystem of a diagonal matrix after modification by a rank-one symmetric matrix. Used when the original matrix is tridiagonal.*

Syntax

```
call slaed1( n, d, q, ldq, indxq, rho, cutpnt, work, iwork, info )
call dlaed1( n, d, q, ldq, indxq, rho, cutpnt, work, iwork, info )
```

Include Files

- mkl.fi

Description

The routine ?laed1 computes the updated eigensystem of a diagonal matrix after modification by a rank-one symmetric matrix. This routine is used only for the eigenproblem which requires all eigenvalues and eigenvectors of a tridiagonal matrix. ?laed7 handles the case in which eigenvalues only or eigenvalues and eigenvectors of a full symmetric matrix (which was reduced to tridiagonal form) are desired.

$T = Q(\text{in})*(D(\text{in})+ rho*Z*Z^T)*Q^T(\text{in}) = Q(\text{out})*D(\text{out})*Q^T(\text{out})$

where $Z = Q^T u$, u is a vector of length *n* with ones in the *cutpnt* and (*cutpnt*+1) -th elements and zeros elsewhere. The eigenvectors of the original matrix are stored in *Q*, and the eigenvalues are in *D*. The algorithm consists of three stages:

The first stage consists of deflating the size of the problem when there are multiple eigenvalues or if there is a zero in the *z* vector. For each such occurrence the dimension of the secular equation problem is reduced by one. This stage is performed by the routine ?laed2.

The second stage consists of calculating the updated eigenvalues. This is done by finding the roots of the secular equation via the routine ?laed4 (as called by ?laed3). This routine also calculates the eigenvectors of the current problem.

The final stage consists of computing the updated eigenvectors directly using the updated eigenvalues. The eigenvectors for the current problem are multiplied with the eigenvectors from the overall problem.

Input Parameters

n	INTEGER. The dimension of the symmetric tridiagonal matrix ($n \geq 0$).
d, *q*, *work*	REAL for slaed1 DOUBLE PRECISION for dlaed1. Arrays: *d*(*) contains the eigenvalues of the rank-1-perturbed matrix. The dimension of *d* must be at least max(1, *n*). *q*(*ldq*, *) contains the eigenvectors of the rank-1-perturbed matrix. The second dimension of *q* must be at least max(1, *n*). *work*(*) is a workspace array, dimension at least ($4n+n^2$).
ldq	INTEGER. The leading dimension of the array *q*; $ldq \geq \max(1, n)$.
indxq	INTEGER. Array, dimension (*n*). On entry, the permutation which separately sorts the two subproblems in *d* into ascending order.
rho	REAL for slaed1 DOUBLE PRECISION for dlaed1. The subdiagonal entry used to create the rank-1 modification. This parameter can be modified by ?laed2, where it is input/output.
cutpnt	INTEGER. The location of the last eigenvalue in the leading sub-matrix. $\min(1,n) \leq cutpnt \leq n/2$.
iwork	INTEGER. Workspace array, dimension (4*n*).

Output Parameters

d	On exit, contains the eigenvalues of the repaired matrix.
q	On exit, *q* contains the eigenvectors of the repaired tridiagonal matrix.
indxq	On exit, contains the permutation which will reintegrate the subproblems back into sorted order, that is, *d*(*indxq*(i = 1, *n*)) will be in ascending order.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = 1, an eigenvalue did not converge.

?laed2

Used by `sstedc/dstedc`*. Merges eigenvalues and deflates secular equation. Used when the original matrix is tridiagonal.*

Syntax

```
call slaed2( k, n, n1, d, q, ldq, indxq, rho, z, dlamda, w, q2, indx, indxc, indxp, coltyp, info )
call dlaed2( k, n, n1, d, q, ldq, indxq, rho, z, dlamda, w, q2, indx, indxc, indxp, coltyp, info )
```

Include Files

- `mkl.fi`

Description

The routine `?laed2` merges the two sets of eigenvalues together into a single sorted set. Then it tries to deflate the size of the problem. There are two ways in which deflation can occur: when two or more eigenvalues are close together or if there is a tiny entry in the *z* vector. For each such occurrence the order of the related secular equation problem is reduced by one.

Input Parameters

k	`INTEGER`. The number of non-deflated eigenvalues, and the order of the related secular equation (`0 ≤ k ≤ n`).
n	`INTEGER`. The dimension of the symmetric tridiagonal matrix (`n≥ 0`).
n1	`INTEGER`. The location of the last eigenvalue in the leading sub-matrix; `min(1,n) ≤ n1 ≤ n/2`.
d, *q*, *z*	`REAL` for `slaed2` `DOUBLE PRECISION` for `dlaed2`. Arrays: `d(*)` contains the eigenvalues of the two submatrices to be combined. The dimension of *d* must be at least `max(1, n)`. `q(ldq, *)` contains the eigenvectors of the two submatrices in the two square blocks with corners at (1,1), (*n1*,*n1*) and (*n1*+1,*n1*+1), (*n*,*n*). The second dimension of *q* must be at least `max(1, n)`. `z(*)` contains the updating vector (the last row of the first sub-eigenvector matrix and the first row of the second sub-eigenvector matrix).
ldq	`INTEGER`. The leading dimension of the array *q*; `ldq≥ max(1, n)`.
indxq	`INTEGER`. Array, dimension (*n*). On entry, the permutation which separately sorts the two subproblems in *d* into ascending order. Note that elements in the second half of this permutation must first have *n1* added to their values.
rho	`REAL` for `slaed2`

DOUBLE PRECISION for dlaed2.

On entry, the off-diagonal element associated with the rank-1 cut which originally split the two submatrices which are now being recombined.

indx, *indxp*

INTEGER.

Workspace arrays, dimension (*n*) each. Array *indx* contains the permutation used to sort the contents of *dlamda* into ascending order.

Array *indxp* contains the permutation used to place deflated values of *d* at the end of the array.

indxp(1:*k*) points to the nondeflated *d*-values and *indxp*(*k*+1:*n*) points to the deflated eigenvalues.

coltyp

INTEGER.

Workspace array, dimension (*n*).

During execution, a label which will indicate which of the following types a column in the *q2* matrix is:

1 : non-zero in the upper half only;

2 : dense;

3 : non-zero in the lower half only;

4 : deflated.

Output Parameters

d

On exit, *d* contains the trailing (*n*-*k*) updated eigenvalues (those which were deflated) sorted into increasing order.

q

On exit, *q* contains the trailing (*n*-*k*) updated eigenvectors (those which were deflated) in its last *n*-*k* columns.

z

On exit, *z* content is destroyed by the updating process.

indxq

Destroyed on exit.

rho

On exit, *rho* has been modified to the value required by ?laed3.

dlamda, *w*, *q2*

REAL for slaed2

DOUBLE PRECISION for dlaed2.

Arrays: *dlamda*(*n*), *w*(*n*), *q2*($n1^2$+(*n*-*n1*)^2).

The array *dlamda* contains a copy of the first *k* eigenvalues which is used by ?laed3 to form the secular equation.

The array *w* contains the first *k* values of the final deflation-altered *z*-vector which is passed to ?laed3.

The array *q2* contains a copy of the first *k* eigenvectors which is used by ?laed3 in a matrix multiply (sgemm/dgemm) to solve for the new eigenvectors.

indxc

INTEGER. Array, dimension (*n*).

The permutation used to arrange the columns of the deflated *q* matrix into three groups: the first group contains non-zero elements only at and above *n1*, the second contains non-zero elements only below *n1*, and the third is dense.

coltyp — On exit, *coltyp*(i) is the number of columns of type i, for i=1 to 4 only (see the definition of types in the description of *coltyp* in *Input Parameters*).

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

?laed3

Used by sstedc/dstedc*. Finds the roots of the secular equation and updates the eigenvectors. Used when the original matrix is tridiagonal.*

Syntax

```
call slaed3( k, n, n1, d, q, ldq, rho, dlamda, q2, indx, ctot, w, s, info )
call dlaed3( k, n, n1, d, q, ldq, rho, dlamda, q2, indx, ctot, w, s, info )
```

Include Files

- mkl.fi

Description

The routine ?laed3 finds the roots of the secular equation, as defined by the values in *d*, *w*, and *rho*, between 1 and *k*.

It makes the appropriate calls to ?laed4 and then updates the eigenvectors by multiplying the matrix of eigenvectors of the pair of eigensystems being combined by the matrix of eigenvectors of the *k*-by-*k* system which is solved here.

This code makes very mild assumptions about floating point arithmetic. It will work on machines with a guard digit in add/subtract, or on those binary machines without guard digits which subtract like the Cray X-MP, Cray Y-MP, Cray C-90, or Cray-2. It could conceivably fail on hexadecimal or decimal machines without guard digits, but none are known.

Input Parameters

k — INTEGER. The number of terms in the rational function to be solved by ?laed4 (*k*≥ 0).

n — INTEGER. The number of rows and columns in the *q* matrix. *n*≥*k* (deflation may result in *n* >*k*).

n1 — INTEGER. The location of the last eigenvalue in the leading sub-matrix; min(1,*n*) ≤ *n1* ≤ *n*/2.

q — REAL for slaed3

DOUBLE PRECISION for dlaed3.

Array *q*(*ldq*, *). The second dimension of *q* must be at least max(1, *n*).

Initially, the first *k* columns of this array are used as workspace.

ldq INTEGER. The leading dimension of the array *q*; *ldq*≥ max(1, *n*).

rho REAL for slaed3

DOUBLE PRECISION for dlaed3.

The value of the parameter in the rank one update equation. *rho*≥ 0 required.

dlamda, *q2*, *w* REAL for slaed3

DOUBLE PRECISION for dlaed3.

Arrays: *dlamda*(*k*), *q2*(*ldq2*, *), *w*(*k*).

The first *k* elements of the array *dlamda* contain the old roots of the deflated updating problem. These are the poles of the secular equation.

The first *k* columns of the array *q2* contain the non-deflated eigenvectors for the split problem. The second dimension of *q2* must be at least max(1, *n*).

The first *k* elements of the array *w* contain the components of the deflation-adjusted updating vector.

indx INTEGER. Array, dimension (*n*).

The permutation used to arrange the columns of the deflated *q* matrix into three groups (see ?laed2).

The rows of the eigenvectors found by ?laed4 must be likewise permuted before the matrix multiply can take place.

ctot INTEGER. Array, dimension (4).

A count of the total number of the various types of columns in *q*, as described in *indx*. The fourth column type is any column which has been deflated.

s REAL for slaed3

DOUBLE PRECISION for dlaed3.

Workspace array, dimension (*n1*+1)**k* .

Will contain the eigenvectors of the repaired matrix which will be multiplied by the previously accumulated eigenvectors to update the system.

Output Parameters

d REAL for slaed3

DOUBLE PRECISION for dlaed3.

Array, dimension at least max(1, *n*).

d(i) contains the updated eigenvalues for 1 ≤ i ≤ *k*.

q On exit, the columns 1 to *k* of *q* contain the updated eigenvectors.

dlamda May be changed on output by having lowest order bit set to zero on Cray X-MP, Cray Y-MP, Cray-2, or Cray C-90, as described above.

w	Destroyed on exit.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = 1, an eigenvalue did not converge.

?laed4

Used by sstedc/dstedc*. Finds a single root of the secular equation.*

Syntax

```
call slaed4( n, i, d, z, delta, rho, dlam, info )
call dlaed4( n, i, d, z, delta, rho, dlam, info )
```

Include Files

- mkl.fi

Description

This routine computes the *i*-th updated eigenvalue of a symmetric rank-one modification to a diagonal matrix whose elements are given in the array *d*, and that

D(i) < *D*(*j*) for *i* < *j*

and that *rho* > 0. This is arranged by the calling routine, and is no loss in generality. The rank-one modified system is thus

diag(*D*) + *rho***Z* * transpose(*Z*).

where we assume the Euclidean norm of *Z* is 1.

The method consists of approximating the rational functions in the secular equation by simpler interpolating rational functions.

Input Parameters

n	INTEGER. The length of all arrays.
i	INTEGER. The index of the eigenvalue to be computed; 1 ≤ i ≤ *n*.
d, *z*	REAL for slaed4 DOUBLE PRECISION for dlaed4 Arrays, dimension (*n*) each. The array *d* contains the original eigenvalues. It is assumed that they are in order, *d*(i) < *d*(*j*) for *i* < *j*. The array *z* contains the components of the updating vector *Z*.
rho	REAL for slaed4 DOUBLE PRECISION for dlaed4 The scalar in the symmetric updating formula.

Output Parameters

delta — REAL for slaed4

DOUBLE PRECISION for dlaed4

Array, dimension (*n*).

If *n* ≠ 1, *delta* contains (*d(j) – lambda_i*) in its *j*-th component. If *n* = 1, then *delta*(1) = 1. The vector *delta* contains the information necessary to construct the eigenvectors.

dlam — REAL for slaed4

DOUBLE PRECISION for dlaed4

The computed *lambda_i*, the *i*-th updated eigenvalue.

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = 1, the updating process failed.

?laed5

Used by sstedc/dstedc*. Solves the 2-by-2 secular equation.*

Syntax

```
call slaed5( i, d, z, delta, rho, dlam )
call dlaed5( i, d, z, delta, rho, dlam )
```

Include Files

- mkl.fi

Description

The routine computes the *i*-th eigenvalue of a symmetric rank-one modification of a 2-by-2 diagonal matrix diag(*D*) + *rho***Z* * transpose(*Z*).

The diagonal elements in the array *D* are assumed to satisfy

D(i) < *D*(*j*) for *i* < *j*.

We also assume *rho* > 0 and that the Euclidean norm of the vector *Z* is one.

Input Parameters

i — INTEGER. The index of the eigenvalue to be computed;

1 ≤ i ≤ 2.

d, *z* — REAL for slaed5

DOUBLE PRECISION for dlaed5

Arrays, dimension (2) each. The array *d* contains the original eigenvalues. It is assumed that *d*(1) < *d*(2).

The array *z* contains the components of the updating vector.

rho

`REAL` for `slaed5`

`DOUBLE PRECISION` for `dlaed5`

The scalar in the symmetric updating formula.

Output Parameters

delta

`REAL` for `slaed5`

`DOUBLE PRECISION` for `dlaed5`

Array, dimension (2).

The vector *delta* contains the information necessary to construct the eigenvectors.

dlam

`REAL` for `slaed5`

`DOUBLE PRECISION` for `dlaed5`

The computed *lambda_i*, the *i*-th updated eigenvalue.

?laed6

Used by `sstedc`/`dstedc`*. Computes one Newton step in solution of the secular equation.*

Syntax

```
call slaed6( kniter, orgati, rho, d, z, finit, tau, info )
call dlaed6( kniter, orgati, rho, d, z, finit, tau, info )
```

Include Files

- `mkl.fi`

Description

The routine computes the positive or negative root (closest to the origin) of

$$f(x) = rho + \frac{z(1)}{d(1) - x} + \frac{z(2)}{d(2) - x} + \frac{z(3)}{d(3) - x}$$

It is assumed that if *orgati* = `.TRUE.` the root is between *d*(2) and *d*(3);otherwise it is between *d*(1) and *d*(2) This routine is called by `?laed4` when necessary. In most cases, the root sought is the smallest in magnitude, though it might not be in some extremely rare situations.

Input Parameters

kniter

`INTEGER`.

Refer to `?laed4` for its significance.

orgati

`LOGICAL`.

If *orgati* = .TRUE., the needed root is between *d*(2) and *d*(3); otherwise it is between *d*(1) and *d*(2). See ?laed4 for further details.

rho

REAL for slaed6

DOUBLE PRECISION for dlaed6

Refer to the equation for *f*(*x*) above.

d, *z*

REAL for slaed6

DOUBLE PRECISION for dlaed6

Arrays, dimension (3) each.

The array *d* satisfies *d*(1) < *d*(2) < *d*(3).

Each of the elements in the array *z* must be positive.

finit

REAL for slaed6

DOUBLE PRECISION for dlaed6

The value of *f*(*x*) at 0. It is more accurate than the one evaluated inside this routine (if someone wants to do so).

Output Parameters

tau

REAL for slaed6

DOUBLE PRECISION for dlaed6

The root of the equation for *f*(*x*).

info

INTEGER.

If *info* = 0, the execution is successful.

If *info* = 1, failure to converge.

?laed7

Used by ?stedc*. Computes the updated eigensystem of a diagonal matrix after modification by a rank-one symmetric matrix. Used when the original matrix is dense.*

Syntax

```
call slaed7( icompq, n, qsiz, tlvls, curlvl, curpbm, d, q, ldq, indxq, rho, cutpnt,
qstore, qptr, prmptr, perm, givptr, givcol, givnum, work, iwork, info )
```

```
call dlaed7( icompq, n, qsiz, tlvls, curlvl, curpbm, d, q, ldq, indxq, rho, cutpnt,

Description

The routine ?laed7 computes the updated eigensystem of a diagonal matrix after modification by a rank-one symmetric matrix. This routine is used only for the eigenproblem which requires all eigenvalues and optionally eigenvectors of a dense symmetric/Hermitian matrix that has been reduced to tridiagonal form. For real flavors, slaed1/dlaed1 handles the case in which all eigenvalues and eigenvectors of a symmetric tridiagonal matrix are desired.

$T = Q(\text{in})*(D(\text{in})+rho*Z*Z^T)*Q^T(\text{in}) = Q(\text{out})*D(\text{out})*Q^T(\text{out})$ for real flavors, or

$T = Q(\text{in})*(D(\text{in})+rho*Z*Z^H)*Q^H(\text{in}) = Q(\text{out})*D(\text{out})*Q^H(\text{out})$ for complex flavors

where $Z = Q^T*u$ for real flavors and $Z = Q^H*u$ for complex flavors, *u* is a vector of length *n* with ones in the *cutpnt* and ($cutpnt + 1$) -th elements and zeros elsewhere. The eigenvectors of the original matrix are stored in *Q*, and the eigenvalues are in *D*. The algorithm consists of three stages:

The first stage consists of deflating the size of the problem when there are multiple eigenvalues or if there is a zero in the *z* vector. For each such occurrence the dimension of the secular equation problem is reduced by one. This stage is performed by the routine slaed8/dlaed8 (for real flavors) or by the routine slaed2/dlaed2 (for complex flavors).

The second stage consists of calculating the updated eigenvalues. This is done by finding the roots of the secular equation via the routine ?laed4 (as called by ?laed9 or ?laed3). This routine also calculates the eigenvectors of the current problem.

The final stage consists of computing the updated eigenvectors directly using the updated eigenvalues. The eigenvectors for the current problem are multiplied with the eigenvectors from the overall problem.

Input Parameters

icompq
INTEGER. Used with real flavors only.
If $icompq = 0$, compute eigenvalues only.
If $icompq = 1$, compute eigenvectors of original dense symmetric matrix also. On entry, the array *q* must contain the orthogonal matrix used to reduce the original matrix to tridiagonal form.

n
INTEGER. The dimension of the symmetric tridiagonal matrix ($n \geq 0$).

cutpnt
INTEGER. The location of the last eigenvalue in the leading sub-matrix. $\min(1,n) \leq cutpnt \leq n$.

qsiz
INTEGER.
The dimension of the orthogonal/unitary matrix used to reduce the full matrix to tridiagonal form; $qsiz \geq n$ (for real flavors, $qsiz \geq n$ if $icompq = 1$).

tlvls
INTEGER. The total number of merging levels in the overall divide and conquer tree.

curlvl
INTEGER. The current level in the overall merge routine, $0 \leq curlvl \leq tlvls$.

curpbm
INTEGER. The current problem in the current level in the overall merge routine (counting from upper left to lower right).

d
REAL for slaed7/claed7

DOUBLE PRECISION for dlaed7/zlaed7.

Array, dimension at least max(1, *n*).

Array *d*(*) contains the eigenvalues of the rank-1-perturbed matrix.

q, *work*

REAL for slaed7

DOUBLE PRECISION for dlaed7

COMPLEX for claed7

DOUBLE COMPLEX for zlaed7.

Arrays:

q(*ldq*, *) contains the eigenvectors of the rank-1-perturbed matrix. The second dimension of *q* must be at least max(1, *n*).

work(*) is a workspace array, dimension at least (3*n*+2**qsiz***n*) for real flavors and at least (*qsiz***n*) for complex flavors.

ldq

INTEGER. The leading dimension of the array *q*; *ldq*≥ max(1, *n*).

indxq

INTEGER. Array, dimension (*n*).

Contains the permutation that separately sorts the two sub-problems in *d* into ascending order.

rho

REAL for slaed7 /claed7

DOUBLE PRECISION for dlaed7/zlaed7.

The subdiagonal element used to create the rank-1 modification.

qstore

REAL for slaed7/claed7

DOUBLE PRECISION for dlaed7/zlaed7.

Array, dimension (n^2+1). Serves also as output parameter.

Stores eigenvectors of submatrices encountered during divide and conquer, packed together. *qptr* points to beginning of the submatrices.

qptr

INTEGER. Array, dimension (*n*+2). Serves also as output parameter. List of indices pointing to beginning of submatrices stored in *qstore*. The submatrices are numbered starting at the bottom left of the divide and conquer tree, from left to right and bottom to top.

prmptr, *perm*, *givptr*

INTEGER. Arrays, dimension ($n \log_2 n$) each.

The array *prmptr*(*) contains a list of pointers which indicate where in *perm* a level's permutation is stored. *prmptr*(i+1) – *prmptr*(i) indicates the size of the permutation and also the size of the full, non-deflated problem.

The array *perm*(*) contains the permutations (from deflation and sorting) to be applied to each eigenblock. This parameter can be modified by ?laed8, where it is output.

The array *givptr*(*) contains a list of pointers which indicate where in *givcol* a level's Givens rotations are stored. *givptr*(i+1) – *givptr*(i) indicates the number of Givens rotations.

givcol

INTEGER. Array, dimension (2, $n \log_2 n$).

Each pair of numbers indicates a pair of columns to take place in a Givens rotation.

givnum REAL for slaed7/claed7

DOUBLE PRECISION for dlaed7/zlaed7.

Array, dimension (2, $n \log_2 n$).

Each number indicates the *S* value to be used in the corresponding Givens rotation.

iwork INTEGER.

Workspace array, dimension (4*n*).

rwork REAL for claed7

DOUBLE PRECISION for zlaed7.

Workspace array, dimension (3*n*+2*qsiz***n*). Used in complex flavors only.

Output Parameters

d On exit, contains the eigenvalues of the repaired matrix.

q On exit, *q* contains the eigenvectors of the repaired tridiagonal matrix.

indxq INTEGER. Array, dimension (*n*).

Contains the permutation that reintegrates the subproblems back into a sorted order, that is,

d(*indxq*(i = 1, *n*)) will be in the ascending order.

rho This parameter can be modified by ?laed8, where it is input/output.

prmptr, *perm*, *givptr* INTEGER. Arrays, dimension ($n \log_2 n$) each.

The array *prmptr* contains an updated list of pointers.

The array *perm* contains an updated permutation.

The array *givptr* contains an updated list of pointers.

givcol This parameter can be modified by ?laed8, where it is output.

givnum This parameter can be modified by ?laed8, where it is output.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = 1, an eigenvalue did not converge.

?laed8

Used by ?stedc*. Merges eigenvalues and deflates secular equation. Used when the original matrix is dense.*

Syntax

call slaed8(*icompq*, *k*, *n*, *qsiz*, *d*, *q*, *ldq*, *indxq*, *rho*, *cutpnt*, *z*, *dlamda*, *q2*, *ldq2*, *w*, *perm*, *givptr*, *givcol*, *givnum*, *indxp*, *indx*, *info*)

call dlaed8(*icompq*, *k*, *n*, *qsiz*, *d*, *q*, *ldq*, *indxq*, *rho*, *cutpnt*, *z*, *dlamda*, *q2*, *ldq2*, *w*, *perm*, *givptr*, *givcol*, *givnum*, *indxp*, *indx*, *info*)

call claed8(*k*, *n*, *qsiz*, *q*, *ldq*, *d*, *rho*, *cutpnt*, *z*, *dlamda*, *q2*, *ldq2*, *w*, *indxp*, *indx*, *indxq*, *perm*, *givptr*, *givcol*, *givnum*, *info*)

call zlaed8(*k*, *n*, *qsiz*, *q*, *ldq*, *d*, *rho*, *cutpnt*, *z*, *dlamda*, *q2*, *ldq2*, *w*, *indxp*, *indx*, *indxq*, *perm*, *givptr*, *givcol*, *givnum*, *info*)

Include Files

- mkl.fi

Description

The routine merges the two sets of eigenvalues together into a single sorted set. Then it tries to deflate the size of the problem. There are two ways in which deflation can occur: when two or more eigenvalues are close together or if there is a tiny element in the *z* vector. For each such occurrence the order of the related secular equation problem is reduced by one.

Input Parameters

icompq

INTEGER. Used with real flavors only.

If *icompq* = 0, compute eigenvalues only.

If *icompq* = 1, compute eigenvectors of original dense symmetric matrix also.

On entry, the array *q* must contain the orthogonal matrix used to reduce the original matrix to tridiagonal form.

n

INTEGER. The dimension of the symmetric tridiagonal matrix ($n \geq 0$).

cutpnt

INTEGER. The location of the last eigenvalue in the leading sub-matrix. $\min(1,n) \leq cutpnt \leq n$.

qsiz

INTEGER.

The dimension of the orthogonal/unitary matrix used to reduce the full matrix to tridiagonal form; $qsiz \geq n$ (for real flavors, $qsiz \geq n$ if $icompq = 1$).

d, *z*

REAL for slaed8/claed8

DOUBLE PRECISION for dlaed8/zlaed8.

Arrays, dimension at least max(1, *n*) each. The array *d*(*) contains the eigenvalues of the two submatrices to be combined.

On entry, *z*(*) contains the updating vector (the last row of the first sub-eigenvector matrix and the first row of the second sub-eigenvector matrix). The contents of *z* are destroyed by the updating process.

q

REAL for slaed8

DOUBLE PRECISION for dlaed8

COMPLEX for claed8

DOUBLE COMPLEX for zlaed8.

Array

q(*ldq*, *). The second dimension of *q* must be at least max(1, *n*). On entry, *q* contains the eigenvectors of the partially solved system which has been previously updated in matrix multiplies with other partially solved eigensystems.

For real flavors, If *icompq* = 0, *q* is not referenced.

ldq — INTEGER. The leading dimension of the array *q*; *ldq* ≥ max(1, *n*).

ldq2 — INTEGER. The leading dimension of the output array *q2*; *ldq2* ≥ max(1, *n*).

indxq — INTEGER. Array, dimension (*n*).

The permutation that separately sorts the two sub-problems in *d* into ascending order. Note that elements in the second half of this permutation must first have *cutpnt* added to their values in order to be accurate.

rho — REAL for slaed8/claed8

DOUBLE PRECISION for dlaed8/zlaed8.

On entry, the off-diagonal element associated with the rank-1 cut which originally split the two submatrices which are now being recombined.

Output Parameters

k — INTEGER. The number of non-deflated eigenvalues, and the order of the related secular equation.

d — On exit, contains the trailing (*n*-*k*) updated eigenvalues (those which were deflated) sorted into increasing order.

z — On exit, the updating process destroys the contents of *z*.

q — On exit, *q* contains the trailing (*n*-*k*) updated eigenvectors (those which were deflated) in its last (*n*-*k*) columns.

indxq — INTEGER. Array, dimension (*n*).

The permutation of merged eigenvalues set.

rho — On exit, *rho* has been modified to the value required by ?laed3.

dlamda, *w* — REAL for slaed8/claed8

DOUBLE PRECISION for dlaed8/zlaed8.

Arrays, dimension (*n*) each. The array *dlamda*(*) contains a copy of the first *k* eigenvalues which will be used by ?laed3 to form the secular equation.

The array *w*(*) will hold the first *k* values of the final deflation-altered *z*-vector and will be passed to ?laed3.

q2 — REAL for slaed8

DOUBLE PRECISION for dlaed8

COMPLEX for claed8

DOUBLE COMPLEX for zlaed8.

Array

q2(*ldq2*, *). The second dimension of *q2* must be at least max(1, *n*).

Contains a copy of the first *k* eigenvectors which will be used by slaed7/dlaed7 in a matrix multiply (sgemm/dgemm) to update the new eigenvectors. For real flavors, If *icompq* = 0, *q2* is not referenced.

indxp, *indx* — INTEGER. Workspace arrays, dimension (*n*) each.

The array *indxp*(*) will contain the permutation used to place deflated values of *d* at the end of the array. On output, *indxp*(1:*k*) points to the nondeflated *d*-values and *indxp*(*k*+1:*n*) points to the deflated eigenvalues.

The array *indx*(*) will contain the permutation used to sort the contents of *d* into ascending order.

perm — INTEGER. Array, dimension (*n*).

Contains the permutations (from deflation and sorting) to be applied to each eigenblock.

givptr — INTEGER. Contains the number of Givens rotations which took place in this subproblem.

givcol — INTEGER. Array, dimension (2, *n*).

Each pair of numbers indicates a pair of columns to take place in a Givens rotation.

givnum — REAL for slaed8/claed8

DOUBLE PRECISION for dlaed8/zlaed8.

Array, dimension (2, *n*).

Each number indicates the *S* value to be used in the corresponding Givens rotation.

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

?laed9

Used by sstedc/dstedc*. Finds the roots of the secular equation and updates the eigenvectors. Used when the original matrix is dense.*

Syntax

```
call slaed9( k, kstart, kstop, n, d, q, ldq, rho, dlamda, w, s, lds, info )
call dlaed9( k, kstart, kstop, n, d, q, ldq, rho, dlamda, w, s, lds, info )
```

Include Files

- mkl.fi

Description

The routine finds the roots of the secular equation, as defined by the values in *d*, *z*, and *rho*, between *kstart* and *kstop*. It makes the appropriate calls to slaed4/dlaed4 and then stores the new matrix of eigenvectors for use in calculating the next level of *z* vectors.

Input Parameters

k

INTEGER. The number of terms in the rational function to be solved by slaed4/dlaed4 (*k*≥ 0).

kstart, *kstop*

INTEGER. The updated eigenvalues *lambda*(i),

kstart ≤ i ≤ *kstop* are to be computed.

1 ≤ *kstart* ≤ *kstop* ≤ *k*.

n

INTEGER. The number of rows and columns in the *Q* matrix. *n*≥*k* (deflation may result in *n* > *k*).

q

REAL for slaed9

DOUBLE PRECISION for dlaed9.

Workspace array, dimension (*ldq*, *).

The second dimension of *q* must be at least max(1, *n*).

ldq

INTEGER. The leading dimension of the array *q*; *ldq*≥ max(1, *n*).

rho

REAL for slaed9

DOUBLE PRECISION for dlaed9

The value of the parameter in the rank one update equation. *rho*≥ 0 required.

dlamda, *w*

REAL for slaed9

DOUBLE PRECISION for dlaed9

Arrays, dimension (*k*) each. The first *k* elements of the array *dlamda*(*) contain the old roots of the deflated updating problem. These are the poles of the secular equation.

The first *k* elements of the array *w*(*) contain the components of the deflation-adjusted updating vector.

lds

INTEGER. The leading dimension of the output array *s*; *lds*≥ max(1, *k*).

Output Parameters

d

REAL for slaed9

DOUBLE PRECISION for dlaed9

	Array, dimension (*n*). Elements in *d(i)* are not referenced for `1 ≤ i < kstart` or `kstop < i ≤ n`.
s	`REAL` for `slaed9` `DOUBLE PRECISION` for `dlaed9`. Array, dimension (*lds*, *) . The second dimension of *s* must be at least `max(1, k)`. Will contain the eigenvectors of the repaired matrix which will be stored for subsequent *z* vector calculation and multiplied by the previously accumulated eigenvectors to update the system.
dlamda	On exit, the value is modified to make sure all `dlamda(i) - dlamda(j)` can be computed with high relative accuracy, barring overflow and underflow.
w	Destroyed on exit.
info	`INTEGER`. If `info = 0`, the execution is successful. If `info = -i`, the *i*-th parameter had an illegal value. If `info = 1`, the eigenvalue did not converge.

?laeda

Used by `?stedc`*. Computes the Z vector determining the rank-one modification of the diagonal matrix. Used when the original matrix is dense.*

Syntax

`call slaeda( n, tlvls, curlvl, curpbm, prmptr, perm, givptr, givcol, givnum, q, qptr, z, ztemp, info )`

`call dlaeda( n, tlvls, curlvl, curpbm, prmptr, perm, givptr, givcol, givnum, q, qptr, z, ztemp, info )`

Include Files

- `mkl.fi`

Description

The routine `?laeda` computes the *Z* vector corresponding to the merge step in the *curlvl*-th step of the merge process with *tlvls* steps for the *curpbm*-th problem.

Input Parameters

n	`INTEGER`. The dimension of the symmetric tridiagonal matrix (*n*≥ `0`).
tlvls	`INTEGER`. The total number of merging levels in the overall divide and conquer tree.
curlvl	`INTEGER`. The current level in the overall merge routine, `0 ≤ curlvl ≤ tlvls` .

curpbm — INTEGER. The current problem in the current level in the overall merge routine (counting from upper left to lower right).

prmptr, *perm*, *givptr* — INTEGER. Arrays, dimension ($n \log_2 n$) each.

The array *prmptr*(*) contains a list of pointers which indicate where in *perm* a level's permutation is stored. *prmptr*(i+1) – *prmptr*(i) indicates the size of the permutation and also the size of the full, non-deflated problem.

The array *perm*(*) contains the permutations (from deflation and sorting) to be applied to each eigenblock.

The array *givptr*(*) contains a list of pointers which indicate where in *givcol* a level's Givens rotations are stored. *givptr*(i+1) – *givptr*(i) indicates the number of Givens rotations.

givcol — INTEGER. Array, dimension (2, $n \log_2 n$).

Each pair of numbers indicates a pair of columns to take place in a Givens rotation.

givnum — REAL for slaeda

DOUBLE PRECISION for dlaeda.

Array, dimension (2, $n \log_2 n$).

Each number indicates the *S* value to be used in the corresponding Givens rotation.

q — REAL for slaeda

DOUBLE PRECISION for dlaeda.

Array, dimension (n^2).

Contains the square eigenblocks from previous levels, the starting positions for blocks are given by *qptr*.

qptr — INTEGER. Array, dimension (*n*+2). Contains a list of pointers which indicate where in *q* an eigenblock is stored. sqrt(*qptr*(i+1) – *qptr*(i)) indicates the size of the block.

ztemp — REAL for slaeda

DOUBLE PRECISION for dlaeda.

Workspace array, dimension (*n*).

Output Parameters

z — REAL for slaeda

DOUBLE PRECISION for dlaeda.

Array, dimension (*n*). Contains the updating vector (the last row of the first sub-eigenvector matrix and the first row of the second sub-eigenvector matrix).

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = –*i*, the *i*-th parameter had an illegal value.

?laein

Computes a specified right or left eigenvector of an upper Hessenberg matrix by inverse iteration.

Syntax

```
call slaein( rightv, noinit, n, h, ldh, wr, wi, vr, vi, b, ldb, work, eps3, smlnum, bignum, info )
call dlaein( rightv, noinit, n, h, ldh, wr, wi, vr, vi, b, ldb, work, eps3, smlnum, bignum, info )
call claein( rightv, noinit, n, h, ldh, w, v, b, ldb, rwork, eps3, smlnum, info )
call zlaein( rightv, noinit, n, h, ldh, w, v, b, ldb, rwork, eps3, smlnum, info )
```

Include Files

- mkl.fi

Description

The routine ?laein uses inverse iteration to find a right or left eigenvector corresponding to the eigenvalue (*wr*,*wi*) of a real upper Hessenberg matrix *H* (for real flavors slaein/dlaein) or to the eigenvalue *w* of a complex upper Hessenberg matrix *H* (for complex flavors claein/zlaein).

Input Parameters

rightv

LOGICAL.

If *rightv* = .TRUE., compute right eigenvector;

if *rightv* = .FALSE., compute left eigenvector.

noinit

LOGICAL.

If *noinit* = .TRUE., no initial vector is supplied in (*vr*,*vi*) or in *v* (for complex flavors);

if *noinit* = .FALSE., initial vector is supplied in (*vr*,*vi*) or in *v* (for complex flavors).

n

INTEGER. The order of the matrix *H* ($n \geq 0$).

h

REAL for slaein

DOUBLE PRECISION for dlaein

COMPLEX for claein

DOUBLE COMPLEX for zlaein.

Array *h*(*ldh*, *).

The second dimension of *h* must be at least max(1, *n*). Contains the upper Hessenberg matrix *H*.

ldh

INTEGER. The leading dimension of the array *h*; $ldh \geq \max(1, n)$.

wr, *wi*

REAL for slaein

DOUBLE PRECISION for dlaein.

The real and imaginary parts of the eigenvalue of *H* whose corresponding right or left eigenvector is to be computed (for real flavors of the routine).

w

COMPLEX for claein

DOUBLE COMPLEX for zlaein.

The eigenvalue of *H* whose corresponding right or left eigenvector is to be computed (for complex flavors of the routine).

vr, *vi*

REAL for slaein

DOUBLE PRECISION for dlaein.

Arrays, dimension (*n*) each. Used for real flavors only. On entry, if *noinit* = .FALSE. and *wi* = 0.0, *vr* must contain a real starting vector for inverse iteration using the real eigenvalue *wr*;

if *noinit* = .FALSE. and *wi*≠ 0.0, *vr* and *vi* must contain the real and imaginary parts of a complex starting vector for inverse iteration using the complex eigenvalue (*wr*,*wi*);otherwise *vr* and *vi* need not be set.

v

COMPLEX for claein

DOUBLE COMPLEX for zlaein.

Array, dimension (*n*). Used for complex flavors only. On entry, if *noinit* = .FALSE., *v* must contain a starting vector for inverse iteration; otherwise *v* need not be set.

b

REAL for slaein

DOUBLE PRECISION for dlaein

COMPLEX for claein

DOUBLE COMPLEX for zlaein.

Workspace array *b*(*ldb*, *). The second dimension of *b* must be at least max(1, *n*).

ldb

INTEGER. The leading dimension of the array *b*;

ldb≥*n*+1 for real flavors;

ldb≥ max(1, *n*) for complex flavors.

work

REAL for slaein

DOUBLE PRECISION for dlaein.

Workspace array, dimension (*n*).

Used for real flavors only.

rwork

REAL for claein

DOUBLE PRECISION for zlaein.

Workspace array, dimension (*n*).

Used for complex flavors only.

eps3, *smlnum*

REAL for slaein/claein

DOUBLE PRECISION for dlaein/zlaein.

eps3 is a small machine-dependent value which is used to perturb close eigenvalues, and to replace zero pivots.

smlnum is a machine-dependent value close to underflow threshold. A suggested value for *smlnum* is `slamch('s') * (n/slamch('p')` for `slaein/claein` or `dlamch('s') * (n/dlamch('p')` for `dlaein/zlaein`. See lamch.

bignum

`REAL` for `slaein`

`DOUBLE PRECISION` for `dlaein`.

bignum is a machine-dependent value close to overflow threshold. Used for real flavors only. A suggested value for *bignum* is `1 / slamch('s')` for `slaein/claein` or `1 / dlamch('s')` for `dlaein/zlaein`.

Output Parameters

vr, *vi*

On exit, if *wi* = 0.0 (real eigenvalue), *vr* contains the computed real eigenvector; if *wi* ≠ 0.0 (complex eigenvalue), *vr* and *vi* contain the real and imaginary parts of the computed complex eigenvector. The eigenvector is normalized so that the component of largest magnitude has magnitude 1; here the magnitude of a complex number (*x*,*y*) is taken to be |*x*| + |*y*|.

vi is not referenced if *wi* = 0.0.

v

On exit, *v* contains the computed eigenvector, normalized so that the component of largest magnitude has magnitude 1; here the magnitude of a complex number (*x*,*y*) is taken to be |*x*| + |*y*|.

info

`INTEGER`.

If *info* = 0, the execution is successful.

If *info* = 1, inverse iteration did not converge. For real flavors, *vr* is set to the last iterate, and so is *vi*, if *wi* ≠ 0.0. For complex flavors, *v* is set to the last iterate.

?laev2

Computes the eigenvalues and eigenvectors of a 2-by-2 symmetric/Hermitian matrix.

Syntax

```
call slaev2( a, b, c, rt1, rt2, cs1, sn1 )
call dlaev2( a, b, c, rt1, rt2, cs1, sn1 )
call claev2( a, b, c, rt1, rt2, cs1, sn1 )
call zlaev2( a, b, c, rt1, rt2, cs1, sn1 )
```

Include Files

- `mkl.fi`

Description

The routine performs the eigendecomposition of a 2-by-2 symmetric matrix

$$\begin{bmatrix} a & b \\ b & c \end{bmatrix}$$ (for slaev2/dlaev2) or Hermitian matrix $$\begin{bmatrix} a & b \\ \text{conjg}(b) & c \end{bmatrix}$$

(for claev2/zlaev2).

On return, *rt1* is the eigenvalue of larger absolute value, *rt2* of smaller absolute value, and (*cs1*, *sn1*) is the unit right eigenvector for *rt1*, giving the decomposition

$$\begin{bmatrix} cs1 & sn1 \\ -sn1 & cs1 \end{bmatrix} \cdot \begin{bmatrix} a & b \\ b & c \end{bmatrix} \cdot \begin{bmatrix} cs1 & sn1 \\ -sn1 & cs1 \end{bmatrix} = \begin{bmatrix} rt1 & 0 \\ 0 & rt2 \end{bmatrix}$$

(for slaev2/dlaev2),

or

$$\begin{bmatrix} cs1 & \text{conjg}(sn1) \\ -sn1 & cs1 \end{bmatrix} \cdot \begin{bmatrix} a & b \\ \text{conjg}(b) & c \end{bmatrix} \cdot \begin{bmatrix} cs1 & -\text{conjg}(sn1) \\ sn1 & cs1 \end{bmatrix} = \begin{bmatrix} rt1 & 0 \\ 0 & rt2 \end{bmatrix}$$

(for claev2/zlaev2).

Input Parameters

a, *b*, *c*

REAL for slaev2

DOUBLE PRECISION for dlaev2

COMPLEX for claev2

DOUBLE COMPLEX for zlaev2.

Elements of the input matrix.

Output Parameters

rt1, *rt2*

REAL for slaev2/claev2

DOUBLE PRECISION for dlaev2/zlaev2.

Eigenvalues of larger and smaller absolute value, respectively.

cs1

REAL for slaev2/claev2

DOUBLE PRECISION for dlaev2/zlaev2.

sn1

REAL for slaev2

DOUBLE PRECISION for dlaev2

COMPLEX for claev2

DOUBLE COMPLEX for zlaev2.

The vector (*cs1*, *sn1*) is the unit right eigenvector for rt1.

Application Notes

rt1 is accurate to a few ulps barring over/underflow. *rt2* may be inaccurate if there is massive cancellation in the determinant `a*c-b*b`; higher precision or correctly rounded or correctly truncated arithmetic would be needed to compute *rt2* accurately in all cases. *cs1* and *sn1* are accurate to a few ulps barring over/underflow. Overflow is possible only if *rt1* is within a factor of 5 of overflow. Underflow is harmless if the input data is 0 or exceeds *underflow_threshold* / `macheps`.

?laexc

Swaps adjacent diagonal blocks of a real upper quasi-triangular matrix in Schur canonical form, by an orthogonal similarity transformation.

Syntax

```
call slaexc( wantq, n, t, ldt, q, ldq, j1, n1, n2, work, info )
call dlaexc( wantq, n, t, ldt, q, ldq, j1, n1, n2, work, info )
```

Include Files

- `mkl.fi`

Description

The routine swaps adjacent diagonal blocks T_{11} and T_{22} of order 1 or 2 in an upper quasi-triangular matrix T by an orthogonal similarity transformation.

T must be in Schur canonical form, that is, block upper triangular with 1-by-1 and 2-by-2 diagonal blocks; each 2-by-2 diagonal block has its diagonal elements equal and its off-diagonal elements of opposite sign.

Input Parameters

wantq

`LOGICAL`.

If *wantq* = `.TRUE.`, accumulate the transformation in the matrix *Q*;

If *wantq* = `.FALSE.`, do not accumulate the transformation.

n

`INTEGER`. The order of the matrix *T* (*n*≥ `0`).

t, *q*

`REAL` for `slaexc`

`DOUBLE PRECISION` for `dlaexc`

Arrays:

t(*ldt*,`*`) contains on entry the upper quasi-triangular matrix *T*, in Schur canonical form.

The second dimension of *t* must be at least `max(1, n)`.

q(*ldq*,`*`) contains on entry, if *wantq* = `.TRUE.`, the orthogonal matrix *Q*. If *wantq* = `.FALSE.`, *q* is not referenced. The second dimension of *q* must be at least `max(1, n)`.

ldt

`INTEGER`. The leading dimension of *t*; at least `max(1, n)`.

ldq

`INTEGER`. The leading dimension of *q*;

If *wantq* = `.FALSE.`, then *ldq*≥ `1`.

If *wantq* = .TRUE., then *ldq* ≥ max(1,*n*).

j1 INTEGER. The index of the first row of the first block T_{11}.

n1 INTEGER. The order of the first block T_{11}

(*n1* = 0, 1, or 2).

n2 INTEGER. The order of the second block T_{22}

(*n2* = 0, 1, or 2).

work REAL for slaexc;

DOUBLE PRECISION for dlaexc.

Workspace array, DIMENSION (*n*).

Output Parameters

t On exit, the updated matrix *T*, again in Schur canonical form.

q On exit, if *wantq* = .TRUE., the updated matrix *Q*.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = 1, the transformed matrix *T* would be too far from Schur form; the blocks are not swapped and *T* and *Q* are unchanged.

?lag2

Computes the eigenvalues of a 2-by-2 generalized eigenvalue problem, with scaling as necessary to avoid over-/underflow.

Syntax

```
call slag2( a, lda, b, ldb, safmin, scale1, scale2, wr1, wr2, wi )
call dlag2( a, lda, b, ldb, safmin, scale1, scale2, wr1, wr2, wi )
```

Include Files

- mkl.fi

Description

The routine computes the eigenvalues of a 2 x 2 generalized eigenvalue problem *A* - *w***B*, with scaling as necessary to avoid over-/underflow. The scaling factor, *s*, results in a modified eigenvalue equation

*s***A* - *w***B*,

where *s* is a non-negative scaling factor chosen so that *w*, *w***B*, and *s***A* do not overflow and, if possible, do not underflow, either.

Input Parameters

a, *b* REAL for slag2

DOUBLE PRECISION for dlag2

Arrays:

a(*lda*,2) contains, on entry, the 2 x 2 matrix *A*. It is assumed that its 1-norm is less than 1/*safmin*. Entries less than sqrt(*safmin*)*norm(*A*) are subject to being treated as zero.

b(*ldb*,2) contains, on entry, the 2 x 2 upper triangular matrix *B*. It is assumed that the one-norm of *B* is less than 1/*safmin*. The diagonals should be at least sqrt(*safmin*) times the largest element of *B* (in absolute value); if a diagonal is smaller than that, then +/- sqrt(*safmin*) will be used instead of that diagonal.

lda INTEGER. The leading dimension of *a*; *lda* ≥ 2.

ldb INTEGER. The leading dimension of *b*; *ldb* ≥ 2.

safmin REAL for slag2;

DOUBLE PRECISION for dlag2.

The smallest positive number such that 1/*safmin* does not overflow. (This should always be ?lamch('S') - it is an argument in order to avoid having to call ?lamch frequently.)

Output Parameters

scale1 REAL for slag2;

DOUBLE PRECISION for dlag2.

A scaling factor used to avoid over-/underflow in the eigenvalue equation which defines the first eigenvalue. If the eigenvalues are complex, then the eigenvalues are (*wr1* +/- *wii*)/*scale1* (which may lie outside the exponent range of the machine), *scale1*=*scale2*, and *scale1* will always be positive.

If the eigenvalues are real, then the first (real) eigenvalue is *wr1*/*scale1*, but this may overflow or underflow, and in fact, *scale1* may be zero or less than the underflow threshhold if the exact eigenvalue is sufficiently large.

scale2 REAL for slag2;

DOUBLE PRECISION for dlag2.

A scaling factor used to avoid over-/underflow in the eigenvalue equation which defines the second eigenvalue. If the eigenvalues are complex, then *scale2*=*scale1*. If the eigenvalues are real, then the second (real) eigenvalue is *wr2*/*scale2*, but this may overflow or underflow, and in fact, *scale2* may be zero or less than the underflow threshold if the exact eigenvalue is sufficiently large.

wr1 REAL for slag2;

DOUBLE PRECISION for dlag2.

If the eigenvalue is real, then *wr1* is *scale1* times the eigenvalue closest to the (2,2) element of *A**inv(*B*).

If the eigenvalue is complex, then *wr1=wr2* is *scale1* times the real part of the eigenvalues.

wr2

REAL for slag2;

DOUBLE PRECISION for dlag2.

If the eigenvalue is real, then *wr2* is *scale2* times the other eigenvalue. If the eigenvalue is complex, then *wr1=wr2* is *scale1* times the real part of the eigenvalues.

wi

REAL for slag2;

DOUBLE PRECISION for dlag2.

If the eigenvalue is real, then *wi* is zero. If the eigenvalue is complex, then *wi* is *scale1* times the imaginary part of the eigenvalues. *wi* will always be non-negative.

?lags2

Computes 2-by-2 orthogonal matrices U, V, and Q, and applies them to matrices A and B such that the rows of the transformed A and B are parallel.

Syntax

```
call slags2( upper, a1, a2, a3, b1, b2, b3, csu, snu, csv, snv, csq, snq)
call dlags2( upper, a1, a2, a3, b1, b2, b3, csu, snu, csv, snv, csq, snq)
call clags2( upper, a1, a2, a3, b1, b2, b3, csu, snu, csv, snv, csq, snq)
call zlags2( upper, a1, a2, a3, b1, b2, b3, csu, snu, csv, snv, csq, snq)
```

Include Files

- mkl.fi

Description

For real flavors, the routine computes 2-by-2 orthogonal matrices *U*, *V* and *Q*, such that if *upper* = .TRUE., then

$$U^T*A*Q = U^T*\begin{bmatrix} A_1 & A_2 \\ 0 & A_3 \end{bmatrix}*Q = \begin{bmatrix} x & 0 \\ x & x \end{bmatrix}$$

and

$$V^T*B*Q = V^T*\begin{bmatrix} B_1 & B_2 \\ 0 & B_3 \end{bmatrix}*Q = \begin{bmatrix} x & 0 \\ x & x \end{bmatrix}$$

or if *upper* = .FALSE., then

$$U^T * A * Q = U^T * \begin{bmatrix} A_1 & 0 \\ A_2 & A_3 \end{bmatrix} * Q = \begin{bmatrix} x & x \\ 0 & x \end{bmatrix}$$

and

$$V^T * B * Q = V^T * \begin{bmatrix} B_1 & 0 \\ B_2 & B_3 \end{bmatrix} * Q = \begin{bmatrix} x & x \\ 0 & x \end{bmatrix}$$

The rows of the transformed *A* and *B* are parallel, where

$$U = \begin{bmatrix} csu & snu \\ -snu & csu \end{bmatrix}, \quad V = \begin{bmatrix} csv & snv \\ -snv & csv \end{bmatrix}, \quad Q = \begin{bmatrix} csq & snq \\ -snq & csq \end{bmatrix}$$

Here Z^T denotes the transpose of *Z*.

For complex flavors, the routine computes 2-by-2 unitary matrices *U*, *V* and *Q*, such that if `upper = .TRUE.`, then

$$U^H * A * Q = U^H * \begin{bmatrix} A_1 & A_2 \\ 0 & A_3 \end{bmatrix} * Q = \begin{bmatrix} x & 0 \\ x & x \end{bmatrix}$$

and

$$V^H * B * Q = V^H * \begin{bmatrix} B_1 & B_2 \\ 0 & B_3 \end{bmatrix} * Q = \begin{bmatrix} x & 0 \\ x & x \end{bmatrix}$$

or if `upper = .FALSE.`, then

$$U^H * A * Q = U^H * \begin{bmatrix} A_1 & 0 \\ A_2 & A_3 \end{bmatrix} * Q = \begin{bmatrix} x & x \\ 0 & x \end{bmatrix}$$

and

$$V^H * B * Q = V^H * \begin{bmatrix} B_1 & 0 \\ B_2 & B_3 \end{bmatrix} * Q = \begin{bmatrix} x & x \\ 0 & x \end{bmatrix}$$

The rows of the transformed *A* and *B* are parallel, where

$$U = \begin{bmatrix} csu & snu \\ -snu^H & csu \end{bmatrix}, V = \begin{bmatrix} csv & snv \\ -snv^H & csv \end{bmatrix}, Q = \begin{bmatrix} csq & snq \\ -snq^H & csq \end{bmatrix}$$

Input Parameters

upper

LOGICAL.

If *upper* = .TRUE., the input matrices *A* and *B* are upper triangular; If *upper* = .FALSE., the input matrices *A* and *B* are lower triangular.

a1, *a3*

REAL for slags2 and clags2

DOUBLE PRECISION for dlags2 and zlags2

a2

REAL for slags2

DOUBLE PRECISION for dlags2

COMPLEX for clags2

COMPLEX*16 for zlags2

On entry, *a1, a2* and *a3* are elements of the input 2-by-2 upper (lower) triangular matrix *A*.

b1, *b3*

REAL for slags2 and clags2

DOUBLE PRECISION for dlags2 and zlags2

b2

REAL for slags2

DOUBLE PRECISION for dlags2

COMPLEX for clags2

COMPLEX*16 for zlags2

On entry, *b1, b2* and *b3* are elements of the input 2-by-2 upper (lower) triangular matrix *B*.

Output Parameters

csu

REAL for slags2 and clags2

DOUBLE PRECISION for dlags2 and zlags2

Element of the desired orthogonal matrix *U*.

snu

REAL for slags2

DOUBLE PRECISION for dlags2

Element of the desired orthogonal matrix *U*.

	COMPLEX for clags2
	COMPLEX*16 for zlags2
csv	REAL for slags2 and clags2
	DOUBLE PRECISION for dlags2 and zlags2
	Element of the desired orthogonal matrix *V*.
snv	REAL for slags2
	DOUBLE PRECISION for dlags2
	COMPLEX for clags2
	COMPLEX*16 for zlags2
	Element of the desired orthogonal matrix *V*.
csq	REAL for slags2 and clags2
	DOUBLE PRECISION for dlags2 and zlags2
	Element of the desired orthogonal matrix *Q*.
snq	REAL for slags2
	DOUBLE PRECISION for dlags2
	Element of the desired orthogonal matrix *Q*.
	COMPLEX for clags2
	COMPLEX*16 for zlags2

?lagtf

*Computes an LU factorization of a matrix T-λ*I, where T is a general tridiagonal matrix, and λ is a scalar, using partial pivoting with row interchanges.*

Syntax

```
call slagtf( n, a, lambda, b, c, tol, d, in, info )
call dlagtf( n, a, lambda, b, c, tol, d, in, info )
```

Include Files

- mkl.fi

Description

The routine factorizes the matrix (*T - lambda*I*), where *T* is an *n*-by-*n* tridiagonal matrix and *lambda* is a scalar, as

*T - lambda*I = P*L*U*,

where *P* is a permutation matrix, *L* is a unit lower tridiagonal matrix with at most one non-zero sub-diagonal elements per column and *U* is an upper triangular matrix with at most two non-zero super-diagonal elements per column. The factorization is obtained by Gaussian elimination with partial pivoting and implicit row scaling. The parameter *lambda* is included in the routine so that ?lagtf may be used, in conjunction with ?lagts, to obtain eigenvectors of *T* by inverse iteration.

Input Parameters

n

INTEGER. The order of the matrix *T* (*n*≥ 0).

a, *b*, *c*

REAL for slagtf

DOUBLE PRECISION for dlagtf

Arrays, dimension *a*(*n*), *b*(*n*-1), *c*(*n*-1):

On entry, *a*(*) must contain the diagonal elements of the matrix *T*.

On entry, *b*(*) must contain the (*n*-1) super-diagonal elements of *T*.

On entry, *c*(*) must contain the (*n*-1) sub-diagonal elements of *T*.

tol

REAL for slagtf

DOUBLE PRECISION for dlagtf

On entry, a relative tolerance used to indicate whether or not the matrix (*T* - *lambda*I*) is nearly singular. *tol* should normally be chose as approximately the largest relative error in the elements of *T*. For example, if the elements of *T* are correct to about 4 significant figures, then *tol* should be set to about $5*10^{-4}$. If *tol* is supplied as less than eps, where eps is the relative machine precision, then the value eps is used in place of *tol*.

Output Parameters

a

On exit, *a* is overwritten by the *n* diagonal elements of the upper triangular matrix *U* of the factorization of *T*.

b

On exit, *b* is overwritten by the *n*-1 super-diagonal elements of the matrix *U* of the factorization of *T*.

c

On exit, *c* is overwritten by the *n*-1 sub-diagonal elements of the matrix *L* of the factorization of *T*.

d

REAL for slagtf

DOUBLE PRECISION for dlagtf

Array, dimension (*n*-2).

On exit, *d* is overwritten by the *n*-2 second super-diagonal elements of the matrix *U* of the factorization of *T*.

in

INTEGER.

Array, dimension (*n*).

On exit, *in* contains details of the permutation matrix *p*. If an interchange occurred at the k-th step of the elimination, then *in*(k) = 1, otherwise *in*(k) = 0. The element *in*(*n*) returns the smallest positive integer j such that

abs(*u*(j,j)) ≤ norm((*T* - *lambda*I*)(j))**tol*,

where norm(*A*(j)) denotes the sum of the absolute values of the j-th row of the matrix *A*.

If no such `j` exists then *in*(*n*) is returned as zero. If *in*(*n*) is returned as positive, then a diagonal element of *U* is small, indicating that (*T* – *lambda*I*) is singular or nearly singular.

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*k*, the *k*-th parameter had an illegal value.

?lagtm

*Performs a matrix-matrix product of the form C = alpha*A*B+beta*C, where A is a tridiagonal matrix, B and C are rectangular matrices, and alpha and beta are scalars, which may be 0, 1, or -1.*

Syntax

```
call slagtm( trans, n, nrhs, alpha, dl, d, du, x, ldx, beta, b, ldb )
call dlagtm( trans, n, nrhs, alpha, dl, d, du, x, ldx, beta, b, ldb )
call clagtm( trans, n, nrhs, alpha, dl, d, du, x, ldx, beta, b, ldb )
call zlagtm( trans, n, nrhs, alpha, dl, d, du, x, ldx, beta, b, ldb )
```

Include Files

- mkl.fi

Description

The routine performs a matrix-vector product of the form:

*B := alpha*A*X + beta*B*

where *A* is a tridiagonal matrix of order *n*, *B* and *X* are *n*-by-*nrhs* matrices, and *alpha* and *beta* are real scalars, each of which may be 0., 1., or -1.

Input Parameters

trans — CHARACTER*1. Must be 'N' or 'T' or 'C'.

Indicates the form of the equations:

If *trans* = 'N', then *B := alpha*A*X + beta*B* (no transpose);

If *trans* = 'T', then *B := alpha*A*^{T}**X + beta*B* (transpose);

If *trans* = 'C', then *B := alpha*A*^{H}**X + beta*B* (conjugate transpose)

n — INTEGER. The order of the matrix *A* (*n* ≥ 0).

nrhs — INTEGER. The number of right-hand sides, i.e., the number of columns in *X* and *B* (*nrhs* ≥ 0).

alpha, *beta* — REAL for slagtm/clagtm

DOUBLE PRECISION for dlagtm/zlagtm

	Specify the scalars *alpha* and *beta* respectively. `alpha` must be 0., 1., or -1.; otherwise, it is assumed to be 0. `beta` must be 0., 1., or -1.; otherwise, it is assumed to be 1.

dl, *d*, *du*	`REAL` for `slagtm`
	`DOUBLE PRECISION` for `dlagtm`
	`COMPLEX` for `clagtm`
	`DOUBLE COMPLEX` for `zlagtm`.
	Arrays: *dl*(*n* - 1), *d*(*n*), *du*(*n* - 1).
	The array *dl* contains the (*n* - 1) sub-diagonal elements of *T*.
	The array *d* contains the *n* diagonal elements of *T*.
	The array *du* contains the (*n* - 1) super-diagonal elements of *T*.

x, *b*	`REAL` for `slagtm`
	`DOUBLE PRECISION` for `dlagtm`
	`COMPLEX` for `clagtm`
	`DOUBLE COMPLEX` for `zlagtm`.
	Arrays:
	`x(ldx,*)` contains the *n*-by-*nrhs* matrix *X*. The second dimension of *x* must be at least `max(1, nrhs)`.
	b(*ldb*,*) contains the *n*-by-*nrhs* matrix *B*. The second dimension of *b* must be at least `max(1, nrhs)`.

ldx	`INTEGER`. The leading dimension of the array *x*; *ldx*≥ `max(1, n)`.
ldb	`INTEGER`. The leading dimension of the array *b*; *ldb*≥ `max(1, n)`.

Output Parameters

b	Overwritten by the matrix expression `B := alpha*A*X + beta*B`

?lagts

*Solves the system of equations (T - lambda*I)*x = y or (T - lambda*I)^T*x = y,where T is a general tridiagonal matrix and lambda is a scalar, using the LU factorization computed by* `?lagtf`.

Syntax

```
call slagts( job, n, a, b, c, d, in, y, tol, info )
call dlagts( job, n, a, b, c, d, in, y, tol, info )
```

Include Files

- `mkl.fi`

Description

The routine may be used to solve for *x* one of the systems of equations:

`(T - lambda*I)*x = y` or `(T - lambda*I)`^{T}`*x = y`,

where *T* is an *n*-by-*n* tridiagonal matrix, following the factorization of (`T - lambda*I`) as

`T - lambda*I = P*L*U`,

computed by the routine `?lagtf`.

The choice of equation to be solved is controlled by the argument *job*, and in each case there is an option to perturb zero or very small diagonal elements of *U*, this option being intended for use in applications such as inverse iteration.

Input Parameters

job

`INTEGER`. Specifies the job to be performed by `?lagts` as follows:

= 1: The equations `(T - lambda*I)x = y` are to be solved, but diagonal elements of *U* are not to be perturbed.

= -1: The equations `(T - lambda*I)x = y` are to be solved and, if overflow would otherwise occur, the diagonal elements of *U* are to be perturbed. See argument *tol* below.

= 2: The equations `(T - lambda*I)`^{T}`x = y` are to be solved, but diagonal elements of *U* are not to be perturbed.

= -2: The equations `(T - lambda*I)`^{T}`x = y` are to be solved and, if overflow would otherwise occur, the diagonal elements of *U* are to be perturbed. See argument *tol* below.

n

`INTEGER`. The order of the matrix *T* (*n*≥ 0).

a, *b*, *c*, *d*

`REAL` for `slagts`

`DOUBLE PRECISION` for `dlagts`

Arrays, dimension *a*(*n*), *b*(*n*-1), *c*(*n*-1), *d*(*n*-2):

On entry, *a*`(*)` must contain the diagonal elements of *U* as returned from `?lagtf`.

On entry, *b*`(*)` must contain the first super-diagonal elements of *U* as returned from `?lagtf`.

On entry, *c*`(*)` must contain the sub-diagonal elements of *L* as returned from `?lagtf`.

On entry, *d*`(*)` must contain the second super-diagonal elements of *U* as returned from `?lagtf`.

in

`INTEGER`.

Array, dimension (*n*).

On entry, *in*`(*)` must contain details of the matrix *p* as returned from `?lagtf`.

y

`REAL` for `slagts`

`DOUBLE PRECISION` for `dlagts`

Array, dimension (*n*). On entry, the right hand side vector *y*.

tol — REAL for slagtf

DOUBLE PRECISION for dlagtf.

On entry, with *job* < 0, *tol* should be the minimum perturbation to be made to very small diagonal elements of *U*. *tol* should normally be chosen as about *eps**norm(*U*), where *eps* is the relative machine precision, but if *tol* is supplied as non-positive, then it is reset to *eps**max(abs(u(i,j))). If *job* > 0 then *tol* is not referenced.

Output Parameters

y — On exit, *y* is overwritten by the solution vector *x*.

tol — On exit, *tol* is changed as described in *Input Parameters* section above, only if *tol* is non-positive on entry. Otherwise *tol* is unchanged.

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i* >0, overflow would occur when computing the *i*th element of the solution vector *x*. This can only occur when *job* is supplied as positive and either means that a diagonal element of *U* is very small, or that the elements of the right-hand side vector *y* are very large.

?lagv2

Computes the Generalized Schur factorization of a real 2-by-2 matrix pencil (A,B) where B is upper triangular.

Syntax

```
call slagv2( a, lda, b, ldb, alphar, alphai, beta, csl, snl, csr, snr )
call dlagv2( a, lda, b, ldb, alphar, alphai, beta, csl, snl, csr, snr )
```

Include Files

- mkl.fi

Description

The routine computes the Generalized Schur factorization of a real 2-by-2 matrix pencil (*A*,*B*) where *B* is upper triangular. The routine computes orthogonal (rotation) matrices given by *csl*, *snl* and *csr*, *snr* such that:

1) if the pencil (*A*,*B*) has two real eigenvalues (include 0/0 or 1/0 types), then

$$\begin{bmatrix} a_{11} & a_{11} \\ 0 & a_{22} \end{bmatrix} = \begin{bmatrix} csl & snl \\ -snl & csl \end{bmatrix} \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix} \begin{bmatrix} csr & -snr \\ snr & csr \end{bmatrix}$$

$$\begin{bmatrix} b_{11} & b_{11} \\ 0 & b_{22} \end{bmatrix} = \begin{bmatrix} csl & snl \\ -snl & csl \end{bmatrix} \begin{bmatrix} b_{11} & b_{12} \\ 0 & b_{22} \end{bmatrix} \begin{bmatrix} csr & -snr \\ snr & csr \end{bmatrix}$$

2) if the pencil (*A*,*B*) has a pair of complex conjugate eigenvalues, then

$$\begin{bmatrix} a_{11} & a_{11} \\ a_{21} & a_{22} \end{bmatrix} = \begin{bmatrix} csl & snl \\ -snl & csl \end{bmatrix} \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix} \begin{bmatrix} csr & -snr \\ snr & csr \end{bmatrix}$$

$$\begin{bmatrix} b_{11} & 0 \\ 0 & b_{22} \end{bmatrix} = \begin{bmatrix} csl & snl \\ -snl & csl \end{bmatrix} \begin{bmatrix} b_{11} & b_{12} \\ 0 & b_{22} \end{bmatrix} \begin{bmatrix} csr & -snr \\ snr & csr \end{bmatrix}$$

where $b_{11} \geq b_{22} > 0$.

Input Parameters

a, *b*

`REAL` for `slagv2`

`DOUBLE PRECISION` for `dlagv2`

Arrays:

a(*lda*,`2`) contains the 2-by-2 matrix *A*;

b(*ldb*,`2`) contains the upper triangular 2-by-2 matrix *B*.

lda

`INTEGER`. The leading dimension of the array *a*;

lda≥ `2`.

ldb

`INTEGER`. The leading dimension of the array *b*;

ldb≥ `2`.

Output Parameters

a

On exit, *a* is overwritten by the "*A*-part" of the generalized Schur form.

b

On exit, *b* is overwritten by the "*B*-part" of the generalized Schur form.

alphar, *alphai*, *beta*

`REAL` for `slagv2`

`DOUBLE PRECISION` for `dlagv2`.

Arrays, dimension (2) each.

(*alphar*(k) + *i***alphai*(k))/*beta*(k) are the eigenvalues of the pencil (*A*,*B*), k=1,2 and *i* = sqrt(-1).

Note that *beta*(k) may be zero.

csl, *snl*

`REAL` for `slagv2`

`DOUBLE PRECISION` for `dlagv2`

The cosine and sine of the left rotation matrix, respectively.

csr, *snr*

REAL for slagv2

DOUBLE PRECISION for dlagv2

The cosine and sine of the right rotation matrix, respectively.

?lahqr

Computes the eigenvalues and Schur factorization of an upper Hessenberg matrix, using the double-shift/ single-shift QR algorithm.

Syntax

```
call slahqr( wantt, wantz, n, ilo, ihi, h, ldh, wr, wi, iloz, ihiz, z, ldz, info )
call dlahqr( wantt, wantz, n, ilo, ihi, h, ldh, wr, wi, iloz, ihiz, z, ldz, info )
call clahqr( wantt, wantz, n, ilo, ihi, h, ldh, w, iloz, ihiz, z, ldz, info )
call zlahqr( wantt, wantz, n, ilo, ihi, h, ldh, w, iloz, ihiz, z, ldz, info )
```

Include Files

- mkl.fi

Description

The routine is an auxiliary routine called by ?hseqr to update the eigenvalues and Schur decomposition already computed by ?hseqr, by dealing with the Hessenberg submatrix in rows and columns *ilo* to *ihi*.

Input Parameters

wantt

LOGICAL.

If *wantt* = .TRUE., the full Schur form *T* is required;

If *wantt* = .FALSE., eigenvalues only are required.

wantz

LOGICAL.

If *wantz* = .TRUE., the matrix of Schur vectors *Z* is required;

If *wantz* = .FALSE., Schur vectors are not required.

n

INTEGER. The order of the matrix *H* ($n \geq 0$).

ilo, *ihi*

INTEGER.

It is assumed that *h* is already upper quasi-triangular in rows and columns *ihi*+1:*n*, and that *h*(*ilo*,*ilo*-1) = 0 (unless *ilo* = 1). The routine ?lahqr works primarily with the Hessenberg submatrix in rows and columns *ilo* to *ihi*, but applies transformations to all of *h* if *wantt* = .TRUE..

Constraints:

$1 \leq ilo \leq \max(1, ihi)$; $ihi \leq n$.

h, *z*

REAL for slahqr

DOUBLE PRECISION for dlahqr

COMPLEX for clahqr

DOUBLE COMPLEX for zlahqr.

Arrays:

h(*ldh*,*) contains the upper Hessenberg matrix *h*.

The second dimension of *h* must be at least max(1, *n*).

z(*ldz*,*)

If *wantz* = .TRUE., then, on entry, *z* must contain the current matrix *z* of transformations accumulated by ?hseqr. The second dimension of *z* must be at least max(1, *n*)

If *wantz* = .FALSE., then *z* is not referenced..

ldh — INTEGER. The leading dimension of *h*; at least max(1, *n*).

ldz — INTEGER. The leading dimension of *z*; at least max(1, *n*).

iloz, *ihiz* — INTEGER. Specify the rows of *z* to which transformations must be applied if *wantz* = .TRUE..

1 ≤ *iloz* ≤ *ilo*; *ihi* ≤ *ihiz* ≤ *n*.

Output Parameters

h

On exit, if *info*= 0 and *wantt* = .TRUE., then,

- for slahqr/dlahqr, *h* is upper quasi-triangular in rows and columns *ilo*:*ihi* with any 2-by-2 diagonal blocks in standard form.
- for clahqr/zlahqr, *h* is upper triangular in rows and columns *ilo*:*ihi*.

If *info*= 0 and *wantt* = .FALSE., the contents of *h* are unspecified on exit. If *info* is positive, see description of *info* for the output state of *h*.

wr, *wi*

REAL for slahqr

DOUBLE PRECISION for dlahqr

Arrays, DIMENSION at least max(1, *n*) each. Used with real flavors only. The real and imaginary parts, respectively, of the computed eigenvalues *ilo* to *ihi* are stored in the corresponding elements of *wr* and *wi*. If two eigenvalues are computed as a complex conjugate pair, they are stored in consecutive elements of *wr* and *wi*, say the i-th and (i+1)-th, with *wi*(i)> 0 and *wi*(i+1) < 0.

If *wantt* = .TRUE., the eigenvalues are stored in the same order as on the diagonal of the Schur form returned in *h*, with *wr*(i) = *h*(i,i), and, if *h*(i:i+1, i:i+1) is a 2-by-2 diagonal block, *wi*(i) = sqrt(*h*(i +1,i)*h(i,i+1)) and *wi*(i+1) = -*wi*(i).

w

COMPLEX for clahqr

DOUBLE COMPLEX for zlahqr.

Array, DIMENSION at least max(1, *n*). Used with complex flavors only. The computed eigenvalues *ilo* to *ihi* are stored in the corresponding elements of *w*.

If *wantt* = .TRUE., the eigenvalues are stored in the same order as on the diagonal of the Schur form returned in *h*, with w(i) = h(i,i).

z — If *wantz* = .TRUE., then, on exit *z* has been updated; transformations are applied only to the submatrix *z*(*iloz*:*ihiz*, *ilo*:*ihi*).

info — INTEGER.

If *info* = 0, the execution is successful.

With *info* > 0,

- if *info* = *i*, ?lahqr failed to compute all the eigenvalues *ilo* to *ihi* in a total of 30 iterations per eigenvalue; elements i+1:*ihi* of *wr* and *wi* (for slahqr/dlahqr) or *w* (for clahqr/zlahqr) contain those eigenvalues which have been successfully computed.
- if *wantt* is .FALSE., then on exit the remaining unconverged eigenvalues are the eigenvalues of the upper Hessenberg matrix rows and columns *ilo* through *info* of the final output value of *h*.
- if *wantt* is .TRUE., then on exit
(initial value of *h*)*u = u*(final value of *h*), (*)
where u is an orthognal matrix. The final value of *h* is upper Hessenberg and triangular in rows and columns *info*+1 through *ihi*.
- if *wantz* is .TRUE., then on exit
(final value of *z*) = (initial value of *z*)* u,
where u is an orthognal matrix in (*) regardless of the value of *wantt*.

?lahrd

Reduces the first nb columns of a general rectangular matrix A so that elements below the k-th subdiagonal are zero, and returns auxiliary matrices which are needed to apply the transformation to the unreduced part of A (deprecated).

Syntax

```
call slahrd( n, k, nb, a, lda, tau, t, ldt, y, ldy )
call dlahrd( n, k, nb, a, lda, tau, t, ldt, y, ldy )
call clahrd( n, k, nb, a, lda, tau, t, ldt, y, ldy )
call zlahrd( n, k, nb, a, lda, tau, t, ldt, y, ldy )
```

Include Files

- mkl.fi

Description

This routine is deprecated; use lahr2.

The routine reduces the first *nb* columns of a real/complex general *n*-by-(*n*-*k*+1) matrix *A* so that elements below the *k*-th subdiagonal are zero. The reduction is performed by an orthogonal/unitary similarity transformation Q^T*A*Q for real flavors, or Q^H*A*Q for complex flavors. The routine returns the matrices *V* and *T* which determine *Q* as a block reflector $I - V*T*V^T$ (for real flavors) or $I - V*T*V^H$ (for complex flavors), and also the matrix $Y = A*V*T$.

The matrix *Q* is represented as products of *nb* elementary reflectors:

$Q = H(1)*H(2)*... *H(nb)$

Each $H(i)$ has the form

$H(i) = I - tau*v*v^T$ for real flavors, or

$H(i) = I - tau*v*v^H$ for complex flavors, or

where *tau* is a real/complex scalar, and *v* is a real/complex vector.

Input Parameters

n — INTEGER. The order of the matrix *A* ($n \geq 0$).

k — INTEGER. The offset for the reduction. Elements below the *k*-th subdiagonal in the first *nb* columns are reduced to zero.

nb — INTEGER. The number of columns to be reduced.

a — REAL for slahrd

DOUBLE PRECISION for dlahrd

COMPLEX for clahrd

DOUBLE COMPLEX for zlahrd.

Array *a*(*lda*, *n*-*k*+1) contains the *n*-by-(*n*-*k*+1) general matrix *A* to be reduced.

lda — INTEGER. The leading dimension of *a*; at least max(1, *n*).

ldt — INTEGER. The leading dimension of the output array *t*; must be at least max(1, *nb*).

ldy — INTEGER. The leading dimension of the output array *y*; must be at least max(1, *n*).

Output Parameters

a — On exit, the elements on and above the *k*-th subdiagonal in the first *nb* columns are overwritten with the corresponding elements of the reduced matrix; the elements below the *k*-th subdiagonal, with the array *tau*, represent the matrix *Q* as a product of elementary reflectors. The other columns of *a* are unchanged. See *Application Notes* below.

tau — REAL for slahrd

DOUBLE PRECISION for dlahrd

COMPLEX for clahrd

DOUBLE COMPLEX for zlahrd.

Array, DIMENSION (*nb*).

Contains scalar factors of the elementary reflectors.

t, *y* — REAL for slahrd

DOUBLE PRECISION for dlahrd

COMPLEX for clahrd

DOUBLE COMPLEX for zlahrd.

Arrays, dimension *t*(*ldt*, *nb*), *y*(*ldy*, *nb*).

The array *t* contains upper triangular matrix *T*.

The array *y* contains the *n*-by-*nb* matrix *Y* .

Application Notes

For the elementary reflector *H*(i),

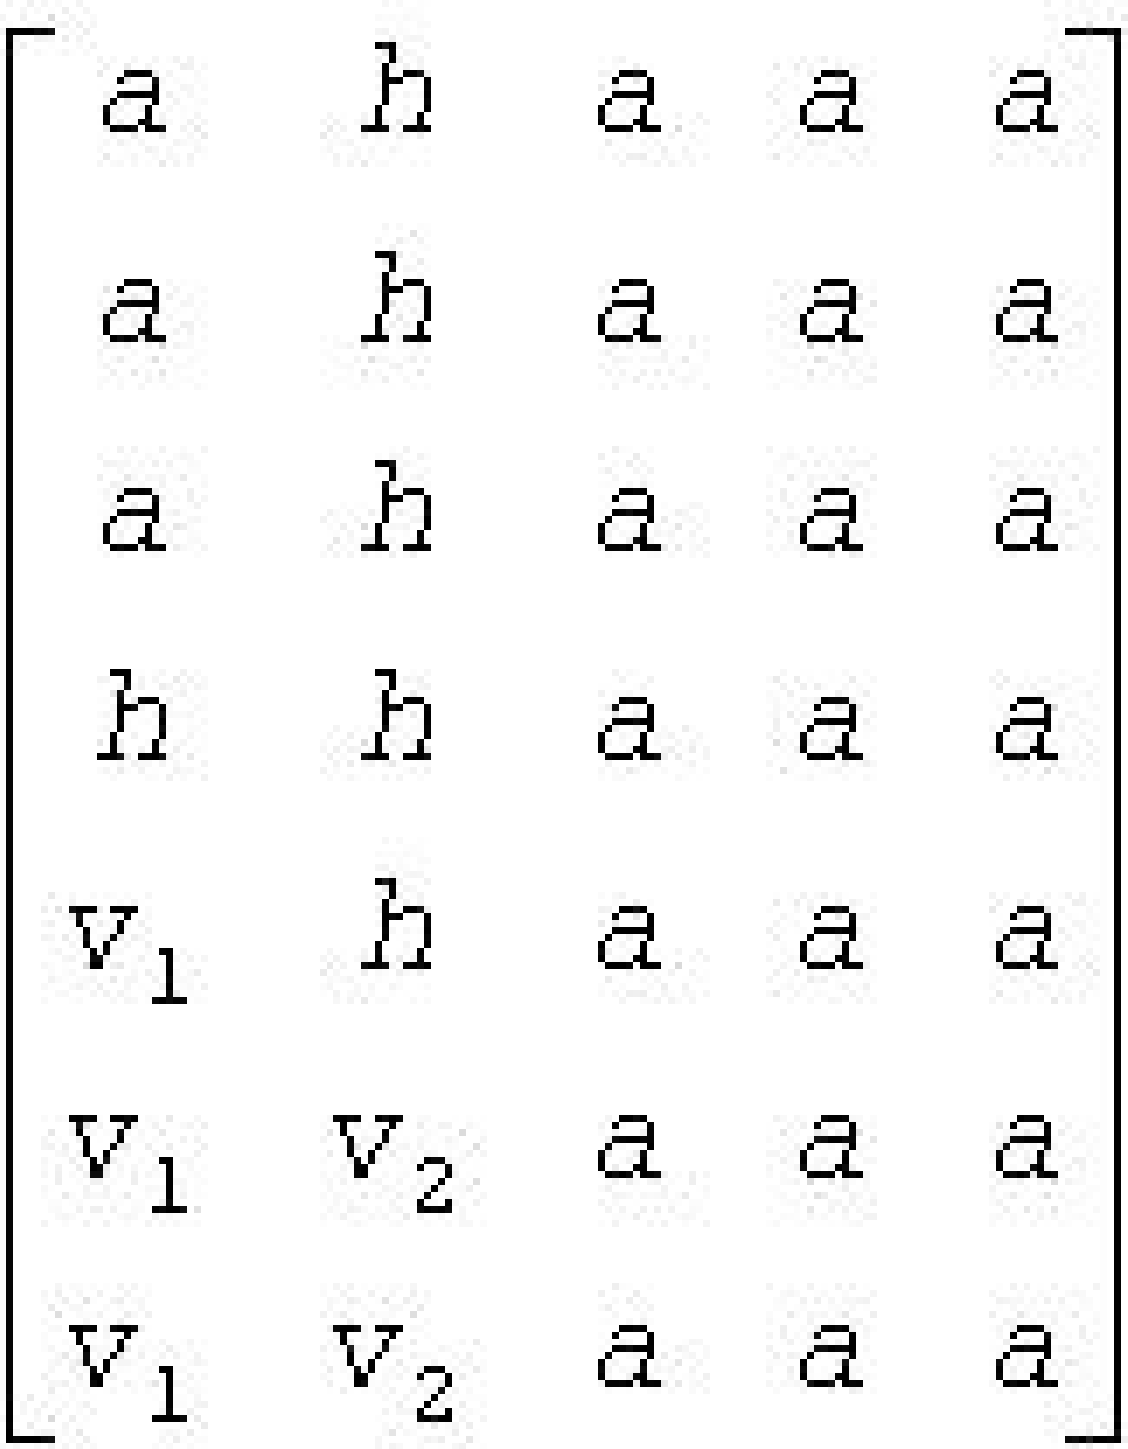
`v(1:i+k-1) = 0`, `v(i+k) = 1`; `v(i+k+1:n)` is stored on exit in *a*(i+*k*+1:*n*, i) and *tau* is stored in *tau*(i).

The elements of the vectors *v* together form the (*n*-*k*+1)-by-*nb* matrix *V* which is needed, with *T* and *Y*, to apply the transformation to the unreduced part of the matrix, using an update of the form:

$A := (I - V*T*V^T) * (A - Y*V^T)$ for real flavors, or

$A := (I - V*T*V^H) * (A - Y*V^H)$ for complex flavors.

The contents of *A* on exit are illustrated by the following example with $n = 7$, $k = 3$ and $nb = 2$:



where *a* denotes an element of the original matrix *A*, *h* denotes a modified element of the upper Hessenberg matrix *H*, and v_i denotes an element of the vector defining *H*(i).

See Also

?lahr2

?lahr2

Reduces the specified number of first columns of a general rectangular matrix A so that elements below the specified subdiagonal are zero, and returns auxiliary matrices which are needed to apply the transformation to the unreduced part of A.

Syntax

```
call slahr2( n, k, nb, a, lda, tau, t, ldt, y, ldy )
call dlahr2( n, k, nb, a, lda, tau, t, ldt, y, ldy )
call clahr2( n, k, nb, a, lda, tau, t, ldt, y, ldy )
call zlahr2( n, k, nb, a, lda, tau, t, ldt, y, ldy )
```

Include Files

Description

The routine reduces the first *nb* columns of a real/complex general *n*-by-(*n*-*k*+1) matrix *A* so that elements below the *k*-th subdiagonal are zero. The reduction is performed by an orthogonal/unitary similarity transformation Q^T*A*Q for real flavors, or Q^H*A*Q for complex flavors. The routine returns the matrices *V* and *T* which determine *Q* as a block reflector $I - V*T*V^T$ (for real flavors) or $I - V*T*V^H$ (for real flavors), and also the matrix $Y = A*V*T$.

The matrix *Q* is represented as products of *nb* elementary reflectors:

$Q = H(1)*H(2)*\ldots *H(nb)$

Each $H(i)$ has the form

$H(i) = I - tau*v*v^T$ for real flavors, or

$H(i) = I - tau*v*v^H$ for complex flavors

where *tau* is a real/complex scalar, and *v* is a real/complex vector.

This is an auxiliary routine called by ?gehrd.

Input Parameters

n	INTEGER. The order of the matrix *A* ($n \geq 0$).
k	INTEGER. The offset for the reduction. Elements below the *k*-th subdiagonal in the first *nb* columns are reduced to zero ($k < n$).
nb	INTEGER. The number of columns to be reduced.
a	REAL for slahr2 DOUBLE PRECISION for dlahr2 COMPLEX for clahr2 DOUBLE COMPLEX for zlahr2. Array, DIMENSION (*lda*, *n*-*k*+1) contains the *n*-by-(*n*-*k*+1) general matrix *A* to be reduced.

lda	INTEGER. The leading dimension of the array *a*; *lda* ≥ max(1, *n*).
ldt	INTEGER. The leading dimension of the output array *t*; *ldt* ≥ *nb*.
ldy	INTEGER. The leading dimension of the output array *y*; *ldy* ≥ *n*.

Output Parameters

a	On exit, the elements on and above the *k*-th subdiagonal in the first *nb* columns are overwritten with the corresponding elements of the reduced matrix; the elements below the *k*-th subdiagonal, with the array *tau*, represent the matrix *Q* as a product of elementary reflectors. The other columns of *a* are unchanged. See *Application Notes* below.
tau	REAL for slahr2 DOUBLE PRECISION for dlahr2 COMPLEX for clahr2 DOUBLE COMPLEX for zlahr2. Array, DIMENSION (*nb*). Contains scalar factors of the elementary reflectors.
t, *y*	REAL for slahr2 DOUBLE PRECISION for dlahr2 COMPLEX for clahr2 DOUBLE COMPLEX for zlahr2. Arrays, dimension *t*(*ldt*, *nb*), *y*(*ldy*, *nb*). The array *t* contains upper triangular matrix *T*. The array *y* contains the *n*-by-*nb* matrix *Y* .

Application Notes

For the elementary reflector *H*(i),

v(1:i+*k*-1) = 0, *v*(i+*k*) = 1; *v*(i+*k*+1:*n*) is stored on exit in *a*(i+*k*+1:*n*, i) and *tau* is stored in *tau*(i).

The elements of the vectors *v* together form the (*n*-*k*+1)-by-*nb* matrix *V* which is needed, with *T* and *Y*, to apply the transformation to the unreduced part of the matrix, using an update of the form:

$A := (I - V*T*V^T) * (A - Y*V^T)$ for real flavors, or

$A := (I - V*T*V^H) * (A - Y*V^H)$ for complex flavors.

The contents of *A* on exit are illustrated by the following example with *n* = 7, *k* = 3 and *nb* = 2:

where *a* denotes an element of the original matrix *A*, *h* denotes a modified element of the upper Hessenberg matrix *H*, and v_i denotes an element of the vector defining `H(i)`.

?laic1

Applies one step of incremental condition estimation.

Syntax

```
call slaic1( job, j, x, sest, w, gamma, sestpr, s, c )
call dlaic1( job, j, x, sest, w, gamma, sestpr, s, c )
call claic1( job, j, x, sest, w, gamma, sestpr, s, c )
call zlaic1( job, j, x, sest, w, gamma, sestpr, s, c )
```

Include Files

- mkl.fi

Description

The routine ?laic1 applies one step of incremental condition estimation in its simplest version.

Let *x*, $||x||_2 = 1$ (where $||a||_2$ denotes the 2-norm of *a*), be an approximate singular vector of an *j*-by-*j* lower triangular matrix *L*, such that

$||L*x||_2 = sest$

Then ?laic1 computes *sestpr*, *s*, *c* such that the vector

$$xhat = \begin{bmatrix} s*x \\ c \end{bmatrix}$$

is an approximate singular vector of

$$Lhat = \begin{bmatrix} L & 0 \\ w^H & gamma \end{bmatrix}$$

(for complex flavors), or

$$Lhat = \begin{bmatrix} L & 0 \\ w^T & gamma \end{bmatrix}$$

(for real flavors), in the sense that

$||Lhat*xhat||_2 = sestpr$.

Depending on *job*, an estimate for the largest or smallest singular value is computed.

For real flavors, $[sc]^T$ and $sestpr^2$ is an eigenpair of the system

$$\mathrm{diag}(sest*sest, 0) + [alpha\ gamma] * \begin{bmatrix} alpha \\ gamma \end{bmatrix}$$

where $alpha = x^T*w$.

For complex flavors, $[sc]^H$ and $sestpr^2$ is an eigenpair of the system

$$\mathrm{diag}(sest*sest, 0) + [alpha\ gamma] * \begin{bmatrix} \mathrm{conjg}(alpha) \\ \mathrm{conjg}(gamma) \end{bmatrix}$$

where *alpha* = $x^{H} * w$.

Input Parameters

job	INTEGER. If *job* =1, an estimate for the largest singular value is computed; If *job* =2, an estimate for the smallest singular value is computed;
j	INTEGER. Length of *x* and *w*.
x, *w*	REAL for slaic1 DOUBLE PRECISION for dlaic1 COMPLEX for claic1 DOUBLE COMPLEX for zlaic1. Arrays, dimension (*j*) each. Contain vectors *x* and *w*, respectively.
sest	REAL for slaic1/claic1; DOUBLE PRECISION for dlaic1/zlaic1. Estimated singular value of *j*-by-*j* matrix *L*.
gamma	REAL for slaic1 DOUBLE PRECISION for dlaic1 COMPLEX for claic1 DOUBLE COMPLEX for zlaic1. The diagonal element *gamma*.

Output Parameters

sestpr	REAL for slaic1/claic1; DOUBLE PRECISION for dlaic1/zlaic1. Estimated singular value of (*j*+1)-by-(*j*+1) matrix *Lhat*.
s, *c*	REAL for slaic1 DOUBLE PRECISION for dlaic1 COMPLEX for claic1 DOUBLE COMPLEX for zlaic1. Sine and cosine needed in forming *xhat*.

?lakf2

Forms a matrix containing Kronecker products between the given matrices.

Syntax

```
call slakf2( m, n, a, lda, b, d, e, z, ldz )
call dlakf2( m, n, a, lda, b, d, e, z, ldz )
```

```
call clakf2( m, n, a, lda, b, d, e, z, ldz )
call zlakf2( m, n, a, lda, b, d, e, z, ldz )
```

Include Files

- mkl.fi

Description

The routine ?lakf2 forms the 2*m*n by 2*m*n matrix *Z*.

$$Z = \begin{bmatrix} \text{kron}(In, A) & -\text{kron}(B^T, Im) \\ \text{kron}(In, D) & -\text{kron}(E^T, Im) \end{bmatrix}$$

,

where *In* is the identity matrix of size *n* and X^T is the transpose of *X*. kron(*X*, *Y*) is the Kronecker product between the matrices *X* and *Y*.

Input Parameters

m	INTEGER. Size of matrix, $m \geq 1$
n	INTEGER. Size of matrix, $n \geq 1$
a	REAL for slakf2, DOUBLE PRECISION for dlakf2, COMPLEX for clakf2, DOUBLE COMPLEX for zlakf2, Array, size *lda*-by-*n*. The matrix *A* in the output matrix *Z*.
lda	INTEGER. The leading dimension of *a*, *b*, *d*, and *e*. $lda \geq m+n$.
b	REAL for slakf2, DOUBLE PRECISION for dlakf2, COMPLEX for clakf2, DOUBLE COMPLEX for zlakf2, Array, size *lda* by *n*. Matrix used in forming the output matrix *Z*.
d	REAL for slakf2, DOUBLE PRECISION for dlakf2, COMPLEX for clakf2, DOUBLE COMPLEX for zlakf2, Array, size *lda* by *m*. Matrix used in forming the output matrix *Z*.
e	REAL for slakf2, DOUBLE PRECISION for dlakf2, COMPLEX for clakf2, DOUBLE COMPLEX for zlakf2,

	Array, size *lda* by *n*. Matrix used in forming the output matrix *Z*.
ldz	INTEGER. The leading dimension of *Z*. *ldz*≥ 2* *m*n*.

Output Parameters

z	REAL for slakf2, DOUBLE PRECISION for dlakf2, COMPLEX for clakf2, DOUBLE COMPLEX for zlakf2, Array, size *ldz*-by-2**m***n*. The resultant Kronecker *m***n*2 -by-*m***n*2 matrix.

?laln2

Solves a 1-by-1 or 2-by-2 linear system of equations of the specified form.

Syntax

```
call slaln2( ltrans, na, nw, smin, ca, a, lda, d1, d2, b, ldb, wr, wi, x, ldx, scale, xnorm, info )
call dlaln2( ltrans, na, nw, smin, ca, a, lda, d1, d2, b, ldb, wr, wi, x, ldx, scale, xnorm, info )
```

Include Files

- mkl.fi

Description

The routine solves a system of the form

$(ca*A - w*D)*X = s*B$, or $(ca*A^T - w*D)*X = s*B$

with possible scaling (*s*) and perturbation of *A*.

A is an *na*-by-*na* real matrix, *ca* is a real scalar, *D* is an *na*-by-*na* real diagonal matrix, *w* is a real or complex value, and *X* and *B* are *na*-by-1 matrices: real if *w* is real, complex if *w* is complex. The parameter *na* may be 1 or 2.

If *w* is complex, *X* and *B* are represented as *na*-by-2 matrices, the first column of each being the real part and the second being the imaginary part.

The routine computes the scaling factor s (≤ 1) so chosen that *X* can be computed without overflow. *X* is further scaled if necessary to assure that norm(*ca*A - w*D*)*norm(*X*) is less than overflow.

If both singular values of (*ca*A - w*D*) are less than *smin*, *smin***I* (where *I* stands for identity) will be used instead of (*ca***A* - *w***D*). If only one singular value is less than *smin*, one element of (*ca***A* - *w***D*) will be perturbed enough to make the smallest singular value roughly *smin*.

If both singular values are at least *smin*, (*ca*A - w*D*) will not be perturbed. In any case, the perturbation will be at most some small multiple of max(*smin*, *ulp**norm(*ca*A - w*D*)).

The singular values are computed by infinity-norm approximations, and thus will only be correct to a factor of 2 or so.

NOTE
All input quantities are assumed to be smaller than overflow by a reasonable factor (see *bignum*).

Input Parameters

trans LOGICAL.

If *trans* = .TRUE., *A*- transpose will be used.

If *trans* = .FALSE., *A* will be used (not transposed.)

na INTEGER. The size of the matrix *A*, possible values 1 or 2.

nw INTEGER. This parameter must be 1 if *w* is real, and 2 if *w* is complex. Possible values 1 or 2.

smin REAL for slaln2

DOUBLE PRECISION for dlaln2.

The desired lower bound on the singular values of *A*.

This should be a safe distance away from underflow or overflow, for example, between (*underflow/machine_precision*) and (*machine_precision* * *overflow*). (See *bignum* and *ulp*).

ca REAL for slaln2

DOUBLE PRECISION for dlaln2.

The coefficient by which *A* is multiplied.

a REAL for slaln2

DOUBLE PRECISION for dlaln2.

Array, DIMENSION (*lda*,*na*).

The *na*-by-*na* matrix *A*.

lda INTEGER. The leading dimension of *a*. Must be at least *na*.

d1, *d2* REAL for slaln2

DOUBLE PRECISION for dlaln2.

The (1,1) and (2,2) elements in the diagonal matrix *D*, respectively. *d2* is not used if *nw* = 1.

b REAL for slaln2

DOUBLE PRECISION for dlaln2.

Array, DIMENSION (*ldb*,*nw*). The *na*-by-*nw* matrix *B* (right-hand side). If *nw* =2 (*w* is complex), column 1 contains the real part of *B* and column 2 contains the imaginary part.

ldb INTEGER. The leading dimension of *b*. Must be at least *na*.

wr, *wi* REAL for slaln2

DOUBLE PRECISION for dlaln2.

The real and imaginary part of the scalar *w*, respectively.

wi is not used if *nw* = 1.

ldx INTEGER. The leading dimension of the output array *x*. Must be at least *na*.

Output Parameters

x REAL for slaln2

DOUBLE PRECISION for dlaln2.

Array, DIMENSION (*ldx*,*nw*). The *na*-by-*nw* matrix *X* (unknowns), as computed by the routine. If *nw* = 2 (*w* is complex), on exit, column 1 will contain the real part of *X* and column 2 will contain the imaginary part.

scale REAL for slaln2

DOUBLE PRECISION for dlaln2.

The scale factor that *B* must be multiplied by to insure that overflow does not occur when computing *X*. Thus (*ca*A - w*D*) *X* will be *scale***B*, not *B* (ignoring perturbations of *A*.) It will be at most 1.

xnorm REAL for slaln2

DOUBLE PRECISION for dlaln2.

The infinity-norm of *X*, when *X* is regarded as an *na*-by-*nw* real matrix.

info INTEGER.

An error flag. It will be zero if no error occurs, a negative number if an argument is in error, or a positive number if (*ca*A - w*D*) had to be perturbed. The possible values are:

If *info* = 0: no error occurred, and (*ca*A - w*D*) did not have to be perturbed.

If *info* = 1: (*ca*A - w*D*) had to be perturbed to make its smallest (or only) singular value greater than *smin*.

NOTE
For higher speed, this routine does not check the inputs for errors.

?lals0

Applies back multiplying factors in solving the least squares problem using divide and conquer SVD approach. Used by ?gelsd.

Syntax

call slals0(*icompq, nl, nr, sqre, nrhs, b, ldb, bx, ldbx, perm, givptr, givcol, ldgcol, givnum, ldgnum, poles, difl, difr, z, k, c, s, work, info*)

call dlals0(*icompq, nl, nr, sqre, nrhs, b, ldb, bx, ldbx, perm, givptr, givcol, ldgcol, givnum, ldgnum, poles, difl, difr, z, k, c, s, work, info*)

call clals0(*icompq, nl, nr, sqre, nrhs, b, ldb, bx, ldbx, perm, givptr, givcol, ldgcol, givnum, ldgnum, poles, difl, difr, z, k, c, s, rwork, info*)

```
call zlals0( icompq, nl, nr, sqre, nrhs, b, ldb, bx, ldbx, perm, givptr, givcol, ldgcol,
givnum, ldgnum, poles, difl, difr, z, k, c, s, rwork, info )
```

Include Files

- mkl.fi

Description

The routine applies back the multiplying factors of either the left or right singular vector matrix of a diagonal matrix appended by a row to the right hand side matrix *B* in solving the least squares problem using the divide-and-conquer SVD approach.

For the left singular vector matrix, three types of orthogonal matrices are involved:

(1L) Givens rotations: the number of such rotations is *givptr*;the pairs of columns/rows they were applied to are stored in *givcol*;and the *c*- and *s*-values of these rotations are stored in *givnum*.

(2L) Permutation. The (*nl*+1)-st row of *B* is to be moved to the first row, and for j=2:*n*, *perm*(*j*)-th row of *B* is to be moved to the *j*-th row.

(3L) The left singular vector matrix of the remaining matrix.

For the right singular vector matrix, four types of orthogonal matrices are involved:

(1R) The right singular vector matrix of the remaining matrix.

(2R) If *sqre* = 1, one extra Givens rotation to generate the right null space.

(3R) The inverse transformation of (2L).

(4R) The inverse transformation of (1L).

Input Parameters

icompq

INTEGER. Specifies whether singular vectors are to be computed in factored form:

If *icompq* = 0: Left singular vector matrix.

If *icompq* = 1: Right singular vector matrix.

nl

INTEGER. The row dimension of the upper block.

nl≥ 1.

nr

INTEGER. The row dimension of the lower block.

nr≥ 1.

sqre

INTEGER.

If *sqre* = 0: the lower block is an *nr*-by-*nr* square matrix.

If *sqre* = 1: the lower block is an *nr*-by-(*nr*+1) rectangular matrix. The bidiagonal matrix has row dimension *n* = *nl* + *nr* + 1, and column dimension *m* = *n* + *sqre*.

nrhs

INTEGER. The number of columns of *B* and *bx*.

Must be at least 1.

b

REAL for slals0

DOUBLE PRECISION for dlals0

COMPLEX for clals0

DOUBLE COMPLEX for zlals0.

Array, DIMENSION (*ldb*, *nrhs*).

Contains the right hand sides of the least squares problem in rows 1 through *m*.

ldb INTEGER. The leading dimension of *b*.

Must be at least max(1,max(*m*, *n*)).

bx REAL for slals0

DOUBLE PRECISION for dlals0

COMPLEX for clals0

DOUBLE COMPLEX for zlals0.

Workspace array, DIMENSION (*ldbx*, *nrhs*).

ldbx INTEGER. The leading dimension of *bx*.

perm INTEGER. Array, DIMENSION (*n*).

The permutations (from deflation and sorting) applied to the two blocks.

givptr INTEGER. The number of Givens rotations which took place in this subproblem.

givcol INTEGER. Array, DIMENSION (*ldgcol*, 2). Each pair of numbers indicates a pair of rows/columns involved in a Givens rotation.

ldgcol INTEGER. The leading dimension of *givcol*, must be at least *n*.

givnum REAL for slals0/clals0

DOUBLE PRECISION for dlals0/zlals0

Array, DIMENSION (*ldgnum*, 2). Each number indicates the c or *s* value used in the corresponding Givens rotation.

ldgnum INTEGER. The leading dimension of arrays *difr*, *poles* and *givnum*, must be at least *k*.

poles REAL for slals0/clals0

DOUBLE PRECISION for dlals0/zlals0

Array, DIMENSION (*ldgnum*, 2). On entry, *poles*(1:*k*, 1) contains the new singular values obtained from solving the secular equation, and *poles*(1:*k*, 2) is an array containing the poles in the secular equation.

difl REAL for slals0/clals0

DOUBLE PRECISION for dlals0/zlals0

Array, DIMENSION (*k*). On entry, *difl*(*i*) is the distance between *i*-th updated (undeflated) singular value and the *i*-th (undeflated) old singular value.

difr REAL for slals0/clals0

DOUBLE PRECISION for dlals0/zlals0

Array, DIMENSION (*ldgnum*, 2). On entry, *difr*(*i*, 1) contains the distances between *i*-th updated (undeflated) singular value and the *i+1*-th (undeflated) old singular value. And *difr*(*i*, 2) is the normalizing factor for the *i*-th right singular vector.

z

REAL for slals0/clals0

DOUBLE PRECISION for dlals0/zlals0

Array, DIMENSION (*k*). Contains the components of the deflation-adjusted updating row vector.

K

INTEGER. Contains the dimension of the non-deflated matrix. This is the order of the related secular equation. $1 \leq k \leq n$.

c

REAL for slals0/clals0

DOUBLE PRECISION for dlals0/zlals0

Contains garbage if *sqre* =0 and the *c* value of a Givens rotation related to the right null space if *sqre* = 1.

s

REAL for slals0/clals0

DOUBLE PRECISION for dlals0/zlals0

Contains garbage if *sqre* =0 and the *s* value of a Givens rotation related to the right null space if *sqre* = 1.

work

REAL for slals0

DOUBLE PRECISION for dlals0

Workspace array, DIMENSION (*k*). Used with real flavors only.

rwork

REAL for clals0

DOUBLE PRECISION for zlals0

Workspace array, DIMENSION (*k**(1+*nrhs*) + 2**nrhs*). Used with complex flavors only.

Output Parameters

b

On exit, contains the solution *X* in rows 1 through *n*.

info

INTEGER.

If *info* = 0: successful exit.

If *info* = -*i* < 0, the *i*-th argument had an illegal value.

?lalsa

Computes the SVD of the coefficient matrix in compact form. Used by ?gelsd.

Syntax

```
call slalsa( icompq, smlsiz, n, nrhs, b, ldb, bx, ldbx, u, ldu, vt, k, difl, difr, z,
poles, givptr, givcol, ldgcol, perm, givnum, c, s, work, iwork, info )
```

```
call dlalsa( icompq, smlsiz, n, nrhs, b, ldb, bx, ldbx, u, ldu, vt, k, difl, difr, z,
poles, givptr, givcol, ldgcol, perm, givnum, c, s, work, iwork, info )

call clalsa( icompq, smlsiz, n, nrhs, b, ldb, bx, ldbx, u, ldu, vt, k, difl, difr, z,
poles, givptr, givcol, ldgcol, perm, givnum, c, s, rwork, iwork, info )

call zlalsa( icompq, smlsiz, n, nrhs, b, ldb, bx, ldbx, u, ldu, vt, k, difl, difr, z,
poles, givptr, givcol, ldgcol, perm, givnum, c, s, rwork, iwork, info )
```

Include Files

- mkl.fi

Description

The routine is an intermediate step in solving the least squares problem by computing the SVD of the coefficient matrix in compact form. The singular vectors are computed as products of simple orthogonal matrices.

If *icompq* = 0, ?lalsa applies the inverse of the left singular vector matrix of an upper bidiagonal matrix to the right hand side; and if *icompq* = 1, the routine applies the right singular vector matrix to the right hand side. The singular vector matrices were generated in the compact form by ?lalsa.

Input Parameters

icompq
: INTEGER. Specifies whether the left or the right singular vector matrix is involved. If *icompq* = 0: left singular vector matrix is used

  If *icompq* = 1: right singular vector matrix is used.

smlsiz
: INTEGER. The maximum size of the subproblems at the bottom of the computation tree.

n
: INTEGER. The row and column dimensions of the upper bidiagonal matrix.

nrhs
: INTEGER. The number of columns of *b* and *bx*. Must be at least 1.

b
: REAL for slalsa

  DOUBLE PRECISION for dlalsa

  COMPLEX for clalsa

  DOUBLE COMPLEX for zlalsa

  Array, DIMENSION (*ldb*, *nrhs*). Contains the right hand sides of the least squares problem in rows 1 through *m*.

ldb
: INTEGER. The leading dimension of *b* in the calling subprogram. Must be at least max(1,max(*m*, *n*)).

ldbx
: INTEGER. The leading dimension of the output array *bx*.

u
: REAL for slalsa/clalsa

  DOUBLE PRECISION for dlalsa/zlalsa

  Array, DIMENSION (*ldu*, *smlsiz*). On entry, *u* contains the left singular vector matrices of all subproblems at the bottom level.

ldu INTEGER, *ldu*≥*n*. The leading dimension of arrays *u*, *vt*, *difl*, *difr*, *poles*, *givnum*, and *z*.

vt REAL for slalsa/clalsa

DOUBLE PRECISION for dlalsa/zlalsa

Array, DIMENSION(*ldu*, *smlsiz* +1). On entry, vt^T (for real flavors) or vt^H (for complex flavors) contains the right singular vector matrices of all subproblems at the bottom level.

k INTEGER array, DIMENSION (*n*).

difl REAL for slalsa/clalsa

DOUBLE PRECISION for dlalsa/zlalsa

Array, DIMENSION (*ldu*, *nlvl*), where $nlvl = \text{int}(\log_2(n/(smlsiz+1))) + 1$.

difr REAL for slalsa/clalsa

DOUBLE PRECISION for dlalsa/zlalsa

Array, DIMENSION(*ldu*, 2**nlvl*). On entry, *difl*(*, *i*) and *difr*(*, 2*i* -1) record distances between singular values on the *i*-th level and singular values on the (*i* -1)-th level, and *difr*(*, 2*i*) record the normalizing factors of the right singular vectors matrices of subproblems on *i*-th level.

z REAL for slalsa/clalsa

DOUBLE PRECISION for dlalsa/zlalsa

Array, DIMENSION (*ldu*, *nlvl* . On entry, *z*(1, *i*) contains the components of the deflation- adjusted updating the row vector for subproblems on the *i*-th level.

poles REAL for slalsa/clalsa

DOUBLE PRECISION for dlalsa/zlalsa

Array, DIMENSION (*ldu*, 2**nlvl*).

On entry, *poles*(*, 2*i*-1: 2*i*) contains the new and old singular values involved in the secular equations on the *i*-th level.

givptr INTEGER. Array, DIMENSION (*n*).

On entry, *givptr*(*i*) records the number of Givens rotations performed on the *i*-th problem on the computation tree.

givcol INTEGER. Array, DIMENSION (*ldgcol*, 2**nlvl*). On entry, for each *i*, *givcol*(*, 2*i*-1: 2*i*) records the locations of Givens rotations performed on the *i*-th level on the computation tree.

ldgcol INTEGER, *ldgcol*≥*n*. The leading dimension of arrays *givcol* and *perm*.

perm INTEGER. Array, DIMENSION (*ldgcol*, *nlvl*). On entry, *perm*(*, *i*) records permutations done on the *i*-th level of the computation tree.

givnum REAL for slalsa/clalsa

DOUBLE PRECISION for dlalsa/zlalsa

Array, DIMENSION (*ldu*, 2**nlvl*). On entry, *givnum*(*, 2*i*-1 : 2*i*) records the *c* and *s* values of Givens rotations performed on the *i*-th level on the computation tree.

c

REAL for slalsa/clalsa

DOUBLE PRECISION for dlalsa/zlalsa

Array, DIMENSION (*n*). On entry, if the *i*-th subproblem is not square, *c*(*i*) contains the *c* value of a Givens rotation related to the right null space of the *i*-th subproblem.

s

REAL for slalsa/clalsa

DOUBLE PRECISION for dlalsa/zlalsa

Array, DIMENSION (*n*). On entry, if the *i*-th subproblem is not square, *s*(*i*) contains the *s*-value of a Givens rotation related to the right null space of the *i*-th subproblem.

work

REAL for slalsa

DOUBLE PRECISION for dlalsa

Workspace array, DIMENSION at least (*n*). Used with real flavors only.

rwork

REAL for clalsa

DOUBLE PRECISION for zlalsa

Workspace array, DIMENSION at least max(*n*, (*smlsz*+1)**nrhs**3). Used with complex flavors only.

iwork

INTEGER.

Workspace array, DIMENSION at least (3*n*).

Output Parameters

b

On exit, contains the solution *X* in rows 1 through *n*.

bx

REAL for slalsa

DOUBLE PRECISION for dlalsa

COMPLEX for clalsa

DOUBLE COMPLEX for zlalsa

Array, DIMENSION (*ldbx*, *nrhs*). On exit, the result of applying the left or right singular vector matrix to *b*.

info

INTEGER. If *info* = 0: successful exit

If *info* = -*i* < 0, the *i*-th argument had an illegal value.

?lalsd

Uses the singular value decomposition of A to solve the least squares problem.

Syntax

```
call slalsd( uplo, smlsiz, n, nrhs, d, e, b, ldb, rcond, rank, work, iwork, info )
```

```
call dlalsd( uplo, smlsiz, n, nrhs, d, e, b, ldb, rcond, rank, work, iwork, info )
call clalsd( uplo, smlsiz, n, nrhs, d, e, b, ldb, rcond, rank, work, rwork, iwork, info )
call zlalsd( uplo, smlsiz, n, nrhs, d, e, b, ldb, rcond, rank, work, rwork, iwork, info )
```

Include Files

- mkl.fi

Description

The routine uses the singular value decomposition of *A* to solve the least squares problem of finding *X* to minimize the Euclidean norm of each column of *A***X*-*B*, where *A* is *n*-by-*n* upper bidiagonal, and *X* and *B* are *n*-by-*nrhs*. The solution *X* overwrites *B*.

The singular values of *A* smaller than *rcond* times the largest singular value are treated as zero in solving the least squares problem; in this case a minimum norm solution is returned. The actual singular values are returned in *d* in ascending order.

This code makes very mild assumptions about floating point arithmetic. It will work on machines with a guard digit in add/subtract, or on those binary machines without guard digits which subtract like the Cray XMP, Cray YMP, Cray C 90, or Cray 2.

It could conceivably fail on hexadecimal or decimal machines without guard digits, but we know of none.

Input Parameters

uplo

CHARACTER*1.

If *uplo* = 'U', *d* and *e* define an upper bidiagonal matrix.

If *uplo* = 'L', *d* and *e* define a lower bidiagonal matrix.

smlsiz

INTEGER. The maximum size of the subproblems at the bottom of the computation tree.

n

INTEGER. The dimension of the bidiagonal matrix.

n≥ 0.

nrhs

INTEGER. The number of columns of *B*. Must be at least 1.

d

REAL for slalsd/clalsd

DOUBLE PRECISION for dlalsd/zlalsd

Array, DIMENSION (*n*). On entry, *d* contains the main diagonal of the bidiagonal matrix.

e

REAL for slalsd/clalsd

DOUBLE PRECISION for dlalsd/zlalsd

Array, DIMENSION (*n*-1). Contains the super-diagonal entries of the bidiagonal matrix. On exit, *e* is destroyed.

b

REAL for slalsd

DOUBLE PRECISION for dlalsd

COMPLEX for clalsd

DOUBLE COMPLEX for zlalsd

Array, DIMENSION (*ldb*,*nrhs*).

On input, *b* contains the right hand sides of the least squares problem. On output, *b* contains the solution X.

ldb

INTEGER. The leading dimension of *b* in the calling subprogram. Must be at least max(1,*n*).

rcond

REAL for slalsd/clalsd

DOUBLE PRECISION for dlalsd/zlalsd

The singular values of *A* less than or equal to *rcond* times the largest singular value are treated as zero in solving the least squares problem. If *rcond* is negative, machine precision is used instead. For example, for the least squares problem diag(*S*)*X=*B*, where diag(*S*) is a diagonal matrix of singular values, the solution is *X*(*i*)=*B*(*i*)/*S*(*i*) if *S*(*i*) is greater than *rcond* *max(*S*), and *X*(*i*)=0 if *S*(*i*) is less than or equal to *rcond* *max(*S*).

rank

INTEGER. The number of singular values of *A* greater than *rcond* times the largest singular value.

work

REAL for slalsd

DOUBLE PRECISION for dlalsd

COMPLEX for clalsd

DOUBLE COMPLEX for zlalsd

Workspace array.

DIMENSION for real flavors at least

(9*n*+2*n**smlsiz*+8*n**nlvl*+*n**nrhs*+(*smlsiz*+1)^2),

where

nlvl = max(0, int($\log_2$(*n*/(*smlsiz*+1))) + 1).

DIMENSION for complex flavors is (*n**nrhs*).

rwork

REAL for clalsd

DOUBLE PRECISION for zlalsd

Workspace array, used with complex flavors only.

DIMENSION at least (9*n* + 2*n**smlsiz* + 8*n**nlvl* + 3**mlsiz**nrhs* + (*smlsiz*+1)^2),

where

nlvl = max(0, int($\log_2$(min(*m*,*n*)/(*smlsiz*+1))) + 1).

iwork

INTEGER.

Workspace array of DIMENSION(3*n**nlvl* + 11*n*).

Output Parameters

d

On exit, if *info* = 0, *d* contains singular values of the bidiagonal matrix.

e	On exit, destroyed.
b	On exit, *b* contains the solution *X*.
info	INTEGER. If *info* = 0: successful exit. If *info* = -*i* < 0, the *i*-th argument had an illegal value. If *info* > 0: The algorithm failed to compute a singular value while working on the submatrix lying in rows and columns *info*/(*n*+1) through mod(*info*,*n*+1).

?lamrg

Creates a permutation list to merge the entries of two independently sorted sets into a single set sorted in acsending order.

Syntax

```
call slamrg( n1, n2, a, strd1, strd2, index )
call dlamrg( n1, n2, a, strd1, strd2, index )
```

Include Files

- mkl.fi

Description

The routine creates a permutation list which will merge the elements of *a* (which is composed of two independently sorted sets) into a single set which is sorted in ascending order.

Input Parameters

n1, *n2*	INTEGER. These arguments contain the respective lengths of the two sorted lists to be merged.
a	REAL for slamrg DOUBLE PRECISION for dlamrg. Array, DIMENSION (*n1*+*n2*). The first *n1* elements of *a* contain a list of numbers which are sorted in either ascending or descending order. Likewise for the final *n2* elements.
strd1, *strd2*	INTEGER. These are the strides to be taken through the array *a*. Allowable strides are 1 and -1. They indicate whether a subset of *a* is sorted in ascending (*strdx* = 1) or descending (*strdx* = -1) order.

Output Parameters

index	INTEGER. Array, DIMENSION (*n1*+*n2*).

On exit, this array will contain a permutation such that if `b(i) = a(index(i))` for `i=1, n1+n2`, then *b* will be sorted in ascending order.

?lamswlq

Multiplies a general real matrix by a real orthogonal matrix defined as the product of blocked elementary reflectors computed by short wide LQ factorization.

```
call slamswlq(side, trans, m, n, k, mb, nb, a, lda, t, ldt, c, ldc, work, lwork, info)
call dlamswlq(side, trans, m, n, k, mb, nb, a, lda, t, ldt, c, ldc, work, lwork, info)
call clamswlq(side, trans, m, n, k, mb, nb, a, lda, t, ldt, c, ldc, work, lwork, info)
call zlamswlq(side, trans, m, n, k, mb, nb, a, lda, t, ldt, c, ldc, work, lwork, info)
```

Description

`?lamswlq` overwrites the general real *m*-by-*n* matrix *C* with

	side = 'L'	*side* = 'R'
trans = 'N'	*Q***C*	*C***Q*
trans = 'T'	Q^T**C*	*C**Q^T
trans = 'C'	Q^H**C*	*C**Q^H

where *Q* is a real orthogonal matrix defined as the product of blocked elementary reflectors computed by short wide LQ factorization (`?laswlq`).

Short-Wide LQ (SWLQ) performs LQ by a sequence of orthogonal transformations, representing *Q* as a product of other orthogonal matrices: *Q* = *Q*(1) * *Q*(2) * . . . * *Q*(*k*), where each *Q*(*i*) zeros out upper diagonal entries of a block of *nb* rows of *A*:

Q(1) zeros out the upper diagonal entries of rows 1:*nb* of *A*,

Q(2) zeros out the bottom *mb*-*n* rows of rows [1:*m*, *nb* + 1:2**nb* - *m*] of *A*,

Q(3) zeros out the bottom *mb*-*n* rows of rows [1:*m*, 2**nb*-*m* + 1:3**nb* - 2**m*] of *A* . . . .

Q(1) is computed by `gelqt`, which represents *Q*(1) by Householder vectors stored under the diagonal of rows 1:*mb* of *A*, and by upper triangular block reflectors, stored in array *t*(1:*ldt*, 1:*n*). For more information, see `gelqt`.

Q(*i*) for *i* > 1 is computed by `tplqt`, which represents *Q*(*i*) by Householder vectors stored in columns [(*i* - 1)*(*nb* - *m*) + *m* + 1:*i**(*nb* - *m*) + *m*] of *A*, and by upper triangular block reflectors, stored in array *t*(1:*ldt*, (*i* - 1)**m* + 1:*i***m*). The last *Q*(*k*) may use fewer rows. For more information see Further Details in `tplqt`. For more details of the overall algorithm, see [DEMMEL12].

Input Parameters

side — CHARACTER*1.

If *side* = 'L': apply op(*Q*) from the left;

if *side* = 'R': apply op(*Q*) from the right.

trans — CHARACTER*1.

If *trans* = 'N': No transpose, op(*Q*) = *Q*;

if *trans* = 'T': Transpose, op(*Q*) = Q^T;

if *trans*= 'C': Transpose, op(*Q*) = Q^H.

m — INTEGER. The number of rows of the matrix *C*. *m*≥ 0.

n — INTEGER. The number of columns of the matrix *C*. *n*≥*m*.

k — INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. *m*≥*k*≥ 0;

mb — INTEGER. The row block size to be used in the blocked QR. *m*≥*mb*≥ 1

nb — INTEGER. The block size to be used in the blocked QR. *nb* > *m*.

a — REAL for slamswlq

DOUBLE PRECISION for dlamswlq

COMPLEX for clamswlq

COMPLEX*16 for zlamswlq

Array of size (*lda*, *m*) if *side* = 'L' or (*lda*, *n*) if *side* = 'R'. The *i*-th row must contain the vector which defines the blocked elementary reflector *H*(*i*), for *i* = 1, 2, ..., *k*, as returned by ?laswlq in the first *k* rows of its array argument *a*.

lda — INTEGER. The leading dimension of the array *a*.*lda*≥ max(1, *k*).

t — REAL for slamswlq

DOUBLE PRECISION for dlamswlq

COMPLEX for clamswlq

COMPLEX*16 for zlamswlq

Array of size (*m* * Number of blocks(ceiling(*n* - *k*/*nb* - *k*))), The blocked upper triangular block reflectors stored in compact form as a sequence of upper triangular blocks as described previously.

ldt — INTEGER. The leading dimension of the array *t*. *ldt*≥*mb*.

c — REAL for slamswlq

DOUBLE PRECISION for dlamswlq

COMPLEX for clamswlq

COMPLEX*16 for zlamswlq

Array of size (*ldc*,*n*). On entry, the *m*-by-*n* matrix *C*.

ldc — INTEGER. The leading dimension of the array *c*. *ldc*≥ max(1,*m*).

lwork — INTEGER. The size of the array *work*. If *side* = 'L', *lwork*≥ max(1, *nb*) * *mb*; if *side* = 'R', *lwork*≥ max(1, *m*) * *mb*. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

Output Parameters

c	On exit, *c* is overwritten by op(*Q*)***C* or *C**op(*Q*).
work	REAL for slamswlq DOUBLE PRECISION for dlamswlq COMPLEX for clamswlq COMPLEX*16 for zlamswlq Workspace array of size (max(1, *lwork*)).
info	INTEGER. *info* = 0: successful exit. *info* < 0: if *info* = -*i*, the *i*-th argument had an illegal value.

?lamtsqr

Multiplies a general matrix by the product of blocked elementary reflectors computed by tall skinny QR factorization (?latsqr)

```
call slamtsqr(side, trans, m, n, k, mb, nb, a, lda, t, ldt, c, ldc, work, lwork, info)
call dlamtsqr(side, trans, m, n, k, mb, nb, a, lda, t, ldt, c, ldc, work, lwork, info)
call clamtsqr(side, trans, m, n, k, mb, nb, a, lda, t, ldt, c, ldc, work, lwork, info)
call zlamtsqr(side, trans, m, n, k, mb, nb, a, lda, t, ldt, c, ldc, work, lwork, info)
```

Description

?lamtsqr overwrites the general real or complex*m*-by-*n* matrix *C* with

	side = 'L'	*side* = 'R'
trans = 'N'	*Q***C*	*C***Q*
trans = 'T'	Q^T**C*	*C**Q^T
trans = 'C'	Q^H**C*	*C**Q^H

where *Q* is a real orthogonal matrix defined as the product of blocked elementary reflectors computed by tall skinny QR factorization (?latsqr). Tall-Skinny QR (TSQR) performs QR by a sequence of orthogonal transformations, representing *Q* as a product of other orthogonal matrices

Q = *Q*(1) * *Q*(2) * . . . * *Q*(*k*)

where each *Q*(*i*) zeros out subdiagonal entries of a block of *mb* rows of *A*:

Q(1) zeros out the subdiagonal entries of rows 1:*mb* of *A*,

Q(2) zeros out the bottom *mb*-*n* rows of rows [1:*n*, *mb* + 1:2**mb* - *n*] of *A*,

Q(3) zeros out the bottom *mb*-*n* rows of rows [1:*n*, 2**mb* - *n* + 1:3**mb* - 2**n*] of *A* . . . .

Q(1) is computed by geqrt, which represents *Q*(1) by Householder vectors stored under the diagonal of rows 1:*mb* of *a*, and by upper triangular block reflectors, stored in array *t*(1:*ldt*, 1:*n*). For more information, see geqrt.

$Q(i)$ for $i > 1$ is computed by `tpqrt`, which represents $Q(i)$ by Householder vectors stored in rows [(*i* - 1)*(*mb* - *n*) + *n* + 1:*i**(*mb* - *n*) + *n*] of *a*, and by upper triangular block reflectors, stored in array *t*(1:*ldt*, (*i* - 1)**n* + 1:*i***n*). The last $Q(k)$ may use fewer rows. For more information, see `tpqrt`. For more details of the overall algorithm, see [DEMMEL12].

Input Parameters

side
`CHARACTER*1`.
If *side* = 'L': apply op(Q) from the left;
if *side* = 'R': apply op(Q) from the right.

trans
`CHARACTER*1`.
If *trans* = 'N': No transpose, op(Q) = Q;
if *trans* = 'T': Transpose, op(Q) = Q^T;
if *trans* = 'C': Transpose, op(Q) = Q^H.

m
`INTEGER`. The number of rows of the matrix C. $m \geq 0$.

n
`INTEGER`. The number of columns of the matrix C. $m \geq n \geq 0$.

k
`INTEGER`. The number of elementary reflectors whose product defines the matrix Q. $n \geq k \geq 0$;

mb
`INTEGER`. The block size to be used in the blocked QR. *mb* > *n*. (Must be the same as in `?latsqr`)

nb
`INTEGER`. The column block size to be used in the blocked QR. $n \geq nb \geq 1$.

a
`REAL` for `slamtsqr`
`DOUBLE PRECISION` for `dlamtsqr`
`COMPLEX` for `clamtsqr`
`COMPLEX*16` for `zlamtsqr`
Array of size (*lda*, *k*). The *i*-th column must contain the vector which defines the blocked elementary reflector $H(i)$, for $i = 1,2,...,k$, as returned by `?latsqr` in the first *k* columns of its array argument *a*.

lda
`INTEGER`. The leading dimension of the array *a*.
If *side* = 'L', $lda \geq \max(1, m)$;
if *side* = 'R', $lda \geq \max(1, n)$.

t
`REAL` for `slamtsqr`
`DOUBLE PRECISION` for `dlamtsqr`
`COMPLEX` for `clamtsqr`
`COMPLEX*16` for `zlamtsqr`
Array of size (*n* * Number of blocks(ceiling(*m*-*k*/*mb*-*k*))). The blocked upper triangular block reflectors stored in compact form as a sequence of upper triangular blocks, as described previously.

ldt
`INTEGER`. The leading dimension of the array *t*. $ldt \geq nb$.

c	REAL for slamtsqr DOUBLE PRECISION for dlamtsqr COMPLEX for clamtsqr COMPLEX*16 for zlamtsqr Array of size (*ldc*,*n*). On entry, the *m*-by-*n* matrix *C*.
ldc	INTEGER. The leading dimension of the array *c*. *ldc*≥ max(1, *m*).
lwork	INTEGER. The dimension of the array *work*. If *side* = 'L', *lwork*≥ max(1, *n*)**nb*; if *side* = 'R', *lwork*≥ max(1, *mb*)**nb*. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

Output Parameters

c	On exit, *c* is overwritten by op(*Q*)**C* or *C**op(*Q*).
work	REAL for slamtsqr DOUBLE PRECISION for dlamtsqr COMPLEX for clamtsqr COMPLEX*16 for zlamtsqr Workspace array of size (max(1, *lwork*)).
info	INTEGER. *info* = 0: successful exit. *info* < 0: if *info* = -*i*, the *i*-th argument had an illegal value.

?laneg

*Computes the Sturm count, the number of negative pivots encountered while factoring tridiagonal T-sigma*I = L*D*L^T.*

Syntax

```
value = slaneg( n, d, lld, sigma, pivmin, r )
value = dlaneg( n, d, lld, sigma, pivmin, r )
```

Include Files

- mkl.fi

Description

The routine computes the Sturm count, the number of negative pivots encountered while factoring tridiagonal $T-sigma*I = L*D*L^T$. This implementation works directly on the factors without forming the tridiagonal matrix *T*. The Sturm count is also the number of eigenvalues of *T* less than *sigma*. This routine is called from ?larb. The current routine does not use the *pivmin* parameter but rather requires IEEE-754

propagation of infinities and NaNs (NaN stands for 'Not A Number'). This routine also has no input range restrictions but does require default exception handling such that *x*/0 produces Inf when *x* is non-zero, and Inf/Inf produces NaN. (For more information see [Marques06]).

Input Parameters

n	INTEGER. The order of the matrix.
d	REAL for slaneg DOUBLE PRECISION for dlaneg Array, DIMENSION (*n*). Contains *n* diagonal elements of the matrix *D*.
lld	REAL for slaneg DOUBLE PRECISION for dlaneg Array, DIMENSION (*n*-1). Contains (*n*-1) elements *L*(i)**L*(i)**D*(i).
sigma	REAL for slaneg DOUBLE PRECISION for dlaneg Shift amount in *T-sigma*I = L*D*L**T*.
pivmin	REAL for slaneg DOUBLE PRECISION for dlaneg The minimum pivot in the Sturm sequence. May be used when zero pivots are encountered on non-IEEE-754 architectures.
r	INTEGER. The twist index for the twisted factorization that is used for the negcount.

Output Parameters

value	INTEGER. The number of negative pivots encountered while factoring.

?langb

Returns the value of the 1-norm, Frobenius norm, infinity-norm, or the largest absolute value of any element of general band matrix.

Syntax

```
val = slangb( norm, n, kl, ku, ab, ldab, work )
val = dlangb( norm, n, kl, ku, ab, ldab, work )
val = clangb( norm, n, kl, ku, ab, ldab, work )
val = zlangb( norm, n, kl, ku, ab, ldab, work )
```

Include Files

- mkl.fi

Description

The function returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of an *n*-by-*n* band matrix *A*, with *kl* sub-diagonals and *ku* super-diagonals.

Input Parameters

norm — CHARACTER*1. Specifies the value to be returned by the routine:

= 'M' or 'm': *val* = max(abs(A_{ij})), largest absolute value of the matrix *A*.

= '1' or 'O' or 'o': *val* = norm1(*A*), 1-norm of the matrix *A* (maximum column sum),

= 'I' or 'i': *val* = normI(*A*), infinity norm of the matrix *A* (maximum row sum),

= 'F', 'f', 'E' or 'e': *val* = normF(*A*), Frobenius norm of the matrix *A* (square root of sum of squares).

n — INTEGER. The order of the matrix *A*. $n \geq 0$. When $n = 0$, ?langb is set to zero.

kl — INTEGER. The number of sub-diagonals of the matrix *A*. $kl \geq 0$.

ku — INTEGER. The number of super-diagonals of the matrix *A*. $ku \geq 0$.

ab — REAL for slangb

DOUBLE PRECISION for dlangb

COMPLEX for clangb

DOUBLE COMPLEX for zlangb

Array, DIMENSION (*ldab*,*n*).

The band matrix *A*, stored in rows 1 to *kl*+*ku*+1. The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows:

ab(*ku*+1+*i*-*j*,*j*) = *a*(*i*,*j*)

for $\max(1, j-ku) \leq i \leq \min(n, j+kl)$.

ldab — INTEGER. The leading dimension of the array *ab*.

$ldab \geq kl+ku+1$.

work — REAL for slangb/clangb

DOUBLE PRECISION for dlangb/zlangb

Workspace array, DIMENSION (max(1,*lwork*)), where

$lwork \geq n$ when *norm* = 'I'; otherwise, *work* is not referenced.

Output Parameters

val — REAL for slangb/clangb

DOUBLE PRECISION for dlangb/zlangb

Value returned by the function.

?lange

Returns the value of the 1-norm, Frobenius norm, infinity-norm, or the largest absolute value of any element of a general rectangular matrix.

Syntax

```
val = slange( norm, m, n, a, lda, work )
val = dlange( norm, m, n, a, lda, work )
val = clange( norm, m, n, a, lda, work )
val = zlange( norm, m, n, a, lda, work )
```

Include Files

- mkl.fi

Description

The function ?lange returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a real/complex matrix *A*.

Input Parameters

The data types are given for the Fortran interface.

norm

CHARACTER*1. Specifies the value to be returned by the routine:

= 'M' or 'm': *val* = max(abs(A_{ij})), largest absolute value of the matrix *A*.

= '1' or 'O' or 'o': *val* = norm1(*A*), 1-norm of the matrix *A* (maximum column sum),

= 'I' or 'i': *val* = normI(*A*), infinity norm of the matrix *A* (maximum row sum),

= 'F', 'f', 'E' or 'e': *val* = normF(*A*), Frobenius norm of the matrix *A* (square root of sum of squares).

m

INTEGER. The number of rows of the matrix *A*.

m ≥ 0. When *m* = 0, ?lange is set to zero.

n

INTEGER. The number of columns of the matrix *A*.

n ≥ 0. When *n* = 0, ?lange is set to zero.

a

REAL for slange

DOUBLE PRECISION for dlange

COMPLEX for clange

DOUBLE COMPLEX for zlange

Array, DIMENSION (*lda*,*n*).

Array *a* contains the *m*-by-*n* matrix *A*.

lda INTEGER. The leading dimension of the array *a*.

.

work REAL for slange and clange.

DOUBLE PRECISION for dlange and zlange.

Workspace array, DIMENSION max(1,*lwork*), where *lwork*≥*m* when *norm* = 'I'; otherwise, *work* is not referenced.

Output Parameters

val REAL for slange/clange

DOUBLE PRECISION for dlange/zlange

Value returned by the function.

?langt

Returns the value of the 1-norm, Frobenius norm, infinity-norm, or the largest absolute value of any element of a general tridiagonal matrix.

Syntax

```
val = slangt( norm, n, dl, d, du )
val = dlangt( norm, n, dl, d, du )
val = clangt( norm, n, dl, d, du )
val = zlangt( norm, n, dl, d, du )
```

Include Files

- mkl.fi

Description

The routine returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a real/complex tridiagonal matrix *A*.

Input Parameters

norm CHARACTER*1. Specifies the value to be returned by the routine:

= 'M' or 'm': *val* = max(abs(A_{ij})), largest absolute value of the matrix *A*.

= '1' or 'O' or 'o': *val* = norm1(*A*), 1-norm of the matrix *A* (maximum column sum),

= 'I' or 'i': *val* = normI(*A*), infinity norm of the matrix *A* (maximum row sum),

= 'F', 'f', 'E' or 'e': *val* = normF(*A*), Frobenius norm of the matrix *A* (square root of sum of squares).

n	INTEGER. The order of the matrix *A*. $n \geq 0$. When $n = 0$, ?langt is set to zero.
dl, *d*, *du*	REAL for slangt DOUBLE PRECISION for dlangt COMPLEX for clangt DOUBLE COMPLEX for zlangt Arrays: *dl* (*n*-1), *d* (*n*), *du* (*n*-1). The array *dl* contains the (*n*-1) sub-diagonal elements of *A*. The array *d* contains the diagonal elements of *A*. The array *du* contains the (*n*-1) super-diagonal elements of *A*.

Output Parameters

val	REAL for slangt/clangt DOUBLE PRECISION for dlangt/zlangt Value returned by the function.

?lanhs

Returns the value of the 1-norm, Frobenius norm, infinity-norm, or the largest absolute value of any element of an upper Hessenberg matrix.

Syntax

val = slanhs(*norm*, *n*, *a*, *lda*, *work*)

val = dlanhs(*norm*, *n*, *a*, *lda*, *work*)

val = clanhs(*norm*, *n*, *a*, *lda*, *work*)

val = zlanhs(*norm*, *n*, *a*, *lda*, *work*)

Include Files

- mkl.fi

Description

The function ?lanhs returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a Hessenberg matrix *A*.

The value *val* returned by the function is:

val = max(abs(A_{ij})), if *norm* = 'M' or 'm'

= norm1(*A*), if *norm* = '1' or 'O' or 'o'

= normI(*A*), if *norm* = 'I' or 'i'

= normF(*A*), if *norm* = 'F', 'f', 'E' or 'e'

where norm1 denotes the 1-norm of a matrix (maximum column sum), normI denotes the infinity norm of a matrix (maximum row sum) and normF denotes the Frobenius norm of a matrix (square root of sum of squares). Note that max(abs(A_{ij})) is not a consistent matrix norm.

Input Parameters

norm	CHARACTER*1. Specifies the value to be returned by the routine as described above.
n	INTEGER. The order of the matrix *A*. *n* ≥ 0. When *n* = 0, ?lanhs is set to zero.
a	REAL for slanhs DOUBLE PRECISION for dlanhs COMPLEX for clanhs DOUBLE COMPLEX for zlanhs Array, DIMENSION (*lda*,*n*). The *n*-by-*n* upper Hessenberg matrix *A*; the part of *A* below the first sub-diagonal is not referenced.
lda	INTEGER. The leading dimension of the array *a*. *lda* ≥ max(*n*,1).
work	REAL for slanhs and clanhs. DOUBLE PRECISION for dlange and zlange. Workspace array, DIMENSION(max(1,*lwork*)), where *lwork* ≥ *n* when *norm* = 'I'; otherwise, *work* is not referenced.

Output Parameters

val	REAL for slanhs/clanhs DOUBLE PRECISION for dlanhs/zlanhs Value returned by the function.

?lansb

Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a symmetric band matrix.

Syntax

```
val = slansb( norm, uplo, n, k, ab, ldab, work )
val = dlansb( norm, uplo, n, k, ab, ldab, work )
val = clansb( norm, uplo, n, k, ab, ldab, work )
val = zlansb( norm, uplo, n, k, ab, ldab, work )
```

Include Files

- mkl.fi

Description

The function ?lansb returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of an *n*-by-*n* real/complex symmetric band matrix *A*, with *k* super-diagonals.

Input Parameters

norm

CHARACTER*1. Specifies the value to be returned by the routine:

= 'M' or 'm': *val* = max(abs(A_{ij})), largest absolute value of the matrix *A*.

= '1' or 'O' or 'o': *val* = norm1(*A*), 1-norm of the matrix *A* (maximum column sum),

= 'I' or 'i': *val* = normI(*A*), infinity norm of the matrix *A* (maximum row sum),

= 'F', 'f', 'E' or 'e': *val* = normF(*A*), Frobenius norm of the matrix *A* (square root of sum of squares).

uplo

CHARACTER*1.

Specifies whether the upper or lower triangular part of the band matrix *A* is supplied. If *uplo* = 'U': upper triangular part is supplied; If *uplo* = 'L': lower triangular part is supplied.

n

INTEGER. The order of the matrix *A*. $n \geq 0$.

When *n* = 0, ?lansb is set to zero.

k

INTEGER. The number of super-diagonals or sub-diagonals of the band matrix *A*. $k \geq 0$.

ab

REAL for slansb

DOUBLE PRECISION for dlansb

COMPLEX for clansb

DOUBLE COMPLEX for zlansb

Array, DIMENSION (*ldab*,*n*).

The upper or lower triangle of the symmetric band matrix *A*, stored in the first *k*+1 rows of *ab*. The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows:

if *uplo* = 'U', *ab*(*k*+1+*i*-*j*,*j*) = *a*(*i*,*j*)

for max(1,*j*-*k*) ≤ *i* ≤ *j*;

if *uplo* = 'L', *ab*(1+*i*-*j*,*j*) = *a*(*i*,*j*) for $j \leq i \leq \min(n, j+k)$.

ldab

INTEGER. The leading dimension of the array *ab*.

$ldab \geq k+1$.

work

REAL for slansb and clansb.

DOUBLE PRECISION for dlansb and zlansb.

Workspace array, DIMENSION(max(1,*lwork*)), where

$lwork \geq n$ when *norm* = 'I' or '1' or 'O'; otherwise, *work* is not referenced.

Output Parameters

val — REAL for slansb/clansb

DOUBLE PRECISION for dlansb/zlansb

Value returned by the function.

?lanhb

Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a Hermitian band matrix.

Syntax

```
val = clanhb( norm, uplo, n, k, ab, ldab, work )
val = zlanhb( norm, uplo, n, k, ab, ldab, work )
```

Include Files

- mkl.fi

Description

The routine returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of an *n*-by-*n* Hermitian band matrix *A*, with *k* super-diagonals.

Input Parameters

norm — CHARACTER*1. Specifies the value to be returned by the routine:

= 'M' or 'm': *val* = max(abs(A_{ij})), largest absolute value of the matrix *A*.

= '1' or 'O' or 'o': *val* = norm1(*A*), 1-norm of the matrix *A* (maximum column sum),

= 'I' or 'i': *val* = normI(*A*), infinity norm of the matrix *A* (maximum row sum),

= 'F', 'f', 'E' or 'e': *val* = normF(*A*), Frobenius norm of the matrix *A* (square root of sum of squares).

uplo — CHARACTER*1.

Specifies whether the upper or lower triangular part of the band matrix *A* is supplied.

If *uplo* = 'U': upper triangular part is supplied;

If *uplo* = 'L': lower triangular part is supplied.

n — INTEGER. The order of the matrix *A*. $n \geq 0$. When *n* = 0, ?lanhb is set to zero.

k — INTEGER. The number of super-diagonals or sub-diagonals of the band matrix *A*.

$k \geq 0$.

ab — COMPLEX for clanhb.

DOUBLE COMPLEX for zlanhb.

Array, DIMENSION (*ldaB*,*n*). The upper or lower triangle of the Hermitian band matrix *A*, stored in the first *k*+1 rows of *ab*. The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows:

if *uplo* = 'U', *ab*(*k*+1+*i*-*j*,*j*) = *a*(*i*,*j*)

for max(1,*j*-*k*) ≤ *i* ≤ *j*;

if *uplo* = 'L', *ab*(1+*i*-*j*,*j*) = *a*(*i*,*j*) for *j* ≤ *i* ≤ min(*n*,*j*+*k*).

Note that the imaginary parts of the diagonal elements need not be set and are assumed to be zero.

ldab — INTEGER. The leading dimension of the array *ab*. *ldab*≥*k*+1.

work — REAL for clanhb.

DOUBLE PRECISION for zlanhb.

Workspace array, DIMENSIONmax(1, *lwork*), where

lwork≥*n* when *norm* = 'I' or '1' or 'O'; otherwise, *work* is not referenced.

Output Parameters

val — REAL for slanhb/clanhb

DOUBLE PRECISION for dlanhb/zlanhb

Value returned by the function.

?lansp

Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a symmetric matrix supplied in packed form.

Syntax

```
val = slansp( norm, uplo, n, ap, work )
val = dlansp( norm, uplo, n, ap, work )
val = clansp( norm, uplo, n, ap, work )
val = zlansp( norm, uplo, n, ap, work )
```

Include Files

- mkl.fi

Description

The function ?lansp returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a real/complex symmetric matrix *A*, supplied in packed form.

Input Parameters

norm

CHARACTER*1. Specifies the value to be returned by the routine:

= 'M' or 'm': *val* = max(abs(A_{ij})), largest absolute value of the matrix *A*.

= '1' or 'O' or 'o': *val* = norm1(*A*), 1-norm of the matrix *A* (maximum column sum),

= 'I' or 'i': *val* = normI(*A*), infinity norm of the matrix *A* (maximum row sum),

= 'F', 'f', 'E' or 'e': *val* = normF(*A*), Frobenius norm of the matrix *A* (square root of sum of squares).

uplo

CHARACTER*1.

Specifies whether the upper or lower triangular part of the symmetric matrix *A* is supplied.

If *uplo* = 'U': Upper triangular part of *A* is supplied

If *uplo* = 'L': Lower triangular part of *A* is supplied.

n

INTEGER. The order of the matrix *A*. $n \geq 0$. When

$n = 0$, ?lansp is set to zero.

ap

REAL for slansp

DOUBLE PRECISION for dlansp

COMPLEX for clansp

DOUBLE COMPLEX for zlansp

Array, DIMENSION ($n(n+1)/2$).

The upper or lower triangle of the symmetric matrix *A*, packed columnwise in a linear array. The *j*-th column of *A* is stored in the array *ap* as follows:

if *uplo* = 'U', $ap(i + (j-1)j/2) = A(i,j)$ for $1 \leq i \leq j$;

if *uplo* = 'L', $ap(i + (j-1)(2n-j)/2) = A(i,j)$ for $j \leq i \leq n$.

work

REAL for slansp and clansp.

DOUBLE PRECISION for dlansp and zlansp.

Workspace array, DIMENSION(max(1, *lwork*)), where

$lwork \geq n$ when *norm* = 'I' or '1' or 'O'; otherwise, *work* is not referenced.

Output Parameters

val

REAL for slansp/clansp

DOUBLE PRECISION for dlansp/zlansp

Value returned by the function.

?lanhp

Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a complex Hermitian matrix supplied in packed form.

Syntax

```
val = clanhp( norm, uplo, n, ap, work )
val = zlanhp( norm, uplo, n, ap, work )
```

Include Files

- mkl.fi

Description

The function ?lanhp returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a complex Hermitian matrix *A*, supplied in packed form.

Input Parameters

norm

CHARACTER*1. Specifies the value to be returned by the routine:

= 'M' or 'm': *val* = max(abs(A_{ij})), largest absolute value of the matrix *A*.

= '1' or 'O' or 'o': *val* = norm1(*A*), 1-norm of the matrix *A* (maximum column sum),

= 'I' or 'i': *val* = normI(*A*), infinity norm of the matrix *A* (maximum row sum),

= 'F', 'f', 'E' or 'e': *val* = normF(*A*), Frobenius norm of the matrix *A* (square root of sum of squares).

uplo

CHARACTER*1.

Specifies whether the upper or lower triangular part of the Hermitian matrix *A* is supplied.

If *uplo* = 'U': Upper triangular part of *A* is supplied

If *uplo* = 'L': Lower triangular part of *A* is supplied.

n

INTEGER. The order of the matrix *A*.

$n \geq 0$. When $n = 0$, ?lanhp is set to zero.

ap

COMPLEX for clanhp.

DOUBLE COMPLEX for zlanhp.

Array, DIMENSION ($n(n+1)/2$). The upper or lower triangle of the Hermitian matrix *A*, packed columnwise in a linear array. The *j*-th column of *A* is stored in the array *ap* as follows:

if *uplo* = 'U', $ap(i + (j-1)j/2) = A(i,j)$ for $1 \leq i \leq j$;

if *uplo* = 'L', $ap(i + (j-1)(2n-j)/2) = A(i,j)$ for $j \leq i \leq n$.

work

REAL for clanhp.

DOUBLE PRECISION for zlanhp.

Workspace array, DIMENSION(max(1,*lwork*)), where

lwork≥*n* when *norm* = 'I' or '1' or 'O'; otherwise, *work* is not referenced.

Output Parameters

val

REAL for clanhp.

DOUBLE PRECISION for zlanhp.

Value returned by the function.

?lanst/?lanht

Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a real symmetric or complex Hermitian tridiagonal matrix.

Syntax

```
val = slanst( norm, n, d, e )
val = dlanst( norm, n, d, e )
val = clanht( norm, n, d, e )
val = zlanht( norm, n, d, e )
```

Include Files

- mkl.fi

Description

The functions ?lanst/?lanht return the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a real symmetric or a complex Hermitian tridiagonal matrix *A*.

Input Parameters

norm

CHARACTER*1. Specifies the value to be returned by the routine:

= 'M' or 'm': *val* = max(abs(A_{ij})), largest absolute value of the matrix *A*.

= '1' or 'O' or 'o': *val* = norm1(*A*), 1-norm of the matrix *A* (maximum column sum),

= 'I' or 'i': *val* = normI(*A*), infinity norm of the matrix *A* (maximum row sum),

= 'F', 'f', 'E' or 'e': *val* = normF(*A*), Frobenius norm of the matrix *A* (square root of sum of squares).

n

INTEGER. The order of the matrix *A*.

n≥ 0. When *n* = 0, ?lanst/?lanht is set to zero.

d — REAL for slanst/clanht

DOUBLE PRECISION for dlanst/zlanht

Array, DIMENSION (*n*). The diagonal elements of *A*.

e — REAL for slanst

DOUBLE PRECISION for dlanst

COMPLEX for clanht

DOUBLE COMPLEX for zlanht

Array, DIMENSION (*n*-1).

The (*n*-1) sub-diagonal or super-diagonal elements of *A*.

Output Parameters

val — REAL for slanst/clanht

DOUBLE PRECISION for dlanst/zlanht

Value returned by the function.

?lansy

Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a real/complex symmetric matrix.

Syntax

```
val = slansy( norm, uplo, n, a, lda, work )
val = dlansy( norm, uplo, n, a, lda, work )
val = clansy( norm, uplo, n, a, lda, work )
val = zlansy( norm, uplo, n, a, lda, work )
```

Include Files

- mkl.fi

Description

The function ?lansy returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a real/complex symmetric matrix *A*.

Input Parameters

The data types are given for the Fortran interface.

norm — CHARACTER*1. Specifies the value to be returned by the routine:

= 'M' or 'm': *val* = max(abs(A_{ij})), largest absolute value of the matrix *A*.

= '1' or 'O' or 'o': *val* = norm1(*A*), 1-norm of the matrix *A* (maximum column sum),

= 'I' or 'i': *val* = normI(*A*), infinity norm of the matrix *A* (maximum row sum),

= 'F', 'f', 'E' or 'e': *val* = normF(*A*), Frobenius norm of the matrix *A* (square root of sum of squares).

uplo — CHARACTER*1.

Specifies whether the upper or lower triangular part of the symmetric matrix *A* is to be referenced.

= 'U': Upper triangular part of *A* is referenced.

= 'L': Lower triangular part of *A* is referenced

n — INTEGER. The order of the matrix *A*. $n \geq 0$. When $n = 0$, ?lansy is set to zero.

a — REAL for slansy

DOUBLE PRECISION for dlansy

COMPLEX for clansy

DOUBLE COMPLEX for zlansy

Array, size (*lda*,*n*). The symmetric matrix *A*.

If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *a* is not referenced.

If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *a* is not referenced.

lda — INTEGER. The leading dimension of the array *a*.

lda ≥ max(*n*,1).

work — REAL for slansy and clansy.

DOUBLE PRECISION for dlansy and zlansy.

Workspace array, DIMENSION(max(1,*lwork*)), where

lwork ≥ *n* when *norm* = 'I' or '1' or 'O'; otherwise, *work* is not referenced.

Output Parameters

val — REAL for slansy/clansy

DOUBLE PRECISION for dlansy/zlansy

Value returned by the function.

?lanhe

Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a complex Hermitian matrix.

Syntax

val = clanhe(*norm*, *uplo*, *n*, *a*, *lda*, *work*)

val = zlanhe(*norm*, *uplo*, *n*, *a*, *lda*, *work*)

Include Files

- mkl.fi

Description

The function ?lanhe returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a complex Hermitian matrix *A*.

Input Parameters

The data types are given for the Fortran interface.

norm — CHARACTER*1. Specifies the value to be returned by the routine:

= 'M' or 'm': *val* = max(abs(A_{ij})), largest absolute value of the matrix *A*.

= '1' or 'O' or 'o': *val* = norm1(*A*), 1-norm of the matrix *A* (maximum column sum),

= 'I' or 'i': *val* = normI(*A*), infinity norm of the matrix *A* (maximum row sum),

= 'F', 'f', 'E' or 'e': *val* = normF(*A*), Frobenius norm of the matrix *A* (square root of sum of squares).

uplo — CHARACTER*1.

Specifies whether the upper or lower triangular part of the Hermitian matrix *A* is to be referenced.

= 'U': Upper triangular part of *A* is referenced.

= 'L': Lower triangular part of *A* is referenced

n — INTEGER. The order of the matrix *A*. $n \geq 0$. When $n = 0$, ?lanhe is set to zero.

a — COMPLEX for clanhe.

DOUBLE COMPLEX for zlanhe.

Array, size (*lda*,*n*). The Hermitian matrix *A*.

If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *a* is not referenced.

If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *a* is not referenced.

lda — INTEGER. The leading dimension of the array *a*.

lda ≥ max(*n*,1).

work — REAL for clanhe.

DOUBLE PRECISION for zlanhe.

Workspace array, DIMENSION(max(1,*lwork*)), where

lwork≥*n* when *norm* = 'I' or '1' or 'O'; otherwise, *work* is not referenced.

Output Parameters

val

REAL for clanhe.

DOUBLE PRECISION for zlanhe.

Value returned by the function.

?lantb

Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a triangular band matrix.

Syntax

```
val = slantb( norm, uplo, diag, n, k, ab, ldab, work )
val = dlantb( norm, uplo, diag, n, k, ab, ldab, work )
val = clantb( norm, uplo, diag, n, k, ab, ldab, work )
val = zlantb( norm, uplo, diag, n, k, ab, ldab, work )
```

Include Files

- mkl.fi

Description

The function ?lantb returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of an *n*-by-*n* triangular band matrix *A*, with (*k* + 1) diagonals.

Input Parameters

norm

CHARACTER*1. Specifies the value to be returned by the routine:

= 'M' or 'm': *val* = max(abs(A_{ij})), largest absolute value of the matrix *A*.

= '1' or 'O' or 'o': *val* = norm1(*A*), 1-norm of the matrix *A* (maximum column sum),

= 'I' or 'i': *val* = normI(*A*), infinity norm of the matrix *A* (maximum row sum),

= 'F', 'f', 'E' or 'e': *val* = normF(*A*), Frobenius norm of the matrix *A* (square root of sum of squares).

uplo

CHARACTER*1.

Specifies whether the matrix *A* is upper or lower triangular.

= 'U': Upper triangular

= 'L': Lower triangular.

diag CHARACTER*1.

Specifies whether or not the matrix *A* is unit triangular.

= 'N': Non-unit triangular

= 'U': Unit triangular.

n INTEGER. The order of the matrix *A*. $n \geq 0$. When $n = 0$, ?lantb is set to zero.

k INTEGER. The number of super-diagonals of the matrix *A* if *uplo* = 'U', or the number of sub-diagonals of the matrix *A* if *uplo* = 'L'. $k \geq 0$.

ab REAL for slantb

DOUBLE PRECISION for dlantb

COMPLEX for clantb

DOUBLE COMPLEX for zlantb

Array, DIMENSION (*ldab*,*n*). The upper or lower triangular band matrix *A*, stored in the first *k*+1 rows of *ab*.

The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows:

if *uplo* = 'U', $ab(k+1+i-j,j) = a(i,j)$ for $\max(1,j-k) \leq i \leq j$;

if *uplo* = 'L', $ab(1+i-j,j) = a(i,j)$ for $j \leq i \leq \min(n,j+k)$.

Note that when *diag* = 'U', the elements of the array *ab* corresponding to the diagonal elements of the matrix *A* are not referenced, but are assumed to be one.

ldab INTEGER. The leading dimension of the array *ab*.

$ldab \geq k+1$.

work REAL for slantb and clantb.

DOUBLE PRECISION for dlantb and zlantb.

Workspace array, DIMENSION(max(1,*lwork*)), where

$lwork \geq n$ when *norm* = 'I' ; otherwise, *work* is not referenced.

Output Parameters

val REAL for slantb/clantb.

DOUBLE PRECISION for dlantb/zlantb.

Value returned by the function.

?lantp

Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a triangular matrix supplied in packed form.

Syntax

```
val = slantp( norm, uplo, diag, n, ap, work )
val = dlantp( norm, uplo, diag, n, ap, work )
val = clantp( norm, uplo, diag, n, ap, work )
val = zlantp( norm, uplo, diag, n, ap, work )
```

Include Files

- mkl.fi

Description

The function ?lantp returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a triangular matrix *A*, supplied in packed form.

Input Parameters

norm

CHARACTER*1. Specifies the value to be returned by the routine:

= 'M' or 'm': *val* = max(abs(A_{ij})), largest absolute value of the matrix *A*.

= '1' or 'O' or 'o': *val* = norm1(*A*), 1-norm of the matrix *A* (maximum column sum),

= 'I' or 'i': *val* = normI(*A*), infinity norm of the matrix *A* (maximum row sum),

= 'F', 'f', 'E' or 'e': *val* = normF(*A*), Frobenius norm of the matrix *A* (square root of sum of squares).

uplo

CHARACTER*1.

Specifies whether the matrix *A* is upper or lower triangular.

= 'U': Upper triangular

= 'L': Lower triangular.

diag

CHARACTER*1.

Specifies whether or not the matrix *A* is unit triangular.

= 'N': Non-unit triangular

= 'U': Unit triangular.

n

INTEGER. The order of the matrix *A*.

$n \geq 0$. When $n = 0$, ?lantp is set to zero.

ap

REAL for slantp

DOUBLE PRECISION for dlantp

COMPLEX for clantp

DOUBLE COMPLEX for zlantp

Array, DIMENSION ($n(n+1)/2$).

The upper or lower triangular matrix *A*, packed columnwise in a linear array. The *j*-th column of *A* is stored in the array *ap* as follows:

if *uplo* = 'U', AP(i + (*j*-1)*j*/2) =*a*(*i*,*j*) for 1≤ *i*≤ *j*;

if *uplo* = 'L', *ap*(*i* + (*j*-1)(2*n*-*j*)/2) = *a*(*i*,*j*) for *j*≤ *i*≤ *n*.

Note that when *diag* = 'U', the elements of the array *ap* corresponding to the diagonal elements of the matrix *A* are not referenced, but are assumed to be one.

work

REAL for slantp and clantp.

DOUBLE PRECISION for dlantp and zlantp.

Workspace array, DIMENSION(max(1,*lwork*)), where *lwork*≥*n* when *norm* = 'I' ; otherwise, *work* is not referenced.

Output Parameters

val

REAL for slantp/clantp.

DOUBLE PRECISION for dlantp/zlantp.

Value returned by the function.

?lantr

Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a trapezoidal or triangular matrix.

Syntax

val = slantr(*norm*, *uplo*, *diag*, *m*, *n*, *a*, *lda*, *work*)

val = dlantr(*norm*, *uplo*, *diag*, *m*, *n*, *a*, *lda*, *work*)

val = clantr(*norm*, *uplo*, *diag*, *m*, *n*, *a*, *lda*, *work*)

val = zlantr(*norm*, *uplo*, *diag*, *m*, *n*, *a*, *lda*, *work*)

Include Files

- mkl.fi

Description

The function ?lantr returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a trapezoidal or triangular matrix *A*.

Input Parameters

The data types are given for the Fortran interface.

norm

CHARACTER*1. Specifies the value to be returned by the routine:

= 'M' or 'm': *val* = max(abs(A_{ij})), largest absolute value of the matrix *A*.

= '1' or 'O' or 'o': *val* = norm1(*A*), 1-norm of the matrix *A* (maximum column sum),

= 'I' or 'i': *val* = normI(*A*), infinity norm of the matrix *A* (maximum row sum),

= 'F', 'f', 'E' or 'e': *val* = normF(*A*), Frobenius norm of the matrix *A* (square root of sum of squares).

uplo — CHARACTER*1.

Specifies whether the matrix *A* is upper or lower trapezoidal.

= 'U': Upper trapezoidal

= 'L': Lower trapezoidal.

Note that *A* is triangular instead of trapezoidal if *m* = *n*.

diag — CHARACTER*1.

Specifies whether or not the matrix *A* has unit diagonal.

= 'N': Non-unit diagonal

= 'U': Unit diagonal.

m — INTEGER. The number of rows of the matrix *A*. *m*≥ 0, and if *uplo* = 'U', *m* ≤ *n*.

When *m* = 0, ?lantr is set to zero.

n — INTEGER. The number of columns of the matrix *A*. *n*≥ 0, and if *uplo* = 'L', *n* ≤ *m*.

When *n* = 0, ?lantr is set to zero.

a — REAL for slantr

DOUBLE PRECISION for dlantr

COMPLEX for clantr

DOUBLE COMPLEX for zlantr

Array, DIMENSION (*lda*,*n*).

The trapezoidal matrix *A* (*A* is triangular if *m* = *n*).

If *uplo* = 'U', the leading *m*-by-*n* upper trapezoidal part of the array *a* contains the upper trapezoidal matrix, and the strictly lower triangular part of *A* is not referenced.

If *uplo* = 'L', the leading *m*-by-*n* lower trapezoidal part of the array *a* contains the lower trapezoidal matrix, and the strictly upper triangular part of *A* is not referenced. Note that when *diag* = 'U', the diagonal elements of *A* are not referenced and are assumed to be one.

lda — INTEGER. The leading dimension of the array *a*.

lda≥ max(*m*,1).

work — REAL for slantr/clantrp.

DOUBLE PRECISION for dlantr/zlantr.

Workspace array, DIMENSION(max(1,*lwork*)), where

lwork≥*m* when *norm* = 'I' ; otherwise, *work* is not referenced.

Output Parameters

val	REAL for slantr/clantrp. DOUBLE PRECISION for dlantr/zlantr. Value returned by the function.

?lanv2

Computes the Schur factorization of a real 2-by-2 nonsymmetric matrix in standard form.

Syntax

```
call slanv2( a, b, c, d, rt1r, rt1i, rt2r, rt2i, cs, sn )
call dlanv2( a, b, c, d, rt1r, rt1i, rt2r, rt2i, cs, sn )
```

Include Files

- mkl.fi

Description

The routine computes the Schur factorization of a real 2-by-2 nonsymmetric matrix in standard form:

$$\begin{bmatrix} a & b \\ c & d \end{bmatrix} = \begin{bmatrix} cs & -sn \\ sn & cs \end{bmatrix} \begin{bmatrix} aa & bb \\ cc & dd \end{bmatrix} \begin{bmatrix} cs & sn \\ -sn & cs \end{bmatrix}$$

where either

1. *cc* = 0 so that *aa* and *dd* are real eigenvalues of the matrix, or
2. *aa* = *dd* and *bb***cc* < 0, so that *aa*± sqrt(*bb***cc*) are complex conjugate eigenvalues.

The routine was adjusted to reduce the risk of cancellation errors, when computing real eigenvalues, and to ensure, if possible, that abs(*rt1r*) ≥ abs(*rt2r*).

Input Parameters

a, *b*, *c*, *d*	REAL for slanv2 DOUBLE PRECISION for dlanv2. On entry, elements of the input matrix.

Output Parameters

a, *b*, *c*, *d*	On exit, overwritten by the elements of the standardized Schur form.
rt1r, *rt1i*, *rt2r*, *rt2i*	REAL for slanv2 DOUBLE PRECISION for dlanv2. The real and imaginary parts of the eigenvalues. If the eigenvalues are a complex conjugate pair, *rt1i* > 0.

cs, *sn*	REAL for slanv2 DOUBLE PRECISION for dlanv2. Parameters of the rotation matrix.

?lapll

Measures the linear dependence of two vectors.

Syntax

```
call slapll( n, x, incx, Y, incy, ssmin )
call dlapll( n, x, incx, Y, incy, ssmin )
call clapll( n, x, incx, Y, incy, ssmin )
call zlapll( n, x, incx, Y, incy, ssmin )
```

Include Files

- mkl.fi

Description

Given two column vectors *x* and *y* of length *n*, let

A = (*xy*) be the *n*-by-2 matrix.

The routine ?lapll first computes the *QR* factorization of *A* as *A* = *Q***R* and then computes the SVD of the 2-by-2 upper triangular matrix *R*. The smaller singular value of *R* is returned in *ssmin*, which is used as the measurement of the linear dependency of the vectors *x* and *y*.

Input Parameters

n	INTEGER. The length of the vectors *x* and *y*.
x	REAL for slapll DOUBLE PRECISION for dlapll COMPLEX for clapll DOUBLE COMPLEX for zlapll Array, DIMENSION(1+(*n*-1)*incx*). On entry, *x* contains the *n*-vector x.
y	REAL for slapll DOUBLE PRECISION for dlapll COMPLEX for clapll DOUBLE COMPLEX for zlapll Array, DIMENSION (1+(*n*-1)*incy*). On entry, *y* contains the *n*-vector y.
incx	INTEGER. The increment between successive elements of x; *incx* > 0.

incy INTEGER. The increment between successive elements of y; *incy* > 0.

Output Parameters

x On exit, *x* is overwritten.

y On exit, *y* is overwritten.

ssmin REAL for slapll/clapll

DOUBLE PRECISION for dlapll/zlapll

The smallest singular value of the *n*-by-2 matrix *A* = (*xy*).

?lapmr

Rearranges rows of a matrix as specified by a permutation vector.

Syntax

```
call slapmr( forwrd, m, n, x, ldx, k )
call dlapmr( forwrd, m, n, x, ldx, k )
call clapmr( forwrd, m, n, x, ldx, k )
call zlapmr( forwrd, m, n, x, ldx, k )
call lapmr( x,k[,forwrd] )
```

Include Files

- mkl.fi

Description

The ?lapmr routine rearranges the rows of the *m*-by-*n* matrix *X* as specified by the permutation *k*(1),*k*(2),...,*k*(*m*) of the integers 1,...,*m*.

If *forwrd* = .TRUE., forward permutation:

X(*k*(*i*,*)) is moved to *X*(*i*,*) for *i*= 1,2,...,*m*.

If *forwrd* = .FALSE., backward permutation:

X(*i*,*) is moved to *X*(*k*(*i*,*)) for *i* = 1,2,...,*m*.

Input Parameters

The data types are given for the Fortran interface.

forwrd LOGICAL.

If *forwrd* = .TRUE., forward permutation.

If *forwrd* = .FALSE., backward permutation.

m INTEGER. The number of rows of the matrix *X*. *m*≥ 0.

n INTEGER. The number of columns of the matrix *X*. *n*≥ 0.

x REAL for slapmr

DOUBLE PRECISION for dlapmr

	COMPLEX for clapmr DOUBLE COMPLEX for zlapmr Array, size (*ldx*,*n*)On entry, the *m*-by-*n* matrix *X*.
ldx	INTEGER. The leading dimension of the array *X*, *ldx*≥ max(1,*m*).
k	INTEGER. Array, size (*m*). On entry, *k* contains the permutation vector and is used as internal workspace.

Output Parameters

x	On exit, *x* contains the permuted matrix *X*.
k	On exit, *k* is reset to its original value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine ?lapmr interface are as follows:

x	Holds the matrix *X* of size (*n*, *n*).
k	Holds the vector of length *m*.
forwrd	Specifies the permutation. Must be '.TRUE.' or '.FALSE.'.

See Also

?lapmt

?lapmt

Performs a forward or backward permutation of the columns of a matrix.

Syntax

```
call slapmt( forwrd, m, n, x, ldx, k )
call dlapmt( forwrd, m, n, x, ldx, k )
call clapmt( forwrd, m, n, x, ldx, k )
call zlapmt( forwrd, m, n, x, ldx, k )
```

Include Files

- mkl.fi

Description

The routine ?lapmt rearranges the columns of the *m*-by-*n* matrix *X* as specified by the permutation *k*(1),*k*(2),...,*k*(*n*) of the integers 1,...,*n*.

If *forwrd*= .TRUE., forward permutation:

X(*,*k*(*j*)) is moved to *X*(*,*j*) for *j*=1,2,...,*n*.

If *forwrd* = .FALSE., backward permutation:

`X(*,j)` is moved to `X(*,k(j))` for `j = 1,2,...,n`.

Input Parameters

forwrd	LOGICAL. If *forwrd*= .TRUE., forward permutation If *forwrd* = .FALSE., backward permutation
m	INTEGER. The number of rows of the matrix *X*. *m*≥ 0.
n	INTEGER. The number of columns of the matrix *X*. *n*≥ 0.
x	REAL for slapmt DOUBLE PRECISION for dlapmt COMPLEX for clapmt DOUBLE COMPLEX for zlapmt Array, size (*ldx*,*n*). On entry, the *m*-by-*n* matrix *X*.
ldx	INTEGER. The leading dimension of the array *x*, *ldx*≥ max(1,*m*).
k	INTEGER. Array, size (*n*). On entry, *k* contains the permutation vector and is used as internal workspace.

Output Parameters

x	On exit, *x* contains the permuted matrix *X*.
k	On exit, *k* is reset to its original value.

See Also

?lapmr

?lapy2

Returns $sqrt(x^2+y^2)$.

Syntax

```
val = slapy2( x, y )
val = dlapy2( x, y )
```

Include Files

- mkl.fi

Description

The function ?lapy2 returns $sqrt(x^2+y^2)$, avoiding unnecessary overflow or harmful underflow.

Input Parameters

The data types are given for the Fortran interface.

x, *y*	REAL for slapy2

`DOUBLE PRECISION` for `dlapy2`

Specify the input values *x* and *y*.

Output Parameters

val

`REAL` for `slapy2`

`DOUBLE PRECISION` for `dlapy2`.

Value returned by the function.

If *val*=`-1D0`, the first argument was NaN.

If *val*=`-2D0`, the second argument was NaN.

?lapy3

Returns $sqrt(x^2+y^2+z^2)$.

Syntax

```
val = slapy3( x, y, z )
val = dlapy3( x, y, z )
```

Include Files

- `mkl.fi`

Description

The function `?lapy3` returns $sqrt(x^2+y^2+z^2)$, avoiding unnecessary overflow or harmful underflow.

Input Parameters

The data types are given for the Fortran interface.

x, *y*, *z*

`REAL` for `slapy3`

`DOUBLE PRECISION` for `dlapy3`

Specify the input values *x*, *y* and *z*.

Output Parameters

val

`REAL` for `slapy3`

`DOUBLE PRECISION` for `dlapy3`.

Value returned by the function.

If *val* = `-1D0`, the first argument was NaN.

If *val* = `-2D0`, the second argument was NaN.

If *val* = `-3D0`, the third argument was NaN.

?laqgb

Scales a general band matrix, using row and column scaling factors computed by `?gbequ`.

Syntax

```
call slaqgb( m, n, kl, ku, ab, ldab, r, c, rowcnd, colcnd, amax, equed )
call dlaqgb( m, n, kl, ku, ab, ldab, r, c, rowcnd, colcnd, amax, equed )
call claqgb( m, n, kl, ku, ab, ldab, r, c, rowcnd, colcnd, amax, equed )
call zlaqgb( m, n, kl, ku, ab, ldab, r, c, rowcnd, colcnd, amax, equed )
```

Include Files

- mkl.fi

Description

The routine equilibrates a general *m*-by-*n* band matrix *A* with *kl* subdiagonals and *ku* superdiagonals using the row and column scaling factors in the vectors *r* and *c*.

Input Parameters

m

INTEGER. The number of rows of the matrix *A*. $m \geq 0$.

n

INTEGER. The number of columns of the matrix *A*. $n \geq 0$.

kl

INTEGER. The number of subdiagonals within the band of *A*. $kl \geq 0$.

ku

INTEGER. The number of superdiagonals within the band of *A*. $ku \geq 0$.

ab

REAL for slaqgb

DOUBLE PRECISION for dlaqgb

COMPLEX for claqgb

DOUBLE COMPLEX for zlaqgb

Array, DIMENSION (*ldab*,*n*). On entry, the matrix *A* in band storage, in rows 1 to *kl*+*ku*+1. The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows: $ab(ku+1+i-j,j) = A(i,j)$ for $\max(1,j-ku) \leq i \leq \min(m,j+kl)$.

ldab

INTEGER. The leading dimension of the array *ab*.

$lda \geq kl+ku+1$.

amax

REAL for slaqgb/claqgb

DOUBLE PRECISION for dlaqgb/zlaqgb

Absolute value of largest matrix entry.

r, *c*

REAL for slaqgb/claqgb

DOUBLE PRECISION for dlaqgb/zlaqgb

Arrays *r* (*m*), *c* (*n*). Contain the row and column scale factors for *A*, respectively.

rowcnd

REAL for slaqgb/claqgb

DOUBLE PRECISION for dlaqgb/zlaqgb

Ratio of the smallest $r(i)$ to the largest $r(i)$.

colcnd

REAL for slaqgb/claqgb

DOUBLE PRECISION for dlaqgb/zlaqgb

Ratio of the smallest $c(i)$ to the largest $c(i)$.

Output Parameters

ab

On exit, the equilibrated matrix, in the same storage format as *A*.

See *equed* for the form of the equilibrated matrix.

equed

CHARACTER*1.

Specifies the form of equilibration that was done.

If *equed* = 'N': No equilibration

If *equed* = 'R': Row equilibration, that is, *A* has been premultiplied by diag(*r*).

If *equed* = 'C': Column equilibration, that is, *A* has been postmultiplied by diag(*c*).

If *equed* = 'B': Both row and column equilibration, that is, *A* has been replaced by diag(*r*)*A*diag(*c*).

Application Notes

The routine uses internal parameters *thresh*, *large*, and *small*, which have the following meaning. *thresh* is a threshold value used to decide if row or column scaling should be done based on the ratio of the row or column scaling factors. If *rowcnd* < *thresh*, row scaling is done, and if *colcnd* < *thresh*, column scaling is done. *large* and *small* are threshold values used to decide if row scaling should be done based on the absolute size of the largest matrix element. If *amax* > *large* or *amax* < *small*, row scaling is done.

?laqge

Scales a general rectangular matrix, using row and column scaling factors computed by ?geequ.

Syntax

```
call slaqge( m, n, a, lda, r, c, rowcnd, colcnd, amax, equed )
call dlaqge( m, n, a, lda, r, c, rowcnd, colcnd, amax, equed )
call claqge( m, n, a, lda, r, c, rowcnd, colcnd, amax, equed )
call zlaqge( m, n, a, lda, r, c, rowcnd, colcnd, amax, equed )
```

Include Files

- mkl.fi

Description

The routine equilibrates a general *m*-by-*n* matrix *A* using the row and column scaling factors in the vectors *r* and *c*.

Input Parameters

m — INTEGER. The number of rows of the matrix *A*.

m ≥ 0.

n — INTEGER. The number of columns of the matrix *A*.

n ≥ 0.

a — REAL for slaqge

DOUBLE PRECISION for dlaqge

COMPLEX for claqge

DOUBLE COMPLEX for zlaqge

Array, DIMENSION (*lda*,*n*). On entry, the *m*-by-*n* matrix *A*.

lda — INTEGER. The leading dimension of the array *a*.

lda ≥ max(*m*,1).

r — REAL for slanqge/claqge

DOUBLE PRECISION for dlaqge/zlaqge

Array, DIMENSION (*m*). The row scale factors for A.

c — REAL for slanqge/claqge

DOUBLE PRECISION for dlaqge/zlaqge

Array, DIMENSION (*n*). The column scale factors for A.

rowcnd — REAL for slanqge/claqge

DOUBLE PRECISION for dlaqge/zlaqge

Ratio of the smallest *r*(*i*) to the largest *r*(*i*).

colcnd — REAL for slanqge/claqge

DOUBLE PRECISION for dlaqge/zlaqge

Ratio of the smallest *c*(*i*) to the largest *c*(*i*).

amax — REAL for slanqge/claqge

DOUBLE PRECISION for dlaqge/zlaqge

Absolute value of largest matrix entry.

Output Parameters

a — On exit, the equilibrated matrix.

See *equed* for the form of the equilibrated matrix.

equed — CHARACTER*1.

Specifies the form of equilibration that was done.

If *equed* = 'N': No equilibration

If *equed* = 'R': Row equilibration, that is, *A* has been premultiplied by diag(*r*).

If *equed* = 'C': Column equilibration, that is, *A* has been postmultiplied by diag(*c*).

If *equed* = 'B': Both row and column equilibration, that is, *A* has been replaced by diag(*r*)*A*diag(*c*).

Application Notes

The routine uses internal parameters *thresh*, *large*, and *small*, which have the following meaning. *thresh* is a threshold value used to decide if row or column scaling should be done based on the ratio of the row or column scaling factors. If *rowcnd* < *thresh*, row scaling is done, and if *colcnd* < *thresh*, column scaling is done. *large* and *small* are threshold values used to decide if row scaling should be done based on the absolute size of the largest matrix element. If *amax* > *large* or *amax* < *small*, row scaling is done.

?laqhb

Scales a Hermetian band matrix, using scaling factors computed by ?pbequ.

Syntax

```
call claqhb( uplo, n, kd, ab, ldab, s, scond, amax, equed )
call zlaqhb( uplo, n, kd, ab, ldab, s, scond, amax, equed )
```

Include Files

- mkl.fi

Description

The routine equilibrates a Hermetian band matrix *A* using the scaling factors in the vector *s*.

Input Parameters

uplo — CHARACTER*1.

Specifies whether the upper or lower triangular part of the band matrix *A* is stored.

If *uplo* = 'U': upper triangular.

If *uplo* = 'L': lower triangular.

n — INTEGER. The order of the matrix *A*.

n ≥ 0.

kd — INTEGER. The number of super-diagonals of the matrix *A* if *uplo* = 'U', or the number of sub-diagonals if *uplo* = 'L'.

kd ≥ 0.

ab — COMPLEX for claqhb

DOUBLE COMPLEX for zlaqhb

Array, DIMENSION (*ldab*,*n*). On entry, the upper or lower triangle of the band matrix *A*, stored in the first *kd*+1 rows of the array. The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows:

if *uplo* = 'U', *ab*(*kd*+1+*i*-*j*,*j*) = A(*i*,*j*) for max(1,*j*-*kd*) ≤ *i* ≤ *j*;

if *uplo* = 'L', *ab*(1+*i*-*j*,*j*) = A(*i*,*j*) for *j* ≤ *i* ≤ min(*n*,*j*+*kd*).

ldab — INTEGER. The leading dimension of the array *ab*.

ldab≥*kd*+1.

scond — REAL for claqsb

DOUBLE PRECISION for zlaqsb

Ratio of the smallest *s*(*i*) to the largest *s*(*i*).

amax — REAL for claqsb

DOUBLE PRECISION for zlaqsb

Absolute value of largest matrix entry.

Output Parameters

ab — On exit, if *info* = 0, the triangular factor *U* or *L* from the Cholesky factorization $A = U^H*U$ or $A = L*L^H$ of the band matrix *A*, in the same storage format as *A*.

s — REAL for claqsb

DOUBLE PRECISION for zlaqsb

Array, DIMENSION (*n*). The scale factors for A.

equed — CHARACTER*1.

Specifies whether or not equilibration was done.

If *equed* = 'N': No equilibration.

If *equed* = 'Y': Equilibration was done, that is, *A* has been replaced by diag(*s*)*A*diag(*s*).

Application Notes

The routine uses internal parameters *thresh*, *large*, and *small*, which have the following meaning. *thresh* is a threshold value used to decide if scaling should be based on the ratio of the scaling factors. If *scond* < *thresh*, scaling is done.

The values *large* and *small* are threshold values used to decide if scaling should be done based on the absolute size of the largest matrix element. If *amax* > *large* or *amax* < *small*, scaling is done.

?laqp2

Computes a QR factorization with column pivoting of the matrix block.

Syntax

```
call slaqp2( m, n, offset, a, lda, jpvt, tau, vn1, vn2, work )
call dlaqp2( m, n, offset, a, lda, jpvt, tau, vn1, vn2, work )
```

```
call claqp2( m, n, offset, a, lda, jpvt, tau, vn1, vn2, work )
call zlaqp2( m, n, offset, a, lda, jpvt, tau, vn1, vn2, work )
```

Include Files

- mkl.fi

Description

The routine computes a *QR* factorization with column pivoting of the block `A(offset+1:m,1:n)`. The block `A(1:offset,1:n)` is accordingly pivoted, but not factorized.

Input Parameters

m	INTEGER. The number of rows of the matrix *A*. *m*≥ 0.
n	INTEGER. The number of columns of the matrix *A*. *n*≥ 0.
offset	INTEGER. The number of rows of the matrix *A* that must be pivoted but no factorized. *offset*≥ 0.
a	REAL for slaqp2 DOUBLE PRECISION for dlaqp2 COMPLEX for claqp2 DOUBLE COMPLEX for zlaqp2 Array, DIMENSION (*lda*,*n*). On entry, the *m*-by-*n* matrix *A*.
lda	INTEGER. The leading dimension of the array *a*. *lda*≥ max(1,*m*).
jpvt	INTEGER. Array, DIMENSION (*n*). On entry, if *jpvt*(*i*) ≠ 0, the *i*-th column of *A* is permuted to the front of *A***P* (a leading column); if *jpvt*(*i*) = 0, the *i*-th column of *A* is a free column.
vn1, *vn2*	REAL for slaqp2/claqp2 DOUBLE PRECISION for dlaqp2/zlaqp2 Arrays, DIMENSION (*n*) each. Contain the vectors with the partial and exact column norms, respectively.
work	REAL for slaqp2 DOUBLE PRECISION for dlaqp2 COMPLEX for claqp2 DOUBLE COMPLEX for zlaqp2 Workspace array, DIMENSION (*n*).

Output Parameters

a	On exit, the upper triangle of block `A(offset+1:m,1:n)` is the triangular factor obtained; the elements in block `A(offset+1:m,1:n)` below the diagonal, together with the array *tau*, represent the orthogonal matrix *Q* as a product of elementary reflectors. Block `A(1:offset,1:n)` has been accordingly pivoted, but not factorized.
jpvt	On exit, if `jpvt(i) = k`, then the *i*-th column of *A***P* was the *k*-th column of *A*.

tau	`REAL` for `slaqp2`
	`DOUBLE PRECISION` for `dlaqp2`
	`COMPLEX` for `claqp2`
	`DOUBLE COMPLEX` for `zlaqp2`
	Array, `DIMENSION(min(m,n))`.
	The scalar factors of the elementary reflectors.

vn1, *vn2*	Contain the vectors with the partial and exact column norms, respectively.

?laqps

Computes a step of QR factorization with column pivoting of a real m-by-n matrix A by using BLAS level 3.

Syntax

```
call slaqps( m, n, offset, nb, kb, a, lda, jpvt, tau, vn1, vn2, auxv, f, ldf )
call dlaqps( m, n, offset, nb, kb, a, lda, jpvt, tau, vn1, vn2, auxv, f, ldf )
call claqps( m, n, offset, nb, kb, a, lda, jpvt, tau, vn1, vn2, auxv, f, ldf )
call zlaqps( m, n, offset, nb, kb, a, lda, jpvt, tau, vn1, vn2, auxv, f, ldf )
```

Include Files

- `mkl.fi`

Description

The routine computes a step of *QR* factorization with column pivoting of a real *m*-by-*n* matrix *A* by using BLAS level 3. The routine tries to factorize *NB* columns from *A* starting from the row *offset*+1, and updates all of the matrix with BLAS level 3 routine `?gemm`.

In some cases, due to catastrophic cancellations, `?laqps` cannot factorize *NB* columns. Hence, the actual number of factorized columns is returned in *kb*.

Block `A(1:offset,1:n)` is accordingly pivoted, but not factorized.

Input Parameters

m	`INTEGER`. The number of rows of the matrix *A*. $m \geq 0$.
n	`INTEGER`. The number of columns of the matrix *A*. $n \geq 0$.

offset INTEGER. The number of rows of *A* that have been factorized in previous steps.

nb INTEGER. The number of columns to factorize.

a REAL for slaqps

DOUBLE PRECISION for dlaqps

COMPLEX for claqps

DOUBLE COMPLEX for zlaqps

Array, DIMENSION (*lda*,*n*).

On entry, the *m*-by-*n* matrix *A*.

lda INTEGER. The leading dimension of the array *a*.

lda ≥ max(1,*m*).

jpvt INTEGER. Array, DIMENSION (*n*).

If *jpvt*(*I*) = *k* then column *k* of the full matrix *A* has been permuted into position *i* in AP.

vn1, *vn2* REAL for slaqps/claqps

DOUBLE PRECISION for dlaqps/zlaqps

Arrays, DIMENSION (*n*) each. Contain the vectors with the partial and exact column norms, respectively.

auxv REAL for slaqps

DOUBLE PRECISION for dlaqps

COMPLEX for claqps

DOUBLE COMPLEX for zlaqps

Array, DIMENSION (*nb*). Auxiliary vector.

f REAL for slaqps

DOUBLE PRECISION for dlaqps

COMPLEX for claqps

DOUBLE COMPLEX for zlaqps

Array, DIMENSION (*ldf*,*nb*). For real flavors, matrix $F^T = L*Y^T*A$. For complex flavors, matrix $F^H = L*Y^H*A$.

ldf INTEGER. The leading dimension of the array *f*.

ldf ≥ max(1,*n*).

Output Parameters

kb INTEGER. The number of columns actually factorized.

a On exit, block *A*(*offset*+1:*m*,1:*kb*) is the triangular factor obtained and block *A*(1:*offset*,1:*n*) has been accordingly pivoted, but no factorized. The rest of the matrix, block *A*(*offset*+1:*m*,*kb*+1:*n*) has been updated.

jpvt	INTEGER array, DIMENSION (*n*). If *jpvt(I) = k* then column *k* of the full matrix *A* has been permuted into position *i* in AP.
tau	REAL for slaqps DOUBLE PRECISION for dlaqps COMPLEX for claqps DOUBLE COMPLEX for zlaqps Array, DIMENSION (*kb*). The scalar factors of the elementary reflectors.
vn1, *vn2*	The vectors with the partial and exact column norms, respectively.
auxv	Auxiliary vector.
f	Matrix *F′ = L*Y′*A*.

?laqr0

Computes the eigenvalues of a Hessenberg matrix, and optionally the marixes from the Schur decomposition.

Syntax

```
call slaqr0( wantt, wantz, n, ilo, ihi, h, ldh, wr, wi, iloz, ihiz, z, ldz, work, lwork, info )
call dlaqr0( wantt, wantz, n, ilo, ihi, h, ldh, wr, wi, iloz, ihiz, z, ldz, work, lwork, info )
call claqr0( wantt, wantz, n, ilo, ihi, h, ldh, w, iloz, ihiz, z, ldz, work, lwork, info )
call zlaqr0( wantt, wantz, n, ilo, ihi, h, ldh, w, iloz, ihiz, z, ldz, work, lwork, info )
```

Include Files

- mkl.fi

Description

The routine computes the eigenvalues of a Hessenberg matrix *H*, and, optionally, the matrices *T* and *Z* from the Schur decomposition $H=Z*T*Z^H$, where *T* is an upper quasi-triangular/triangular matrix (the Schur form), and *Z* is the orthogonal/unitary matrix of Schur vectors.

Optionally *Z* may be postmultiplied into an input orthogonal/unitary matrix *Q* so that this routine can give the Schur factorization of a matrix *A* which has been reduced to the Hessenberg form *H* by the orthogonal/unitary matrix *Q*: $A = Q*H*Q^H = (QZ)*H*(QZ)^H$.

Input Parameters

wantt	LOGICAL. If *wantt* = .TRUE., the full Schur form T is required; If *wantt* = .FALSE., only eigenvalues are required.

wantz — LOGICAL.

If *wantz* = .TRUE., the matrix of Schur vectors *Z* is required;

If *wantz* = .FALSE., Schur vectors are not required.

n — INTEGER. The order of the Hessenberg matrix *H*. (*n* ≥ 0).

ilo, *ihi* — INTEGER.

It is assumed that *H* is already upper triangular in rows and columns 1:*ilo*-1 and *ihi*+1:*n*, and if *ilo* > 1 then *H*(*ilo*, *ilo*-1) = 0.

ilo and *ihi* are normally set by a previous call to cgebal, and then passed to cgehrd when the matrix output by cgebal is reduced to Hessenberg form. Otherwise, *ilo* and *ihi* should be set to 1 and *n*, respectively.

If *n* > 0, then 1 ≤ *ilo* ≤ *ihi* ≤ *n*.

If *n*=0, then *ilo*=1 and *ihi*=0

h — REAL for slaqr0

DOUBLE PRECISION for dlaqr0

COMPLEX for claqr0

DOUBLE COMPLEX for zlaqr0.

Array, DIMENSION (*ldh*, *n*), contains the upper Hessenberg matrix *H*.

ldh — INTEGER. The leading dimension of the array *h*. *ldh* ≥ max(1, *n*).

iloz, *ihiz* — INTEGER. Specify the rows of *Z* to which transformations must be applied if *wantz* is .TRUE., 1 ≤ *iloz* ≤ *ilo*; *ihi* ≤ *ihiz* ≤ *n*.

z — REAL for slaqr0

DOUBLE PRECISION for dlaqr0

COMPLEX for claqr0

DOUBLE COMPLEX for zlaqr0.

Array, DIMENSION (*ldz*, *ihi*), contains the matrix *Z* if *wantz* is .TRUE.. If *wantz* is .FALSE., *z* is not referenced.

ldz — INTEGER. The leading dimension of the array *z*.

If *wantz* is .TRUE., then *ldz* ≥ max(1, *ihiz*). Otherwise, *ldz* ≥ 1.

work — REAL for slaqr0

DOUBLE PRECISION for dlaqr0

COMPLEX for claqr0

DOUBLE COMPLEX for zlaqr0.

Workspace array with dimension *lwork*.

lwork — INTEGER. The dimension of the array *work*.

lwork ≥ max(1,*n*) is sufficient, but for the optimal performance a greater workspace may be required, typically as large as 6**n*.

It is recommended to use the workspace query to determine the optimal workspace size. If *lwork*=-1, then the routine performs a workspace query: it estimates the optimal workspace size for the given values of the input parameters *n*, *ilo*, and *ihi*. The estimate is returned in *work*(1). No error messages related to the *lwork* is issued by xerbla. Neither *H* nor *Z* are accessed.

Output Parameters

h

If *info*=0, and *wantt* is .TRUE., then *h* contains the upper quasi-triangular/ triangular matrix *T* from the Schur decomposition (the Schur form).

If *info*=0, and *wantt* is .FALSE., then the contents of *h* are unspecified on exit.

(The output values of *h* when *info* > 0 are given under the description of the *info* parameter below.)

The routine may explicitly set *h*(i,j) for i>j and j=1,2,...*ilo*-1 or j=*ihi*+1, *ihi*+2,...*n*.

work(1)

On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.

w

COMPLEX for claqr0

DOUBLE COMPLEX for zlaqr0.

Arrays, DIMENSION(*n*). The computed eigenvalues of *h*(*ilo*:*ihi*, *ilo*:*ihi*) are stored in *w*(*ilo*:*ihi*). If *wantt* is .TRUE., then the eigenvalues are stored in the same order as on the diagonal of the Schur form returned in *h*, with *w*(i) = *h*(i,i).

wr, *wi*

REAL for slaqr0

DOUBLE PRECISION for dlaqr0

Arrays, DIMENSION(*ihi*) each. The real and imaginary parts, respectively, of the computed eigenvalues of *h*(*ilo*:*ihi*, *ilo*:*ihi*) are stored in *wr*(*ilo*:*ihi*) and *wi*(*ilo*:*ihi*). If two eigenvalues are computed as a complex conjugate pair, they are stored in consecutive elements of *wr* and *wi*, say the *i*-th and (*i*+1)-th, with *wi*(*i*)> 0 and *wi*(*i*+1) < 0. If *wantt* is .TRUE., then the eigenvalues are stored in the same order as on the diagonal of the Schur form returned in *h*, with *wr*(i) = *h*(i,i), and if *h*(i:i+1,i:i+1)is a 2-by-2 diagonal block, then *wi*(i)=sqrt(-*h*(i+1,i)*h(i,i+1)).

z

If *wantz* is .TRUE., then *z(ilo:ihi, iloz:ihiz)* is replaced by *z(ilo:ihi, iloz:ihiz)*U*, where *U* is the orthogonal/unitary Schur factor of *h(ilo:ihi, ilo:ihi)*.

If *wantz* is .FALSE., *z* is not referenced.

(The output values of *z* when *info* > 0 are given under the description of the *info* parameter below.)

info

INTEGER.

= 0: the execution is successful.

> 0: if *info* = *i*, then the routine failed to compute all the eigenvalues. Elements 1:*ilo*-1 and i+1:*n* of *wr* and *wi* contain those eigenvalues which have been successfully computed.

> 0: if *wantt* is .FALSE., then the remaining unconverged eigenvalues are the eigenvalues of the upper Hessenberg matrix rows and columns *ilo* through *info* of the final output value of *h*.

> 0: if *wantt* is .TRUE., then (initial value of *h*)**U* = *U**(final value of *h*, where *U* is an orthogonal/unitary matrix. The final value of *h* is upper Hessenberg and quasi-triangular/triangular in rows and columns *info*+1 through *ihi*.

> 0: if *wantz* is .TRUE., then (final value of *z*(*ilo*:*ihi*, *iloz*:*ihiz*))=(initial value of *z*(*ilo*:*ihi*, *iloz*:*ihiz*)***U*, where *U* is the orthogonal/unitary matrix in the previous expression (regardless of the value of *wantt*).

> 0: if *wantz* is .FALSE., then *z* is not accessed.

?laqr1

Sets a scalar multiple of the first column of the product of 2-by-2 or 3-by-3 matrix H and specified shifts.

Syntax

```
call slaqr1( n, h, ldh, sr1, si1, sr2, si2, v )
call dlaqr1( n, h, ldh, sr1, si1, sr2, si2, v )
call claqr1( n, h, ldh, s1, s2, v )
call zlaqr1( n, h, ldh, s1, s2, v )
```

Include Files

- mkl.fi

Description

Given a 2-by-2 or 3-by-3 matrix *H*, this routine sets *v* to a scalar multiple of the first column of the product *K* = (*H* - *s1***I*)*(*H* - *s2***I*), or *K* = (*H* - (*sr1* + i**si1*)**I*)*(*H* - (*sr2* + i**si2*)**I*) scaling to avoid overflows and most underflows.

It is assumed that either 1) *sr1* = *sr2* and *si1* = -*si2*, or 2) *si1* = *si2* = 0.

This is useful for starting double implicit shift bulges in the QR algorithm.

Input Parameters

n	INTEGER. The order of the matrix *H*. *n* must be equal to 2 or 3.
sr1, *si2*, *sr2*, *si2*	REAL for slaqr1 DOUBLE PRECISION for dlaqr1

Shift values that define *K* in the formula above.

s1, *s2*

COMPLEX for claqr1

DOUBLE COMPLEX for zlaqr1.

Shift values that define *K* in the formula above.

h

REAL for slaqr1

DOUBLE PRECISION for dlaqr1

COMPLEX for claqr1

DOUBLE COMPLEX for zlaqr1.

Array, DIMENSION (*ldh*, *n*), contains 2-by-2 or 3-by-3 matrix *H* in the formula above.

ldh

INTEGER.

The leading dimension of the array *h* just as declared in the calling routine. *ldh* ≥ *n*.

Output Parameters

v

REAL for slaqr1

DOUBLE PRECISION for dlaqr1

COMPLEX for claqr1

DOUBLE COMPLEX for zlaqr1.

Array with dimension (*n*).

A scalar multiple of the first column of the matrix *K* in the formula above.

?laqr2

Performs the orthogonal/unitary similarity transformation of a Hessenberg matrix to detect and deflate fully converged eigenvalues from a trailing principal submatrix (aggressive early deflation).

Syntax

```
call slaqr2( wantt, wantz, n, ktop, kbot, nw, h, ldh, iloz, ihiz, z, ldz, ns, nd, sr, si, v, ldv, nh, t, ldt, nv, wv, ldwv, work, lwork )
call dlaqr2( wantt, wantz, n, ktop, kbot, nw, h, ldh, iloz, ihiz, z, ldz, ns, nd, sr, si, v, ldv, nh, t, ldt, nv, wv, ldwv, work, lwork )
call claqr2( wantt, wantz, n, ktop, kbot, nw, h, ldh, iloz, ihiz, z, ldz, ns, nd, sh, v, ldv, nh, t, ldt, nv, wv, ldwv, work, lwork )
call zlaqr2( wantt, wantz, n, ktop, kbot, nw, h, ldh, iloz, ihiz, z, ldz, ns, nd, sh, v, ldv, nh, t, ldt, nv, wv, ldwv, work, lwork )
```

Include Files

- mkl.fi

Description

The routine accepts as input an upper Hessenberg matrix *H* and performs an orthogonal/unitary similarity transformation designed to detect and deflate fully converged eigenvalues from a trailing principal submatrix. On output *H* has been overwritten by a new Hessenberg matrix that is a perturbation of an orthogonal/unitary similarity transformation of *H*. It is to be hoped that the final version of *H* has many zero subdiagonal entries.

This subroutine is identical to `?laqr3` except that it avoids recursion by calling `?lahqr` instead of `?laqr4`.

Input Parameters

wantt

`LOGICAL`.

If *wantt* = `.TRUE.`, then the Hessenberg matrix *H* is fully updated so that the quasi-triangular/triangular Schur factor may be computed (in cooperation with the calling subroutine).

If *wantt* = `.FALSE.`, then only enough of *H* is updated to preserve the eigenvalues.

wantz

`LOGICAL`.

If *wantz* = `.TRUE.`, then the orthogonal/unitary matrix *Z* is updated so that the orthogonal/unitary Schur factor may be computed (in cooperation with the calling subroutine).

If *wantz* = `.FALSE.`, then *Z* is not referenced.

n

`INTEGER`. The order of the Hessenberg matrix *H* and (if *wantz* = `.TRUE.`) the order of the orthogonal/unitary matrix *Z*.

ktop

`INTEGER`.

It is assumed that either *ktop*=1 or *h*(*ktop*,*ktop*-1)=0. *ktop* and *kbot* together determine an isolated block along the diagonal of the Hessenberg matrix.

kbot

`INTEGER`.

It is assumed without a check that either *kbot*=*n* or *h*(*kbot*+1,*kbot*)=0. *ktop* and *kbot* together determine an isolated block along the diagonal of the Hessenberg matrix.

nw

`INTEGER`.

Size of the deflation window. 1 ≤ *nw* ≤ (*kbot*-*ktop*+1).

h

`REAL` for `slaqr2`

`DOUBLE PRECISION` for `dlaqr2`

`COMPLEX` for `claqr2`

`DOUBLE COMPLEX` for `zlaqr2`.

Array, `DIMENSION` (*ldh*, *n*), on input the initial *n*-by-*n* section of *h* stores the Hessenberg matrix *H* undergoing aggressive early deflation.

ldh

`INTEGER`. The leading dimension of the array *h* just as declared in the calling subroutine. *ldh*≥*n*.

iloz, *ihiz* — INTEGER. Specify the rows of *Z* to which transformations must be applied if *wantz* is .TRUE.. $1 \le iloz \le ihiz \le n$.

z — REAL for slaqr2

DOUBLE PRECISION for dlaqr2

COMPLEX for claqr2

DOUBLE COMPLEX for zlaqr2.

Array, DIMENSION (*ldz*, *n*), contains the matrix *Z* if *wantz* is .TRUE.. If *wantz* is .FALSE., then *z* is not referenced.

ldz — INTEGER. The leading dimension of the array *z* just as declared in the calling subroutine. $ldz \ge 1$.

v — REAL for slaqr2

DOUBLE PRECISION for dlaqr2

COMPLEX for claqr2

DOUBLE COMPLEX for zlaqr2.

Workspace array with dimension (*ldv*, *nw*). An *nw*-by-*nw* work array.

ldv — INTEGER. The leading dimension of the array *v* just as declared in the calling subroutine. $ldv \ge nw$.

nh — INTEGER. The number of column of *t*. $nh \ge nw$.

t — REAL for slaqr2

DOUBLE PRECISION for dlaqr2

COMPLEX for claqr2

DOUBLE COMPLEX for zlaqr2.

Workspace array with dimension (*ldt*, *nw*).

ldt — INTEGER. The leading dimension of the array *t* just as declared in the calling subroutine. $ldt \ge nw$.

nv — INTEGER. The number of rows of work array *wv* available for workspace. $nv \ge nw$.

wv — REAL for slaqr2

DOUBLE PRECISION for dlaqr2

COMPLEX for claqr2

DOUBLE COMPLEX for zlaqr2.

Workspace array with dimension (*ldwv*, *nw*).

ldwv — INTEGER. The leading dimension of the array *wv* just as declared in the calling subroutine. $ldwv \ge nw$.

work — REAL for slaqr2

DOUBLE PRECISION for dlaqr2

COMPLEX for claqr2

DOUBLE COMPLEX for zlaqr2.

Workspace array with dimension *lwork*.

lwork INTEGER. The dimension of the array *work*.

lwork=2*nw) is sufficient, but for the optimal performance a greater workspace may be required.

If *lwork*=-1, then the routine performs a workspace query: it estimates the optimal workspace size for the given values of the input parameters *n*, *nw*, *ktop*, and *kbot*. The estimate is returned in *work*(1). No error messages related to the *lwork* is issued by xerbla. Neither *H* nor *Z* are accessed.

Output Parameters

h On output *h* has been transformed by an orthogonal/unitary similarity transformation, perturbed, and the returned to Hessenberg form that (it is to be hoped) has some zero subdiagonal entries.

work(1) On exit *work*(1) is set to an estimate of the optimal value of *lwork* for the given values of the input parameters *n*, *nw*, *ktop*, and *kbot*.

z If *wantz* is .TRUE., then the orthogonal/unitary similarity transformation is accumulated into *z(iloz:ihiz, ilo:ihi)* from the right.

If *wantz* is .FALSE., then *z* is unreferenced.

nd INTEGER. The number of converged eigenvalues uncovered by the routine.

ns INTEGER. The number of unconverged, that is approximate eigenvalues returned in *sr*, *si* or in *sh* that may be used as shifts by the calling subroutine.

sh COMPLEX for claqr2

DOUBLE COMPLEX for zlaqr2.

Arrays, DIMENSION (*kbot*).

The approximate eigenvalues that may be used for shifts are stored in the *sh*(*kbot*-*nd*-*ns*+1) through the *sh*(*kbot*-*nd*).

The converged eigenvalues are stored in the *sh*(*kbot*-*nd*+1) through the *sh*(*kbot*).

sr, *si* REAL for slaqr2

DOUBLE PRECISION for dlaqr2

Arrays, DIMENSION (*kbot*) each.

The real and imaginary parts of the approximate eigenvalues that may be used for shifts are stored in the *sr*(*kbot*-*nd*-*ns*+1) through the *sr*(*kbot*-*nd*), and *si*(*kbot*-*nd*-*ns*+1) through the *si*(*kbot*-*nd*), respectively.

The real and imaginary parts of converged eigenvalues are stored in the *sr*(*kbot*-*nd*+1) through the *sr*(*kbot*), and *si*(*kbot*-*nd*+1) through the *si*(*kbot*), respectively.

?laqr3

Performs the orthogonal/unitary similarity transformation of a Hessenberg matrix to detect and deflate fully converged eigenvalues from a trailing principal submatrix (aggressive early deflation).

Syntax

```
call slaqr3( wantt, wantz, n, ktop, kbot, nw, h, ldh, iloz, ihiz, z, ldz, ns, nd, sr, si, v, ldv, nh, t, ldt, nv, wv, ldwv, work, lwork )
call dlaqr3( wantt, wantz, n, ktop, kbot, nw, h, ldh, iloz, ihiz, z, ldz, ns, nd, sr, si, v, ldv, nh, t, ldt, nv, wv, ldwv, work, lwork )
call claqr3( wantt, wantz, n, ktop, kbot, nw, h, ldh, iloz, ihiz, z, ldz, ns, nd, sh, v, ldv, nh, t, ldt, nv, wv, ldwv, work, lwork )
call zlaqr3( wantt, wantz, n, ktop, kbot, nw, h, ldh, iloz, ihiz, z, ldz, ns, nd, sh, v, ldv, nh, t, ldt, nv, wv, ldwv, work, lwork )
```

Include Files

- mkl.fi

Description

The routine accepts as input an upper Hessenberg matrix *H* and performs an orthogonal/unitary similarity transformation designed to detect and deflate fully converged eigenvalues from a trailing principal submatrix. On output *H* has been overwritten by a new Hessenberg matrix that is a perturbation of an orthogonal/unitary similarity transformation of *H*. It is to be hoped that the final version of *H* has many zero subdiagonal entries.

Input Parameters

wantt

LOGICAL.

If *wantt* = .TRUE., then the Hessenberg matrix *H* is fully updated so that the quasi-triangular/triangular Schur factor may be computed (in cooperation with the calling subroutine).

If *wantt* = .FALSE., then only enough of *H* is updated to preserve the eigenvalues.

wantz

LOGICAL.

If *wantz* = .TRUE., then the orthogonal/unitary matrix *Z* is updated so that the orthogonal/unitary Schur factor may be computed (in cooperation with the calling subroutine).

If *wantz* = .FALSE., then *Z* is not referenced.

n

INTEGER. The order of the Hessenberg matrix *H* and (if *wantz* = .TRUE.) the order of the orthogonal/unitary matrix *Z*.

ktop

INTEGER.

It is assumed that either *ktop*=1 or *h*(*ktop*,*ktop-1*)=0. *ktop* and *kbot* together determine an isolated block along the diagonal of the Hessenberg matrix.

kbot INTEGER.

It is assumed without a check that either *kbot*=*n* or *h*(*kbot*+1,*kbot*)=0. *ktop* and *kbot* together determine an isolated block along the diagonal of the Hessenberg matrix.

nw INTEGER.

Size of the deflation window. 1≤*nw*≤(*kbot*-*ktop*+1).

h REAL for slaqr3

DOUBLE PRECISION for dlaqr3

COMPLEX for claqr3

DOUBLE COMPLEX for zlaqr3.

Array, DIMENSION (*ldh*, *n*), on input the initial *n*-by-*n* section of *h* stores the Hessenberg matrix *H* undergoing aggressive early deflation.

ldh INTEGER. The leading dimension of the array *h* just as declared in the calling subroutine. *ldh*≥*n*.

iloz, *ihiz* INTEGER. Specify the rows of *Z* to which transformations must be applied if *wantz* is .TRUE.. 1≤*iloz*≤*ihiz*≤*n*.

z REAL for slaqr3

DOUBLE PRECISION for dlaqr3

COMPLEX for claqr3

DOUBLE COMPLEX for zlaqr3.

Array, DIMENSION (*ldz*, *n*), contains the matrix *Z* if *wantz* is .TRUE.. If *wantz* is .FALSE., then *z* is not referenced.

ldz INTEGER. The leading dimension of the array *z* just as declared in the calling subroutine. *ldz*≥1.

v REAL for slaqr3

DOUBLE PRECISION for dlaqr3

COMPLEX for claqr3

DOUBLE COMPLEX for zlaqr3.

Workspace array with dimension (*ldv*, *nw*). An *nw*-by-*nw* work array.

ldv INTEGER. The leading dimension of the array *v* just as declared in the calling subroutine. *ldv*≥*nw*.

nh INTEGER. The number of column of *t*. *nh*≥*nw*.

t REAL for slaqr3

DOUBLE PRECISION for dlaqr3

COMPLEX for claqr3

DOUBLE COMPLEX for zlaqr3.

Workspace array with dimension (*ldt*, *nw*).

ldt — INTEGER. The leading dimension of the array *t* just as declared in the calling subroutine. *ldt*≥*nw*.

nv — INTEGER. The number of rows of work array *wv* available for workspace. *nv*≥*nw*.

wv — REAL for slaqr3

DOUBLE PRECISION for dlaqr3

COMPLEX for claqr3

DOUBLE COMPLEX for zlaqr3.

Workspace array with dimension (*ldwv*, *nw*).

ldwv — INTEGER. The leading dimension of the array *wv* just as declared in the calling subroutine. *ldwv*≥*nw*.

work — REAL for slaqr3

DOUBLE PRECISION for dlaqr3

COMPLEX for claqr3

DOUBLE COMPLEX for zlaqr3.

Workspace array with dimension *lwork*.

lwork — INTEGER. The dimension of the array *work*.

lwork=2**nw*) is sufficient, but for the optimal performance a greater workspace may be required.

If *lwork*=-1, then the routine performs a workspace query: it estimates the optimal workspace size for the given values of the input parameters *n*, *nw*, *ktop*, and *kbot*. The estimate is returned in *work*(1). No error messages related to the *lwork* is issued by xerbla. Neither *H* nor *Z* are accessed.

Output Parameters

h — On output *h* has been transformed by an orthogonal/unitary similarity transformation, perturbed, and the returned to Hessenberg form that (it is to be hoped) has some zero subdiagonal entries.

work(1) — On exit *work*(1) is set to an estimate of the optimal value of *lwork* for the given values of the input parameters *n*, *nw*, *ktop*, and *kbot*.

z — If *wantz* is .TRUE., then the orthogonal/unitary similarity transformation is accumulated into *z(iloz:ihiz, ilo:ihi)* from the right.

If *wantz* is .FALSE., then *z* is unreferenced.

nd — INTEGER. The number of converged eigenvalues uncovered by the routine.

ns — INTEGER. The number of unconverged, that is approximate eigenvalues returned in *sr*, *si* or in *sh* that may be used as shifts by the calling subroutine.

sh — COMPLEX for claqr3

DOUBLE COMPLEX for zlaqr3.

Arrays, DIMENSION (*kbot*).

The approximate eigenvalues that may be used for shifts are stored in the *sh*(*kbot*-*nd*-*ns*+1) through the *sh*(*kbot*-*nd*).

The converged eigenvalues are stored in the *sh*(*kbot*-*nd*+1) through the *sh*(*kbot*).

sr, *si*

REAL for slaqr3

DOUBLE PRECISION for dlaqr3

Arrays, DIMENSION (*kbot*) each.

The real and imaginary parts of the approximate eigenvalues that may be used for shifts are stored in the *sr*(*kbot*-*nd*-*ns*+1) through the *sr*(*kbot*-*nd*), and *si*(*kbot*-*nd*-*ns*+1) through the *si*(*kbot*-*nd*), respectively.

The real and imaginary parts of converged eigenvalues are stored in the *sr*(*kbot*-*nd*+1) through the *sr*(*kbot*), and *si*(*kbot*-*nd*+1) through the *si*(*kbot*), respectively.

?laqr4

Computes the eigenvalues of a Hessenberg matrix, and optionally the matrices from the Schur decomposition.

Syntax

call slaqr4(*wantt*, *wantz*, *n*, *ilo*, *ihi*, *h*, *ldh*, *wr*, *wi*, *iloz*, *ihiz*, *z*, *ldz*, *work*, *lwork*, *info*)

call dlaqr4(*wantt*, *wantz*, *n*, *ilo*, *ihi*, *h*, *ldh*, *wr*, *wi*, *iloz*, *ihiz*, *z*, *ldz*, *work*, *lwork*, *info*)

call claqr4(*wantt*, *wantz*, *n*, *ilo*, *ihi*, *h*, *ldh*, *w*, *iloz*, *ihiz*, *z*, *ldz*, *work*, *lwork*, *info*)

call zlaqr4(*wantt*, *wantz*, *n*, *ilo*, *ihi*, *h*, *ldh*, *w*, *iloz*, *ihiz*, *z*, *ldz*, *work*, *lwork*, *info*)

Include Files

- mkl.fi

Description

The routine computes the eigenvalues of a Hessenberg matrix *H*, and, optionally, the matrices *T* and *Z* from the Schur decomposition $H=Z*T*Z^H$, where *T* is an upper quasi-triangular/triangular matrix (the Schur form), and *Z* is the orthogonal/unitary matrix of Schur vectors.

Optionally *Z* may be postmultiplied into an input orthogonal/unitary matrix *Q* so that this routine can give the Schur factorization of a matrix *A* which has been reduced to the Hessenberg form *H* by the orthogonal/unitary matrix *Q*: $A = Q*H*Q^H = (QZ)*H*(QZ)^H$.

This routine implements one level of recursion for ?laqr0. It is a complete implementation of the small bulge multi-shift QR algorithm. It may be called by ?laqr0 and, for large enough deflation window size, it may be called by ?laqr3. This routine is identical to ?laqr0 except that it calls ?laqr2 instead of ?laqr3.

Input Parameters

wantt

LOGICAL.

If *wantt* = .TRUE., the full Schur form T is required;

If *wantt* = .FALSE., only eigenvalues are required.

wantz

LOGICAL.

If *wantz* = .TRUE., the matrix of Schur vectors *Z* is required;

If *wantz* = .FALSE., Schur vectors are not required.

n

INTEGER. The order of the Hessenberg matrix *H*. ($n \geq 0$).

ilo, *ihi*

INTEGER.

It is assumed that *H* is already upper triangular in rows and columns 1:*ilo*-1 and *ihi*+1:*n*, and if $ilo > 1$ then $h(ilo, ilo-1) = 0$.

ilo and *ihi* are normally set by a previous call to cgebal, and then passed to cgehrd when the matrix output by cgebal is reduced to Hessenberg form. Otherwise, *ilo* and *ihi* should be set to 1 and *n*, respectively.

If $n > 0$, then $1 \leq ilo \leq ihi \leq n$.

If $n=0$, then $ilo=1$ and $ihi=0$

h

REAL for slaqr4

DOUBLE PRECISION for dlaqr4

COMPLEX for claqr4

DOUBLE COMPLEX for zlaqr4.

Array, DIMENSION (*ldh*, *n*), contains the upper Hessenberg matrix *H*.

ldh

INTEGER. The leading dimension of the array *h*. $ldh \geq \max(1, n)$.

iloz, *ihiz*

INTEGER. Specify the rows of *Z* to which transformations must be applied if *wantz* is .TRUE., $1 \leq iloz \leq ilo$; $ihi \leq ihiz \leq n$.

z

REAL for slaqr4

DOUBLE PRECISION for dlaqr4

COMPLEX for claqr4

DOUBLE COMPLEX for zlaqr4.

Array, DIMENSION (*ldz*, *ihi*), contains the matrix *Z* if *wantz* is .TRUE.. If *wantz* is .FALSE., *z* is not referenced.

ldz

INTEGER. The leading dimension of the array *z*.

If *wantz* is .TRUE., then $ldz \geq \max(1, ihiz)$. Otherwise, $ldz \geq 1$.

work

REAL for slaqr4

DOUBLE PRECISION for dlaqr4

COMPLEX for claqr4

DOUBLE COMPLEX for zlaqr4.

Workspace array with dimension *lwork*.

lwork INTEGER. The dimension of the array *work*.

lwork ≥ max(1,*n*) is sufficient, but for the optimal performance a greater workspace may be required, typically as large as 6**n*.

It is recommended to use the workspace query to determine the optimal workspace size. If *lwork*=-1, then the routine performs a workspace query: it estimates the optimal workspace size for the given values of the input parameters *n*, *ilo*, and *ihi*. The estimate is returned in *work*(1). No error messages related to the *lwork* is issued by xerbla. Neither *H* nor *Z* are accessed.

Output Parameters

h If *info*=0, and *wantt* is .TRUE., then *h* contains the upper quasi-triangular/triangular matrix *T* from the Schur decomposition (the Schur form).

If *info*=0, and *wantt* is .FALSE., then the contents of *h* are unspecified on exit.

(The output values of *h* when *info* > 0 are given under the description of the *info* parameter below.)

The routines may explicitly set *h*(i,j) for i>j and j=1,2,...*ilo*-1 or j=*ihi*+1, *ihi*+2,...*n*.

work(1) On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.

w COMPLEX for claqr4

DOUBLE COMPLEX for zlaqr4.

Arrays, DIMENSION(*n*). The computed eigenvalues of *h*(*ilo*:*ihi*, *ilo*:*ihi*) are stored in *w*(*ilo*:*ihi*). If *wantt* is .TRUE., then the eigenvalues are stored in the same order as on the diagonal of the Schur form returned in *h*, with *w*(i) = *h*(i,i).

wr, *wi* REAL for slaqr4

DOUBLE PRECISION for dlaqr4

Arrays, DIMENSION(*ihi*) each. The real and imaginary parts, respectively, of the computed eigenvalues of *h*(*ilo*:*ihi*, *ilo*:*ihi*) are stored in the *wr*(*ilo*:*ihi*) and *wi*(*ilo*:*ihi*). If two eigenvalues are computed as a complex conjugate pair, they are stored in consecutive elements of *wr* and *wi*, say the *i*-th and (*i*+1)-th, with *wi*(*i*)> 0 and *wi*(*i*+1) < 0. If *wantt* is .TRUE., then the eigenvalues are stored in the same order as on the diagonal of the Schur form returned in *h*, with *wr*(i) = *h*(i,i), and if *h*(i:i+1,i:i+1) is a 2-by-2 diagonal block, then *wi*(i)=sqrt(-*h*(i+1,i)**h*(i,i+1)).

z If *wantz* is .TRUE., then *z(ilo:ihi, iloz:ihiz)* is replaced by *z(ilo:ihi, iloz:ihiz)***U*, where *U* is the orthogonal/unitary Schur factor of *h(ilo:ihi, ilo:ihi)*.

If *wantz* is .FALSE., *z* is not referenced.

(The output values of *z* when *info* > 0 are given under the description of the *info* parameter below.)

info INTEGER.

= 0: the execution is successful.

> 0: if *info* = *i*, then the routine failed to compute all the eigenvalues. Elements 1:*ilo*-1 and i+1:*n* of *wr* and *wi* contain those eigenvalues which have been successfully computed.

> 0: if *wantt* is .FALSE., then the remaining unconverged eigenvalues are the eigenvalues of the upper Hessenberg matrix rows and columns *ilo* through *info* of the final output value of *h*.

> 0: if *wantt* is .TRUE., then (initial value of *h*)**U* = *U**(final value of *h*, where *U* is an orthogonal/unitary matrix. The final value of *h* is upper Hessenberg and quasi-triangular/triangular in rows and columns *info*+1 through *ihi*.

> 0: if *wantz* is .TRUE., then (final value of *z*(*ilo*:*ihi*, *iloz*:*ihiz*))=(initial value of *z*(*ilo*:*ihi*, *iloz*:*ihiz*)***U*, where *U* is the orthogonal/unitary matrix in the previous expression (regardless of the value of *wantt*).

> 0: if *wantz* is .FALSE., then *z* is not accessed.

?laqr5

Performs a single small-bulge multi-shift QR sweep.

Syntax

```
call slaqr5( wantt, wantz, kacc22, n, ktop, kbot, nshfts, sr, si, h, ldh, iloz, ihiz, z, ldz, v, ldv, u, ldu, nv, wv, ldwv, nh, wh, ldwh )
call dlaqr5( wantt, wantz, kacc22, n, ktop, kbot, nshfts, sr, si, h, ldh, iloz, ihiz, z, ldz, v, ldv, u, ldu, nv, wv, ldwv, nh, wh, ldwh )
call claqr5( wantt, wantz, kacc22, n, ktop, kbot, nshfts, s, h, ldh, iloz, ihiz, z, ldz, v, ldv, u, ldu, nv, wv, ldwv, nh, wh, ldwh )
call zlaqr5( wantt, wantz, kacc22, n, ktop, kbot, nshfts, s, h, ldh, iloz, ihiz, z, ldz, v, ldv, u, ldu, nv, wv, ldwv, nh, wh, ldwh )
```

Include Files

- mkl.fi

Description

This auxiliary routine called by ?laqr0 performs a single small-bulge multi-shift QR sweep.

Input Parameters

wantt LOGICAL.

wantt = .TRUE. if the quasi-triangular/triangular Schur factor is computed.

wantt is set to .FALSE. otherwise.

wantz

LOGICAL.

wantz = .TRUE. if the orthogonal/unitary Schur factor is computed.

wantz is set to .FALSE. otherwise.

kacc22

INTEGER. Possible values are 0, 1, or 2.

Specifies the computation mode of far-from-diagonal orthogonal updates.

= 0: the routine does not accumulate reflections and does not use matrix-matrix multiply to update far-from-diagonal matrix entries.

= 1: the routine accumulates reflections and uses matrix-matrix multiply to update the far-from-diagonal matrix entries.

= 2: the routine accumulates reflections, uses matrix-matrix multiply to update the far-from-diagonal matrix entries, and takes advantage of 2-by-2 block structure during matrix multiplies.

n

INTEGER. The order of the Hessenberg matrix *H* upon which the routine operates.

ktop, *kbot*

INTEGER.

It is assumed without a check that either *ktop*=1 or *h*(*ktop*,*ktop-1*)=0, and either *kbot*=*n* or *h*(*kbot*+1,*kbot*)=0.

nshfts

INTEGER.

Number of simultaneous shifts, must be positive and even.

sr, *si*

REAL for slaqr5

DOUBLE PRECISION for dlaqr5

Arrays, DIMENSION (*nshfts*) each.

sr contains the real parts and *si* contains the imaginary parts of the *nshfts* shifts of origin that define the multi-shift QR sweep.

s

COMPLEX for claqr5

DOUBLE COMPLEX for zlaqr5.

Arrays, DIMENSION (*nshfts*).

s contains the shifts of origin that define the multi-shift QR sweep.

h

REAL for slaqr5

DOUBLE PRECISION for dlaqr5

COMPLEX for claqr5

DOUBLE COMPLEX for zlaqr5.

Array, DIMENSION (*ldh*, *n*), on input contains the Hessenberg matrix.

ldh — INTEGER. The leading dimension of the array *h* just as declared in the calling routine. *ldh* ≥ max(1, *n*).

iloz, *ihiz* — INTEGER. Specify the rows of *Z* to which transformations must be applied if *wantz* is .TRUE.. 1 ≤ *iloz* ≤ *ihiz* ≤ *n*.

z — REAL for slaqr5

DOUBLE PRECISION for dlaqr5

COMPLEX for claqr5

DOUBLE COMPLEX for zlaqr5.

Array, DIMENSION (*ldz*, *ihi*), contains the matrix *Z* if *wantz* is .TRUE.. If *wantz* is .FALSE., then *z* is not referenced.

ldz — INTEGER. The leading dimension of the array *z* just as declared in the calling routine. *ldz* ≥ *n*.

v — REAL for slaqr5

DOUBLE PRECISION for dlaqr5

COMPLEX for claqr5

DOUBLE COMPLEX for zlaqr5.

Workspace array with dimension (*ldv*, *nshfts*/2).

ldv — INTEGER. The leading dimension of the array *v* just as declared in the calling routine. *ldv* ≥ 3.

u — REAL for slaqr5

DOUBLE PRECISION for dlaqr5

COMPLEX for claqr5

DOUBLE COMPLEX for zlaqr5.

Workspace array with dimension (*ldu*, 3**nshfts*-3).

ldu — INTEGER. The leading dimension of the array *u* just as declared in the calling routine. *ldu* ≥ 3**nshfts*-3.

nh — INTEGER. The number of column in the array *wh* available for workspace. *nh* ≥ 1.

wh — REAL for slaqr5

DOUBLE PRECISION for dlaqr5

COMPLEX for claqr5

DOUBLE COMPLEX for zlaqr5.

Workspace array with dimension (*ldwh*, *nh*)

ldwh — INTEGER. The leading dimension of the array *wh* just as declared in the calling routine. *ldwh* ≥ 3**nshfts*-3

nv — INTEGER. The number of rows of the array *wv* available for workspace. *nv* ≥ 1.

wv
: REAL for slaqr5
: DOUBLE PRECISION for dlaqr5
: COMPLEX for claqr5
: DOUBLE COMPLEX for zlaqr5.
: Workspace array with dimension (*ldwv*, 3**nshfts*-3).

ldwv
: INTEGER. The leading dimension of the array *wv* just as declared in the calling routine. *ldwv* ≥ *nv*.

Output Parameters

sr, *si*
: On output, may be reordered.

h
: On output a multi-shift QR Sweep with shifts *sr*(j)+i**si*(j) or *s*(j) is applied to the isolated diagonal block in rows and columns *ktop* through *kbot* .

z
: If *wantz* is .TRUE., then the QR Sweep orthogonal/unitary similarity transformation is accumulated into *z(iloz:ihiz, ilo:ihi)* from the right.
: If *wantz* is .FALSE., then *z* is unreferenced.

?laqsb

Scales a symmetric band matrix, using scaling factors computed by ?pbequ.

Syntax

```
call slaqsb( uplo, n, kd, ab, ldab, s, scond, amax, equed )
call dlaqsb( uplo, n, kd, ab, ldab, s, scond, amax, equed )
call claqsb( uplo, n, kd, ab, ldab, s, scond, amax, equed )
call zlaqsb( uplo, n, kd, ab, ldab, s, scond, amax, equed )
```

Include Files

- mkl.fi

Description

The routine equilibrates a symmetric band matrix *A* using the scaling factors in the vector *s*.

Input Parameters

uplo
: CHARACTER*1.
: Specifies whether the upper or lower triangular part of the symmetric matrix *A* is stored.
: If *uplo* = 'U': upper triangular.
: If *uplo* = 'L': lower triangular.

n
: INTEGER. The order of the matrix *A*.

n ≥ 0.

kd — INTEGER. The number of super-diagonals of the matrix *A* if *uplo* = 'U', or the number of sub-diagonals if *uplo* = 'L'.

kd ≥ 0.

ab — REAL for slaqsb

DOUBLE PRECISION for dlaqsb

COMPLEX for claqsb

DOUBLE COMPLEX for zlaqsb

Array, DIMENSION (*ldab*,*n*). On entry, the upper or lower triangle of the symmetric band matrix *A*, stored in the first *kd*+1 rows of the array. The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows:

if *uplo* = 'U', *ab*(*kd*+1+*i*-*j*,*j*) = A(*i*,*j*) for max(1,*j*-*kd*) ≤ *i* ≤ *j*;

if *uplo* = 'L', *ab*(1+*i*-*j*,*j*) = A(*i*,*j*) for *j* ≤ *i* ≤ min(*n*,*j*+*kd*).

ldab — INTEGER. The leading dimension of the array *ab*.

ldab ≥ *kd*+1.

s — REAL for slaqsb/claqsb

DOUBLE PRECISION for dlaqsb/zlaqsb

Array, DIMENSION (*n*). The scale factors for A.

scond — REAL for slaqsb/claqsb

DOUBLE PRECISION for dlaqsb/zlaqsb

Ratio of the smallest *s*(*i*) to the largest *s*(*i*).

amax — REAL for slaqsb/claqsb

DOUBLE PRECISION for dlaqsb/zlaqsb

Absolute value of largest matrix entry.

Output Parameters

ab — On exit, if *info* = 0, the triangular factor *U* or *L* from the Cholesky factorization of the band matrix *A* that can be $A = U^T*U$ or $A = L*L^T$ for real flavors and $A = U^H*U$ or $A = L*L^H$ for complex flavors, in the same storage format as *A*.

equed — CHARACTER*1.

Specifies whether or not equilibration was done.

If *equed* = 'N': No equilibration.

If *equed* = 'Y': Equilibration was done, that is, *A* has been replaced by diag(*s*)*A*diag(*s*).

Application Notes

The routine uses internal parameters *thresh*, *large*, and *small*, which have the following meaning. *thresh* is a threshold value used to decide if scaling should be based on the ratio of the scaling factors. If *scond* < *thresh*, scaling is done. *large* and *small* are threshold values used to decide if scaling should be done based on the absolute size of the largest matrix element. If *amax* > *large* or *amax* < *small*, scaling is done.

?laqsp

Scales a symmetric/Hermitian matrix in packed storage, using scaling factors computed by ?ppequ.

Syntax

```
call slaqsp( uplo, n, ap, s, scond, amax, equed )
call dlaqsp( uplo, n, ap, s, scond, amax, equed )
call claqsp( uplo, n, ap, s, scond, amax, equed )
call zlaqsp( uplo, n, ap, s, scond, amax, equed )
```

Include Files

- mkl.fi

Description

The routine ?laqsp equilibrates a symmetric matrix *A* using the scaling factors in the vector *s*.

Input Parameters

uplo

CHARACTER*1.

Specifies whether the upper or lower triangular part of the symmetric matrix *A* is stored.

If *uplo* = 'U': upper triangular.

If *uplo* = 'L': lower triangular.

n

INTEGER. The order of the matrix *A*. $n \geq 0$.

ap

REAL for slaqsp

DOUBLE PRECISION for dlaqsp

COMPLEX for claqsp

DOUBLE COMPLEX for zlaqsp

Array, DIMENSION ($n(n+1)/2$).

On entry, the upper or lower triangle of the symmetric matrix *A*, packed columnwise in a linear array. The *j*-th column of *A* is stored in the array *ap* as follows:

if *uplo* = 'U', $ap(i + (j-1)j/2) = A(i,j)$ for $1 \leq i \leq j$;

if *uplo* = 'L', $ap(i + (j-1)(2n-j)/2) = A(i,j)$ for $j \leq i \leq n$.

s

REAL for slaqsp/claqsp

DOUBLE PRECISION for dlaqsp/zlaqsp

Array, DIMENSION (*n*). The scale factors for A.

scond

REAL for slaqsp/claqsp

DOUBLE PRECISION for dlaqsp/zlaqsp

Ratio of the smallest *s*(*i*) to the largest *s*(*i*).

amax

REAL for slaqsp/claqsp

DOUBLE PRECISION for dlaqsp/zlaqsp

Absolute value of largest matrix entry.

Output Parameters

ap

On exit, the equilibrated matrix: diag(*s*)*A*diag(*s*), in the same storage format as *A*.

equed

CHARACTER*1.

Specifies whether or not equilibration was done.

If *equed* = 'N': No equilibration.

If *equed* = 'Y': Equilibration was done, that is, *A* has been replaced by diag(*s*)*A*diag(*s*).

Application Notes

The routine uses internal parameters *thresh*, *large*, and *small*, which have the following meaning. *thresh* is a threshold value used to decide if scaling should be based on the ratio of the scaling factors. If *scond* < *thresh*, scaling is done. *large* and *small* are threshold values used to decide if scaling should be done based on the absolute size of the largest matrix element. If *amax* > *large* or *amax* < *small*, scaling is done.

?laqsy

Scales a symmetric/Hermitian matrix, using scaling factors computed by ?syequ*,* ?syequb*,* ?poequ *,* *or* ?poequb*.*

Syntax

```
call slaqsy( uplo, n, a, lda, s, scond, amax, equed )
call dlaqsy( uplo, n, a, lda, s, scond, amax, equed )
call claqsy( uplo, n, a, lda, s, scond, amax, equed )
call zlaqsy( uplo, n, a, lda, s, scond, amax, equed )
```

Include Files

- mkl.fi

Description

The routine equilibrates a symmetric matrix *A* using the scaling factors in the vector *s*.

Input Parameters

uplo

CHARACTER*1.

Specifies whether the upper or lower triangular part of the symmetric matrix *A* is stored.

If *uplo* = 'U': upper triangular.

If *uplo* = 'L': lower triangular.

n

INTEGER. The order of the matrix *A*.

n ≥ 0.

a

REAL for slaqsy

DOUBLE PRECISION for dlaqsy

COMPLEX for claqsy

DOUBLE COMPLEX for zlaqsy

Array, DIMENSION (*lda*,*n*). On entry, the symmetric matrix *A*.

If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *a* is not referenced.

If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *a* is not referenced.

lda

INTEGER. The leading dimension of the array *a*.

lda ≥ max(*n*,1).

s

REAL for slaqsy/claqsy

DOUBLE PRECISION for dlaqsy/zlaqsy

Array, DIMENSION (*n*). The scale factors for A.

scond

REAL for slaqsy/claqsy

DOUBLE PRECISION for dlaqsy/zlaqsy

Ratio of the smallest *s*(*i*) to the largest *s*(*i*).

amax

REAL for slaqsy/claqsy

DOUBLE PRECISION for dlaqsy/zlaqsy

Absolute value of largest matrix entry.

Output Parameters

a

On exit, if *equed* = 'Y', the equilibrated matrix: diag(*s*)*A*diag(*s*).

equed

CHARACTER*1.

Specifies whether or not equilibration was done.

If *equed* = 'N': No equilibration.

If *equed* = 'Y': Equilibration was done, i.e., *A* has been replaced by diag(*s*)*A*diag(*s*).

Application Notes

The routine uses internal parameters *thresh*, *large*, and *small*, which have the following meaning. *thresh* is a threshold value used to decide if scaling should be based on the ratio of the scaling factors. If *scond* < *thresh*, scaling is done. *large* and *small* are threshold values used to decide if scaling should be done based on the absolute size of the largest matrix element. If *amax* > *large* or *amax* < *small*, scaling is done.

?laqtr

Solves a real quasi-triangular system of equations, or a complex quasi-triangular system of special form, in real arithmetic.

Syntax

```
call slaqtr( ltran, lreal, n, t, ldt, b, w, scale, x, work, info )
call dlaqtr( ltran, lreal, n, t, ldt, b, w, scale, x, work, info )
```

Include Files

- mkl.fi

Description

The routine ?laqtr solves the real quasi-triangular system

op(*T*) * *p* = *scale***c*, if *lreal* = .TRUE.

or the complex quasi-triangular systems

op(*T* + *iB*)*(*p*+*iq*) = *scale**(*c*+*id*), if *lreal* = .FALSE.

in real arithmetic, where *T* is upper quasi-triangular.

If *lreal* = .FALSE., then the first diagonal block of *T* must be 1-by-1, *B* is the specially structured matrix

$$B = \begin{bmatrix} b_1 & b_2 & \dots & \dots & b_n \\ & W & & & \\ & & W & & \\ & & & \dots & \\ & & & & W \end{bmatrix}$$

`op(A) = A` or A^T, A^T denotes the transpose of matrix A.

On input,

$$x = \begin{bmatrix} c \\ d \end{bmatrix}, \text{ on output } x = \begin{bmatrix} p \\ q \end{bmatrix}$$

This routine is designed for the condition number estimation in routine `?trsna`.

Input Parameters

ltran — `LOGICAL`.

On entry, *ltran* specifies the option of conjugate transpose:

= `.FALSE.`, `op(T + iB) = T + iB`,

= `.TRUE.`, `op(T + iB) = (T + iB)`^{T}.

lreal — `LOGICAL`.

On entry, *lreal* specifies the input matrix structure:

= `.FALSE.`, the input is complex

= `.TRUE.`, the input is real.

n — `INTEGER`.

On entry, *n* specifies the order of `T + iB`. *n*≥ `0`.

t — `REAL` for `slaqtr`

DOUBLE PRECISION for dlaqtr

Array, dimension (*ldt*,*n*). On entry, *t* contains a matrix in Schur canonical form. If *lreal* = .FALSE., then the first diagonal block of *t* must be 1-by-1.

ldt INTEGER. The leading dimension of the matrix *T*.

ldt≥ max(1,*n*).

b REAL for slaqtr

DOUBLE PRECISION for dlaqtr

Array, dimension (*n*). On entry, *b* contains the elements to form the matrix *B* as described above. If *lreal* = .TRUE., *b* is not referenced.

w REAL for slaqtr

DOUBLE PRECISION for dlaqtr

On entry, *w* is the diagonal element of the matrix *B*.

If *lreal* = .TRUE., *w* is not referenced.

x REAL for slaqtr

DOUBLE PRECISION for dlaqtr

Array, dimension (2*n*). On entry, *x* contains the right hand side of the system.

work REAL for slaqtr

DOUBLE PRECISION for dlaqtr

Workspace array, dimension (*n*).

Output Parameters

scale REAL for slaqtr

DOUBLE PRECISION for dlaqtr

On exit, *scale* is the scale factor.

x On exit, *X* is overwritten by the solution.

info INTEGER.

If *info* = 0: successful exit.

If *info* = 1: the some diagonal 1-by-1 block has been perturbed by a small number smin to keep nonsingularity.

If *info* = 2: the some diagonal 2-by-2 block has been perturbed by a small number in ?laln2 to keep nonsingularity.

NOTE
For higher speed, this routine does not check the inputs for errors.

?laqz0

Implements the multishift QZ method with aggressive early deflation for finding the generalized eigenvalues of the matrix pair (A,B).

Syntax

FORTRAN 77:

```
call slaqz0(wants, wantq, wantz, n, ilo, ihi, a, lda, b, ldb, alphar, alphai, beta, q, ldq, z, ldz, work, lwork, rec, info)
call dlaqz0(wants, wantq, wantz, n, ilo, ihi, a, lda, b, ldb, alphar, alphai, beta, q, ldq, z, ldz, work, lwork, rec, info)
call claqz0(wants, wantq, wantz, n, ilo, ihi, a, lda, b, ldb, alpha, beta, q, ldq, z, ldz, work, lwork, rwork, rec, info)
call zlaqz0(wants, wantq, wantz, n, ilo, ihi, a, lda, b, ldb, alpha, beta, q, ldq, z, ldz, work, lwork, rwork, rec, info)
```

Include Files

The FORTRAN 77 interfaces are specified in the `mkl_lapack.fi` and `mkl_lapack.h` include files.

Description

The routine computes the eigenvalues of a real/complex matrix pair (A,B), where A is an upper Hessenberg matrix and B is upper triangular, using the double-shift version (for real flavors) or single-shift version (for complex flavors) of the multishift QZ method with aggressive early deflation.

For real flavors:

If `wants` = 'S', then the Hessenberg-triangular pair (A,B) is also reduced to generalized Schur form:

```
A = Q*S*Z^T, B = Q *P*Z^T
```

where Q and Z are orthogonal matrices, P is an upper triangular matrix, and S is a quasi-triangular matrix with 1-by-1 and 2-by-2 diagonal blocks. The 1-by-1 blocks correspond to real eigenvalues of the matrix pair (A,B) and the 2-by-2 blocks correspond to complex conjugate pairs of eigenvalues.

Additionally, the 2-by-2 upper triangular diagonal blocks of P corresponding to 2-by-2 blocks of S are reduced to positive diagonal form; that is, if `S(j+1,j)` is non-zero, then `P(j+1,j) = P(j,j+1) = 0`, `P(j,j) > 0`, and `P(j+1,j+1) > 0`.

For complex flavors:

If `wants` = 'S', then the Hessenberg-triangular pair (A,B) is also reduced to generalized Schur form:

```
A = Q* S*Z^H, B = Q*P*Z^H
```

where Q and Z are unitary matrices, P is an upper triangular matrix, and S is a quasi-triangular matrix with 1-by-1 and 2-by-2 diagonal blocks.

For all function flavors:

Optionally, the orthogonal/unitary matrix Q from the generalized Schur factorization may be postmultiplied into an input matrix Q1, and the orthogonal/unitary matrix Z may be postmultiplied into an input matrix Z1.

If Q1 and Z1 are the orthogonal/unitary matrices from `?gghrd` that reduced the matrix pair (A1,B1) to generalized upper Hessenberg form (A,B), then the output matrices Q1*Q and Z1*Z are the orthogonal/unitary factors from the generalized Schur factorization of (A,B):

A1 = (Q1*Q)**S** ***(Z1*Z)^H, B1 = (Q1*Q)*P**(Z1*Z)^H

To avoid overflow, eigenvalues of the matrix pair (A,B) are computed as a pair of values (alpha,beta). For `claqz0/zlaqz0`, alpha and beta are complex, and for `slaqz0/dlaqz0`, alpha is complex and beta real.

If beta is nonzero, λ = alpha/beta is an eigenvalue of the generalized nonsymmetric eigenvalue problem (GNEP):

```
A*x = λ*B*x
```

and if alpha is nonzero, μ = beta/alpha is an eigenvalue of the alternate form of the GNEP:

```
μ*A*y = B*y
```

Real eigenvalues (for real flavors) or the values of alpha and beta for the i-th eigenvalue (for complex flavors) can be read directly from the generalized Schur form:

```
alpha = S(i,i), beta = P(i,i)
```

Input Parameters

The data types are given for the Fortran interface. A *datatype* placeholder, if present, is used for the C interface data types.

Refer to the *C Interface Conventions* topic in the C-based reference for the C interface principal conventions and type definitions.

wants

`CHARACTER*1`. Specifies the operations to be performed. Must be 'E' or 'S'.

If wants = 'E', then compute eigenvalues only.

If wants = 'S', then compute eigenvalues and the Schur form.

wantq

`CHARACTER*1`. Must be 'N', 'I', or 'V'.

If wantq = 'N', left Schur vectors `(q)` are not computed.

If wantq = 'I', `q` is initialized to the unit matrix and the matrix of left Schur vectors of `(A, B)` is returned.

If wantq = 'V', q must contain an orthogonal/unitary matrix Q1 on entry and the product `Q1*Q` is returned.

wantz

`CHARACTER*1`. Must be 'N', 'I', or 'V'.

If wantz = 'N', right Schur vectors `(z)` are not computed.

If wantz = 'I', `z` is initialized to the unit matrix and the matrix of right Schur vectors of `(A,B)` is returned.

If wantz = 'V', `z` must contain an orthogonal/unitary matrix `Z1` on entry and the product `Z1*Z` is returned.

n

`INTEGER`. The order of the matrices A, B, Q, and Z (`n ≥ 0`).

ilo, ihi

`INTEGER`. `ilo` and `ihi` mark the rows and columns of A which are in Hessenberg form. It is assumed that A is already upper triangular in rows and columns `1:ilo-1` and `ihi+1:n`.

Constraint:

If `n > 0`, then `1 ≤ ilo ≤ ihi ≤ n`.

If `n = 0`, then `ilo = 1` and `ihi = 0`.

a, b, q, z, work

`REAL` for `slaqz0`..

`DOUBLE PRECISION` for `dlaqz0`.

`COMPLEX` for `claqz0`.

`DOUBLE COMPLEX` for `zlaqz0`.

Arrays:

On entry, `a(lda,*)` contains the n-by-n upper Hessenberg matrix A. The second dimension of `a` must be at least `max(1, n)`.

On entry, `b(ldb,*)` contains the n-by-n upper triangular matrix B. The second dimension of `b` must be at least `max(1, n)`.

q (ldq,*):

On entry, if `wantq` = 'V', this array contains the orthogonal/unitary matrix Q1 used in the reduction of (A1,B1) to generalized Hessenberg form.

If `wantq` = 'N', then `q` is not referenced. The second dimension of `q` must be at least `max(1, n)`.

z (ldz,*):

On entry, if `wantz` = 'V', this array contains the orthogonal/unitary matrix Z1 used in the reduction of (A1,B1) to generalized Hessenberg form (A, B).

If `wantz` = 'N', then `z` is not referenced.

The second dimension of `z` must be at least `max(1, n)`.

`work` is a workspace array; its dimension is `max(1, lwork)`.

lda — `INTEGER`. The first dimension of `a`; at least `max(1, n)`.

ldb — `INTEGER`. The first dimension of `b`; at least `max(1, n)`.

ldq — `INTEGER`. The first dimension of `q`.

If `wantq` = 'N', then `ldq ≥ 1`.

If `wantq` = 'I' or 'V', then `ldq ≥ max(1, n)`.

ldz — `INTEGER`. The first dimension of `z`.

If `wantq` = 'N', then `ldz ≥ 1`.

If `wantq` = 'I'or 'V', then `ldz ≥ max(1, n)`.

rec — `INTEGER`. Indicates the current recursion level. Should be set to 0 on first call.

lwork — `INTEGER`. The dimension of the array `work`. `lwork ≥ max(1, n)`.

If `lwork = -1`, then a workspace query is assumed; the routine calculates only the optimal size of the `work` array, returns this value as the first entry of the `work` array, and no error message related to `lwork` is issued by xerbla.

For details, see Application Notes.

rwork — `REAL` for `claqz0`.

`DOUBLE PRECISION` for `zlaqz0`.

Workspace array with DIMENSION at least `max(1, n)`. Used in complex flavors only.

Output Parameters

a

For real flavors:

If `wants` = 'S', then on exit `a` contains the upper quasi-triangular matrix S from the generalized Schur factorization; 2-by-2 diagonal blocks (corresponding to complex conjugate pairs of eigenvalues) are returned in standard form, with `a(i,i) = a(i+1, i+1)` and `a(i+1, i) * a(i, i+1) < 0`.

If `wants` = 'E', then on exit the diagonal blocks of a match those of S, but the rest of a is unspecified.

For complex flavors:

If `wants` = 'S', then on exit `a` contains the upper triangular matrix S from the generalized Schur factorization.

If `wants` = 'E', then on exit the diagonal of a matches that of S, but the rest of `a` is unspecified.

b

If `wants` = 'S', then on exit `b` contains the upper triangular matrix P from the generalized Schur factorization.

For real flavors:

2-by-2 diagonal blocks of P corresponding to 2-by-2 blocks of S are reduced to positive diagonal form; that is, if `b(j+1,j)` is non-zero, then `b(j+1,j)=b(j,j+1)=0` and `b(j,j)` and `b(j+1,j+1)` will be positive.

If `wants` = 'E', then on exit the diagonal blocks of `b` match those of P, but the rest of `b` is unspecified.

For complex flavors:

if wants = 'E', then on exit the diagonal of `b` matches that of P, but the rest of `b` is unspecified.

alphar, alphai

`REAL` for slaqz0;

`DOUBLE PRECISION` for dlaqz0.

Arrays, DIMENSION at least `max(1, n)`. The real and imaginary parts, respectively, of each scalar `alpha` define an eigenvalue of GNEP.

If `alphai(j)` is zero, then the `j`-th eigenvalue is real; if positive, then the `j`-th and `(j+1)`-th eigenvalues are a complex conjugate pair, with `alphai(j+1) = -alphai(j)`.

alpha

`COMPLEX` for `claqz0`.

`DOUBLE COMPLEX` for `zlaqz0`.

Array, DIMENSION at least `max(1, n)`.

The complex scalars `alpha` defines the eigenvalues of GNEP. `alphai(i) = S(i,i)` in the generalized Schur factorization.

beta

`REAL` for slaqz0.

`DOUBLE PRECISION` for dlaqz0

`COMPLEX` for claqz0

`DOUBLE COMPLEX` for zlaqz0.

Array, DIMENSION at least `max(1, n)`.

For real flavors:

The scalars `beta` defines the eigenvalues of GNEP.

Together, the quantities `alpha = (alphar(j), alphai(j))` and `beta = beta(j)` represents the `j`-th eigenvalue of the matrix pair (A,B), in one of the forms `lambda = alpha/beta` or `mu = beta/alpha`. In general, because either lambda or mu may overflow, they should not be computed.

For complex flavors:

The real non-negative scalars `beta` defines the eigenvalues of GNEP. Together, the quantities `alpha = alpha(j)` and `beta = beta(j)` represent the `j`-th eigenvalue of the matrix pair (A,B), in one of the forms `lambda = alpha/beta` or `mu = beta/alpha`. In general, because either lambda or mu may overflow, they should not be computed.

q

On exit, if `wantq` = 'I', `q` is overwritten by the orthogonal/unitary matrix of left Schur vectors of the pair (A,B), and if `wantq` = 'V', `q` is overwritten by the orthogonal/unitary matrix of left Schur vectors of (A1, B1).

z

On exit, if `wantz` = 'I', `z` is overwritten by the orthogonal/unitary matrix of right Schur vectors of the pair (A, B), and if `wantz` = 'V', `z` is overwritten by the orthogonal/unitary matrix of right Schur vectors of (A1, B1).

`work(1)`

If `info` ≥ `0`, on exit `work(1)` contains the minimum value of `lwork` required for optimum performance. Use this `lwork` for subsequent runs.

info

`INTEGER`.

If `info = 0`, the execution is successful.

If `info = -i`, the `i`-th parameter had an illegal value.

If `info = 1,..., n`, the QZ iteration did not converge.

(A,B) is not in Schur form, but `alphar(i)`, `alphai(i)` (for real flavors), `alpha(i)` (for complex flavors), and `beta(i), i=info+1,..., n` should be correct.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of `lwork` for the first run or set `lwork = -1`.

If you choose the first option and set any of the admissible `lwork` sizes no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array `work` on exit. Use this value of `work(1)` for subsequent runs.

If you set `lwork = -1`, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array `work`. This operation is called a workspace query.

Note that if you set `lwork` to less than the minimal required value and not `-1`, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?lar1v

Computes the (scaled) r-th column of the inverse of the submatrix in rows b1 through bn of tridiagonal matrix.

Syntax

```
call slar1v( n, b1, bn, lambda, d, l, ld, lld, pivmin, gaptol, z, wantnc, negcnt, ztz, mingma, r, isuppz, nrminv, resid, rqcorr, work )
call dlar1v( n, b1, bn, lambda, d, l, ld, lld, pivmin, gaptol, z, wantnc, negcnt, ztz, mingma, r, isuppz, nrminv, resid, rqcorr, work )
call clar1v( n, b1, bn, lambda, d, l, ld, lld, pivmin, gaptol, z, wantnc, negcnt, ztz, mingma, r, isuppz, nrminv, resid, rqcorr, work )
call zlar1v( n, b1, bn, lambda, d, l, ld, lld, pivmin, gaptol, z, wantnc, negcnt, ztz, mingma, r, isuppz, nrminv, resid, rqcorr, work )
```

Include Files

- `mkl.fi`

Description

The routine `?lar1v` computes the (scaled) *r*-th column of the inverse of the submatrix in rows *b1* through *bn* of the tridiagonal matrix $L*D*L^T - \lambda*I$. When λ is close to an eigenvalue, the computed vector is an accurate eigenvector. Usually, *r* corresponds to the index where the eigenvector is largest in magnitude.

The following steps accomplish this computation :

- Stationary *qd* transform, $L*D*L^T - \lambda*I = L(+)*D(+)*L(+)^T$
- Progressive *qd* transform, $L*D*L^T - \lambda*I = U(-)*D(-)*U(-)^T$,
- Computation of the diagonal elements of the inverse of $L*D*L^T - \lambda*I$ by combining the above transforms, and choosing *r* as the index where the diagonal of the inverse is (one of the) largest in magnitude.
- Computation of the (scaled) *r*-th column of the inverse using the twisted factorization obtained by combining the top part of the stationary and the bottom part of the progressive transform.

Input Parameters

n
: `INTEGER`. The order of the matrix $L*D*L^T$.

b1
: `INTEGER`. First index of the submatrix of $L*D*L^T$.

bn
: `INTEGER`. Last index of the submatrix of $L*D*L^T$.

lambda
: `REAL` for `slar1v`/`clar1v`

`DOUBLE PRECISION` for `dlar1v`/`zlar1v`

The shift. To compute an accurate eigenvector, *lambda* should be a good approximation to an eigenvalue of $L*D*L^T$.

l
: `REAL` for `slar1v`/`clar1v`

DOUBLE PRECISION for dlar1v/zlar1v

Array, DIMENSION (*n*-1).

The (*n*-1) subdiagonal elements of the unit bidiagonal matrix *L*, in elements 1 to *n*-1.

d

REAL for slar1v/clar1v

DOUBLE PRECISION for dlar1v/zlar1v

Array, DIMENSION (*n*).

The *n* diagonal elements of the diagonal matrix *D*.

ld

REAL for slar1v/clar1v

DOUBLE PRECISION for dlar1v/zlar1v

Array, DIMENSION (*n*-1).

The *n*-1 elements L_i*D_i.

lld

REAL for slar1v/clar1v

DOUBLE PRECISION for dlar1v/zlar1v

Array, DIMENSION (*n*-1).

The *n*-1 elements $L_i*L_i*D_i$.

pivmin

REAL for slar1v/clar1v

DOUBLE PRECISION for dlar1v/zlar1v

The minimum pivot in the Sturm sequence.

gaptol

REAL for slar1v/clar1v

DOUBLE PRECISION for dlar1v/zlar1v

Tolerance that indicates when eigenvector entries are negligible with respect to their contribution to the residual.

z

REAL for slar1v

DOUBLE PRECISION for dlar1v

COMPLEX for clar1v

DOUBLE COMPLEX for zlar1v

Array, DIMENSION (*n*). All entries of *z* must be set to 0.

wantnc

LOGICAL.

Specifies whether *negcnt* has to be computed.

r

INTEGER.

The twist index for the twisted factorization used to compute *z*. On input, $0 \le r \le n$. If *r* is input as 0, *r* is set to the index where $(L*D*L^T - lambda*I)^{-1}$ is largest in magnitude. If $1 \le r \le n$, *r* is unchanged.

work

REAL for slar1v/clar1v

DOUBLE PRECISION for dlar1v/zlar1v

Workspace array, DIMENSION (4*n).

Output Parameters

z

REAL for slar1v

DOUBLE PRECISION for dlar1v

COMPLEX for clar1v

DOUBLE COMPLEX for zlar1v

Array, DIMENSION (*n*). The (scaled) *r*-th column of the inverse. *z*(*r*) is returned to be 1.

negcnt

INTEGER. If *wantnc* is .TRUE. then *negcnt* = the number of pivots < *pivmin* in the matrix factorization $L*D*L^T$, and *negcnt* = -1 otherwise.

ztz

REAL for slar1v/clar1v

DOUBLE PRECISION for dlar1v/zlar1v

The square of the 2-norm of *z*.

mingma

REAL for slar1v/clar1v

DOUBLE PRECISION for dlar1v/zlar1v

The reciprocal of the largest (in magnitude) diagonal element of the inverse of $L*D*L^T$ - *lambda*I*.

r

On output, *r* is the twist index used to compute *z*. Ideally, *r* designates the position of the maximum entry in the eigenvector.

isuppz

INTEGER. Array, DIMENSION (2). The support of the vector in *Z*, that is, the vector *z* is nonzero only in elements *isuppz*(1) through *isuppz*(2).

nrminv

REAL for slar1v/clar1v

DOUBLE PRECISION for dlar1v/zlar1v

Equals 1/sqrt(*ztz*).

resid

REAL for slar1v/clar1v

DOUBLE PRECISION for dlar1v/zlar1v

The residual of the FP vector.

resid = ABS(*mingma*)/sqrt(*ztz*).

rqcorr

REAL for slar1v/clar1v

DOUBLE PRECISION for dlar1v/zlar1v

The Rayleigh Quotient correction to *lambda*.

rqcorr = *mingma*/*ztz*.

?lar2v

Applies a vector of plane rotations with real cosines and real/complex sines from both sides to a sequence of 2-by-2 symmetric/Hermitian matrices.

Syntax

```
call slar2v( n, x, y, z, incx, c, s, incc )
call dlar2v( n, x, y, z, incx, c, s, incc )
call clar2v( n, x, y, z, incx, c, s, incc )
call zlar2v( n, x, y, z, incx, c, s, incc )
```

Include Files

- mkl.fi

Description

The routine ?lar2v applies a vector of real/complex plane rotations with real cosines from both sides to a sequence of 2-by-2 real symmetric or complex Hermitian matrices, defined by the elements of the vectors x, y and z. For i = 1,2,...,*n*

$$\begin{bmatrix} x_i & z_i \\ \mathrm{conjg}(z_i) & y_i \end{bmatrix} := \begin{bmatrix} c(i) & \mathrm{conjg}(s(i)) \\ -s(i) & c(i) \end{bmatrix} \begin{bmatrix} x_i & z_i \\ \mathrm{conjg}(z_i) & y_i \end{bmatrix} \begin{bmatrix} c(i) & -\mathrm{conjg}(s(i)) \\ s(i) & c(i) \end{bmatrix}$$

Input Parameters

n	INTEGER. The number of plane rotations to be applied.
x, *y*, *z*	REAL for slar2v DOUBLE PRECISION for dlar2v COMPLEX for clar2v DOUBLE COMPLEX for zlar2v Arrays, DIMENSION (1+(*n*-1)**incx*) each. Contain the vectors x, y and z, respectively. For all flavors of ?lar2v, elements of *x* and *y* are assumed to be real.
incx	INTEGER. The increment between elements of *x*, *y*, and *z*. *incx* > 0.
c	REAL for slar2v/clar2v DOUBLE PRECISION for dlar2v/zlar2v Array, DIMENSION (1+(*n*-1)**incc*). The cosines of the plane rotations.
s	REAL for slar2v DOUBLE PRECISION for dlar2v COMPLEX for clar2v DOUBLE COMPLEX for zlar2v Array, DIMENSION (1+(*n*-1)**incc*). The sines of the plane rotations.
incc	INTEGER. The increment between elements of *c* and *s*. *incc* > 0.

Output Parameters

x, *y*, *z*	Vectors *x*, *y* and *z*, containing the results of transform.

?laran

Returns a random real number from a uniform distribution.

Syntax

```
res = slaran (iseed)
res = dlaran (iseed)
```

Description

The `?laran` routine returns a random real number from a uniform (0,1) distribution. This routine uses a multiplicative congruential method with modulus 2^{48} and multiplier 33952834046453. 48-bit integers are stored in four integer array elements with 12 bits per element. Hence the routine is portable across machines with integers of 32 bits or more.

Input Parameters

iseed	INTEGER. Array, size 4. On entry, the seed of the random number generator. The array elements must be between 0 and 4095, and `iseed(4)` must be odd.

Output Parameters

iseed	INTEGER. On exit, the seed is updated.
res	`REAL` for slaran, `DOUBLE PRECISION` for dlaran, Random number.

?larf

Applies an elementary reflector to a general rectangular matrix.

Syntax

```
call slarf( side, m, n, v, incv, tau, c, ldc, work )
call dlarf( side, m, n, v, incv, tau, c, ldc, work )
call clarf( side, m, n, v, incv, tau, c, ldc, work )
call zlarf( side, m, n, v, incv, tau, c, ldc, work )
```

Include Files

- `mkl.fi`

Description

The routine applies a real/complex elementary reflector *H* to a real/complex *m*-by-*n* matrix *C*, from either the left or the right. *H* is represented in one of the following forms:

- `H = I - tau*v*v^T`

  where *tau* is a real scalar and v is a real vector.

  If `tau = 0`, then *H* is taken to be the unit matrix.
- `H = I - tau*v*v^H`

  where *tau* is a complex scalar and v is a complex vector.

  If `tau = 0`, then *H* is taken to be the unit matrix. For `clarf`/`zlarf`, to apply H^H (the conjugate transpose of *H*), supply conjg(*tau*) instead of *tau*.

Input Parameters

side	`CHARACTER*1`. If `side = 'L'`: form *H***C* If `side = 'R'`: form *C***H*.
m	`INTEGER`. The number of rows of the matrix *C*.
n	`INTEGER`. The number of columns of the matrix *C*.

v	`REAL` for `slarf`
	`DOUBLE PRECISION` for `dlarf`
	`COMPLEX` for `clarf`
	`DOUBLE COMPLEX` for `zlarf`
	Array, `DIMENSION`
	`(1 + (m-1)*abs(incv))` if `side = 'L'` or
	`(1 + (n-1)*abs(incv))` if `side = 'R'`. The vector *v* in the representation of *H*. *v* is not used if *tau* = 0.

incv	`INTEGER`. The increment between elements of *v*. `incv≠ 0`.

tau	`REAL` for `slarf`
	`DOUBLE PRECISION` for `dlarf`
	`COMPLEX` for `clarf`
	`DOUBLE COMPLEX` for `zlarf`
	The value *tau* in the representation of *H*.

c	`REAL` for `slarf`
	`DOUBLE PRECISION` for `dlarf`
	`COMPLEX` for `clarf`
	`DOUBLE COMPLEX` for `zlarf`
	Array, `DIMENSION` (*ldc*,*n*).
	On entry, the *m*-by-*n* matrix *C*.

ldc INTEGER. The leading dimension of the array *c*.

ldc≥ max(1,*m*).

work REAL for slarf

DOUBLE PRECISION for dlarf

COMPLEX for clarf

DOUBLE COMPLEX for zlarf

Workspace array, DIMENSION

(*n*) if *side* = 'L' or

(*m*) if *side* = 'R'.

Output Parameters

c On exit, *C* is overwritten by the matrix *H***C* if *side* = 'L', or *C***H* if *side* = 'R'.

?larfb

Applies a block reflector or its transpose/conjugate-transpose to a general rectangular matrix.

Syntax

```
call slarfb( side, trans, direct, storev, m, n, k, v, ldv, t, ldt, c, ldc, work, ldwork )
call dlarfb( side, trans, direct, storev, m, n, k, v, ldv, t, ldt, c, ldc, work, ldwork )
call clarfb( side, trans, direct, storev, m, n, k, v, ldv, t, ldt, c, ldc, work, ldwork )
call zlarfb( side, trans, direct, storev, m, n, k, v, ldv, t, ldt, c, ldc, work, ldwork )
```

Include Files

- mkl.fi

Description

The real flavors of the routine ?larfb apply a real block reflector *H* or its transpose H^T to a real *m*-by-*n* matrix *C* from either left or right.

The complex flavors of the routine ?larfb apply a complex block reflector *H* or its conjugate transpose H^H to a complex *m*-by-*n* matrix *C* from either left or right.

Input Parameters

The data types are given for the Fortran interface.

side CHARACTER*1.

If *side* = 'L': apply *H* or H^T for real flavors and *H* or H^H for complex flavors from the left.

If *side* = 'R': apply *H* or H^T for real flavors and *H* or H^H for complex flavors from the right.

trans CHARACTER*1.

If *trans* = 'N': apply *H* (No transpose).

If *trans* = 'C': apply H^H (Conjugate transpose).

If *trans* = 'T': apply H^T (Transpose).

direct CHARACTER*1.

Indicates how *H* is formed from a product of elementary reflectors

If *direct* = 'F': *H* = *H*(1)*H(2)*. . . *H*(*k*) (forward)

If *direct* = 'B': *H* = *H*(*k*)* . . . *H*(2)*H(1) (backward)

storev CHARACTER*1.

Indicates how the vectors which define the elementary reflectors are stored:

If *storev* = 'C': Column-wise

If *storev* = 'R': Row-wise

m INTEGER. The number of rows of the matrix *C*.

n INTEGER. The number of columns of the matrix *C*.

k INTEGER. The order of the matrix *T* (equal to the number of elementary reflectors whose product defines the block reflector).

v REAL for slarfb

DOUBLE PRECISION for dlarfb

COMPLEX for clarfb

DOUBLE COMPLEX for zlarfb

Array, DIMENSION

(*ldv*, *k*) if *storev* = 'C'

(*ldv*, *m*) if *storev* = 'R' and *side* = 'L'

(*ldv*, *n*) if *storev* = 'R' and *side* = 'R'

The matrix *v*. See *Application Notes* below.

ldv INTEGER. The leading dimension of the array v.

If *storev* = 'C' and *side* = 'L', *ldv*≥ max(1,*m*);

if *storev* = 'C' and *side* = 'R', *ldv*≥ max(1,*n*);

if *storev* = 'R', *ldv*≥*k*.

t REAL for slarfb

DOUBLE PRECISION for dlarfb

COMPLEX for clarfb

DOUBLE COMPLEX for zlarfb

Array, size (*ldt*,*k*).

Contains the triangular *k*-by-*k* matrix *T* in the representation of the block reflector.

ldt INTEGER. The leading dimension of the array *t*.

ldt≥*k*.

c REAL for slarfb

DOUBLE PRECISION for dlarfb

COMPLEX for clarfb

DOUBLE COMPLEX for zlarfb

Array, size (*ldc*,*n*).

On entry, the *m*-by-*n* matrix *C*.

ldc INTEGER. The leading dimension of the array *c*.

ldc≥ max(1,*m*).

work REAL for slarfb

DOUBLE PRECISION for dlarfb

COMPLEX for clarfb

DOUBLE COMPLEX for zlarfb

Workspace array, DIMENSION (*ldwork*, *k*).

ldwork INTEGER. The leading dimension of the array *work*.

If *side* = 'L', *ldwork*≥ max(1, *n*);

if *side* = 'R', *ldwork*≥ max(1, *m*).

Output Parameters

c On exit, *c* is overwritten by the product of the following:

- *H***C,* or H^T**C,* or *C***H,* or *C**H^T for real flavors
- *H***C,* or H^H**C,* or *C***H,* or *C**H^H for complex flavors

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = –*i*, the *i*-th parameter had an illegal value.

If *info* = –1011, memory allocation error occurred.

Application Notes

The shape of the matrix *V* and the storage of the vectors which define the *H*(*i*) is best illustrated by the following example with *n* = 5 and *k* = 3. The elements equal to 1 are not stored; the corresponding array elements are modified but restored on exit. The rest of the array is not used.

$direct = 'F'$ and $storev = 'C'$:

$$\begin{bmatrix} 1 & & \\ v_1 & 1 & \\ v_1 & v_2 & 1 \\ v_1 & v_2 & v_3 \\ v_1 & v_2 & v_3 \end{bmatrix}$$

$direct = 'F'$ and $storev = 'R'$:

$$\begin{bmatrix} 1 & v_1 & v_1 & v_1 & v_1 \\ & 1 & v_2 & v_2 & v_2 \\ & & 1 & v_3 & v_3 \end{bmatrix}$$

$direct = 'B'$ and $storev = 'C'$:

$$\begin{bmatrix} v_1 & v_2 & v_3 \\ v_1 & v_2 & v_3 \\ 1 & v_2 & v_3 \\ & 1 & v_3 \\ & & 1 \end{bmatrix}$$

$direct = 'B'$ and $storev = 'R'$:

$$\begin{bmatrix} v_1 & v_1 & 1 & & \\ v_2 & v_2 & v_2 & 1 & \\ v_3 & v_3 & v_3 & v_3 & 1 \end{bmatrix}$$

?larfg

Generates an elementary reflector (Householder matrix).

Syntax

```
call slarfg( n, alpha, x, incx, tau )
call dlarfg( n, alpha, x, incx, tau )
call clarfg( n, alpha, x, incx, tau )
call zlarfg( n, alpha, x, incx, tau )
```

Include Files

- mkl.fi

Description

The routine ?larfg generates a real/complex elementary reflector *H* of order *n*, such that

$$H * \begin{bmatrix} alpha \\ x \end{bmatrix} = \begin{bmatrix} beta \\ 0 \end{bmatrix}, \quad H^T * H = I,$$

for real flavors and

$$H^H * \begin{bmatrix} alpha \\ x \end{bmatrix} = \begin{bmatrix} beta \\ 0 \end{bmatrix}, \quad H^H * H = I,$$

for complex flavors,

where *alpha* and *beta* are scalars (with *beta* real for all flavors), and *x* is an (*n*-1)-element real/complex vector. *H* is represented in the form

$$H = I - tau * \begin{bmatrix} 1 \\ v \end{bmatrix} * \begin{bmatrix} 1 & v^T \end{bmatrix}$$

for real flavors and

$$H = I - tau * \begin{bmatrix} 1 \\ v \end{bmatrix} * \begin{bmatrix} 1 & v^H \end{bmatrix}$$

for complex flavors,

where *tau* is a real/complex scalar and v is a real/complex (*n*-1)-element vector, respectively. Note that for `clarfg`/`zlarfg`, *H* is not Hermitian.

If the elements of *x* are all zero (and, for complex flavors, *alpha* is real), then `tau = 0` and *H* is taken to be the unit matrix.

Otherwise, `1 ≤ tau ≤ 2` (for real flavors), or

`1 ≤ Re(tau) ≤ 2` and `abs(tau-1) ≤ 1` (for complex flavors).

Input Parameters

The data types are given for the Fortran interface.

n
: `INTEGER`. The order of the elementary reflector.

alpha
: `REAL` for `slarfg`
`DOUBLE PRECISION` for `dlarfg`
`COMPLEX` for `clarfg`
`DOUBLE COMPLEX` for `zlarfg` On entry, the value alpha.

x
: `REAL` for `slarfg`
`DOUBLE PRECISION` for `dlarfg`
`COMPLEX` for `clarfg`
`DOUBLE COMPLEX` for `zlarfg`
Array, size (1+(*n*-2)*abs(*incx*)).
On entry, the vector *x*.

incx
: `INTEGER`.
The increment between elements of *x*. `incx > 0`.

Output Parameters

alpha
: On exit, it is overwritten with the value *beta*.

x
: On exit, it is overwritten with the vector *v*.

tau
: `REAL` for `slarfg`
`DOUBLE PRECISION` for `dlarfg`
`COMPLEX` for `clarfg`
`DOUBLE COMPLEX` for `zlarfg` The value *tau*.

?larfgp

Generates an elementary reflector (Householder matrix) with non-negative beta .

Syntax

```
call slarfgp( n, alpha, x, incx, tau )
call dlarfgp( n, alpha, x, incx, tau )
call clarfgp( n, alpha, x, incx, tau )
call zlarfgp( n, alpha, x, incx, tau )
```

Include Files

- mkl.fi

Description

The routine ?larfgp generates a real/complex elementary reflector *H* of order *n*, such that

$$H * \begin{bmatrix} alpha \\ x \end{bmatrix} = \begin{bmatrix} beta \\ 0 \end{bmatrix}, \quad H^T * H = I,$$

for real flavors and

$$H^H * \begin{bmatrix} alpha \\ x \end{bmatrix} = \begin{bmatrix} beta \\ 0 \end{bmatrix}, \quad H^H * H = I,$$

for complex flavors,

where *alpha* and *beta* are scalars (with *beta* real and non-negative for all flavors), and *x* is an (*n*-1)-element real/complex vector. *H* is represented in the form

$$H = I - tau * \begin{bmatrix} 1 \\ v \end{bmatrix} * \begin{bmatrix} 1 & v^T \end{bmatrix}$$

for real flavors and

$$H = I - tau * \begin{bmatrix} 1 \\ v \end{bmatrix} * \begin{bmatrix} 1 & v^H \end{bmatrix}$$

for complex flavors,

where *tau* is a real/complex scalar and v is a real/complex (*n*-1)-element vector. Note that for c/zlarfgp, *H* is not Hermitian.

If the elements of *x* are all zero (and, for complex flavors, *alpha* is real), then $tau = 0$ and *H* is taken to be the unit matrix.

Otherwise, $1 \le tau \le 2$ (for real flavors), or

$1 \le \mathrm{Re}(tau) \le 2$ and $\mathrm{abs}(tau-1) \le 1$ (for complex flavors).

Input Parameters

n	INTEGER. The order of the elementary reflector.
alpha	REAL for slarfgp

DOUBLE PRECISION for dlarfgp

COMPLEX for clarfgp

DOUBLE COMPLEX for zlarfgp

On entry, the value alpha.

x

REAL for s

DOUBLE PRECISION for dlarfgp

COMPLEX for clarfgp

DOUBLE COMPLEX for zlarfgp

Array, DIMENSION (1+(*n*-2)*abs(*incx*)).

On entry, the vector *x*.

incx

INTEGER.

The increment between elements of *x*. *incx* > 0.

Output Parameters

alpha

On exit, it is overwritten with the value *beta*.

x

On exit, it is overwritten with the vector *v*.

tau

REAL for slarfgp

DOUBLE PRECISION for dlarfgp

COMPLEX for clarfgp

DOUBLE COMPLEX for zlarfgp

The value *tau*.

?larft

*Forms the triangular factor T of a block reflector H = I - V*T*V**H.*

Syntax

```
call slarft( direct, storev, n, k, v, ldv, tau, t, ldt )
call dlarft( direct, storev, n, k, v, ldv, tau, t, ldt )
call clarft( direct, storev, n, k, v, ldv, tau, t, ldt )
call zlarft( direct, storev, n, k, v, ldv, tau, t, ldt )
```

Include Files

- mkl.fi

Description

The routine ?larft forms the triangular factor *T* of a real/complex block reflector *H* of order *n*, which is defined as a product of *k* elementary reflectors.

If *direct* = 'F', *H* = *H*(1)*H(2)* . . .*H(k)* and *T* is upper triangular;

If *direct* = 'B', *H* = *H(k)*. . .*H(2)*H(1)* and *T* is lower triangular.

If *storev* = 'C', the vector which defines the elementary reflector H(*i*) is stored in the *i*-th column of the array *v*, and $H = I - V*T*V^T$ (for real flavors) or $H = I - V*T*V^H$ (for complex flavors) .

If *storev* = 'R', the vector which defines the elementary reflector H(*i*) is stored in the *i*-th row of the array *v*, and $H = I - V^T*T*V$ (for real flavors) or $H = I - V^H*T*V$ (for complex flavors).

Input Parameters

The data types are given for the Fortran interface.

direct

CHARACTER*1.

Specifies the order in which the elementary reflectors are multiplied to form the block reflector:

= 'F': $H = H(1)*H(2)*. \ . \ . \ *H(k)$ (forward)

= 'B': $H = H(k)*. \ . \ .*H(2)*H(1)$ (backward)

storev

CHARACTER*1.

Specifies how the vectors which define the elementary reflectors are stored (see also *Application Notes* below):

= 'C': column-wise

= 'R': row-wise.

n

INTEGER. The order of the block reflector *H*. $n \geq 0$.

k

INTEGER. The order of the triangular factor *T* (equal to the number of elementary reflectors). $k \geq 1$.

v

REAL for slarft

DOUBLE PRECISION for dlarft

COMPLEX for clarft

DOUBLE COMPLEX for zlarft

Array, DIMENSION

(*ldv*, *k*) if *storev* = 'C' or

(*ldv*, *n*) if *storev* = 'R'.

The matrix *V*.

ldv

INTEGER. The leading dimension of the array *v*.

If *storev* = 'C', $ldv \geq \max(1,n)$

if *storev* = 'R', $ldv \geq k$.

tau

REAL for slarft

DOUBLE PRECISION for dlarft

COMPLEX for clarft

DOUBLE COMPLEX for zlarft

Array, size (*k*). *tau*(*i*) must contain the scalar factor of the elementary reflector *H*(*i*).

ldt

INTEGER. The leading dimension of the output array *t*. $ldt \geq k$.

Output Parameters

t	`REAL` for `slarft`
	`DOUBLE PRECISION` for `dlarft`
	`COMPLEX` for `clarft`
	`DOUBLE COMPLEX` for `zlarft`
	Array, size *ldt* by *k*. The *k*-by-*k* triangular factor *T* of the block reflector. If *direct* = `'F'`, *T* is upper triangular; if *direct* = `'B'`, *T* is lower triangular. The rest of the array is not used.

v	The matrix *V*.

Application Notes

The shape of the matrix *V* and the storage of the vectors which define the *H*(*i*) is best illustrated by the following example with *n* = 5 and *k* = 3. The elements equal to 1 are not stored; the corresponding array elements are modified but restored on exit. The rest of the array is not used.

direct = 'F' and *storev* = 'C':

$$\begin{bmatrix} 1 & & \\ v_1 & 1 & \\ v_1 & v_2 & 1 \\ v_1 & v_2 & v_3 \\ v_1 & v_2 & v_3 \end{bmatrix}$$

direct = 'F' and *storev* = 'R':

$$\begin{bmatrix} 1 & v_1 & v_1 & v_1 & v_1 \\ & 1 & v_2 & v_2 & v_2 \\ & & 1 & v_3 & v_3 \end{bmatrix}$$

direct = 'B' and *storev* = 'C':

$$\begin{bmatrix} v_1 & v_2 & v_3 \\ v_1 & v_2 & v_3 \\ 1 & v_2 & v_3 \\ & 1 & v_3 \\ & & 1 \end{bmatrix}$$

direct = 'B' and *storev* = 'R':

$$\begin{bmatrix} v_1 & v_1 & 1 & & \\ v_2 & v_2 & v_2 & 1 & \\ v_3 & v_3 & v_3 & v_3 & 1 \end{bmatrix}$$

?larfx

Applies an elementary reflector to a general rectangular matrix, with loop unrolling when the reflector has order less than or equal to 10.

Syntax

```
call slarfx( side, m, n, v, tau, c, ldc, work )
call dlarfx( side, m, n, v, tau, c, ldc, work )
call clarfx( side, m, n, v, tau, c, ldc, work )
call zlarfx( side, m, n, v, tau, c, ldc, work )
```

Include Files

- mkl.fi

Description

The routine ?larfx applies a real/complex elementary reflector *H* to a real/complex *m*-by-*n* matrix *C*, from either the left or the right.

H is represented in the following forms:

- *H = I - tau*v*v*^{T}, where *tau* is a real scalar and v is a real vector.
- *H = I - tau*v*v*^{H}, where *tau* is a complex scalar and v is a complex vector.

If *tau = 0*, then *H* is taken to be the unit matrix.

Input Parameters

The data types are given for the Fortran interface.

side — CHARACTER*1.

If *side = 'L'*: form *H*C*

If *side = 'R'*: form *C*H*.

m — INTEGER. The number of rows of the matrix *C*.

n — INTEGER. The number of columns of the matrix *C*.

v — REAL for slarfx

DOUBLE PRECISION for dlarfx

COMPLEX for clarfx

DOUBLE COMPLEX for zlarfx

Array, size

(*m*) if *side = 'L'* or

(*n*) if *side = 'R'*.

The vector *v* in the representation of *H*.

tau — REAL for slarfx

DOUBLE PRECISION for dlarfx

COMPLEX for clarfx

DOUBLE COMPLEX for zlarfx

The value *tau* in the representation of *H*.

c — REAL for slarfx

DOUBLE PRECISION for dlarfx

COMPLEX for clarfx

DOUBLE COMPLEX for zlarfx

Array, size *ldc* by *n*. On entry, the *m*-by-*n* matrix C.

ldc INTEGER. The leading dimension of the array *c*. *lda*≥ (1,*m*).

work REAL for slarfx

DOUBLE PRECISION for dlarfx

COMPLEX for clarfx

DOUBLE COMPLEX for zlarfx

Workspace array, size

(*n*) if *side* = 'L' or

(*m*) if *side* = 'R'.

work is not referenced if *H* has order < 11.

Output Parameters

c On exit, C is overwritten by the matrix *H*C* if *side* = 'L', or *C*H* if *side* = 'R'.

?larfy

Applies an elementary reflector, or Householder matrix, H, to an n by n symmetric or Hermitian matrix C, from both the left and the right.

```
call slarfy(uplo, n, v, incv, tau, C, ldc, work)
call dlarfy(uplo, n, v, incv, tau, C, ldc, work)
call clarfy(uplo, n, v, incv, tau, C, ldc, work)
call zlarfy(uplo, n, v, incv, tau, C, ldc, work)
```

Description

?larfy applies an elementary reflector, or Householder matrix, H, to an *n* by *n* symmetric or Hermitian matrix C, from both the left and the right. H is represented in the form H = I - *tau* * *v* * v^T (for real flavors) or H = I - *tau* * *v* * v^H (for complex flavors), where tau is a scalar and *v* is a vector. If *tau* is zero, H is taken to be the unit matrix.

Input Parameters

uplo CHARACTER*1

Specifies whether the upper or lower triangular part of the symmetric or Hermitian matrix C is stored.

- = 'U': Upper triangular part of C is stored.
- = 'L': Lower triangular part of C is stored.

n INTEGER

The number of rows and columns of the matrix C. *n* ≥ 0.

v REAL for slarfy

DOUBLE PRECISION for dlarfy

COMPLEX for clarfy

COMPLEX*16 for zlarfy

Array, dimension (1 + (*n*–1)*abs(*incv*)). The vector *v* as described above.

incv INTEGER

The increment between successive elements of v. *incv* must not be zero.

tau REAL for slarfy

DOUBLE PRECISION for dlarfy

COMPLEX for clarfy

COMPLEX*16 for zlarfy

The value *tau* as described above.

C REAL for slarfy

DOUBLE PRECISION for dlarfy

COMPLEX for clarfy

COMPLEX*16 for zlarfy

Array, dimension (*ldc*, *n*). On entry, the matrix C.

ldc INTEGER

The leading dimension of the array *C*. *ldc* ≥ max(1, *n*).

Output Parameters

C REAL for slarfy

DOUBLE PRECISION for dlarfy

COMPLEX for clarfy

COMPLEX*16 for zlarfy

On exit, *C* is overwritten by H * *C* * H^T (for real flavors) or H * *C* * H^H (for complex flavors).

work REAL for slarfy

DOUBLE PRECISION for dlarfy

COMPLEX for clarfy

COMPLEX*16 for zlarfy

Array, dimension (*n*).

?large

Pre- and post-multiplies a real general matrix with a random orthogonal matrix.

Syntax

```
call slarge( n, a, lda, iseed, work, info )
call dlarge( n, a, lda, iseed, work, info )
call clarge( n, a, lda, iseed, work, info )
```

```
call zlarge( n, a, lda, iseed, work, info )
```

Include Files

- mkl.fi

Description

The routine ?large pre- and post-multiplies a general *n*-by-*n* matrix *A* with a random orthogonal or unitary matrix: $A = U*D*U^T$.

Input Parameters

n — INTEGER. The order of the matrix *A*. $n \geq 0$

a — REAL for slarge,

DOUBLE PRECISION for dlarge,

COMPLEX for clarge,

DOUBLE COMPLEX for zlarge,

Array, size *lda* by *n*.

On entry, the original *n*-by-*n* matrix *A*.

lda — INTEGER. The leading dimension of the array *a*. $lda \geq n$.

iseed — INTEGER. Array, size 4.

On entry, the seed of the random number generator. The array elements must be between 0 and 4095, and *iseed*(4) must be odd.

work — REAL for slarge,

DOUBLE PRECISION for dlarge,

COMPLEX for clarge,

DOUBLE COMPLEX for zlarge,

Workspace array, size 2*n.

Output Parameters

a — INTEGER.

On exit, *A* is overwritten by *U**A**U'* for some random orthogonal matrix *U*.

iseed — INTEGER.

On exit, the seed is updated.

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* < 0, the *i* -th parameter had an illegal value.

?largv

Generates a vector of plane rotations with real cosines and real/complex sines.

Syntax

```
call slargv( n, x, incx, y, incy, c, incc )
call dlargv( n, x, incx, y, incy, c, incc )
call clargv( n, x, incx, y, incy, c, incc )
call zlargv( n, x, incx, y, incy, c, incc )
```

Include Files

- mkl.fi

Description

The routine generates a vector of real/complex plane rotations with real cosines, determined by elements of the real/complex vectors *x* and *y*.

For slargv/dlargv:

$$\begin{bmatrix} c(i) & s(i) \\ -s(i) & c(i) \end{bmatrix} \begin{bmatrix} x_i \\ y_i \end{bmatrix} = \begin{bmatrix} a_i \\ 0 \end{bmatrix}, \text{for } i = 1,2,\ldots,n$$

For clargv/zlargv:

$$\begin{bmatrix} c(i) & s(i) \\ -\text{conjg}(s(i)) & c(i) \end{bmatrix} \begin{bmatrix} x_i \\ y_i \end{bmatrix} = \begin{bmatrix} r_i \\ 0 \end{bmatrix}, \text{for } i = 1,2,\ldots,n$$

where $c(i)^2 + \text{abs}(s(i))^2 = 1$ and the following conventions are used (these are the same as in clartg/zlartg but differ from the BLAS Level 1 routine crotg/zrotg):

If $y_i = 0$, then $c(i) = 1$ and $s(i) = 0$;

If $x_i = 0$, then $c(i) = 0$ and $s(i)$ is chosen so that r_i is real.

Input Parameters

n	INTEGER. The number of plane rotations to be generated.
x, *y*	REAL for slargv DOUBLE PRECISION for dlargv COMPLEX for clargv DOUBLE COMPLEX for zlargv Arrays, DIMENSION (1+(*n*-1)**incx*) and (1+(*n*-1)**incy*), respectively. On entry, the vectors *x* and *y*.

incx INTEGER. The increment between elements of *x*.

incx > 0.

incy INTEGER. The increment between elements of *y*.

incy > 0.

incc INTEGER. The increment between elements of the output array *c*. *incc* > 0.

Output Parameters

x On exit, $x(i)$ is overwritten by a_i (for real flavors), or by r_i (for complex flavors), for $i = 1, \ldots, n$.

y On exit, the sines $s(i)$ of the plane rotations.

c REAL for slargv/clargv

DOUBLE PRECISION for dlargv/zlargv

Array, DIMENSION (1+(*n*-1)**incc*). The cosines of the plane rotations.

?larnd

Returns a random real number from a uniform or normal distribution.

Syntax

```
res = slarnd( idist, iseed )
res = dlarnd( idist, iseed )
res = clarnd( idist, iseed )
res = zlarnd( idist, iseed )
```

Include Files

- mkl.fi

Description

The routine ?larnd returns a random number from a uniform or normal distribution.

Input Parameters

idist INTEGER. Specifies the distribution of the random numbers. For slarnd and dlanrd:

= 1: uniform (0,1)

= 2: uniform (-1,1)

= 3: normal (0,1).

For clarnd and zlanrd:

= 1: real and imaginary parts each uniform (0,1)

= 2: real and imaginary parts each uniform (-1,1)

= 3: real and imaginary parts each normal (0,1)

= 4: uniformly distributed on the disc abs(z) ≤ 1

= 5: uniformly distributed on the circle abs(z) = 1

iseed INTEGER. Array, size 4.

On entry, the seed of the random number generator. The array elements must be between 0 and 4095, and *iseed*(4) must be odd.

Output Parameters

iseed INTEGER.

On exit, the seed is updated.

res REAL for slarnd,

DOUBLE PRECISION for dlarnd,

COMPLEX for clarnd,

DOUBLE COMPLEX for zlarnd,

Random number.

?larnv

Returns a vector of random numbers from a uniform or normal distribution.

Syntax

```
call slarnv( idist, iseed, n, x )
call dlarnv( idist, iseed, n, x )
call clarnv( idist, iseed, n, x )
call zlarnv( idist, iseed, n, x )
```

Include Files

- mkl.fi

Description

The routine ?larnv returns a vector of *n* random real/complex numbers from a uniform or normal distribution.

This routine calls the auxiliary routine ?laruv to generate random real numbers from a uniform (0,1) distribution, in batches of up to 128 using vectorisable code. The Box-Muller method is used to transform numbers from a uniform to a normal distribution.

Input Parameters

The data types are given for the Fortran interface.

idist INTEGER. Specifies the distribution of the random numbers: for slarnv and dlarnv:

= 1: uniform (0,1)

= 2: uniform (-1,1)

= 3: normal (0,1).

for `clarnv` and `zlarnv`:

= 1: real and imaginary parts each uniform (0,1)

= 2: real and imaginary parts each uniform (-1,1)

= 3: real and imaginary parts each normal (0,1)

= 4: uniformly distributed on the disc abs(z) < 1

= 5: uniformly distributed on the circle abs(z) = 1

iseed — `INTEGER`. Array, size (4).

On entry, the seed of the random number generator; the array elements must be between 0 and 4095, and *iseed*(4) must be odd.

n — `INTEGER`. The number of random numbers to be generated.

Output Parameters

x — `REAL` for `slarnv`

`DOUBLE PRECISION` for `dlarnv`

`COMPLEX` for `clarnv`

`DOUBLE COMPLEX` for `zlarnv`

Array, size (*n*). The generated random numbers.

iseed — On exit, the seed is updated.

?laror

Pre- or post-multiplies an m-by-n matrix by a random orthogonal/unitary matrix.

Syntax

```
call slaror( side, init, m, n, a, lda, iseed, x, info )
call dlaror( side, init, m, n, a, lda, iseed, x, info )
call claror( side, init, m, n, a, lda, iseed, x, info )
call zlaror( side, init, m, n, a, lda, iseed, x, info )
```

Include Files

- `mkl.fi`

Description

The routine `?laror` pre- or post-multiplies an *m*-by-*n* matrix *A* by a random orthogonal or unitary matrix *U*, overwriting *A*. *A* may optionally be initialized to the identity matrix before multiplying by *U*. *U* is generated using the method of G.W. Stewart (SIAM J. Numer. Anal. 17, 1980, 403-409).

Input Parameters

side

CHARACTER*1. Specifies whether *A* is multiplied by *U* on the left or right.

for slaror and dlaror:

If *side* = 'L', multiply *A* on the left (premultiply) by *U*.

If *side* = 'R', multiply *A* on the right (postmultiply) by U^T.

If *side* = 'C' or 'T', multiply *A* on the left by *U* and the right by U^T.

for claror and zlaror:

If *side* = 'L', multiply *A* on the left (premultiply) by *U*.

If *side* = 'R', multiply *A* on the right (postmultiply) by *UC*>.

If *side* = 'C', multiply *A* on the left by *U* and the right by *UC*>

If*side* = 'T', multiply *A* on the left by *U* and the right by U^T.

init

CHARACTER*1. Specifies whether or not *a* should be initialized to the identity matrix.

If *init* = 'I', initialize *a* to (a section of) the identity matrix before applying *U*.

If *init* = 'N', no initialization. Apply *U* to the input matrix *A*.

init = 'I' generates square or rectangular orthogonal matrices:

For *m* = *n* and *side* = 'L' or 'R', the rows and the columns are orthogonal to each other.

For rectangular matrices where *m* < *n*:

- If *side* = 'R', ?laror produces a dense matrix in which rows are orthogonal and columns are not.
- If *side*= 'L', ?laror produces a matrix in which rows are orthogonal, first *m* columns are orthogonal, and remaining columns are zero.

For rectangular matrices where *m* > *n*:

- If *side* = 'L', ?laror produces a dense matrix in which columns are orthogonal and rows are not.
- If *side* = 'R', ?laror produces a matrix in which columns are orthogonal, first *m* rows are orthogonal, and remaining rows are zero.

m

INTEGER. The number of rows of *A*.

n

INTEGER. The number of columns of *A*.

a

REAL for slaror,

DOUBLE PRECISION for dlaror,

COMPLEX for claror,

DOUBLE COMPLEX for zlaror,

Array, size *lda* by *n*.

lda

INTEGER. The leading dimension of the array *a*.

lda≥ max(1, *m*).

iseed INTEGER. Array, size (4).

On entry, specifies the seed of the random number generator. The array elements must be between 0 and 4095; if not they are reduced mod 4096. Also, *iseed*(4) must be odd.

x REAL for slaror,

DOUBLE PRECISION for dlaror,

COMPLEX for claror,

DOUBLE COMPLEX for zlaror,

Workspace array, size (3*max(*m*, *n*)) .

Value of *side*	Length of workspace
'L'	2*m + n
'R'	2*n + m
'C' or 'T'	3*n

Output Parameters

a On exit, overwritten

by *UA* (if *side* = 'L'),

by *AU* (if *side* = 'R'),

by UAU^T (if *side* = 'C' or 'T').

iseed The values of *iseed* are changed on exit, and can be used in the next call to continue the same random number sequence.

info INTEGER. Array, size (4).

For slaror and dlaror:

If *info* = 0, the execution is successful.

If *info* < 0, the *i* -th parameter had an illegal value.

If *info* = 1, the random numbers generated by ?laror are bad.

For claror and zlaror:

If *info* = 0, the execution is successful.

If *info* = -1, *side* is not 'L', 'R', 'C', or 'T'.

If *info* = -3, if *m* is negative.

If *info* = -4, if *m* is negative or if side is 'C' or 'T' and *n* is not equal to *m* .

If *info* = -6, if *lda* is less than *m* .

?larot

Applies a Givens rotation to two adjacent rows or columns.

Syntax

```
call slarot( lrows, lleft, lright, nl, c, s, a, lda, xleft, xright )
call dlarot( lrows, lleft, lright, nl, c, s, a, lda, xleft, xright )
call clarot( lrows, lleft, lright, nl, c, s, a, lda, xleft, xright )
call zlarot( lrows, lleft, lright, nl, c, s, a, lda, xleft, xright )
```

Include Files

- mkl.fi

Description

The routine ?larot applies a Givens rotation to two adjacent rows or columns, where one element of the first or last column or row is stored in some format other than GE so that elements of the matrix may be used or modified for which no array element is provided.

One example is a symmetric matrix in SB format (bandwidth = 4), for which *uplo* = 'L'. Two adjacent rows will have the format:

```
row j :      C > C > C > C > C > . . . .
row j + 1 :  C > C > C > C > C > . . . .
```

'*' indicates elements for which storage is provided.

'.' indicates elements for which no storage is provided, but are not necessarily zero; their values are determined by symmetry.

' ' indicates elements which are required to be zero, and have no storage provided.

Those columns which have two '*' entries can be handled by srot (for slarot and clarot), or by drot(for dlarot and zlarot).

Those columns which have no '*' entries can be ignored, since as long as the Givens rotations are carefully applied to preserve symmetry, their values are determined.

Those columns which have one '*' have to be handled separately, by using separate variables *p* and *q* :

```
row j :      C > C > C > C > C > p. . . .
row j + 1 :  q  C > C > C > C > C > . . . .
```

If element *p* is set correctly, ?larot rotates the column and sets *p* to its new value. The next call to ?larot rotates columns *j* and *j* +1, and restore symmetry. The element *q* is zero at the beginning, and non-zero after the rotation. Later, rotations would presumably be chosen to zero *q* out.

Typical Calling Sequences: rotating the *i* -th and (*i* +1)–st rows.

Example

Typical Calling Sequences

These examples rotate the *i* -th and (*i* +1)–st rows.

General dense matrix:

```
call dlarot (.TRUE.,.FALSE.,.FALSE., n, c, s,
a(i,1),lda, dummy, dummy)
```

General banded matrix in GB format:

```
            j = max(1, i-kl )
            nl = min( n, i+ku+1 ) + 1-j
            call dlarot( .TRUE., i-kl.GE.1, i+ku.LT.n, nl, c,s,
                    a(ku+i+1-j,j),lda-1, xleft, xright )
```

NOTE
i + 1 - *j* is just min(*i*, *kl* + 1).

Symmetric banded matrix in SY format, bandwidth K, lower triangle only:

```
            j = max(1, i-k )
            nl = min( k+1, i ) + 1
            call dlarot( .TRUE., i-k.GE.1, .TRUE., nl, c,s,
                    a(i,j), lda, xleft, xright )
```

Same, but upper triangle only:

```
            nl = min( k+1, n-i ) + 1
            call dlarot( .TRUE., .TRUE., i+k.LT.n, nl, c,s,
                    a(i,i), lda, xleft, xright )
```

Symmetric banded matrix in SB format, bandwidth K, lower triangle only: [same as for SY, except:]

```
                . . . .
                    a(i+1-j,j), lda, xleft, xright )
```

NOTE
i+1-*j* is just min(*i*,*k*+1)

Same, but upper triangle only:

```
              . . . .
                    a(k+1,i), lda-1, xleft, xright )
```

Rotating columns is just the transpose of rotating rows, except for GB and SB: (rotating columns i and i+1)
GB:

NOTE
ku+*j*+1-*i* is just max(1,*ku*+2-*i*)

```
            j = max(1, i-ku )
            nl = min( n, i+kl+1 ) + 1-j
            call dlarot( .TRUE., i-ku.LE.1, i+kl.LT.n, nl, c,s,
                    a(ku+j+1-i,i),lda-1, xtop, xbottm )
```

SB: (upper triangle)

```
                . . . . . .
                    a(k+j+1-i,i),lda-1, xtop, xbottm )
```

SB: (lower triangle) . . . . . A(1,i),LDA-1, XTOP, XBOTTM)

```
                . . . . . .
                    a(1,i),lda-1, xtop, xbottm )
```

Input Parameters

lrows

LOGICAL.

If *lrows* = .TRUE., ?larot rotates two rows.

If *lrows* = .FALSE., ?larot rotates two columns.

lleft

LOGICAL.

If *lleft* = .TRUE., *xleft* is used instead of the corresponding element of *a* for the first element in the second row (if *lrows* = .FALSE.) or column (if *lrows*=.TRUE.).

If *lleft* = .FALSE., the corresponding element of *a* is used.

lright

LOGICAL.

If *lleft* = .TRUE., *xright* is used instead of the corresponding element of *a* for the first element in the second row (if *lrows* = .FALSE.) or column (if *lrows*=.TRUE.).

If *lright* = .FALSE., the corresponding element of *a* is used.

nl

INTEGER. The length of the rows (if *lrows*=.TRUE.) or columns (if *lrows*=.TRUE.) to be rotated.

If *xleft* or *xright* are used, the columns or rows they are in should be included in *nl*, e.g., if *lleft* = *lright* = .TRUE., then *nl* must be at least 2.

The number of rows or columns to be rotated exclusive of those involving *xleft* and/or *xright* may not be negative, i.e., *nl* minus how many of *lleft* and *lright* are .TRUE. must be at least zero; if not, xerbla is called.

c, s

REAL for slarot,

DOUBLE PRECISION for dlarot,

COMPLEX for clarot,

DOUBLE COMPLEX for zlarot,

Specify the Givens rotation to be applied.

If *lrows* = .TRUE., then the matrix

$$\begin{bmatrix} c & s \\ -s & c \end{bmatrix}$$

is applied from the left.

If *lrows* = .FALSE., then the transpose thereof is applied from the right.

a

REAL for slarot,

DOUBLE PRECISION for dlarot,

COMPLEX for clarot,

DOUBLE COMPLEX for zlarot,

The array containing the rows or columns to be rotated. The first element of *a* should be the upper left element to be rotated.

lda

INTEGER. The "effective" leading dimension of *a*.

If *a* contains a matrix stored in GE or SY format, then this is just the leading dimension of *A*.

If *a* contains a matrix stored in band (GB or SB) format, then this should be one less than the leading dimension used in the calling routine. Thus, if *a* is dimensioned *a*(*lda*,*) in ?larot, then *a*(1,*j*) would be the *j* -th element in the first of the two rows to be rotated, and *a*(2,*j*) would be the *j* -th in the second, regardless of how the array may be stored in the calling routine. *a* cannot be dimensioned, because for band format the row number may exceed *lda*, which is not legal FORTRAN.

If *lrows* = .TRUE., then *lda* must be at least 1, otherwise it must be at least *nl* minus the number of .TRUE. values in *xleft* and *xright*.

xleft

REAL for slarot,

DOUBLE PRECISION for dlarot,

COMPLEX for clarot,

DOUBLE COMPLEX for zlarot,

If *lrows* = .TRUE., *xleft* is used and modified instead of *a*(2,1) (if *lrows* = .TRUE.) or *a*(1,2) (if *lrows* = .FALSE.).

xright

REAL for slarot,

DOUBLE PRECISION for dlarot,

COMPLEX for clarot,

DOUBLE COMPLEX for zlarot,

If *lright* = .TRUE., *xright* is used and modified instead of *a*(1,*nl*) (if *lrows* = .TRUE.) or *a*(*nl*,1) (if *lrows* = .FALSE.).

Output Parameters

a

On exit, modified array *A*.

?larra

Computes the splitting points with the specified threshold.

Syntax

```
call slarra( n, d, e, e2, spltol, tnrm, nsplit, isplit, info )
call dlarra( n, d, e, e2, spltol, tnrm, nsplit, isplit, info )
```

Include Files

- mkl.fi

Description

The routine computes the splitting points with the specified threshold and sets any "small" off-diagonal elements to zero.

Input Parameters

n
INTEGER. The order of the matrix (*n*> 1).

d
REAL for slarra
DOUBLE PRECISION for dlarra
Array, DIMENSION (*n*).
Contains *n* diagonal elements of the tridiagonal matrix *T*.

e
REAL for slarra
DOUBLE PRECISION for dlarra
Array, DIMENSION (*n*).
First (*n*–1) entries contain the subdiagonal elements of the tridiagonal matrix *T*; *e*(*n*) need not be set.

e2
REAL for slarra
DOUBLE PRECISION for dlarra
Array, DIMENSION (*n*).
First (*n*–1) entries contain the squares of the subdiagonal elements of the tridiagonal matrix *T*; *e2*(*n*) need not be set.

spltol
REAL for slarra
DOUBLE PRECISION for dlarra
The threshold for splitting. Two criteria can be used: *spltol*<0 : criterion based on absolute off-diagonal value; *spltol*>0 : criterion that preserves relative accuracy.

tnrm
REAL for slarra
DOUBLE PRECISION for dlarra
The norm of the matrix.

Output Parameters

e
On exit, the entries *e*(*isplit*(i)), 1 ≤ i ≤ *nsplit*, are set to zero, the other entries of *e* are untouched.

e2
On exit, the entries *e2*(*isplit*(i)), 1 ≤ i ≤ *nsplit*, are set to zero.

nsplit
INTEGER.
The number of blocks the matrix *T* splits into. 1 ≤ *nsplit* ≤ *n*

isplit
INTEGER.
Array, DIMENSION (*n*).

The splitting points, at which *T* breaks up into blocks. The first block consists of rows/columns `1` to *isplit*`(1)`, the second of rows/columns *isplit*`(1)+1` through *isplit*`(2)`, and so on, and the *nsplit*-th consists of rows/columns *isplit*`(`*nsplit*`-1)+1` through *isplit*`(`*nsplit*`)=`*n*.

info — INTEGER.

= 0: successful exit.

?larrb

Provides limited bisection to locate eigenvalues for more accuracy.

Syntax

```
call slarrb( n, d, lld, ifirst, ilast, rtol1, rtol2, offset, w, wgap, werr, work, iwork, pivmin, spdiam, twist, info )
call dlarrb( n, d, lld, ifirst, ilast, rtol1, rtol2, offset, w, wgap, werr, work, iwork, pivmin, spdiam, twist, info )
```

Include Files

- mkl.fi

Description

Given the relatively robust representation (RRR) $L*D*L^T$, the routine does "limited" bisection to refine the eigenvalues of $L*D*L^T$, *w*(*ifirst-offset*) through *w*(*ilast-offset*), to more accuracy. Initial guesses for these eigenvalues are input in *w*. The corresponding estimate of the error in these guesses and their gaps are input in *werr* and *wgap*, respectively. During bisection, intervals [*left*, *right*] are maintained by storing their mid-points and semi-widths in the arrays *w* and *werr* respectively.

Input Parameters

n — INTEGER. The order of the matrix.

d — REAL for slarrb

DOUBLE PRECISION for dlarrb

Array, DIMENSION (*n*). The *n* diagonal elements of the diagonal matrix *D*.

lld — REAL for slarrb

DOUBLE PRECISION for dlarrb

Array, DIMENSION (*n*-1).

The *n*-1 elements $L_i*L_i*D_i$.

ifirst — INTEGER. The index of the first eigenvalue to be computed.

ilast — INTEGER. The index of the last eigenvalue to be computed.

rtol1, *rtol2* — REAL for slarrb

DOUBLE PRECISION for dlarrb

Tolerance for the convergence of the bisection intervals. An interval [*left*, *right*] has converged if `RIGHT-LEFT.LT.MAX( rtol1*gap, rtol2*max(|left|,|right|) )`, where `gap` is the (estimated) distance to the nearest eigenvalue.

offset

`INTEGER`. Offset for the arrays *w*, *wgap* and *werr*, that is, the *ifirst-offset* through *ilast-offset* elements of these arrays are to be used.

w

`REAL` for `slarrb`

`DOUBLE PRECISION` for `dlarrb`

Array, `DIMENSION` (*n*). On input, *w*(*ifirst-offset*) through *w*(*ilast-offset*) are estimates of the eigenvalues of $L*D*L^T$ indexed *ifirst* through *ilast*.

wgap

`REAL` for `slarrb`

`DOUBLE PRECISION` for `dlarrb`

Array, `DIMENSION` (*n*-1). The estimated gaps between consecutive eigenvalues of $L*D*L^T$, that is, *wgap*(*i-offset*) is the gap between eigenvalues *i* and *i*+1. Note that if `IFIRST.EQ.ILAST` then *wgap*(*ifirst-offset*) must be set to 0.

werr

`REAL` for `slarrb`

`DOUBLE PRECISION` for `dlarrb`

Array, `DIMENSION` (*n*). On input, *werr*(*ifirst-offset*) through *werr*(*ilast-offset*) are the errors in the estimates of the corresponding elements in *w*.

work

`REAL` for `slarrb`

`DOUBLE PRECISION` for `dlarrb`

Workspace array, `DIMENSION` (2**n*).

pivmin

`REAL` for `slarrb`

`DOUBLE PRECISION` for `dlarrb`

The minimum pivot in the Sturm sequence.

spdiam

`REAL` for `slarrb`

`DOUBLE PRECISION` for `dlarrb`

The spectral diameter of the matrix.

twist

`INTEGER`. The twist index for the twisted factorization that is used for the negcount.

twist = *n*: Compute negcount from $L*D*L^T - lambda*i = L+* D+ *L+^T$
twist = *n*: Compute negcount from $L*D*L^T - lambda*i = U-*D-*U-^T$
twist = *n*: Compute negcount from $L*D*L^T - lambda*i = N_r*D_r*N_r$

iwork

`INTEGER`.

Workspace array, `DIMENSION` (2**n*).

Output Parameters

w	On output, the estimates of the eigenvalues are "refined".
wgap	On output, the gaps are refined.
werr	On output, "refined" errors in the estimates of *w*.
info	INTEGER. Error flag.

?larrc

Computes the number of eigenvalues of the symmetric tridiagonal matrix.

Syntax

```
call slarrc( jobt, n, vl, vu, d, e, pivmin, eigcnt, lcnt, rcnt, info )
call dlarrc( jobt, n, vl, vu, d, e, pivmin, eigcnt, lcnt, rcnt, info )
```

Include Files

- mkl.fi

Description

The routine finds the number of eigenvalues of the symmetric tridiagonal matrix *T* or of its factorization $L*D*L^T$ in the specified interval.

Input Parameters

jobt	CHARACTER*1. = 'T': computes Sturm count for matrix *T*. = 'L': computes Sturm count for matrix $L*D*L^T$.
n	INTEGER. The order of the matrix. ($n > 1$).
vl,*vu*	REAL for slarrc DOUBLE PRECISION for dlarrc The lower and upper bounds for the eigenvalues.
d	REAL for slarrc DOUBLE PRECISION for dlarrc Array, DIMENSION (*n*). If *jobt*= 'T': contains the *n* diagonal elements of the tridiagonal matrix *T*. If *jobt*= 'L': contains the *n* diagonal elements of the diagonal matrix *D*.
e	REAL for slarrc DOUBLE PRECISION for dlarrc

Array, DIMENSION (*n*).

If *jobt*= 'T': contains the (*n*-1) offdiagonal elements of the matrix *T*.

If *jobt*= 'L': contains the (*n*-1) offdiagonal elements of the matrix *L*.

pivmin — REAL for slarrc

DOUBLE PRECISION for dlarrc

The minimum pivot in the Sturm sequence for the matrix *T*.

Output Parameters

eigcnt — INTEGER.

The number of eigenvalues of the symmetric tridiagonal matrix *T* that are in the half-open interval (*vl*, *vu*].

lcnt,*rcnt* — INTEGER.

The left and right negcounts of the interval.

info — INTEGER.

Now it is not used and always is set to 0.

?larrd

Computes the eigenvalues of a symmetric tridiagonal matrix to suitable accuracy.

Syntax

```
call slarrd( range, order, n, vl, vu, il, iu, gers, reltol, d, e, e2, pivmin, nsplit, isplit, m, w, werr, wl, wu, iblock, indexw, work, iwork, info )
```

```
call dlarrd( range, order, n, vl, vu, il, iu, gers, reltol, d, e, e2, pivmin, nsplit, isplit, m, w, werr, wl, wu, iblock, indexw, work, iwork, info )
```

Include Files

- mkl.fi

Description

The routine computes the eigenvalues of a symmetric tridiagonal matrix *T* to suitable accuracy. This is an auxiliary code to be called from ?stemr. The user may ask for all eigenvalues, all eigenvalues in the half-open interval (*vl*, *vu*], or the *il*-th through *iu*-th eigenvalues.

To avoid overflow, the matrix must be scaled so that its largest element is no greater than $(overflow^{1/2}*underflow^{1/4})$ in absolute value, and for greatest accuracy, it should not be much smaller than that. (For more details see [Kahan66].

Input Parameters

range — CHARACTER.

= 'A': ("All") all eigenvalues will be found.

= 'V': ("Value") all eigenvalues in the half-open interval (*vl*, *vu*] will be found.

= 'I': ("Index") the *il*-th through *iu*-th eigenvalues will be found.

order CHARACTER.

= 'B': ("By block") the eigenvalues will be grouped by split-off block (see *iblock*, *isplit* below) and ordered from smallest to largest within the block.

= 'E': ("Entire matrix") the eigenvalues for the entire matrix will be ordered from smallest to largest.

n INTEGER. The order of the tridiagonal matrix *T* ($n \geq 1$).

vl,*vu* REAL for slarrd

DOUBLE PRECISION for dlarrd

If *range* = 'V': the lower and upper bounds of the interval to be searched for eigenvalues. Eigenvalues less than or equal to *vl*, or greater than *vu*, will not be returned. $vl < vu$.

If *range* = 'A' or 'I': not referenced.

il,*iu* INTEGER.

If *range* = 'I': the indices (in ascending order) of the smallest and largest eigenvalues to be returned. $1 \leq il \leq iu \leq n$, if $n > 0$; $il=1$ and $iu=0$ if $n=0$.

If *range* = 'A' or 'V': not referenced.

gers REAL for slarrd

DOUBLE PRECISION for dlarrd

Array, DIMENSION (2*n).

The *n* Gerschgorin intervals (the i-th Gerschgorin interval is (*gers*(2*i-1), *gers*(2*i)).

reltol REAL for slarrd

DOUBLE PRECISION for dlarrd

The minimum relative width of an interval. When an interval is narrower than *reltol* times the larger (in magnitude) endpoint, then it is considered to be sufficiently small, that is converged. Note: this should always be at least *radix*machine epsilon*.

d REAL for slarrd

DOUBLE PRECISION for dlarrd

Array, DIMENSION (*n*).

Contains *n* diagonal elements of the tridiagonal matrix *T*.

e REAL for slarrd

DOUBLE PRECISION for dlarrd

Array, DIMENSION (*n*-1).

Contains (*n*-1) off-diagonal elements of the tridiagonal matrix *T*.

e2

REAL for slarrd

DOUBLE PRECISION for dlarrd

Array, DIMENSION (*n*-1).

Contains (*n*-1) squared off-diagonal elements of the tridiagonal matrix *T*.

pivmin

REAL for slarrd

DOUBLE PRECISION for dlarrd

The minimum pivot in the Sturm sequence for the matrix *T*.

nsplit

INTEGER.

The number of diagonal blocks the matrix *T* . $1 \le nsplit \le n$

isplit

INTEGER.

Arrays, DIMENSION (*n*).

The splitting points, at which *T* breaks up into submatrices. The first submatrix consists of rows/columns 1 to *isplit*(1), the second of rows/columns *isplit*(1)+1 through *isplit*(2), and so on, and the *nsplit*-th consists of rows/columns *isplit*(*nsplit*-1)+1 through *isplit*(*nsplit*)=*n*.

(Only the first *nsplit* elements actually is used, but since the user cannot know a priori value of *nsplit*, *n* words must be reserved for *isplit*.)

work

REAL for slarrd

DOUBLE PRECISION for dlarrd

Workspace array, DIMENSION (4**n*).

iwork

INTEGER.

Workspace array, DIMENSION (4**n*).

Output Parameters

m

INTEGER.

The actual number of eigenvalues found. $0 \le m \le n$. (See also the description of *info*=2, 3.)

w

REAL for slarrd

DOUBLE PRECISION for dlarrd

Array, DIMENSION (*n*).

The first *m* elements of *w* contain the eigenvalue approximations. ?laprd computes an interval $I_j = (a_j, b_j]$ that includes eigenvalue j. The eigenvalue approximation is given as the interval midpoint $w(j) = (a_j + b_j)/2$. The corresponding error is bounded by $werr(j) = abs(a_j - b_j)/2$.

werr

REAL for slarrd

DOUBLE PRECISION for dlarrd

Array, DIMENSION (*n*).

The error bound on the corresponding eigenvalue approximation in *w*.

wl, *wu*

REAL for slarrd

DOUBLE PRECISION for dlarrd

The interval (*wl*, *wu*] contains all the wanted eigenvalues.

If *range* = 'V': then *wl*=*vl* and *wu*=*vu*.

If *range* = 'A': then *wl* and *wu* are the global Gerschgorin bounds on the spectrum.

If *range* = 'I': then *wl* and *wu* are computed by ?laebz from the index range specified.

iblock

INTEGER.

Array, DIMENSION (*n*).

At each row/column j where *e*(j) is zero or small, the matrix *T* is considered to split into a block diagonal matrix.

If *info* = 0, then *iblock*(i) specifies to which block (from 1 to the number of blocks) the eigenvalue *w*(i) belongs. (The routine may use the remaining *n*–*m* elements as workspace.)

indexw

INTEGER.

Array, DIMENSION (*n*).

The indices of the eigenvalues within each block (submatrix); for example, *indexw*(i)= j and *iblock*(i)=k imply that the i-th eigenvalue *w*(i) is the j-th eigenvalue in block k.

info

INTEGER.

= 0: successful exit.

< 0: if *info* = -i, the i-th argument has an illegal value

> 0: some or all of the eigenvalues fail to converge or are not computed:

=1 or 3: bisection fail to converge for some eigenvalues; these eigenvalues are flagged by a negative block number. The effect is that the eigenvalues may not be as accurate as the absolute and relative tolerances.

=2 or 3:*range*='I' only: not all of the eigenvalues *il*:*iu* are found.

=4: *range*='I', and the Gershgorin interval initially used is too small. No eigenvalues are computed.

?larre

Given the tridiagonal matrix T, sets small off-diagonal elements to zero and for each unreduced block T_i, finds base representations and eigenvalues.

Syntax

```
call slarre( range, n, vl, vu, il, iu, d, e, e2, rtol1, rtol2, spltol, nsplit, isplit, m, w, werr, wgap, iblock, indexw, gers, pivmin, work, iwork, info )
```

```
call dlarre( range, n, vl, vu, il, iu, d, e, e2, rtol1, rtol2, spltol, nsplit, isplit, m, w, werr, wgap, iblock, indexw, gers, pivmin, work, iwork, info )
```

Include Files

- mkl.fi

Description

To find the desired eigenvalues of a given real symmetric tridiagonal matrix T, the routine sets any "small" off-diagonal elements to zero, and for each unreduced block T_i, it finds

- a suitable shift at one end of the block spectrum
- the base representation, $T_i - \sigma_i*I = L_i*D_i*L_i^T$, and
- eigenvalues of each $L_i*D_i*L_i^T$.

The representations and eigenvalues found are then used by ?stemr to compute the eigenvectors of a symmetric tridiagonal matrix. The accuracy varies depending on whether bisection is used to find a few eigenvalues or the dqds algorithm (subroutine ?lasq2) to compute all and discard any unwanted one. As an added benefit, ?larre also outputs the n Gerschgorin intervals for the matrices $L_i*D_i*L_i^T$.

Input Parameters

range

CHARACTER.

= 'A': ("All") all eigenvalues will be found.

= 'V': ("Value") all eigenvalues in the half-open interval (*vl*, *vu*] will be found.

= 'I': ("Index") the *il*-th through *iu*-th eigenvalues of the entire matrix will be found.

n

INTEGER. The order of the matrix. $n > 0$.

vl, *vu*

REAL for slarre

DOUBLE PRECISION for dlarre

If *range*='V', the lower and upper bounds for the eigenvalues. Eigenvalues less than or equal to *vl*, or greater than *vu*, are not returned. $vl < vu$.

il, *iu*

INTEGER.

If *range*='I', the indices (in ascending order) of the smallest and largest eigenvalues to be returned. $1 \le il \le iu \le n$.

d

REAL for slarre

DOUBLE PRECISION for dlarre

Array, DIMENSION (n).

The n diagonal elements of the diagonal matrices T.

e

REAL for slarre

DOUBLE PRECISION for dlarre

Array, DIMENSION (*n*). The first (*n*-1) entries contain the subdiagonal elements of the tridiagonal matrix *T*; *e*(*n*) need not be set.

e2

REAL for slarre

DOUBLE PRECISION for dlarre

Array, DIMENSION (*n*). The first (*n*-1) entries contain the squares of the subdiagonal elements of the tridiagonal matrix *T*; *e2*(*n*) need not be set.

rtol1, *rtol2*

REAL for slarre

DOUBLE PRECISION for dlarre

Parameters for bisection. An interval [LEFT,RIGHT] has converged if RIGHT-LEFT.LT.MAX(*rtol1**gap, *rtol2**max(|LEFT|,|RIGHT|)).

spltol

REAL for slarre

DOUBLE PRECISION for dlarre

The threshold for splitting.

work

REAL for slarre

DOUBLE PRECISION for dlarre

Workspace array, DIMENSION (6**n*).

iwork

INTEGER.

Workspace array, DIMENSION (5**n*).

Output Parameters

vl, *vu*

On exit, if *range*='I' or ='A', contain the bounds on the desired part of the spectrum.

d

On exit, the *n* diagonal elements of the diagonal matrices D_i .

e

On exit, the subdiagonal elements of the unit bidiagonal matrices L_i . The entries *e*(*isplit*(*i*)), 1 ≤ *i* ≤ *nsplit*, contain the base points $sigma_i$ on output.

e2

On exit, the entries *e2*(*isplit*(*i*)), 1 ≤ *i* ≤ *nsplit*, have been set to zero.

nsplit

INTEGER. The number of blocks *T* splits into. 1 ≤ *nsplit* ≤ *n*.

isplit

INTEGER. Array, DIMENSION (*n*). The splitting points, at which *T* breaks up into blocks. The first block consists of rows/columns 1 to *isplit*(1), the second of rows/columns *isplit*(1)+1 through *isplit*(2), etc., and the *nsplit*-th consists of rows/columns *isplit*(*nsplit*-1)+1 through *isplit*(*nsplit*)=*n*.

m

INTEGER. The total number of eigenvalues (of all the $L_i*D_i*L_i^T$) found.

w

REAL for slarre

DOUBLE PRECISION for dlarre

Array, DIMENSION (*n*). The first *m* elements contain the eigenvalues. The eigenvalues of each of the blocks, $L_i*D_i*L_i^T$, are sorted in ascending order. The routine may use the remaining *n*-*m* elements as workspace.

werr

REAL for slarre

DOUBLE PRECISION for dlarre

Array, DIMENSION (*n*). The error bound on the corresponding eigenvalue in *w*.

wgap

REAL for slarre

DOUBLE PRECISION for dlarre

Array, DIMENSION (*n*). The separation from the right neighbor eigenvalue in *w*. The gap is only with respect to the eigenvalues of the same block as each block has its own representation tree. Exception: at the right end of a block the left gap is stored.

iblock

INTEGER. Array, DIMENSION (*n*).

The indices of the blocks (submatrices) associated with the corresponding eigenvalues in *w*; *iblock*(*i*)=1 if eigenvalue *w*(*i*) belongs to the first block from the top, =2 if *w*(*i*) belongs to the second block, etc.

indexw

INTEGER. Array, DIMENSION (*n*).

The indices of the eigenvalues within each block (submatrix); for example, *indexw*(*i*)= 10 and *iblock*(*i*)=2 imply that the *i*-th eigenvalue *w*(*i*) is the 10-th eigenvalue in the second block.

gers

REAL for slarre

DOUBLE PRECISION for dlarre

Array, DIMENSION (2*n*). The *n* Gerschgorin intervals (the *i*-th Gerschgorin interval is (*gers*(2*i*-1), *gers*(2*i*)).

pivmin

REAL for slarre

DOUBLE PRECISION for dlarre

The minimum pivot in the Sturm sequence for *T* .

info

INTEGER.

If *info* = 0: successful exit

If *info* > 0: A problem occured in ?larre. If *info* = 5, the Rayleigh Quotient Iteration failed to converge to full accuracy.

If *info* < 0: One of the called subroutines signaled an internal problem. Inspection of the corresponding parameter *info* for further information is required.

- If *info* = -1, there is a problem in ?larrd
- If *info* = -2, no base representation could be found in maxtry iterations. Increasing maxtry and recompilation might be a remedy.
- If *info* = -3, there is a problem in ?larrb when computing the refined root representation for ?lasq2.

- If *info* = -4, there is a problem in ?larrb when preforming bisection on the desired part of the spectrum.
- If *info* = -5, there is a problem in ?lasq2.
- If *info* = -6, there is a problem in ?lasq2.

?larrf

Finds a new relatively robust representation such that at least one of the eigenvalues is relatively isolated.

Syntax

```
call slarrf( n, d, l, ld, clstrt, clend, w, wgap, werr, spdiam, clgapl, clgapr, pivmin, sigma, dplus, lplus, work, info )
```

```
call dlarrf( n, d, l, ld, clstrt, clend, w, wgap, werr, spdiam, clgapl, clgapr, pivmin, sigma, dplus, lplus, work, info )
```

Include Files

- mkl.fi

Description

Given the initial representation $L*D*L^T$ and its cluster of close eigenvalues (in a relative measure), *w*(*clstrt*), *w*(*clstrt*+1), ... *w*(*clend*), the routine ?larrf finds a new relatively robust representation

$$L*D*L^T - \sigma_i*I = L(+)*D(+)*L(+)^T$$

such that at least one of the eigenvalues of $L(+)*D*(+)*L(+)^T$ is relatively isolated.

Input Parameters

n

INTEGER. The order of the matrix (subblock, if the matrix is splitted).

d

REAL for slarrf

DOUBLE PRECISION for dlarrf

Array, DIMENSION (*n*). The *n* diagonal elements of the diagonal matrix *D*.

l

REAL for slarrf

DOUBLE PRECISION for dlarrf

Array, DIMENSION (*n*-1).

The (*n*-1) subdiagonal elements of the unit bidiagonal matrix *L*.

ld

REAL for slarrf

DOUBLE PRECISION for dlarrf

Array, DIMENSION (*n*-1).

The n-1 elements L_i*D_i.

clstrt INTEGER. The index of the first eigenvalue in the cluster.

clend INTEGER. The index of the last eigenvalue in the cluster.

w REAL for slarrf

DOUBLE PRECISION for dlarrf

Array, DIMENSION ≥ (*clend* -*clstrt*+1). The eigenvalue approximations of $L*D*L^T$ in ascending order. *w*(*clstrt*) through *w*(*clend*) form the cluster of relatively close eigenvalues.

wgap REAL for slarrf

DOUBLE PRECISION for dlarrf

Array, DIMENSION ≥ (*clend* -*clstrt*+1). The separation from the right neighbor eigenvalue in *w*.

werr REAL for slarrf

DOUBLE PRECISION for dlarrf

Array, DIMENSION ≥ (*clend* -*clstrt*+1). On input, *werr* contains the semiwidth of the uncertainty interval of the corresponding eigenvalue approximation in *w*.

spdiam REAL for slarrf

DOUBLE PRECISION for dlarrf

Estimate of the spectral diameter obtained from the Gerschgorin intervals.

clgapl, *clgapr* REAL for slarrf

DOUBLE PRECISION for dlarrf

Absolute gap on each end of the cluster. Set by the calling routine to protect against shifts too close to eigenvalues outside the cluster.

pivmin REAL for slarrf

DOUBLE PRECISION for dlarrf

The minimum pivot allowed in the Sturm sequence.

work REAL for slarrf

DOUBLE PRECISION for dlarrf

Workspace array, DIMENSION (2*n).

Output Parameters

wgap On output, the gaps are refined.

sigma REAL for slarrf

DOUBLE PRECISION for dlarrf

The shift used to form $L(+)*D*(+)*L(+)^T$.

dplus REAL for slarrf

DOUBLE PRECISION for dlarrf

Array, DIMENSION (*n*). The *n* diagonal elements of the diagonal matrix *D*(+).

lplus — REAL for slarrf

DOUBLE PRECISION for dlarrf

Array, DIMENSION (*n*). The first (*n*-1) elements of *lplus* contain the subdiagonal elements of the unit bidiagonal matrix *L*(+).

?larrj

Performs refinement of the initial estimates of the eigenvalues of the matrix T.

Syntax

```
call slarrj( n, d, e2, ifirst, ilast, rtol, offset, w, werr, work, iwork, pivmin, spdiam, info )
call dlarrj( n, d, e2, ifirst, ilast, rtol, offset, w, werr, work, iwork, pivmin, spdiam, info )
```

Include Files

- mkl.fi

Description

Given the initial eigenvalue approximations of *T*, this routine does bisection to refine the eigenvalues of *T*, *w*(*ifirst-offset*) through *w*(*ilast-offset*), to more accuracy. Initial guesses for these eigenvalues are input in *w*, the corresponding estimate of the error in these guesses in *werr*. During bisection, intervals [a,b] are maintained by storing their mid-points and semi-widths in the arrays *w* and *werr* respectively.

Input Parameters

n — INTEGER. The order of the matrix *T*.

d — REAL for slarrj

DOUBLE PRECISION for dlarrj

Array, DIMENSION (*n*).

Contains *n* diagonal elements of the matrix *T*.

e2 — REAL for slarrj

DOUBLE PRECISION for dlarrj

Array, DIMENSION (*n*-1).

Contains (*n*-1) squared sub-diagonal elements of the *T*.

ifirst — INTEGER.

The index of the first eigenvalue to be computed.

ilast — INTEGER.

The index of the last eigenvalue to be computed.

rtol

REAL for slarrj

DOUBLE PRECISION for dlarrj

Tolerance for the convergence of the bisection intervals. An interval [a,b] is considered to be converged if (b-a) ≤ *rtol**max(|a|,|b|).

offset

INTEGER.

Offset for the arrays *w* and *werr*, that is the *ifirst-offset* through *ilast-offset* elements of these arrays are to be used.

w

REAL for slarrj

DOUBLE PRECISION for dlarrj

Array, DIMENSION (*n*).

On input, *w*(*ifirst-offset*) through *w*(*ilast-offset*) are estimates of the eigenvalues of $L*D*L^T$ indexed *ifirst* through *ilast*.

werr

REAL for slarrj

DOUBLE PRECISION for dlarrj

Array, DIMENSION (*n*).

On input, *werr*(*ifirst-offset*) through *werr*(*ilast-offset*) are the errors in the estimates of the corresponding elements in *w*.

work

REAL for slarrj

DOUBLE PRECISION for dlarrj

Workspace array, DIMENSION (2**n*).

iwork

INTEGER.

Workspace array, DIMENSION (2**n*).

pivmin

REAL for slarrj

DOUBLE PRECISION for dlarrj

The minimum pivot in the Sturm sequence for the matrix *T*.

spdiam

REAL for slarrj

DOUBLE PRECISION for dlarrj

The spectral diameter of the matrix *T*.

Output Parameters

w

On exit, contains the refined estimates of the eigenvalues.

werr

On exit, contains the refined errors in the estimates of the corresponding elements in *w*.

info

INTEGER.

Now it is not used and always is set to 0.

?larrk

Computes one eigenvalue of a symmetric tridiagonal matrix T to suitable accuracy.

Syntax

```
call slarrk( n, iw, gl, gu, d, e2, pivmin, reltol, w, werr, info )
call dlarrk( n, iw, gl, gu, d, e2, pivmin, reltol, w, werr, info )
```

Include Files

- mkl.fi

Description

The routine computes one eigenvalue of a symmetric tridiagonal matrix *T* to suitable accuracy. This is an auxiliary code to be called from ?stemr.

To avoid overflow, the matrix must be scaled so that its largest element is no greater than $(overflow^{1/2}*underflow^{1/4})$ in absolute value, and for greatest accuracy, it should not be much smaller than that. For more details see [Kahan66].

Input Parameters

n
INTEGER. The order of the matrix *T*. ($n \geq 1$).

iw
INTEGER.
The index of the eigenvalue to be returned.

gl, *gu*
REAL for slarrk
DOUBLE PRECISION for dlarrk
An upper and a lower bound on the eigenvalue.

d
REAL for slarrk
DOUBLE PRECISION for dlarrk
Array, DIMENSION (*n*).
Contains *n* diagonal elements of the matrix *T*.

e2
REAL for slarrk
DOUBLE PRECISION for dlarrk
Array, DIMENSION (*n*-1).
Contains (*n*-1) squared off-diagonal elements of the *T*.

pivmin
REAL for slarrk
DOUBLE PRECISION for dlarrk
The minimum pivot in the Sturm sequence for the matrix *T*.

reltol
REAL for slarrk
DOUBLE PRECISION for dlarrk

The minimum relative width of an interval. When an interval is narrower than *reltol* times the larger (in magnitude) endpoint, then it is considered to be sufficiently small, that is converged. Note: this should always be at least *radix*machine epsilon*.

Output Parameters

w

REAL for slarrk

DOUBLE PRECISION for dlarrk

Contains the eigenvalue approximation.

werr

REAL for slarrk

DOUBLE PRECISION for dlarrk

Contains the error bound on the corresponding eigenvalue approximation in *w*.

info

INTEGER.

= 0: Eigenvalue converges

= -1: Eigenvalue does not converge

?larrr

Performs tests to decide whether the symmetric tridiagonal matrix T warrants expensive computations which guarantee high relative accuracy in the eigenvalues.

Syntax

```
call slarrr( n, d, e, info )
call dlarrr( n, d, e, info )
```

Include Files

- mkl.fi

Description

The routine performs tests to decide whether the symmetric tridiagonal matrix *T* warrants expensive computations which guarantee high relative accuracy in the eigenvalues.

Input Parameters

n

INTEGER. The order of the matrix *T*. (*n*> 0).

d

REAL for slarrr

DOUBLE PRECISION for dlarrr

Array, DIMENSION (*n*).

Contains *n* diagonal elements of the matrix *T*.

e

REAL for slarrr

DOUBLE PRECISION for dlarrr

Array, DIMENSION (*n*).

The first (*n*-1) entries contain sub-diagonal elements of the tridiagonal matrix *T*; e(*n*) is set to 0.

Output Parameters

info INTEGER.

= 0: the matrix warrants computations preserving relative accuracy (default value).

= -1: the matrix warrants computations guaranteeing only absolute accuracy.

?larrv

*Computes the eigenvectors of the tridiagonal matrix T = L*D*L^T given L, D and the eigenvalues of L*D*L^T.*

Syntax

```
call slarrv( n, vl, vu, d, l, pivmin, isplit, m, dol, dou, minrgp, rtol1, rtol2, w, werr, wgap, iblock, indexw, gers, z, ldz, isuppz, work, iwork, info )
call dlarrv( n, vl, vu, d, l, pivmin, isplit, m, dol, dou, minrgp, rtol1, rtol2, w, werr, wgap, iblock, indexw, gers, z, ldz, isuppz, work, iwork, info )
call clarrv( n, vl, vu, d, l, pivmin, isplit, m, dol, dou, minrgp, rtol1, rtol2, w, werr, wgap, iblock, indexw, gers, z, ldz, isuppz, work, iwork, info )
call zlarrv( n, vl, vu, d, l, pivmin, isplit, m, dol, dou, minrgp, rtol1, rtol2, w, werr, wgap, iblock, indexw, gers, z, ldz, isuppz, work, iwork, info )
```

Include Files

- mkl.fi

Description

The routine ?larrv computes the eigenvectors of the tridiagonal matrix $T = L*D*L^T$ given *L*, *D* and approximations to the eigenvalues of $L*D*L^T$.

The input eigenvalues should have been computed by slarre for real flavors (slarrv/clarrv) and by dlarre for double precision flavors (dlarre/zlarre).

Input Parameters

n INTEGER. The order of the matrix. *n* ≥ 0.

vl, *vu* REAL for slarrv/clarrv

DOUBLE PRECISION for dlarrv/zlarrv

Lower and upper bounds respectively of the interval that contains the desired eigenvalues. *vl* < *vu*. Needed to compute gaps on the left or right end of the extremal eigenvalues in the desired range.

d

REAL for slarrv/clarrv

DOUBLE PRECISION for dlarrv/zlarrv

Array, DIMENSION (*n*). On entry, the *n* diagonal elements of the diagonal matrix *D*.

l

REAL for slarrv/clarrv

DOUBLE PRECISION for dlarrv/zlarrv

Array, DIMENSION (*n*).

On entry, the (*n*-1) subdiagonal elements of the unit bidiagonal matrix *L* are contained in elements 1 to *n*-1 of *L* if the matrix is not splitted. At the end of each block the corresponding shift is stored as given by slarre for real flavors and by dlarre for double precision flavors.

pivmin

REAL for slarrv/clarrv

DOUBLE PRECISION for dlarrv/zlarrv

The minimum pivot allowed in the Sturm sequence.

isplit

INTEGER. Array, DIMENSION (*n*).

The splitting points, at which *T* breaks up into blocks. The first block consists of rows/columns 1 to *isplit*(1), the second of rows/columns *isplit*(1)+1 through *isplit*(2), etc.

m

INTEGER. The total number of eigenvalues found.

$0 \le m \le n$. If *range* = 'A', $m = n$, and if *range* = 'I', $m = iu - il + 1$.

dol, *dou*

INTEGER.

If you want to compute only selected eigenvectors from all the eigenvalues supplied, specify an index range *dol*:*dou*. Or else apply the setting *dol*=1, *dou*=*m*. Note that *dol* and *dou* refer to the order in which the eigenvalues are stored in *w*.

If you want to compute only selected eigenpairs, then the columns *dol*-1 to *dou*+1 of the eigenvector space *Z* contain the computed eigenvectors. All other columns of *Z* are set to zero.

minrgp, *rtol1*, *rtol2*

REAL for slarrv/clarrv

DOUBLE PRECISION for dlarrv/zlarrv

Parameters for bisection. An interval [LEFT,RIGHT] has converged if RIGHT-LEFT.LT.MAX(*rtol1**gap, *rtol2**max(|LEFT|,|RIGHT|)).

w

REAL for slarrv/clarrv

DOUBLE PRECISION for dlarrv/zlarrv

Array, DIMENSION (*n*). The first *m* elements of *w* contain the approximate eigenvalues for which eigenvectors are to be computed. The eigenvalues should be grouped by split-off block and ordered from smallest to largest within the block (the output array *w* from ?larre is expected here). These eigenvalues are set with respect to the shift of the corresponding root representation for their block.

werr
REAL for slarrv/clarrv
DOUBLE PRECISION for dlarrv/zlarrv
Array, DIMENSION (*n*). The first *m* elements contain the semiwidth of the uncertainty interval of the corresponding eigenvalue in *w*.

wgap
REAL for slarrv/clarrv
DOUBLE PRECISION for dlarrv/zlarrv
Array, DIMENSION (*n*). The separation from the right neighbor eigenvalue in *w*.

iblock
INTEGER. Array, DIMENSION (*n*).
The indices of the blocks (submatrices) associated with the corresponding eigenvalues in *w*; *iblock*(*i*)=1 if eigenvalue *w*(*i*) belongs to the first block from the top, =2 if *w*(*i*) belongs to the second block, etc.

indexw
INTEGER. Array, DIMENSION (*n*).
The indices of the eigenvalues within each block (submatrix); for example, *indexw*(*i*)= 10 and *iblock*(*i*)=2 imply that the *i*-th eigenvalue *w*(*i*) is the 10-th eigenvalue in the second block.

gers
REAL for slarrv/clarrv
DOUBLE PRECISION for dlarrv/zlarrv
Array, DIMENSION (2**n*). The *n* Gerschgorin intervals (the *i*-th Gerschgorin interval is (*gers*(2**i*-1), *gers*(2**i*)). The Gerschgorin intervals should be computed from the original unshifted matrix.

ldz
INTEGER. The leading dimension of the output array *Z*. *ldz*≥ 1, and if *jobz* = 'V', *ldz*≥ max(1,*n*).

work
REAL for slarrv/clarrv
DOUBLE PRECISION for dlarrv/zlarrv
Workspace array, DIMENSION (12**n*).

iwork
INTEGER.
Workspace array, DIMENSION (7**n*).

Output Parameters

d
On exit, *d* may be overwritten.

l
On exit, *l* is overwritten.

w
On exit, *w* holds the eigenvalues of the unshifted matrix.

werr
On exit, *werr* contains refined values of its input approximations.

wgap
On exit, *wgap* contains refined values of its input approximations. Very small gaps are changed.

z
REAL for slarrv
DOUBLE PRECISION for dlarrv

`COMPLEX` for `clarrv`

`DOUBLE COMPLEX` for `zlarrv`

Array, `DIMENSION` (*ldz*, max(1,*m*)).

If *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *T* corresponding to the input eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*).

NOTE
The user must ensure that at least max(1,*m*) columns are supplied in the array *z*.

isuppz

`INTEGER` .

Array, `DIMENSION(2*max(1,m))`. The support of the eigenvectors in *z*, that is, the indices indicating the nonzero elements in *z*. The *i*-th eigenvector is nonzero only in elements *isuppz*(2*i*-1) through *isuppz*(2*i*).

info

`INTEGER`.

If *info* = 0: successful exit

If *info* > 0: A problem occured in `?larrv`. If *info* = 5, the Rayleigh Quotient Iteration failed to converge to full accuracy.

If *info* < 0: One of the called subroutines signaled an internal problem. Inspection of the corresponding parameter *info* for further information is required.

- If *info* = -1, there is a problem in `?larrb` when refining a child eigenvalue;
- If *info* = -2, there is a problem in `?larrf` when computing the relatively robust representation (RRR) of a child. When a child is inside a tight cluster, it can be difficult to find an RRR. A partial remedy from the user's point of view is to make the parameter *minrgp* smaller and recompile. However, as the orthogonality of the computed vectors is proportional to 1/*minrgp*, you should be aware that you might be trading in precision when you decrease *minrgp*.
- If *info* = -3, there is a problem in `?larrb` when refining a single eigenvalue after the Rayleigh correction was rejected.

`?larrf`

?lartg

Generates a plane rotation with real cosine and real/ complex sine.

Syntax

```
call slartg( f, g, cs, sn, r )
call dlartg( f, g, cs, sn, r )
```

```
call clartg( f, g, cs, sn, r )
call zlartg( f, g, cs, sn, r )
```

Include Files

- mkl.fi

Description

The routine generates a plane rotation so that

$$\begin{bmatrix} cs & sn \\ -conjg(sn) & cs \end{bmatrix} \cdot \begin{bmatrix} f \\ g \end{bmatrix} = \begin{bmatrix} r \\ 0 \end{bmatrix}$$

where $cs^2 + |sn|^2 = 1$

This is a slower, more accurate version of the BLAS Level 1 routine ?rotg, except for the following differences.

For slartg/dlartg:

f and *g* are unchanged on return;

If $g=0$, then *cs*=1 and *sn*=0;

If $f=0$ and $g \neq 0$, then $cs=0$ and $sn=1$ without doing any floating point operations (saves work in ?bdsqr when there are zeros on the diagonal);

If *f* exceeds *g* in magnitude, *cs* will be positive.

For clartg/zlartg:

f and *g* are unchanged on return;

If $g=0$, then $cs=1$ and $sn=0$;

If $f=0$, then $cs=0$ and *sn* is chosen so that *r* is real.

Input Parameters

f, *g*

REAL for slartg

DOUBLE PRECISION for dlartg

COMPLEX for clartg

DOUBLE COMPLEX for zlartg

The first and second component of vector to be rotated.

Output Parameters

cs

REAL for slartg/clartg

DOUBLE PRECISION for dlartg/zlartg

The cosine of the rotation.

sn	REAL for slartg DOUBLE PRECISION for dlartg COMPLEX for clartg DOUBLE COMPLEX for zlartg The sine of the rotation.
r	REAL for slartg DOUBLE PRECISION for dlartg COMPLEX for clartg DOUBLE COMPLEX for zlartg The nonzero component of the rotated vector.

?lartgp

Generates a plane rotation.

Syntax

```
call slartgp( f, g, cs, sn, r )
call dlartgp( f, g, cs, sn, r )
call lartgp( f,g,cs,sn,r )
```

Include Files

- mkl.fi

Description

The routine generates a plane rotation so that

$$\begin{bmatrix} cs & sn \\ -sn & cs \end{bmatrix} \cdot \begin{bmatrix} f \\ g \end{bmatrix} = \begin{bmatrix} r \\ 0 \end{bmatrix}$$

where $cs^2 + sn^2 = 1$

This is a slower, more accurate version of the BLAS Level 1 routine ?rotg, except for the following differences:

- *f* and *g* are unchanged on return.
- If *g*=0, then *cs*=(+/-)1 and *sn*=0.
- If *f*=0 and *g*≠ 0, then *cs*=0 and *sn*=(+/-)1.

The sign is chosen so that *r*≥ 0.

Input Parameters

The data types are given for the Fortran interface.

f, *g*

REAL for slartgp

DOUBLE PRECISION for dlartgp

The first and second component of the vector to be rotated.

Output Parameters

cs

REAL for slartgp

DOUBLE PRECISION for dlartgp

The cosine of the rotation.

sn

REAL for slartgp

DOUBLE PRECISION for dlartgp

The sine of the rotation.

r

REAL for slartgp

DOUBLE PRECISION for dlartgp

The nonzero component of the rotated vector.

info

INTEGER. If *info* = 0, the execution is successful.

If *info* =-1,*f* is NaN.

If *info* = -2, *g* is NaN.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine ?lartgp interface are as follows:

f Holds the first component of the vector to be rotated.

g Holds the second component of the vector to be rotated.

cs Holds the cosine of the rotation.

sn Holds the sine of the rotation.

r Holds the nonzero component of the rotated vector.

See Also

?rotg

?lartg

?lartgs

?lartgs

Generates a plane rotation designed to introduce a bulge in implicit QR iteration for the bidiagonal SVD problem.

Syntax

```
call slartgs( x, y, sigma, cs, sn )
```

```
call dlartgs( x, y, sigma, cs, sn )
call lartgs( x,y,sigma,cs,sn )
```

Include Files

- mkl.fi

Description

The routine generates a plane rotation designed to introduce a bulge in Golub-Reinsch-style implicit QR iteration for the bidiagonal SVD problem. *x* and *y* are the top-row entries, and *sigma* is the shift. The computed *cs* and *sn* define a plane rotation that satisfies the following:

$$\begin{bmatrix} cs & sn \\ -sn & cs \end{bmatrix} \cdot \begin{bmatrix} x^2 - sigma \\ x * y \end{bmatrix} = \begin{bmatrix} r \\ 0 \end{bmatrix}$$

with *r* nonnegative.

If x^2 – *sigma* and *x* * *y* are 0, the rotation is by $\pi/2$

Input Parameters

The data types are given for the Fortran interface.

x, *y*
REAL for slartgs
DOUBLE PRECISION for dlartgs
The (1,1) and (1,2) entries of an upper bidiagonal matrix, respectively.

sigma
REAL for slartgs
DOUBLE PRECISION for dlartgs
Shift

Output Parameters

cs
REAL for slartgs
DOUBLE PRECISION for dlartgs
The cosine of the rotation.

sn
REAL for slartgs
DOUBLE PRECISION for dlartgs
The sine of the rotation.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine ?lartgs interface are as follows:

x	Holds the (1,1) entry of an upper diagonal matrix.
y	Holds the (1,2) entry of an upper diagonal matrix.
sigma	Holds the shift.
cs	Holds the cosine of the rotation.
sn	Holds the sine of the rotation.

?lartv

Applies a vector of plane rotations with real cosines and real/complex sines to the elements of a pair of vectors.

Syntax

```
call slartv( n, x, incx, y, incy, c, s, incc )
call dlartv( n, x, incx, y, incy, c, s, incc )
call clartv( n, x, incx, y, incy, c, s, incc )
call zlartv( n, x, incx, y, incy, c, s, incc )
```

Include Files

- mkl.fi

Description

The routine applies a vector of real/complex plane rotations with real cosines to elements of the real/complex vectors *x* and *y*. For `i = 1,2,...,n`

$$\begin{bmatrix} x_i \\ y_i \end{bmatrix} := \begin{bmatrix} c(i) & s(i) \\ -\mathrm{conjg}(s(i)) & c(i) \end{bmatrix} \begin{bmatrix} x_i \\ y_i \end{bmatrix}$$

Input Parameters

n	INTEGER. The number of plane rotations to be applied.
x, *y*	REAL for slartv DOUBLE PRECISION for dlartv COMPLEX for clartv DOUBLE COMPLEX for zlartv

	Arrays, DIMENSION (1+(*n*-1)***incx*) and (1+(*n*-1)***incy*), respectively. The input vectors *x* and *y*.
incx	INTEGER. The increment between elements of *x*. *incx* > 0.
incy	INTEGER. The increment between elements of *y*. *incy* > 0.
c	REAL for slartv/clartv DOUBLE PRECISION for dlartv/zlartv Array, DIMENSION (1+(*n*-1)***incc*). The cosines of the plane rotations.
s	REAL for slartv DOUBLE PRECISION for dlartv COMPLEX for clartv DOUBLE COMPLEX for zlartv Array, DIMENSION (1+(*n*-1)***incc*). The sines of the plane rotations.
incc	INTEGER. The increment between elements of *c* and *s*. *incc* > 0.

Output Parameters

x, *y*	The rotated vectors *x* and *y*.

?laruv

Returns a vector of n random real numbers from a uniform distribution.

Syntax

```
call slaruv( iseed, n, x )
call dlaruv( iseed, n, x )
```

Include Files

- mkl.fi

Description

The routine ?laruv returns a vector of *n* random real numbers from a uniform (0,1) distribution (n ≤ 128).

This is an auxiliary routine called by ?larnv.

Input Parameters

iseed	INTEGER. Array, DIMENSION (4). On entry, the seed of the random number generator; the array elements must be between 0 and 4095, and *iseed*(4) must be odd.
n	INTEGER. The number of random numbers to be generated. *n* ≤ 128.

Output Parameters

x	REAL for slaruv DOUBLE PRECISION for dlaruv Array, DIMENSION (*n*). The generated random numbers.
seed	On exit, the seed is updated.

?larz

Applies an elementary reflector (as returned by ?tzrzf) to a general matrix.

Syntax

```
call slarz( side, m, n, l, v, incv, tau, c, ldc, work )
call dlarz( side, m, n, l, v, incv, tau, c, ldc, work )
call clarz( side, m, n, l, v, incv, tau, c, ldc, work )
call zlarz( side, m, n, l, v, incv, tau, c, ldc, work )
```

Include Files

- mkl.fi

Description

The routine ?larz applies a real/complex elementary reflector *H* to a real/complex *m*-by-*n* matrix *C*, from either the left or the right. *H* is represented in the forms

$H = I - tau * v * v^T$ for real flavors and $H = I - tau * v * v^H$ for complex flavors,

where *tau* is a real/complex scalar and v is a real/complex vector, respectively.

If $tau = 0$, then *H* is taken to be the unit matrix.

For complex flavors, to apply H^H (the conjugate transpose of *H*), supply conjg(*tau*) instead of *tau*.

H is a product of *k* elementary reflectors as returned by ?tzrzf.

Input Parameters

side	CHARACTER*1. If *side* = 'L': form *H***C* If *side* = 'R': form *C***H*
m	INTEGER. The number of rows of the matrix *C*.
n	INTEGER. The number of columns of the matrix *C*.
l	INTEGER. The number of entries of the vector *v* containing the meaningful part of the Householder vectors. If *side* = 'L', $m \geq l \geq 0$, if *side* = 'R', $n \geq l \geq 0$.

v
REAL for slarz
DOUBLE PRECISION for dlarz
COMPLEX for clarz
DOUBLE COMPLEX for zlarz
Array, DIMENSION (1+(*l*-1)*abs(*incv*)).
The vector *v* in the representation of *H* as returned by ?tzrzf.
v is not used if *tau* = 0.

incv
INTEGER. The increment between elements of *v*.
incv≠ 0.

tau
REAL for slarz
DOUBLE PRECISION for dlarz
COMPLEX for clarz
DOUBLE COMPLEX for zlarz
The value *tau* in the representation of *H*.

c
REAL for slarz
DOUBLE PRECISION for dlarz
COMPLEX for clarz
DOUBLE COMPLEX for zlarz
Array, DIMENSION (*ldc*,*n*).
On entry, the *m*-by-*n* matrix *C*.

ldc
INTEGER. The leading dimension of the array *c*.
ldc≥ max(1,*m*).

work
REAL for slarz
DOUBLE PRECISION for dlarz
COMPLEX for clarz
DOUBLE COMPLEX for zlarz
Workspace array, DIMENSION
(*n*) if *side* = 'L' or
(*m*) if *side* = 'R'.

Output Parameters

c
On exit, *C* is overwritten by the matrix *H***C* if *side* = 'L', or *C***H* if *side* = 'R'.

?larzb

Applies a block reflector or its transpose/conjugate-transpose to a general matrix.

Syntax

```
call slarzb( side, trans, direct, storev, m, n, k, l, v, ldv, t, ldt, c, ldc, work, ldwork )
call dlarzb( side, trans, direct, storev, m, n, k, l, v, ldv, t, ldt, c, ldc, work, ldwork )
call clarzb( side, trans, direct, storev, m, n, k, l, v, ldv, t, ldt, c, ldc, work, ldwork )
call zlarzb( side, trans, direct, storev, m, n, k, l, v, ldv, t, ldt, c, ldc, work, ldwork )
```

Include Files

- mkl.fi

Description

The routine applies a real/complex block reflector H or its transpose H^T (or the conjugate transpose H^H for complex flavors) to a real/complex distributed m-by-n matrix C from the left or the right. Currently, only *storev* = 'R' and *direct* = 'B' are supported.

Input Parameters

side

CHARACTER*1.

If *side* = 'L': apply H or H^T/H^H from the left

If *side* = 'R': apply H or H^T/H^H from the right

trans

CHARACTER*1.

If *trans* = 'N': apply H (No transpose)

If *trans*='C': apply H^H (conjugate transpose)

If *trans*='T': apply H^T (transpose transpose)

direct

CHARACTER*1.

Indicates how H is formed from a product of elementary reflectors

= 'F': $H = H(1)*H(2)*...*H(k)$ (forward, not supported)

= 'B': $H = H(k)*...*H(2)*H(1)$ (backward)

storev

CHARACTER*1.

Indicates how the vectors which define the elementary reflectors are stored:

= 'C': Column-wise (not supported)

= 'R': Row-wise.

m

INTEGER. The number of rows of the matrix C.

n INTEGER. The number of columns of the matrix *C*.

k INTEGER. The order of the matrix *T* (equal to the number of elementary reflectors whose product defines the block reflector).

l INTEGER. The number of columns of the matrix *V* containing the meaningful part of the Householder reflectors.

If *side* = 'L', *m*≥*l*≥ 0, if *side* = 'R', *n*≥*l*≥ 0.

v REAL for slarzb

DOUBLE PRECISION for dlarzb

COMPLEX for clarzb

DOUBLE COMPLEX for zlarzb

Array, DIMENSION (*ldv*, nv).

If *storev* = 'C', nv = *k*;

if *storev* = 'R', nv = *l*.

ldv INTEGER. The leading dimension of the array *v*.

If *storev* = 'C', *ldv*≥*l*; if *storev* = 'R', *ldv*≥*k*.

t REAL for slarzb

DOUBLE PRECISION for dlarzb

COMPLEX for clarzb

DOUBLE COMPLEX for zlarzb

Array, DIMENSION (*ldt*,*k*). The triangular *k*-by-*k* matrix *T* in the representation of the block reflector.

ldt INTEGER. The leading dimension of the array *t*.

ldt≥*k*.

c REAL for slarzb

DOUBLE PRECISION for dlarzb

COMPLEX for clarzb

DOUBLE COMPLEX for zlarzb

Array, DIMENSION (*ldc*,*n*). On entry, the *m*-by-*n* matrix *C*.

ldc INTEGER. The leading dimension of the array *c*.

ldc≥ max(1,*m*).

work REAL for slarzb

DOUBLE PRECISION for dlarzb

COMPLEX for clarzb

DOUBLE COMPLEX for zlarzb

Workspace array, DIMENSION (*ldwork*, *k*).

ldwork INTEGER. The leading dimension of the array *work*.

If *side* = 'L', *ldwork* ≥ max(1, *n*);

if *side* = 'R', *ldwork* ≥ max(1, *m*).

Output Parameters

c On exit, *C* is overwritten by $H*C$, or H^T/H^H*C, or $C*H$, or $C*H^T/H^H$.

?larzt

*Forms the triangular factor T of a block reflector H = I - V*T*V^H.*

Syntax

```
call slarzt( direct, storev, n, k, v, ldv, tau, t, ldt )
call dlarzt( direct, storev, n, k, v, ldv, tau, t, ldt )
call clarzt( direct, storev, n, k, v, ldv, tau, t, ldt )
call zlarzt( direct, storev, n, k, v, ldv, tau, t, ldt )
```

Include Files

- mkl.fi

Description

The routine forms the triangular factor *T* of a real/complex block reflector *H* of order > *n*, which is defined as a product of *k* elementary reflectors.

If *direct* = 'F', $H = H(1)*H(2)*...*H(k)$, and *T* is upper triangular.

If *direct* = 'B', $H = H(k)*...*H(2)*H(1)$, and *T* is lower triangular.

If *storev* = 'C', the vector which defines the elementary reflector *H*(*i*) is stored in the *i*-th column of the array *v*, and $H = I-V*T*V^T$ (for real flavors) or $H = I-V*T*V^H$ (for complex flavors).

If *storev* = 'R', the vector which defines the elementary reflector *H*(*i*) is stored in the *i*-th row of the array *v*, and $H = I-V^T*T*V$ (for real flavors) or $H = I-V^H*T*V$ (for complex flavors).

Currently, only *storev* = 'R' and *direct* = 'B' are supported.

Input Parameters

direct CHARACTER*1.

Specifies the order in which the elementary reflectors are multiplied to form the block reflector:

If *direct* = 'F': $H = H(1)*H(2)*...*H(k)$ (forward, not supported)

If *direct* = 'B': $H = H(k)*...*H(2)*H(1)$ (backward)

storev CHARACTER*1.

Specifies how the vectors which define the elementary reflectors are stored (see also *Application Notes* below):

If *storev* = 'C': column-wise (not supported)

If *storev* = 'R': row-wise

n INTEGER. The order of the block reflector *H*. *n* ≥ 0.

k INTEGER. The order of the triangular factor *T* (equal to the number of elementary reflectors). *k* ≥ 1.

v REAL for slarzt

DOUBLE PRECISION for dlarzt

COMPLEX for clarzt

DOUBLE COMPLEX for zlarzt

Array, DIMENSION

(*ldv*, *k*) if *storev* = 'C'

(*ldv*, *n*) if *storev* = 'R' The matrix *V*.

ldv INTEGER. The leading dimension of the array *v*.

If *storev* = 'C', *ldv* ≥ max(1,*n*);

if *storev* = 'R', *ldv* ≥ *k*.

tau REAL for slarzt

DOUBLE PRECISION for dlarzt

COMPLEX for clarzt

DOUBLE COMPLEX for zlarzt

Array, DIMENSION (*k*). *tau*(*i*) must contain the scalar factor of the elementary reflector *H*(*i*).

ldt INTEGER. The leading dimension of the output array *t*.

ldt ≥ *k*.

Output Parameters

t REAL for slarzt

DOUBLE PRECISION for dlarzt

COMPLEX for clarzt

DOUBLE COMPLEX for zlarzt

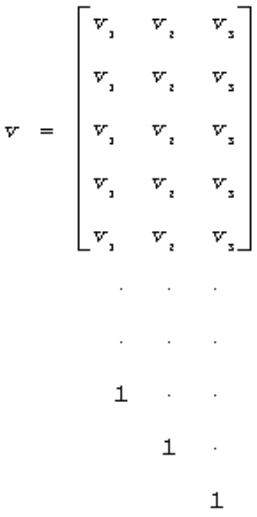
Array, DIMENSION (*ldt*,*k*). The *k*-by-*k* triangular factor *T* of the block reflector. If *direct* = 'F', *T* is upper triangular; if *direct* = 'B', *T* is lower triangular. The rest of the array is not used.

v The matrix *V*. See *Application Notes* below.

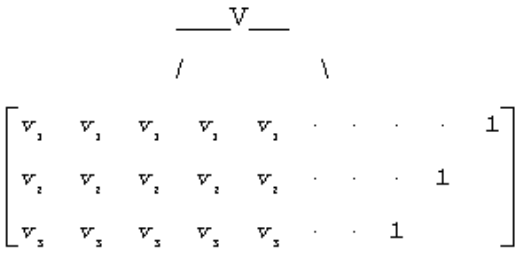
Application Notes

The shape of the matrix *V* and the storage of the vectors which define the *H*(i) is best illustrated by the following example with *n* = 5 and *k* = 3. The elements equal to 1 are not stored; the corresponding array elements are modified but restored on exit. The rest of the array is not used.

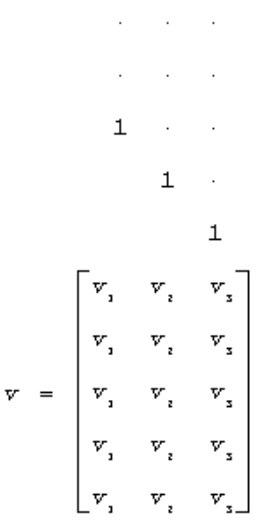
direct = 'F' and *storev* = 'C':



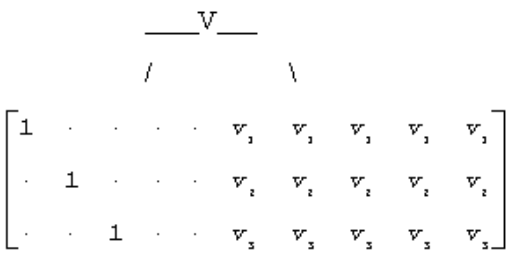
direct = 'F' and *storev* = 'R':



direct = 'B' and *storev* = 'C':



direct = 'B' and *storev* = 'R':



?las2

Computes singular values of a 2-by-2 triangular matrix.

Syntax

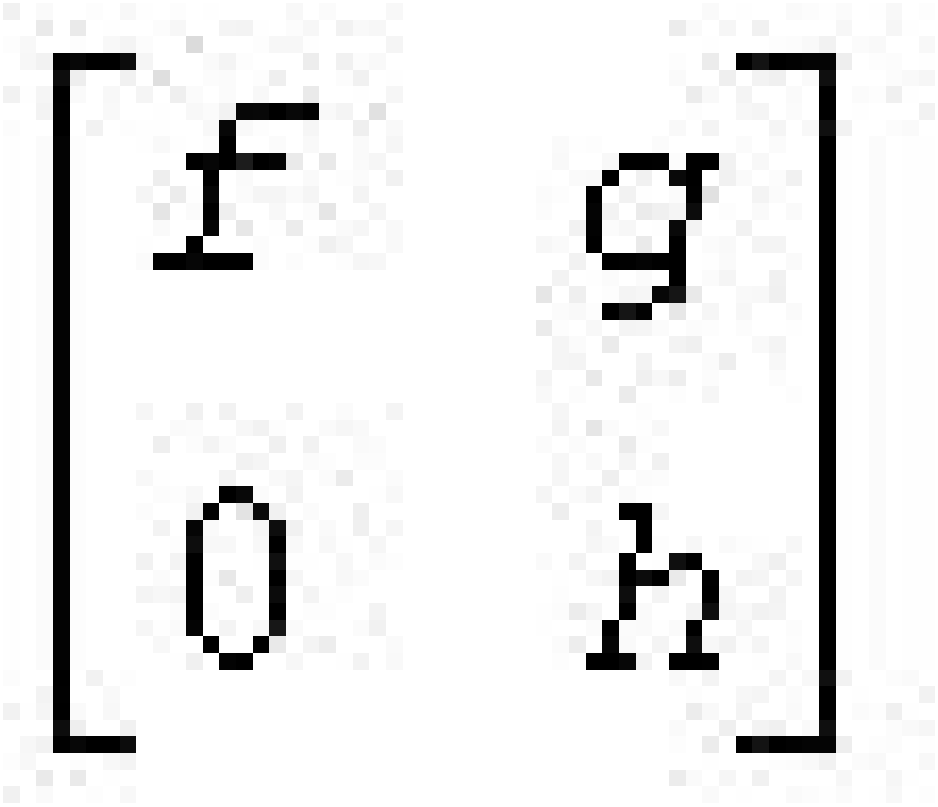
```
call slas2( f, g, h, ssmin, ssmax )
call dlas2( f, g, h, ssmin, ssmax )
```

Include Files

- mkl.fi

Description

The routine ?las2 computes the singular values of the 2-by-2 matrix



On return, *ssmin* is the smaller singular value and *SSMAX* is the larger singular value.

Input Parameters

f, *g*, *h*

REAL for slas2

DOUBLE PRECISION for dlas2

The (1,1), (1,2) and (2,2) elements of the 2-by-2 matrix, respectively.

Output Parameters

ssmin, *ssmax*

REAL for slas2

DOUBLE PRECISION for dlas2

The smaller and the larger singular values, respectively.

Application Notes

Barring over/underflow, all output quantities are correct to within a few units in the last place (*ulps*), even in the absence of a guard digit in addition/subtraction. In ieee arithmetic, the code works correctly if one matrix element is infinite. Overflow will not occur unless the largest singular value itself overflows, or is within a few ulps of overflow. (On machines with partial overflow, like the Cray, overflow may occur if the largest singular value is within a factor of 2 of overflow.) Underflow is harmless if underflow is gradual. Otherwise, results may correspond to a matrix modified by perturbations of size near the underflow threshold.

?lascl

Multiplies a general rectangular matrix by a real scalar defined as c_{to}/c_{from}.

Syntax

```
call slascl( type, kl, ku, cfrom, cto, m, n, a, lda, info )
call dlascl( type, kl, ku, cfrom, cto, m, n, a, lda, info )
call clascl( type, kl, ku, cfrom, cto, m, n, a, lda, info )
call zlascl( type, kl, ku, cfrom, cto, m, n, a, lda, info )
```

Include Files

- mkl.fi

Description

The routine ?lascl multiplies the *m*-by-*n* real/complex matrix *A* by the real scalar c_{to}/c_{from}. The operation is performed without over/underflow as long as the final result $c_{to}*A(i,j)/c_{from}$ does not over/underflow.

type specifies that *A* may be full, upper triangular, lower triangular, upper Hessenberg, or banded.

Input Parameters

type

CHARACTER*1. This parameter specifies the storage type of the input matrix.

= 'G': *A* is a full matrix.

= 'L': *A* is a lower triangular matrix.

= 'U': *A* is an upper triangular matrix.

= 'H': *A* is an upper Hessenberg matrix.

= 'B': *A* is a symmetric band matrix with lower bandwidth *kl* and upper bandwidth *ku* and with the only the lower half stored

= 'Q': *A* is a symmetric band matrix with lower bandwidth *kl* and upper bandwidth *ku* and with the only the upper half stored.

= 'Z': *A* is a band matrix with lower bandwidth *kl* and upper bandwidth *ku*. See description of the ?gbtrf function for storage details.

kl

INTEGER. The lower bandwidth of *A*. Referenced only if *type* = 'B', 'Q' or 'Z'.

ku

INTEGER. The upper bandwidth of *A*. Referenced only if *type* = 'B', 'Q' or 'Z'.

cfrom, *cto*

REAL for slascl/clascl

DOUBLE PRECISION for dlascl/zlascl

The matrix *A* is multiplied by *cto*/*cfrom*. A(*i*,*j*) is computed without over/underflow if the final result *cto**A(*i*,*j*)/*cfrom* can be represented without over/underflow. *cfrom* must be nonzero.

m	INTEGER. The number of rows of the matrix *A*. *m* ≥ 0.
n	INTEGER. The number of columns of the matrix *A*. *n* ≥ 0.
a	REAL for slascl DOUBLE PRECISION for dlascl COMPLEX for clascl DOUBLE COMPLEX for zlascl Array, size (*lda*, *n*). The matrix to be multiplied by *cto*/*cfrom*. See *type* for the storage type.
lda	INTEGER. The leading dimension of the array *a*. *lda* ≥ max(1,*m*).

Output Parameters

a	The multiplied matrix *A*.
info	INTEGER. If *info* = 0 - successful exit If *info* = -*i* < 0, the *i*-th argument had an illegal value.

?gbtrf

?lasd0

Computes the singular values of a real upper bidiagonal n-by-m matrix B with diagonal d and off-diagonal e. Used by ?bdsdc.

Syntax

```
call slasd0( n, sqre, d, e, u, ldu, vt, ldvt, smlsiz, iwork, work, info )
call dlasd0( n, sqre, d, e, u, ldu, vt, ldvt, smlsiz, iwork, work, info )
```

Include Files

- mkl.fi

Description

Using a divide and conquer approach, the routine ?lasd0 computes the singular value decomposition (SVD) of a real upper bidiagonal *n*-by-*m* matrix *B* with diagonal *d* and offdiagonal *e*, where *m* = *n* + *sqre*.

The algorithm computes orthogonal matrices *U* and *VT* such that *B* = *U*S*VT*. The singular values *S* are overwritten on *d*.

The related subroutine ?lasda computes only the singular values, and optionally, the singular vectors in compact form.

Input Parameters

n — INTEGER. On entry, the row dimension of the upper bidiagonal matrix. This is also the dimension of the main diagonal array *d*.

sqre — INTEGER. Specifies the column dimension of the bidiagonal matrix.

If *sqre* = 0: the bidiagonal matrix has column dimension *m* = *n*.

If *sqre* = 1: the bidiagonal matrix has column dimension *m* = *n*+1.

d — REAL for slasd0

DOUBLE PRECISION for dlasd0

Array, DIMENSION (*n*). On entry, *d* contains the main diagonal of the bidiagonal matrix.

e — REAL for slasd0

DOUBLE PRECISION for dlasd0

Array, DIMENSION (*m*-1). Contains the subdiagonal entries of the bidiagonal matrix. On exit, *e* is destroyed.

ldu — INTEGER. On entry, leading dimension of the output array *u*.

ldvt — INTEGER. On entry, leading dimension of the output array *vt*.

smlsiz — INTEGER. On entry, maximum size of the subproblems at the bottom of the computation tree.

iwork — INTEGER.

Workspace array, dimension must be at least (8*n*).

work — REAL for slasd0

DOUBLE PRECISION for dlasd0

Workspace array, dimension must be at least $(3m^2+2m)$.

Output Parameters

d — On exit *d*, If *info* = 0, contains singular values of the bidiagonal matrix.

u — REAL for slasd0

DOUBLE PRECISION for dlasd0

Array, DIMENSION at least (*ldq*, *n*). On exit, *u* contains the left singular vectors.

vt — REAL for slasd0

DOUBLE PRECISION for dlasd0

Array, DIMENSION at least (*ldvt*, *m*). On exit, vt^T contains the right singular vectors.

info — INTEGER.

If *info* = 0: successful exit.

If *info* = -*i* < 0, the *i*-th argument had an illegal value.

If *info* = 1, a singular value did not converge.

?lasd1

Computes the SVD of an upper bidiagonal matrix B of the specified size. Used by ?bdsdc.

Syntax

```
call slasd1( nl, nr, sqre, d, alpha, beta, u, ldu, vt, ldvt, idxq, iwork, work, info )
call dlasd1( nl, nr, sqre, d, alpha, beta, u, ldu, vt, ldvt, idxq, iwork, work, info )
```

Include Files

- mkl.fi

Description

The routine computes the SVD of an upper bidiagonal *n*-by-*m* matrix *B*, where *n* = *nl* + *nr* + 1 and *m* = *n* + *sqre*.

The routine ?lasd1 is called from ?lasd0.

A related subroutine ?lasd7 handles the case in which the singular values (and the singular vectors in factored form) are desired.

?lasd1 computes the SVD as follows:

$$VT = U(in)^* \begin{bmatrix} D1(in) & 0 & 0 & 0 \\ Z1^T & a & Z2^T & b \\ 0 & 0 & D2(in) & 0 \end{bmatrix} ^*VT(in)$$

= *U*(*out*)*(*D*(*out*) 0)**VT*(*out*)

whereZ^T = ($Z1^T a Z2^T b$) = $u^T * VT^T$, and *u* is a vector of dimension *m* with *alpha* and *beta* in the *nl*+1 and *nl* +2-th entries and zeros elsewhere; and the entry *b* is empty if *sqre* = 0.

The left singular vectors of the original matrix are stored in *u*, and the transpose of the right singular vectors are stored in *vt*, and the singular values are in *d*. The algorithm consists of three stages:

1. The first stage consists of deflating the size of the problem when there are multiple singular values or when there are zeros in the *Z* vector. For each such occurrence the dimension of the secular equation problem is reduced by one. This stage is performed by the routine ?lasd2.
2. The second stage consists of calculating the updated singular values. This is done by finding the square roots of the roots of the secular equation via the routine ?lasd4 (as called by ?lasd3). This routine also calculates the singular vectors of the current problem.
3. The final stage consists of computing the updated singular vectors directly using the updated singular values. The singular vectors for the current problem are multiplied with the singular vectors from the overall problem.

Input Parameters

nl

INTEGER. The row dimension of the upper block.

nl ≥ 1.

nr

INTEGER. The row dimension of the lower block.

nr ≥ 1.

sqre

INTEGER.

If *sqre* = 0: the lower block is an *nr*-by-*nr* square matrix.

If *sqre* = 1: the lower block is an *nr*-by-(*nr*+1) rectangular matrix. The bidiagonal matrix has row dimension *n* = *nl* + *nr* + 1, and column dimension *m* = *n* + *sqre*.

d

REAL for slasd1

DOUBLE PRECISION for dlasd1

Array, DIMENSION (*nl*+*nr*+1). *n* = *nl*+*nr*+1. On entry *d*(1:*nl*,1:*nl*) contains the singular values of the upper block; and *d*(*nl*+2:*n*) contains the singular values of the lower block.

alpha

REAL for slasd1

DOUBLE PRECISION for dlasd1

Contains the diagonal element associated with the added row.

beta

REAL for slasd1

DOUBLE PRECISION for dlasd1

Contains the off-diagonal element associated with the added row.

u

REAL for slasd1

DOUBLE PRECISION for dlasd1

Array, DIMENSION (*ldu*, *n*). On entry *u*(1:*nl*, 1:*nl*) contains the left singular vectors of the upper block; *u*(*nl*+2:*n*, *nl*+2:*n*) contains the left singular vectors of the lower block.

ldu

INTEGER. The leading dimension of the array *U*.

ldu ≥ max(1, *n*).

vt

REAL for slasd1

DOUBLE PRECISION for dlasd1

Array, DIMENSION (*ldvt*, *m*), where *m* = *n* + *sqre*.

On entry $vt(1:nl+1, 1:nl+1)^T$ contains the right singular vectors of the upper block; $vt(nl+2:m, nl+2:m)^T$ contains the right singular vectors of the lower block.

ldvt

INTEGER. The leading dimension of the array *vt*.

ldvt ≥ max(1, *M*).

iwork

INTEGER.

Workspace array, DIMENSION (4*n*).

work

REAL for slasd1

DOUBLE PRECISION for dlasd1

Workspace array, DIMENSION ($3m_2 + 2m$).

Output Parameters

d

On exit *d*(1:*n*) contains the singular values of the modified matrix.

alpha

On exit, the diagonal element associated with the added row deflated by max(abs(*alpha*), abs(*beta*), abs(D(I))), I = 1,n.

beta

On exit, the off-diagonal element associated with the added row deflated by max(abs(*alpha*), abs(*beta*), abs(D(I))), I = 1,n.

u

On exit *u* contains the left singular vectors of the bidiagonal matrix.

vt

On exit vt^T contains the right singular vectors of the bidiagonal matrix.

idxq

INTEGER.

Array, DIMENSION (*n*). Contains the permutation which will reintegrate the subproblem just solved back into sorted order, that is, *d*(*idxq*(*i* = 1, *n*)) will be in ascending order.

info

INTEGER.

If *info* = 0: successful exit.

If *info* = -*i* < 0, the *i*-th argument had an illegal value.

If *info* = 1, a singular value did not converge.

?lasd2

Merges the two sets of singular values together into a single sorted set. Used by ?bdsdc.

Syntax

call slasd2(*nl*, *nr*, *sqre*, *k*, *d*, *z*, *alpha*, *beta*, *u*, *ldu*, *vt*, *ldvt*, *dsigma*, *u2*, *ldu2*, *vt2*, *ldvt2*, *idxp*, *idx*, *idxp*, *idxq*, *coltyp*, *info*)

call dlasd2(*nl*, *nr*, *sqre*, *k*, *d*, *z*, *alpha*, *beta*, *u*, *ldu*, *vt*, *ldvt*, *dsigma*, *u2*, *ldu2*, *vt2*, *ldvt2*, *idxp*, *idx*, *idxp*, *idxq*, *coltyp*, *info*)

Include Files

- mkl.fi

Description

The routine ?lasd2 merges the two sets of singular values together into a single sorted set. Then it tries to deflate the size of the problem. There are two ways in which deflation can occur: when two or more singular values are close together or if there is a tiny entry in the *Z* vector. For each such occurrence the order of the related secular equation problem is reduced by one.

The routine ?lasd2 is called from ?lasd1.

Input Parameters

nl — INTEGER. The row dimension of the upper block.

nl≥ 1.

nr — INTEGER. The row dimension of the lower block.

nr≥ 1.

sqre — INTEGER.

If *sqre* = 0): the lower block is an *nr*-by-*nr* square matrix

If *sqre* = 1): the lower block is an *nr*-by-(*nr*+1) rectangular matrix. The bidiagonal matrix has *n* = *nl* + *nr* + 1 rows and *m* = *n* + *sqre*≥*n* columns.

d — REAL for slasd2

DOUBLE PRECISION for dlasd2

Array, DIMENSION (*n*). On entry *d* contains the singular values of the two submatrices to be combined.

alpha — REAL for slasd2

DOUBLE PRECISION for dlasd2

Contains the diagonal element associated with the added row.

beta — REAL for slasd2

DOUBLE PRECISION for dlasd2

Contains the off-diagonal element associated with the added row.

u — REAL for slasd2

DOUBLE PRECISION for dlasd2

Array, DIMENSION (*ldu*, *n*). On entry *u* contains the left singular vectors of two submatrices in the two square blocks with corners at (1,1), (*nl*, *nl*), and (*nl*+2, *nl*+2), (*n*,*n*).

ldu — INTEGER. The leading dimension of the array *u*.

ldu≥*n*.

ldu2 — INTEGER. The leading dimension of the output array *u2*. *ldu2*≥*n*.

vt — REAL for slasd2

DOUBLE PRECISION for dlasd2

Array, DIMENSION (*ldvt*, *m*). On entry, vt^T contains the right singular vectors of two submatrices in the two square blocks with corners at (1,1), (*nl*+1, *nl*+1), and (*nl*+2, *nl*+2), (*m*, *m*).

ldvt — INTEGER. The leading dimension of the array *vt*. *ldvt*≥*m*.

ldvt2 — INTEGER. The leading dimension of the output array *vt2*. *ldvt2*≥*m*.

idxp — INTEGER.

Workspace array, DIMENSION (*n*). This will contain the permutation used to place deflated values of *D* at the end of the array. On output *idxp*(2:*k*) points to the nondeflated *d*-values and *idxp*(*k*+1:*n*) points to the deflated singular values.

idx

INTEGER.

Workspace array, DIMENSION (*n*). This will contain the permutation used to sort the contents of *d* into ascending order.

coltyp

INTEGER.

Workspace array, DIMENSION (*n*). As workspace, this array contains a label that indicates which of the following types a column in the *u2* matrix or a row in the *vt2* matrix is:

1 : non-zero in the upper half only

2 : non-zero in the lower half only

3 : dense

4 : deflated.

idxq

INTEGER. Array, DIMENSION (*n*). This parameter contains the permutation that separately sorts the two sub-problems in *D* in the ascending order. Note that entries in the first half of this permutation must first be moved one position backwards and entries in the second half must have *nl*+1 added to their values.

Output Parameters

k

INTEGER. Contains the dimension of the non-deflated matrix, This is the order of the related secular equation. $1 \leq k \leq n$.

d

On exit *D* contains the trailing (*n*-*k*) updated singular values (those which were deflated) sorted into increasing order.

u

On exit *u* contains the trailing (*n*-*k*) updated left singular vectors (those which were deflated) in its last *n*-*k* columns.

z

REAL for slasd2

DOUBLE PRECISION for dlasd2

Array, DIMENSION (*n*). On exit, *z* contains the updating row vector in the secular equation.

dsigma

REAL for slasd2

DOUBLE PRECISION for dlasd2

Array, DIMENSION (*n*). Contains a copy of the diagonal elements (*k*-1 singular values and one zero) in the secular equation.

u2

REAL for slasd2

DOUBLE PRECISION for dlasd2

Array, DIMENSION (*ldu2*, *n*). Contains a copy of the first *k*-1 left singular vectors which will be used by ?lasd3 in a matrix multiply (?gemm) to solve for the new left singular vectors. *u2* is arranged into four blocks. The first

block contains a column with 1 at *nl*+1 and zero everywhere else; the second block contains non-zero entries only at and above *nl*; the third contains non-zero entries only below *nl*+1; and the fourth is dense.

vt — On exit, vt^T contains the trailing (*n*-*k*) updated right singular vectors (those which were deflated) in its last *n*-*k* columns. In case *sqre* =1, the last row of *vt* spans the right null space.

vt2 — REAL for slasd2

DOUBLE PRECISION for dlasd2

Array, DIMENSION (*ldvt2*, *n*). $vt2^T$ contains a copy of the first *k* right singular vectors which will be used by ?lasd3 in a matrix multiply (?gemm) to solve for the new right singular vectors. *vt2* is arranged into three blocks. The first block contains a row that corresponds to the special 0 diagonal element in *sigma*; the second block contains non-zeros only at and before *nl* +1; the third block contains non-zeros only at and after *nl* +2.

idxc — INTEGER. Array, DIMENSION (*n*). This will contain the permutation used to arrange the columns of the deflated *u* matrix into three groups: the first group contains non-zero entries only at and above *nl*, the second contains non-zero entries only below *nl*+2, and the third is dense.

coltyp — On exit, it is an array of dimension 4, with *coltyp*(*i*) being the dimension of the *i*-th type columns.

info — INTEGER.

If *info* = 0): successful exit

If *info* = -*i* < 0, the *i*-th argument had an illegal value.

?lasd3

Finds all square roots of the roots of the secular equation, as defined by the values in D and Z, and then updates the singular vectors by matrix multiplication. Used by ?bdsdc.

Syntax

```
call slasd3( nl, nr, sqre, k, d, q, ldq, dsigma, u, ldu, u2, ldu2, vt, ldvt, vt2, ldvt2,
idxc, ctot, z, info )
```

```
call dlasd3( nl, nr, sqre, k, d, q, ldq, dsigma, u, ldu, u2, ldu2, vt, ldvt, vt2, ldvt2,
idxc, ctot, z, info )
```

Include Files

- mkl.fi

Description

The routine ?lasd3 finds all the square roots of the roots of the secular equation, as defined by the values in *D* and *Z*.

It makes the appropriate calls to ?lasd4 and then updates the singular vectors by matrix multiplication.

The routine ?lasd3 is called from ?lasd1.

Input Parameters

nl

INTEGER. The row dimension of the upper block.

nl≥ 1.

nr

INTEGER. The row dimension of the lower block.

nr≥ 1.

sqre

INTEGER.

If *sqre* = 0): the lower block is an *nr*-by-*nr* square matrix.

If *sqre* = 1): the lower block is an *nr*-by-(*nr*+1) rectangular matrix. The bidiagonal matrix has *n* = *nl* + *nr* + 1 rows and *m* = *n* + *sqre*≥*n* columns.

k

INTEGER.The size of the secular equation, 1 ≤ *k* ≤ *n*.

q

REAL for slasd3

DOUBLE PRECISION for dlasd3

Workspace array, DIMENSION at least (*ldq*, *k*).

ldq

INTEGER. The leading dimension of the array *Q*.

ldq≥*k*.

dsigma

REAL for slasd3

DOUBLE PRECISION for dlasd3

Array, DIMENSION (*k*). The first *k* elements of this array contain the old roots of the deflated updating problem. These are the poles of the secular equation.

ldu

INTEGER. The leading dimension of the array *u*.

ldu≥*n*.

u2

REAL for slasd3

DOUBLE PRECISION for dlasd3

Array, DIMENSION (*ldu2*, *n*).

The first *k* columns of this matrix contain the non-deflated left singular vectors for the split problem.

ldu2

INTEGER. The leading dimension of the array *u2*.

ldu2≥*n*.

ldvt

INTEGER. The leading dimension of the array *vt*.

ldvt≥*n*.

vt2

REAL for slasd3

DOUBLE PRECISION for dlasd3

Array, DIMENSION (*ldvt2*, *n*).

The first *k* columns of *vt2*' contain the non-deflated right singular vectors for the split problem.

ldvt2 INTEGER. The leading dimension of the array *vt2*.

ldvt2≥*n*.

idxc INTEGER. Array, DIMENSION (*n*).

The permutation used to arrange the columns of u (and rows of *vt*) into three groups: the first group contains non-zero entries only at and above (or before) *nl* +1; the second contains non-zero entries only at and below (or after) *nl*+2; and the third is dense. The first column of *u* and the row of *vt* are treated separately, however. The rows of the singular vectors found by ?lasd4 must be likewise permuted before the matrix multiplies can take place.

ctot INTEGER. Array, DIMENSION (4). A count of the total number of the various types of columns in *u* (or rows in *vt*), as described in *idxc*.

The fourth column type is any column which has been deflated.

z REAL for slasd3

DOUBLE PRECISION for dlasd3

Array, DIMENSION (*k*). The first *k* elements of this array contain the components of the deflation-adjusted updating row vector.

Output Parameters

d REAL for slasd3

DOUBLE PRECISION for dlasd3

Array, DIMENSION (*k*). On exit the square roots of the roots of the secular equation, in ascending order.

u REAL for slasd3

DOUBLE PRECISION for dlasd3

Array, DIMENSION (*ldu*, *n*).

The last *n* - *k* columns of this matrix contain the deflated left singular vectors.

vt REAL for slasd3

DOUBLE PRECISION for dlasd3

Array, DIMENSION (*ldvt*, *m*).

The last *m* – *k* columns of *vt*' contain the deflated right singular vectors.

vt2 Destroyed on exit.

z Destroyed on exit.

info INTEGER.

If *info* = 0): successful exit.

If *info* = -*i* < 0, the *i*-th argument had an illegal value.

If *info* = 1, an singular value did not converge.

Application Notes

This code makes very mild assumptions about floating point arithmetic. It will work on machines with a guard digit in add/subtract, or on those binary machines without guard digits which subtract like the Cray XMP, Cray YMP, Cray C 90, or Cray 2. It could conceivably fail on hexadecimal or decimal machines without guard digits, but we know of none.

?lasd4

Computes the square root of the i-th updated eigenvalue of a positive symmetric rank-one modification to a positive diagonal matrix. Used by ?bdsdc*.*

Syntax

```
call slasd4( n, i, d, z, delta, rho, sigma, work, info)
call dlasd4( n, i, d, z, delta, rho, sigma, work, info )
```

Include Files

- mkl.fi

Description

The routine computes the square root of the *i*-th updated eigenvalue of a positive symmetric rank-one modification to a positive diagonal matrix whose entries are given as the squares of the corresponding entries in the array *d*, and that $0 \le d(i) < d(j)$ for $i < j$ and that $rho > 0$. This is arranged by the calling routine, and is no loss in generality. The rank-one modified system is thus

$diag(d)*diag(d) + rho*Z*Z^T$,

where the Euclidean norm of *Z* is equal to 1.The method consists of approximating the rational functions in the secular equation by simpler interpolating rational functions.

Input Parameters

n

INTEGER. The length of all arrays.

i

INTEGER.

The index of the eigenvalue to be computed. $1 \le i \le n$.

d

REAL for slasd4

DOUBLE PRECISION for dlasd4

Array, DIMENSION (*n*).

The original eigenvalues. They must be in order, $0 \le d(i) < d(j)$ for $i < j$.

z

REAL for slasd4

DOUBLE PRECISION for dlasd4

Array, DIMENSION (*n*).

The components of the updating vector.

rho

REAL for slasd4

DOUBLE PRECISION for dlasd4

The scalar in the symmetric updating formula.

work

REAL for slasd4

DOUBLE PRECISION for dlasd4

Workspace array, DIMENSION (*n*).

If *n*≠ 1, *work* contains (*d*(*j*) + *sigma_i*) in its *j*-th component.

If *n* = 1, then *work*(1) = 1.

Output Parameters

delta

REAL for slasd4

DOUBLE PRECISION for dlasd4

Array, DIMENSION (*n*).

If *n*≠ 1, *delta* contains (*d*(*j*) – *sigma_i*) in its *j*-th component.

If *n* = 1, then *delta* (1) = 1. The vector *delta* contains the information necessary to construct the (singular) eigenvectors.

sigma

REAL for slasd4

DOUBLE PRECISION for dlasd4

The computed *sigma_i*, the *i*-th updated eigenvalue.

info

INTEGER.

= 0: successful exit

> 0: If *info* = 1, the updating process failed.

?lasd5

Computes the square root of the i-th eigenvalue of a positive symmetric rank-one modification of a 2-by-2 diagonal matrix.Used by ?bdsdc.

Syntax

```
call slasd5( i, d, z, delta, rho, dsigma, work )
call dlasd5( i, d, z, delta, rho, dsigma, work )
```

Include Files

- mkl.fi

Description

The routine computes the square root of the *i*-th eigenvalue of a positive symmetric rank-one modification of a 2-by-2 diagonal matrix diag(*d*)*diag(*d*)+*rho***Z***Z^T

The diagonal entries in the array *d* must satisfy `0 ≤ d(i) < d(j)` for `i<i`, *rho* mustbe greater than 0, and that the Euclidean norm of the vector *Z* is equal to 1.

Input Parameters

i — `INTEGER`.The index of the eigenvalue to be computed. `i = 1` or `i = 2`.

d — `REAL` for `slasd5`

`DOUBLE PRECISION` for `dlasd5`

Array, `dimension` (2).

The original eigenvalues, `0 ≤ d(1) < d(2)`.

z — `REAL` for `slasd5`

`DOUBLE PRECISION` for `dlasd5`

Array, `dimension` (2).

The components of the updating vector.

rho — `REAL` for `slasd5`

`DOUBLE PRECISION` for `dlasd5`

The scalar in the symmetric updating formula.

work — `REAL` for `slasd5`

`DOUBLE PRECISION` for `dlasd5`

Workspace array, `dimension` (2). Contains (`d(j) + sigma_i`) in its *j*-th component.

Output Parameters

delta — `REAL` for `slasd5`

`DOUBLE PRECISION` for `dlasd5`

Array, `dimension` (2).

Contains (`d(j) - sigma_i`) in its *j*-th component. The vector *delta* contains the information necessary to construct the eigenvectors.

dsigma — `REAL` for `slasd5`

`DOUBLE PRECISION` for `dlasd5`

The computed *sigma_i*, the *i*-th updated eigenvalue.

?lasd6

Computes the SVD of an updated upper bidiagonal matrix obtained by merging two smaller ones by appending a row. Used by `?bdsdc`.

Syntax

```
call slasd6( icompq, nl, nr, sqre, d, vf, vl, alpha, beta, idxq, perm, givptr, givcol,
ldgcol, givnum, ldgnum, poles, difl, difr, z, k, c, s, work, iwork, info )
```

```
call dlasd6( icompq, nl, nr, sqre, d, vf, vl, alpha, beta, idxq, perm, givptr, givcol,
ldgcol, givnum, ldgnum, poles, difl, difr, z, k, c, s, work, iwork, info )
```

Include Files

- mkl.fi

Description

The routine ?lasd6 computes the *SVD* of an updated upper bidiagonal matrix *B* obtained by merging two smaller ones by appending a row. This routine is used only for the problem which requires all singular values and optionally singular vector matrices in factored form. *B* is an *n*-by-*m* matrix with $n = nl + nr + 1$ and $m = n + sqre$. A related subroutine, ?lasd1, handles the case in which all singular values and singular vectors of the bidiagonal matrix are desired. ?lasd6 computes the *SVD* as follows:

$$B = U(in)*\begin{bmatrix} D1(in) & 0 & 0 & 0 \\ Z1' & a & Z2' & b \\ 0 & 0 & D2(in) & 0 \end{bmatrix}*VT(in)$$

$= U(\text{out})*(D(\text{out})*VT(out)$

where $Z' = (Z1'\ aZ2'\ b) = u'*VT'$, and *u* is a vector of dimension *m* with *alpha* and *beta* in the *nl*+1 and *nl*+2-th entries and zeros elsewhere; and the entry b is empty if $sqre = 0$.

The singular values of *B* can be computed using *D1*, *D2*, the first components of all the right singular vectors of the lower block, and the last components of all the right singular vectors of the upper block. These components are stored and updated in *vf* and *vl*, respectively, in ?lasd6. Hence *U* and *VT* are not explicitly referenced.

The singular values are stored in *D*. The algorithm consists of two stages:

1. The first stage consists of deflating the size of the problem when there are multiple singular values or if there is a zero in the *Z* vector. For each such occurrence the dimension of the secular equation problem is reduced by one. This stage is performed by the routine ?lasd7.
2. The second stage consists of calculating the updated singular values. This is done by finding the roots of the secular equation via the routine ?lasd4 (as called by ?lasd8). This routine also updates *vf* and *vl* and computes the distances between the updated singular values and the old singular values. ?lasd6 is called from ?lasda.

Input Parameters

icompq — INTEGER. Specifies whether singular vectors are to be computed in factored form:

= 0: Compute singular values only

= 1: Compute singular vectors in factored form as well.

nl — INTEGER. The row dimension of the upper block.

$nl \geq 1$.

nr — INTEGER. The row dimension of the lower block.

	nr≥ 1.
sqre	INTEGER. = 0: the lower block is an *nr*-by-*nr* square matrix. = 1: the lower block is an *nr*-by-(*nr*+1) rectangular matrix. The bidiagonal matrix has row dimension *n*=*nl*+*nr*+1, and column dimension *m* = *n* + *sqre*.
d	REAL for slasd6 DOUBLE PRECISION for dlasd6 Array, dimension (*nl*+*nr*+1). On entry *d*(1:*nl*,1:*nl*) contains the singular values of the upper block, and *d*(*nl*+2:*n*) contains the singular values of the lower block.
vf	REAL for slasd6 DOUBLE PRECISION for dlasd6 Array, dimension (*m*). On entry, *vf*(1:*nl*+1) contains the first components of all right singular vectors of the upper block; and *vf*(*nl*+2:*m*) contains the first components of all right singular vectors of the lower block.
vl	REAL for slasd6 DOUBLE PRECISION for dlasd6 Array, dimension (*m*). On entry, *vl*(1:*nl*+1) contains the last components of all right singular vectors of the upper block; and *vl*(*nl*+2:*m*) contains the last components of all right singular vectors of the lower block.
alpha	REAL for slasd6 DOUBLE PRECISION for dlasd6 Contains the diagonal element associated with the added row.
beta	REAL for slasd6 DOUBLE PRECISION for dlasd6 Contains the off-diagonal element associated with the added row.
ldgcol	INTEGER.The leading dimension *of* the output array *givcol*, must be at least *n*.
ldgnum	INTEGER The leading dimension of the output arrays *givnum* and *poles*, must be at least *n*.
work	REAL for slasd6 DOUBLE PRECISION for dlasd6 Workspace array, dimension (4*m*).

iwork INTEGER

Workspace array, dimension (3*n*).

Output Parameters

d On exit *d*(1:*n*) contains the singular values of the modified matrix.

vf On exit, *vf* contains the first components of all right singular vectors of the bidiagonal matrix.

vl On exit, *vl* contains the last components of all right singular vectors of the bidiagonal matrix.

alpha On exit, the diagonal element associated with the added row deflated by max(abs(*alpha*), abs(*beta*), abs(D(I))), I = 1,n.

beta On exit, the off-diagonal element associated with the added row deflated by max(abs(*alpha*), abs(*beta*), abs(D(I))), I = 1,n.

idxq INTEGER .

Array, dimension (*n*). This contains the permutation which will reintegrate the subproblem just solved back into sorted order, that is, *d*(*idxq*(*i* = 1, *n*)) will be in ascending order.

perm INTEGER .

Array, dimension (*n*). The permutations (from deflation and sorting) to be applied to each block. Not referenced if *icompq* = 0.

givptr INTEGER. The number of Givens rotations which took place in this subproblem. Not referenced if *icompq* = 0.

givcol INTEGER .

Array, dimension (*ldgcol*, 2). Each pair of numbers indicates a pair of columns to take place in a Givens rotation. Not referenced if *icompq* = 0.

givnum REAL for slasd6

DOUBLE PRECISION for dlasd6

Array, dimension (*ldgnum*, 2). Each number indicates the *C* or *S* value to be used in the corresponding Givens rotation. Not referenced if *icompq* = 0.

poles REAL for slasd6

DOUBLE PRECISION for dlasd6

Array, dimension (*ldgnum*, 2). On exit, *poles*(1,*) is an array containing the new singular values obtained from solving the secular equation, and *poles*(2,*) is an array containing the poles in the secular equation. Not referenced if *icompq* = 0.

difl REAL for slasd6

DOUBLE PRECISION for dlasd6

Array, dimension (*n*). On exit, *difl*(*i*) is the distance between *i*-th updated (undeflated) singular value and the *i*-th (undeflated) old singular value.

difr

REAL for slasd6

DOUBLE PRECISION for dlasd6

Array, dimension (*ldgnum*, 2) if *icompq* = 1 and dimension (*n*) if *icompq* = 0.

On exit, *difr*(*i*, 1) is the distance between *i*-th updated (undeflated) singular value and the *i*+1-th (undeflated) old singular value. If *icompq* = 1, *difr*(1: *k*, 2) is an array containing the normalizing factors for the right singular vector matrix.

See ?lasd8 for details on *difl* and *difr*.

z

REAL for slasd6

DOUBLE PRECISION for dlasd6

Array, dimension (*m*).

The first elements of this array contain the components of the deflation-adjusted updating row vector.

k

INTEGER. Contains the dimension of the non-deflated matrix. This is the order of the related secular equation. 1 ≤ *k* ≤ *n*.

c

REAL for slasd6

DOUBLE PRECISION for dlasd6

c contains garbage if *sqre* =0 and the *C*-value of a Givens rotation related to the right null space if *sqre* = 1.

s

REAL for slasd6

DOUBLE PRECISION for dlasd6

s contains garbage if *sqre* =0 and the *S*-value of a Givens rotation related to the right null space if *sqre* = 1.

info

INTEGER .

= 0: successful exit.

< 0: if *info* = -*i*, the *i*-th argument had an illegal value.

> 0: if *info* = 1, an singular value did not converge

?lasd7

Merges the two sets of singular values together into a single sorted set. Then it tries to deflate the size of the problem. Used by ?bdsdc.

Syntax

call slasd7(*icompq*, *nl*, *nr*, *sqre*, *k*, *d*, *z*, *zw*, *vf*, *vfw*, *vl*, *vlw*, *alpha*, *beta*, *dsigma*, *idx*, *idxp*, *idxq*, *perm*, *givptr*, *givcol*, *ldgcol*, *givnum*, *ldgnum*, *c*, *s*, *info*)

call dlasd7(*icompq*, *nl*, *nr*, *sqre*, *k*, *d*, *z*, *zw*, *vf*, *vfw*, *vl*, *vlw*, *alpha*, *beta*, *dsigma*, *idx*, *idxp*, *idxq*, *perm*, *givptr*, *givcol*, *ldgcol*, *givnum*, *ldgnum*, *c*, *s*, *info*)

Include Files

- mkl.fi

Description

The routine ?lasd7 merges the two sets of singular values together into a single sorted set. Then it tries to deflate the size of the problem. There are two ways in which deflation can occur: when two or more singular values are close together or if there is a tiny entry in the *Z* vector. For each such occurrence the order of the related secular equation problem is reduced by one. ?lasd7 is called from ?lasd6.

Input Parameters

icompq

INTEGER. Specifies whether singular vectors are to be computed in compact form, as follows:

= 0: Compute singular values only.

= 1: Compute singular vectors of upper bidiagonal matrix in compact form.

nl

INTEGER. The row dimension of the upper block.

nl ≥ 1.

nr

INTEGER. The row dimension of the lower block.

nr ≥ 1.

sqre

INTEGER.

= 0: the lower block is an *nr*-by-*nr* square matrix.

= 1: the lower block is an *nr*-by-(*nr*+1) rectangular matrix. The bidiagonal matrix has *n* = *nl* + *nr* + 1 rows and *m* = *n* + *sqre* ≥ *n* columns.

d

REAL for slasd7.

DOUBLE PRECISION for dlasd7.

Array, DIMENSION (*n*). On entry *d* contains the singular values of the two submatrices to be combined.

zw

REAL for slasd7.

DOUBLE PRECISION for dlasd7.

Array, DIMENSION (*m*).

Workspace for z.

vf

REAL for slasd7.

DOUBLE PRECISION for dlasd7.

Array, DIMENSION (*m*). On entry, *vf*(1:*nl*+1) contains the first components of all right singular vectors of the upper block; and *vf*(*nl* +2:*m*) contains the first components of all right singular vectors of the lower block.

vfw

REAL for slasd7.

DOUBLE PRECISION for dlasd7.

Array, DIMENSION (*m*).

Workspace for vf.

vl

REAL for slasd7.

DOUBLE PRECISION for dlasd7.

Array, DIMENSION (*m*).

On entry, *vl*(1:*nl*+1) contains the last components of all right singular vectors of the upper block; and *vl*(*nl*+2:*m*) contains the last components of all right singular vectors of the lower block.

VLW

REAL for slasd7.

DOUBLE PRECISION for dlasd7.

Array, DIMENSION (*m*).

Workspace for VL.

alpha

REAL for slasd7

DOUBLE PRECISION for dlasd7.

Contains the diagonal element associated with the added row.

beta

REAL for slasd7.

DOUBLE PRECISION for dlasd7.

Contains the off-diagonal element associated with the added row.

idx

INTEGER.

Workspace array, DIMENSION (*n*). This will contain the permutation used to sort the contents of *d* into ascending order.

idxp

INTEGER.

Workspace array, DIMENSION (*n*). This will contain the permutation used to place deflated values of *d* at the end of the array.

idxq

INTEGER.

Array, DIMENSION (*n*).

This contains the permutation which separately sorts the two sub-problems in *d* into ascending order. Note that entries in the first half of this permutation must first be moved one position backward; and entries in the second half must first have *nl*+1 added to their values.

ldgcol

INTEGER.The leading dimension of the output array *givcol*, must be at least *n*.

ldgnum

INTEGER. The leading dimension of the output array *givnum*, must be at least *n*.

Output Parameters

k

INTEGER. Contains the dimension of the non-deflated matrix, this is the order of the related secular equation.

$1 \leq k \leq n$.

d — On exit, *d* contains the trailing (*n*-*k*) updated singular values (those which were deflated) sorted into increasing order.

z — REAL for slasd7.

DOUBLE PRECISION for dlasd7.

Array, DIMENSION (*m*).

On exit, *Z* contains the updating row vector in the secular equation.

vf — On exit, *vf* contains the first components of all right singular vectors of the bidiagonal matrix.

vl — On exit, *vl* contains the last components of all right singular vectors of the bidiagonal matrix.

dsigma — REAL for slasd7.

DOUBLE PRECISION for dlasd7.

Array, DIMENSION (*n*). Contains a copy of the diagonal elements (*k*-1 singular values and one zero) in the secular equation.

idxp — On output, *idxp*(2: *k*) points to the nondeflated *d*-values and *idxp*(*k*+1:*n*) points to the deflated singular values.

perm — INTEGER.

Array, DIMENSION (*n*).

The permutations (from deflation and sorting) to be applied to each singular block. Not referenced if *icompq* = 0.

givptr — INTEGER.

The number of Givens rotations which took place in this subproblem. Not referenced if *icompq* = 0.

givcol — INTEGER.

Array, DIMENSION (*ldgcol*, 2). Each pair of numbers indicates a pair of columns to take place in a Givens rotation. Not referenced if *icompq* = 0.

givnum — REAL for slasd7.

DOUBLE PRECISION for dlasd7.

Array, DIMENSION (*ldgnum*, 2). Each number indicates the *C* or *S* value to be used in the corresponding Givens rotation. Not referenced if *icompq* = 0.

c — REAL for slasd7.

DOUBLE PRECISION for dlasd7.

If *sqre* =0, then *c* contains garbage, and if *sqre* = 1, then *c* contains *C*-value of a Givens rotation related to the right null space.

S — REAL for slasd7.

DOUBLE PRECISION for dlasd7.

If *sqre* =0, then *s* contains garbage, and if *sqre* = 1, then *s* contains *S*-value of a Givens rotation related to the right null space.

info INTEGER.

= 0: successful exit.

< 0: if *info* = -*i*, the *i*-th argument had an illegal value.

?lasd8

Finds the square roots of the roots of the secular equation, and stores, for each element in D, the distance to its two nearest poles. Used by ?bdsdc.

Syntax

```
call slasd8( icompq, k, d, z, vf, vl, difl, difr, lddifr, dsigma, work, info )
call dlasd8( icompq, k, d, z, vf, vl, difl, difr, lddifr, dsigma, work, info )
```

Include Files

- mkl.fi

Description

The routine ?lasd8 finds the square roots of the roots of the secular equation, as defined by the values in *dsigma* and *z*. It makes the appropriate calls to ?lasd4, and stores, for each element in *d*, the distance to its two nearest poles (elements in *dsigma*). It also updates the arrays *vf* and *vl*, the first and last components of all the right singular vectors of the original bidiagonal matrix. ?lasd8 is called from ?lasd6.

Input Parameters

icompq INTEGER. Specifies whether singular vectors are to be computed in factored form in the calling routine:

= 0: Compute singular values only.

= 1: Compute singular vectors in factored form as well.

k INTEGER. The number of terms in the rational function to be solved by ?lasd4. $k \geq 1$.

z REAL for slasd8

DOUBLE PRECISION for dlasd8.

Array, DIMENSION (*k*).

The first *k* elements of this array contain the components of the deflation-adjusted updating row vector.

vf REAL for slasd8

DOUBLE PRECISION for dlasd8.

Array, DIMENSION (*k*).

On entry, *vf* contains information passed through dbede8.

vl

REAL for slasd8

DOUBLE PRECISION for dlasd8.

Array, DIMENSION (*k*). On entry, *vl* contains information passed through dbede8.

lddifr

INTEGER. The leading dimension of the output array *difr*, must be at least *k*.

dsigma

REAL for slasd8

DOUBLE PRECISION for dlasd8.

Array, DIMENSION (*k*).

The first *k* elements of this array contain the old roots of the deflated updating problem. These are the poles of the secular equation.

work

REAL for slasd8

DOUBLE PRECISION for dlasd8.

Workspace array, DIMENSION at least (3*k*).

Output Parameters

d

REAL for slasd8

DOUBLE PRECISION for dlasd8.

Array, DIMENSION (*k*).

On output, *D* contains the updated singular values.

z

Updated on exit.

vf

On exit, *vf* contains the first *k* components of the first components of all right singular vectors of the bidiagonal matrix.

vl

On exit, *vl* contains the first *k* components of the last components of all right singular vectors of the bidiagonal matrix.

difl

REAL for slasd8

DOUBLE PRECISION for dlasd8.

Array, DIMENSION (*k*). On exit, *difl*(*i*) = *d*(*i*) - *dsigma*(*i*).

difr

REAL for slasd8

DOUBLE PRECISION for dlasd8.

Array,

DIMENSION (*lddifr*, 2) if *icompq* = 1 and

DIMENSION (*k*) if *icompq* = 0.

On exit, *difr*(i,1) = *d*(*i*) - *dsigma*(i+1), *difr*(*k*,1) is not defined and will not be referenced. If *icompq* = 1, *difr*(1:*k*,2) is an array containing the normalizing factors for the right singular vector matrix.

dsigma

The elements of this array may be very slightly altered in value.

info INTEGER.

= 0: successful exit.

< 0: if *info* = -*i*, the *i*-th argument had an illegal value.

> 0: If *info* = 1, an singular value did not converge.

?lasd9

Finds the square roots of the roots of the secular equation, and stores, for each element in D, the distance to its two nearest poles. Used by ?bdsdc.

Syntax

```
call slasd9( icompq, ldu, k, d, z, vf, vl, difl, difr, dsigma, work, info )
call dlasd9( icompq, ldu, k, d, z, vf, vl, difl, difr, dsigma, work, info )
```

Include Files

- mkl.fi

Description

The routine ?lasd9 finds the square roots of the roots of the secular equation, as defined by the values in *dsigma* and *z*. It makes the appropriate calls to ?lasd4, and stores, for each element in *d*, the distance to its two nearest poles (elements in *dsigma*). It also updates the arrays *vf* and *vl*, the first and last components of all the right singular vectors of the original bidiagonal matrix. ?lasd9 is called from ?lasd7.

Input Parameters

icompq INTEGER. Specifies whether singular vectors are to be computed in factored form in the calling routine:

If *icompq* = 0, compute singular values only;

If *icompq* = 1, compute singular vector matrices in factored form also.

k INTEGER. The number of terms in the rational function to be solved by slasd4. $k \geq 1$.

dsigma REAL for slasd9

DOUBLE PRECISION for dlasd9.

Array, DIMENSION(*k*).

The first *k* elements of this array contain the old roots of the deflated updating problem. These are the poles of the secular equation.

z REAL for slasd9

DOUBLE PRECISION for dlasd9.

Array, DIMENSION (*k*). The first *k* elements of this array contain the components of the deflation-adjusted updating row vector.

vf REAL for slasd9

DOUBLE PRECISION for dlasd9.

Array, DIMENSION(*k*). On entry, *vf* contains information passed through sbede8.

vl

REAL for slasd9

DOUBLE PRECISION for dlasd9.

Array, DIMENSION(*k*). On entry, *vl* contains information passed through sbede8.

work

REAL for slasd9

DOUBLE PRECISION for dlasd9.

Workspace array, DIMENSION at least (3*k*).

Output Parameters

d

REAL for slasd9

DOUBLE PRECISION for dlasd9.

Array, DIMENSION(*k*). *d*(*i*) contains the updated singular values.

vf

On exit, *vf* contains the first *k* components of the first components of all right singular vectors of the bidiagonal matrix.

vl

On exit, *vl* contains the first *k* components of the last components of all right singular vectors of the bidiagonal matrix.

difl

REAL for slasd9

DOUBLE PRECISION for dlasd9.

Array, DIMENSION (*k*).

On exit, *difl*(*i*) = *d*(*i*) - *dsigma*(*i*).

difr

REAL for slasd9

DOUBLE PRECISION for dlasd9.

Array,

DIMENSION (*ldu*, 2) if *icompq* =1 and

DIMENSION (*k*) if *icompq* = 0.

On exit, *difr*(*i*, 1) = *d*(*i*) - *dsigma*(*i*+1), *difr*(*k*, 1) is not defined and will not be referenced.

If *icompq* = 1, *difr*(1:*k*, 2) is an array containing the normalizing factors for the right singular vector matrix.

info

INTEGER.

= 0: successful exit.

< 0: if *info* = -*i*, the *i*-th argument had an illegal value.

> 0: If *info* = 1, an singular value did not converge

?lasda

Computes the singular value decomposition (SVD) of a real upper bidiagonal matrix with diagonal d and off-diagonal e. Used by ?bdsdc.

Syntax

call slasda(*icompq*, *smlsiz*, *n*, *sqre*, *d*, *e*, *u*, *ldu*, *vt*, *k*, *difl*, *difr*, *z*, *poles*, *givptr*, *givcol*, *ldgcol*, *perm*, *givnum*, *c*, *s*, *work*, *iwork*, *info*)

call dlasda(*icompq*, *smlsiz*, *n*, *sqre*, *d*, *e*, *u*, *ldu*, *vt*, *k*, *difl*, *difr*, *z*, *poles*, *givptr*, *givcol*, *ldgcol*, *perm*, *givnum*, *c*, *s*, *work*, *iwork*, *info*)

Include Files

- mkl.fi

Description

Using a divide and conquer approach, ?lasda computes the singular value decomposition (*SVD*) of a real upper bidiagonal *n*-by-*m* matrix *B* with diagonal *d* and off-diagonal *e*, where *m = n + sqre*.

The algorithm computes the singular values in the *SVD B = U*S*VT*. The orthogonal matrices *U* and *VT* are optionally computed in compact form. A related subroutine ?lasd0 computes the singular values and the singular vectors in explicit form.

Input Parameters

icompq — INTEGER.

Specifies whether singular vectors are to be computed in compact form, as follows:

= 0: Compute singular values only.

= 1: Compute singular vectors of upper bidiagonal matrix in compact form.

smlsiz — INTEGER.

The maximum size of the subproblems at the bottom of the computation tree.

n — INTEGER. The row dimension of the upper bidiagonal matrix. This is also the dimension of the main diagonal array *d*.

sqre — INTEGER. Specifies the column dimension of the bidiagonal matrix.

If *sqre = 0*: the bidiagonal matrix has column dimension *m = n*

If *sqre = 1*: the bidiagonal matrix has column dimension *m = n + 1*.

d — REAL for slasda

DOUBLE PRECISION for dlasda.

Array, DIMENSION (*n*). On entry, *d* contains the main diagonal of the bidiagonal matrix.

e — REAL for slasda

DOUBLE PRECISION for dlasda.

Array, DIMENSION (*m* - 1). Contains the subdiagonal entries of the bidiagonal matrix. On exit, *e* is destroyed.

ldu — INTEGER. The leading dimension of arrays *u*, *vt*, *difl*, *difr*, *poles*, *givnum*, and *z*. $ldu \geq n$.

ldgcol — INTEGER. The leading dimension of arrays *givcol* and *perm*. $ldgcol \geq n$.

work — REAL for slasda

DOUBLE PRECISION for dlasda.

Workspace array, DIMENSION $(6n+(smlsiz+1)^2)$.

iwork — INTEGER.

Workspace array, *Dimension* must be at least (7*n*).

Output Parameters

d — On exit *d*, if $info = 0$, contains the singular values of the bidiagonal matrix.

u — REAL for slasda

DOUBLE PRECISION for dlasda.

Array, DIMENSION (*ldu*, *smlsiz*) if $icompq = 1$.

Not referenced if $icompq = 0$.

If $icompq = 1$, on exit, *u* contains the left singular vector matrices of all subproblems at the bottom level.

vt — REAL for slasda

DOUBLE PRECISION for dlasda.

Array, DIMENSION (*ldu*, *smlsiz*+1) if $icompq = 1$, and not referenced if $icompq = 0$. If $icompq = 1$, on exit, *vt*' contains the right singular vector matrices of all subproblems at the bottom level.

k — INTEGER.

Array, DIMENSION (*n*) if $icompq = 1$ and

DIMENSION (1) if $icompq = 0$.

If $icompq = 1$, on exit, *k*(*i*) is the dimension of the *i*-th secular equation on the computation tree.

difl — REAL for slasda

DOUBLE PRECISION for dlasda.

Array, DIMENSION (*ldu*, *nlvl*),

where $nlvl = \text{floor}(\log_2(n/smlsiz))$.

difr — REAL for slasda

DOUBLE PRECISION for dlasda.

Array,

DIMENSION (*ldu*, 2 *nlvl*) if *icompq* = 1 and

DIMENSION (*n*) if *icompq* = 0.

If *icompq* = 1, on exit, *difl*(1:*n*, *i*) and *difr*(1:*n*,2*i* -1) record distances between singular values on the *i*-th level and singular values on the (*i* -1)-th level, and *difr*(1:*n*, 2i) contains the normalizing factors for the right singular vector matrix. See ?lasd8 for details.

z

REAL for slasda

DOUBLE PRECISION for dlasda.

Array,

DIMENSION (*ldu*, *nlvl*) if *icompq* = 1 and

DIMENSION (*n*) if *icompq* = 0. The first *k* elements of *z*(1, *i*) contain the components of the deflation-adjusted updating row vector for subproblems on the *i*-th level.

poles

REAL for slasda

DOUBLE PRECISION for dlasda.

Array, DIMENSION(*ldu*, 2**nlvl*)

if *icompq* = 1, and not referenced if *icompq* = 0. If *icompq* = 1, on exit, *poles*(1, 2*i* - 1) and *poles*(1, 2*i*) contain the new and old singular values involved in the secular equations on the *i*-th level.

givptr

INTEGER. Array, DIMENSION (*n*) if *icompq* = 1, and not referenced if *icompq* = 0. If *icompq* = 1, on exit, *givptr*(*i*) records the number of Givens rotations performed on the *i*-th problem on the computation tree.

givcol

INTEGER .

Array, DIMENSION(*ldgcol*, 2**nlvl*) if *icompq* = 1, and not referenced if *icompq* = 0. If *icompq* = 1, on exit, for each *i*, *givcol*(1, 2 *i* - 1) and *givcol*(1, 2 *i*) record the locations of Givens rotations performed on the *i*-th level on the computation tree.

perm

INTEGER. Array, DIMENSION (*ldgcol*, *nlvl*) if *icompq* = 1, and not referenced if *icompq* = 0. If *icompq* = 1, on exit, *perm* (1, *i*) records permutations done on the *i*-th level of the computation tree.

givnum

REAL for slasda

DOUBLE PRECISION for dlasda.

Array DIMENSION (*ldu*, 2**nlvl*) if *icompq* = 1, and not referenced if *icompq* = 0. If *icompq* = 1, on exit, for each *i*, *givnum*(1, 2 *i* - 1) and *givnum*(1, 2 *i*) record the *C*- and *S*-values of Givens rotations performed on the *i*-th level on the computation tree.

c

REAL for slasda

DOUBLE PRECISION for dlasda.

Array,

DIMENSION (*n*) if *icompq* = 1, and

DIMENSION (1) if *icompq* = 0.

If *icompq* = 1 and the *i*-th subproblem is not square, on exit, *c*(*i*) contains the *C*-value of a Givens rotation related to the right null space of the *i*-th subproblem.

s — REAL for slasda

DOUBLE PRECISION for dlasda.

Array,

DIMENSION (*n*) *icompq* = 1, and

DIMENSION (1) if *icompq* = 0.

If *icompq* = 1 and the *i*-th subproblem is not square, on exit, *s*(*i*) contains the *S*-value of a Givens rotation related to the right null space of the *i*-th subproblem.

info — INTEGER.

= 0: successful exit.

< 0: if *info* = -*i*, the *i*-th argument had an illegal value

> 0: If *info* = 1, an singular value did not converge

?lasdq

Computes the SVD of a real bidiagonal matrix with diagonal d and off-diagonal e. Used by ?bdsdc.

Syntax

```
call slasdq( uplo, sqre, n, ncvt, nru, ncc, d, e, vt, ldvt, u, ldu, c, ldc, work, info )
call dlasdq( uplo, sqre, n, ncvt, nru, ncc, d, e, vt, ldvt, u, ldu, c, ldc, work, info )
```

Include Files

- mkl.fi

Description

The routine ?lasdq computes the singular value decomposition (*SVD*) of a real (upper or lower) bidiagonal matrix with diagonal *d* and off-diagonal *e*, accumulating the transformations if desired. If *B* is the input bidiagonal matrix, the algorithm computes orthogonal matrices *Q* and *P* such that $B = Q*S*P^T$. The singular values *S* are overwritten on *d*.

The input matrix *U* is changed to $U*Q$ if desired.

The input matrix *VT* is changed to P^T*VT if desired.

The input matrix *C* is changed to Q^T*C if desired.

Input Parameters

uplo — CHARACTER*1. On entry, *uplo* specifies whether the input bidiagonal matrix is upper or lower bidiagonal.

If *uplo* = 'U' or 'u', *B* is upper bidiagonal;

If *uplo* = 'L' or 'l', *B* is lower bidiagonal.

sqre INTEGER.

= 0: then the input matrix is *n*-by-*n*.

= 1: then the input matrix is *n*-by-(*n*+1) if *uplu* = 'U' and (*n*+1)-by-*n* if *uplu*

= 'L'. The bidiagonal matrix has $n = nl + nr + 1$ rows and $m = n + sqre \geq n$ columns.

n INTEGER. On entry, *n* specifies the number of rows and columns in the matrix. *n* must be at least 0.

ncvt INTEGER. On entry, *ncvt* specifies the number of columns of the matrix *VT*. *ncvt* must be at least 0.

nru INTEGER. On entry, *nru* specifies the number of rows of the matrix *U*. *nru* must be at least 0.

ncc INTEGER. On entry, *ncc* specifies the number of columns of the matrix *C*. *ncc* must be at least 0.

d REAL for slasdq

DOUBLE PRECISION for dlasdq.

Array, DIMENSION (*n*). On entry, *d* contains the diagonal entries of the bidiagonal matrix.

e REAL for slasdq

DOUBLE PRECISION for dlasdq.

Array, DIMENSION is (*n*-1) if *sqre* = 0 and *n* if *sqre* = 1. On entry, the entries of *e* contain the off-diagonal entries of the bidiagonal matrix.

vt REAL for slasdq

DOUBLE PRECISION for dlasdq.

Array, DIMENSION (*ldvt*, *ncvt*). On entry, contains a matrix which on exit has been premultiplied by P^T, dimension *n*-by-*ncvt* if *sqre* = 0 and (*n*+1)-by-*ncvt* if *sqre* = 1 (not referenced if *ncvt*=0).

ldvt INTEGER. On entry, *ldvt* specifies the leading dimension of *vt* as declared in the calling (sub) program. *ldvt* must be at least 1. If *ncvt* is nonzero, *ldvt* must also be at least *n*.

u REAL for slasdq

DOUBLE PRECISION for dlasdq.

Array, DIMENSION (*ldu*, *n*). On entry, contains a matrix which on exit has been postmultiplied by *Q*, dimension *nru*-by-*n* if *sqre* = 0 and *nru*-by-(*n* +1) if *sqre* = 1 (not referenced if *nru*=0).

ldu INTEGER. On entry, *ldu* specifies the leading dimension of *u* as declared in the calling (sub) program. *ldu* must be at least max(1, *nru*) .

c REAL for slasdq

DOUBLE PRECISION for dlasdq.

Array, DIMENSION (*ldc*, *ncc*). On entry, contains an *n*-by-*ncc* matrix which on exit has been premultiplied by *Q*', dimension *n*-by-*ncc* if *sqre* = 0 and (*n*+1)-by-*ncc* if *sqre* = 1 (not referenced if *ncc*=0).

ldc — INTEGER. On entry, *ldc* specifies the leading dimension of *C* as declared in the calling (sub) program. *ldc* must be at least 1. If *ncc* is non-zero, *ldc* must also be at least *n*.

work — REAL for slasdq

DOUBLE PRECISION for dlasdq.

Array, DIMENSION (4*n*). This is a workspace array. Only referenced if one of *ncvt*, *nru*, or *ncc* is nonzero, and if *n* is at least 2.

Output Parameters

d — On normal exit, *d* contains the singular values in ascending order.

e — On normal exit, *e* will contain 0. If the algorithm does not converge, *d* and *e* will contain the diagonal and superdiagonal entries of a bidiagonal matrix orthogonally equivalent to the one given as input.

vt — On exit, the matrix has been premultiplied by *P*'.

u — On exit, the matrix has been postmultiplied by *Q*.

c — On exit, the matrix has been premultiplied by *Q*'.

info — INTEGER. On exit, a value of 0 indicates a successful exit. If *info* < 0, argument number -*info* is illegal. If *info* > 0, the algorithm did not converge, and *info* specifies how many superdiagonals did not converge.

?lasdt

Creates a tree of subproblems for bidiagonal divide and conquer. Used by ?bdsdc.

Syntax

```
call slasdt( n, lvl, nd, inode, ndiml, ndimr, msub )
call dlasdt( n, lvl, nd, inode, ndiml, ndimr, msub )
```

Include Files

- mkl.fi

Description

The routine creates a tree of subproblems for bidiagonal divide and conquer.

Input Parameters

n — INTEGER. On entry, the number of diagonal elements of the bidiagonal matrix.

msub INTEGER. On entry, the maximum row dimension each subproblem at the bottom of the tree can be of.

Output Parameters

lvl INTEGER. On exit, the number of levels on the computation tree.

nd INTEGER. On exit, the number of nodes on the tree.

inode INTEGER.

Array, DIMENSION (*n*). On exit, centers of subproblems.

ndiml INTEGER.

Array, DIMENSION (*n*). On exit, row dimensions of left children.

ndimr INTEGER.

Array, DIMENSION (*n*). On exit, row dimensions of right children.

?laset

Initializes the off-diagonal elements and the diagonal elements of a matrix to given values.

Syntax

```
call slaset( uplo, m, n, alpha, beta, a, lda )
call dlaset( uplo, m, n, alpha, beta, a, lda )
call claset( uplo, m, n, alpha, beta, a, lda )
call zlaset( uplo, m, n, alpha, beta, a, lda )
```

Include Files

- mkl.fi

Description

The routine initializes an *m*-by-*n* matrix *A* to *beta* on the diagonal and *alpha* on the off-diagonals.

Input Parameters

The data types are given for the Fortran interface.

uplo CHARACTER*1. Specifies the part of the matrix *A* to be set.

If *uplo* = 'U', upper triangular part is set; the strictly lower triangular part of *A* is not changed.

If *uplo* = 'L': lower triangular part is set; the strictly upper triangular part of *A* is not changed.

Otherwise: *A*ll of the matrix *A* is set.

m INTEGER. The number of rows of the matrix *A*. $m \geq 0$.

n INTEGER. The number of columns of the matrix *A*.

	$n \geq 0$.
alpha, *beta*	REAL for slaset DOUBLE PRECISION for dlaset COMPLEX for claset DOUBLE COMPLEX for zlaset. The constants to which the off-diagonal and diagonal elements are to be set, respectively.
a	REAL for slaset DOUBLE PRECISION for dlaset COMPLEX for claset DOUBLE COMPLEX for zlaset. Array, DIMENSION (*lda*, *n*). The array *a* contains the *m*-by-*n* matrix *A*.
lda	INTEGER. The leading dimension of the array *a*. *lda* $\geq$ max(1,*m*).

Output Parameters

a	On exit, the leading *m*-by-*n* submatrix of *A* is set as follows: if *uplo* = 'U', $A_{ij} = alpha, 1 \leq i \leq j-1, 1 \leq j \leq n$, if *uplo* = 'L', $A_{ij} = alpha, j+1 \leq i \leq m, 1 \leq j \leq n$, otherwise, $A_{ij} = alpha, 1 \leq i \leq m, 1 \leq j \leq n, i \neq j$, and, for all *uplo*, $A_{ii} = beta, 1 \leq i \leq \min(m, n)$.

?lasq1

Computes the singular values of a real square bidiagonal matrix. Used by ?bdsqr.

Syntax

```
call slasq1( n, d, e, work, info )
call dlasq1( n, d, e, work, info )
```

Include Files

- mkl.fi

Description

The routine ?lasq1 computes the singular values of a real *n*-by-*n* bidiagonal matrix *Z* with diagonal *d* and off-diagonal *e*. The singular values are computed to high relative accuracy, in the absence of denormalization, underflow and overflow.

Input Parameters

n	INTEGER.The number of rows and columns in the matrix. $n \geq 0$.
d	REAL for slasq1 DOUBLE PRECISION for dlasq1. Array, DIMENSION (*n*). On entry, *d* contains the diagonal elements of the bidiagonal matrix whose *SVD* is desired.
e	REAL for slasq1 DOUBLE PRECISION for dlasq1. Array, DIMENSION (*n*). On entry, elements *e*(1:*n*-1) contain the off-diagonal elements of the bidiagonal matrix whose *SVD* is desired.
work	REAL for slasq1 DOUBLE PRECISION for dlasq1. Workspace array, DIMENSION(4*n*).

Output Parameters

d	On normal exit, *d* contains the singular values in decreasing order.
e	On exit, *e* is overwritten.
info	INTEGER. = 0: successful exit; < 0: if *info* = -*i*, the *i*-th argument had an illegal value; > 0: the algorithm failed: = 1, a split was marked by a positive value in *e*; = 2, current block of *Z* not diagonalized after 100*n* iterations (in inner while loop) - on exit the current contents of *d* and *e* represent a matrix with the same singular values as the matrix with which ?lasq1 was originally called, and which the calling subroutine could use to finish the computation, or even feed back into ?lasq1; = 3, termination criterion of outer while loop not met (program created more than *n* unreduced blocks.

?lasq2

Computes all the eigenvalues of the symmetric positive definite tridiagonal matrix associated with the quotient difference array z to high relative accuracy. Used by ?bdsqr *and* ?stegr.

Syntax

```
call slasq2( n, z, info )
call dlasq2( n, z, info )
```

Include Files

- mkl.fi

Description

The routine ?lasq2 computes all the eigenvalues of the symmetric positive definite tridiagonal matrix associated with the quotient difference array *z* to high relative accuracy, in the absence of denormalization, underflow and overflow.

To see the relation of *z* to the tridiagonal matrix, let *L* be a unit lower bidiagonal matrix with subdiagonals *z*(2,4,6,,..) and let *U* be an upper bidiagonal matrix with 1's above and diagonal *z*(1,3,5,,..). The tridiagonal is *LU* or, if you prefer, the symmetric tridiagonal to which it is similar.

Input Parameters

n — INTEGER. The number of rows and columns in the matrix. $n \geq 0$.

z — REAL for slasq2

DOUBLE PRECISION for dlasq2.

Array, DIMENSION (4 * *n*).

On entry, *z* holds the quotient difference array.

Output Parameters

z — On exit, entries 1 to *n* hold the eigenvalues in decreasing order, *z*(2*n*+1) holds the trace, and *z*(2*n*+2) holds the sum of the eigenvalues. If $n > 2$, then *z*(2*n*+3) holds the iteration count, *z*(2*n*+4) holds ndivs/nin^2, and *z*(2*n*+5) holds the percentage of shifts that failed.

info — INTEGER.

= 0: successful exit;

< 0: if the *i*-th argument is a scalar and had an illegal value, then *info* = −*i*, if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = −(*i**100+ *j*);

> 0: the algorithm failed:

= 1, a split was marked by a positive value in *e*;

= 2, current block of *z* not diagonalized after 100**n* iterations (in inner while loop) - On exit *z* holds a quotient difference array with the same eigenvalues as the *z* array on entry;

= 3, termination criterion of outer while loop not met (program created more than *n* unreduced blocks).

Application Notes

The routine ?lasq2 defines a logical variable, *ieee*, which is .TRUE. on machines which follow ieee-754 floating-point standard in their handling of infinities and NaNs, and .FALSE. otherwise. This variable is passed to ?lasq3.

?lasq3

Checks for deflation, computes a shift and calls dqds.
Used by ?bdsqr.

Syntax

call slasq3(*i0*, *n0*, *z*, *pp*, *dmin*, *sigma*, *desig*, *qmax*, *nfail*, *iter*, *ndiv*, *ieee*, *ttype*, *dmin1*, *dmin2*, *dn*, *dn1*, *dn2*, *g*, *tau*)

call dlasq3(*i0*, *n0*, *z*, *pp*, *dmin*, *sigma*, *desig*, *qmax*, *nfail*, *iter*, *ndiv*, *ieee*, *ttype*, *dmin1*, *dmin2*, *dn*, *dn1*, *dn2*, *g*, *tau*)

Include Files

- mkl.fi

Description

The routine ?lasq3 checks for deflation, computes a shift *tau*, and calls *dqds*. In case of failure, it changes shifts, and tries again until output is positive.

Input Parameters

i0	INTEGER. First index.
n0	INTEGER. Last index.
z	REAL for slasq3 DOUBLE PRECISION for dlasq3. Array, DIMENSION (4*n*). *z* holds the *qd* array.
pp	INTEGER. *pp*=0 for ping, *pp*=1 for pong. *pp*=2 indicates that flipping was applied to the *Z* array and that the initial tests for deflation should not be performed.
desig	REAL for slasq3 DOUBLE PRECISION for dlasq3. Lower order part of *sigma*.
qmax	REAL for slasq3 DOUBLE PRECISION for dlasq3. Maximum value of *q*.
ieee	LOGICAL. Flag for ieee or non-ieee arithmetic (passed to ?lasq5).
ttype	INTEGER. Shift type.
dmin1, *dmin2*, *dn*, *dn1*, *dn2*, *g*, *tau*	REAL for slasq3 DOUBLE PRECISION for dlasq3.

	These scalars are passed as arguments in order to save their values between calls to `?lasq3`.

Output Parameters

dmin	`REAL` for `slasq3` `DOUBLE PRECISION` for `dlasq3`. Minimum value of *d*.
pp	`INTEGER`. *pp*=0 for ping, *pp*=1 for pong. *pp*=2 indicates that flipping was applied to the *Z* array and that the initial tests for deflation should not be performed.
sigma	`REAL` for `slasq3` `DOUBLE PRECISION` for `dlasq3`. Sum of shifts used in the current segment.
desig	Lower order part of *sigma*.
nfail	`INTEGER`. Number of times shift was too big.
iter	`INTEGER`. Number of iterations.
ndiv	`INTEGER`. Number of divisions.
ttype	`INTEGER`. Shift type.
dmin1, *dmin2*, *dn*, *dn1*, *dn2*, *g*, *tau*	`REAL` for `slasq3` `DOUBLE PRECISION` for `dlasq3`. These scalars are passed as arguments in order to save their values between calls to `?lasq3`.

?lasq4

Computes an approximation to the smallest eigenvalue using values of d from the previous transform. Used by `?bdsqr`.

Syntax

```
call slasq4( i0, n0, z, pp, n0in, dmin, dmin1, dmin2, dn, dn1, dn2, tau, ttype, g )
call dlasq4( i0, n0, z, pp, n0in, dmin, dmin1, dmin2, dn, dn1, dn2, tau, ttype, g )
```

Include Files

- `mkl.fi`

Description

The routine computes an approximation *tau* to the smallest eigenvalue using values of d from the previous transform.

Input Parameters

i0 — INTEGER. First index.

n0 — INTEGER. Last index.

z — REAL for slasq4

DOUBLE PRECISION for dlasq4.

Array, DIMENSION (4*n*).

z holds the *qd* array.

pp — INTEGER. *pp*=0 for ping, *pp*=1 for pong.

n0in — INTEGER. The value of *n0* at start of eigtest.

dmin — REAL for slasq4

DOUBLE PRECISION for dlasq4.

Minimum value of *d*.

dmin1 — REAL for slasq4

DOUBLE PRECISION for dlasq4.

Minimum value of *d*, excluding *d*(*n0*).

dmin2 — REAL for slasq4

DOUBLE PRECISION for dlasq4.

Minimum value of *d*, excluding *d*(*n0*) and *d*(*n0*-1).

dn — REAL for slasq4

DOUBLE PRECISION for dlasq4. Contains *d*(*n*).

dn1 — REAL for slasq4

DOUBLE PRECISION for dlasq4. Contains *d*(*n*-1).

dn2 — REAL for slasq4

DOUBLE PRECISION for dlasq4. Contains *d*(*n*-2).

g — REAL for slasq4

DOUBLE PRECISION for dlasq4.

A scalar passed as an argument in order to save its value between calls to ?lasq4.

Output Parameters

tau — REAL for slasq4

DOUBLE PRECISION for dlasq4.

Shift.

ttype — INTEGER. Shift type.

g — REAL for slasq4

DOUBLE PRECISION for dlasq4.

A scalar passed as an argument in order to save its value between calls to ?lasq4.

?lasq5

Computes one dqds transform in ping-pong form.
Used by ?bdsqr *and* ?stegr.

Syntax

```
call slasq5( i0, n0, z, pp, tau, sigma, dmin, dmin1, dmin2, dn, dnm1, dnm2, ieee, eps )
call dlasq5( i0, n0, z, pp, tau, sigma, dmin, dmin1, dmin2, dn, dnm1, dnm2, ieee, eps )
```

Include Files

- mkl.fi

Description

The routine computes one dqds transform in ping-pong form: one version for ieee machines, another for non-ieee machines.

Input Parameters

i0 — INTEGER. First index.

n0 — INTEGER. Last index.

z — REAL for slasq5

DOUBLE PRECISION for dlasq5.

Array, DIMENSION (4*n*). *z* holds the qd array. *emin* is stored in *z*(4**n0*) to avoid an extra argument.

pp — INTEGER. *pp*=0 for ping, *pp*=1 for pong.

tau — REAL for slasq5

DOUBLE PRECISION for dlasq5.

This is the shift.

sigma — REAL for slasq5

DOUBLE PRECISION for dlasq5.

This is the accumulated shift up to the current point.

ieee — LOGICAL. Flag for IEEE or non-IEEE arithmetic.

eps — REAL for slasq5

DOUBLE PRECISION for dlasq5.

This is the value of epsilon used.

Output Parameters

dmin
REAL for slasq5
DOUBLE PRECISION for dlasq5.
Minimum value of *d*.

dmin1
REAL for slasq5
DOUBLE PRECISION for dlasq5.
Minimum value of *d*, excluding *d*(*n0*).

dmin2
REAL for slasq5
DOUBLE PRECISION for dlasq5.
Minimum value of *d*, excluding *d*(*n0*) and *d*(*n0*-1).

dn
REAL for slasq5
DOUBLE PRECISION for dlasq5. Contains *d*(*n0*), the last value of *d*.

dnm1
REAL for slasq5
DOUBLE PRECISION for dlasq5. Contains *d*(*n0*-1).

dnm2
REAL for slasq5
DOUBLE PRECISION for dlasq5. Contains *d*(*n0*-2).

?lasq6

Computes one dqd transform in ping-pong form. Used by ?bdsqr *and* ?stegr.

Syntax

```
call slasq6( i0, n0, z, pp, dmin, dmin1, dmin2, dn, dnm1, dnm2 )
call dlasq6( i0, n0, z, pp, dmin, dmin1, dmin2, dn, dnm1, dnm2 )
```

Include Files

- mkl.fi

Description

The routine ?lasq6 computes one *dqd* (shift equal to zero) transform in ping-pong form, with protection against underflow and overflow.

Input Parameters

i0
INTEGER. First index.

n0
INTEGER. Last index.

z
REAL for slasq6
DOUBLE PRECISION for dlasq6.

Array, DIMENSION (4*n*). *Z* holds the qd array. *emin* is stored in `z(4*n0)` to avoid an extra argument.

pp — INTEGER. *pp*=0 for ping, *pp*=1 for pong.

Output Parameters

dmin — REAL for slasq6

DOUBLE PRECISION for dlasq6.

Minimum value of *d*.

dmin1 — REAL for slasq6

DOUBLE PRECISION for dlasq6.

Minimum value of *d*, excluding *d*(*n0*).

dmin2 — REAL for slasq6

DOUBLE PRECISION for dlasq6.

Minimum value of *d*, excluding *d*(*n0*) and *d*(*n0*-1).

dn — REAL for slasq6

DOUBLE PRECISION for dlasq6. Contains *d*(*n0*), the last value of *d*.

dnm1 — REAL for slasq6

DOUBLE PRECISION for dlasq6. Contains *d*(*n0*-1).

dnm2 — REAL for slasq6

DOUBLE PRECISION for dlasq6. Contains *d*(*n0*-2).

?lasr

Applies a sequence of plane rotations to a general rectangular matrix.

Syntax

```
call slasr( side, pivot, direct, m, n, c, s, a, lda )
call dlasr( side, pivot, direct, m, n, c, s, a, lda )
call clasr( side, pivot, direct, m, n, c, s, a, lda )
call zlasr( side, pivot, direct, m, n, c, s, a, lda )
```

Include Files

- mkl.fi

Description

The routine applies a sequence of plane rotations to a real/complex matrix *A*, from the left or the right.

A := *P***A*, when *side* = 'L' (Left-hand side)

A := *A***P*', when *side* = 'R' (Right-hand side)

where *P* is an orthogonal matrix consisting of a sequence of plane rotations with *z* = *m* when `side = 'L'` and *z* = *n* when `side = 'R'`.

When `direct = 'F'` (Forward sequence), then

$P = P(z-1)*...P(2)*P(1)$,

and when `direct = 'B'` (Backward sequence), then

$P = P(1)*P(2)*...*P(z-1)$,

where *P*(*k*) is a plane rotation matrix defined by the 2-by-2 plane rotation:

$$R(k) = \begin{bmatrix} c(k) & s(k) \\ -s(k) & c(k) \end{bmatrix}$$

When `pivot = 'V'` (Variable pivot), the rotation is performed for the plane (*k*, *k* + 1), that is, *P*(*k*) has the form

$$P(k) = \begin{bmatrix} 1 & & & & & & \\ & \cdots & & & & & \\ & & 1 & & & & \\ & & & c(k) & s(k) & & \\ & & & -s(k) & c(k) & & \\ & & & & & 1 & \\ & & & & & & \cdots \\ & & & & & & & 1 \end{bmatrix}$$

where *R*(*k*) appears as a rank-2 modification to the identity matrix in rows and columns *k* and *k*+1.

When `pivot = 'T'` (Top pivot), the rotation is performed for the plane `(1,k+1)`, so *P*(*k*) has the form

$$P(k) = \begin{bmatrix} c(k) & & & s(k) & & \\ & 1 & & & & \\ & & \cdots & & & \\ & & & 1 & & \\ -s(k) & & & c(k) & & \\ & & & & 1 & \\ & & & & & \cdots \\ & & & & & & 1 \end{bmatrix}$$

where $R(k)$ appears in rows and columns k and $k+1$.

Similarly, when *pivot* = 'B' (Bottom pivot), the rotation is performed for the plane (k, z), giving $P(k)$ the form

$$P(k) = \begin{bmatrix} 1 & & & & & & \\ & \cdots & & & & & \\ & & 1 & & & & \\ & & & c(k) & & & s(k) \\ & & & & 1 & & \\ & & & & & \cdots & \\ & & & & & & 1 \\ & & & -s(k) & & & c(k) \end{bmatrix}$$

where $R(k)$ appears in rows and columns k and z. The rotations are performed without ever forming $P(k)$ explicitly.

Input Parameters

side — CHARACTER*1. Specifies whether the plane rotation matrix P is applied to A on the left or the right.

= 'L': left, compute $A := P*A$

= 'R': right, compute $A := A*P'$

direct CHARACTER*1. Specifies whether *P* is a forward or backward sequence of plane rotations.

= 'F': forward, $P = P(z-1)*...*P(2)*P(1)$

= 'B': backward, $P = P(1)*P(2)*...*P(z-1)$

pivot CHARACTER*1. Specifies the plane for which *P*(*k*) is a plane rotation matrix.

= 'V': Variable pivot, the plane (*k*, *k*+1)

= 'T': Top pivot, the plane (1, *k*+1)

= 'B': Bottom pivot, the plane (*k*, *z*)

m INTEGER. The number of rows of the matrix *A*.

If $m \leq 1$, an immediate return is effected.

n INTEGER. The number of columns of the matrix *A*.

If $n \leq 1$, an immediate return is effected.

c, *s* REAL for slasr/clasr

DOUBLE PRECISION for dlasr/zlasr.

Arrays, DIMENSION

(*m*-1) if *side* = 'L',

(*n*-1) if *side* = 'R' .

c(*k*) and *s*(*k*) contain the cosine and sine of the plane rotations respectively that define the 2-by-2 plane rotation part (*R*(*k*)) of the *P*(*k*) matrix as described above in *Description*.

a REAL for slasr

DOUBLE PRECISION for dlasr

COMPLEX for clasr

DOUBLE COMPLEX for zlasr.

Array, DIMENSION (*lda*, *n*).

The *m*-by-*n* matrix *A*.

lda INTEGER. The leading dimension of the array *a*.

$lda \geq \max(1,m)$.

Output Parameters

a On exit, *A* is overwritten by *P***A* if *side* = 'R', or by *A***P*' if *side* = 'L'.

?lasrt

Sorts numbers in increasing or decreasing order.

Syntax

```
call slasrt( id, n, d, info )
call dlasrt( id, n, d, info )
```

Include Files

- mkl.fi

Description

The routine ?lasrt sorts the numbers in *d* in increasing order (if *id* = 'I') or in decreasing order (if *id* = 'D'). It uses Quick Sort, reverting to Insertion Sort on arrays of size ≤ 20. Dimension of stack limits *n* to about 2^{32}.

Input Parameters

The data types are given for the Fortran interface.

id	CHARACTER*1. (*d*(1) ≤ ... ≤ *d*(*n*)) or into decreasing order (*d*(1) ≥ ... ≥*d*(*n*)), depending on *id*.
n	INTEGER. The length of the array *d*.
d	REAL for slasrt DOUBLE PRECISION for dlasrt. On entry, the array to be sorted.

Output Parameters

d	On exit, *d* has been sorted into increasing order (*d*[0]≤d[1]≤ ... ≤ *d*[n-1]) or into decreasing order (*d*[0] ≥ d[1] ≥ ... ≥*d*[*n*-1]), depending on *id*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* < 0, the *i*-th parameter had an illegal value.

?lassq

Updates a sum of squares represented in scaled form.

Syntax

```
call slassq( n, x, incx, scale, sumsq )
call dlassq( n, x, incx, scale, sumsq )
call classq( n, x, incx, scale, sumsq )
call zlassq( n, x, incx, scale, sumsq )
```

Include Files

- mkl.fi

Description

The real routines slassq/dlassq return the values *scl* and *smsq* such that

$scl^2 * smsq = x(1)^2 + ... + x(n)^2 + scale^2 * sumsq$,

where $x(i) = x(1 + (i - 1) incx)$.

The value of *sumsq* is assumed to be non-negative and *scl* returns the value

$scl = \max(scale, \text{abs}(x(i)))$.

Values *scale* and *sumsq* must be supplied in *scale* and *sumsq*, and *scl* and *smsq* are overwritten on *scale* and *sumsq*, respectively.

The complex routines classq/zlassq return the values *scl* and *ssq* such that

$scl^2 * ssq = x(1)^2 + ... + x(n)^2 + scale^2 * sumsq$,

where $x(i) = \text{abs}(x(1 + (i - 1) * incx))$.

The value of *sumsq* is assumed to be at least unity and the value of *ssq* will then satisfy $1.0 \le ssq \le sumsq + 2n$

scale is assumed to be non-negative and *scl* returns the value

$scl = \max(scale, \text{abs}(\text{real}(x(i))), \text{abs}(\text{aimag}(x(i))))$.

Values *scale* and *sumsq* must be supplied in *scale* and *sumsq*, and *scl* and *ssq* are overwritten on *scale* and *sumsq*, respectively.

All routines ?lassq make only one pass through the vector *x*.

Input Parameters

n	INTEGER. The number of elements to be used from the vector *x*.
x	REAL for slassq DOUBLE PRECISION for dlassq COMPLEX for classq DOUBLE COMPLEX for zlassq. The vector for which a scaled sum of squares is computed: $x(i) = x(1+(i-1)*incx), 1 \le i \le n$.
incx	INTEGER. The increment between successive values of the vector *x*. $incx > 0$.
scale	REAL for slassq/classq DOUBLE PRECISION for dlassq/zlassq. On entry, the value *scale* in the equation above.
sumsq	REAL for slassq/classq DOUBLE PRECISION for dlassq/zlassq. On entry, the value *sumsq* in the equation above.

Output Parameters

scale	On exit, *scale* is overwritten with *scl*, the scaling factor for the sum of squares.
sumsq	For real flavors: On exit, *sumsq* is overwritten with the value *smsq* in the equation above. For complex flavors: On exit, *sumsq* is overwritten with the value *ssq* in the equation above.

?lasv2

Computes the singular value decomposition of a 2-by-2 triangular matrix.

Syntax

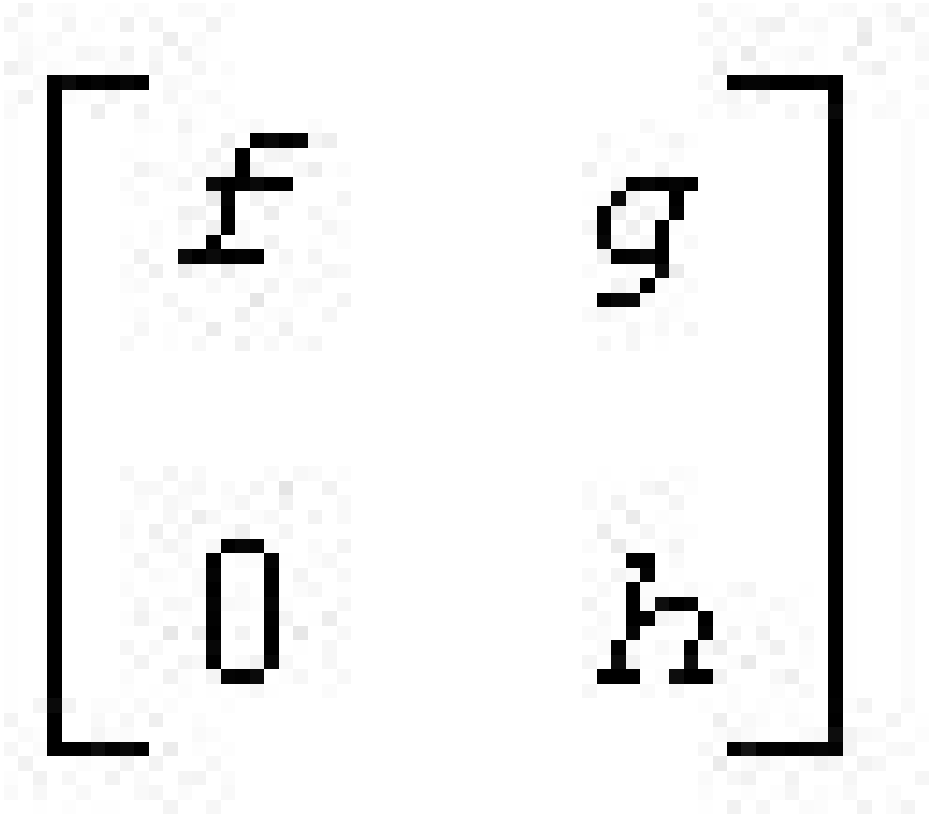
```
call slasv2( f, g, h, ssmin, ssmax, snr, csr, snl, csl )
call dlasv2( f, g, h, ssmin, ssmax, snr, csr, snl, csl )
```

Include Files

- mkl.fi

Description

The routine ?lasv2 computes the singular value decomposition of a 2-by-2 triangular matrix



On return, abs(*ssmax*) is the larger singular value, abs(*ssmin*) is the smaller singular value, and (*csl*,*snl*) and (*csr*,*snr*) are the left and right singular vectors for abs(*ssmax)*, giving the decomposition

$$\begin{bmatrix} csl & snl \\ -snl & csl \end{bmatrix} \begin{bmatrix} f & g \\ 0 & h \end{bmatrix} \begin{bmatrix} csr & -snr \\ snr & csr \end{bmatrix} = \begin{bmatrix} ssmax & 0 \\ 0 & ssmin \end{bmatrix}$$

Input Parameters

f, *g*, *h*

REAL for slasv2

DOUBLE PRECISION for dlasv2.

The (1,1), (1,2) and (2,2) elements of the 2-by-2 matrix, respectively.

Output Parameters

ssmin, *ssmax*

REAL for slasv2

DOUBLE PRECISION for dlasv2.

abs(*ssmin*) and abs(*ssmax*) is the smaller and the larger singular value, respectively.

snl, *csl*

REAL for slasv2

DOUBLE PRECISION for dlasv2.

The vector (*csl*, *snl*) is a unit left singular vector for the singular value abs(*ssmax*).

snr, *csr*

REAL for slasv2

DOUBLE PRECISION for dlasv2.

The vector (*csr*, *snr*) is a unit right singular vector for the singular value abs(*ssmax*).

Application Notes

Any input parameter may be aliased with any output parameter.

Barring over/underflow and assuming a guard digit in subtraction, all output quantities are correct to within a few units in the last place (ulps).

In ieee arithmetic, the code works correctly if one matrix element is infinite. Overflow will not occur unless the largest singular value itself overflows or is within a few ulps of overflow. (On machines with partial overflow, like the Cray, overflow may occur if the largest singular value is within a factor of 2 of overflow.) Underflow is harmless if underflow is gradual. Otherwise, results may correspond to a matrix modified by perturbations of size near the underflow threshold.

?laswlq

Computes blocked Short-Wide LQ matrix factorization.

```
call slaswlq(m, n, mb, nb, a, lda, t, ldt, work, lwork, info)
call dlaswlq(m, n, mb, nb, a, lda, t, ldt, work, lwork, info)
call claswlq(m, n, mb, nb, a, lda, t, ldt, work, lwork, info)
call zlaswlq(m, n, mb, nb, a, lda, t, ldt, work, lwork, info)
```

Description

?laswlq computes a blocked Short-Wide LQ (SWLQ) factorization of an *m*-by-*n* matrix *A*, where *n*≥*m*: *A* = *L***Q*.

SWLQ performs LQ by a sequence of orthogonal transformations, representing *Q* as a product of other orthogonal matrices

Q = *Q*(1) * *Q*(2) * . . . * *Q*(*k*)

where each *Q*(*i*) zeros out upper diagonal entries of a block of *nb* rows of *A*:

Q(1) zeros out the upper diagonal entries of rows 1:*nb* of *A*,

Q(2) zeros out the bottom *mb* - *n* rows of rows [1:*m*, *nb* + 1:2**nb* - *m*] of *A*,

Q(3) zeros out the bottom *mb* - *n* rows of rows [1:*m*, 2**nb* - *m* + 1:3**nb* - 2**m*] of *A*....

Q(1) is computed bygelqt, which represents *Q*(1) by Householder vectors stored under the diagonal of rows 1:*mb* of *a*, and by upper triangular block reflectors, stored in array *t*(1:*ldt*, 1:*n*). For more information, see gelqt.

Q(*i*) for *i* > 1 is computed by tplqt, which represents *Q*(*i*) by Householder vectors stored in columns [(*i* - 1)*(*nb* - *m*) + *m* + 1:*i**(*nb* - *m*) + *m*] of *a*, and by upper triangular block reflectors, stored in array *t*(1:*ldt*, (*i* - 1)**m* + 1:*i***m*). The last *Q*(*k*) may use fewer rows. For more information, see tplqt. For more details of the overall algorithm, see [DEMMEL12].

Input Parameters

m	INTEGER. The number of rows of the matrix *A*. *m*≥ 0.
n	INTEGER. The number of columns of the matrix *A*. *n*≥*m*≥ 0.
mb	INTEGER. The row block size to be used in the blocked QR. *m*≥*mb*≥ 1
nb	INTEGER. The column block size to be used in the blocked QR. *nb* > *m*.
a	REAL for slaswlq DOUBLE PRECISION for dlaswlq COMPLEX for claswlq COMPLEX*16 for zlaswlq Array of size (*lda*, *n*). On entry, the *m*-by-*n* matrix *A*.
lda	INTEGER. The leading dimension of the array *a*. *lda*≥ max(1,*m*).
ldt	INTEGER. The leading dimension of the array *t*. *ldt*≥*mb*.
lwork	INTEGER. The dimension of the array *work*. *lwork*≥*mb* * *m*. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by XERBLA.

Output Parameters

a	On exit, the elements on and below the diagonal of the array contain the *n*-by-*n* lower triangular matrix *L*; the elements above the diagonal represent *Q* by the rows of blocked *V*.
t	REAL for slaswlq DOUBLE PRECISION for dlaswlq COMPLEX for claswlq COMPLEX*16 for zlaswlq Array of size (*ldt*, *n* * *Number_of_row_blocks*), where *Number_of_row_blocks* = ceiling((*n* - *m*)/(*nb*-*m*)). The blocked upper triangular block reflectors stored in compact form as a sequence of upper triangular blocks.
work	REAL for slaswlq DOUBLE PRECISION for dlaswlq COMPLEX for claswlq COMPLEX*16 for zlaswlq Workspace array of size (max(1, *lwork*)).
info	INTEGER. *info* = 0: successful exit. *info* < 0: if *info* = -*i*, the *i*-th argument had an illegal value.

?laswp

Performs a series of row interchanges on a general rectangular matrix.

Syntax

```
call slaswp( n, a, lda, k1, k2, ipiv, incx )
call dlaswp( n, a, lda, k1, k2, ipiv, incx )
call claswp( n, a, lda, k1, k2, ipiv, incx )
call zlaswp( n, a, lda, k1, k2, ipiv, incx )
```

Include Files

- mkl.fi

Description

The routine performs a series of row interchanges on the matrix *A*. One row interchange is initiated for each of rows *k1* through *k2* of *A*.

Input Parameters

The data types are given for the Fortran interface.

n	INTEGER. The number of columns of the matrix *A*.
a	REAL for slaswp DOUBLE PRECISION for dlaswp COMPLEX for claswp DOUBLE COMPLEX for zlaswp. Array, size *lda* by *n*. Array *a* contains the *m*-by-*n* matrix *A*.
lda	INTEGER. The leading dimension of the array *a*.
k1	INTEGER. The first element of *ipiv* for which a row interchange will be done.
k2	INTEGER. The last element of *ipiv* for which a row interchange will be done.
ipiv	INTEGER. Array, size *k1*+(*k2*–*k1*)*|*incx*|). The vector of pivot indices. Only the elements in positions *k1* through *k2* of *ipiv* are accessed. *ipiv*(*k*) = *l* implies rows *k* and *l* are to be interchanged.
incx	INTEGER. The increment between successive values of *ipiv*. If *ipiv* is negative, the pivots are applied in reverse order.

Output Parameters

a	On exit, the permuted matrix.

?lasy2

Solves the Sylvester matrix equation where the matrices are of order 1 or 2.

Syntax

```
call slasy2( ltranl, ltranr, isgn, n1, n2, tl, ldtl, tr, ldtr, b, ldb, scale, x, ldx, xnorm, info )
call dlasy2( ltranl, ltranr, isgn, n1, n2, tl, ldtl, tr, ldtr, b, ldb, scale, x, ldx, xnorm, info )
```

Include Files

- mkl.fi

Description

The routine solves for the *n1*-by-*n2* matrix *X*, 1 ≤ *n1*, *n2* ≤ 2, in

op(*TL*)*X + *isgn**X*op(*TR*) = *scale**B*,

where

TL is *n1*-by-*n1*,

TR is *n2*-by-*n2*,

B is *n1*-by-*n2*,

and *isgn* = 1 or -1. op(*T*) = *T* or T^T, where T^T denotes the transpose of *T*.

Input Parameters

ltranl
LOGICAL.
On entry, *ltranl* specifies the op(*TL*):
= .FALSE., op(*TL*) = *TL*,
= .TRUE., op(*TL*) = $(TL)^T$.

ltranr
LOGICAL.
On entry, *ltranr* specifies the op(*TR*):
= .FALSE., op(*TR*) = *TR*,
= .TRUE., op(*TR*) = $(TR)^T$.

isgn
INTEGER. On entry, *isgn* specifies the sign of the equation as described before. *isgn* may only be 1 or -1.

n1
INTEGER. On entry, *n1* specifies the order of matrix *TL*.
n1 may only be 0, 1 or 2.

n2
INTEGER. On entry, *n2* specifies the order of matrix *TR*.
n2 may only be 0, 1 or 2.

tl
REAL for slasy2
DOUBLE PRECISION for dlasy2.
Array, DIMENSION (*ldtl*,2).
On entry, *tl* contains an *n1*-by-*n1* matrix *TL*.

ldtl
INTEGER.The leading dimension of the matrix *TL*.
ldtl≥ max(1,*n1*).

tr
REAL for slasy2
DOUBLE PRECISION for dlasy2.
Array, DIMENSION (*ldtr*,2). On entry, *tr* contains an *n2*-by-*n2* matrix *TR*.

ldtr
INTEGER. The leading dimension of the matrix *TR*.
ldtr≥ max(1,*n2*).

b
REAL for slasy2
DOUBLE PRECISION for dlasy2.
Array, DIMENSION (*ldb*,2). On entry, the *n1*-by-*n2* matrix *B* contains the right-hand side of the equation.

ldb
INTEGER. The leading dimension of the matrix *B*.
ldb≥ max(1,*n1*).

ldx	INTEGER. The leading dimension of the output matrix *X*. *ldx*≥ max(1,*n1*).

Output Parameters

scale	REAL for slasy2 DOUBLE PRECISION for dlasy2. On exit, *scale* contains the scale factor. *scale* is chosen less than or equal to 1 to prevent the solution overflowing.
x	REAL for slasy2 DOUBLE PRECISION for dlasy2. Array, DIMENSION (*ldx*,2). On exit, *x* contains the *n1*-by-*n2* solution.
xnorm	REAL for slasy2 DOUBLE PRECISION for dlasy2. On exit, *xnorm* is the infinity-norm of the solution.
info	INTEGER. On exit, *info* is set to 0: successful exit. 1: *TL* and *TR* have too close eigenvalues, so *TL* or *TR* is perturbed to get a nonsingular equation.

NOTE
For higher speed, this routine does not check the inputs for errors.

?lasyf

Computes a partial factorization of a symmetric matrix, using the diagonal pivoting method.

Syntax

```
call slasyf( uplo, n, nb, kb, a, lda, ipiv, w, ldw, info )
call dlasyf( uplo, n, nb, kb, a, lda, ipiv, w, ldw, info )
call clasyf( uplo, n, nb, kb, a, lda, ipiv, w, ldw, info )
call zlasyf( uplo, n, nb, kb, a, lda, ipiv, w, ldw, info )
```

Include Files

- mkl.fi

Description

The routine ?*lasyf* computes a partial factorization of a symmetric matrix *A* using the Bunch-Kaufman diagonal pivoting method. The partial factorization has the form:

If *uplo* = 'U':

$$A = \begin{bmatrix} I & U_{12} \\ 0 & U_{22} \end{bmatrix} \begin{bmatrix} A_{11} & 0 \\ 0 & D \end{bmatrix} \begin{bmatrix} I & 0 \\ U_{12}^{T} & U_{22}^{T} \end{bmatrix}$$

uplo = 'L'

$$A = \begin{bmatrix} L_{11} & 0 \\ L_{21} & I \end{bmatrix} \begin{bmatrix} D & 0 \\ 0 & A_{22} \end{bmatrix} \begin{bmatrix} L_{11}^{T} & L_{21}^{T} \\ 0 & I \end{bmatrix}$$

where the order of *D* is at most *nb*.

The actual order is returned in the argument *kb*, and is either *nb* or *nb*-1, or *n* if $n \leq nb$.

This is an auxiliary routine called by `?sytrf`. It uses blocked code (calling Level 3 BLAS) to update the submatrix A_{11} (if *uplo* = 'U') or A_{22} (if *uplo* = 'L').

Input Parameters

uplo

CHARACTER*1.

Specifies whether the upper or lower triangular part of the symmetric matrix *A* is stored:

= 'U': Upper triangular

= 'L': Lower triangular

n

INTEGER. The order of the matrix *A*. $n \geq 0$.

nb

INTEGER. The maximum number of columns of the matrix *A* that should be factored. *nb* should be at least 2 to allow for 2-by-2 pivot blocks.

a

REAL for `slasyf`

DOUBLE PRECISION for `dlasyf`

COMPLEX for `clasyf`

DOUBLE COMPLEX for `zlasyf`.

Array, DIMENSION (*lda*, *n*). If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *a* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *a* is not referenced.

lda

INTEGER. The leading dimension of the array *a*. $lda \geq \max(1, n)$.

w

REAL for `slasyf`

DOUBLE PRECISION for `dlasyf`

COMPLEX for clasyf

DOUBLE COMPLEX for zlasyf.

Workspace array, DIMENSION (*ldw*, *nb*).

ldw INTEGER. The leading dimension of the array *w*. *ldw* ≥ max(1,*n*).

Output Parameters

kb INTEGER. The number of columns of *A* that were actually factored *kb* is either *nb*-1 or *nb*, or *n* if *n* ≤ *nb*.

a On exit, *a* contains details of the partial factorization.

ipiv INTEGER. Array, DIMENSION (*n*). Details of the interchanges and the block structure of *D*.

If *uplo* = 'U', only the last *kb* elements of *ipiv* are set;

if *uplo* = 'L', only the first *kb* elements are set.

If *ipiv*(*k*) > 0, then rows and columns *k* and *ipiv*(*k*) were interchanged and *D*(*k*, *k*) is a 1-by-1 diagonal block.

If *uplo* = 'U' and *ipiv*(*k*) = *ipiv*(*k*–1) < 0, then rows and columns *k*-1 and -*ipiv*(*k*) were interchanged and *D*(*k*–1:*k*, *k*–1:*k*) is a 2-by-2 diagonal block.

If *uplo* = 'L' and *ipiv*(*k*) = *ipiv*(*k*+1) < 0, then rows and columns *k* +1 and -*ipiv*(*k*) were interchanged and *D*(*k*:*k*+1, *k*:*k*+1) is a 2-by-2 diagonal block.

info INTEGER.

= 0: successful exit

?lasyf_aa

Factorizes a panel of a real or complex symmetric matrix using Aasen's algorithm.

```
call slasyf_aa(uplo, j1, m, nb, a, lda, ipiv, h, ldh, work)
call dlasyf_aa(uplo, j1, m, nb, a, lda, ipiv, h, ldh, work)
call clasyf_aa(uplo, j1, m, nb, a, lda, ipiv, h, ldh, work)
call zlasyf_aa(uplo, j1, m, nb, a, lda, ipiv, h, ldh, work)
```

Description

?lasyf_aa factorizes a panel of a real or complex symmetric matrix *A* using Aasen's algorithm. The panel consists of a set of *nb* rows of *A* when *uplo* is 'U', or a set of *nb* columns when *uplo* is 'L'. In order to factorize the panel, Aasen's algorithm requires the last row, or column, of the previous panel. The first row, or column, of *A* is set to be the first row, or column, of an identity matrix, which is used to factorize the first panel. The resulting *j*-th row of *U*, or *j*-th column of *L*, is stored in the (*j*-1)-st row, or column, of *A* (without the unit diagonals), while the diagonal and subdiagonal of *A* are overwritten by those of *T*.

Input Parameters

uplo	CHARACTER*1. If *uplo* = 'U': Upper triangular of *A* is stored. If *uplo*= 'L': Lower triangular of *A* is stored..
j1	INTEGER. The location of the first row, or column, of the panel within the submatrix of *A*, passed to this routine: when called by ?sytrf_aa, for the first panel, *j1* is 1, while for the remaining panels, *j1* is 2.
m	INTEGER. The size of the submatrix. $m \geq 0$.
nb	INTEGER. The size of the panel to be factorized.
a	REAL for slasyf_aa DOUBLE PRECISION for dlasyf_aa REAL for clasyf_aa COMPLEX*16 for zlasyf_aa Array of size (*lda*, *m*) for the first panel, and size (*lda*,*m* + 1) for the remaining panels. On entry, *a* contains the last row, or column, of the previous panel, and the trailing submatrix of *a* to be factorized, except for the first panel, when only the panel is passed.
lda	INTEGER. The leading dimension of the array *a*. $lda \geq \max(1, n)$.
h	REAL for slasyf_aa DOUBLE PRECISION for dlasyf_aa REAL for clasyf_aa COMPLEX*16 for zlasyf_aa Workspace array of size (*ldh*,*nb*).
ldh	INTEGER. The leading dimension of the workspace *h*. $ldh \geq \max(1, m)$.

Output Parameters

a	On exit, the leading panel is factorized.
ipiv	INTEGER . Array of size (*n*). Details of the row and column interchanges: the row and column *k* were interchanged with the row and column *ipiv*(*k*).
work	REAL for slasyf_aa DOUBLE PRECISION for dlasyf_aa REAL for clasyf_aa COMPLEX*16 for zlasyf_aa Workspace array of size(*m*).

?lasyf_rook

Computes a partial factorization of a complex symmetric matrix, using the bounded Bunch-Kaufman diagonal pivoting method.

Syntax

```
call slasyf_rook( uplo, n, nb, kb, a, lda, ipiv, w, ldw, info )
call dlasyf_rook( uplo, n, nb, kb, a, lda, ipiv, w, ldw, info )
call clasyf_rook( uplo, n, nb, kb, a, lda, ipiv, w, ldw, info )
call zlasyf_rook( uplo, n, nb, kb, a, lda, ipiv, w, ldw, info )
```

Include Files

- mkl.fi

Description

The routine ?*lasyf_rook* computes a partial factorization of a complex symmetric matrix *A* using the bounded Bunch-Kaufman ("rook") diagonal pivoting method. The partial factorization has the form:

$$A = \begin{bmatrix} I & U_{12} \\ 0 & U_{22} \end{bmatrix} \begin{bmatrix} A_{11} & 0 \\ 0 & D \end{bmatrix} \begin{bmatrix} I & 0 \\ U_{12}^{T} & U_{22}^{T} \end{bmatrix}$$

$$A = \begin{bmatrix} L_{11} & 0 \\ L_{21} & I \end{bmatrix} \begin{bmatrix} D & 0 \\ 0 & A_{22} \end{bmatrix} \begin{bmatrix} L_{11}^{T} & L_{21}^{T} \\ 0 & I \end{bmatrix}$$

where the order of *D* is at most *nb*.

The actual order is returned in the argument *kb*, and is either *nb* or *nb*-1, or *n* if $n \leq nb$.

This is an auxiliary routine called by ?sytrf_rook. It uses blocked code (calling Level 3 BLAS) to update the submatrix A_{11} (if *uplo* = 'U') or A_{22} (if *uplo* = 'L').

Input Parameters

uplo — CHARACTER*1.

Specifies whether the upper or lower triangular part of the symmetric matrix *A* is stored:

= 'U': Upper triangular

= 'L': Lower triangular

n INTEGER. The order of the matrix *A*. *n* ≥ 0.

nb INTEGER. The maximum number of columns of the matrix *A* that should be factored. *nb* should be at least 2 to allow for 2-by-2 pivot blocks.

a REAL for slasyf_rook

DOUBLE PRECISION for dlasyf_rook

COMPLEX for clasyf_rook

DOUBLE COMPLEX for zlasyf_rook.

Array, DIMENSION (*lda*, *n*). If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *a* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *a* is not referenced.

lda INTEGER. The leading dimension of the array *a*. *lda* ≥ max(1,*n*).

w REAL for slasyf_rook

DOUBLE PRECISION for dlasyf_rook

COMPLEX for clasyf_rook

DOUBLE COMPLEX for zlasyf_rook.

Workspace array, DIMENSION (*ldw*, *nb*).

ldw INTEGER. The leading dimension of the array *w*. *ldw* ≥ max(1,*n*).

Output Parameters

kb INTEGER. The number of columns of *A* that were actually factored *kb* is either *nb*-1 or *nb*, or *n* if *n* ≤ *nb*.

a On exit, *a* contains details of the partial factorization.

ipiv INTEGER. Array, DIMENSION (*n*). Details of the interchanges and the block structure of *D*.

If *uplo* = 'U', only the last *kb* elements of *ipiv* are set;

if *uplo* = 'L', only the first *kb* elements are set.

If *ipiv*(*k*) > 0, then rows and columns *k* and *ipiv*(*k*) were interchanged and $D_{k,k}$ is a 1-by-1 diagonal block.

If *uplo* = 'U' and *ipiv*(*k*) < 0 and *ipiv*(*k* – 1) < 0, then rows and columns *k* and -*ipiv*(*k*) were interchanged, rows and columns *k* - 1 and -*ipiv*(*k* - 1) were interchanged, and $D_{k-1:k,\ k-1:k}$ is a 2-by-2 diagonal block.

If *uplo* = 'L' and *ipiv*(*k*) < 0 and *ipiv*(*k* + 1) < 0, then rows and columns *k* and -*ipiv*(*k*) were interchanged, rows and columns *k* + 1 and -*ipiv*(*k* + 1) were interchanged, and $D_{k:k+1,\ k:k+1}$ is a 2-by-2 diagonal block.

info INTEGER.

= 0: successful exit

> 0: if *info* = *k*, *D*(*k*, *k*) is exactly zero. The factorization has been completed, but the block diagonal matrix *D* is exactly singular.

?lahef

Computes a partial factorization of a complex Hermitian indefinite matrix, using the diagonal pivoting method.

Syntax

```
call clahef( uplo, n, nb, kb, a, lda, ipiv, w, ldw, info )
call zlahef( uplo, n, nb, kb, a, lda, ipiv, w, ldw, info )
```

Include Files

- mkl.fi

Description

The routine ?lahef computes a partial factorization of a complex Hermitian matrix *A*, using the Bunch-Kaufman diagonal pivoting method. The partial factorization has the form:

If *uplo* = 'U':

$$A = \begin{bmatrix} I & U_{12} \\ 0 & U_{22} \end{bmatrix} \begin{bmatrix} A_{11} & 0 \\ 0 & D \end{bmatrix} \begin{bmatrix} I & 0 \\ U_{12}^{H} & U_{22}^{H} \end{bmatrix}$$

If *uplo* = 'U':

$$A = \begin{bmatrix} L_{11} & 0 \\ L_{21} & I \end{bmatrix} \begin{bmatrix} D & 0 \\ 0 & A_{22} \end{bmatrix} \begin{bmatrix} L_{11}^{H} & L_{21}^{H} \\ 0 & I \end{bmatrix}$$

where the order of *D* is at most *nb*.

The actual order is returned in the argument *kb*, and is either *nb* or *nb*-1, or *n* if $n \leq nb$.

Note that U^H denotes the conjugate transpose of *U*.

This is an auxiliary routine called by ?hetrf. It uses blocked code (calling Level 3 BLAS) to update the submatrix A_{11} (if *uplo* = 'U') or A_{22} (if *uplo* = 'L').

Input Parameters

uplo — CHARACTER*1.

Specifies whether the upper or lower triangular part of the Hermitian matrix *A* is stored:

= 'U': upper triangular

= 'L': lower triangular

n INTEGER. The order of the matrix *A*. *n* ≥ 0.

nb INTEGER. The maximum number of columns of the matrix *A* that should be factored. *nb* should be at least 2 to allow for 2-by-2 pivot blocks.

a COMPLEX for clahef

DOUBLE COMPLEX for zlahef.

Array, DIMENSION (*lda*, *n*).

On entry, the Hermitian matrix *A*.

If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *A* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *A* is not referenced.

If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *A* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *A* is not referenced.

lda INTEGER. The leading dimension of the array *a*. *lda* ≥ max(1,*n*).

w COMPLEX for clahef

DOUBLE COMPLEX for zlahef.

Workspace array, DIMENSION (*ldw*, *nb*).

ldw INTEGER. The leading dimension of the array *w*. *ldw* ≥ max(1,*n*).

Output Parameters

kb INTEGER. The number of columns of *A* that were actually factored *kb* is either *nb*-1 or *nb*, or *n* if *n* ≤ *nb*.

a On exit, *A* contains details of the partial factorization.

ipiv INTEGER.

Array, DIMENSION (*n*). Details of the interchanges and the block structure of *D*.

If *uplo* = 'U', only the last *kb* elements of *ipiv* are set;

if *uplo* = 'L', only the first *kb* elements are set.

If *ipiv*(*k*) > 0, then rows and columns *k* and *ipiv*(*k*) are interchanged and *D*(*k*, *k*) is a 1-by-1 diagonal block.

If *uplo* = 'U' and *ipiv*(*k*) = *ipiv*(*k*–1) < 0, then rows and columns *k*-1 and -*ipiv*(*k*) are interchanged and *D*(*k*–1:*k*, *k*–1:*k*) is a 2-by-2 diagonal block.

If *uplo* = 'L' and *ipiv*(*k*) = *ipiv*(*k*+1) < 0, then rows and columns *k* +1 and -*ipiv*(*k*) are interchanged and *D*(*k*:*k*+1, *k*:*k*+1) is a 2-by-2 diagonal block.

info INTEGER.

= 0: successful exit

> 0: if *info* = *k*, *D*(*k*, *k*) is exactly zero. The factorization has been completed, but the block diagonal matrix *D* is exactly singular.

?lahef_aa

Factorizes a panel of a complex Hermitian matrix A using Aasen's algorithm.

```
call clahef_aa(uplo, j1, m, nb, a, lda, ipiv, h, ldh, work)
call zlahef_aa(uplo, j1, m, nb, a, lda, ipiv, h, ldh, work)
```

Description

?lahef_aa factorizes a panel of a complex Hermitian matrix *A* using Aasen's algorithm. The panel consists of a set of *nb* rows of *A* when *uplo* is 'U', or a set of *nb* columns when *uplo* is 'L'. In order to factorize the panel, Aasen's algorithm requires the last row, or column, of the previous panel. The first row, or column, of *A* is set to be the first row, or column, of an identity matrix, which is used to factorize the first panel. The resulting *j*-th row of *U*, or *j*-th column of *L*, is stored in the (*j*-1)-st row, or column, of *A* (without the unit diagonals), while the diagonal and subdiagonal of *A* are overwritten by those of *T*.

Input Parameters

uplo
CHARACTER*1.
If *uplo* = 'U': Upper triangular of *A* is stored.
If *uplo*= 'L': Lower triangular of *A* is stored..

j1
INTEGER. The location of the first row, or column, of the panel within the submatrix of *A*, passed to this routine, for example when called by ?hetrf_aa. For the first panel, *j1* is 1, while for the remaining panels, *j1* is 2.

m
INTEGER. The dimension of the submatrix. *m*≥ 0.

nb
INTEGER. The dimension of the panel to be factorized.

a
COMPLEX for clahef_aa
COMPLEX*16 for zlahef_aa
Array of size (*lda*,*m*) for the first panel, and size (*lda*,*m*+1) for the remaining panels. On entry, *a* contains the last row, or column, of the previous panel, and the trailing submatrix of *A* to be factorized, except for the first panel, only the panel is passed.

lda
INTEGER. The leading dimension of the array *a*. *lda*≥ max(1, *n*).

h
COMPLEX for clahef_aa
COMPLEX*16 for zlahef_aa
Workspace array of size (*ldh*, *nb*).

ldh
INTEGER. The leading dimension of the workspace *h*. *ldh*≥ max(1,*m*).

Output Parameters

a	On exit, the leading panel is factorized.
ipiv	INTEGER . Array of size (*n*). Details of the row and column interchanges: the row and column *k* were interchanged with the row and column *ipiv*(*k*).
h	Workspace array.
work	COMPLEX for clahef_aa COMPLEX*16 for zlahef_aa Workspace array of size (*m*).

?lahef_rook

Computes a partial factorization of a complex Hermitian indefinite matrix, using the bounded Bunch-Kaufman diagonal pivoting method.

Syntax

```
call clahef_rook( uplo, n, nb, kb, a, lda, ipiv, w, ldw, info )
call zlahef_rook( uplo, n, nb, kb, a, lda, ipiv, w, ldw, info )
```

Include Files

- mkl.fi

Description

The routine ?lahef_rook computes a partial factorization of a complex Hermitian matrix *A*, using the bounded Bunch-Kaufman ("rook") diagonal pivoting method. The partial factorization has the form:

If *uplo* = 'U':

$$A = \begin{bmatrix} I & U_{12} \\ 0 & U_{22} \end{bmatrix} \begin{bmatrix} A_{11} & 0 \\ 0 & D \end{bmatrix} \begin{bmatrix} I & 0 \\ U_{12}^{H} & U_{22}^{H} \end{bmatrix}$$

If *uplo* = 'L':

$$A = \begin{bmatrix} L_{11} & 0 \\ L_{21} & I \end{bmatrix} \begin{bmatrix} D & 0 \\ 0 & A_{22} \end{bmatrix} \begin{bmatrix} L_{11}^{H} & L_{21}^{H} \\ 0 & I \end{bmatrix}$$

where the order of *D* is at most *nb*.

The actual order is returned in the argument *kb*, and is either *nb* or *nb*-1, or *n* if $n \leq nb$.

Note that U^H denotes the conjugate transpose of U.

This is an auxiliary routine called by ?hetrf_rook. It uses blocked code (calling Level 3 BLAS) to update the submatrix A_{11} (if *uplo* = 'U') or A_{22} (if *uplo* = 'L').

Input Parameters

uplo

CHARACTER*1.

Specifies whether the upper or lower triangular part of the Hermitian matrix *A* is stored:

= 'U': upper triangular

= 'L': lower triangular

n

INTEGER. The order of the matrix *A*. $n \geq 0$.

nb

INTEGER. The maximum number of columns of the matrix *A* that should be factored. *nb* should be at least 2 to allow for 2-by-2 pivot blocks.

a

COMPLEX for clahef_rook

DOUBLE COMPLEX for zlahef_rook.

Array, DIMENSION (*lda*, *n*).

On entry, the Hermitian matrix *A*.

If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *A* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *A* is not referenced.

If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *A* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *A* is not referenced.

lda

INTEGER. The leading dimension of the array *a*. $lda \geq \max(1,n)$.

w

COMPLEX for clahef_rook

DOUBLE COMPLEX for zlahef_rook.

Workspace array, DIMENSION (*ldw*, *nb*).

ldw

INTEGER. The leading dimension of the array *w*. $ldw \geq \max(1,n)$.

Output Parameters

kb

INTEGER. The number of columns of *A* that were actually factored *kb* is either *nb*-1 or *nb*, or *n* if $n \leq nb$.

a

On exit, *A* contains details of the partial factorization.

ipiv

INTEGER.

Array, DIMENSION (*n*). Details of the interchanges and the block structure of *D*.

If *uplo* = 'U', only the last *kb* elements of *ipiv* are set;

if *uplo* = 'L', only the first *kb* elements are set.

If *ipiv*(*k*) > 0, then rows and columns *k* and *ipiv*(*k*) are interchanged and *D*(*k*, *k*) is a 1-by-1 diagonal block.

If *uplo* = 'U' and *ipiv*(*k*) < 0 and *ipiv*(*k*-1) < 0, then rows and columns *k* and -*ipiv*(*k*) are interchanged, rows and columns *k* - 1 and -*ipiv*(*k* - 1) are interchanged, and $D_{k-1:k,\ k-1:k}$ is a 2-by-2 diagonal block.

If *uplo* = 'L' and *ipiv*(*k*) < 0 and *ipiv*(*k* + 1) < 0, then rows and columns *k* and -*ipiv*(*k*) are interchanged, rows and columns *k* + 1 and -*ipiv*(*k* + 1) are interchanged, and $D_{k:k+1,\ k:k+1}$ is a 2-by-2 diagonal block.

info INTEGER.

= 0: successful exit

> 0: if *info* = *k*, *D*(*k*, *k*) is exactly zero. The factorization has been completed, but the block diagonal matrix *D* is exactly singular.

?latbs

Solves a triangular banded system of equations.

Syntax

```
call slatbs( uplo, trans, diag, normin, n, kd, ab, ldab, x, scale, cnorm, info )
call dlatbs( uplo, trans, diag, normin, n, kd, ab, ldab, x, scale, cnorm, info )
call clatbs( uplo, trans, diag, normin, n, kd, ab, ldab, x, scale, cnorm, info )
call zlatbs( uplo, trans, diag, normin, n, kd, ab, ldab, x, scale, cnorm, info )
```

Include Files

- mkl.fi

Description

The routine solves one of the triangular systems

*A*x = s*b*, or A^T*x = s*b*, or A^H*x = s*b* (for complex flavors)

with scaling to prevent overflow, where *A* is an upper or lower triangular band matrix. Here A^T denotes the transpose of *A*, A^H denotes the conjugate transpose of *A*, *x* and *b* are *n*-element vectors, and *s* is a scaling factor, usually less than or equal to 1, chosen so that the components of *x* will be less than the overflow threshold. If the unscaled problem will not cause overflow, the Level 2 BLAS routine ?tbsv is called. If the matrix *A* is singular (*A*(*j*, *j*)=0 for some *j*), then *s* is set to 0 and a non-trivial solution to *A*x = 0 is returned.

Input Parameters

uplo CHARACTER*1.

Specifies whether the matrix *A* is upper or lower triangular.

= 'U': upper triangular

= 'L': lower triangular

trans CHARACTER*1.

Specifies the operation applied to *A*.

= 'N': solve $A*x = s*b$ (no transpose)

= 'T': solve $A^T*x = s*b$ (transpose)

= 'C': solve $A^H*x = s*b$ (conjugate transpose)

diag CHARACTER*1.

Specifies whether the matrix *A* is unit triangular

= 'N': non-unit triangular

= 'U': unit triangular

normin CHARACTER*1.

Specifies whether *cnorm* is set.

= 'Y': *cnorm* contains the column norms on entry;

= 'N': *cnorm* is not set on entry. On exit, the norms is computed and stored in *cnorm*.

n INTEGER. The order of the matrix *A*. $n \geq 0$.

kd INTEGER. The number of subdiagonals or superdiagonals in the triangular matrix *A*. $kb \geq 0$.

ab REAL for slatbs

DOUBLE PRECISION for dlatbs

COMPLEX for clatbs

DOUBLE COMPLEX for zlatbs.

Array, DIMENSION (*ldab*, *n*).

The upper or lower triangular band matrix *A*, stored in the first *kb*+1 rows of the array. The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows:

if *uplo* = 'U', $ab(kd+1+i-j,j) = A(i,j)$ for $\max(1, j-kd) \leq i \leq j$;

if *uplo* = 'L', $ab(1+i-j,j) = A(i,j)$ for $j \leq i \leq \min(n, j+kd)$.

ldab INTEGER. The leading dimension of the array *ab*. $ldab \geq kb+1$.

x REAL for slatbs

DOUBLE PRECISION for dlatbs

COMPLEX for clatbs

DOUBLE COMPLEX for zlatbs.

Array, DIMENSION (*n*).

On entry, the right hand side *b* of the triangular system.

cnorm REAL for slatbs/clatbs

DOUBLE PRECISION for dlatbs/zlatbs.

Array, DIMENSION (*n*).

If *NORMIN* = 'Y', *cnorm* is an input argument and *cnorm*(*j*) contains the norm of the off-diagonal part of the *j*-th column of *A*.

If *trans* = 'N', *cnorm*(*j*) must be greater than or equal to the infinity-norm, and if *trans* = 'T' or 'C', *cnorm*(*j*) must be greater than or equal to the 1-norm.

Output Parameters

scale

REAL for slatbs/clatbs

DOUBLE PRECISION for dlatbs/zlatbs.

The scaling factor s for the triangular system as described above. If *scale* = 0, the matrix *A* is singular or badly scaled, and the vector *x* is an exact or approximate solution to *Ax* = 0.

cnorm

If *normin* = 'N', *cnorm* is an output argument and *cnorm*(*j*) returns the 1-norm of the off-diagonal part of the *j*-th column of *A*.

info

INTEGER.

= 0: successful exit

< 0: if *info* = -*k*, the *k*-th argument had an illegal value

?latm1

Computes the entries of a matrix as specified.

Syntax

```
call slatm1( mode, cond, irsign, idist, iseed, d, n, info )
call dlatm1( mode, cond, irsign, idist, iseed, d, n, info )
call clatm1( mode, cond, irsign, idist, iseed, d, n, info )
call zlatm1( mode, cond, irsign, idist, iseed, d, n, info )
```

Include Files

- mkl.fi

Description

The ?latm1 routine computes the entries of *D*(1..*n*) as specified by *mode*, *cond* and *irsign*. *idist* and *iseed* determine the generation of random numbers.

?latm1 is called by slatmr (for slatm1 and dlatm1), and by clatmr(for clatm1 and zlatm1) to generate random test matrices for LAPACK programs.

Input Parameters

mode

INTEGER. On entry describes how *d* is to be computed:

mode = 0 means do not change *d*.

mode = 1 sets *d*(1) = 1 and *d*(2:*n*) = 1.0/*cond*

mode = 2 sets *d*(1:*n*-1) = 1 and *d*(*n*)=1.0/*cond*

mode = 3 sets *d*(*i*)=*cond***(-(*i*-1)/(*n*-1))

mode = 4 sets *d*(*i*)= 1 - (*i*-1)/(*n*-1)*(1 - 1/*cond*)

mode = 5 sets *d* to random numbers in the range (1/*cond* , 1) such that their logarithms are uniformly distributed.

mode = 6 sets *d* to random numbers from same distribution as the rest of the matrix.

mode < 0 has the same meaning as abs(*mode*), except that the order of the elements of *d* is reversed.

Thus if *mode* is positive, *d* has entries ranging from 1 to 1/*cond*, if negative, from 1/*cond* to 1.

cond

REAL for slatm1,

DOUBLE PRECISION for dlatm1,

REAL for clatm1,

DOUBLE PRECISION for zlatm1,

On entry, used as described under *mode* above. If used, it must be ≥ 1.

irsign

INTEGER.

On entry, if *mode* is not -6, 0, or 6, determines sign of entries of *d*.

If *irsign* = 0, entries of *d* are unchanged.

If *irsign* = 1, each entry of *d* is multiplied by a random complex number uniformly distributed with absolute value 1.

idist

INTEGER. Specifies the distribution of the random numbers.

For slatm1 and dlatm1:

= 1: uniform (0,1)

= 2: uniform (-1,1)

= 3: normal (0,1)

For clatm1 and zlatm1:

= 1: real and imaginary parts each uniform (0,1)

= 2: real and imaginary parts each uniform (-1,1)

= 3: real and imaginary parts each normal (0,1)

= 4: complex number uniform in disk(0, 1)

iseed

INTEGER. Array, size (4).

Specifies the seed of the random number generator. The random number generator uses a linear congruential sequence limited to small integers, and so should produce machine independent random numbers. The values of *iseed*(4) are changed on exit, and can be used in the next call to ?latm1 to continue the same random number sequence.

d

REAL for slatm1,

DOUBLE PRECISION for dlatm1,

	COMPLEX for clatm1, DOUBLE COMPLEX for zlatm1, Array, size *n*.
n	INTEGER. Number of entries of *d*.

Output Parameters

iseed	On exit, the seed is updated.
d	On exit, *d* is updated, unless *mode* = 0.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -1, *mode* is not in range -6 to 6. If *info* = -2, *mode* is neither -6, 0 nor 6, and *irsign* is neither 0 nor 1. If *info* = -3, *mode* is neither -6, 0 nor 6 and *cond* is less than 1. If *info* = -4, *mode* equals 6 or -6 and *idist* is not in range 1 to 4. If *info* = -7, *n* is negative.

?latm2

Returns an entry of a random matrix.

Syntax

```
res = slatm2( m, n, i, j, kl, ku, idist, iseed, d, igrade, dl, dr, ipvtng, iwork, sparse )
res = dlatm2( m, n, i, j, kl, ku, idist, iseed, d, igrade, dl, dr, ipvtng, iwork, sparse )
res = clatm2( m, n, i, j, kl, ku, idist, iseed, d, igrade, dl, dr, ipvtng, iwork, sparse )
res = zlatm2( m, n, i, j, kl, ku, idist, iseed, d, igrade, dl, dr, ipvtng, iwork, sparse )
```

Include Files

- mkl.fi

Description

The ?latm2 routine returns entry (*i* , *j*) of a random matrix of dimension (*m*, *n*). It is called by the ?latmr routine in order to build random test matrices. No error checking on parameters is done, because this routine is called in a tight loop by ?latmr which has already checked the parameters.

Use of ?latm2 differs from ?latm3 in the order in which the random number generator is called to fill in random matrix entries. With ?latm2, the generator is called to fill in the pivoted matrix columnwise. With ?latm2, the generator is called to fill in the matrix columnwise, after which it is pivoted. Thus, ?latm3

can be used to construct random matrices which differ only in their order of rows and/or columns. ?latm2 is used to construct band matrices while avoiding calling the random number generator for entries outside the band (and therefore generating random numbers).

The matrix whose (*i* , *j*) entry is returned is constructed as follows (this routine only computes one entry):

- If *i* is outside (1..*m*) or *j* is outside (1..n), returns zero (this is convenient for generating matrices in band format).
- Generate a matrix *A* with random entries of distribution *idist*.
- Set the diagonal to *D*.
- Grade the matrix, if desired, from the left (by *dl*) and/or from the right (by *dr* or *dl*) as specified by *igrade*.
- Permute, if desired, the rows and/or columns as specified by *ipvtng* and *iwork*.
- Band the matrix to have lower bandwidth *kl* and upper bandwidth *ku*.
- Set random entries to zero as specified by *sparse*.

Input Parameters

m — INTEGER. Number of rows of the matrix.

n — INTEGER. Number of columns of the matrix.

i — INTEGER. Row of the entry to be returned.

j — INTEGER. Column of the entry to be returned.

kl — INTEGER. Lower bandwidth.

ku — INTEGER. Upper bandwidth.

idist — INTEGER. On entry, *idist* specifies the type of distribution to be used to generate a random matrix .

for slatm2 and dlatm2:

= 1: uniform (0,1)

= 2: uniform (-1,1)

= 3: normal (0,1)

for clatm2 and zlatm2:

= 1: real and imaginary parts each uniform (0,1)

= 2: real and imaginary parts each uniform (-1,1)

= 3: real and imaginary parts each normal (0,1)

= 4: complex number uniform in disk (0, 1)

iseed — INTEGER. Array, size 4.

Seed for the random number generator.

d — REAL for slatm2,

DOUBLE PRECISION for dlatm2,

COMPLEX for clatm2,

DOUBLE COMPLEX for zlatm2,

Array, size (min(*i*, *j*)). Diagonal entries of matrix.

igrade INTEGER. Specifies grading of matrix as follows:

= 0: no grading

= 1: matrix premultiplied by diag(*dl*)

= 2: matrix postmultiplied by diag(*dr*)

= 3: matrix premultiplied by diag(*dl*) and postmultiplied by diag(*dr*)

= 4: matrix premultiplied by diag(*dl*) and postmultiplied by inv(diag(*dl*))

For `slatm2` and `slatm2`:

= 5: matrix premultiplied by diag(*dl*) and postmultiplied by diag(*dl*)

For `clatm2` and `zlatm2`:

= 5: matrix premultiplied by diag(*dl*) and postmultiplied by diag(conjg(*dl*))

= 6: matrix premultiplied by diag(*dl*) and postmultiplied by diag(*dl*)

dl `REAL` for `slatm2`,

`DOUBLE PRECISION` for `dlatm2`,

`COMPLEX` for `clatm2`,

`DOUBLE COMPLEX` for `zlatm2`,

Array, size (*i* or *j*), as appropriate.

Left scale factors for grading matrix.

dr `REAL` for `slatm2`,

`DOUBLE PRECISION` for `dlatm2`,

`COMPLEX` for `clatm2`,

`DOUBLE COMPLEX` for `zlatm2`,

Array, size (*i* or *j*), as appropriate.

Right scale factors for grading matrix.

ipvtng INTEGER. On entry specifies pivoting permutations as follows:

= 0: none

= 1: row pivoting

= 2: column pivoting

= 3: full pivoting, i.e., on both sides

iwork INTEGER.

Array, size (*i* or *j*), as appropriate. This array specifies the permutation used. The row (or column) in position *k* was originally in position *iwork*`( k )`. This differs from *iwork* for `?latm3`.

sparse `REAL` for `slatm2`,

`DOUBLE PRECISION` for `dlatm2`,

`REAL` for `clatm2`,

DOUBLE PRECISION for zlatm2,

Specifies the sparsity of the matrix. If sparse matrix is to be generated, *sparse* should lie between 0 and 1. A uniform (0, 1) random number *x* is generated and compared to *sparse*. If *x* is larger the matrix entry is unchanged and if *x* is smaller the entry is set to zero. Thus on the average a fraction *sparse* of the entries will be set to zero.

Output Parameters

iseed INTEGER.

On exit, the seed is updated.

res REAL for slatm2,

DOUBLE PRECISION for dlatm2,

COMPLEX for clatm2,

DOUBLE COMPLEX for zlatm2,

Entry of a random matrix.

?latm3

Returns set entry of a random matrix.

Syntax

```
res = slatm3( m, n, i, j, isub, jsub, kl, ku, idist, iseed, d, igrade, dl, dr, ipvtng, iwork, sparse )
res = dlatm3( m, n, i, j, isub, jsub, kl, ku, idist, iseed, d, igrade, dl, dr, ipvtng, iwork, sparse )
res = clatm3( m, n, i, j, isub, jsub, kl, ku, idist, iseed, d, igrade, dl, dr, ipvtng, iwork, sparse )
res = zlatm3( m, n, i, j, isub, jsub, kl, ku, idist, iseed, d, igrade, dl, dr, ipvtng, iwork, sparse )
```

Description

The ?latm3 routine returns the (*isub*, *jsub*) entry of a random matrix of dimension (*m*, *n*) described by the other parameters. (*isub*, *jsub*) is the final position of the (*i* ,*j*) entry after pivoting according to *ipvtng* and *iwork*. ?latm3 is called by the ?latmr routine in order to build random test matrices. No error checking on parameters is done, because this routine is called in a tight loop by ?latmr which has already checked the parameters.

Use of ?latm3 differs from ?latm2 in the order in which the random number generator is called to fill in random matrix entries. With ?latm2, the generator is called to fill in the pivoted matrix columnwise. With ?latm3, the generator is called to fill in the matrix columnwise, after which it is pivoted. Thus, ?latm3 can be used to construct random matrices which differ only in their order of rows and/or columns. ?latm2 is used to construct band matrices while avoiding calling the random number generator for entries outside the band (and therefore generating random numbers in different orders for different pivot orders).

The matrix whose (*isub*, *jsub*) entry is returned is constructed as follows (this routine only computes one entry):

- If *isub* is outside `(1..m)` or *jsub* is outside `(1..n)`, returns zero (this is convenient for generating matrices in band format).
- Generate a matrix *A* with random entries of distribution *idist*.
- Set the diagonal to *D*.
- Grade the matrix, if desired, from the left (by *dl*) and/or from the right (by *dr* or *dl*) as specified by *igrade*.
- Permute, if desired, the rows and/or columns as specified by *ipvtng* and *iwork*.
- Band the matrix to have lower bandwidth *kl* and upper bandwidth *ku*.
- Set random entries to zero as specified by *sparse*.

Input Parameters

m — `INTEGER`. Number of rows of matrix.

n — `INTEGER`. Number of columns of matrix.

i — `INTEGER`. Row of unpivoted entry to be returned.

j — `INTEGER`. Column of unpivoted entry to be returned.

isub — `INTEGER`. Row of pivoted entry to be returned.

jsub — `INTEGER`. Column of pivoted entry to be returned.

kl — `INTEGER`. Lower bandwidth.

ku — `INTEGER`. Upper bandwidth.

idist — `INTEGER`. On entry, *idist* specifies the type of distribution to be used to generate a random matrix.

for `slatm2` and `dlatm2`:

= 1: uniform (0,1)

= 2: uniform (-1,1)

= 3: normal (0,1)

for `clatm2` and `zlatm2`:

= 1: real and imaginary parts each uniform (0,1)

= 2: real and imaginary parts each uniform (-1,1)

= 3: real and imaginary parts each normal (0,1)

= 4: complex number uniform in disk(0, 1)

iseed — `INTEGER`. Array, size 4.

Seed for random number generator.

d — `REAL` for `slatm3`,

`DOUBLE PRECISION` for `dlatm3`,

`COMPLEX` for `clatm3`,

`DOUBLE COMPLEX` for `zlatm3`,

Array, size `(min(i, j))`. Diagonal entries of matrix.

igrade INTEGER. Specifies grading of matrix as follows:

= 0: no grading

= 1: matrix premultiplied by diag(*dl*)

= 2: matrix postmultiplied by diag(*dr*)

= 3: matrix premultiplied by diag(*dl*) and postmultiplied by diag(*dr*)

= 4: matrix premultiplied by diag(*dl*) and postmultiplied by inv(diag(*dl*))

For slatm2 and slatm2:

= 5: matrix premultiplied by diag(*dl*) and postmultiplied by diag(*dl*)

For clatm2 and zlatm2:

= 5: matrix premultiplied by diag(*dl*) and postmultiplied by diag(conjg(*dl*))

= 6: matrix premultiplied by diag(*dl*) and postmultiplied by diag(*dl*)

dl REAL for slatm3,

DOUBLE PRECISION for dlatm3,

COMPLEX for clatm3,

DOUBLE COMPLEX for zlatm3,

Array, size (*i* or *j*, as appropriate).

Left scale factors for grading matrix.

dr REAL for slatm3,

DOUBLE PRECISION for dlatm3,

COMPLEX for clatm3,

DOUBLE COMPLEX for zlatm3,

Array, size (*i* or *j*, as appropriate).

Right scale factors for grading matrix.

ipvtng INTEGER. On entry specifies pivoting permutations as follows:

If *ipvtng* = 0: none.

If *ipvtng* = 1: row pivoting.

If *ipvtng* = 2: column pivoting.

If *ipvtng* = 3: full pivoting, i.e., on both sides.

sparse REAL for slatm3,

DOUBLE PRECISION for dlatm3,

REAL for clatm3,

DOUBLE PRECISION for zlatm3,

	On entry, specifies the sparsity of the matrix if sparse matrix is to be generated. *sparse* should lie between 0 and 1. A uniform(0, 1) random number *x* is generated and compared to *sparse*; if *x* is larger the matrix entry is unchanged and if *x* is smaller the entry is set to zero. Thus on the average a fraction *sparse* of the entries will be set to zero.
iwork	INTEGER. Array, size (*i* or *j*, as appropriate). This array specifies the permutation used. The row (or column) originally in position *k* is in position *iwork(k)* after pivoting. This differs from *iwork* for ?latm2.

Output Parameters

isub	On exit, row of pivoted entry is updated.
jsub	On exit, column of pivoted entry is updated.
iseed	On exit, the seed is updated.
res	REAL for slatm3, DOUBLE PRECISION for dlatm3, COMPLEX for clatm3, DOUBLE COMPLEX for zlatm3, Entry of a random matrix.

?latm5

Generates matrices involved in the Generalized Sylvester equation.

Syntax

```
call slatm5( prtype, m, n, a, lda, b, ldb, c, ldc, d, ldd, e, lde, f, ldf, r, ldr, l,
ldl, alpha, qblcka, qblckb )
call dlatm5( prtype, m, n, a, lda, b, ldb, c, ldc, d, ldd, e, lde, f, ldf, r, ldr, l,
ldl, alpha, qblcka, qblckb )
call clatm5( prtype, m, n, a, lda, b, ldb, c, ldc, d, ldd, e, lde, f, ldf, r, ldr, l,
ldl, alpha, qblcka, qblckb )
call zlatm5( prtype, m, n, a, lda, b, ldb, c, ldc, d, ldd, e, lde, f, ldf, r, ldr, l,
ldl, alpha, qblcka, qblckb )
```

Include Files

- mkl.fi

Description

The ?latm5 routine generates matrices involved in the Generalized Sylvester equation:

*A * R - L * B = C*

*D * R - L * E = F*

They also satisfy the diagonalization condition:

$$\begin{bmatrix} I & -L \\ & I \end{bmatrix}\begin{bmatrix} A & -C \\ & B \end{bmatrix}\begin{bmatrix} I & R \\ & I \end{bmatrix}=\begin{bmatrix} A & \\ & B \end{bmatrix}$$
$$\begin{bmatrix} I & -L \\ & I \end{bmatrix}\begin{bmatrix} D & -F \\ & E \end{bmatrix}\begin{bmatrix} I & R \\ & I \end{bmatrix}=\begin{bmatrix} D & \\ & E \end{bmatrix}$$

Input Parameters

prtype

INTEGER. Specifies the type of matrices to generate.

- If *prtype* = 1, *A* and *B* are Jordan blocks, *D* and *E* are identity matrices.

  A:

  If (*i* == *j*) then $A_{i,j}$ = 1.0.

  If (*j* == *i* + 1) then $A_{i,j}$ = -1.0.

  Otherwise $A_{i,j}$ = 0.0, *i*, *j* = 1...*m*

  B:

  If (*i* == *j*) then $B_{i,j}$ = 1.0 - *alpha*.

  If (*j* == *i* + 1) then $B_{i,j}$ = 1.0 .

  Otherwise $B_{i,j}$ = 0.0, *i*, *j* = 1...*n*.

  D:

  If (*i* == *j*) then $D_{i,j}$ = 1.0.

  Otherwise $D_{i,j}$ = 0.0, *i*, *j* = 1...*m*.

  E:

  If (*i* == *j*) then $E_{i,j}$ = 1.0

  Otherwise $E_{i,j}$ = 0.0, *i*, *j* = 1...*n*.

  L = *R* are chosen from [-10...10], which specifies the right hand sides (*C*, *F*).
- If *prtype* = 2 or 3: Triangular and/or quasi- triangular.

  A:

  If (*i* ≤ *j*) then $A_{i,j}$ = [-1...1].

  Otherwise $A_{i,j}$ = 0.0, *i*, *j* = 1...M.

  If (*prtype* = 3) then $A_{k+1,k+1} = A_{k,k}$;

  $A_{k+1,k}$ = [-1...1];

  sign($A_{k,k+1}$) = -(sign($A_{k+1,k}$).

  k = 1, *m*- 1, *qblcka*

  B :

  If (*i* ≤ *j*) then $B_{i,j}$ = [-1...1].

  Otherwise $B_{i,j}$ = 0.0, *i*, *j* = 1...*n*.

  If (*prtype* = 3) then$B_{k+1,k+1} = B_{k,k}$

$B_{k+1,k}$ = [-1...1]

sign($B_{k,k+1}$)= -(sign($B_{k+1,k}$)

k = 1, n - 1, $qblckb$.

D:

If ($i \leq j$) then $D_{i,j}$ = [-1...1].

Otherwise $D_{i,j}$ = 0.0, i, j = 1...m.

E:

If (i <= j) then $E_{i,j}$ = [-1...1].

Otherwise $E_{i,j}$ = 0.0, i, j = 1...N.

L, R are chosen from [-10...10], which specifies the right hand sides (C, F).

- If $prtype$ = 4 Full

  $A_{i,j}$ = [-10...10]

  $D_{i,j}$ = [-1...1] i,j = 1...m

  $B_{i,j}$ = [-10...10]

  $E_{i,j}$ = [-1...1] i,j = 1...n

  $R_{i,j}$ = [-10...10]

  $L_{i,j}$ = [-1...1] i = 1..m ,j = 1...n

  L and R specifies the right hand sides (C, F).
- If $prtype$ = 5 special case common and/or close eigs.

m — INTEGER. Specifies the order of A and D and the number of rows in C, F, R and L.

n — INTEGER. Specifies the order of B and E and the number of columns in C, F, R and L.

lda — INTEGER. The leading dimension of a.

ldb — INTEGER. The leading dimension of b.

ldc — INTEGER. The leading dimension of c.

ldd — INTEGER. The leading dimension of d.

lde — INTEGER. The leading dimension of e.

ldf — INTEGER. The leading dimension of f.

ldr — INTEGER. The leading dimension of r.

ldl — INTEGER. The leading dimension of l.

alpha — REAL for slatm5,

DOUBLE PRECISION for dlatm5,

REAL for clatm5,

DOUBLE PRECISION for zlatm5,

Parameter used in generating *prtype* = 1 and 5 matrices.

qblcka — INTEGER. When *prtype* = 3, specifies the distance between 2-by-2 blocks on the diagonal in *A*. Otherwise, *qblcka* is not referenced. *qblcka* > 1.

qblckb — INTEGER. When *prtype* = 3, specifies the distance between 2-by-2 blocks on the diagonal in *B*. Otherwise, *qblckb* is not referenced. *qblckb* > 1.

Output Parameters

a

REAL for slatm5,

DOUBLE PRECISION for dlatm5,

COMPLEX for clatm5,

DOUBLE COMPLEX for zlatm5,

Array, size (*lda*, *m*). On exit *a* contains the*m*-by-*m* array *A* initialized according to *prtype*.

b

REAL for slatm5,

DOUBLE PRECISION for dlatm5,

COMPLEX for clatm5,

DOUBLE COMPLEX for zlatm5,

Array, size (*ldb*, *n*). On exit *b* contains the *n*-by-*n* array *B* initialized according to *prtype*.

c

REAL for slatm5,

DOUBLE PRECISION for dlatm5,

COMPLEX for clatm5,

DOUBLE COMPLEX for zlatm5,

Array, size (*ldc*, *n*). On exit *c* contains the *m*-by-*n* array *C* initialized according to *prtype*.

d

REAL for slatm5,

DOUBLE PRECISION for dlatm5,

COMPLEX for clatm5,

DOUBLE COMPLEX for zlatm5,

Array, size (*ldd*, *m*). On exit *d* contains the *m*-by-*m* array *D* initialized according to *prtype*.

e

REAL for slatm5,

DOUBLE PRECISION for dlatm5,

COMPLEX for clatm5,

DOUBLE COMPLEX for zlatm5,

Array, size (*lde*, *n*). On exit *e* contains the *n*-by-*n* array *E* initialized according to *prtype*.

f	REAL for slatm5, DOUBLE PRECISION for dlatm5, COMPLEX for clatm5, DOUBLE COMPLEX for zlatm5, Array, size (*ldf*, *n*). On exit *f* contains the *m*-by-*n* array *F* initialized according to *prtype*.
r	REAL for slatm5, DOUBLE PRECISION for dlatm5, COMPLEX for clatm5, DOUBLE COMPLEX for zlatm5, Array, size (*ldr*, *n*). On exit *R* contains the *m*-by-*n* array *R* initialized according to *prtype*.
l	REAL for slatm5, DOUBLE PRECISION for dlatm5, COMPLEX for clatm5, DOUBLE COMPLEX for zlatm5, Array, size (*ldl*, *n*). On exit *l* contains the *m*-by-*n*array *L* initialized according to *prtype*.

?latm6

Generates test matrices for the generalized eigenvalue problem, their corresponding right and left eigenvector matrices, and also reciprocal condition numbers for all eigenvalues and the reciprocal condition numbers of eigenvectors corresponding to the 1th and 5th eigenvalues.

Syntax

```
call slatm6( type, n, a, lda, b, x, ldx, y, ldy, alpha, beta, wx, wy, s, dif )
call dlatm6( type, n, a, lda, b, x, ldx, y, ldy, alpha, beta, wx, wy, s, dif )
call clatm6( type, n, a, lda, b, x, ldx, y, ldy, alpha, beta, wx, wy, s, dif )
call zlatm6( type, n, a, lda, b, x, ldx, y, ldy, alpha, beta, wx, wy, s, dif )
```

Include Files

- mkl.fi

Description

The ?latm6 routine generates test matrices for the generalized eigenvalue problem, their corresponding right and left eigenvector matrices, and also reciprocal condition numbers for all eigenvalues and the reciprocal condition numbers of eigenvectors corresponding to the 1th and 5th eigenvalues.

There two kinds of test matrix pairs:

(*A*, *B*)= inverse(*YH*) * (*Da*, *Db*) * inverse(*X*)

Type 1:

$$Da = \begin{bmatrix} 1+a & 0 & 0 & 0 & 0 \\ 0 & 2+a & 0 & 0 & 0 \\ 0 & 0 & 3+a & 0 & 0 \\ 0 & 0 & 0 & 4+a & 0 \\ 0 & 0 & 0 & 0 & 5+2 \end{bmatrix} \quad Db = \begin{bmatrix} 1 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 1 \end{bmatrix}$$

Type 2:

$$Da = \begin{bmatrix} 1+i & 0 & 0 & 0 & 0 \\ 0 & 1-i & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & (1+a)+(1+b)i & 0 \\ 0 & 0 & 0 & 0 & (1+a)-(1+b)i \end{bmatrix} \quad Db = \begin{bmatrix} 1 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 1 \end{bmatrix}$$

In both cases the same inverse(*YH*) and inverse(X) are used to compute (*A*, *B*), giving the exact eigenvectors to (*A*,*B*) as (*YH*, *X*):

$$YH = \begin{bmatrix} 1 & 0 & -y & y & -y \\ 0 & 1 & -y & y & -y \\ 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 1 \end{bmatrix} \quad X = \begin{bmatrix} 1 & 0 & -x & -x & x \\ 0 & 1 & x & -x & -x \\ 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 1 \end{bmatrix}$$

,

where *a*, *b*, *x* and *y* will have all values independently of each other.

Input Parameters

type	INTEGER. Specifies the problem type.
n	INTEGER. Size of the matrices *A* and *B*.
lda	INTEGER. The leading dimension of *a* and of *b*.
ldx	INTEGER. The leading dimension of *x*.
ldy	INTEGER. The leading dimension of *y*.
alpha, *beta*	REAL for slatm6, DOUBLE PRECISION for dlatm6, COMPLEX for clatm6, DOUBLE COMPLEX for zlatm6, Weighting constants for matrix *A*.
wx	REAL for slatm6,

DOUBLE PRECISION for dlatm6,

COMPLEX for clatm6,

DOUBLE COMPLEX for zlatm6,

Constant for right eigenvector matrix.

wy REAL for slatm6,

DOUBLE PRECISION for dlatm6,

COMPLEX for clatm6,

DOUBLE COMPLEX for zlatm6,

Constant for left eigenvector matrix.

Output Parameters

a REAL for slatm6,

DOUBLE PRECISION for dlatm6,

COMPLEX for clatm6,

DOUBLE COMPLEX for zlatm6,

Array, size (*lda*, *n*). On exit, *a* contains the *n*-by-*n* matrix initialized according to *type*.

b REAL for slatm26,

DOUBLE PRECISION for dlatm6,

COMPLEX for clatm6,

DOUBLE COMPLEX for zlatm6,

Array, size (*lda*, *n*). On exit, *b* contains the *n*-by-*n* matrix initialized according to *type*.

x REAL for slatm6,

DOUBLE PRECISION for dlatm6,

COMPLEX for clatm6,

DOUBLE COMPLEX for zlatm6,

Array, size (*ldx*, *n*). On exit, *x* contains the *n*-by-*n* matrix of right eigenvectors.

y REAL for slatm6,

DOUBLE PRECISION for dlatm6,

COMPLEX for clatm6,

DOUBLE COMPLEX for zlatm6,

Array, size (*ldy*, *n*). On exit, *y* is the *n*-by-*n* matrix of left eigenvectors.

s REAL for slatm6,

DOUBLE PRECISION for dlatm6,

REAL for clatm6,

DOUBLE PRECISION for zlatm6,

Array, size (*n*). *s*(*i*) is the reciprocal condition number for eigenvalue *i* .

dif

REAL for slatm6,

DOUBLE PRECISION for dlatm6,

REAL for clatm6,

DOUBLE PRECISION for zlatm6,

Array, size(*n*). *dif*(*i*) is the reciprocal condition number for eigenvector *i* .

?latme

Generates random non-symmetric square matrices with specified eigenvalues.

Syntax

```
call slatme( n, dist, iseed, d, mode, cond, dmax, ei, rsign, upper, sim, ds, modes, conds, kl, ku, anorm, a, lda, work, info )
call dlatme( n, dist, iseed, d, mode, cond, dmax, ei, rsign, upper, sim, ds, modes, conds, kl, ku, anorm, a, lda, work, info )
call clatme( n, dist, iseed, d, mode, cond, dmax, ei, rsign, upper, sim, ds, modes, conds, kl, ku, anorm, a, lda, work, info )
call zlatme( n, dist, iseed, d, mode, cond, dmax, ei, rsign, upper, sim, ds, modes, conds, kl, ku, anorm, a, lda, work, info )
```

Include Files

- mkl.fi

Description

The ?latme routine generates random non-symmetric square matrices with specified eigenvalues. ?latme operates by applying the following sequence of operations:

1. Set the diagonal to *d*, where *d* may be input or computed according to *mode*, *cond*, *dmax*, and *rsign* as described below.
2. If *upper* = 'T', the upper triangle of *a* is set to random values out of distribution *dist*.
3. If *sim*='T', *a* is multiplied on the left by a random matrix *X*, whose singular values are specified by *ds*, *modes*, and *conds*, and on the right by *X* inverse.
4. If *kl* < *n*-1, the lower bandwidth is reduced to *kl* using Householder transformations. If *ku* < *n*-1, the upper bandwidth is reduced to *ku*.
5. If *anorm* is not negative, the matrix is scaled to have maximum-element-norm *anorm*.

NOTE
Since the matrix cannot be reduced beyond Hessenberg form, no packing options are available.

Input Parameters

n

INTEGER. The number of columns (or rows) of *A*.

dist

CHARACTER*1. On entry, *dist* specifies the type of distribution to be used to generate the random eigen-/singular values, and on the upper triangle (see *upper*).

If *dist* = 'U': uniform(0, 1)

If *dist* = 'S': uniform(-1, 1)

If *dist* = 'N': normal(0, 1)

If *dist* = 'D': uniform on the complex disc |*z*| < 1.

iseed

INTEGER. Array, size 4.

On entry *iseed* specifies the seed of the random number generator. The elements should lie between 0 and 4095 inclusive, and *iseed*(4) should be odd. The random number generator uses a linear congruential sequence limited to small integers, and so should produce machine independent random numbers.

d

REAL for slatme,

DOUBLE PRECISION for dlatme,

COMPLEX for clatme,

DOUBLE COMPLEX for zlatme,

Array, size (*n*). This array is used to specify the eigenvalues of *A*.

If *mode* = 0, then *d* is assumed to contain the eigenvalues. Otherwise they are computed according to *mode*, *cond*, *dmax*, and *rsign* and placed in *d*.

mode

INTEGER. On entry *mode* describes how the eigenvalues are to be specified:

mode = 0 means use *d* (with *ei* for slatme and dlatme) as input.

mode = 1 sets *d*(1) = 1 and *d*[1:*n* - 1]=1.0/*cond*.

mode = 2 sets *d*(1:*n*-1) = 1 and *d*(*n*)=1.0/*cond*.

mode = 3 sets *d*(*i*) = *cond***(-(*i*-1)/(*n*-1)).

mode = 4 sets *d*(*i*) = 1 - (*i*-1)/(*n*-1)*(1 - 1/*cond*).

mode = 5 sets *d* to random numbers in the range (1/*cond* , 1) such that their logarithms are uniformly distributed.

mode = 6 sets *d* to random numbers from same distribution as the rest of the matrix.

mode < 0 has the same meaning as abs(*mode*), except that the order of the elements of *d* is reversed.

Thus if *mode* is between 1 and 4, *d* has entries ranging from 1 to 1/*cond*, if between -1 and -4, *d* has entries ranging from 1/*cond* to 1.

cond

REAL for slatme,

DOUBLE PRECISION for dlatme,

REAL for clatme,

DOUBLE PRECISION for zlatme,

On entry, this is used as described under *mode* above. If used, it must be ≥ 1.

dmax

REAL for slatme,

DOUBLE PRECISION for dlatme,

COMPLEX for clatme,

DOUBLE COMPLEX for zlatme,

If *mode* is not -6, 0 or 6, the contents of *d* as computed according to *mode* and *cond* are scaled by *dmax* / max(abs(*d*(*i*))). Note that *dmax* needs not be positive or real: if *dmax* is negative or complex (or zero), *d* will be scaled by a negative or complex number (or zero). If *rsign*='F' then the largest (absolute) eigenvalue will be equal to *dmax*.

ei

CHARACTER*1. Used by slatme and dlatme only.

Array, size (*n*).

If *mode* = 0, and *ei*(1) is not ' ' (space character), this array specifies which elements of *d* (on input) are real eigenvalues and which are the real and imaginary parts of a complex conjugate pair of eigenvalues. The elements of *ei* may then only have the values 'R' and 'I'.

If *ei*(*j*) = 'R' and *ei*(*j* + 1) = 'I', then the *j* -th eigenvalue is cmplx(*d*(*j*) , *d*(*j* + 1)), and the (*j* +1)-th is the complex conjugate thereof.

If *ei*(*j*) = *ei*(*j* + 1)='R', then the *j*-th eigenvalue is *d*(*j*) (i.e., real). *ei*(1) may not be 'I', nor may two adjacent elements of *ei* both have the value 'I'.

If *mode* is not 0, then *ei* is ignored. If *mode* is 0 and *ei*(1) = ' ', then the eigenvalues will all be real.

rsign

CHARACTER*1. If *mode* is not 0, 6, or -6, and *rsign* = 'T', then the elements of *d*, as computed according to *mode* and *cond*, are multiplied by a random sign (+1 or -1) for slatme and dlatme or by a complex number from the unit circle |*z*| = 1 for clatme and zlatme.

If *rsign* = 'F', the elements of *d* are not multiplied. *rsign* may only have the values 'T' or 'F'.

upper

CHARACTER*1. If *upper* = 'T', then the elements of *a* above the diagonal will be set to random numbers out of *dist*.

If *upper* = 'F', they will not. *upper* may only have the values 'T' or 'F'.

sim

CHARACTER*1. If *sim* = 'T', then *a* will be operated on by a "similarity transform", i.e., multiplied on the left by a matrix *X* and on the right by *X* inverse. *X* = *USV*, where *U* and *V* are random unitary matrices and *S* is a (diagonal) matrix of singular values specified by *ds*, *modes*, and *conds*.

If *sim* = 'F', then *a* will not be transformed.

ds

REAL for slatme,

DOUBLE PRECISION for dlatme,

REAL for clatme,

DOUBLE PRECISION for zlatme,

This array is used to specify the singular values of *X*, in the same way that *d* specifies the eigenvalues of *a*. If *mode* = 0, the *ds* contains the singular values, which may not be zero.

modes INTEGER.

Similar to *mode*, but for specifying the diagonal of *S*. *modes* = -6 and +6 are not allowed (since they would result in randomly ill-conditioned eigenvalues.)

conds REAL for slatme,

DOUBLE PRECISION for dlatme,

REAL for clatme,

DOUBLE PRECISION for zlatme,

Similar to *cond*, but for specifying the diagonal of *S*.

kl INTEGER. This specifies the lower bandwidth of the matrix. *kl* = 1 specifies upper Hessenberg form. If *kl* is at least *n*-1, then *A* will have full lower bandwidth.

ku INTEGER. This specifies the upper bandwidth of the matrix. *ku* = 1 specifies lower Hessenberg form.

If *ku* is at least *n*-1, then *a* will have full upper bandwidth.

If *ku* and *ku* are both at least *n*-1, then *a* will be dense. Only one of *ku* and *kl* may be less than *n*-1.

anorm REAL for slatme,

DOUBLE PRECISION for dlatme,

REAL for clatme,

DOUBLE PRECISION for zlatme,

If *anorm* is not negative, then *a* is scaled by a non-negative real number to make the maximum-element-norm of *a* to be *anorm*.

lda INTEGER. Number of rows of matrix *A*.

work REAL for slatme,

DOUBLE PRECISION for dlatme,

COMPLEX for clatme,

DOUBLE COMPLEX for zlatme,

Array, size (3*n) . Workspace.

Output Parameters

iseed INTEGER.

	On exit, the seed is updated.
d	Modified if *mode* is nonzero.
ds	Modified if *mode* is nonzero.
a	REAL for slatme, DOUBLE PRECISION for dlatme, COMPLEX for clatme, DOUBLE COMPLEX for zlatme, Array, size (*lda*, *n*). On exit, *a* is the desired test matrix.
info	INTEGER. If *info* = 0, execution is successful. If *info* = -1, *n* is negative . If *info* = -2, *dist* is an illegal string. If *info* = -5, *mode* is not in range -6 to 6. If *info* = -6, *cond* is less than 1.0, and *mode* is not -6, 0, or 6 . If *info* = -9, *rsign* is not 'T' or 'F' . If *info* = -10, *upper* is not 'T' or 'F'. If *info* = -11, *sim* is not 'T' or 'F'. If *info* = -12, *modes* = 0 and *ds* has a zero singular value. If *info* = -13, *modes* is not in the range -5 to 5. If *info* = -14, *modes* is nonzero and *conds* is less than 1. . If *info* = -15, *kl* is less than 1. If *info* = -16, *ku* is less than 1, or *kl* and *ku* are both less than *n*-1. If *info* = -19, *lda* is less than *m*. If *info* = 1, error return from ?latm1 (computing *d*) . If *info* = 2, cannot scale to *dmax* (max. eigenvalue is 0) . If *info* = 3, error return from slatm1(for slatme and clatme), dlatm1 (for dlatme and zlatme) . If *info* = 4, error return from ?large. If *info* = 5, zero singular value from slatm1(for slatme and clatme), dlatm1(for dlatme and zlatme).

?latmr

Generates random matrices of various types.

Description

The ?latmr routine operates by applying the following sequence of operations:

1. Generate a matrix *A* with random entries of distribution *dist*:

   If *sym* = 'S', the matrix is symmetric,

   If *sym* = 'H', the matrix is Hermitian,

   If *sym* = 'N', the matrix is nonsymmetric.
2. Set the diagonal to *D*, where *D* may be input or computed according to *mode*, *cond*, *dmax* and *rsign* as described below.
3. Grade the matrix, if desired, from the left or right as specified by grade. The inputs *dl*, *model*, *condl*, *dr*, *moder* and *condr* also determine the grading as described below.
4. Permute, if desired, the rows and/or columns as specified by *pivtng* and *ipivot*.
5. Set random entries to zero, if desired, to get a random sparse matrix as specified by *sparse*.
6. Make *A* a band matrix, if desired, by zeroing out the matrix outside a band of lower bandwidth *kl* and upper bandwidth *ku*.
7. Scale *A*, if desired, to have maximum entry *anorm*.
8. Pack the matrix if desired. See options specified by the *pack* parameter.

> **NOTE**
> If two calls to ?latmr differ only in the pack parameter, they generate mathematically equivalent matrices. If two calls to ?latmr both have full bandwidth (*kl* = *m*-1 and *ku* = *n*-1), and differ only in the *pivtng* and *pack* parameters, then the matrices generated differ only in the order of the rows and columns, and otherwise contain the same data. This consistency cannot be and is not maintained with less than full bandwidth.

Input Parameters

m — INTEGER. Number of rows of *A*.

n — INTEGER. Number of columns of *A*.

dist — CHARACTER. On entry, *dist* specifies the type of distribution to be used to generate a random matrix .

If *dist* = 'U', real and imaginary parts are independent uniform(0, 1).

If *dist* = 'S', real and imaginary parts are independent uniform(-1, 1).

If *dist* = 'N', real and imaginary parts are independent normal(0, 1).

If *dist* = 'D', distribution is uniform on interior of unit disk.

iseed INTEGER. Array, size 4.

On entry, *iseed* specifies the seed of the random number generator. They should lie between 0 and 4095 inclusive, and *iseed*(4) should be odd. The random number generator uses a linear congruential sequence limited to small integers, and so should produce machine independent random numbers.

sym CHARACTER. If *sym* = 'S', generated matrix is symmetric.

If *sym* = 'H', generated matrix is Hermitian.

If *sym* = 'N', generated matrix is nonsymmetric.

d REAL for slatmr,

DOUBLE PRECISION for dlatmr,

COMPLEX for clatmr,

DOUBLE COMPLEX for zlatmr,

On entry this array specifies the diagonal entries of the diagonal of *A*. *d* may either be specified on entry, or set according to *mode* and *cond* as described below. If the matrix is Hermitian, the real part of *d* is taken. May be changed on exit if *mode* is nonzero.

mode INTEGER. On entry describes how *d* is to be used:

mode = 0 means use *d* as input.

mode = 1 sets *d*(1)=1 and *d*(2:*n*)=1.0/*cond*.

mode = 2 sets *d*(1:*n*-1)=1 and *d*(*n*)=1.0/*cond*.

mode = 3 sets *d*(*i*)=*cond***(-(*i*-1)/(*n*-1)).

mode = 4 sets *d*(*i*)=1 - (*i*-1)/(*n*-1)*(1 - 1/*cond*).

mode = 5 sets *d* to random numbers in the range (1/*cond* , 1) such that their logarithms are uniformly distributed.

mode = 6 sets *d* to random numbers from same distribution as the rest of the matrix.

mode < 0 has the same meaning as abs(*mode*), except that the order of the elements of *d* is reversed.

Thus if *mode* is between 1 and 4, *d* has entries ranging from 1 to 1/*cond*, if between -1 and -4, *D* has entries ranging from 1/*cond* to 1.

cond REAL for slatmr,

DOUBLE PRECISION for dlatmr,

REAL for clatmr,

DOUBLE PRECISION for zlatmr,

On entry, used as described under *mode* above. If used, *cond* must be ≥ 1.

dmax REAL for slatmr,

DOUBLE PRECISION for dlatmr,

COMPLEX for clatmr,

DOUBLE COMPLEX for zlatmr,

If *mode* is not -6, 0, or 6, the diagonal is scaled by *dmax* / max(abs(*d*(*i*))), so that maximum absolute entry of diagonal is abs(*dmax*). If *dmax* is complex (or zero), the diagonal is scaled by a complex number (or zero).

rsign

CHARACTER. If *mode* is not -6, 0, or 6, specifies the sign of the diagonal as follows:

For slatmr and dlatmr, if *rsign* = 'T', diagonal entries are multiplied 1 or -1 with a probability of 0.5.

For clatmr and zlatmr, if *rsign* = 'T', diagonal entries are multiplied by a random complex number uniformly distributed with absolute value 1.

If *rsign* = 'F', diagonal entries are unchanged.

grade

CHARACTER. Specifies grading of matrix as follows:

If *grade* = 'N', there is no grading

If *grade* = 'L', matrix is premultiplied by diag(*dl*) (only if matrix is nonsymmetric)

If *grade* = 'R', matrix is postmultiplied by diag(*dr*) (only if matrix is nonsymmetric)

If *grade* = 'B', matrix is premultiplied by diag(*dl*) and postmultiplied by diag(*dr*) (only if matrix is nonsymmetric)

If *grade* = 'H', matrix is premultiplied by diag(*dl*) and postmultiplied by diag(conjg(*dl*)) (only if matrix is Hermitian or nonsymmetric)

If *grade* = 'S', matrix is premultiplied by diag(*dl*) and postmultiplied by diag(*dl*) (only if matrix is symmetric or nonsymmetric)

If *grade* = 'E', matrix is premultiplied by diag(*dl*) and postmultiplied by inv(diag(*dl*)) (only if matrix is nonsymmetric)

NOTE
if *grade* = 'E', then *m* must equal *n*.

dl

REAL for slatmr,

DOUBLE PRECISION for dlatmr,

COMPLEX for clatmr,

DOUBLE COMPLEX for zlatmr,

Array, size (*m*).

If *model* = 0, then on entry this array specifies the diagonal entries of a diagonal matrix used as described under grade above.

If *model* is not zero, then *dl* is set according to *model* and *condl*, analogous to the way *D* is set according to *mode* and *cond* (except there is no *dmax* parameter for *dl*).

If *grade* = 'E', then *dl* cannot have zero entries.

Not referenced if *grade* = 'N' or 'R'. Changed on exit.

model INTEGER. This specifies how the diagonal array *dl* is computed, just as *mode* specifies how *D* is computed.

condl REAL for slatmr,

DOUBLE PRECISION for dlatmr,

REAL for clatmr,

DOUBLE PRECISION for zlatmr,

When *model* is not zero, this specifies the condition number of the computed *dl*.

dr REAL for slatmr,

DOUBLE PRECISION for dlatmr,

COMPLEX for clatmr,

DOUBLE COMPLEX for zlatmr,

If *moder* = 0, then on entry this array specifies the diagonal entries of a diagonal matrix used as described under *grade* above.

If *moder* is not zero, then *dr* is set according to *moder* and *condr*, analogous to the way *d* is set according to *mode* and *cond* (except there is no *dmax* parameter for *dr*).

Not referenced if *grade* = 'N', 'L', 'H''S' or 'E'.

moder INTEGER. This specifies how the diagonal array *dr* is to be computed, just as mode specifies how *d* is to be computed.

condr REAL for slatmr and clatmr,

DOUBLE PRECISION for dlatmr and zlatmr,

When *moder* is not zero, this specifies the condition number of the computed *dr*.

pivtng CHARACTER. On entry specifies pivoting permutations as follows:

If *pivtng* = 'N' or ' ': no pivoting permutation.

If *pivtng* = 'L': left or row pivoting (matrix must be nonsymmetric).

If *pivtng* = 'R': right or column pivoting (matrix must be nonsymmetric).

If *pivtng* = 'B' or 'F': both or full pivoting, i.e., on both sides. In this case, *m* must equal *n*.

If two calls to ?latmr both have full bandwidth (*kl* = *m* – 1 and *ku* = *n*–1), and differ only in the *pivtng* and *pack* parameters, then the matrices generated differs only in the order of the rows and columns, and otherwise contain the same data. This consistency cannot be maintained with less than full bandwidth.

ipivot

INTEGER. Array, size (*n* or *m*) This array specifies the permutation used. After the basic matrix is generated, the rows, columns, or both are permuted.

If row pivoting is selected, ?latmr starts with the last row and interchanges row *m* and row *ipivot*(*m*), then moves to the next-to-last row, interchanging rows (*m*–1) and row *ipivot*(*m*–1), and so on. In terms of "2-cycles", the permutation is (1 *ipivot*(1)) (2 *ipivot*(2)) ... (*mipivot*(*m*)) where the rightmost cycle is applied first. This is the inverse of the effect of pivoting in LINPACK. The idea is that factoring (with pivoting) an identity matrix which has been inverse-pivoted in this way should result in a pivot vector identical to *ipivot*. Not referenced if *pivtng* = 'N'.

sparse

REAL for slatmr,

DOUBLE PRECISION for dlatmr,

REAL for clatmr,

DOUBLE PRECISION for zlatmr,

On entry, specifies the sparsity of the matrix if a sparse matrix is to be generated. *sparse* should lie between 0 and 1. To generate a sparse matrix, for each matrix entry a uniform (0, 1) random number *x* is generated and compared to sparse; if *x* is larger the matrix entry is unchanged and if *x* is smaller the entry is set to zero. Thus on the average a fraction *sparse* of the entries is set to zero.

kl

INTEGER. On entry, specifies the lower bandwidth of the matrix. For example, *kl* = 0 implies upper triangular, *kl* = 1 implies upper Hessenberg, and *kl* at least *m*-1 implies the matrix is not banded. Must equal *ku* if matrix is symmetric or Hermitian.

ku

INTEGER. On entry, specifies the upper bandwidth of the matrix. For example, *ku* = 0 implies lower triangular, *ku* = 1 implies lower Hessenberg, and *ku*at least *n*-1 implies the matrix is not banded. Must equal *kl* if matrix is symmetric or Hermitian.

anorm

REAL for slatmr,

DOUBLE PRECISION for dlatmr,

REAL for clatmr,

DOUBLE PRECISION for zlatmr,

On entry, specifies maximum entry of output matrix (output matrix is multiplied by a constant so that its largest absolute entry equal *anorm*) if *anorm* is nonnegative. If *anorm* is negative no scaling is done.

pack

for slatmr,

for dlatmr,

for `clatmr`,

for `zlatmr`,

On entry, specifies packing of matrix as follows:

If *pack* = `'N'`: no packing

If *pack* = `'U'`: zero out all subdiagonal entries (if symmetric or Hermitian)

If *pack* = `'L'`: zero out all superdiagonal entries (if symmetric or Hermitian)

If *pack* = `'C'`: store the upper triangle columnwise (only if matrix symmetric or Hermitian or square upper triangular)

If *pack* = `'R'`: store the lower triangle columnwise (only if matrix symmetric or Hermitian or square lower triangular) (same as upper half rowwise if symmetric) (same as conjugate upper half rowwise if Hermitian)

If *pack* = `'B'`: store the lower triangle in band storage scheme (only if matrix symmetric or Hermitian)

If *pack* = `'Q'`: store the upper triangle in band storage scheme (only if matrix symmetric or Hermitian)

If *pack* = `'Z'`: store the entire matrix in band storage scheme (pivoting can be provided for by using this option to store *A* in the trailing rows of the allocated storage)

Using these options, the various LAPACK packed and banded storage schemes can be obtained:

LAPACK storage scheme	Value of *pack*
GB	`'Z'`
PB, HB or TB	`'B'` or `'Q'`
PP, HP or TP	`'C'` or `'R'`

If two calls to `?latmr` differ only in the pack parameter, they generate mathematically equivalent matrices.

lda INTEGER. On entry, *lda* specifies the first dimension of *a* as declared in the calling program.

If *pack* = `'N', 'U' or 'L'`, *lda* must be at least *max*`( 1, m )`.

If *pack* = `'C' or 'R'`, *lda* must be at least 1.

If *pack* = `'B', or 'Q'`, *lda* must be `min(` *ku* `+ 1,` *n* `)`.

If *pack* = `'Z'`, *lda* must be at least *kuu* `+` *kll* `+ 1`, where *kuu* = `min(` *ku*`,` *n*`-1 )` and *kll* = `min(` *kl*`,` *n*`-1 )`.

iwork INTEGER. Array, size (*n* or *m*). Workspace. Not referenced if *pivtng* = `'N'`. Changed on exit.

Output Parameters

iseed On exit, the seed is changed.

d May be changed on exit if *mode* is nonzero.

dl On exit, array is changed.

dr On exit, array is changed.

a `REAL` for `slatmr`,

`DOUBLE PRECISION` for `dlatmr`,

`COMPLEX` for `clatmr`,

`DOUBLE COMPLEX` for `zlatmr`,

On exit, *a* is the desired test matrix. Only those entries of *a* which are significant on output is referenced (even if *a* is in packed or band storage format). The unoccupied corners of *a* in band format are zeroed out.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -1, *m* is negative or unequal to *n* and *sym* = 'S' or 'H'.

If *info* = -2, *n* is negative .

If *info* = -3, *dist* is an illegal string.

If *info* = -5, *sym* is an illegal string..

If *info* = -7, *mode* is not in range -6 to 6.

If *info* = -8, *cond* is less than 1.0, and *mode* is neither -6, 0 nor 6.

If *info* = -10, *mode* is neither -6, 0 nor 6 and *rsign* is an illegal string.

If *info* = -11, *grade* is an illegal string, or *grade* = 'E' and *m* is not equal to *n*, or *grade*='L', 'R', 'B', 'S' or 'E' and *sym* = 'H', or *grade* = 'L', 'R', 'B', 'H' or 'E' and *sym* = 'S'

If *info* = -12,*grade* = 'E'and *dl* contains zero .

If *info* = -13, *model* is not in range -6 to 6 and *grade* = 'L', 'B', 'H', 'S' or 'E' .

If *info* = -14, *condl* is less than 1.0, *grade* = 'L', 'B', 'H', 'S' or 'E', and *model* is neither -6, 0 nor 6.

If *info* = -16, *moder* is not in range -6 to 6 and *grade* = 'R' or 'B' .

If *info* = -17, *condr* is less than 1.0, *grade* = 'R' or 'B', and *moder* is neither -6, 0 nor 6 .

If *info* = -18, *pivtng* is an illegal string, or *pivtng* = 'B' or 'F' and *m* is not equal to *n*, or *pivtng* = 'L' or 'R' and *sym* = 'S' or 'H'.

If *info* = -19, *ipivot* contains out of range number and *pivtng* is not equal to 'N' .

If *info* = -20, *kl* is negative.

If *info* = -21, *ku* is negative, or *sym* = 'S' or 'H' and *ku* not equal to *kl* .

If *info* = -22, *sparse* is not in range 0 to 1.

If *info* = -24, *pack* is an illegal string, or *pack* = 'U', 'L', 'B' or 'Q' and *sym* = 'N', or *pack* = 'C' and *sym* = 'N' and either *kl* is not equal to 0 or *n* is not equal to *m*, or *pack* = 'R' and *sym* = 'N', and either *ku* is not equal to 0 or *n* is not equal to *m* .

If *info* = -26, *lda* is too small .

If *info* = 1, error return from ?latm1 (computing *D*) .

If *info* = 2, cannot scale to *dmax* (max. entry is 0) .

If *info* = 3, error return from ?latm1(computing *dl*) .

If *info* = 4, error return from ?latm1(computing *dr*) .

If *info* = 5, *anorm* is positive, but matrix constructed prior to attempting to scale it to have norm *anorm*, is zero .

?latdf

Uses the LU factorization of the n-by-n matrix computed by ?getc2 *and computes a contribution to the reciprocal Dif-estimate.*

Syntax

```
call slatdf( ijob, n, z, ldz, rhs, rdsum, rdscal, ipiv, jpiv )
call dlatdf( ijob, n, z, ldz, rhs, rdsum, rdscal, ipiv, jpiv )
call clatdf( ijob, n, z, ldz, rhs, rdsum, rdscal, ipiv, jpiv )
call zlatdf( ijob, n, z, ldz, rhs, rdsum, rdscal, ipiv, jpiv )
```

Include Files

- mkl.fi

Description

The routine ?latdf uses the *LU* factorization of the *n*-by-*n* matrix *Z* computed by ?getc2 and computes a contribution to the reciprocal Dif-estimate by solving *Z*x = b* for *x*, and choosing the right-hand side *b* such that the norm of *x* is as large as possible. On entry *rhs = b* holds the contribution from earlier solved sub-systems, and on return *rhs = x*.

The factorization of *Z* returned by ?getc2 has the form *Z = P*L*U*Q*, where *P* and *Q* are permutation matrices. *L* is lower triangular with unit diagonal elements and *U* is upper triangular.

Input Parameters

ijob

INTEGER.

ijob = 2: First compute an approximative null-vector *e* of *Z* using ?gecon, *e* is normalized, and solve for *Z*x = ±e-f*with the sign giving the greater value of 2-norm(*x*). This option is about 5 times as expensive as default.

ijob≠ 2 (default): Local look ahead strategy where all entries of the right-hand side *b* is chosen as either +1 or -1 .

n INTEGER. The number of columns of the matrix *Z*.

z REAL for slatdf/clatdf

DOUBLE PRECISION for dlatdf/zlatdf.

Array, DIMENSION (*ldz*, *n*)

On entry, the *LU* part of the factorization of the *n*-by-*n* matrix *Z* computed by ?getc2: *Z = P*L*U*Q*.

ldz INTEGER. The leading dimension of the array *Z*. *lda*≥ max(1, *n*).

rhs REAL for slatdf/clatdf

DOUBLE PRECISION for dlatdf/zlatdf.

Array, DIMENSION (*n*).

On entry, *rhs* contains contributions from other subsystems.

rdsum REAL for slatdf/clatdf

DOUBLE PRECISION for dlatdf/zlatdf.

On entry, the sum of squares of computed contributions to the *D*if-estimate under computation by ?tgsyL, where the scaling factor *rdscal* has been factored out. If *trans* = 'T', *rdsum* is not touched.

Note that *rdsum* only makes sense when ?tgsy2 is called by ?tgsyL.

rdscal REAL for slatdf/clatdf

DOUBLE PRECISION for dlatdf/zlatdf.

On entry, scaling factor used to prevent overflow in *rdsum*.

If *trans* = *T*', *rdscal* is not touched.

Note that *rdscal* only makes sense when ?tgsy2 is called by ?tgsyL.

ipiv INTEGER.

Array, DIMENSION (*n*).

The pivot indices; for 1 ≤ i ≤ *n*, row *i* of the matrix has been interchanged with row *ipiv*(*i*).

jpiv INTEGER.

Array, DIMENSION (*n*).

The pivot indices; for 1 ≤j≤ *n*, column *j* of the matrix has been interchanged with column *jpiv*(*j*).

Output Parameters

rhs On exit, *rhs* contains the solution of the subsystem with entries according to the value of *ijob*.

rdsum On exit, the corresponding sum of squares updated with the contributions from the current sub-system.

If *trans* = 'T', *rdsum* is not touched.

rdscal — On exit, *rdscal* is updated with respect to the current contributions in *rdsum*.

If `trans = 'T'`, *rdscal* is not touched.

?latps

Solves a triangular system of equations with the matrix held in packed storage.

Syntax

```

Description

The routine `?latps` solves one of the triangular systems

$A*x = s*b$, or $A^T*x = s*b$, or $A^H*x = s*b$ (for complex flavors)

with scaling to prevent overflow, where *A* is an upper or lower triangular matrix stored in packed form. Here A^T denotes the transpose of *A*, A^H denotes the conjugate transpose of *A*, *x* and *b* are *n*-element vectors, and *s* is a scaling factor, usually less than or equal to 1, chosen so that the components of *x* will be less than the overflow threshold. If the unscaled problem does not cause overflow, the Level 2 BLAS routine `?tpsv` is called. If the matrix *A* is singular ($A(j, j) = 0$ for some *j*), then s is set to 0 and a non-trivial solution to $A*x = 0$ is returned.

Input Parameters

uplo — `CHARACTER*1`.

Specifies whether the matrix *A* is upper or lower triangular.

= `'U'`: upper triangular

= `'L'`: uower triangular

trans — `CHARACTER*1`.

Specifies the operation applied to *A*.

= `'N'`: solve $A*x = s*b$ (no transpose)

= `'T'`: solve $A^T*x = s*b$ (transpose)

= `'C'`: solve $A^H*x = s*b$ (conjugate transpose)

diag — `CHARACTER*1`.

Specifies whether the matrix *A* is unit triangular.

= *'N'*: non-unit triangular

= `'U'`: unit triangular

normin CHARACTER*1.

Specifies whether *cnorm* is set.

= 'Y': *cnorm* contains the column norms on entry;

= 'N': *cnorm* is not set on entry. On exit, the norms will be computed and stored in cnorm.

n INTEGER. The order of the matrix *A*. $n \geq 0$.

ap REAL for slatps

DOUBLE PRECISION for dlatps

COMPLEX for clatps

DOUBLE COMPLEX for zlatps.

Array, DIMENSION ($n(n+1)/2$).

The upper or lower triangular matrix *A*, packed columnwise in a linear array. The *j*-th column of *A* is stored in the array *ap* as follows:

if *uplo* = 'U', $ap(i + (j-1)j/2) = A(i,j)$ for $1 \leq i \leq j$;

if *uplo* = 'L', $ap(i + (j-1)(2n-j)/2) = A(i, j)$ for $j \leq i \leq n$.

x REAL for slatpsDOUBLE PRECISION for dlatps

COMPLEX for clatps

DOUBLE COMPLEX for zlatps.

Array, DIMENSION (*n*)

On entry, the right hand side *b* of the triangular system.

cnorm REAL for slatps/clatps

DOUBLE PRECISION for dlatps/zlatps.

Array, DIMENSION (*n*).

If *normin* = 'Y', *cnorm* is an input argument and *cnorm*(*j*) contains the norm of the off-diagonal part of the *j*-th column of *A*.

If *trans* = 'N', *cnorm*(*j*) must be greater than or equal to the infinity-norm, and if *trans* = 'T' or 'C', *cnorm*(*j*) must be greater than or equal to the 1-norm.

Output Parameters

x On exit, *x* is overwritten by the solution vector *x*.

scale REAL for slatps/clatps

DOUBLE PRECISION for dlatps/zlatps.

The scaling factor *s* for the triangular system as described above.

If *scale* = 0, the matrix *A* is singular or badly scaled, and the vector *x* is an exact or approximate solution to *A*x* = 0.

cnorm If *normin* = 'N', *cnorm* is an output argument and *cnorm*(*j*) returns the 1-norm of the off-diagonal part of the *j*-th column of *A*.

info	INTEGER. = 0: successful exit < 0: if *info* = -*k*, the *k*-th argument had an illegal value

?latrd

Reduces the first nb rows and columns of a symmetric/Hermitian matrix A to real tridiagonal form by an orthogonal/unitary similarity transformation.

Syntax

```
call slatrd( uplo, n, nb, a, lda, e, tau, w, ldw )
call dlatrd( uplo, n, nb, a, lda, e, tau, w, ldw )
call clatrd( uplo, n, nb, a, lda, e, tau, w, ldw )
call zlatrd( uplo, n, nb, a, lda, e, tau, w, ldw )
```

Include Files

- mkl.fi

Description

The routine ?latrd reduces *nb* rows and columns of a real symmetric or complex Hermitian matrix *A* to symmetric/Hermitian tridiagonal form by an orthogonal/unitary similarity transformation Q^T*A*Q for real flavors, Q^H*A*Q for complex flavors, and returns the matrices *V* and *W* which are needed to apply the transformation to the unreduced part of *A*.

If *uplo* = 'U', ?latrd reduces the last *nb* rows and columns of a matrix, of which the upper triangle is supplied;

if *uplo* = 'L', ?latrd reduces the first *nb* rows and columns of a matrix, of which the lower triangle is supplied.

This is an auxiliary routine called by ?sytrd/?hetrd.

Input Parameters

uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the symmetric/ Hermitian matrix *A* is stored: = 'U': upper triangular = 'L': lower triangular
n	INTEGER. The order of the matrix *A*.
nb	INTEGER. The number of rows and columns to be reduced.
a	REAL for slatrd DOUBLE PRECISION for dlatrd COMPLEX for clatrd DOUBLE COMPLEX for zlatrd.

Array, DIMENSION (*lda*, *n*).

On entry, the symmetric/Hermitian matrix *A*

If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *a* is not referenced.

If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *a* is not referenced.

lda INTEGER. The leading dimension of the array *a*. *lda* ≥ (1,*n*).

ldw INTEGER.

The leading dimension of the output array *w*. *ldw* ≥ max(1,*n*).

Output Parameters

a On exit, if *uplo* = 'U', the last *nb* columns have been reduced to tridiagonal form, with the diagonal elements overwriting the diagonal elements of *a*; the elements above the diagonal with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors;

if *uplo* = 'L', the first *nb* columns have been reduced to tridiagonal form, with the diagonal elements overwriting the diagonal elements of *a*; the elements below the diagonal with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors.

e REAL for slatrd/clatrd

DOUBLE PRECISION for dlatrd/zlatrd.

If *uplo* = 'U', *e*(*n*-*nb*:*n*-1) contains the superdiagonal elements of the last *nb* columns of the reduced matrix;

if *uplo* = 'L', *e*(1:*nb*) contains the subdiagonal elements of the first *nb* columns of the reduced matrix.

tau REAL for slatrd

DOUBLE PRECISION for dlatrd

COMPLEX for clatrd

DOUBLE COMPLEX for zlatrd.

Array, DIMENSION (*lda*, *n*).

The scalar factors of the elementary reflectors, stored in *tau*(*n*-*nb*:*n*-1) if *uplo* = 'U', and in *tau*(1:*nb*) if *uplo* = 'L'.

w REAL for slatrd

DOUBLE PRECISION for dlatrd

COMPLEX for clatrd

DOUBLE COMPLEX for zlatrd.

Array, DIMENSION (*ldw*, *n*).

The *n*-by-*nb* matrix *W* required to update the unreduced part of *A*.

Application Notes

If `uplo = 'U'`, the matrix *Q* is represented as a product of elementary reflectors

`Q = H(n)*H(n-1)*...*H(n-nb+1)`

Each *H*(*i*) has the form

`H(i) = I - tau*v*v'`

where *tau* is a real/complex scalar, and *v* is a real/complex vector with `v(i:n) = 0` and `v(i-1) = 1`; `v(1: i-1)` is stored on exit in `a(1: i-1, i)`, and *tau* in `tau(i-1)`.

If `uplo = 'L'`, the matrix *Q* is represented as a product of elementary reflectors

`Q = H(1)*H(2)*...*H(nb)`

Each *H*(*i*) has the form `H(i) = I - tau*v*v'`

where *tau* is a real/complex scalar, and *v* is a real/complex vector with `v(1: i) = 0` and `v(i+1) = 1`; `v( i +1:n)` is stored on exit in `a(i+1:n, i)`, and *tau* in *tau*(*i*).

The elements of the vectors *v* together form the *n*-by-*nb* matrix *V* which is needed, with *W*, to apply the transformation to the unreduced part of the matrix, using a symmetric/Hermitian rank-2k update of the form:

`A := A - VW' - WV'`.

The contents of *a* on exit are illustrated by the following examples with `n = 5` and `nb = 2`:

if $uplo = $'U':

$$\begin{bmatrix} a & a & a & v_4 & v_4 \\ & a & a & v_4 & v_5 \\ & & a & 1 & v_5 \\ & & & d & 1 \\ & & & & d \end{bmatrix}$$

if $uplo = $'L'

$$\begin{bmatrix} d & & & & \\ 1 & d & & & \\ v_1 & 1 & a & & \\ v_1 & v_2 & a & a & \\ v_1 & v_2 & a & a & a \end{bmatrix}$$

where *d* denotes a diagonal element of the reduced matrix, *a* denotes an element of the original matrix that is unchanged, and v_i denotes an element of the vector defining *H*(*i*).

?latrs

Solves a triangular system of equations with the scale factor set to prevent overflow.

Syntax

```
call slatrs( uplo, trans, diag, normin, n, a, lda, x, scale, cnorm, info )
call dlatrs( uplo, trans, diag, normin, n, a, lda, x, scale, cnorm, info )
```

```
call clatrs( uplo, trans, diag, normin, n, a, lda, x, scale, cnorm, info )
call zlatrs( uplo, trans, diag, normin, n, a, lda, x, scale, cnorm, info )
```

Include Files

- mkl.fi

Description

The routine solves one of the triangular systems

$A*x = s*b$, or $A^T*x = s*b$, or $A^H*x = s*b$ (for complex flavors)

with scaling to prevent overflow. Here A is an upper or lower triangular matrix, A^T denotes the transpose of A, A^H denotes the conjugate transpose of A, x and b are n-element vectors, and s is a scaling factor, usually less than or equal to 1, chosen so that the components of x will be less than the overflow threshold. If the unscaled problem will not cause overflow, the Level 2 BLAS routine ?trsv is called. If the matrix A is singular ($A(j,j) = 0$ for some j), then s is set to 0 and a non-trivial solution to $A*x = 0$ is returned.

Input Parameters

uplo

CHARACTER*1.

Specifies whether the matrix A is upper or lower triangular.

= 'U': Upper triangular

= 'L': Lower triangular

trans

CHARACTER*1.

Specifies the operation applied to A.

= 'N': solve $A*x = s*b$ (no transpose)

= 'T': solve $A^T*x = s*b$ (transpose)

= 'C': solve $A^H*x = s*b$ (conjugate transpose)

diag

CHARACTER*1.

Specifies whether or not the matrix A is unit triangular.

= 'N': non-unit triangular

= 'N': non-unit triangular

normin

CHARACTER*1.

Specifies whether *cnorm* has been set or not.

= 'Y': *cnorm* contains the column norms on entry;

= 'N': *cnorm* is not set on entry. O

n exit, the norms will be computed and stored in *cnorm*.

n

INTEGER. The order of the matrix A. $n \geq 0$

a

REAL for slatrs

DOUBLE PRECISION for dlatrs

COMPLEX for clatrs

DOUBLE COMPLEX for zlatrs.

Array, DIMENSION (*lda*, *n*). Contains the triangular matrix *A*.

If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of the array *a* contains the upper triangular matrix, and the strictly lower triangular part of *A* is not referenced.

If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of the array *a* contains the lower triangular matrix, and the strictly upper triangular part of *A* is not referenced.

If *diag* = 'U', the diagonal elements of *A* are also not referenced and are assumed to be 1.

lda INTEGER. The leading dimension of the array *a*. *lda* ≥ max(1, *n*).

x REAL for slatrs

DOUBLE PRECISION for dlatrs

COMPLEX for clatrs

DOUBLE COMPLEX for zlatrs.

Array, DIMENSION (*n*).

On entry, the right hand side *b* of the triangular system.

cnorm REAL for slatrs/clatrs

DOUBLE PRECISION for dlatrs/zlatrs.

Array, DIMENSION (*n*).

If *normin* = 'Y', *cnorm* is an input argument and *cnorm* (*j*) contains the norm of the off-diagonal part of the *j*-th column of *A*.

If *trans* = 'N', *cnorm* (*j*) must be greater than or equal to the infinity-norm, and if *trans* = 'T' or 'C', *cnorm*(*j*) must be greater than or equal to the 1-norm.

Output Parameters

x On exit, *x* is overwritten by the solution vector *x*.

scale REAL for slatrs/clatrs

DOUBLE PRECISION for dlatrs/zlatrs.

Array, DIMENSION (*lda*, *n*). The scaling factor *s* for the triangular system as described above.

If *scale* = 0, the matrix *A* is singular or badly scaled, and the vector *x* is an exact or approximate solution to *A***x* = 0.

cnorm If *normin* = 'N', *cnorm* is an output argument and *cnorm*(*j*) returns the 1-norm of the off-diagonal part of the *j*-th column of *A*.

info INTEGER.

= 0: successful exit

< 0: if *info* = -*k*, the *k*-th argument had an illegal value

Application Notes

A rough bound on *x* is computed; if that is less than overflow, `?trsv` is called, otherwise, specific code is used which checks for possible overflow or divide-by-zero at every operation.

A columnwise scheme is used for solving $Ax = b$. The basic algorithm if *A* is lower triangular is

```
x[1:n] := b[1:n]
for j = 1, ..., n
x(j) := x(j) / A(j,j)
x[j+1:n] := x[j+1:n] - x(j)*a[j+1:n,j]
end
```

Define bounds on the components of *x* after *j* iterations of the loop:

$M(j)$ = bound on $x[1:j]$

$G(j)$ = bound on $x[j+1:n]$

Initially, let $M(0) = 0$ and $G(0) = \max\{x(i), i=1,...,n\}$.

Then for iteration $j+1$ we have

$M(j+1) \le G(j) / |a(j+1,j+1)|$

$G(j+1) \le G(j) + M(j+1)*|a[j+2:n,j+1]|$

$\le G(j)(1 + cnorm(j+1)/|a(j+1,j+1)|,$

where *cnorm*(*j*+1) is greater than or equal to the infinity-norm of column *j*+1 of *a*, not counting the diagonal. Hence

$$G(j) \le G(0) \prod_{1 \le i \le j} (1 + cnorm(i)/|A(i,i)|)$$

and

$$|x(j)| \le (G(0)/|A(j,j)|) \prod_{1 \le i \le j} (1 + cnorm(i)/|A(i,i)|)$$

Since $|x(j)| \le M(j)$, we use the Level 2 BLAS routine `?trsv` if the reciprocal of the largest $M(j)$, $j=1,..,n$, is larger than $\max(underflow, 1/overflow)$.

The bound on *x*(*j*) is also used to determine when a step in the columnwise method can be performed without fear of overflow. If the computed bound is greater than a large constant, *x* is scaled to prevent overflow, but if the bound overflows, *x* is set to 0, *x*(*j*) to 1, and scale to 0, and a non-trivial solution to $Ax = 0$ is found.

Similarly, a row-wise scheme is used to solve $A^Tx = b$ or $A^Hx = b$. The basic algorithm for *A* upper triangular is

```
for j = 1, ..., n
x(j) := ( b(j) - A[1:j-1,j]' x[1:j-1]) / A(j,j)
end
```

We simultaneously compute two bounds

$G(j) = \text{bound on } (b(i) - A[1:i-1,i]'*x[1:i-1]),\ 1 \le i \le j$

$M(j) = \text{bound on } x(i),\ 1 \le i \le j$

The initial values are $G(0) = 0$, $M(0) = \max\{ b(i),\ i=1,..,n\}$, and we add the constraint $G(j) \ge G(j-1)$ and $M(j) \ge M(j-1)$ for $j \ge 1$.

Then the bound on $x(j)$ is

$M(j) \le M(j-1) *(1 + cnorm(j)) / | A(j,j)|$

$$\le M(0) \prod_{1 \le i \le j} (1 + cnorm(i)/|A(i,i)|)$$

and we can safely call ?trsv if $1/M(n)$ and $1/G(n)$ are both greater than $\max(underflow,\ 1/overflow)$.

?latrz

Factors an upper trapezoidal matrix by means of orthogonal/unitary transformations.

Syntax

```
call slatrz( m, n, l, a, lda, tau, work )
call dlatrz( m, n, l, a, lda, tau, work )
call clatrz( m, n, l, a, lda, tau, work )
call zlatrz( m, n, l, a, lda, tau, work )
```

Include Files

- mkl.fi

Description

The routine ?latrz factors the *m*-by-(*m*+*l*) real/complex upper trapezoidal matrix

$[A1\ A2] = [A(1:m,1:m)\ A(1:\ m,\ n-l+1:n)]$

as (*R* 0)* *Z*, by means of orthogonal/unitary transformations. *Z* is an (*m*+*l*)-by-(*m*+*l*) orthogonal/unitary matrix and *R* and *A*1 are *m*-by -*m* upper triangular matrices.

Input Parameters

m	INTEGER. The number of rows of the matrix *A*. $m \ge 0$.
n	INTEGER. The number of columns of the matrix *A*. $n \ge 0$.
l	INTEGER. The number of columns of the matrix *A* containing the meaningful part of the Householder vectors. $n-m \ge l \ge 0$.
a	REAL for slatrz DOUBLE PRECISION for dlatrz COMPLEX for clatrz DOUBLE COMPLEX for zlatrz.

Array, DIMENSION (*lda*, *n*).

On entry, the leading *m*-by-*n* upper trapezoidal part of the array *a* must contain the matrix to be factorized.

lda INTEGER. The leading dimension of the array *a*. *lda* ≥ max(1,*m*).

work REAL for slatrz

DOUBLE PRECISION for dlatrz

COMPLEX for clatrz

DOUBLE COMPLEX for zlatrz.

Workspace array, DIMENSION (*m*).

Output Parameters

a On exit, the leading *m*-by-*m* upper triangular part of *a* contains the upper triangular matrix *R*, and elements *n*-*l*+1 to *n* of the first *m* rows of *a*, with the array *tau*, represent the orthogonal/unitary matrix *Z* as a product of *m* elementary reflectors.

tau REAL for slatrz

DOUBLE PRECISION for dlatrz

COMPLEX for clatrz

DOUBLE COMPLEX for zlatrz.

Array, DIMENSION (*m*).

The scalar factors of the elementary reflectors.

Application Notes

The factorization is obtained by Householder's method. The *k*-th transformation matrix, *z*(*k*), which is used to introduce zeros into the (*m* - *k* + 1)-th row of *A*, is given in the form

$$Z(k) = \begin{bmatrix} I & 0 \\ 0 & T(k) \end{bmatrix}$$

where for real flavors

$$T(k) = I - tau^* u(k)^* T(k)^T, \quad u(k) = \begin{bmatrix} 1 \\ 0 \\ z(k) \end{bmatrix}$$

and for complex flavors

$$T(k) = I - tau^* u(k)^* T(k)^H, \quad u(k) = \begin{bmatrix} 1 \\ 0 \\ z(k) \end{bmatrix}$$

tau is a scalar and *z*(*k*) is an *l*-element vector. *tau* and *z*(*k*) are chosen to annihilate the elements of the *k*-th row of *A*2.

The scalar *tau* is returned in the *k*-th element of *tau* and the vector *u*(*k*) in the *k*-th row of *A*2, such that the elements of *z*(*k*) are in `a(k, l+1), ..., a(k, n)`.

The elements of *r* are returned in the upper triangular part of *A*1.

Z is given by

`Z = Z(1)*Z(2)*...*Z(m)`.

?latsqr

Computes a blocked Tall-Skinny QR matrix factorization.

```
call slatsqr(m, n, mb, nb, a, lda, t, ldt, work, lwork, info)
call dlatsqr(m, n, mb, nb, a, lda, t, ldt, work, lwork, info)
call clatsqr(m, n, mb, nb, a, lda, t, ldt, work, lwork, info)
call zlatsqr(m, n, mb, nb, a, lda, t, ldt, work, lwork, info)
```

Description

`?latsqr` computes a blocked Tall-Skinny QR (TSQR) factorization of an `m`-by-`n` matrix *A*, where `m≥n`: *A* = *Q***R*.

TSQR performs QR by a sequence of orthogonal transformations, representing *Q* as a product of other orthogonal matrices

Q = *Q*(1) * *Q*(2) * . . . * *Q*(*k*)

where each *Q*(*i*) zeros out subdiagonal entries of a block of `mb` rows of *A*:

Q(1) zeros out the subdiagonal entries of rows 1:MB of *A*,

$Q(2)$ zeros out the bottom mb - n rows of rows [1:n, mb + 1:2*mb - n] of A,

$Q(3)$ zeros out the bottom mb - n rows of rows [1:n, 2*mb - n + 1:3*mb - 2*n] of A . . . .

$Q(1)$ is computed by `geqrt`, which represents $Q(1)$ by Householder vectors stored under the diagonal of rows 1:mb of a, and by upper triangular block reflectors, stored in array t(1:ldt, 1:n). For more information see `geqrt`.

$Q(i)$ for $i > 1$ is computed by `tpqrt`, which represents $Q(i)$ by Householder vectors stored in rows [(i - 1)*(mb - n) + n + 1:i*(mb - n) + n] of a, and by upper triangular block reflectors, stored in array t(1:ldt, (i - 1)*n + 1:i*n). The last $Q(k)$ may use fewer rows. For more information, see `tpqrt`. For more details of the overall algorithm, see [DEMMEL12]

Input Parameters

m	`INTEGER`. The number of rows of the matrix A. $m \geq 0$.
n	`INTEGER`. The number of columns of the matrix A. $m \geq n \geq 0$.
mb	`INTEGER`. The row block size to be used in the blocked QR. $mb > n$.
nb	`INTEGER`. The column block size to be used in the blocked QR. $n \geq nb \geq 1$.

a	`REAL` for `slatsqr`
	`DOUBLE PRECISION` for `dlatsqr`
	`COMPLEX` for `clatsqr`
	`COMPLEX*16` for `zlatsqr`
	Array of size (lda, n). On entry, the m-by-n matrix A.

lda	`INTEGER`. The leading dimension of the array a. $lda \geq$ max(1, m).
ldt	`INTEGER`. The leading dimension of the array t. $ldt \geq nb$.
$lwork$	`INTEGER`. The dimension of the array $work$. $lwork \geq nb*n$. If $lwork$ = -1, then a workspace query is assumed; the routine only calculates the optimal size of the $work$ array, returns this value as the first entry of the $work$ array, and no error message related to $lwork$ is issued by `xerbla`.

Output Parameters

a	On exit, the elements on and above the diagonal of the array contain the n-by-n upper triangular matrix R and the elements below the diagonal represent Q by the columns of blocked V.

t	`REAL` for `slatsqr`
	`DOUBLE PRECISION` for `dlatsqr`
	`COMPLEX` for `clatsqr`
	`COMPLEX*16` for `zlatsqr`
	Array of size (ldt, n * *Number_of_row_blocks*) where *Number_of_row_blocks* = ceiling((m - n)/(mb - n)) The blocked upper triangular block reflectors stored in compact form as a sequence of upper triangular blocks.

work REAL for slatsqr

DOUBLE PRECISION for dlatsqr

COMPLEX for clatsqr

COMPLEX*16 for zlatsqr

Workspace array of size (max(1, *lwork*)).

info INTEGER.

info = 0: successful exit.

info < 0: if *info* = -*i*, the *i*-th argument had an illegal value.

?lauu2

Computes the product $U*U^T$ ($U*U^H$) or L^T*L (L^H*L), where U and L are upper or lower triangular matrices (unblocked algorithm).

Syntax

```
call slauu2( uplo, n, a, lda, info )
call dlauu2( uplo, n, a, lda, info )
call clauu2( uplo, n, a, lda, info )
call zlauu2( uplo, n, a, lda, info )
```

Include Files

- mkl.fi

Description

The routine ?lauu2 computes the product $U*U^T$ or L^T*L for real flavors, and $U*U^H$ or L^H*L for complex flavors. Here the triangular factor *U* or *L* is stored in the upper or lower triangular part of the array *a*.

If *uplo* = 'U' or 'u', then the upper triangle of the result is stored, overwriting the factor *U* in *A*.

If *uplo* = 'L' or 'l', then the lower triangle of the result is stored, overwriting the factor *L* in *A*.

This is the unblocked form of the algorithm, calling BLAS Level 2 Routines.

Input Parameters

uplo CHARACTER*1.

Specifies whether the triangular factor stored in the array *a* is upper or lower triangular:

= 'U': Upper triangular

= 'L': Lower triangular

n INTEGER. The order of the triangular factor *U* or *L*. $n \geq 0$.

a REAL for slauu2

DOUBLE PRECISION for dlauu2

COMPLEX for clauu2

DOUBLE COMPLEX for zlauu2.

Array, DIMENSION (*lda*, *n*). On entry, the triangular factor *U* or *L*.

lda INTEGER. The leading dimension of the array *a*. *lda* ≥ max(1, *n*).

Output Parameters

a On exit,

if *uplo* = 'U', then the upper triangle of *a* is overwritten with the upper triangle of the product $U*U^T$ ($U*U^H$);

if *uplo* = 'L', then the lower triangle of *a* is overwritten with the lower triangle of the product L^T*L (L^H*L).

info INTEGER.

= 0: successful exit

< 0: if *info* = −*k*, the *k*-th argument had an illegal value

?lauum

Computes the product $U*U^T$ ($U*U^H$) or L^T*L (L^H*L), where U and L are upper or lower triangular matrices (blocked algorithm).

Syntax

```
call slauum( uplo, n, a, lda, info )
call dlauum( uplo, n, a, lda, info )
call clauum( uplo, n, a, lda, info )
call zlauum( uplo, n, a, lda, info )
```

Include Files

- mkl.fi

Description

The routine ?lauum computes the product $U*U^T$ or L^T*L for real flavors, and $U*U^H$ or L^H*L for complex flavors. Here the triangular factor *U* or *L* is stored in the upper or lower triangular part of the array *a*.

If *uplo* = 'U' or 'u', then the upper triangle of the result is stored, overwriting the factor *U* in *A*.

If *uplo* = 'L' or 'l', then the lower triangle of the result is stored, overwriting the factor *L* in *A*.

This is the blocked form of the algorithm, calling BLAS Level 3 Routines.

Input Parameters

The data types are given for the Fortran interface.

uplo CHARACTER*1.

Specifies whether the triangular factor stored in the array *a* is upper or lower triangular:

= 'U': Upper triangular

= 'L': Lower triangular

n — INTEGER. The order of the triangular factor *U* or *L*. $n \geq 0$.

a — REAL for slauum

DOUBLE PRECISION for dlauum

COMPLEX for clauum

DOUBLE COMPLEX for zlauum .

Array of size (*lda*, *n*).

On entry, the triangular factor *U* or *L*.

lda — INTEGER. The leading dimension of the array *a*. $lda \geq \max(1, n)$.

Output Parameters

a

On exit,

if *uplo* = 'U', then the upper triangle of *a* is overwritten with the upper triangle of the product $U * U^T$($U * U^H$);

if *uplo* = 'L', then the lower triangle of *a* is overwritten with the lower triangle of the product $L^T * L$ ($L^H * L$).

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = *-k*, the *k*-th parameter had an illegal value.

If *info* = -1011, memory allocation error occurred.

?orbdb1/?unbdb1

Simultaneously bidiagonalizes the blocks of a tall and skinny matrix with orthonormal columns.

Syntax

```
call sorbdb1( m, p, q, x11, ldx11, x21, ldx21, theta, phi, taup1, taup2, tauq1, work, lwork, info )
call dorbdb1( m, p, q, x11, ldx11, x21, ldx21, theta, phi, taup1, taup2, tauq1, work, lwork, info )
call cunbdb1( m, p, q, x11, ldx11, x21, ldx21, theta, phi, taup1, taup2, tauq1, work, lwork, info )

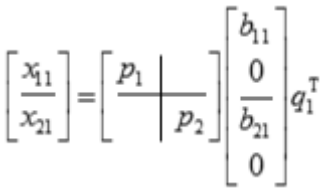
Description

The routines ?orbdb1/?unbdb1 simultaneously bidiagonalize the blocks of a tall and skinny matrix *X* with orthonormal columns:



The size of x_{11} is p by q, and x_{12} is $(m - p)$ by q. q must not be larger than p, m-p, or m-q.

Tall and Skinny Matrix Routines

$q \leq \min(p, m - p, m - q)$	?orbdb1/?unbdb1
$p \leq \min(q, m - p, m - q)$	?orbdb2/?unbdb2
$m - p \leq \min(p, q, m - q)$	?orbdb3/?unbdb3
$m - q \leq \min(p, q, m - p)$	?orbdb4/?unbdb4

The orthogonal/unitary matrices p_1, p_2, and q_1 are p-by-p, $(m-p)$-by-$(m-p)$, $(m-q)$-by-$(m-q)$, respectively.

p_1, p_2, and q_1 are represented as products of elementary reflectors. See the description of ?orcsd2by1/?uncsd2by1 for details on generating p_1, p_2, and q_1 using ?orgqr and ?orglq.

The upper-bidiagonal matrices b_{11} and b_{12} of size q by q are represented implicitly by angles *theta*(1), ..., *theta*(q) and *phi*(1), ..., *phi*(q-1). Every entry in each bidiagonal band is a product of a sine or cosine of *theta* with a sine or cosine of *phi*. See [Sutton09] or the description of ?orcsd/?uncsd for details.

Input Parameters

m
INTEGER. The number of rows in x_{11} plus the number of rows in x_{21}.

p
INTEGER. The number of rows in x_{11}. $0 \leq p \leq m$.

q
INTEGER. The number of columns in x_{11} and x_{21}. $0 \leq q \leq \min(p, m-p, m-q)$.

x11
REAL for sorbdb1
DOUBLE PRECISION for dorbdb1
COMPLEX for cunbdb1
DOUBLE COMPLEX for zunbdb1
Array, DIMENSION (*ldx11*,*q*).
On entry, the top block of the orthogonal/unitary matrix to be reduced.

ldx11
INTEGER. The leading dimension of the array X_{11}. $ldx11 \geq p$.

x21
REAL for sorbdb1
DOUBLE PRECISION for dorbdb1
COMPLEX for cunbdb1
DOUBLE COMPLEX for zunbdb1
Array, DIMENSION (*ldx21*,*q*).
On entry, the bottom block of the orthogonal/unitary matrix to be reduced.

ldx21
INTEGER. The leading dimension of the array X_{21}. $ldx21 \geq m-p$.

work

REAL for sorbdb1

DOUBLE PRECISION for dorbdb1

COMPLEX for cunbdb1

DOUBLE COMPLEX for zunbdb1

Workspace array, DIMENSION (*lwork*).

lwork

INTEGER. The size of the *work* array. *lwork*≥*m-q*

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

Output Parameters

x11

The columns of tril(*x11*) specify reflectors for p_1 and the rows of triu(*x11*,1) specify reflectors for q_1, where tril(*A*) denotes the lower triangle of *A*, and triu(*A*) denotes the upper triangle of *A*.

x21

On exit, the columns of tril(*x21*) specify the reflectors for p_2

theta

REAL for sorbdb1

DOUBLE PRECISION for dorbdb1

COMPLEX for cunbdb1

DOUBLE COMPLEX for zunbdb1

Array, DIMENSION (*q*). The entries of bidiagonal blocks b_{11} and b_{21} can be computed from the angles *theta* and *phi*. See the Description section for details.

phi

REAL for sorbdb1

DOUBLE PRECISION for dorbdb1

COMPLEX for cunbdb1

DOUBLE COMPLEX for zunbdb1

Array, DIMENSION (*q*-1). The entries of bidiagonal blocks b_{11} and b_{21} can be computed from the angles *theta* and *phi*. See the Description section for details.

taup1

REAL for sorbdb1

DOUBLE PRECISION for dorbdb1

COMPLEX for cunbdb1

DOUBLE COMPLEX for zunbdb1

Array, DIMENSION (*p*).

Scalar factors of the elementary reflectors that define p_1.

taup2

REAL for sorbdb1

DOUBLE PRECISION for dorbdb1

	COMPLEX for cunbdb1 DOUBLE COMPLEX for zunbdb1 Array, DIMENSION (*m*-*p*). Scalar factors of the elementary reflectors that define p_2.
tauq1	REAL for sorbdb1 DOUBLE PRECISION for dorbdb1 COMPLEX for cunbdb1 DOUBLE COMPLEX for zunbdb1 Array, DIMENSION (*q*). Scalar factors of the elementary reflectors that define q_1.
info	INTEGER. = 0: successful exit < 0: if *info* = -*i*, the *i*-th argument has an illegal value.

Description

The ?orbdb5/?unbdb5 routines orthogonalize the column vector

$$x = \begin{bmatrix} x_1 \\ x_2 \end{bmatrix}$$

with respect to the columns of

$$q = \begin{bmatrix} q_1 \\ q_2 \end{bmatrix}$$

The columns of Q must be orthonormal.

If the projection is zero according to Kahan's "twice is enough" criterion, then some other vector from the orthogonal complement is returned. This vector is chosen in an arbitrary but deterministic way.

Input Parameters

m1

INTEGER

The dimension of *x1* and the number of rows in *q1*. 0 ≤*m1*.

m2

INTEGER

The dimension of *x2* and the number of rows in *q2*. 0 ≤*m2*.

n

INTEGER

The number of columns in *q1* and *q2*. 0 ≤*n*.

x1

REAL for sordb5

DOUBLE PRECISION for dordb5

COMPLEX for cundb5

COMPLEX*16 for zundb5

Array of size *m1*.

The top part of the vector to be orthogonalized.

incx1

INTEGER

	Increment for entries of *x1*.
x2	REAL for sordb5 DOUBLE PRECISION for dordb5 COMPLEX for cundb5 COMPLEX*16 for zundb5 Array of size *m2*. The bottom part of the vector to be orthogonalized.
incx2	INTEGER Increment for entries of *x2*.
q1	REAL for sordb5 DOUBLE PRECISION for dordb5 COMPLEX for cundb5 COMPLEX*16 for zundb5 Array of size (*ldq1*, *n*). The top part of the orthonormal basis matrix.
ldq1	INTEGER The leading dimension of *q1*. *ldq1*≥*m1*.
q2	REAL for sordb5 DOUBLE PRECISION for dordb5 COMPLEX for cundb5 COMPLEX*16 for zundb5 Array of size (*ldq2*, *n*). The bottom part of the orthonormal basis matrix.
ldq2	INTEGER The leading dimension of *q2*. *ldq2*≥*m2*.
work	REAL for sordb5 DOUBLE PRECISION for dordb5 COMPLEX for cundb5 COMPLEX*16 for zundb5 Workspace array of size *lwork*.
lwork	INTEGER The size of the array *work*. *lwork*≥*n*.

Output Parameters

x1	The top part of the projected vector.

x2	The bottom part of the projected vector.
info	INTEGER. = 0: successful exit < 0: if *info* = -*i*, the *i*-th argument has an illegal value.

Description

The routine ?orm2l/?unm2l overwrites the general real/complex *m*-by-*n* matrix *C* with

*Q***C* if *side* = 'L' and *trans* = 'N', or

Q^T**C* / Q^H**C* if *side* = 'L' and *trans* = 'T' (for real flavors) or *trans* = 'C' (for complex flavors), or

*C***Q* if *side* = 'R' and *trans* = 'N', or

*C**Q^T / *C**Q^H if *side* = 'R' and *trans* = 'T' (for real flavors) or *trans* = 'C' (for complex flavors).

Here *Q* is a real orthogonal or complex unitary matrix defined as the product of *k* elementary reflectors

Q = *H*(*k*)*...**H*(2)**H*(1) as returned by ?geqlf.

Q is of order *m* if *side* = 'L' and of order *n* if *side* = 'R'.

Input Parameters

side	CHARACTER*1. = 'L': apply *Q* or Q^T / Q^H from the left = 'R': apply *Q* or Q^T / Q^H from the right
trans	CHARACTER*1. = 'N': apply *Q* (no transpose) = 'T': apply Q^T (transpose, for real flavors) = 'C': apply Q^H (conjugate transpose, for complex flavors)
m	INTEGER. The number of rows of the matrix *C*. *m* ≥ 0.

n INTEGER. The number of columns of the matrix *C*. *n*≥ 0.

k INTEGER. The number of elementary reflectors whose product defines the matrix *Q*.

If *side* = 'L', *m*≥*k*≥ 0;

if *side* = 'R', *n*≥*k*≥ 0.

a REAL for sorm2l

DOUBLE PRECISION for dorm2l

COMPLEX for cunm2l

DOUBLE COMPLEX for zunm2l.

Array, DIMENSION (*lda*,*k*).

The *i*-th column must contain the vector which defines the elementary reflector *H*(*i*), for *i* = 1,2,..., *k*, as returned by ?geqlf in the last *k* columns of its array argument *a*. The array *a* is modified by the routine but restored on exit.

lda INTEGER. The leading dimension of the array *a*.

If *side* = 'L', *lda*≥ max(1, *m*)

if *side* = 'R', *lda*≥ max(1, *n*).

tau REAL for sorm2l

DOUBLE PRECISION for dorm2l

COMPLEX for cunm2l

DOUBLE COMPLEX for zunm2l.

Array, DIMENSION (*k*). *tau*(*i*) must contain the scalar factor of the elementary reflector *H*(*i*), as returned by ?geqlf.

c REAL for sorm2l

DOUBLE PRECISION for dorm2l

COMPLEX for cunm2l

DOUBLE COMPLEX for zunm2l.

Array, DIMENSION (*ldc*, *n*).

On entry, the *m*-by-*n* matrix *C*.

ldc INTEGER. The leading dimension of the array *C*. *ldc*≥ max(1,*m*).

work REAL for sorm2l

DOUBLE PRECISION for dorm2l

COMPLEX for cunm2l

DOUBLE COMPLEX for zunm2l.

Workspace array, DIMENSION:

(*n*) if *side* = 'L',

Description

The routine ?ormr2/?unmr2 overwrites the general real/complex *m*-by-*n* matrix *C* with

*Q*C* if *side* = 'L' and *trans* = 'N', or

Q^T*C / Q^H*C if *side* = 'L' and *trans* = 'T' (for real flavors) or *trans* = 'C' (for complex flavors), or

*C*Q* if *side* = 'R' and *trans* = 'N', or

$C*Q^T$ / $C*Q^H$ if *side* = 'R' and *trans* = 'T' (for real flavors) or *trans* = 'C' (for complex flavors).

Here *Q* is a real orthogonal or complex unitary matrix defined as the product of *k* elementary reflectors

Q = *H*(1)**H*(2)*...**H*(*k*) for real flavors, or *Q* = $(H(1))^H*(H(2))^H*...*(H(k))^H$ as returned by ?gerqf.

Q is of order *m* if *side* = 'L' and of order *n* if *side* = 'R'.

Input Parameters

side — CHARACTER*1.

= 'L': apply *Q* or Q^T / Q^H from the left

= 'R': apply *Q* or Q^T / Q^H from the right

trans CHARACTER*1.

= 'N': apply Q (no transpose)

= 'T': apply Q^T (transpose, for real flavors)

= 'C': apply Q^H (conjugate transpose, for complex flavors)

m INTEGER. The number of rows of the matrix C. $m \geq 0$.

n INTEGER. The number of columns of the matrix C. $n \geq 0$.

k INTEGER. The number of elementary reflectors whose product defines the matrix Q.

If *side* = 'L', $m \geq k \geq 0$;

if *side* = 'R', $n \geq k \geq 0$.

a REAL for sormr2

DOUBLE PRECISION for dormr2

COMPLEX for cunmr2

DOUBLE COMPLEX for zunmr2.

Array, DIMENSION

(*lda*, *m*) if *side* = 'L',

(*lda*, *n*) if *side* = 'R'

The *i*-th row must contain the vector which defines the elementary reflector $H(i)$, for $i = 1,2,\ldots,k$, as returned by ?gerqf in the last k rows of its array argument *a*. The array *a* is modified by the routine but restored on exit.

lda INTEGER.

The leading dimension of the array *a*. $lda \geq \max(1,k)$.

tau REAL for sormr2

DOUBLE PRECISION for dormr2

COMPLEX for cunmr2

DOUBLE COMPLEX for zunmr2.

Array, DIMENSION (*k*).

tau(*i*) must contain the scalar factor of the elementary reflector $H(i)$, as returned by ?gerqf.

c REAL for sormr2

DOUBLE PRECISION for dormr2

COMPLEX for cunmr2

DOUBLE COMPLEX for zunmr2.

Array, DIMENSION (*ldc*, *n*).

On entry, the m-by-n matrix C.

ldc	INTEGER. The leading dimension of the array *c*. *ldc* ≥ max(1,*m*).
work	REAL for sormr2 DOUBLE PRECISION for dormr2 COMPLEX for cunmr2 DOUBLE COMPLEX for zunmr2. Workspace array, DIMENSION (*n*) if *side* = 'L', (*m*) if *side* = 'R'

Output Parameters

c	On exit, *c* is overwritten by *Q*C* or Q^T*C / Q^H*C, or *C*Q*, or $C*Q^T$ / $C*Q^H$.
info	INTEGER. = 0: successful exit < 0: if *info* = -*i*, the *i*-th argument had an illegal value

?ormr3/?unmr3

Multiplies a general matrix by the orthogonal/unitary matrix from a RZ factorization determined by ?tzrzf *(unblocked algorithm).*

Syntax

```
call sormr3( side, trans, m, n, k, l, a, lda, tau, c, ldc, work, info )
call dormr3( side, trans, m, n, k, l, a, lda, tau, c, ldc, work, info )
call cunmr3( side, trans, m, n, k, l, a, lda, tau, c, ldc, work, info )
call zunmr3( side, trans, m, n, k, l, a, lda, tau, c, ldc, work, info )
```

Include Files

- mkl.fi

Description

The routine ?ormr3/?unmr3 overwrites the general real/complex *m*-by-*n* matrix *C* with

*Q*C* if *side* = 'L' and *trans* = 'N', or

Q^T*C / Q^H*C if *side* = 'L' and *trans* = 'T' (for real flavors) or *trans* = 'C' (for complex flavors), or

*C*Q* if *side* = 'R' and *trans* = 'N', or

$C*Q^T$ / $C*Q^H$ if *side* = 'R' and *trans* = 'T' (for real flavors) or *trans* = 'C' (for complex flavors).

Here *Q* is a real orthogonal or complex unitary matrix defined as the product of *k* elementary reflectors

Q = *H*(1)**H*(2)*...**H*(*k*) as returned by ?tzrzf.

Q is of order *m* if *side* = 'L' and of order *n* if *side* = 'R'.

Input Parameters

side CHARACTER*1.

= 'L': apply Q or Q^T / Q^H from the left

= 'R': apply Q or Q^T / Q^H from the right

trans CHARACTER*1.

= 'N': apply Q (no transpose)

= 'T': apply Q^T (transpose, for real flavors)

= 'C': apply Q^H (conjugate transpose, for complex flavors)

m INTEGER. The number of rows of the matrix C. $m \geq 0$.

n INTEGER. The number of columns of the matrix C. $n \geq 0$.

k INTEGER. The number of elementary reflectors whose product defines the matrix Q.

If *side* = 'L', $m \geq k \geq 0$;

if *side* = 'R', $n \geq k \geq 0$.

l INTEGER. The number of columns of the matrix A containing the meaningful part of the Householder reflectors.

If *side* = 'L', $m \geq l \geq 0$,

if *side* = 'R', $n \geq l \geq 0$.

a REAL for sormr3

DOUBLE PRECISION for dormr3

COMPLEX for cunmr3

DOUBLE COMPLEX for zunmr3.

Array, DIMENSION

(*lda*, *m*) if *side* = 'L',

The i-th row must contain the vector which defines the elementary reflector $H(i)$, for $i = 1, 2, \ldots, k$, as returned by ?tzrzf in the last k rows of its array argument *a*. The array *a* is modified by the routine but restored on exit.

lda INTEGER.

The leading dimension of the array *a*. $lda \geq \max(1, k)$.

tau REAL for sormr3

DOUBLE PRECISION for dormr3

COMPLEX for cunmr3

DOUBLE COMPLEX for zunmr3.

Array, DIMENSION (k).

tau(*i*) must contain the scalar factor of the elementary reflector H(*i*), as returned by `?tzrzf`.

c — `REAL` for `sormr3`
`DOUBLE PRECISION` for `dormr3`
`COMPLEX` for `cunmr3`
`DOUBLE COMPLEX` for `zunmr3`.
Array, `DIMENSION` (*ldc*, *n*).
On entry, the *m*-by-*n* matrix *C*.

ldc — `INTEGER`. The leading dimension of the array *c*. *ldc*≥ `max(1,m)`.

work — `REAL` for `sormr3`
`DOUBLE PRECISION` for `dormr3`
`COMPLEX` for `cunmr3`
`DOUBLE COMPLEX` for `zunmr3`.
Workspace array, `DIMENSION`
(*n*) if *side* = `'L'`,
(*m*) if *side* = `'R'`.

Output Parameters

c — On exit, *c* is overwritten by $Q*C$ or Q^T*C / Q^H*C, or $C*Q$, or $C*Q^T$ / $C*Q^H$.

info — `INTEGER`.
= 0: successful exit
< 0: if *info* = *-i*, the *i*-th argument had an illegal value

?pbtf2

Computes the Cholesky factorization of a symmetric/ Hermitian positive-definite band matrix (unblocked algorithm).

Syntax

```
call spbtf2( uplo, n, kd, ab, ldab, info )
call dpbtf2( uplo, n, kd, ab, ldab, info )
call cpbtf2( uplo, n, kd, ab, ldab, info )
call zpbtf2( uplo, n, kd, ab, ldab, info )
```

Include Files

- `mkl.fi`

Description

The routine computes the Cholesky factorization of a real symmetric or complex Hermitian positive definite band matrix *A*.

The factorization has the form

$A = U^T*U$ for real flavors, $A = U^H*U$ for complex flavors if *uplo* = 'U', or

$A = L*L^T$ for real flavors, $A = L*L^H$ for complex flavors if *uplo* = 'L',

where *U* is an upper triangular matrix, and *L* is lower triangular. This is the unblocked version of the algorithm, calling BLAS Level 2 Routines.

Input Parameters

uplo — CHARACTER*1.

Specifies whether the upper or lower triangular part of the symmetric/ Hermitian matrix *A* is stored:

= 'U': upper triangular

= 'L': lower triangular

n — INTEGER. The order of the matrix *A*. $n \geq 0$.

kd — INTEGER. The number of super-diagonals of the matrix *A* if *uplo* = 'U', or the number of sub-diagonals if *uplo* = 'L'.

$kd \geq 0$.

ab — REAL for spbtf2

DOUBLE PRECISION for dpbtf2

COMPLEX for cpbtf2

DOUBLE COMPLEX for zpbtf2.

Array, DIMENSION (*ldab*, *n*).

On entry, the upper or lower triangle of the symmetric/ Hermitian band matrix *A*, stored in the first *kd*+1 rows of the array. The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows:

if *uplo* = 'U', $ab(kd+1+i-j,j) = A(i, j)$ for $\max(1, j-kd) \leq i \leq j$;

if *uplo* = 'L', $ab(1+i-j,j) = A(i, j)$ for $j \leq i \leq \min(n, j+kd)$.

ldab — INTEGER. The leading dimension of the array *ab*. $ldab \geq kd+1$.

Output Parameters

ab — On exit, If *info* = 0, the triangular factor *U* or *L* from the Cholesky factorization $A=U^T*U$ ($A=U^H*U$), or $A= L*L^T$ ($A = L*L^H$) of the band matrix *A*, in the same storage format as *A*.

info — INTEGER.

= 0: successful exit

< 0: if *info* = −*k*, the *k*-th argument had an illegal value

> 0: if *info* = *k*, the leading minor of order *k* is not positive definite, and the factorization could not be completed.

?potf2

Computes the Cholesky factorization of a symmetric/ Hermitian positive-definite matrix (unblocked algorithm).

Syntax

```
call spotf2( uplo, n, a, lda, info )
call dpotf2( uplo, n, a, lda, info )
call cpotf2( uplo, n, a, lda, info )
call zpotf2( uplo, n, a, lda, info )
```

Include Files

- mkl.fi

Description

The routine ?potf2 computes the Cholesky factorization of a real symmetric or complex Hermitian positive definite matrix *A*. The factorization has the form

$A = U^T*U$ for real flavors, $A = U^H*U$ for complex flavors if *uplo* = 'U', or

$A = L*L^T$ for real flavors, $A = L*L^H$ for complex flavors if *uplo* = 'L',

where *U* is an upper triangular matrix, and *L* is lower triangular.

This is the unblocked version of the algorithm, calling BLAS Level 2 Routines

Input Parameters

uplo

CHARACTER*1.

Specifies whether the upper or lower triangular part of the symmetric/ Hermitian matrix *A* is stored.

= 'U': upper triangular

= 'L': lower triangular

n

INTEGER. The order of the matrix *A*. $n \geq 0$.

a

REAL for spotf2

DOUBLE PRECISION or dpotf2

COMPLEX for cpotf2

DOUBLE COMPLEX for zpotf2.

Array, DIMENSION (*lda*, *n*).

On entry, the symmetric/Hermitian matrix *A*.

If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *a* is not referenced.

If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *a* is not referenced.

lda INTEGER. The leading dimension of the array *a*.

lda ≥ max(1,*n*).

Output Parameters

a On exit, If *info* = 0, the factor *U* or *L* from the Cholesky factorization $A=U^{T}*U$ ($A=U^{H}*U$), or $A= L*L^{T}$ ($A = L*L^{H}$).

info INTEGER.

= 0: successful exit

< 0: if *info* = -*k*, the *k*-th argument had an illegal value

> 0: if *info* = *k*, the leading minor of order *k* is not positive definite, and the factorization could not be completed.

?ptts2

Solves a tridiagonal system of the form $A*X=B$ *using the* $L*D*L^{H}/L*D*L^{H}$ *factorization computed by* ?pttrf.

Syntax

```
call sptts2( n, nrhs, d, e, b, ldb )
call dptts2( n, nrhs, d, e, b, ldb )
call cptts2( iuplo, n, nrhs, d, e, b, ldb )
call zptts2( iuplo, n, nrhs, d, e, b, ldb )
```

Include Files

- mkl.fi

Description

The routine ?ptts2 solves a tridiagonal system of the form

$A*X = B$

Real flavors sptts2/dptts2 use the $L*D*L^{T}$ factorization of *A* computed by spttrf/dpttrf, and complex flavors cptts2/zptts2 use the $U^{H}*D*U$ or $L*D*L^{H}$ factorization of *A* computed by cpttrf/zpttrf.

D is a diagonal matrix specified in the vector *d*, *U* (or *L*) is a unit bidiagonal matrix whose superdiagonal (subdiagonal) is specified in the vector *e*, and *X* and *B* are *n*-by-*nrhs* matrices.

Input Parameters

iuplo INTEGER. Used with complex flavors only.

Specifies the form of the factorization, and whether the vector *e* is the superdiagonal of the upper bidiagonal factor *U* or the subdiagonal of the lower bidiagonal factor *L*.

= 1: $A = U^{H}*D*U$, *e* is the superdiagonal of *U*;

= 0: $A = L*D*L^{H}$, *e* is the subdiagonal of *L*

n INTEGER. The order of the tridiagonal matrix *A*. *n* ≥ 0.

nrhs INTEGER. The number of right hand sides, that is, the number of columns of the matrix *B*. nrhs≥ 0.

d REAL for sptts2/cptts2

DOUBLE PRECISION for dptts2/zptts2.

Array, DIMENSION (*n*).

The *n* diagonal elements of the diagonal matrix *D* from the factorization of *A*.

e REAL for sptts2

DOUBLE PRECISION for dptts2

COMPLEX for cptts2

DOUBLE COMPLEX for zptts2.

Array, DIMENSION (*n*-1).

Contains the (*n*-1) subdiagonal elements of the unit bidiagonal factor *L* from the $L*D*L^T$ (for real flavors) or $L*D*L^H$ (for complex flavors when *iuplo* = 0) factorization of *A*.

For complex flavors when *iuplo* = 1, *e* contains the (*n*-1) superdiagonal elements of the unit bidiagonal factor *U* from the factorization $A = U^H*D*U$.

B REAL for sptts2/cptts2

DOUBLE PRECISION for dptts2/zptts2.

Array, DIMENSION (*ldb*, *nrhs*).

On entry, the right hand side vectors *B* for the system of linear equations.

ldb INTEGER. The leading dimension of the array *B*. *ldb*≥ max(1,*n*).

Output Parameters

b On exit, the solution vectors, *X*.

?rscl

Multiplies a vector by the reciprocal of a real scalar.

Syntax

```
call srscl( n, sa, sx, incx )
call drscl( n, sa, sx, incx )
call csrscl( n, sa, sx, incx )
call zdrscl( n, sa, sx, incx )
```

Include Files

- mkl.fi

Description

The routine ?rscl multiplies an *n*-element real/complex vector *x* by the real scalar 1/*a*. This is done without overflow or underflow as long as the final result *x*/*a* does not overflow or underflow.

Input Parameters

n	INTEGER. The number of components of the vector *x*.
sa	REAL for srscl/csrscl DOUBLE PRECISION for drscl/zdrscl. The scalar a which is used to divide each component of the vector *x*. sa must be ≥ 0, or the subroutine will divide by zero.
sx	REAL for srscl DOUBLE PRECISION for drscl COMPLEX for csrscl DOUBLE COMPLEX for zdrscl. Array, DIMENSION(1+(*n*-1)*|*incx*|). The *n*-element vector *x*.
incx	INTEGER. The increment between successive values of the vector *sx*. If *incx* > 0, *sx*(1)=*x*(1), and *sx*(1+(i-1)**incx*)=*x*(*i*), 1<*i*≤*n*.

Output Parameters

sx	On exit, the result *x*/*a*.

?syswapr

Applies an elementary permutation on the rows and columns of a symmetric matrix.

Syntax

```
call ssyswapr( uplo, n, a, lda, i1, i2 )
call dsyswapr( uplo, n, a, lda, i1, i2 )
call csyswapr( uplo, n, a, lda, i1, i2 )
call zsyswapr( uplo, n, a, lda, i1, i2 )
call syswapr( a,i1,i2[,uplo] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine applies an elementary permutation on the rows and columns of a symmetric matrix.

Input Parameters

The data types are given for the Fortran interface.

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates how the input matrix *A* has been factored:

If *uplo* = 'U', the array *a* stores the upper triangular factor *U* of the factorization $A = U*D*U^T$.

If *uplo* = 'L', the array *a* stores the lower triangular factor *L* of the factorization $A = L*D*L^T$.

n — INTEGER. The order of matrix *A*; $n \geq 0$.

nrhs — INTEGER. The number of right-hand sides; $nrhs \geq 0$.

a — REAL for ssyswapr

DOUBLE PRECISION for dsyswapr

COMPLEX for csyswapr

DOUBLE COMPLEX for zsyswapr

Array of size (*lda*, *n*).

The array *a* contains the block diagonal matrix *D* and the multipliers used to obtain the factor *U* or *L* as computed by ?sytrf.

lda — INTEGER. The leading dimension of the array *a*. $lda \geq max(1,n)$.

i1 — INTEGER. Index of the first row to swap.

i2 — INTEGER. Index of the second row to swap.

Output Parameters

a

If *info* = 0, the symmetric inverse of the original matrix.

If *info* = 'U', the upper triangular part of the inverse is formed and the part of *A* below the diagonal is not referenced.

If *info* = 'L', the lower triangular part of the inverse is formed and the part of *A* above the diagonal is not referenced.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine syswapr interface are as follows:

a — Holds the matrix *A* of size (*n*, *n*).

i1 — Holds the index for swap.

i2 — Holds the index for swap.

uplo — Indicates how the matrix *A* has been factored. Must be 'U' or 'L'.

See Also

See Also

`?sytrf`

?sygs2/?hegs2

Reduces a symmetric/Hermitian positive-definite generalized eigenproblem to standard form, using the factorization results obtained from `?potrf` *(unblocked algorithm).*

Syntax

```
call ssygs2( itype, uplo, n, a, lda, b, ldb, info )
call dsygs2( itype, uplo, n, a, lda, b, ldb, info )
call chegs2( itype, uplo, n, a, lda, b, ldb, info )
call zhegs2( itype, uplo, n, a, lda, b, ldb, info )
```

Include Files

- `mkl.fi`

Description

The routine `?sygs2`/`?hegs2` reduces a real symmetric-definite or a complex Hermitian positive-definite generalized eigenproblem to standard form.

If *itype* = 1, the problem is

$A*x = \lambda*B*x$

and *A* is overwritten by $\text{inv}(U^H)*A*\text{inv}(U)$ or $\text{inv}(L)*A*\text{inv}(L^H)$ for complex flavors and by $\text{inv}(U^T)*A*\text{inv}(U)$ or $\text{inv}(L)*A*\text{inv}(L^T)$ for real flavors.

If *itype* = 2 or 3, the problem is

$A*B*x = \lambda*x$, or $B*A*x = \lambda*x$,

and *A* is overwritten by $U*A*U^H$ or L^H*A*L for complex flavors and by $U*A*U^T$ or L^T*A*L for real flavors. Here U^T and L^T are the transpose while U^H and L^H are conjugate transpose of *U* and *L*.

B must be previously factorized by ?potrf as follows:

- U^H*U or $L*L^H$ for complex flavors
- U^T*U or $L*L^T$ for real flavors

Input Parameters

itype

INTEGER.

For complex flavors:

= 1: compute $\text{inv}(U^H)*A*\text{inv}(U)$ or $\text{inv}(L)*A*\text{inv}(L^H)$;

= 2 or 3: compute $U*A*U^H$ or L^H*A*L.

For real flavors:

= 1: compute $\text{inv}(U^T)*A*\text{inv}(U)$ or $\text{inv}(L)*A*\text{inv}(L^T)$;

= 2 or 3: compute $U*A*U^T$ or L^T*A*L.

uplo

CHARACTER*1. Specifies whether the upper or lower triangular part of the symmetric/Hermitian matrix *A* is stored, and how *B* has been factorized.

= 'U': upper triangular

= 'L': lower triangular

n

INTEGER. The order of the matrices *A* and *B*. $n \geq 0$.

a

REAL for ssygs2

DOUBLE PRECISION for dsygs2

COMPLEX for chegs2

DOUBLE COMPLEX for zhegs2.

Array, DIMENSION (*lda*, *n*).

On entry, the symmetric/Hermitian matrix *A*.

If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *a* is not referenced.

If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *a* is not referenced.

lda

INTEGER.

The leading dimension of the array *a*. *lda*≥ max(1,*n*).

b

REAL for ssygs2

DOUBLE PRECISION for dsygs2

COMPLEX for chegs2

DOUBLE COMPLEX for zhegs2.

Array, DIMENSION (*ldb*, *n*).

The triangular factor from the Cholesky factorization of *B* as returned by ?potrf.

ldb

INTEGER. The leading dimension of the array *b*. *ldb*≥ max(1,*n*).

Output Parameters

a

On exit, If *info* = 0, the transformed matrix, stored in the same format as *A*.

info

INTEGER.

= 0: successful exit.

< 0: if *info* = -*i*, the *i*-th argument had an illegal value.

?sytd2/?hetd2

Reduces a symmetric/Hermitian matrix to real symmetric tridiagonal form by an orthogonal/unitary similarity transformation(unblocked algorithm).

Syntax

```
call ssytd2( uplo, n, a, lda, d, e, tau, info )
call dsytd2( uplo, n, a, lda, d, e, tau, info )
call chetd2( uplo, n, a, lda, d, e, tau, info )
call zhetd2( uplo, n, a, lda, d, e, tau, info )
```

Include Files

- mkl.fi

Description

The routine ?sytd2/?hetd2 reduces a real symmetric/complex Hermitian matrix *A* to real symmetric tridiagonal form *T* by an orthogonal/unitary similarity transformation: $Q^T*A*Q = T$ ($Q^H*A*Q = T$).

Input Parameters

uplo

CHARACTER*1.

Specifies whether the upper or lower triangular part of the symmetric/ Hermitian matrix *A* is stored:

= 'U': upper triangular

= 'L': lower triangular

n INTEGER. The order of the matrix *A*. *n* ≥ 0.

a REAL for ssytd2

DOUBLE PRECISION for dsytd2

COMPLEX for chetd2

DOUBLE COMPLEX for zhetd2.

Array, DIMENSION (*lda*, *n*).

On entry, the symmetric/Hermitian matrix *A*.

If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *a* is not referenced.

If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *a* is not referenced.

lda INTEGER. The leading dimension of the array *a*. *lda* ≥ max(1, *n*).

Output Parameters

a On exit, if *uplo* = 'U', the diagonal and first superdiagonal of *a* are overwritten by the corresponding elements of the tridiagonal matrix *T*, and the elements above the first superdiagonal, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors;

if *uplo* = 'L', the diagonal and first subdiagonal of *a* are overwritten by the corresponding elements of the tridiagonal matrix *T*, and the elements below the first subdiagonal, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors.

d REAL for ssytd2/chetd2

DOUBLE PRECISION for dsytd2/zhetd2.

Array, DIMENSION (*n*).

The diagonal elements of the tridiagonal matrix *T*:

d(*i*) = *a*(*i*,*i*).

e REAL for ssytd2/chetd2

DOUBLE PRECISION for dsytd2/zhetd2.

Array, DIMENSION (*n*-1).

The off-diagonal elements of the tridiagonal matrix *T*:

e(*i*) = *a*(*i*,*i*+1) if *uplo* = 'U',

e(*i*) = *a*(*i*+1,*i*) if *uplo* = 'L'.

tau REAL for ssytd2

DOUBLE PRECISION for dsytd2

COMPLEX for chetd2

DOUBLE COMPLEX for zhetd2.

Array, DIMENSION (*n*).

The first *n*-1 elements contain scalar factors of the elementary reflectors. *tau*(*n*) is used as workspace.

info INTEGER.

= 0: successful exit

< 0: if *info* = -*i*, the *i*-th argument had an illegal value.

?sytf2

Computes the factorization of a real/complex symmetric indefinite matrix, using the diagonal pivoting method (unblocked algorithm).

Syntax

```
call ssytf2( uplo, n, a, lda, ipiv, info )
call dsytf2( uplo, n, a, lda, ipiv, info )
call csytf2( uplo, n, a, lda, ipiv, info )
call zsytf2( uplo, n, a, lda, ipiv, info )
```

Include Files

- mkl.fi

Description

The routine ?sytf2 computes the factorization of a real/complex symmetric matrix *A* using the Bunch-Kaufman diagonal pivoting method:

$A = U*D*U^T$, or $A = L*D*L^T$,

where *U* (or *L*) is a product of permutation and unit upper (lower) triangular matrices, and *D* is symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

This is the unblocked version of the algorithm, calling BLAS Level 2 Routines.

Input Parameters

uplo CHARACTER*1.

Specifies whether the upper or lower triangular part of the symmetric matrix *A* is stored

= 'U': upper triangular

= 'L': lower triangular

n INTEGER. The order of the matrix *A*. $n \geq 0$.

a REAL for ssytf2

DOUBLE PRECISION for dsytf2

COMPLEX for csytf2

DOUBLE COMPLEX for zsytf2.

Array, DIMENSION (*lda*, *n*).

On entry, the symmetric matrix *A*.

If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *a* is not referenced.

If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *a* is not referenced.

lda INTEGER.

The leading dimension of the array *a*. *lda* ≥ max(1,*n*).

Output Parameters

a On exit, the block diagonal matrix *D* and the multipliers used to obtain the factor *U* or *L*.

ipiv INTEGER.

Array, DIMENSION (*n*).

Details of the interchanges and the block structure of *D*

If *ipiv*(*k*) > 0, then rows and columns *k* and *ipiv*(*k*) are interchanged and *D*(*k*,*k*) is a 1-by-1 diagonal block.

If *uplo* = 'U' and *ipiv*(*k*) = *ipiv*(*k*–1) < 0, then rows and columns *k*-1 and -*ipiv*(*k*) are interchanged and *D*(*k* - 1:*k*, *k* - 1:*k*) is a 2-by-2 diagonal block.

If *uplo* = 'L' and *ipiv*(*k*) = *ipiv*(*k*+1)< 0, then rows and columns *k*+1 and -*ipiv*(*k*) were interchanged and *D*(*k*:*k* + 1,*k*:*k* + 1) is a 2-by-2 diagonal block.

info INTEGER.

= 0: successful exit

< 0: if *info* = -*k*, the *k*-th argument has an illegal value

> 0: if *info* = *k*, *D*(*k*,*k*) is exactly zero. The factorization are completed, but the block diagonal matrix *D* is exactly singular, and division by zero will occur if it is used to solve a system of equations.

?sytf2_rook

Computes the factorization of a real/complex symmetric indefinite matrix, using the bounded Bunch-Kaufman diagonal pivoting method (unblocked algorithm).

Syntax

```
call ssytf2_rook( uplo, n, a, lda, ipiv, info )
call dsytf2_rook( uplo, n, a, lda, ipiv, info )
call csytf2_rook( uplo, n, a, lda, ipiv, info )
call zsytf2_rook( uplo, n, a, lda, ipiv, info )
```

Include Files

- mkl.fi

Description

The routine ?sytf2_rook computes the factorization of a real/complex symmetric matrix *A* using the bounded Bunch-Kaufman ("rook") diagonal pivoting method:

A = *U***D***U*^{T}, or *A* = *L***D***L*^{T},

where *U* (or *L*) is a product of permutation and unit upper (lower) triangular matrices, and *D* is symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

This is the unblocked version of the algorithm, calling BLAS Level 2 Routines.

Input Parameters

uplo

CHARACTER*1.

Specifies whether the upper or lower triangular part of the symmetric matrix *A* is stored

= 'U': upper triangular

= 'L': lower triangular

n

INTEGER. The order of the matrix *A*. *n* ≥ 0.

a

REAL for ssytf2_rook

DOUBLE PRECISION for dsytf2_rook

COMPLEX for csytf2_rook

DOUBLE COMPLEX for zsytf2_rook.

Array, DIMENSION (*lda*, *n*).

On entry, the symmetric matrix *A*.

If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *a* is not referenced.

If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *a* is not referenced.

lda

INTEGER.

The leading dimension of the array *a*. *lda* ≥ max(1, *n*).

Output Parameters

a

On exit, the block diagonal matrix *D* and the multipliers used to obtain the factor *U* or *L*.

ipiv

INTEGER.

Array, DIMENSION (*n*).

Details of the interchanges and the block structure of *D*

If *ipiv*(*k*) > 0, then rows and columns *k* and *ipiv*(*k*) were interchanged and $D_{k,k}$ is a 1-by-1 diagonal block.

If *uplo* = 'U' and *ipiv*(*k*) < 0 and *ipiv*(*k* – 1) < 0, then rows and columns *k* and -*ipiv*(*k*) were interchanged, rows and columns *k* - 1 and -*ipiv*(*k* - 1) were interchanged, and $D_{k-1:k,\ k-1:k}$ is a 2-by-2 diagonal block.

If *uplo* = 'L' and *ipiv*(*k*) < 0 and *ipiv*(*k* + 1) < 0, then rows and columns *k* and -*ipiv*(*k*) were interchanged, rows and columns *k* + 1 and -*ipiv*(*k* + 1) were interchanged, and $D_{k:k+1,\ k:k+1}$ is a 2-by-2 diagonal block.

info INTEGER.

= 0: successful exit

< 0: if *info* = -*k*, the *k*-th argument has an illegal value

> 0: if *info* = *k*, *D*(*k*,*k*) is exactly zero. The factorization are completed, but the block diagonal matrix *D* is exactly singular, and division by zero will occur if it is used to solve a system of equations.

?hetf2

Computes the factorization of a complex Hermitian matrix, using the diagonal pivoting method (unblocked algorithm).

Syntax

```
call chetf2( uplo, n, a, lda, ipiv, info )
call zhetf2( uplo, n, a, lda, ipiv, info )
```

Include Files

- mkl.fi

Description

The routine computes the factorization of a complex Hermitian matrix *A* using the Bunch-Kaufman diagonal pivoting method:

$A = U*D*U^H$ or $A = L*D*L^H$

where *U* (or *L*) is a product of permutation and unit upper (lower) triangular matrices, U^H is the conjugate transpose of *U*, and *D* is Hermitian and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

This is the unblocked version of the algorithm, calling BLAS Level 2 Routines.

Input Parameters

uplo CHARACTER*1.

Specifies whether the upper or lower triangular part of the Hermitian matrix *A* is stored:

= 'U': Upper triangular

= 'L': Lower triangular

n INTEGER. The order of the matrix *A*. $n \geq 0$.

A

COMPLEX for chetf2

DOUBLE COMPLEX for zhetf2.

Array, DIMENSION (*lda*, *n*).

On entry, the Hermitian matrix *A*.

If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *A* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *A* is not referenced.

If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *A* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *A* is not referenced.

Description

The routine computes the factorization of a complex Hermitian matrix *A* using the bounded Bunch-Kaufman ("rook") diagonal pivoting method:

$A = U*D*U^H$ or $A = L*D*L^H$

where *U* (or *L*) is a product of permutation and unit upper (lower) triangular matrices, U^H is the conjugate transpose of *U*, and *D* is Hermitian and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

This is the unblocked version of the algorithm, calling BLAS Level 2 Routines.

Input Parameters

uplo — CHARACTER*1.

Specifies whether the upper or lower triangular part of the Hermitian matrix *A* is stored:

= 'U': Upper triangular

= 'L': Lower triangular

n — INTEGER. The order of the matrix *A*. $n \geq 0$.

a — COMPLEX for chetf2_rook

DOUBLE COMPLEX for zhetf2_rook.

Array, DIMENSION (*lda*, *n*).

On entry, the Hermitian matrix *A*.

If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *A* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *A* is not referenced.

If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *A* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *A* is not referenced.

lda — INTEGER. The leading dimension of the array *a*. $lda \geq \max(1, n)$.

Output Parameters

a — On exit, the block diagonal matrix *D* and the multipliers used to obtain the factor *U* or *L*.

ipiv — INTEGER. Array, DIMENSION (*n*).

Details of the interchanges and the block structure of *D*.

If $ipiv(k) > 0$, then rows and columns *k* and *ipiv*(*k*) were interchanged and *D(k,k)* is a 1-by-1 diagonal block.

If *uplo* = 'U' and $ipiv(k) < 0$ and $ipiv(k - 1) < 0$, then rows and columns *k* and -*ipiv*(*k*) were interchanged, rows and columns *k* - 1 and -*ipiv*(*k* - 1) were interchanged, and $D_{k-1:k,\ k-1:k}$ is a 2-by-2 diagonal block.

If *uplo* = 'L' and $ipiv(k) < 0$ and $ipiv(k + 1) < 0$, then rows and columns *k* and -*ipiv*(*k*) were interchanged, rows and columns *k* + 1 and -*ipiv*(*k* + 1) were interchanged, and $D_{k:k+1,\ k:k+1}$ is a 2-by-2 diagonal block.

info INTEGER.

= 0: successful exit

< 0: if *info* = *-k*, the *k*-th argument had an illegal value

> 0: if *info* = *k*, *D(k,k)* is exactly zero. The factorization has been completed, but the block diagonal matrix *D* is exactly singular, and division by zero will occur if it is used to solve a system of equations.

?tgex2

Swaps adjacent diagonal blocks in an upper (quasi) triangular matrix pair by an orthogonal/unitary equivalence transformation.

Syntax

```
call stgex2( wantq, wantz, n, a, lda, b, ldb, q, ldq, z, ldz, j1, n1, n2, work, lwork, info )
call dtgex2( wantq, wantz, n, a, lda, b, ldb, q, ldq, z, ldz, j1, n1, n2, work, lwork, info )
call ctgex2( wantq, wantz, n, a, lda, b, ldb, q, ldq, z, ldz, j1, info )
call ztgex2( wantq, wantz, n, a, lda, b, ldb, q, ldq, z, ldz, j1, info )
```

Include Files

- mkl.fi

Description

The real routines stgex2/dtgex2 swap adjacent diagonal blocks (*A*11, *B*11) and (*A*22, *B*22) of size 1-by-1 or 2-by-2 in an upper (quasi) triangular matrix pair (*A*, *B*) by an orthogonal equivalence transformation. (*A*, *B*) must be in generalized real Schur canonical form (as returned by sgges/dgges), that is, *A* is block upper triangular with 1-by-1 and 2-by-2 diagonal blocks. *B* is upper triangular.

The complex routines ctgex2/ztgex2 swap adjacent diagonal 1-by-1 blocks (*A*11, *B*11) and (*A*22, *B*22) in an upper triangular matrix pair (*A*, *B*) by an unitary equivalence transformation.

(*A*, *B*) must be in generalized Schur canonical form, that is, *A* and *B* are both upper triangular.

All routines optionally update the matrices *Q* and *Z* of generalized Schur vectors:

For real flavors,

$Q(\text{in}) * A(\text{in}) * Z(\text{in})^T = Q(\text{out}) * A(\text{out}) * Z(\text{out})^T$

$Q(\text{in}) * B(\text{in}) * Z(\text{in})^T = Q(\text{out}) * B(\text{out}) * Z(\text{out})^T$.

For complex flavors,

$Q(\text{in}) * A(\text{in}) * Z(\text{in})^H = Q(\text{out}) * A(\text{out}) * Z(\text{out})^H$

$Q(\text{in}) * B(\text{in}) * Z(\text{in})^H = Q(\text{out}) * B(\text{out}) * Z(\text{out})^H$.

Input Parameters

wantq LOGICAL.

If *wantq* = .TRUE. : update the left transformation matrix *Q*;

If *wantq* = .FALSE. : do not update *Q*.

wantz — LOGICAL.

If *wantz* = .TRUE. : update the right transformation matrix *Z*;

If *wantz* = .FALSE.: do not update *Z*.

n — INTEGER. The order of the matrices *A* and *B*. *n*≥ 0.

a, *b* — REAL for stgex2DOUBLE PRECISION for dtgex2

COMPLEX for ctgex2

DOUBLE COMPLEX for ztgex2.

Arrays, DIMENSION (*lda*, *n*) and (*ldb*, *n*), respectively.

On entry, the matrices *A* and *B* in the pair (*A*, *B*).

lda — INTEGER. The leading dimension of the array *a*. *lda*≥ max(1,*n*).

ldb — INTEGER. The leading dimension of the array *b*. *ldb*≥ max(1,*n*).

q, *z* — REAL for stgex2DOUBLE PRECISION for dtgex2

COMPLEX for ctgex2

DOUBLE COMPLEX for ztgex2.

Arrays, DIMENSION (*ldq*, *n*) and (*ldz*, *n*), respectively.

On entry, if *wantq* = .TRUE., *q* contains the orthogonal/unitary matrix *Q*, and if *wantz* = .TRUE., *z* contains the orthogonal/unitary matrix *Z*.

ldq — INTEGER. The leading dimension of the array *q*. *ldq*≥ 1.

If *wantq* = .TRUE., *ldq*≥*n*.

ldz — INTEGER. The leading dimension of the array *z*. *ldz*≥ 1.

If *wantz* = .TRUE., *ldz*≥*n*.

j1 — INTEGER.

The index to the first block (*A*11, *B*11). 1 ≤ *j1* ≤ *n*.

n1 — INTEGER. Used with real flavors only. The order of the first block (*A*11, *B*11). *n1* = 0, 1 or 2.

n2 — INTEGER. Used with real flavors only. The order of the second block (*A*22, *B*22). *n2* = 0, 1 or 2.

work — REAL for stgex2

DOUBLE PRECISION for dtgex2.

Workspace array, DIMENSION(max(1,*lwork*)). Used with real flavors only.

lwork — INTEGER. The dimension of the array *work*.

lwork≥max(*n**(*n2*+*n1*), 2*(*n2*+*n1*)^2)

Output Parameters

a — On exit, the updated matrix *A*.

B	On exit, the updated matrix *B*.
Q	On exit, the updated matrix *Q*. Not referenced if *wantq* = .FALSE..
z	On exit, the updated matrix *Z*. Not referenced if *wantz* = .FALSE..
info	INTEGER. =0: Successful exit For stgex2/dtgex2: If *info* = 1, the transformed matrix (*A*, *B*) would be too far from generalized Schur form; the blocks are not swapped and (*A*, *B*) and (*Q*, *Z*) are unchanged. The problem of swapping is too ill-conditioned. If *info* = -16: *lwork* is too small. Appropriate value for *lwork* is returned in *work*(1). For ctgex2/ztgex2: If *info* = 1, the transformed matrix pair (*A*, *B*) would be too far from generalized Schur form; the problem is ill-conditioned.

?tgsy2

Solves the generalized Sylvester equation (unblocked algorithm).

Syntax

call stgsy2(*trans*, *ijob*, *m*, *n*, *a*, *lda*, *b*, *ldb*, *c*, *ldc*, *d*, *ldd*, *e*, *lde*, *f*, *ldf*, *scale*, *rdsum*, *rdscal*, *iwork*, *pq*, *info*)

call dtgsy2(*trans*, *ijob*, *m*, *n*, *a*, *lda*, *b*, *ldb*, *c*, *ldc*, *d*, *ldd*, *e*, *lde*, *f*, *ldf*, *scale*, *rdsum*, *rdscal*, *iwork*, *pq*, *info*)

call ctgsy2(*trans*, *ijob*, *m*, *n*, *a*, *lda*, *b*, *ldb*, *c*, *ldc*, *d*, *ldd*, *e*, *lde*, *f*, *ldf*, *scale*, *rdsum*, *rdscal*, *iwork*, *pq*, *info*)

call ztgsy2(*trans*, *ijob*, *m*, *n*, *a*, *lda*, *b*, *ldb*, *c*, *ldc*, *d*, *ldd*, *e*, *lde*, *f*, *ldf*, *scale*, *rdsum*, *rdscal*, *iwork*, *pq*, *info*)

Include Files

- mkl.fi

Description

The routine ?tgsy2 solves the generalized Sylvester equation:

*A*R-L*B=scale*C* (1)

*D*R-L*E=scale*F*

using Level 1 and 2 BLAS, where *R* and *L* are unknown *m*-by-*n* matrices, (*A*, *D*), (*B, E)* and (*C*, *F*) are given matrix pairs of size *m*-by -*m*, *n*-by-*n* and *m*-by-*n*, respectively. For stgsy2/dtgsy2, pairs (*A*, *D*) and (*B*, *E*) must be in generalized Schur canonical form, that is, *A*, *B* are upper quasi triangular and *D*, *E* are upper triangular. For ctgsy2/ztgsy2, matrices *A*, *B*, *D* and *E* are upper triangular (that is, (*A*, *D*) and (*B*, *E*) in generalized Schur form).

The solution (*R*, *L*) overwrites (*C*, *F*).

$0 \le scale \le 1$ is an output scaling factor chosen to avoid overflow.

In matrix notation, solving equation (1) corresponds to solve

`Z*x = scale*b`

where *Z* is defined for real flavors as

$$Z = \begin{bmatrix} \text{kron}(I_n, A) & -\text{kron}(B^T, I_m) \\ \text{kron}(I_n, D) & -\text{kron}(E^T, I_m) \end{bmatrix} \quad (2)$$

and for complex flavors as

$$Z = \begin{bmatrix} \text{kron}(I_n, A) & -\text{kron}(B^H, I_m) \\ \text{kron}(I_n, D) & -\text{kron}(E^H, I_m) \end{bmatrix} \quad (3)$$

Here I_k is the identity matrix of size *k* and X^T (X^H) is the transpose (conjugate transpose) of *X*. `kron`(*X*, *Y*) denotes the Kronecker product between the matrices *X* and *Y*.

For real flavors, if `trans = 'T'`, solve the transposed system

$Z^T*y = scale*b$

for *y*, which is equivalent to solving for *R* and *L* in

$$A^T*R+D^T*L=scale*C \quad (4)$$

$$R*B^T+L*E^T=scale*(-F)$$

For complex flavors, if `trans = 'C'`, solve the conjugate transposed system

$Z^H*y = scale*b$

for *y*, which is equivalent to solving for *R* and *L* in

$$A^H*R+D^H*L=scale*C \quad (5)$$

$$R*B^H+L*E^H=scale*(-F)$$

These cases are used to compute an estimate of `Dif[(A,D),(B,E)] = sigma_min(Z)` using reverse communication with `?lacon`.

`?tgsy2` also (for `ijob`≥ `1`) contributes to the computation in `?tgsyl` of an upper bound on the separation between two matrix pairs. Then the input (*A*, *D*), (*B*, *E*) are sub-pencils of the matrix pair (two matrix pairs) in `?tgsyl`. See `?tgsyl` for details.

Input Parameters

`trans`	`CHARACTER*1`. If `trans = 'N'`, solve the generalized Sylvester equation (1); If `trans = 'T'`: solve the transposed system (4). If `trans = 'C'`: solve the conjugate transposed system (5).
`ijob`	`INTEGER`. Specifies what kind of functionality is to be performed. If `ijob = 0`: solve (1) only.

If *ijob* = 1: a contribution from this subsystem to a Frobenius norm-based estimate of the separation between two matrix pairs is computed (look ahead strategy is used);

If *ijob* = 2: a contribution from this subsystem to a Frobenius norm-based estimate of the separation between two matrix pairs is computed (?gecon on sub-systems is used).

Not referenced if *trans* = 'T'.

m — INTEGER. On entry, *m* specifies the order of *A* and *D*, and the row dimension of *C*, *F*, *R* and *L*.

n — INTEGER. On entry, *n* specifies the order of *B* and *E*, and the column dimension of *C*, *F*, *R* and *L*.

a, *b* — REAL for stgsy2

DOUBLE PRECISION for dtgsy2

COMPLEX for ctgsy2

DOUBLE COMPLEX for ztgsy2.

Arrays, DIMENSION (*lda*, *m*) and (*ldb*, *n*), respectively. On entry, *a* contains an upper (quasi) triangular matrix *A*, and *b* contains an upper (quasi) triangular matrix *B*.

lda — INTEGER. The leading dimension of the array *a*. *lda* ≥ max(1, *m*).

ldb — INTEGER.

The leading dimension of the array *b*. *ldb* ≥ max(1, *n*).

c, *f* — REAL for stgsy2

DOUBLE PRECISION for dtgsy2

COMPLEX for ctgsy2

DOUBLE COMPLEX for ztgsy2.

Arrays, DIMENSION (*ldc*, *n*) and (*ldf*, *n*), respectively. On entry, *c* contains the right-hand-side of the first matrix equation in (1), and *f* contains the right-hand-side of the second matrix equation in (1).

ldc — INTEGER. The leading dimension of the array *c*. *ldc* ≥ max(1, *m*).

d, *e* — REAL for stgsy2

DOUBLE PRECISION for dtgsy2

COMPLEX for ctgsy2

DOUBLE COMPLEX for ztgsy2.

Arrays, DIMENSION (*ldd*, *m*) and (*lde*, *n*), respectively. On entry, *d* contains an upper triangular matrix *D*, and *e* contains an upper triangular matrix *E*.

ldd — INTEGER. The leading dimension of the array *d*. *ldd* ≥ max(1, *m*).

lde — INTEGER. The leading dimension of the array *e*. *lde* ≥ max(1, *n*).

ldf — INTEGER. The leading dimension of the array *f*. *ldf* ≥ max(1, *m*).

rdsum

REAL for stgsy2/ctgsy2

DOUBLE PRECISION for dtgsy2/ztgsy2.

On entry, the sum of squares of computed contributions to the Dif-estimate under computation by ?tgsyL, where the scaling factor *rdscal* has been factored out.

rdscal

REAL for stgsy2/ctgsy2

DOUBLE PRECISION for dtgsy2/ztgsy2.

On entry, scaling factor used to prevent overflow in *rdsum*.

iwork

INTEGER. Used with real flavors only.

Workspace array, DIMENSION (*m*+*n*+2).

Output Parameters

c

On exit, if *ijob* = 0, *c* is overwritten by the solution *R*.

f

On exit, if *ijob* = 0, *f* is overwritten by the solution *L*.

scale

REAL for stgsy2/ctgsy2

DOUBLE PRECISION for dtgsy2/ztgsy2.

On exit, $0 \le scale \le 1$. If $0 < scale < 1$, the solutions *R* and *L* (*C* and *F* on entry) hold the solutions to a slightly perturbed system, but the input matrices *A*, *B*, *D* and *E* are not changed. If $scale = 0$, *R* and *L* hold the solutions to the homogeneous system with $C = F = 0$. Normally $scale = 1$.

rdsum

On exit, the corresponding sum of squares updated with the contributions from the current sub-system.

If *trans* = 'T', *rdsum* is not touched.

Note that *rdsum* only makes sense when ?tgsy2 is called by ?tgsyl.

rdscal

On exit, *rdscal* is updated with respect to the current contributions in *rdsum*.

If *trans* = 'T', *rdscal* is not touched.

Note that *rdscal* only makes sense when ?tgsy2 is called by ?tgsyl.

pq

INTEGER. Used with real flavors only.

On exit, the number of subsystems (of size 2-by-2, 4-by-4 and 8-by-8) solved by the routine stgsy2/dtgsy2.

info

INTEGER. On exit, if *info* is set to

= 0: Successful exit

< 0: If *info* = -*i*, the *i*-th argument has an illegal value.

> 0: The matrix pairs (*A*, *D*) and (*B*, *E*) have common or very close eigenvalues.

?trti2

Computes the inverse of a triangular matrix (unblocked algorithm).

Syntax

```
call strti2( uplo, diag, n, a, lda, info )
call dtrti2( uplo, diag, n, a, lda, info )
call ctrti2( uplo, diag, n, a, lda, info )
call ztrti2( uplo, diag, n, a, lda, info )
```

Include Files

- mkl.fi

Description

The routine ?trti2 computes the inverse of a real/complex upper or lower triangular matrix.

This is the *Level 2 BLAS* version of the algorithm.

Input Parameters

uplo

CHARACTER*1.

Specifies whether the matrix *A* is upper or lower triangular.

= 'U': upper triangular

= 'L': lower triangular

diag

CHARACTER*1.

Specifies whether or not the matrix *A* is unit triangular.

= 'N': non-unit triangular

= 'N': non-unit triangular

n

INTEGER. The order of the matrix *A*. $n \geq 0$.

a

REAL for strti2

DOUBLE PRECISION for dtrti2

COMPLEX for ctrti2

DOUBLE COMPLEX for ztrti2.

Array, DIMENSION (*lda*, *n*).

On entry, the triangular matrix *A*.

If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of the array *a* contains the upper triangular matrix, and the strictly lower triangular part of *a* is not referenced.

If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of the array *a* contains the lower triangular matrix, and the strictly upper triangular part of *a* is not referenced.

If *diag* = 'U', the diagonal elements of *a* are also not referenced and are assumed to be 1.

lda — INTEGER. The leading dimension of the array *a*. *lda* ≥ max(1,*n*).

Output Parameters

a — On exit, the (triangular) inverse of the original matrix, in the same storage format.

info — INTEGER.

= 0: successful exit

< 0: if *info* = -*k*, the *k*-th argument had an illegal value

clag2z

Converts a complex single precision matrix to a complex double precision matrix.

Syntax

```
call clag2z( m, n, sa, ldsa, a, lda, info )
```

Include Files

- mkl.fi

Description

This routine converts a complex single precision matrix *SA* to a complex double precision matrix *A*.

Note that while it is possible to overflow while converting from double to single, it is not possible to overflow when converting from single to double.

This is an auxiliary routine so there is no argument checking.

Input Parameters

m — INTEGER. The number of lines of the matrix *A* (*m* ≥ 0).

n — INTEGER. The number of columns in the matrix *A* (*n* ≥ 0).

ldsa — INTEGER. The leading dimension of the array *sa*; *ldsa* ≥ max(1, *m*).

a — DOUBLE PRECISION array, DIMENSION (*lda*, *n*).

On entry, contains the *m*-by-*n* coefficient matrix *A*.

lda — INTEGER. The leading dimension of the array *a*; *lda* ≥ max(1, *m*).

Output Parameters

sa — REAL array, DIMENSION (*ldsa*, *n*).

On exit, contains the *m*-by-*n* coefficient matrix *SA*.

info — INTEGER.

If *info* = 0, the execution is successful.

dlag2s

Converts a double precision matrix to a single precision matrix.

Syntax

```
call dlag2s( m, n, a, lda, sa, ldsa, info )
```

Include Files

- mkl.fi

Description

This routine converts a double precision matrix *SA* to a single precision matrix *A*.

RMAX is the overflow for the single precision arithmetic. dlag2s checks that all the entries of *A* are between –RMAX and RMAX. If not, the convertion is aborted and a flag is raised.

This is an auxiliary routine so there is no argument checking.

Input Parameters

m	INTEGER. The number of rows of the matrix *A* (*m*≥ 0).
n	INTEGER. The number of columns in the matrix *A* (*n*≥ 0).
a	DOUBLE PRECISION array, DIMENSION (*lda*, *n*). On entry, contains the *m*-by-*n* coefficient matrix *A*.
lda	INTEGER. The leading dimension of the array *a*; *lda*≥ max(1, *m*).
ldsa	INTEGER. The leading dimension of the array *sa*; *ldsa*≥ max(1, *m*).

Output Parameters

sa	REAL array, DIMENSION (*ldsa*, *n*). On exit, if *info* = 0, contains the *m*-by-*n* coefficient matrix *SA*; if *info* > 0, the content of *sa* is unspecified.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = 1, an entry of the matrix *A* is greater than the single precision overflow threshold; in this case, the content of *sa* on exit is unspecified.

slag2d

Converts a single precision matrix to a double precision matrix.

Syntax

```
call slag2d( m, n, sa, ldsa, a, lda, info )
```

Include Files

- mkl.fi

Description

The routine converts a single precision matrix *SA* to a double precision matrix *A*.

Note that while it is possible to overflow while converting from double to single, it is not possible to overflow when converting from single to double.

This is an auxiliary routine so there is no argument checking.

Input Parameters

m	INTEGER. The number of lines of the matrix *A* (*m*≥ 0).
n	INTEGER. The number of columns in the matrix *A* (*n*≥ 0).
sa	REAL array, DIMENSION (*ldsa*, *n*). On entry, contains the *m*-by-*n* coefficient matrix *SA*.
ldsa	INTEGER. The leading dimension of the array *sa*; *ldsa*≥ max(1, *m*).
lda	INTEGER. The leading dimension of the array *a*; *lda*≥ max(1, *m*).

Output Parameters

a	DOUBLE PRECISION array, DIMENSION (*lda*, *n*). On exit, contains the *m*-by-*n* coefficient matrix *A*.
info	INTEGER. If *info* = 0, the execution is successful.

zlag2c

Converts a complex double precision matrix to a complex single precision matrix.

Syntax

```
call zlag2c( m, n, a, lda, sa, ldsa, info )
```

Include Files

- mkl.fi

Description

The routine converts a double precision complex matrix *SA* to a single precision complex matrix *A*.

RMAX is the overflow for the single precision arithmetic. zlag2c checks that all the entries of *A* are between –RMAX and RMAX. If not, the convertion is aborted and a flag is raised.

This is an auxiliary routine so there is no argument checking.

Input Parameters

m	INTEGER. The number of lines of the matrix *A* (*m*≥ 0).
n	INTEGER. The number of columns in the matrix *A* (*n*≥ 0).
a	DOUBLE COMPLEX array, DIMENSION (*lda*, *n*).

	On entry, contains the *m*-by-*n* coefficient matrix *A*.
lda	INTEGER. The leading dimension of the array *a*; *lda*≥ max(1, *m*).
ldsa	INTEGER. The leading dimension of the array *sa*; *ldsa*≥ max(1, *m*).

Output Parameters

sa	COMPLEX array, DIMENSION (*ldsa*, *n*). On exit, if *info* = 0, contains the *m*-by-*n* coefficient matrix *SA*; if *info* > 0, the content of *sa* is unspecified.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = 1, an entry of the matrix *A* is greater than the single precision overflow threshold; in this case, the content of *sa* on exit is unspecified.

?larfp

Generates a real or complex elementary reflector.

Syntax

```
call slarfp(n, alpha, x, incx, tau)
call dlarfp(n, alpha, x, incx, tau)
call clarfp(n, alpha, x, incx, tau)
call zlarfp(n, alpha, x, incx, tau)
```

Include Files

- mkl.fi

Description

The ?larfp routines generate a real or complex elementary reflector *H* of order *n*, such that

```
H * (alpha) = (beta),
    (  x  )   ( 0  )
```

and *H*'**H* =*I* for real flavors, conjg(*H*)'**H* =*I* for complex flavors.

Here

alpha and *beta* are scalars, *beta* is real and non-negative,

x is (*n*-1)-element vector.

H is represented in the form

```
H = I - tau*( 1 )* (1   v'),
            ( v )
```

where *tau* is scalar, and *v* is (*n*-1)-element vector .

For real flavors if the elements of *x* are all zero, then *tau* = 0 and *H* is taken to be the unit matrix. Otherwise 1 ≤*tau*≤ 2.

For complex flavors if the elements of *x* are all zero and *alpha* is real, then *tau* = 0 and *H* is taken to be the unit matrix. Otherwise 1 ≤ real(*tau*) ≤ 2, and abs (*tau*-1≤ 1.

Input Parameters

n	INTEGER. Specifies the order of the elementary reflector.
alpha	REAL for slarfp DOUBLE PRECISION for dlarfp COMPLEX for clarfp DOUBLE COMPLEX for zlarfp Specifies the scalar *alpha*.
x	REAL for slarfp DOUBLE PRECISION for dlarfp COMPLEX for clarfp DOUBLE COMPLEX for zlarfp Array, DIMENSION at least (1 + (*n* – 1)*abs(*incx*)). It contains the vector *x*.
incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.

Output Parameters

alpha	Overwritten by the value *beta*.
y	Overwritten by the vector *v*.
tau	REAL for slarfp DOUBLE PRECISION for dlarfp COMPLEX for clarfp DOUBLE COMPLEX for zlarfp Contains the scalar *tau*.

ila?lc

Scans a matrix for its last non-zero column.

Syntax

value = ilaslc(*m*, *n*, *a*, *lda*)

value = iladlc(*m*, *n*, *a*, *lda*)

value = ilaclc(*m*, *n*, *a*, *lda*)

value = ilazlc(*m*, *n*, *a*, *lda*)

Include Files

- mkl.fi

Description

The ila?lc routines scan a matrix *A* for its last non-zero column.

Input Parameters

m	INTEGER. Specifies number of rows in the matrix *A*.
n	INTEGER. Specifies number of columns in the matrix *A*.
a	REAL for ilaslc DOUBLE PRECISION for iladlc COMPLEX for ilaclc DOUBLE COMPLEX for ilazlc Array, DIMENSION(*lda*, *). The second dimension of *a* must be at least max(1, *n*). Before entry the leading *n*-by-*n* part of the array *a* must contain the matrix *A*.
lda	INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least max(1, *m*).

Output Parameters

value	INTEGER Number of the last non-zero column.

ila?lr

Scans a matrix for its last non-zero row.

Syntax

```
value = ilaslr(m, n, a, lda)
value = iladlr(m, n, a, lda)
value = ilaclr(m, n, a, lda)
value = ilazlr(m, n, a, lda)
```

Include Files

- mkl.fi

Description

The ila?lr routines scan a matrix *A* for its last non-zero row.

Input Parameters

m	INTEGER. Specifies number of rows in the matrix *A*.
n	INTEGER. Specifies number of columns in the matrix *A*.

a	REAL for ilaslr DOUBLE PRECISION for iladlr COMPLEX for ilaclr DOUBLE COMPLEX for idazlr Array, DIMENSION(*lda*, *). The second dimension of *a* must be at least max(1, *n*). Before entry the leading *n*-by-*n* part of the array *a* must contain the matrix *A*.
lda	INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least max(1, *m*).

Output Parameters

value	INTEGER Number of the last non-zero row.

?gsvj0

Pre-processor for the routine ?gesvj.

Syntax

call sgsvj0(*jobv*, *m*, *n*, *a*, *lda*, *d*, *sva*, *mv*, *v*, *ldv*, *eps*, *sfmin*, *tol*, *nsweep*, *work*, *lwork*, *info*)

call dgsvj0(*jobv*, *m*, *n*, *a*, *lda*, *d*, *sva*, *mv*, *v*, *ldv*, *eps*, *sfmin*, *tol*, *nsweep*, *work*, *lwork*, *info*)

call cgsvj0(*jobv*, *m*, *n*, *a*, *lda*, *d*, *sva*, *mv*, *v*, *ldv*, *eps*, *sfmin*, *tol*, *nsweep*, *work*, *lwork*, *info*)

call zgsvj0(*jobv*, *m*, *n*, *a*, *lda*, *d*, *sva*, *mv*, *v*, *ldv*, *eps*, *sfmin*, *tol*, *nsweep*, *work*, *lwork*, *info*)

Include Files

- mkl.fi

Description

This routine is called from ?gesvj as a pre-processor and that is its main purpose. It applies Jacobi rotations in the same way as ?gesvj does, but it does not check convergence (stopping criterion).

The routine ?gsvj0 enables ?gesvj to use a simplified version of itself to work on a submatrix of the original matrix.

Input Parameters

jobv	CHARACTER*1. Must be 'V', 'A', or 'N'. Specifies whether the output from this routine is used to compute the matrix *V*.

If *jobv* = 'V', the product of the Jacobi rotations is accumulated by post-multiplying the *n*-by-*n* array *v*.

If *jobv* = 'A', the product of the Jacobi rotations is accumulated by post-multiplying the *mv*-by-*n* array *v*.

If *jobv* = 'N', the Jacobi rotations are not accumulated.

m INTEGER. The number of rows of the input matrix *A* ($m \geq 0$).

n INTEGER. The number of columns of the input matrix *B* ($m \geq n \geq 0$).

a REAL for sgsvj0

DOUBLE PRECISION for dgsvj0.

COMPLEX for cgsvj0

DOUBLE COMPLEX for zgsvj0

Array, DIMENSION (*lda*, *n*). Contains the *m*-by-*n* matrix *A*, such that *A**diag(*D*) represents the input matrix.

lda INTEGER. The leading dimension of *a*; at least max(1, *m*).

d REAL for sgsvj0

DOUBLE PRECISION for dgsvj0.

COMPLEX for cgsvj0

DOUBLE COMPLEX for zgsvj0

Array, DIMENSION (*n*). Contains the diagonal matrix *D* that accumulates the scaling factors from the fast scaled Jacobi rotations. On entry *A**diag(*D*) represents the input matrix.

sva REAL for sgsvj0

DOUBLE PRECISION for dgsvj0.

REAL for cgsvj0

DOUBLE PRECISION for zgsvj0.

Array, DIMENSION (*n*). Contains the Euclidean norms of the columns of the matrix *A**diag(*D*).

mv INTEGER. The leading dimension of *b*; at least max(1, *p*).

If *jobv* = 'A', then *mv* rows of *v* are post-multiplied by a sequence of Jacobi rotations.

If *jobv* = 'N', then *mv* is not referenced .

v REAL for sgsvj0

DOUBLE PRECISION for dgsvj0.

COMPLEX for cgsvj0

DOUBLE COMPLEX for zgsvj0

Array, DIMENSION (*ldv*, *n*).

If *jobv* = 'V', then *n* rows of *v* are post-multiplied by a sequence of Jacobi rotations.

If *jobv* = 'A', then *mv* rows of *v* are post-multiplied by a sequence of Jacobi rotations.

If *jobv* = 'N', then *v* is not referenced.

ldv

INTEGER. The leading dimension of the array *v*; *ldv* ≥ 1

ldv ≥ *n* if *jobv* = 'V';

ldv ≥ *mv* if *jobv* = 'A'.

eps

REAL for sgsvj0

DOUBLE PRECISION for dgsvj0.

REAL for cgsvj0

DOUBLE PRECISION for zgsvj0.

The relative machine precision (epsilon) returned by the routine ?lamch.

sfmin

REAL for sgsvj0

DOUBLE PRECISION for dgsvj0.

REAL for cgsvj0

DOUBLE PRECISION for zgsvj0.

Value of safe minimum returned by the routine ?lamch.

tol

REAL for sgsvj0

DOUBLE PRECISION for dgsvj0.

REAL for cgsvj0

DOUBLE PRECISION for zgsvj0.

The threshold for Jacobi rotations. For a pair *A*(:,p), *A*(:,q) of pivot columns, the Jacobi rotation is applied only if abs(cos(angle(*A*(:,p),*A*(:,q)))) > *tol*.

nsweep

INTEGER.

The number of sweeps of Jacobi rotations to be performed.

work

REAL for sgsvj0

DOUBLE PRECISION for dgsvj0.

COMPLEX for cgsvj0

DOUBLE COMPLEX for zgsvj0

Workspace array, DIMENSION (*lwork*).

lwork

INTEGER. The size of the array *work*; at least max(1, *m*).

Output Parameters

a	On exit, *A**diag(*D*) represents the input matrix post-multiplied by a sequence of Jacobi rotations, where the rotation threshold and the total number of sweeps are given in *tol* and *nsweep*, respectively
d	On exit, *A**diag(*D*) represents the input matrix post-multiplied by a sequence of Jacobi rotations, where the rotation threshold and the total number of sweeps are given in *tol* and *nsweep*, respectively.
sva	On exit, contains the Euclidean norms of the columns of the output matrix *A**diag(*D*).
v	If *jobv* = 'V', then *n* rows of *v* are post-multiplied by a sequence of Jacobi rotations. If *jobv* = 'A', then *mv* rows of *v* are post-multiplied by a sequence of Jacobi rotations. If *jobv* = 'N', then *v* is not referenced.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

?gsvj1

Pre-processor for the routine ?gesvj*, applies Jacobi rotations targeting only particular pivots.*

Syntax

```
call sgsvj1(jobv, m, n, n1, a, lda, d, sva, mv, v, ldv, eps, sfmin, tol, nsweep, work, lwork, info)
call dgsvj1(jobv, m, n, n1, a, lda, d, sva, mv, v, ldv, eps, sfmin, tol, nsweep, work, lwork, info)
call cgsvj1(jobv, m, n, n1, a, lda, d, sva, mv, v, ldv, eps, sfmin, tol, nsweep, work, lwork, info)
call zgsvj1(jobv, m, n, n1, a, lda, d, sva, mv, v, ldv, eps, sfmin, tol, nsweep, work, lwork, info)
```

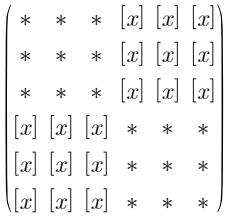
Include Files

- mkl.fi

Description

This routine is called from ?gesvj as a pre-processor and that is its main purpose. It applies Jacobi rotations in the same way as ?gesvj does, but it targets only particular pivots and it does not check convergence (stopping criterion).

The routine ?gsvj1 applies few sweeps of Jacobi rotations in the column space of the input *m*-by-*n* matrix *A*. The pivot pairs are taken from the (1,2) off-diagonal block in the corresponding *n*-by-*n* Gram matrix *A*'**A*. The block-entries (*tiles*) of the (1,2) off-diagonal block are marked by the [x]'s in the following scheme:



row-cycling in the *nblr*-by-*nblc*[x] blocks, row-cyclic pivoting inside each [x] block

In terms of the columns of the matrix *A*, the first *n1* columns are rotated 'against' the remaining *n*-*n1* columns, trying to increase the angle between the corresponding subspaces. The off-diagonal block is *n1*-by-(*n*-*n1*) and it is tiled using quadratic tiles. The number of sweeps is specified by *nsweep*, and the orthogonality threshold is set by *tol*.

Input Parameters

jobv

CHARACTER*1. Must be 'V', 'A', or 'N'.

Specifies whether the output from this routine is used to compute the matrix *V*.

If *jobv* = 'V', the product of the Jacobi rotations is accumulated by post-multiplying the *n*-by-*n* array *v*.

If *jobv* = 'A', the product of the Jacobi rotations is accumulated by post-multiplying the *mv*-by-*n* array *v*.

If *jobv* = 'N', the Jacobi rotations are not accumulated.

m

INTEGER. The number of rows of the input matrix *A* ($m \geq 0$).

n

INTEGER. The number of columns of the input matrix *B* ($m \geq n \geq 0$).

n1

INTEGER. Specifies the 2-by-2 block partition. The first *n1* columns are rotated 'against' the remaining *n*–*n1* columns of the matrix *A*.

a

REAL for sgsvj1

DOUBLE PRECISION for dgsvj1.

COMPLEX for cgsvj1

DOUBLE COMPLEX for zgsvj1.

Array, DIMENSION (*lda*, *n*). Contains the *m*-by-*n* matrix *A*, such that *A**diag(*D*) represents the input matrix.

lda

INTEGER. The leading dimension of *a*; at least max(1, *m*).

d

REAL for sgsvj1

DOUBLE PRECISION for dgsvj1.

COMPLEX for cgsvj1

DOUBLE COMPLEX for zgsvj1.

Arrays, DIMENSION (*n*). Contains the diagonal matrix *D* that accumulates the scaling factors from the fast scaled Jacobi rotations. On entry *A**diag(*D*) represents the input matrix.

sva

REAL for sgsvj1

DOUBLE PRECISION for dgsvj1.

REAL for cgsvj1

DOUBLE PRECISION for zgsvj1.

Arrays, DIMENSION (*n*). Contains the Euclidean norms of the columns of the matrix *A**diag(*D*).

mv INTEGER. The leading dimension of *b*; at least max(1, *p*).

If *jobv* = 'A', then *mv* rows of *v* are post-multiplied by a sequence of Jacobi rotations.

If *jobv* = 'N', then *mv* is not referenced .

v REAL for sgsvj1

DOUBLE PRECISION for dgsvj1.

COMPLEX for cgsvj1

DOUBLE COMPLEX for zgsvj1.

Array, DIMENSION (*ldv*, *n*).

If *jobv* = 'V', then *n* rows of *v* are post-multiplied by a sequence of Jacobi rotations.

If *jobv* = 'A', then *mv* rows of *v* are post-multiplied by a sequence of Jacobi rotations.

If *jobv* = 'N', then *v* is not referenced.

ldv INTEGER. The leading dimension of the array *v*; *ldv*≥ 1

ldv≥ *n* if *jobv* = 'V';

ldv≥ *mv* if *jobv* = 'A'.

eps REAL for sgsvj1

DOUBLE PRECISION for dgsvj1.

REAL for cgsvj1

DOUBLE PRECISION for zgsvj1.

The relative machine precision (epsilon) returned by the routine ?lamch.

sfmin REAL for sgsvj1

DOUBLE PRECISION for dgsvj1.

REAL for cgsvj1

DOUBLE PRECISION for zgsvj1.

Value of safe minimum returned by the routine ?lamch.

tol REAL for sgsvj1

DOUBLE PRECISION for dgsvj1.

REAL for cgsvj1

DOUBLE PRECISION for zgsvj1.

	The threshold for Jacobi rotations. For a pair `A(:,p)`, `A(:,q)` of pivot columns, the Jacobi rotation is applied only if `abs(cos(angle(A(:,p),A(:,q))))> tol`.
nsweep	`INTEGER`. The number of sweeps of Jacobi rotations to be performed.

work	`REAL` for `sgsvj1`
	`DOUBLE PRECISION` for `dgsvj1`.
	`COMPLEX` for `cgsvj1`
	`DOUBLE COMPLEX` for `zgsvj1`.
	Workspace array, `DIMENSION` (*lwork*).

lwork	`INTEGER`. The size of the array *work*; at least `max(1, m)`.

Output Parameters

a	On exit, `A*diag(D)` represents the input matrix post-multiplied by a sequence of Jacobi rotations, where the rotation threshold and the total number of sweeps are given in *tol* and *nsweep*, respectively
d	On exit, `A*diag(D)` represents the input matrix post-multiplied by a sequence of Jacobi rotations, where the rotation threshold and the total number of sweeps are given in *tol* and *nsweep*, respectively.
sva	On exit, contains the Euclidean norms of the columns of the output matrix `A*diag(D)`.
v	If *jobv* = `'V'`, then *n* rows of *v* are post-multiplied by a sequence of Jacobi rotations. If *jobv* = `'A'`, then *mv* rows of *v* are post-multiplied by a sequence of Jacobi rotations. If *jobv* = `'N'`, then *v* is not referenced.
info	`INTEGER`. If *info* = `0`, the execution is successful. If *info* = `-i`, the *i*-th parameter had an illegal value.

?sfrk

Performs a symmetric rank-k operation for matrix in RFP format.

Syntax

```
call ssfrk(transr, uplo, trans, n, k, alpha, a, lda, beta, c)
call dsfrk(transr, uplo, trans, n, k, alpha, a, lda, beta, c)
```

Include Files

- `mkl.fi`

Description

The ?sfrk routines perform a matrix-matrix operation using symmetric matrices. The operation is defined as

$C := alpha*A*A^T + beta*C$,

or

$C := alpha*A^T*A + beta*C$,

where:

alpha and *beta* are scalars,

C is an *n*-by-*n* symmetric matrix in rectangular full packed (RFP) format,

A is an *n*-by-*k* matrix in the first case and a *k*-by-*n* matrix in the second case.

Input Parameters

transr

CHARACTER*1.

if *transr* = 'N' or 'n', the normal form of RFP *C* is stored;

if *transr*= 'T' or 't', the transpose form of RFP *C* is stored.

uplo

CHARACTER*1. Specifies whether the upper or lower triangular part of the array *c* is used.

If *uplo* = 'U' or 'u', then the upper triangular part of the array *c* is used.

If *uplo* = 'L' or 'l', then the low triangular part of the array *c* is used.

trans

CHARACTER*1. Specifies the operation:

if *trans* = 'N' or 'n', then $C := alpha*A*A^T + beta*C$;

if *trans* = 'T' or 't', then $C := alpha*A^T*A + beta*C$;

n

INTEGER. Specifies the order of the matrix *C*. The value of *n* must be at least zero.

k

INTEGER. On entry with *trans* = 'N' or 'n', *k* specifies the number of columns of the matrix *A*, and on entry with *trans* = 'T' or 't', *k* specifies the number of rows of the matrix *A*.

The value of *k* must be at least zero.

alpha

REAL for ssfrk

DOUBLE PRECISION for dsfrk

Specifies the scalar *alpha*.

a

REAL for ssfrk

DOUBLE PRECISION for dsfrk

Array, DIMENSION(*lda*,*ka*), where *ka* is *k* when *trans* = 'N' or 'n', and is *n* otherwise. Before entry with *trans* = 'N' or 'n', the leading *n*-by-*k* part of the array *a* must contain the matrix *A*, otherwise the leading *k*-by-*n* part of the array *a* must contain the matrix *A*.

lda — INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program. When *trans* = 'N' or 'n', then *lda* must be at least max(1,*n*), otherwise *lda* must be at least max(1, *k*).

beta — REAL for ssfrk

DOUBLE PRECISION for dsfrk

Specifies the scalar *beta*.

c — REAL for ssfrk

DOUBLE PRECISION for dsfrk

Array, size (*n**(*n*+1)/2). Before entry contains the symmetric matrix *C* in RFP format.

Output Parameters

c — If *trans* = 'N' or 'n', then *c* contains *C* := *alpha***A***A*' + *beta***C*;

if *trans* = 'T' or 't', then *c* contains *C* := *alpha***A*'**A* + *beta***C*;

?hfrk

Performs a Hermitian rank-k operation for matrix in RFP format.

Syntax

```
call chfrk(transr, uplo, trans, n, k, alpha, a, lda, beta, c)
call zhfrk(transr, uplo, trans, n, k, alpha, a, lda, beta, c)
```

Include Files

- mkl.fi

Description

The ?hfrk routines perform a matrix-matrix operation using Hermitian matrices. The operation is defined as

$C := alpha*A*A^H + beta*C,$

or

$C := alpha*A^H*A + beta*C,$

where:

alpha and *beta* are real scalars,

C is an *n*-by-*n* Hermitian matrix in RFP format,

A is an *n*-by-*k* matrix in the first case and a *k*-by-*n* matrix in the second case.

Input Parameters

transr — CHARACTER*1.

if *transr* = 'N' or 'n', the normal form of RFP *C* is stored;

if *transr* = 'C' or 'c', the conjugate-transpose form of RFP *C* is stored.

uplo

CHARACTER*1. Specifies whether the upper or lower triangular part of the array *c* is used.

If *uplo* = 'U' or 'u', then the upper triangular part of the array *c* is used.

If *uplo* = 'L' or 'l', then the low triangular part of the array *c* is used.

trans

CHARACTER*1. Specifies the operation:

if *trans* = 'N' or 'n', then $C := alpha*A*A^H + beta*C$;

if *trans* = 'C' or 'c', then $C := alpha*A^H*A + beta*C$.

n

INTEGER. Specifies the order of the matrix *C*. The value of *n* must be at least zero.

k

INTEGER. On entry with *trans* = 'N' or 'n', *k* specifies the number of columns of the matrix *a*, and on entry with *trans* = 'T' or 't' or 'C' or 'c', *k* specifies the number of rows of the matrix *a*.

The value of *k* must be at least zero.

alpha

COMPLEX for chfrk

DOUBLE COMPLEX for zhfrk

Specifies the scalar *alpha*.

a

COMPLEX for chfrk

DOUBLE COMPLEX for zhfrk

Array, DIMENSION(*lda*,*ka*), where *ka* is *k* when *trans* = 'N' or 'n', and is *n* otherwise. Before entry with *trans* = 'N' or 'n', the leading *n*-by-*k* part of the array *a* must contain the matrix *A*, otherwise the leading *k*-by-*n* part of the array *a* must contain the matrix *A*.

lda

INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program. When *trans* = 'N' or 'n', then *lda* must be at least max(1,*n*), otherwise *lda* must be at least max(1, *k*).

beta

COMPLEX for chfrk

DOUBLE COMPLEX for zhfrk

Specifies the scalar *beta*.

c

COMPLEX for chfrk

DOUBLE COMPLEX for zhfrk

Array, size (*n**(*n*+1)/2). Before entry contains the Hermitian matrix *C* in in RFP format.

Output Parameters

c

If *trans* = 'N' or 'n', then *c* contains $C := alpha*A*A^H + beta*C$;

if *trans* = 'C' or 'c', then *c* contains $C := alpha*A^H*A + beta*C$;

?tfsm

Solves a matrix equation (one operand is a triangular matrix in RFP format).

Syntax

```
call stfsm(transr, side, uplo, trans, diag, m, n, alpha, a, b, ldb)
call dtfsm(transr, side, uplo, trans, diag, m, n, alpha, a, b, ldb)
call ctfsm(transr, side, uplo, trans, diag, m, n, alpha, a, b, ldb)
call ztfsm(transr, side, uplo, trans, diag, m, n, alpha, a, b, ldb)
```

Include Files

- mkl.fi

Description

The ?tfsm routines solve one of the following matrix equations:

```
op(A)*X = alpha*B,
```

or

```
X*op(A) = alpha*B,
```

where:

alpha is a scalar,

X and *B* are *m*-by-*n* matrices,

A is a unit, or non-unit, upper or lower triangular matrix in rectangular full packed (RFP) format.

op(*A*) can be one of the following:

- op(*A*) = *A* or op(*A*) = A^T for real flavors
- op(*A*) = *A* or op(*A*) = A^H for complex flavors

The matrix *B* is overwritten by the solution matrix *X*.

Input Parameters

transr

CHARACTER*1.

if *transr* = 'N' or 'n', the normal form of RFP *A* is stored;

if *transr* = 'T' or 't', the transpose form of RFP *A* is stored;

if *transr* = 'C' or 'c', the conjugate-transpose form of RFP *A* is stored.

side

CHARACTER*1. Specifies whether op(*A*) appears on the left or right of *X* in the equation:

if *side* = 'L' or 'l', then op(*A*)**X* = *alpha***B*;

if *side* = 'R' or 'r', then *X**op(*A*) = *alpha***B*.

uplo

CHARACTER*1. Specifies whether the RFP matrix *A* is upper or lower triangular:

if *uplo* = 'U' or 'u', then the matrix is upper triangular;

if *uplo* = 'L' or 'l', then the matrix is low triangular.

trans — CHARACTER*1. Specifies the form of op(*A*) used in the matrix multiplication:

if *trans* = 'N' or 'n', then op(*A*) = *A*;

if *trans* = 'T' or 't', then op(*A*) = *A*';

if *trans* = 'C' or 'c', then op(*A*) = conjg(*A*').

diag — CHARACTER*1. Specifies whether the RFP matrix *A* is unit triangular:

if *diag* = 'U' or 'u' then the matrix is unit triangular;

if *diag* = 'N' or 'n', then the matrix is not unit triangular.

m — INTEGER. Specifies the number of rows of *B*. The value of *m* must be at least zero.

n — INTEGER. Specifies the number of columns of *B*. The value of *n* must be at least zero.

alpha — REAL for stfsm

DOUBLE PRECISION for dtfsm

COMPLEX for ctfsm

DOUBLE COMPLEX for ztfsm

Specifies the scalar *alpha*.

When *alpha* is zero, then *a* is not referenced and *b* need not be set before entry.

a — REAL for stfsm

DOUBLE PRECISION for dtfsm

COMPLEX for ctfsm

DOUBLE COMPLEX for ztfsm

Array, size (*n**(*n*+1)/2). Contains the matrix *A* in RFP format.

b — REAL for stfsm

DOUBLE PRECISION for dtfsm

COMPLEX for ctfsm

DOUBLE COMPLEX for ztfsm

Array, size (1, *ldb***n*)

Before entry, the leading *m*-by-*n* part of the array *b* must contain the right-hand side matrix *B*.

ldb — INTEGER. Specifies the leading dimension of *b* as declared in the calling (sub)program. The value of *ldb* must be at least max(1, *m*).

Output Parameters

b — Overwritten by the solution matrix *X*.

?lansf

Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a symmetric matrix in RFP format.

Syntax

```
val = slansf(norm, transr, uplo, n, a, work)
val = dlansf(norm, transr, uplo, n, a, work)
```

Include Files

- mkl.fi

Description

T

The function ?lansf returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of an *n*-by-*n* real symmetric matrix *A* in the rectangular full packed (RFP) format .

Input Parameters

norm

CHARACTER*1. Specifies the value to be returned by the routine:

= 'M' or 'm': *val* = max(abs(A_{ij})), largest absolute value of the matrix *A*.

= '1' or 'O' or 'o': *val* = norm1(*A*), 1-norm of the matrix *A* (maximum column sum),

= 'I' or 'i': *val* = normI(*A*), infinity norm of the matrix *A* (maximum row sum),

= 'F', 'f', 'E' or 'e': *val* = normF(*A*), Frobenius norm of the matrix *A* (square root of sum of squares).

transr

CHARACTER*1.

Specifies whether the RFP format of matrix *A* is normal or transposed format.

If *transr* = 'N': RFP format is normal;

if *transr* = 'T': RFP format is transposed.

uplo

CHARACTER*1.

Specifies whether the RFP matrix *A* came from upper or lower triangular matrix.

If *uplo* = 'U': RFP matrix *A* came from an upper triangular matrix;

if *uplo* = 'L': RFP matrix *A* came from a lower triangular matrix.

n

INTEGER. The order of the matrix *A*. $n \geq 0$.

When *n* = 0, ?lansf is set to zero.

a

REAL for slansf

DOUBLE PRECISION for dlansf

Array, DIMENSION (*n**(*n*+1)/2).

The upper (if *uplo* = 'U') or lower (if *uplo* = 'L') part of the symetric matrix *A* stored in RFP format.

work

REAL for slansf.

DOUBLE PRECISION for dlansf.

Workspace array, DIMENSION(max(1,*lwork*)), where

lwork≥*n* when *norm* = 'I' or '1' or 'O'; otherwise, *work* is not referenced.

Output Parameters

val

REAL for slansf

DOUBLE PRECISION for dlansf

Value returned by the function.

?lanhf

Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a Hermitian matrix in RFP format.

Syntax

val = clanhf(*norm*, *transr*, *uplo*, *n*, *a*, *work*)

val = zlanhf(*norm*, *transr*, *uplo*, *n*, *a*, *work*)

Include Files

- mkl.fi

Description

The function ?lanhf returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of an *n*-by-*n* complex Hermitian matrix *A* in the rectangular full packed (RFP) format.

Input Parameters

norm

CHARACTER*1.

Specifies the value to be returned by the routine:

= 'M' or 'm': *val* = max(abs(A_{ij})), largest absolute value of the matrix *A*.

= '1' or 'O' or 'o': *val* = norm1(*A*), 1-norm of the matrix *A* (maximum column sum),

= 'I' or 'i': *val* = normI(*A*), infinity norm of the matrix *A* (maximum row sum),

= 'F', 'f', 'E' or 'e': *val* = normF(*A*), Frobenius norm of the matrix *A* (square root of sum of squares).

transr CHARACTER*1.

Specifies whether the RFP format of matrix *A* is normal or conjugate-transposed format.

If *transr* = 'N': RFP format is normal;

if *transr* = 'C': RFP format is conjugate-transposed.

uplo CHARACTER*1.

Specifies whether the RFP matrix *A* came from upper or lower triangular matrix.

If *uplo* = 'U': RFP matrix *A* came from an upper triangular matrix;

if *uplo* = 'L': RFP matrix *A* came from a lower triangular matrix.

n INTEGER. The order of the matrix *A*. $n \geq 0$.

When *n* = 0, ?lanhf is set to zero.

a COMPLEX for clanhf

DOUBLE COMPLEX for zlanhf

Array, DIMENSION ($n*(n+1)/2$).

The upper (if *uplo* = 'U') or lower (if *uplo* = 'L') part of the Hermitian matrix *A* stored in RFP format.

work COMPLEX for clanhf.

DOUBLE COMPLEX for zlanhf.

Workspace array, DIMENSION(max(1,*lwork*)), where

lwork≥*n* when *norm* = 'I' or '1' or 'O'; otherwise, *work* is not referenced.

Output Parameters

val COMPLEX for clanhf

DOUBLE COMPLEX for zlanhf

Value returned by the function.

?tfttp

Copies a triangular matrix from the rectangular full packed format (TF) to the standard packed format (TP) .

Syntax

```
call stfttp( transr, uplo, n, arf, ap, info )
call dtfttp( transr, uplo, n, arf, ap, info )
call ctfttp( transr, uplo, n, arf, ap, info )
call ztfttp( transr, uplo, n, arf, ap, info )
```

Include Files

- mkl.fi

Description

The routine copies a triangular matrix *A* from the Rectangular Full Packed (RFP) format to the standard packed format. For the description of the RFP format, see Matrix Storage Schemes.

Input Parameters

transr CHARACTER*1.

= 'N': *arf* is in the Normal format,

= 'T': *arf* is in the Transpose format (for stfttp and dtfttp),

= 'C': *arf* is in the Conjugate-transpose format (for ctfttp and ztfttp).

uplo CHARACTER*1.

Specifies whether *A* is upper or lower triangular:

= 'U': A is upper triangular,

= 'L': A is lower triangular.

n INTEGER. The order of the matrix *A*. $n \geq 0$.

arf REAL for stfttp,

DOUBLE PRECISION for dtfttp,

COMPLEX for ctfttp,

DOUBLE COMPLEX for ztfttp.

Array, size at least *max* (1, $n*(n+1)/2$).

On entry, the upper or lower triangular matrix *A* stored in the RFP format.

Output Parameters

ap REAL for stfttp,

DOUBLE PRECISION for dtfttp,

COMPLEX for ctfttp,

DOUBLE COMPLEX for ztfttp.

Array, size at least *max* (1, $n*(n+1)/2$).

On exit, the upper or lower triangular matrix *A*, packed columnwise in a linear array.

The *j*-th column of *A* is stored in the array *ap* as follows:

if *uplo* = 'U', $ap(i + (j-1)*j/2) = A(i,j)$ for $1 \leq i \leq j$,

if *uplo* = 'L', $ap(i + (j-1)*(2n-j)/2) = A(i,j)$ for $j \leq i \leq n$.

info INTEGER. If $info = 0$, the execution is successful.

If $info < 0$, the *i*-th parameter had an illegal value.

If *info* = -1011, memory allocation error occurred.

?tfttr

Copies a triangular matrix from the rectangular full packed format (TF) to the standard full format (TR) .

Syntax

```
call stfttr( transr, uplo, n, arf, a, lda, info )
call dtfttr( transr, uplo, n, arf, a, lda, info )
call ctfttr( transr, uplo, n, arf, a, lda, info )
call ztfttr( transr, uplo, n, arf, a, lda, info )
```

Include Files

- mkl.fi

Description

The routine copies a triangular matrix *A* from the Rectangular Full Packed (RFP) format to the standard full format. For the description of the RFP format, see Matrix Storage Schemes.

Input Parameters

transr — CHARACTER*1.

= 'N': *arf* is in the Normal format,

= 'T': *arf* is in the Transpose format (for stfttr and dtfttr),

= 'C': *arf* is in the Conjugate-transpose format (for ctfttr and ztfttr).

uplo — CHARACTER*1.

Specifies whether *A* is upper or lower triangular:

= 'U': A is upper triangular,

= 'L': A is lower triangular.

n — INTEGER. The order of the matrices *arf* and *a*. $n \geq 0$.

arf — REAL for stfttr,

DOUBLE PRECISION for dtfttr,

COMPLEX for ctfttr,

DOUBLE COMPLEX for ztfttr.

Array, size at least *max* (1, $n*(n+1)/2$).

On entry, the upper or lower triangular matrix *A* stored in the RFP format.

lda — INTEGER. The leading dimension of the array *a*. $lda \geq max(1,n)$.

Output Parameters

a	REAL for stfttr, DOUBLE PRECISION for dtfttr, COMPLEX for ctfttr, DOUBLE COMPLEX for ztfttr. Array, size (*lda, **). On exit, the triangular matrix *A*. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of the array *a* contains the upper triangular matrix, and the strictly lower triangular part of *a* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of the array *a* contains the lower triangular matrix, and the strictly upper triangular part of *a* is not referenced.
info	INTEGER. If *info* = 0, the execution is successful. If *info* < 0, the *i*-th parameter had an illegal value. If *info* = –1011, memory allocation error occurred.

?tplqt2

?tplqt2 *computes an LQ factorization of a real or complex "triangular-pentagonal" matrix, which is composed of a triangular block and a pentagonal using the compact WY representation for Q.*

```
call stplqt2(m, n, l, a, lda, b, ldb, t, ldt, info)
call dtplqt2(m, n, l, a, lda, b, ldb, t, ldt, info)
call ctplqt2(m, n, l, a, lda, b, ldb, t, ldt, info)
call ztplqt2(m, n, l, a, lda, b, ldb, t, ldt, info)
```

Description

?tplqt2 computes a LQ a factorization of a real or complex "triangular-pentagonal" matrix *C*, which is composed of a triangular block *A* and pentagonal block *B*, using the compact WY representation for *Q*.

The input matrix *C* is an *m*-by-(*m*+*n*) matrix:

C = [*A*] [*B*]

where *A* is a lower triangular *m*-by-*m* matrix, and *B* is an *m*-by-*n* pentagonal matrix consisting of an *m*-by-(*n*-*l*) rectangular matrix *B1* to the left of an *m*-by-*l* lower trapezoidal matrix *B2*:

[*B*] = [*B1*] [*B2*]

[*B1*] <- *m*-by-(*n*-*l*) rectangular

[*B2*] <- *m*-by-*l* lower trapezoidal.

The lower trapezoidal matrix *B2* consists of the first *l* columns of an *n*-by-*n* lower triangular matrix, where 0 ≤*l*≤ min(*m*,*n*). If *l*=0, *b* is rectangular *m*-by-*n*; if *m*=*l*=*n*, *b* is lower triangular.

The matrix *W* stores the elementary reflectors *H*(*i*) in the *i*-th row above the diagonal (of *A*) in the *m*-by-(*m* +*n*) input matrix *C*:

[*C*] = [*A*] [*B*]

[*A*] <- lower triangular *m*-by-*m*

[*B*] <- *m*-by-*n* pentagonal

so that *W* can be represented as

[*W*] = [*I*] [*V*]

[*I*] <- *m*-by-*m* identity matrix

[*V*] <- *m*-by-*n*, same form as *B*.

Thus, all of information needed for *W* is contained on exit in the array *b*, called *V* in the preceding. Note that *V* has the same form as *B*; that is,

[*V*] = [*V1*] [*V2*]

[*V1*] <- *m*-by-(*n*-*l*) rectangular

[*V2*] <- *m*-by-*l* lower trapezoidal.

The rows of *V* represent the vectors which define the *H*(*i*) elementary reflectors .

The (*m*+*n*)-by-(*m*+*n*) block reflector *H* is then given by $H = I - W^H * T * W$ where W^H is the conjugate transpose of *W* and *T* is the upper triangular factor of the block reflector.

Input Parameters

m	INTEGER. The total number of rows of the matrix *B*. *m*≥ 0.
n	INTEGER. The number of columns of the matrix *B*, and the order of the triangular matrix *A*. *n*≥ 0.
l	INTEGER. The number of rows of the lower trapezoidal part of *B*. min(*m*, *n*) ≥*l*≥ 0.
a	REAL for stplqt2 DOUBLE PRECISION for dtplqt2 COMPLEX for ctplqt2 COMPLEX*16 for ztplqt2 Array of size (*lda*,*m*). On entry, the lower triangular *m*-by-*m* matrix *A*.
lda	INTEGER. The leading dimension of the array *a*. *lda*≥ max(1, *m*).
b	REAL for stplqt2 DOUBLE PRECISION for dtplqt2 COMPLEX for ctplqt2 COMPLEX*16 for ztplqt2 Array of size (*ldb*,*n*). On entry, the pentagonal *m*-by-*n* matrix *B*. The first *n*-*l* columns are rectangular, and the last *l* columns are lower trapezoidal.
ldb	INTEGER. The leading dimension of the array *b*. *ldb*≥ max(1, *m*).
ldt	INTEGER. The leading dimension of the array *t*. *ldt*≥ max(1, *m*)

Output Parameters

a	On exit, the elements on and below the diagonal of the array contain the lower triangular matrix *L*.

b	On exit, *b* contains the pentagonal matrix *V*.
t	REAL for stplqt2 DOUBLE PRECISION for dtplqt2 COMPLEX for ctplqt2 COMPLEX*16 for ztplqt2 Array of size (*ldt*,*m*). The *n*-by-*n* upper triangular factor *T* of the block reflector.
info	INTEGER. *info* = 0: successful exit. *info* < 0: if *info* = -*i*, the *i*-th argument had an illegal value.

?tpqrt2

Computes a QR factorization of a real or complex "triangular-pentagonal" matrix, which is composed of a triangular block and a pentagonal block, using the compact WY representation for Q.

Syntax

```
call stpqrt2(m, n, l, a, lda, b, ldb, t, ldt, info)
call dtpqrt2(m, n, l, a, lda, b, ldb, t, ldt, info)
call ctpqrt2(m, n, l, a, lda, b, ldb, t, ldt, info)
call ztpqrt2(m, n, l, a, lda, b, ldb, t, ldt, info)
call tpqrt2(a, b, t [, info])
```

Include Files

- mkl.fi, lapack.f90

Description

The input matrix *C* is an (*n*+*m*)-by-*n* matrix

$$C = \begin{bmatrix} A \\ B \end{bmatrix} \begin{matrix} \leftarrow n \times n \text{ upper triangular} \\ \leftarrow m \times n \text{ pentagonal} \end{matrix}$$

where *A* is an *n*-by-*n* upper triangular matrix, and *B* is an *m*-by-*n* pentagonal matrix consisting of an (*m*-*l*)-by-*n* rectangular matrix *B1* on top of an *l*-by-*n* upper trapezoidal matrix *B2*:

$$B = \begin{bmatrix} B1 \\ B2 \end{bmatrix} \begin{matrix} \leftarrow (m-l)\times n \text{ rectangular} \\ \leftarrow l \times n \text{ upper trapezoidal} \end{matrix}$$

The upper trapezoidal matrix *B2* consists of the first l rows of an n-by-n upper triangular matrix, where $0 \le l \le \min(m,n)$. If $l=0$, *B* is an m-by-n rectangular matrix. If $m=l=n$, *B* is upper triangular. The matrix *W* contains the elementary reflectors *H(i)* in the *i*th column below the diagonal (of *A*) in the $(n+m)$-by-n input matrix *C* so that *W* can be represented as

$$W = \begin{bmatrix} I \\ V \end{bmatrix} \begin{matrix} \leftarrow n \times n \text{ identity} \\ \leftarrow m \times n \text{ pentagonal} \end{matrix}$$

Thus, *V* contains all of the information needed for *W*, and is returned in array b.

NOTE

V has the same form as *B*:

$$V = \begin{bmatrix} V1 \\ V2 \end{bmatrix} \begin{matrix} \leftarrow (m-l)\times n \text{ rectangular} \\ \leftarrow l \times n \text{ upper trapezoidal} \end{matrix}$$

The columns of *V* represent the vectors which define the *H(i)*s.

The $(m+n)$-by-$(m+n)$ block reflector *H* is then given by

$H = I - W*T*W^T$ for real flavors, and

$H = I - W*T*W^H$ for complex flavors

where W^T is the transpose of *W*, W^H is the conjugate transpose of *W*, and *T* is the upper triangular factor of the block reflector.

Input Parameters

m	INTEGER. The total number of rows in the matrix *B* ($m \ge 0$).
n	INTEGER. The number of columns in *B* and the order of the triangular matrix *A* ($n \ge 0$).
l	INTEGER. The number of rows of the upper trapezoidal part of *B* ($\min(m, n) \ge l \ge 0$).

a, *b*	REAL for stpqrt2 DOUBLE PRECISION for dtpqrt2 COMPLEX for ctpqrt2 COMPLEX*16 for ztpqrt2. Arrays: *a*, size (*lda*, *n*) contains the *n*-by-*n* upper triangular matrix *A*. *b*, size (*ldb*, *n*), the pentagonal *m*-by-*n* matrix *B*. The first (*m*-*l*) rows contain the rectangular *B1* matrix, and the next *l* rows contain the upper trapezoidal *B2* matrix.
lda	INTEGER. The leading dimension of *a*; at least max(1, *n*).
ldb	INTEGER. The leading dimension of *b*; at least max(1, *m*).
ldt	INTEGER. The leading dimension of *t*; at least max(1, *n*).

Output Parameters

a	The elements on and above the diagonal of the array contain the upper triangular matrix *R*.
b	The pentagonal matrix *V*.
t	REAL for stpqrt2 DOUBLE PRECISION for dtpqrt2 COMPLEX for ctpqrt2 COMPLEX*16 for ztpqrt2. Array, size (*ldt*, *n*). The upper *n*-by-*n* upper triangular factor *T* of the block reflector.
info	INTEGER. If *info* = 0, the execution is successful. If *info* < 0 and *info* = -*i*, the *i*th argument had an illegal value. If *info* = -1011, memory allocation error occurred.

?tprfb

Applies a real or complex "triangular-pentagonal" blocked reflector to a real or complex matrix, which is composed of two blocks.

Syntax

```
call stprfb(side, trans, direct, storev, m, n, k, l, v, ldv, t, ldt, a, lda, b, ldb, work, ldwork)
call dtprfb(side, trans, direct, storev, m, n, k, l, v, ldv, t, ldt, a, lda, b, ldb, work, ldwork)
call ctprfb(side, trans, direct, storev, m, n, k, l, v, ldv, t, ldt, a, lda, b, ldb, work, ldwork)
```

```
call ztprfb(side, trans, direct, storev, m, n, k, l, v, ldv, t, ldt, a, lda, b, ldb,
work, ldwork)
```

```
call tprfb(t, v, a, b[, direct][, storev][, side][, trans])
```

Include Files

- mkl.fi, lapack.f90

Description

The ?tprfb routine applies a real or complex "triangular-pentagonal" block reflector H, H^T, or H^H from either the left or the right to a real or complex matrix C, which is composed of two blocks A and B.

The block B is m-by-n. If *side* = 'R', A is m-by-k, and if *side* = 'L', A is of size k-by-n.

$$direct = \text{'F'} \quad direct = \text{'B'}$$

$$side = \text{'R'} \quad C = \begin{bmatrix} A & B \end{bmatrix} \quad C = \begin{bmatrix} B & A \end{bmatrix}$$

$$side = \text{'L'} \quad C = \begin{bmatrix} A \\ B \end{bmatrix} \quad C = \begin{bmatrix} B \\ A \end{bmatrix}$$

The pentagonal matrix V is composed of a rectangular block $V1$ and a trapezoidal block $V2$. The size of the trapezoidal block is determined by the parameter l, where $0 \le l \le k$. if $l=k$, the $V2$ block of V is triangular; if $l=0$, there is no trapezoidal block, thus $V = V1$ is rectangular.

	direct='F'	*direct*='B'
storev='C'	$V = \begin{bmatrix} V1 \\ V2 \end{bmatrix}$ $V2$ is upper trapezoidal (first l rows of k-by-k upper triangular)	$V = \begin{bmatrix} V2 \\ V1 \end{bmatrix}$ $V2$ is lower trapezoidal (last l rows of k-by-k lower triangular matrix)
storev='R'	$V = \begin{bmatrix} V1 & V2 \end{bmatrix}$ $V2$ is lower trapezoidal (first l columns of k-by-k lower triangular matrix)	$V = \begin{bmatrix} V2 & V1 \end{bmatrix}$ $V2$ is upper trapezoidal (last l columns of k-by-k upper triangular matrix)

	side='L'	*side*='R'

storev='C'	*V* is *m*-by-*k* *V2* is *l*-by-*k*	*V* is *n*-by-*k* *V2* is *l*-by-*k*
storev='R'	*V* is *k*-by-*m* *V2* is *k*-by-*l*	*V* is *k*-by-*n* *V2* is *k*-by-*l*

Input Parameters

side CHARACTER*1.

= 'L': apply *H*, H^T, or H^H from the left,

= 'R': apply *H*, H^T, or H^H from the right.

trans CHARACTER*1.

= 'N': apply *H* (no transpose),

= 'T': apply H^T (transpose),

= 'C': apply H^H (conjugate transpose).

direct CHARACTER*1.

Indicates how *H* is formed from a product of elementary reflectors:

= 'F': *H* = *H*(1) *H*(2) . . . *H*(*k*) (Forward),

= 'B': *H* = *H*(*k*) . . . *H*(2) *H*(1) (Backward).

storev CHARACTER*1.

Indicates how the vectors that define the elementary reflectors are stored:

= 'C': Columns,

= 'R': Rows.

m INTEGER. The total number of rows in the matrix *B* (*m* ≥ 0).

n INTEGER. The number of columns in *B* (*n* ≥ 0).

k INTEGER. The order of the matrix *T*, which is the number of elementary reflectors whose product defines the block reflector. (*k* ≥ 0)

l INTEGER. The order of the trapezoidal part of *V*. (*k* ≥ *l* ≥ 0).

v REAL for stprfb

DOUBLE PRECISION for dtprfb

COMPLEX for ctprfb

COMPLEX*16 for ztprfb.

DIMENSION (*ldv*, *k*) if *storev* = 'C',

DIMENSION (*ldv*, *m*) if *storev* = 'R' and *side* = 'L',

DIMENSION (*ldv*, *n*) if *storev* = 'R' and *side* = 'R'.

The pentagonal matrix *V*, which contains the elementary reflectors *H*(1), *H*(2), ..., *H*(*k*).

ldv INTEGER. The leading dimension of the array *v*.

If *storev* = 'C' and *side* = 'L', at least max(1, *m*).

If *storev* = 'C' and *side* = 'R', at least max(1, *n*).

If *storev* = 'R' , at least *k*.

t REAL for stprfb

DOUBLE PRECISION for dtprfb

COMPLEX for ctprfb

COMPLEX*16 for ztprfb.

Array size (*ldt*, *k*). The triangular *k*-by-*k* matrix *T* in the representation of the block reflector.

ldt INTEGER. The leading dimension of the array *t* (*ldt* ≥ *k*).

a REAL for stprfb

DOUBLE PRECISION for dtprfb

COMPLEX for ctprfb

COMPLEX*16 for ztprfb.

DIMENSION (*lda*, *n*) if *side* = 'L',

DIMENSION (*lda*, *k*) if *side* = 'R'.

The *k*-by-*n* or *m*-by-*k* matrix *A*.

lda INTEGER. The leading dimension of the array *a*.

If *side* = 'L', at least max(1, *k*).

If *side* = 'R', at least max(1, *m*).

b REAL for stprfb

DOUBLE PRECISION for dtprfb

COMPLEX for ctprfb

COMPLEX*16 for ztprfb.

Array size (*ldb*, *n*), the *m*-by-*n* matrix *B*.

ldb INTEGER. The leading dimension of the array *b* (*ldb* ≥ max(1, *m*)).

work REAL for stprfb

DOUBLE PRECISION for dtprfb

COMPLEX for ctprfb

COMPLEX*16 for ztprfb.

DIMENSION (*ldwork*, *n*) if *side* = 'L',

DIMENSION (*ldwork*, *k*) if *side* = 'R'.

Workspace array.

ldwork INTEGER. The leading dimension of the array *work*.

If *side* = 'L', at least *k*.

If *side* = 'R', at least *m*.

Output Parameters

a — Contains the corresponding block of $H*C$, H^T*C, H^H*C, $C*H$, $C*H^T$, or $C*H^H$.

b — Contains the corresponding block of $H*C$, H^T*C, H^H*C, $C*H$, $C*H^T$, or $C*H^H$.

info — INTEGER. If *info* = 0, the execution is successful.

If *info* < 0, the *i*-th parameter had an illegal value.

If *info* = -1011, memory allocation error occurred.

?tpttf

Copies a triangular matrix from the standard packed format (TP) to the rectangular full packed format (TF).

Syntax

```
call stpttf( transr, uplo, n, ap, arf, info )
call dtpttf( transr, uplo, n, ap, arf, info )
call ctpttf( transr, uplo, n, ap, arf, info )
call ztpttf( transr, uplo, n, ap, arf, info )
```

Include Files

- mkl.fi

Description

The routine copies a triangular matrix *A* from the standard packed format to the Rectangular Full Packed (RFP) format. For the description of the RFP format, see Matrix Storage Schemes.

Input Parameters

transr — CHARACTER*1.

= 'N': *arf* must be in the Normal format,

= 'T': *arf* must be in the Transpose format (for stpttf and dtpttf),

= 'C': *arf* must be in the Conjugate-transpose format (for ctpttf and ztpttf).

uplo — CHARACTER*1.

Specifies whether *A* is upper or lower triangular:

= 'U': A is upper triangular,

= 'L': A is lower triangular.

n — INTEGER. The order of the matrix *A*. $n \geq 0$.

ap — REAL for stpttf,

DOUBLE PRECISION for dtpttf,

COMPLEX for ctpttf,

DOUBLE COMPLEX for ztpttf.

Array, size at least max (1, *n**(*n*+1)/2).

On entry, the upper or lower triangular matrix *A*, packed columnwise in a linear array.

The *j*-th column of *A* is stored in the array *ap* as follows:

if *uplo* = 'U', *ap(i + (j-1)*j/2) = A(i,j)* for $1 \le i \le j$,

if *uplo* = 'L', *ap(i + (j-1)*(2n-j)/2) = A(i,j)* for $j \le i \le n$.

Output Parameters

arf

REAL for stpttf,

DOUBLE PRECISION for dtpttf,

COMPLEX for ctfttp,

DOUBLE COMPLEX for ztpttf.

Array, size at least *max* (1, *n**(*n*+1)/2).

On exit, the upper or lower triangular matrix *A* stored in the RFP format.

info

INTEGER.

=0: successful exit,

< 0: if *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = -1011, memory allocation error occurred.

?tpttr

Copies a triangular matrix from the standard packed format (TP) to the standard full format (TR) .

Syntax

```
call stpttr( uplo, n, ap, a, lda, info )
call dtpttr( uplo, n, ap, a, lda, info )
call ctpttr( uplo, n, ap, a, lda, info )
call ztpttr( uplo, n, ap, a, lda, info )
```

Include Files

- mkl.fi

Description

The routine copies a triangular matrix *A* from the standard packed format to the standard full format.

Input Parameters

uplo — CHARACTER*1.

Specifies whether *A* is upper or lower triangular:

= 'U': A is upper triangular,

= 'L': A is lower triangular.

n — INTEGER. The order of the matrices *ap* and *a*. $n \geq 0$.

ap — REAL for stpttr,

DOUBLE PRECISION for dtpttr,

COMPLEX for ctpttr,

DOUBLE COMPLEX for ztpttr.

On entry, the upper or lower triangular matrix *A*, packed columnwise in a linear array. The *j*-th column of *A* is stored in the array *ap* as follows:

if *uplo* = 'U', $ap(i + (j-1)*j/2) = A(i,j)$ for $1 \leq i \leq j$,

if *uplo* = 'L', $ap(i + (j-1)*(2n-j)/2) = A(i,j)$ for $j \leq i \leq n$.

lda — INTEGER. The leading dimension of the array *a*. $lda \geq max(1,n)$.

Output Parameters

a — REAL for stpttr,

DOUBLE PRECISION for dtpttr,

COMPLEX for ctpttr,

DOUBLE COMPLEX for ztpttr.

Array, size (*lda, **).

On exit, the triangular matrix *A*. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of the array *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *a* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of the array *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *a* is not referenced.

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = -1011, memory allocation error occurred.

?trttf

Copies a triangular matrix from the standard full format (TR) to the rectangular full packed format (TF).

Syntax

```
call strttf( transr, uplo, n, a, lda, arf, info )
call dtrttf( transr, uplo, n, a, lda, arf, info )
```

```
call ctrttf( transr, uplo, n, a, lda, arf, info )
call ztrttf( transr, uplo, n, a, lda, arf, info )
```

Include Files

Description

The routine copies a triangular matrix *A* from the standard full format to the standard packed format.

Input Parameters

uplo — CHARACTER*1.

Specifies whether *A* is upper or lower triangular:

= 'U': A is upper triangular,

= 'L': A is lower triangular.

n — INTEGER. The order of the matrix *A*, $n \geq 0$.

a — REAL for strttp,

DOUBLE PRECISION for dtrttp,

COMPLEX for ctrttp,

DOUBLE COMPLEX for ztrttp.

Array, size (*lda*, *n*).

On entry, the triangular matrix *A*. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of the array *a* contains the upper triangular matrix, and the strictly lower triangular part of *a* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of the array *a* contains the lower triangular matrix, and the strictly upper triangular part of *a* is not referenced.

lda — INTEGER. The leading dimension of the array *a*. *lda* ≥ *max*(1,*n*).

Output Parameters

ap	`REAL` for `strttp`, `DOUBLE PRECISION` for `dtrttp`, `COMPLEX` for `ctrttp`, `DOUBLE COMPLEX` for `ztrttp`. Array, size at least *max* (1, *n**(*n*+1)/2). On exit, the upper or lower triangular matrix *A*, packed columnwise in a linear array. The *j*-th column of *A* is stored in the array *ap* as follows: if *uplo* = 'U', *ap(i + (j-1)*j/2) = A(i,j)* for $1 \le i \le j$, if *uplo* = 'L', *ap(i + (j-1)*(2n-j)/2) = A(i,j)* for $j \le i \le n$.
info	`INTEGER`. If *info* = 0, the execution is successful. If *info* < 0, the *i*-th parameter had an illegal value. If *info* = -1011, memory allocation error occurred.

?pstf2

Computes the Cholesky factorization with complete pivoting of a real symmetric or complex Hermitian positive semi-definite matrix.

Syntax

```
call spstf2( uplo, n, a, lda, piv, rank, tol, work, info )
call dpstf2( uplo, n, a, lda, piv, rank, tol, work, info )
call cpstf2( uplo, n, a, lda, piv, rank, tol, work, info )
call zpstf2( uplo, n, a, lda, piv, rank, tol, work, info )
```

Include Files

- `mkl.fi`

Description

The real flavors `spstf2` and `dpstf2` compute the Cholesky factorization with complete pivoting of a real symmetric positive semi-definite matrix *A*. The complex flavors `cpstf2` and `zpstf2` compute the Cholesky factorization with complete pivoting of a complex Hermitian positive semi-definite matrix *A*. The factorization has the form:

$P^T * A * P = U^T * U$, if *uplo* = 'U' for real flavors,

$P^T * A * P = U^H * U$, if *uplo* = 'U' for complex flavors,

$P^T * A * P = L * L^T$, if *uplo* = 'L' for real flavors,

$P^T * A * P = L * L^H$, if *uplo* = 'L' for complex flavors,

where *U* is an upper triangular matrix and *L* is lower triangular, and *P* is stored as vector *piv*.

This algorithm does not check that *A* is positive semi-definite. This version of the algorithm calls level 2 BLAS.

Input Parameters

uplo — CHARACTER*1.

Specifies whether the upper or lower triangular part of the symmetric or Hermitian matrix *A* is stored:

= 'U': Upper triangular,

= 'L': Lower triangular.

n — INTEGER. The order of the matrix *A*. *n* ≥ 0.

a — REAL for spstf2,

DOUBLE PRECISION for dpstf2,

COMPLEX for cpstf2,

DOUBLE COMPLEX for zpstf2.

Array, DIMENSION (*lda, **).

On entry, the symmetric matrix *A*. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of the array *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *a* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of the array *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *a* is not referenced.

tol — REAL for spstf2 and cpstf2,

DOUBLE PRECISION for dpstf2 and zpstf2.

A user-defined tolerance.

If *tol* < 0, *n*ulp*max(A(k,k))* will be used (*ulp* is the Unit in the Last Place, or Unit of Least Precision). The algorithm terminates at the (*k* - 1)-st step if the pivot is not greater than *tol*.

lda — INTEGER. The leading dimension of the matrix *A*. *lda* ≥ *max*(1,*n*).

work — REAL for spstf2 and cpstf2,

DOUBLE PRECISION for dpstf2 and zpstf2.

Workspace array, DIMENSION at least *max* (1, *2*n).*

Output Parameters

piv — INTEGER. Array. DIMENSION at least *max (1,n)*.

piv is such that the non-zero entries are *P* (*piv* (*k*), *k*) = 1.

a — On exit, if *info* = 0, the factor U or L from the Cholesky factorization stored the same way as the matrix *A* is stored on entry.

rank — INTEGER.

The rank of *A*, determined by the number of steps the algorithm completed.

info — INTEGER.

< 0: if *info* = -*k*, the *k*-th parameter had an illegal value,

=0: the algorithm completed successfully,

> 0: the matrix *A* is rank-deficient with the computed rank, returned in *rank*, or indefinite.

dlat2s

Converts a double-precision triangular matrix to a single-precision triangular matrix.

Syntax

```
call dlat2s( uplo, n, a, lda, sa, ldsa, info )
```

Include Files

- mkl.fi

Description

This routine converts a double-precision triangular matrix *A* to a single-precision triangular matrix *SA*. dlat2s checks that all the elements of *A* are between *-RMAX* and *RMAX*, where *RMAX* is the overflow for the single-precision arithmetic. If this condition is not met, the conversion is aborted and a flag is raised. The routine does no parameter checking.

Input Parameters

uplo CHARACTER*1.

Specifies whether the matrix *A* is upper or lower triangular:

= 'U': *A* is upper triangular,

= 'L': *A* is lower triangular.

n INTEGER. The number of rows and columns of the matrix *A*. $n \geq 0$.

a DOUBLE PRECISION.

Array, DIMENSION (*lda, **).

On entry, the *n*-by-*n* triangular matrix *A*.

lda INTEGER. The leading dimension of the array *a*. $lda \geq max(1,n)$.

ldsa INTEGER. The leading dimension of the array *sa*. $ldsa \geq max(1,n)$.

Output Parameters

sa REAL.

Array, DIMENSION (*ldsa, **).

Only the part of *sa* determined by *uplo* is referenced. On exit,

- if *info* = 0, the *n*-by-*n* triangular matrix *SA*,
- if *info* > 0, the content of the part of *sa* determined by *uplo* is unspecified.

info INTEGER.

=0: successful exit,

> 0: an element of the matrix *A* is greater than the single-precision overflow threshold; in this case, the content of the part of *sa* determined by *uplo* is unspecified on exit.

zlat2c

Converts a double complex triangular matrix to a complex triangular matrix.

Syntax

```
call zlat2c( uplo, n, a, lda, sa, ldsa, info )
```

Include Files

- mkl.fi

Description

This routine is declared in mkl_lapack.fi.

The routine converts a DOUBLE COMPLEX triangular matrix *A* to a COMPLEX triangular matrix *SA*. zlat2c checks that the real and complex parts of all the elements of *A* are between *-RMAX* and *RMAX*, where *RMAX* is the overflow for the single-precision arithmetic. If this condition is not met, the conversion is aborted and a flag is raised. The routine does no parameter checking.

Input Parameters

uplo

CHARACTER*1.

Specifies whether the matrix *A* is upper or lower triangular:

= 'U': *A* is upper triangular,

= 'L': *A* is lower triangular.

n

INTEGER. The number of rows and columns in the matrix *A*. $n \geq 0$.

a

DOUBLE COMPLEX.

Array, DIMENSION (*lda, **).

On entry, the *n*-by-*n* triangular matrix *A*.

lda

INTEGER. The leading dimension of the array *a*. $lda \geq max(1,n)$.

ldsa

INTEGER. The leading dimension of the array *sa*. $ldsa \geq max(1,n)$.

Output Parameters

sa

COMPLEX.

Array, DIMENSION (*ldsa, **).

Only the part of *sa* determined by *uplo* is referenced. On exit,

- if *info* = 0, the *n*-by-*n* triangular matrix *sa*,
- if *info* > 0, the content of the part of *sa* determined by *uplo* is unspecified.

info

INTEGER.

=0: successful exit,

> 0: the real or complex part of an element of the matrix *A* is greater than the single-precision overflow threshold; in this case, the content of the part of *sa* determined by *uplo* is unspecified on exit.

?lacp2

Copies all or part of a real two-dimensional array to a complex array.

Syntax

```
call clacp2( uplo, m, n, a, lda, b, ldb )
call zlacp2( uplo, m, n, a, lda, b, ldb )
```

Include Files

- mkl.fi

Description

The routine copies all or part of a real matrix *A* to another matrix *B*.

Input Parameters

uplo — CHARACTER*1.

Specifies the part of the matrix *A* to be copied to *B*.

If *uplo* = 'U', the upper triangular part of *A*;

if *uplo* = 'L', the lower triangular part of *A*.

Otherwise, all of the matrix *A* is copied.

m — INTEGER. The number of rows in the matrix *A* (*m*≥ 0).

n — INTEGER. The number of columns in *A* (*n*≥ 0).

a — REAL for clacp2

DOUBLE PRECISION for zlacp2

Array, size at least (*lda*, *n*), contains the *m*-by-*n* matrix *A*.

If *uplo* = 'U', only the upper triangle or trapezoid is accessed; if *uplo* = 'L', only the lower triangle or trapezoid is accessed.

lda — INTEGER. The leading dimension of *a*; *lda*≥ max(1, *m*) .

ldb — INTEGER. The leading dimension of the output array *b*; *ldb*≥ max(1, *m*).

Output Parameters

b — COMPLEX for clacp2

DOUBLE COMPLEX for zlacp2.

Array, size (*ldb*, *n*).

On exit, `B = A` in the locations specified by *uplo*.

info — `INTEGER`. If `info = 0`, the execution is successful.

If `info < 0`, the *i*-th parameter had an illegal value.

If `info = -1011`, memory allocation error occurred.

?la_gbamv

Performs a matrix-vector operation to calculate error bounds.

Syntax

```
call sla_gbamv(trans, m, n, kl, ku, alpha, ab, ldab, x, incx, beta, y, incy)
call dla_gbamv(trans, m, n, kl, ku, alpha, ab, ldab, x, incx, beta, y, incy)
call cla_gbamv(trans, m, n, kl, ku, alpha, ab, ldab, x, incx, beta, y, incy)
call zla_gbamv(trans, m, n, kl, ku, alpha, ab, ldab, x, incx, beta, y, incy)
```

Include Files

- `mkl.fi`

Description

The `?la_gbamv` function performs one of the matrix-vector operations defined as

`y := alpha*abs(A)*abs(x) + beta*abs(y),`

or

$y := alpha*abs(A)^T*abs(x) + beta*abs(y)$,

where:

alpha and *beta* are scalars,

x and *y* are vectors,

A is an *m*-by-*n* matrix, with *kl* sub-diagonals and *ku* super-diagonals.

This function is primarily used in calculating error bounds. To protect against underflow during evaluation, the function perturbs components in the resulting vector away from zero by `(n + 1)` times the underflow threshold. To prevent unnecessarily large errors for block structure embedded in general matrices, the function does not perturb *symbolically* zero components. A zero entry is considered *symbolic* if all multiplications involved in computing that entry have at least one zero multiplicand.

Input Parameters

trans — `INTEGER`. Specifies the operation to be performed:

If `trans = 'BLAS_NO_TRANS'`, then `y := alpha*abs(A)*abs(x) + beta*abs(y)`

If `trans = 'BLAS_TRANS'`, then $y := alpha*abs(A^T)*abs(x) + beta*abs(y)$

If `trans = 'BLAS_CONJ_TRANS'`, then $y := alpha*abs(A^T)*abs(x) + beta*abs(y)$

The parameter is unchanged on exit.

m INTEGER. Specifies the number of rows of the matrix *A*.

The value of *m* must be at least zero. Unchanged on exit.

n INTEGER. Specifies the number of columns of the matrix *A*.

The value of *n* must be at least zero. Unchanged on exit.

kl INTEGER. Specifies the number of sub-diagonals within the band of *A*.

kl≥ 0.

ku INTEGER. Specifies the number of super-diagonals within the band of *A*.

ku≥ 0.

alpha REAL for sla_gbamv and cla_gbamv

DOUBLE PRECISION for dla_gbamv and zla_gbamv

Specifies the scalar *alpha*. Unchanges on exit.

ab REAL for sla_gbamv

DOUBLE PRECISION for dla_gbamv

COMPLEX for cla_gbamv

DOUBLE COMPLEX for zla_gbamv

Array, DIMENSION(*ldab*, *).

Before entry, the leading *m*-by-*n* part of the array *ab* must contain the matrix of coefficients. The second dimension of *ab* must be at least max(1,*n*). Unchanged on exit.

ldab INTEGER. Specifies the leading dimension of *ab* as declared in the calling (sub)program. The value of *ldab* must be at least max(1, *m*). Unchanged on exit.

x REAL for sla_gbamv

DOUBLE PRECISION for dla_gbamv

COMPLEX for cla_gbamv

DOUBLE COMPLEX for zla_gbamv

Array, DIMENSION

(1 + (*n* - 1)*abs(*incx*)) when *trans* = 'N' or 'n'

and at least

(1 + (*m* - 1)*abs(*incx*)) otherwise.

Before entry, the incremented array *x* must contain the vector *x*.

incx INTEGER. Specifies the increment for the elements of *x*. *incx* must not be zero.

beta REAL for sla_gbamv and cla_gbamv

DOUBLE PRECISION for dla_gbamv and zla_gbamv

Specifies the scalar *beta*. When *beta* is zero, you do not need to set *y* on input.

y	REAL for sla_gbamv and cla_gbamv DOUBLE PRECISION for dla_gbamv and zla_gbamv Array, DIMENSION at least (1 +(*m* - 1)*abs(*incy*)) when *trans* = 'N' or 'n' and at least (1 +(*n* - 1)*abs(*incy*)) otherwise. Before entry with *beta* non-zero, the incremented array *y* must contain the vector *y*.
incy	INTEGER. Specifies the increment for the elements of *y*. The value of *incy* must not be zero. Unchanged on exit.

Output Parameters

y	Updated vector *y*.

?la_gbrcond

Estimates the Skeel condition number for a general banded matrix.

Syntax

```
call sla_gbrcond( trans, n, kl, ku, ab, ldab, afb, ldafb, ipiv, cmode, c, info, work, iwork )
call dla_gbrcond( trans, n, kl, ku, ab, ldab, afb, ldafb, ipiv, cmode, c, info, work, iwork )
```

Include Files

- mkl.fi

Description

The function estimates the Skeel condition number of

op(*A*) * op2(*C*)

where

the *cmode* parameter determines op2 as follows:

cmode **Value**	**op2(C)**
1	*C*
0	*I*
-1	inv(*C*)

The Skeel condition number

cond(*A*) = norminf(|inv(*A*)||*A*|)

is computed by computing scaling factors *R* such that

diag(*R*)*A*op2(*C*)

is row equilibrated and by computing the standard infinity-norm condition number.

Input Parameters

trans

CHARACTER*1. Must be 'N' or 'T' or 'C'.

Specifies the form of the system of equations:

If *trans* = 'N', the system has the form $A*X = B$.

If *trans* = 'T', the system has the form $A^T*X = B$.

If *trans* = 'C', the system has the form $A^H*X = B$.

n

INTEGER. The number of linear equations, that is, the order of the matrix *A*; $n \geq 0$.

kl

INTEGER. The number of subdiagonals within the band of *A*; $kl \geq 0$.

ku

INTEGER. The number of superdiagonals within the band of *A*; $ku \geq 0$.

ab, *afb*, *c*, *work*

REAL for sla_gbrcond

DOUBLE PRECISION for dla_gbrcond

Arrays:

ab(*ldab*,*) contains the original band matrix *A* stored in rows from 1 to *kl* + *ku* + 1. The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows:

ab(*ku*+1+*i*-*j*,*j*) = A(*i*,*j*)

for

max(1,*j*-*ku*) ≤*i*≤ min(*n*,*j*+*kl*)

afb(*ldafb*,*) contains details of the LU factorization of the band matrix *A*, as returned by ?gbtrf. *U* is stored as an upper triangular band matrix with *kl*+*ku* superdiagonals in rows 1 to *kl*+*ku*+1, and the multipliers used during the factorization are stored in rows *kl*+*ku*+2 to 2**kl*+*ku*+1.

c, DIMENSION*n*. The vector *C* in the formula op(*A*) * op2(*C*).

work is a workspace array of DIMENSION (5**n*).

The second dimension of *ab* and *afb* must be at least max(1, *n*).

ldab

INTEGER. The leading dimension of the array *ab*. *ldab*≥*kl*+*ku*+1.

ldafb

INTEGER. The leading dimension of *afb*. *ldafb*≥2**kl*+*ku*+1.

ipiv

INTEGER.

Array with DIMENSION*n*. The pivot indices from the factorization *A* = *P*L*U* as computed by ?gbtrf. Row *i* of the matrix was interchanged with row *ipiv*(*i*).

cmode

INTEGER. Determines op2(*C*) in the formula op(*A*) * op2(*C*) as follows:

If *cmode* = 1, op2(*C*) = *C*.

If *cmode* = 0, op2(*C*) = *I*.

If *cmode* = -1, op2(*C*) = inv(*C*).

iwork

INTEGER. Workspace array with DIMENSION*n*.

Output Parameters

info	INTEGER. If *info* = 0, the execution is successful. If *i* > 0, the *i*-th parameter is invalid.

?la_gbrcond_c

*Computes the infinity norm condition number of op(A)*inv(diag(c)) for general banded matrices.*

Syntax

```
call cla_gbrcond_c( trans, n, kl, ku, ab, ldab, afb, ldafb, ipiv, c, capply, info, work, rwork )
call zla_gbrcond_c( trans, n, kl, ku, ab, ldab, afb, ldafb, ipiv, c, capply, info, work, rwork )
```

Include Files

- mkl.fi

Description

The function computes the infinity norm condition number of

```
op(A) * inv(diag(c))
```

where the *c* is a REAL vector for cla_gbrcond_c and a DOUBLE PRECISION vector for zla_gbrcond_c.

Input Parameters

trans	CHARACTER*1. Must be 'N' or 'T' or 'C'. Specifies the form of the system of equations: If *trans* = 'N', the system has the form $A*X = B$ (No transpose) If *trans* = 'T', the system has the form $A^T*X = B$ (Transpose) If *trans* = 'C', the system has the form $A^H*X = B$ (Conjugate Transpose = Transpose)
n	INTEGER. The number of linear equations, that is, the order of the matrix *A*; $n \geq 0$.
kl	INTEGER. The number of subdiagonals within the band of *A*; $kl \geq 0$.
ku	INTEGER. The number of superdiagonals within the band of *A*; $ku \geq 0$.
ab, *afb*, *work*	COMPLEX for cla_gbrcond_c DOUBLE COMPLEX for zla_gbrcond_c Arrays: *ab*(*ldab*,*) contains the original band matrix *A* stored in rows from 1 to *kl* + *ku* + 1. The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows:

`ab(ku+1+i-j,j) = A(i,j)`

for

`max(1,j-ku) ≤i≤ min(n,j+kl)`

afb(*ldafb*,*) contains details of the LU factorization of the band matrix *A*, as returned by `?gbtrf`. *U* is stored as an upper triangular band matrix with *kl*+*ku* superdiagonals in rows 1 to *kl*+*ku*+1, and the multipliers used during the factorization are stored in rows *kl*+*ku*+2 to 2**kl*+*ku*+1.

work is a workspace array of `DIMENSION` (5**n*).

The second dimension of *ab* and *afb* must be at least `max(1, n)`.

ldab — `INTEGER`. The leading dimension of the array *ab*. *ldab*≥*kl*+*ku*+1.

ldafb — `INTEGER`. The leading dimension of *afb*. *ldafb*≥2**kl*+*ku*+1.

ipiv — `INTEGER`.

Array with `DIMENSION`*n*. The pivot indices from the factorization *A = P*L*U* as computed by `?gbtrf`. Row *i* of the matrix was interchanged with row *ipiv*(*i*).

c, *rwork* — `REAL` for `cla_gbrcond_c`

`DOUBLE PRECISION` for `zla_gbrcond_c`

Array *c* with `DIMENSION`*n*. The vector *c* in the formula

`op(A) * inv(diag(c))`.

Array *rwork* with `DIMENSION`*n* is a workspace.

capply — `LOGICAL`. If `.TRUE.`, then the function uses the vector *c* from the formula

`op(A) * inv(diag(c))`.

Output Parameters

info — `INTEGER`.

If *info* = 0, the execution is successful.

If *i* > 0, the *i*-th parameter is invalid.

Description

The function computes the infinity norm condition number of

`op(A) * diag(x)`

where the *x* is a `COMPLEX` vector for `cla_gbrcond_x` and a `DOUBLE COMPLEX` vector for `zla_gbrcond_x`.

Input Parameters

trans

`CHARACTER*1`. Must be `'N'` or `'T'` or `'C'`.

Specifies the form of the system of equations:

If *trans* = `'N'`, the system has the form $A*X = B$ (No transpose)

If *trans* = `'T'`, the system has the form $A^T*X = B$ (Transpose)

If *trans* = `'C'`, the system has the form $A^H*X = B$ (Conjugate Transpose = Transpose)

n

`INTEGER`. The number of linear equations, that is, the order of the matrix *A*; $n \geq 0$.

kl

`INTEGER`. The number of subdiagonals within the band of *A*; $kl \geq 0$.

ku

`INTEGER`. The number of superdiagonals within the band of *A*; $ku \geq 0$.

ab, *afb*, *x*, *work*

`COMPLEX` for `cla_gbrcond_x`

`DOUBLE COMPLEX` for `zla_gbrcond_x`

Arrays:

ab(*ldab*,*) contains the original band matrix *A* stored in rows from 1 to *kl* + *ku* + 1. The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows:

ab(*ku*+1+*i*-*j*,*j*) = A(*i*,*j*)

for

max(1,*j*-*ku*) ≤*i*≤ min(*n*,*j*+*kl*)

afb(*ldafb*,*) contains details of the LU factorization of the band matrix *A*, as returned by `?gbtrf`. *U* is stored as an upper triangular band matrix with *kl*+*ku* superdiagonals in rows 1 to *kl*+*ku*+1, and the multipliers used during the factorization are stored in rows *kl*+*ku*+2 to 2**kl*+*ku*+1.

x, `DIMENSION`*n*. The vector *x* in the formula `op(A) * diag(x)`.

work is a workspace array of `DIMENSION` (2**n*).

The second dimension of *ab* and *afb* must be at least `max(1, n)`.

ldab

`INTEGER`. The leading dimension of the array *ab*. *ldab*≥*kl*+*ku*+1.

ldafb

`INTEGER`. The leading dimension of *afb*. *ldafb*≥2**kl*+*ku*+1.

ipiv

`INTEGER`.

Array with `DIMENSION`*n*. The pivot indices from the factorization *A = P*L*U* as computed by `?gbtrf`. Row *i* of the matrix was interchanged with row *ipiv*(*i*).

rwork

`REAL` for `cla_gbrcond_x`

`DOUBLE PRECISION` for `zla_gbrcond_x`

Array *rwork* with DIMENSION*n* is a workspace.

Output Parameters

info INTEGER.

If *info* = 0, the execution is successful.

If *i* > 0, the *i*-th parameter is invalid.

Description

The ?la_gbrfsx_extended subroutine improves the computed solution to a system of linear equations by performing extra-precise iterative refinement and provides error bounds and backward error estimates for the solution. The ?gbrfsx routine calls ?la_gbrfsx_extended to perform iterative refinement.

In addition to normwise error bound, the code provides maximum componentwise error bound, if possible. See comments for *err_bnds_norm* and *err_bnds_comp* for details of the error bounds.

Use ?la_gbrfsx_extended to set only the second fields of *err_bnds_norm* and *err_bnds_comp*.

Input Parameters

prec_type INTEGER.

Specifies the intermediate precision to be used in refinement. The value is defined by ilaprec(p), where p is a CHARACTER and:

If *p* = 'S': Single.

If *p* = 'D': Double.

If *p* = 'I': Indigenous.

If *p* = 'X', 'E': Extra.

trans_type INTEGER.

Specifies the transposition operation on *A*. The value is defined by ilatrans(t), where t is a CHARACTER and:

If *t* = 'N': No transpose.

If *t* = 'T': Transpose.

If *t* = 'C': Conjugate Transpose.

n INTEGER. The number of linear equations; the order of the matrix *A*; *n*≥ 0.

kl INTEGER. The number of subdiagonals within the band of *A*; *kl*≥ 0.

ku INTEGER. The number of superdiagonals within the band of *A*; *ku*≥ 0.

nrhs INTEGER. The number of right-hand sides; the number of columns of the matrix *B*.

ab, *afb*, *b*, *y* REAL for sla_gbrfsx_extended

DOUBLE PRECISION for dla_gbrfsx_extended

COMPLEX for cla_gbrfsx_extended

DOUBLE COMPLEX for zla_gbrfsx_extended.

Arrays: *ab*(*ldab*,*), *afb*(*ldafb*,*), *b*(*ldb*,*), *y*(*ldy*,*).

The array *ab* contains the original *n*-by-*n* matrix *A*. The second dimension of *ab* must be at least max(1,*n*).

The array *afb* contains the factors *L* and *U* from the factorization *A = P*L*U*) as computed by ?gbtrf. The second dimension of *afb* must be at least max(1,*n*).

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).

The array *y* on entry contains the solution matrix *X* as computed by ?gbtrs. The second dimension of *y* must be at least max(1,*nrhs*).

ldab INTEGER. The leading dimension of the array *ab*; *ldab*≥ max(1,*n*).

ldafb INTEGER. The leading dimension of the array *afb*; *ldafb*≥ max(1,*n*).

ipiv INTEGER.

Array, DIMENSION at least max(1, *n*). Contains the pivot indices from the factorization *A = P*L*U*) as computed by ?gbtrf; row *i* of the matrix was interchanged with row *ipiv*(*i*).

colequ LOGICAL. If *colequ* = .TRUE., column equilibration was done to *A* before calling this routine. This is needed to compute the solution and error bounds correctly.

c

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

c contains the column scale factors for *A*. If *colequ* = .FALSE., *c* is not accessed.

If *c* is input, each element of *c* should be a power of the radix to ensure a reliable solution and error estimates. Scaling by power of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

ldb

INTEGER. The leading dimension of the array *b*; *ldb*≥ max(1, *n*).

ldy

INTEGER. The leading dimension of the array *y*; *ldy*≥ max(1, *n*).

n_norms

INTEGER. Determines which error bounds to return. See *err_bnds_norm* and *err_bnds_comp* descriptions in *Output Arguments* section below.

If *n_norms*≥ 1, returns normwise error bounds.

If *n_norms*≥ 2, returns componentwise error bounds.

err_bnds_norm

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, DIMENSION(*nrhs*,*n_err_bnds*). For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:

Normwise relative error in the *i*-th solution vector

$$\frac{\max_j \left|Xtrue_{ji} - X_{ji}\right|}{\max_j \left|X_{ji}\right|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.

The first index in *err_bnds_norm(i,:)* corresponds to the *i*-th right-hand side.

The second index in *err_bnds_norm(:,err)* contains the following three fields:

err=1

"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors.

err=2

"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and

sqrt(*n*)**dlamch*(ε) for double precision flavors. This error bound should only be trusted if the previous boolean is true.

err=3 Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers are `1/(norm(1/z,inf)*norm(z,inf))` for some appropriately scaled matrix *Z*.

Let *z*=*s***a*, where *s* scales each row by a power of the radix so all absolute row sums of *z* are approximately 1.

Use this subroutine to set only the second field above.

err_bnds_comp `REAL` for single precision flavors

`DOUBLE PRECISION` for double precision flavors.

Array, `DIMENSION(`*nrhs*`,`*n_err_bnds*`)`. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:

Componentwise relative error in the *i*-th solution vector:

$$\max_j \frac{\left|Xtrue_{ji} - X_{ji}\right|}{\left|X_{ji}\right|}$$

The array is indexed by the right-hand side *i*, on which the componentwise relative error depends, and by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is nit requested (*params(3)* = 0.0), then *err_bnds_comp* is not accessed. If *n_err_bnds* < 3, then at most the first *(:,n_err_bnds)* entries are returned.

The first index in *err_bnds_comp(i,:)* corresponds to the *i*-th right-hand side.

The second index in *err_bnds_comp(:,err)* contains the follwoing three fields:

err=1 "Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors.

	err=2	"Guaranteed" error bpound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors. This error bound should only be trusted if the previous boolean is true.
	err=3	Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers are 1/(norm(1/z,inf)*norm(z,inf)) for some appropriately scaled matrix *Z*. Let *z*=*s**(*a**diag(*x*)), where *x* is the solution for the current right-hand side and *s* scales each row of *a**diag(*x*) by a power of the radix so all absolute row sums of *z* are approximately 1. Use this subroutine to set only the second field above.
res, *dy*, *y_tail*	REAL for sla_gbrfsx_extended DOUBLE PRECISION for dla_gbrfsx_extended COMPLEX for cla_gbrfsx_extended DOUBLE COMPLEX for zla_gbrfsx_extended. Workspace arrays of DIMENSION*n*. *res* holds the intermediate residual. *dy* holds the intermediate solution. *y_tail* holds the trailing bits of the intermediate solution.	
ayb	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Workspace array, DIMENSION*n*.	
rcond	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision, in particular, if *rcond* = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.	

ithresh INTEGER. The maximum number of residual computations allowed for refinement. The default is 10. For 'aggressive', set to 100 to permit convergence using approximate factorizations or factorizations other than LU. If the factorization uses a technique other than Gaussian elimination, the guarantees in *err_bnds_norm* and *err_bnds_comp* may no longer be trustworthy.

rthresh REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Determines when to stop refinement if the error estimate stops decreasing. Refinement stops when the next solution no longer satisfies

norm(dx_{*i*+1}) < *rthresh* * norm(dx_*i*)

where norm(*z*) is the infinity norm of *Z*.

rthresh satisfies

0 < *rthresh*≤ 1.

The default value is 0.5. For 'aggressive' set to 0.9 to permit convergence on extremely ill-conditioned matrices.

dz_ub REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Determines when to start considering componentwise convergence. Componentwise *dz_ub* convergence is only considered after each component of the solution *y* is stable, that is, the relative change in each component is less than *dz_ub*. The default value is 0.25, requiring the first bit to be stable.

ignore_cwise LOGICAL

If .TRUE., the function ignores componentwise convergence. Default value is .FALSE.

Output Parameters

y REAL for sla_gbrfsx_extended

DOUBLE PRECISION for dla_gbrfsx_extended

COMPLEX for cla_gbrfsx_extended

DOUBLE COMPLEX for zla_gbrfsx_extended.

The improved solution matrix *Y*.

berr_out REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, DIMENSION at least max(1, *nrhs*). Contains the componentwise relative backward error for right-hand-side *j* from the formula

max(*i*) (abs(*res*(*i*)) / (abs(op(*A*))*abs(*y*) + abs(*B*))(*i*))

where abs(*z*) is the componentwise absolute value of the matrix or vector *Z*. This is computed by ?la_lin_berr.

err_bnds_norm, *err_bnds_comp*	Values of the corresponding input parameters improved after iterative refinement and stored in the second column of the array `( 1:nrhs, 2 )`. The other elements are kept unchanged.
info	`INTEGER`. If *info* = 0, the execution is successful. The solution to every right-hand side is guaranteed. If *info* = -*i*, the *i*-th parameter had an illegal value.

?la_gbrpvgrw

Computes the reciprocal pivot growth factor `norm(A)/ norm(U)` *for a general band matrix.*

Syntax

```
call sla_gbrpvgrw( n, kl, ku, ncols, ab, ldab, afb, ldafb )
call dla_gbrpvgrw( n, kl, ku, ncols, ab, ldab, afb, ldafb )
call cla_gbrpvgrw( n, kl, ku, ncols, ab, ldab, afb, ldafb )
call zla_gbrpvgrw( n, kl, ku, ncols, ab, ldab, afb, ldafb )
```

Include Files

- mkl.fi

Description

The `?la_gbrpvgrw` routine computes the reciprocal pivot growth factor `norm(A)/norm(U)`. The *max absolute element* norm is used. If this is much less than 1, the stability of the *LU* factorization of the equilibrated matrix *A* could be poor. This also means that the solution *X*, estimated condition numbers, and error bounds could be unreliable.

Input Parameters

n	`INTEGER`. The number of linear equations, the order of the matrix *A*; $n \geq 0$.
kl	`INTEGER`. The number of subdiagonals within the band of *A*; $kl \geq 0$.
ku	`INTEGER`. The number of superdiagonals within the band of *A*; $ku \geq 0$.
ncols	`INTEGER`. The number of columns of the matrix *A*; $ncols \geq 0$.

ab, *afb*	`REAL` for `sla_gbrpvgrw`
	`DOUBLE PRECISION` for `dla_gbrpvgrw`
	`COMPLEX` for `cla_gbrpvgrw`

DOUBLE COMPLEX for zla_gbrpvgrw.

Arrays: *ab*(*ldab*,*), *afb*(*ldafb*,*).

ab contains the original band matrix *A* (see Matrix Storage Schemes) stored in rows from 1 to *kl* + *ku* + 1. The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows:

ab(*ku*+1+*i*-*j*,*j*) = A(*i*,*j*)

for

max(1,*j*-*ku*) ≤*i*≤ min(*n*,*j*+*kl*)

afb contains details of the LU factorization of the band matrix *A*, as returned by ?gbtrf. *U* is stored as an upper triangular band matrix with *kl*+*ku* superdiagonals in rows 1 to *kl*+*ku*+1, and the multipliers used during the factorization are stored in rows *kl*+*ku*+2 to 2**kl*+*ku*+1.

ldab — INTEGER. The leading dimension of *ab*; *ldab*≥*kl*+*ku*+1.

ldafb — INTEGER. The leading dimension of *afb*; *ldafb*≥ 2**kl*+*ku*+1.

?gbtrf

?la_geamv

Computes a matrix-vector product using a general matrix to calculate error bounds.

Syntax

```
call sla_geamv(trans, m, n, alpha, a, lda, x, incx, beta, y, incy)
call dla_geamv(trans, m, n, alpha, a, lda, x, incx, beta, y, incy)
call cla_geamv(trans, m, n, alpha, a, lda, x, incx, beta, y, incy)
call zla_geamv(trans, m, n, alpha, a, lda, x, incx, beta, y, incy)
```

Include Files

- mkl.fi

Description

The ?la_geamv routines perform a matrix-vector operation defined as

y := *alpha**abs(*A*)*(*x*) + *beta**abs(*y*),

or

y := *alpha**abs(A^T)*abs(*x*) + *beta**abs(*y*),

where:

alpha and *beta* are scalars,

x and *y* are vectors,

A is an *m*-by-*n* matrix.

This function is primarily used in calculating error bounds. To protect against underflow during evaluation, the function perturbs components in the resulting vector away from zero by `(n + 1)` times the underflow threshold. To prevent unnecessarily large errors for block structure embedded in general matrices, the function does not perturb *symbolically* zero components. A zero entry is considered *symbolic* if all multiplications involved in computing that entry have at least one zero multiplicand.

Input Parameters

trans

`CHARACTER*1`. Specifies the operation:

if *trans* = `BLAS_NO_TRANS` , then $y := alpha*abs(A)*abs(x) + beta*abs(y)$

if *trans* = `BLAS_TRANS`, then $y := alpha*abs(A^T)*abs(x) + beta*abs(y)$

if *trans* = `'BLAS_CONJ_TRANS`, then $y := alpha*abs(A^T)*abs(x) + beta*abs(y)$.

m

`INTEGER`. Specifies the number of rows of the matrix *A*. The value of *m* must be at least zero.

n

`INTEGER`. Specifies the number of columns of the matrix *A*. The value of *n* must be at least zero.

alpha

`REAL` for `sla_geamv` and for `cla_geamv`

`DOUBLE PRECISION` for `dla_geamv` and `zla_geamv`

Specifies the scalar *alpha*.

a

`REAL` for `sla_geamv`

`DOUBLE PRECISION` for `dla_geamv`

`COMPLEX` for `cla_geamv`

`DOUBLE COMPLEX` for `zla_geamv`

Array, `DIMENSION(lda, *)`. Before entry, the leading *m*-by-*n* part of the array *a* must contain the matrix of coefficients. The second dimension of *a* must be at least `max(1,n)`.

lda

`INTEGER`. Specifies the leading dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least `max(1, m)`.

x

`REAL` for `sla_geamv`

`DOUBLE PRECISION` for `dla_geamv`

`COMPLEX` for `cla_geamv`

`DOUBLE COMPLEX` for `zla_geamv`

Array, `DIMENSION` at least `(1+(n-1)*abs(incx))` when *trans* = `'N'` or `'n'` and at least `(1+(m - 1)*abs(incx))` otherwise. Before entry, the incremented array *x* must contain the vector *X*.

incx

`INTEGER`. Specifies the increment for the elements of *x*.

The value of *incx* must be non-zero.

beta

`REAL` for `sla_geamv` and for `cla_geamv`

DOUBLE PRECISION for dla_geamv and zla_geamv

Specifies the scalar *beta*. When *beta* is zero, you do not need to set *y* on input.

y

REAL for sla_geamv and for cla_geamv

DOUBLE PRECISION for dla_geamv and zla_geamv

Array, DIMENSION at least (1 +(*m* - 1)*abs(*incy*)) when *trans* = 'N' or 'n' and at least (1 +(*n* - 1)*abs(*incy*)) otherwise. Before entry with non-zero *beta*, the incremented array *y* must contain the vector *Y*.

incy

INTEGER. Specifies the increment for the elements of *y*.

The value of *incy* must be non-zero.

Output Parameters

y

Updated vector *Y*.

?la_gercond

Estimates the Skeel condition number for a general matrix.

Syntax

```
call sla_gercond( trans, n, a, lda, af, ldaf, ipiv, cmode, c, info, work, iwork )
call dla_gercond( trans, n, a, lda, af, ldaf, ipiv, cmode, c, info, work, iwork )
```

Include Files

- mkl.fi

Description

The function estimates the Skeel condition number of

op(*A*) * op2(*C*)

where

the *cmode* parameter determines op2 as follows:

cmode **Value**	**op2(C)**
1	*C*
0	*I*
-1	inv(*C*)

The Skeel condition number

cond(*A*) = norminf(|inv(*A*)||*A*|

is computed by computing scaling factors *R* such that

diag(*R*)*A*op2(*C*)

is row equilibrated and by computing the standard infinity-norm condition number.

Input Parameters

trans — CHARACTER*1. Must be 'N' or 'T' or 'C'.

Specifies the form of the system of equations:

If *trans* = 'N', the system has the form $A*X = B$ (No transpose).

If *trans* = 'T', the system has the form $A^T*X = B$ (Transpose).

If *trans* = 'C', the system has the form $A^H*X = B$ (Conjugate Transpose = Transpose).

n — INTEGER. The number of linear equations, that is, the order of the matrix *A*; $n \geq 0$.

a, *af*, *c*, *work* — REAL for sla_gercond

DOUBLE PRECISION for dla_gercond

Arrays:

a(*lda*,*) contains the original general *n*-by-*n* matrix *A*.

af(*ldaf*,*) contains factors *L* and *U* from the factorization of the general matrix *A*=*P*L*U*, as returned by ?getrf.

c, DIMENSION*n*. The vector *C* in the formula op(*A*) * op2(*C*).

work is a workspace array of DIMENSION (3**n*).

The second dimension of *a* and *af* must be at least max(1, *n*).

lda — INTEGER. The leading dimension of the array *a*. *lda*≥max(1,*n*).

ldaf — INTEGER. The leading dimension of *af*. *ldaf*≥max(1, *n*).

ipiv — INTEGER.

Array with DIMENSION*n*. The pivot indices from the factorization *A* = *P*L*U* as computed by ?getrf. Row *i* of the matrix was interchanged with row *ipiv*(*i*).

cmode — INTEGER. Determines op2(*C*) in the formula op(*A*) * op2(*C*) as follows:

If *cmode* = 1, op2(*C*) = *C*.

If *cmode* = 0, op2(*C*) = *I*.

If *cmode* = -1, op2(*C*) = inv(*C*).

iwork — INTEGER. Workspace array with DIMENSION*n*.

Output Parameters

info — INTEGER.

If *info* = 0, the execution is successful.

If *i* > 0, the *i*-th parameter is invalid.

?la_gercond_c

*Computes the infinity norm condition number of op(A)*inv(diag(c)) for general matrices.*

Syntax

```
call cla_gercond_c( trans, n, a, lda, af, ldaf, ipiv, c, capply, info, work, rwork )
call zla_gercond_c( trans, n, a, lda, af, ldaf, ipiv, c, capply, info, work, rwork )
```

Include Files

- mkl.fi

Description

The function computes the infinity norm condition number of

op(*A*) * inv(diag(c))

where the *c* is a REAL vector for cla_gercond_c and a DOUBLE PRECISION vector for zla_gercond_c.

Input Parameters

trans

CHARACTER*1. Must be 'N' or 'T' or 'C'.

Specifies the form of the system of equations:

If *trans* = 'N', the system has the form $A*X = B$ (No transpose)

If *trans* = 'T', the system has the form $A^T*X = B$ (Transpose)

If *trans* = 'C', the system has the form $A^H*X = B$ (Conjugate Transpose = Transpose)

n

INTEGER. The number of linear equations, that is, the order of the matrix *A*; $n \geq 0$.

a, *af*, *work*

COMPLEX for cla_gercond_c

DOUBLE COMPLEX for zla_gercond_c

Arrays:

a(*lda*,*) contains the original general *n*-by-*n* matrix *A*.

af(*ldaf*,*) contains the factors *L* and *U* from the factorization *A=P*L*U* as returned by ?getrf.

work is a workspace array of DIMENSION (2**n*).

The second dimension of *a* and *af* must be at least max(1, *n*).

lda

INTEGER. The leading dimension of the array *a*. $lda \geq \max(1,n)$.

ldaf

INTEGER. The leading dimension of *af*. $ldaf \geq \max(1,n)$.

ipiv

INTEGER.

Array with DIMENSION*n*. The pivot indices from the factorization *A = P*L*U* as computed by ?getrf. Row *i* of the matrix was interchanged with row *ipiv*(*i*).

c, *rwork*

REAL for cla_gercond_c

DOUBLE PRECISION for zla_gercond_c

Array *c* with DIMENSION*n*. The vector *c* in the formula

op(*A*) * inv(diag(*c*)).

Array *rwork* with DIMENSION*n* is a workspace.

capply LOGICAL. If *capply*=.TRUE., then the function uses the vector *c* from the formula

op(*A*) * inv(diag(*c*)).

Output Parameters

info INTEGER.

If *info* = 0, the execution is successful.

If *i* > 0, the *i*-th parameter is invalid.

call zla_gerfsx_extended(*prec_type*, *trans_type*, *n*, *nrhs*, *a*, *lda*, *af*, *ldaf*, *ipiv*, *colequ*, *c*, *b*, *ldb*, *y*, *ldy*, *berr_out*, *n_norms*, *errs_n*, *errs_c*, *res*, *ayb*, *dy*, *y_tail*, *rcond*, *ithresh*, *rthresh*, *dz_ub*, *ignore_cwise*, *info*)

Include Files

- mkl.fi

Description

The ?la_gerfsx_extended subroutine improves the computed solution to a system of linear equations for general matrices by performing extra-precise iterative refinement and provides error bounds and backward error estimates for the solution. The ?gerfsx routine calls ?la_gerfsx_extended to perform iterative refinement.

In addition to normwise error bound, the code provides maximum componentwise error bound, if possible. See comments for *errs_n* and *errs_c* for details of the error bounds.

Use ?la_gerfsx_extended to set only the second fields of *errs_n* and *errs_c*.

Input Parameters

prec_type

INTEGER.

Specifies the intermediate precision to be used in refinement. The value is defined by ilaprec(p), where p is a CHARACTER and:

If *p* = 'S': Single.

If *p* = 'D': Double.

If *p* = 'I': Indigenous.

If *p* = 'X', 'E': Extra.

trans_type

INTEGER.

Specifies the transposition operation on *A*. The value is defined by ilatrans(t), where t is a CHARACTER and:

If *t* = 'N': No transpose.

If *t* = 'T': Transpose.

If *t* = 'C': Conjugate Transpose.

n

INTEGER. The number of linear equations; the order of the matrix *A*; $n \geq 0$.

nrhs

INTEGER. The number of right-hand sides; the number of columns of the matrix *B*.

a, *af*, *b*, *y*

REAL for sla_gerfsx_extended

DOUBLE PRECISION for dla_gerfsx_extended

COMPLEX for cla_gerfsx_extended

DOUBLE COMPLEX for zla_gerfsx_extended.

Arrays: *a*(*lda*,*), *af*(*ldaf*,*), *b*(*ldb*,*), *y*(*ldy*,*).

The array *a* contains the original matrix *n*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1,*n*).

The array *af* contains the factors *L* and *U* from the factorization *A = P*L*U*) as computed by ?getrf. The second dimension of *af* must be at least max(1,*n*).

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).

The array *y* on entry contains the solution matrix *X* as computed by ?getrs. The second dimension of *y* must be at least max(1,*nrhs*).

lda INTEGER. The leading dimension of the array *a*; *lda*≥ max(1,*n*).

ldaf INTEGER. The leading dimension of the array *af*; *ldaf*≥ max(1,*n*).

ipiv INTEGER.

Array, DIMENSION at least max(1, *n*). Contains the pivot indices from the factorization *A = P*L*U*) as computed by ?getrf; row *i* of the matrix was interchanged with row *ipiv*(*i*).

colequ LOGICAL. If *colequ* = .TRUE., column equilibration was done to *A* before calling this routine. This is needed to compute the solution and error bounds correctly.

c REAL for single precision flavors (sla_gerfsx_extended, cla_gerfsx_extended)

DOUBLE PRECISION for double precision flavors (dla_gerfsx_extended, zla_gerfsx_extended).

c contains the column scale factors for *A*. If *colequ* = .FALSE., *c* is not used.

If *c* is input, each element of *c* should be a power of the radix to ensure a reliable solution and error estimates. Scaling by power of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

ldb INTEGER. The leading dimension of the array *b*; *ldb*≥ max(1, *n*).

ldy INTEGER. The leading dimension of the array *y*; *ldy*≥ max(1, *n*).

n_norms INTEGER. Determines which error bounds to return. See *errs_n* and *errs_c* descriptions in *Output Arguments* section below.

If *n_norms*≥ 1, returns normwise error bounds.

If *n_norms*≥ 2, returns componentwise error bounds.

errs_n REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, DIMENSION(*nrhs*,*n_err_bnds*). For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:

Normwise relative error in the *i*-th solution vector

$$\frac{\max_j \left| Xtrue_{ji} - X_{ji} \right|}{\max_j \left| X_{ji} \right|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.

The first index in *errs_n(i,:)* corresponds to the *i*-th right-hand side.

The second index in *errs_n(:,err)* contains the following three fields:

err=1	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors.
err=2	"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors. This error bound should only be trusted if the previous boolean is true.
err=3	Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers are 1/(norm(1/z,inf)*norm(z,inf)) for some appropriately scaled matrix *Z*. Let *z*=*s***a*, where *s* scales each row by a power of the radix so all absolute row sums of *z* are approximately 1. Use this subroutine to set only the second field above.

errs_c

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, DIMENSION(*nrhs*,*n_err_bnds*). For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:

Componentwise relative error in the *i*-th solution vector:

$$\max_j \frac{\left|Xtrue_{ji} - X_{ji}\right|}{\left|X_{ji}\right|}$$

The array is indexed by the right-hand side *i*, on which the componentwise relative error depends, and by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is nit requested (*params(3)* = 0.0), then *errs_c* is not accessed. If *n_err_bnds* < 3, then at most the first *(:,n_err_bnds)* entries are returned.

The first index in *errs_c(i,:)* corresponds to the *i*-th right-hand side.

The second index in *errs_c(:,err)* contains the follwoing three fields:

err=1	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors.
err=2	"Guaranteed" error bpound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors. This error bound should only be trusted if the previous boolean is true.
err=3	Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers are `1/(norm(1/z,inf)*norm(z,inf))` for some appropriately scaled matrix *Z*. Let *z=s**(*a**diag(*x*)), where *x* is the solution for the current right-hand side and *s* scales each row of *a**diag(*x*) by a power of the radix so all absolute row sums of *z* are approximately 1. Use this subroutine to set only the second field above.

res, *dy*, *y_tail*

`REAL` for `sla_gerfsx_extended`

`DOUBLE PRECISION` for `dla_gerfsx_extended`

`COMPLEX` for `cla_gerfsx_extended`

`DOUBLE COMPLEX` for `zla_gerfsx_extended`.

Workspace arrays of DIMENSION*n*.

res holds the intermediate residual.

dy holds the intermediate solution.

y_tail holds the trailing bits of the intermediate solution.

ayb

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Workspace array, DIMENSION*n*.

rcond

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision, in particular, if *rcond* = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.

ithresh

INTEGER. The maximum number of residual computations allowed for refinement. The default is 10. For 'aggressive', set to 100 to permit convergence using approximate factorizations or factorizations other than LU. If the factorization uses a technique other than Gaussian elimination, the guarantees in *errs_n* and *errs_c* may no longer be trustworthy.

rthresh

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Determines when to stop refinement if the error estimate stops decreasing. Refinement stops when the next solution no longer satisfies

norm(dx_{*i*+1}) < *rthresh* * norm(dx_*i*)

where norm(*z*) is the infinity norm of *Z*.

rthresh satisfies

0 < *rthresh*≤ 1.

The default value is 0.5. For 'aggressive' set to 0.9 to permit convergence on extremely ill-conditioned matrices.

dz_ub

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Determines when to start considering componentwise convergence. Componentwise *dz_ub* convergence is only considered after each component of the solution *y* is stable, that is, the relative change in each component is less than *dz_ub*. The default value is 0.25, requiring the first bit to be stable.

ignore_cwise

LOGICAL

If .TRUE., the function ignores componentwise convergence. Default value is .FALSE.

Output Parameters

y	REAL for sla_gerfsx_extended DOUBLE PRECISION for dla_gerfsx_extended COMPLEX for cla_gerfsx_extended DOUBLE COMPLEX for zla_gerfsx_extended. The improved solution matrix *Y*.
berr_out	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Array, DIMENSION at least max(1, *nrhs*). Contains the componentwise relative backward error for right-hand-side *j* from the formula max(*i*) (abs(*res*(*i*)) / (abs(op(*A*))*abs(*y*) + abs(*B*))(*i*)) where abs(*z*) is the componentwise absolute value of the matrix or vector *Z*. This is computed by ?la_lin_berr.
errs_n, *errs_c*	Values of the corresponding input parameters improved after iterative refinement and stored in the second column of the array (1:*nrhs*, 2). The other elements are kept unchanged.
info	INTEGER. If *info* = 0, the execution is successful. The solution to every right-hand side is guaranteed. If *info* = -*i*, the *i*-th parameter had an illegal value.

?la_heamv

Computes a matrix-vector product using a Hermitian indefinite matrix to calculate error bounds.

Syntax

```
call cla_heamv(uplo, n, alpha, a, lda, x, incx, beta, y, incy)
call zla_heamv(uplo, n, alpha, a, lda, x, incx, beta, y, incy)
```

Include Files

- mkl.fi

Description

The ?la_heamv routines perform a matrix-vector operation defined as

y := *alpha**abs(*A*)*abs(*x*) + *beta**abs(*y*),

where:

alpha and *beta* are scalars,

x and *y* are vectors,

A is an *n*-by-*n* Hermitian matrix.

This function is primarily used in calculating error bounds. To protect against underflow during evaluation, the function perturbs components in the resulting vector away from zero by `(n + 1)` times the underflow threshold. To prevent unnecessarily large errors for block structure embedded in general matrices, the function does not perturb *symbolically* zero components. A zero entry is considered *symbolic* if all multiplications involved in computing that entry have at least one zero multiplicand.

Input Parameters

uplo

`CHARACTER*1`.

Specifies whether the upper or lower triangular part of the array A is to be referenced:

If *uplo* = `'BLAS_UPPER'`, only the upper triangular part of A is to be referenced,

If *uplo* = `'BLAS_LOWER'`, only the lower triangular part of A is to be referenced.

n

`INTEGER`. Specifies the number of rows and columns of the matrix *A*. The value of *n* must be at least zero.

alpha

`REAL` for `cla_heamv`

`DOUBLE PRECISION` for `zla_heamv`

Specifies the scalar *alpha*.

a

`COMPLEX` for `cla_heamv`

`DOUBLE COMPLEX` for `zla_heamv`

Array, `DIMENSION(lda, *)`. Before entry, the leading *m*-by-*n* part of the array *a* must contain the matrix of coefficients. The second dimension of *a* must be at least `max(1,n)`.

lda

`INTEGER`. Specifies the leading dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least `max(1, n)`.

x

`COMPLEX` for `cla_heamv`

`DOUBLE COMPLEX` for `zla_heamv`

Array, `DIMENSION` at least `(1+(n-1)*abs(incx))`. Before entry, the incremented array *x* must contain the vector *X*.

incx

`INTEGER`. Specifies the increment for the elements of *x*.

The value of *incx* must be non-zero.

beta

`REAL` for `cla_heamv`

`DOUBLE PRECISION` for `zla_heamv`

Specifies the scalar *beta*. When *beta* is zero, you do not need to set *y* on input.

y	REAL for cla_heamv DOUBLE PRECISION for zla_heamv Array, DIMENSION at least (1 +(*n* – 1)*abs(*incy*)) otherwise. Before entry with non-zero *beta*, the incremented array *y* must contain the vector *Y*.
incy	INTEGER. Specifies the increment for the elements of *y*. The value of *incy* must be non-zero.

Output Parameters

y	Updated vector *Y*.

?la_hercond_c

*Computes the infinity norm condition number of op(A)*inv(diag(c)) for Hermitian indefinite matrices.*

Syntax

```
call cla_hercond_c( uplo, n, a, lda, af, ldaf, ipiv, c, capply, info, work, rwork )
call zla_hercond_c( uplo, n, a, lda, af, ldaf, ipiv, c, capply, info, work, rwork )
```

Include Files

- mkl.fi

Description

The function computes the infinity norm condition number of

op(*A*) * inv(diag(c))

where the *c* is a REAL vector for cla_hercond_c and a DOUBLE PRECISION vector for zla_hercond_c.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Specifies the triangle of A to store: If *uplo* = 'U', the upper triangle of *A* is stored, If *uplo* = 'L', the lower triangle of *A* is stored.
n	INTEGER. The number of linear equations, that is, the order of the matrix *A*; *n*≥ 0.
a	COMPLEX for cla_hercond_c DOUBLE COMPLEX for zla_hercond_c Array, DIMENSION(*lda*, *). On entry, the *n*-by-*n* matrix A. The second dimension of *a* must be at least max(1,*n*).
lda	INTEGER. The leading dimension of the array *a*. *lda*≥max(1,*n*).
af	COMPLEX for cla_hercond_c

DOUBLE COMPLEX for zla_hercond_c

Array, DIMENSION(*ldaf*, *). The block diagonal matrix D and the multipliers used to obtain the factor U or L as computed by ?hetrf. The second dimension of *af* must be at least max(1,*n*).

ldaf — INTEGER. The leading dimension of the array *af*. *ldaf*≥max(1,*n*).

ipiv — INTEGER.

Array with DIMENSION*n*. Details of the interchanges and the block structure of D as determined by ?hetrf.

c — REAL for cla_hercond_c

DOUBLE PRECISION for zla_hercond_c

Array *c* with DIMENSION*n*. The vector *c* in the formula

op(*A*) * inv(diag(*c*)).

capply — LOGICAL. If .TRUE., then the function uses the vector *c* from the formula

op(*A*) * inv(diag(*c*)).

work — COMPLEX for cla_hercond_c

DOUBLE COMPLEX for zla_hercond_c

Array DIMENSION 2**n*. Workspace.

rwork — REAL for cla_hercond_c

DOUBLE PRECISION for zla_hercond_c

Array DIMENSION*n*. Workspace.

Output Parameters

info — INTEGER.

If *info* = 0, the execution is successful.

If *i* > 0, the *i*-th parameter is invalid.

Include Files

- mkl.fi

Description

The function computes the infinity norm condition number of

`op(A) * diag(x)`

where the *x* is a `COMPLEX` vector for `cla_hercond_x` and a `DOUBLE COMPLEX` vector for `zla_hercond_x`.

Input Parameters

uplo

`CHARACTER*1`. Must be `'U'` or `'L'`.

Specifies the triangle of A to store:

If *uplo* = `'U'`, the upper triangle of *A* is stored,

If *uplo* = `'L'`, the lower triangle of *A* is stored.

n

`INTEGER`. The number of linear equations, that is, the order of the matrix *A*; $n \geq 0$.

a

`COMPLEX` for `cla_hercond_c`

`DOUBLE COMPLEX` for `zla_hercond_c`

Array, `DIMENSION(lda, *)`. On entry, the *n*-by-*n* matrix A. The second dimension of *a* must be at least `max(1,n)`.

lda

`INTEGER`. The leading dimension of the array *a*. $lda \geq \max(1,n)$.

af

`COMPLEX` for `cla_hercond_c`

`DOUBLE COMPLEX` for `zla_hercond_c`

Array, `DIMENSION(ldaf, *)`. The block diagonal matrix D and the multipliers used to obtain the factor `U` or `L` as computed by `?hetrf`. The second dimension of *af* must be at least `max(1,n)`.

ldaf

`INTEGER`. The leading dimension of the array *af*. $ldaf \geq \max(1,n)$.

ipiv

`INTEGER`.

Array with `DIMENSION`*n*. Details of the interchanges and the block structure of D as determined by `?hetrf`.

x

`COMPLEX` for `cla_hercond_c`

`DOUBLE COMPLEX` for `zla_hercond_c`

Array *x* with `DIMENSION`*n*. The vector *x* in the formula

`op(A) * inv(diag(x))`.

work

`COMPLEX` for `cla_hercond_c`

`DOUBLE COMPLEX` for `zla_hercond_c`

Array `DIMENSION` 2**n*. Workspace.

rwork

`REAL` for `cla_hercond_c`

`DOUBLE PRECISION` for `zla_hercond_c`

Array `DIMENSION`*n*. Workspace.

Output Parameters

info INTEGER.

If *info* = 0, the execution is successful.

If *i* > 0, the *i*-th parameter is invalid.

Include Files

- mkl.fi

Description

The ?la_herfsx_extended subroutine improves the computed solution to a system of linear equations by performing extra-precise iterative refinement and provides error bounds and backward error estimates for the solution. The ?herfsx routine calls ?la_herfsx_extended to perform iterative refinement.

In addition to normwise error bound, the code provides maximum componentwise error bound, if possible. See comments for *err_bnds_norm* and *err_bnds_comp* for details of the error bounds.

Use ?la_herfsx_extended to set only the second fields of *err_bnds_norm* and *err_bnds_comp*.

Input Parameters

prec_type INTEGER.

Specifies the intermediate precision to be used in refinement. The value is defined by ilaprec(p), where *p* is a CHARACTER and:

If *p* = 'S': Single.

If *p* = 'D': Double.

If *p* = 'I': Indigenous.

If *p* = 'X', 'E': Extra.

uplo CHARACTER*1. Must be 'U' or 'L'.

Specifies the triangle of A to store:

If *uplo* = 'U', the upper triangle of *A* is stored,

If *uplo* = 'L', the lower triangle of *A* is stored.

n — INTEGER. The number of linear equations; the order of the matrix *A*; *n*≥ 0.

nrhs — INTEGER. The number of right-hand sides; the number of columns of the matrix *B*.

a, af, b, y — COMPLEX for cla_herfsx_extended

DOUBLE COMPLEX for zla_herfsx_extended.

Arrays: *a*(*lda*,*), *af*(*ldaf*,*), *b*(*ldb*,*), *y*(*ldy*,*).

The array *a* contains the original *n*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1,*n*).

The array *af* contains the block diagonal matrix D and the multipliers used to obtain the factor U or L as computed by ?hetrf. The second dimension of *af* must be at least max(1,*n*).

The array *b* contains the right-hand-side of the matrix *B*. The second dimension of *b* must be at least max(1,*nrhs*).

The array *y* on entry contains the solution matrix *X* as computed by ?hetrs. The second dimension of *y* must be at least max(1,*nrhs*).

lda — INTEGER. The leading dimension of the array *a*; *lda*≥ max(1,*n*).

ldaf — INTEGER. The leading dimension of the array *af*; *ldaf*≥ max(1,*n*).

ipiv — INTEGER.

Array, DIMENSION*n*. Details of the interchanges and the block structure of D as determined by ?hetrf.

colequ — LOGICAL. If *colequ* = .TRUE., column equilibration was done to *A* before calling this routine. This is needed to compute the solution and error bounds correctly.

c — REAL for cla_herfsx_extended

DOUBLE PRECISION for zla_herfsx_extended.

c contains the column scale factors for *A*. If *colequ* = .FALSE., *c* is not used.

If *c* is input, each element of *c* should be a power of the radix to ensure a reliable solution and error estimates. Scaling by power of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

ldb — INTEGER. The leading dimension of the array *b*; *ldb*≥ max(1, *n*).

ldy — INTEGER. The leading dimension of the array *y*; *ldy*≥ max(1, *n*).

n_norms — INTEGER. Determines which error bounds to return. See *err_bnds_norm* and *err_bnds_comp* descriptions in *Output Arguments* section below.

If *n_norms*≥ 1, returns normwise error bounds.

If *n_norms*≥ 2, returns componentwise error bounds.

err_bnds_norm

REAL for cla_herfsx_extended

DOUBLE PRECISION for zla_herfsx_extended.

Array, DIMENSION(*nrhs*,*n_err_bnds*). For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error.

Normwise relative error in the *i*-th solution vector is defined as follows:

$$\frac{\max_j \left|Xtrue_{ji} - X_{ji}\right|}{\max_j \left|X_{ji}\right|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.

The first index in *err_bnds_norm(i,:)* corresponds to the *i*-th right-hand side.

The second index in *err_bnds_norm(:,err)* contains the following three fields:

err=1 — "Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for cla_herfsx_extended and *sqrt*(*n*)**dlamch*(ε) for zla_herfsx_extended.

err=2 — "Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for cla_herfsx_extended and *sqrt*(*n*)**dlamch*(ε) for zla_herfsx_extended. This error bound should only be trusted if the previous boolean is true.

err=3 — Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for cla_herfsx_extended and *sqrt*(*n*)**dlamch*(ε) for zla_herfsx_extended to determine if the error estimate is "guaranteed". These reciprocal condition numbers are 1/(norm(1/z,inf)*norm(z,inf)) for some appropriately scaled matrix *Z*.

Let *z*=*s***a*, where *s* scales each row by a power of the radix so all absolute row sums of *z* are approximately 1.

Use this subroutine to set only the second field above.

err_bnds_comp

`REAL` for `cla_herfsx_extended`

`DOUBLE PRECISION` for `zla_herfsx_extended`.

Array, `DIMENSION(`*`nrhs`*`,`*`n_err_bnds`*`)`. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:

Componentwise relative error in the *i*-th solution vector:

$$\max_j \frac{\left|Xtrue_{ji} - X_{ji}\right|}{\left|X_{ji}\right|}$$

The array is indexed by the right-hand side *i*, on which the componentwise relative error depends, and by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is nit requested (*params(3)* = 0.0), then *err_bnds_comp* is not accessed. If *n_err_bnds* < 3, then at most the first *(:,n_err_bnds)* entries are returned.

The first index in *err_bnds_comp(i,:)* corresponds to the *i*-th right-hand side.

The second index in *err_bnds_comp(:,err)* contains the follwoing three fields:

err=1

"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for `cla_herfsx_extended` and *sqrt*(*n*)**dlamch*(ε) for `zla_herfsx_extended`.

err=2

"Guaranteed" error bpound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for `cla_herfsx_extended` and *sqrt*(*n*)**dlamch*(ε) for `zla_herfsx_extended`. This error bound should only be trusted if the previous boolean is true.

err=3

Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for

cla_herfsx_extended and *sqrt*(*n*)**dlamch*(ε) for zla_herfsx_extended to determine if the error estimate is "guaranteed". These reciprocal condition numbers are 1/(norm(1/z,inf)*norm(z,inf)) for some appropriately scaled matrix *Z*.

Let *z*=*s**(*a**diag(*x*)), where *x* is the solution for the current right-hand side and *s* scales each row of *a**diag(*x*) by a power of the radix so all absolute row sums of *z* are approximately 1.

Use this subroutine to set only the second field above.

res, *dy*, *y_tail*

COMPLEX for cla_herfsx_extended

DOUBLE COMPLEX for zla_herfsx_extended.

Workspace arrays of DIMENSION*n*.

res holds the intermediate residual.

dy holds the intermediate solution.

y_tail holds the trailing bits of the intermediate solution.

ayb

REAL for cla_herfsx_extended

DOUBLE PRECISION for zla_herfsx_extended.

Workspace array, DIMENSION*n*.

rcond

REAL for cla_herfsx_extended

DOUBLE PRECISION for zla_herfsx_extended.

Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision, in particular, if *rcond* = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.

ithresh

INTEGER. The maximum number of residual computations allowed for refinement. The default is 10. For 'aggressive', set to 100 to permit convergence using approximate factorizations or factorizations other than LU. If the factorization uses a technique other than Gaussian elimination, the guarantees in *err_bnds_norm* and *err_bnds_comp* may no longer be trustworthy.

rthresh

REAL for cla_herfsx_extended

DOUBLE PRECISION for zla_herfsx_extended.

Determines when to stop refinement if the error estimate stops decreasing. Refinement stops when the next solution no longer satisfies

norm(dx_{*i*+1}) < *rthresh* * norm(dx_*i*)

where norm(*z*) is the infinity norm of *Z*.

rthresh satisfies

`0 < rthresh≤ 1`.

The default value is 0.5. For 'aggressive' set to 0.9 to permit convergence on extremely ill-conditioned matrices.

dz_ub

`REAL` for `cla_herfsx_extended`

`DOUBLE PRECISION` for `zla_herfsx_extended`.

Determines when to start considering componentwise convergence. Componentwise *dz_ub* convergence is only considered after each component of the solution *y* is stable, that is, the relative change in each component is less than *dz_ub*. The default value is 0.25, requiring the first bit to be stable.

ignore_cwise

`LOGICAL`

If `.TRUE.`, the function ignores componentwise convergence. Default value is `.FALSE.`

Output Parameters

y

`COMPLEX` for `cla_herfsx_extended`

`DOUBLE COMPLEX` for `zla_herfsx_extended`.

The improved solution matrix *Y*.

berr_out

`REAL` for `cla_herfsx_extended`

`DOUBLE PRECISION` for `zla_herfsx_extended`.

Array, `DIMENSION`*nrhs*. *berr_out(j)* contains the componentwise relative backward error for right-hand-side *j* from the formula

`max(i) ( abs(res(i)) / ( abs(op(A))*abs(y) + abs(B) )(i) )`

where `abs(z)` is the componentwise absolute value of the matrix or vector *Z*. This is computed by `?la_lin_berr`.

err_bnds_norm, *err_bnds_comp*

Values of the corresponding input parameters improved after iterative refinement and stored in the second column of the array `( 1:nrhs, 2 )`. The other elements are kept unchanged.

info

`INTEGER`. If *info* `= 0`, the execution is successful. The solution to every right-hand side is guaranteed.

If *info* `= -i`, the *i*-th parameter had an illegal value.

?la_herpvgrw

Computes the reciprocal pivot growth factor `norm(A)/ norm(U)` *for a Hermitian indefinite matrix.*

Syntax

```
call cla_herpvgrw( uplo, n, info, a, lda, af, ldaf, ipiv, work )
call zla_herpvgrw( uplo, n, info, a, lda, af, ldaf, ipiv, work )
```

Include Files

- `mkl.fi`

Description

The `?la_herpvgrw` routine computes the reciprocal pivot growth factor `norm(A)/norm(U)`. The *max absolute element* norm is used. If this is much less than 1, the stability of the *LU* factorization of the equilibrated matrix *A* could be poor. This also means that the solution *X*, estimated condition numbers, and error bounds could be unreliable.

Input Parameters

uplo	`CHARACTER*1`. Must be `'U'` or `'L'`. Specifies the triangle of A to store: If *uplo* = `'U'`, the upper triangle of *A* is stored, If *uplo* = `'L'`, the lower triangle of *A* is stored.
n	`INTEGER`. The number of linear equations, the order of the matrix *A*; *n*≥ 0.
info	`INTEGER`. The value of INFO returned from `?hetrf`, that is, the pivot in column *info* is exactly 0.
a, *af*	`COMPLEX` for `cla_herpvgrw` `DOUBLE COMPLEX` for `zla_herpvgrw`. Arrays: *a*(*lda*,*), *af*(*ldaf*,*). *a* contains the *n*-by-*n* matrix *A*. The second dimension of *a* must be at least `max(1,n)`. *af* contains the block diagonal matrix D and the multipliers used to obtain the factor U or L as computed by `?hetrf`. The second dimension of *af* must be at least `max(1,n)`.
lda	`INTEGER`. The leading dimension of array *a*; *lda*≥`max(1,n)`.
ldaf	`INTEGER`. The leading dimension of array *af*; *ldaf*≥`max(1,n)`.
ipiv	`INTEGER`. Array, `DIMENSION`*n*. Details of the interchanges and the block structure of D as determined by `?hetrf`.
work	`REAL` for `cla_herpvgrw` `DOUBLE PRECISION` for `zla_herpvgrw`.

Array, DIMENSION 2*n. Workspace.

?hetrf

?la_lin_berr

Computes component-wise relative backward error.

Syntax

```
call sla_lin_berr(n, nz, nrhs, res, ayb, berr )
call dla_lin_berr(n, nz, nrhs, res, ayb, berr )
call cla_lin_berr(n, nz, nrhs, res, ayb, berr )
call zla_lin_berr(n, nz, nrhs, res, ayb, berr )
```

Include Files

- mkl.fi

Description

The ?la_lin_berr computes a component-wise relative backward error from the formula:

max(*i*) (abs(R(*i*))/(abs(op(*A_s*))*abs(*Y*) + abs(*B_s*))(*i*))

where abs(*Z*) is the component-wise value of the matrix or vector *Z*.

Input Parameters

n

INTEGER. The number of linear equations, the order of the matrix *A*; *n*≥ 0.

nz

INTEGER. The parameter for guarding against spuriously zero residuals.

(*nz*+1)*slamch('Safe minimum') is added to R(*i*) in the numerator of the relative backward error formula. The default value is *n*.

nrhs

INTEGER. Number of right-hand sides, the number of columns in the matrices *AYB*, *RES*, and *BERR*; *nrhs*≥ 0.

res, *ayb*

REAL for sla_lin_berr, cla_lin_berr

DOUBLE PRECISION for dla_lin_berr, zla_lin_berr

Arrays, DIMENSION (*n*,*nrhs*).

res is the residual matrix, that is, the matrix *R* in the relative backward error formula.

ayb is the denominator of that formula, that is, the matrix abs(op(*A_s*))*abs(*Y*) + abs(*B_s*). The matrices *A*, *Y*, and *B* are from iterative refinement. See description of ?la_gerfsx_extended.

Output Parameters

berr

REAL for sla_lin_berr

DOUBLE PRECISION for dla_lin_berr

COMPLEX for cla_lin_berr

DOUBLE COMPLEX for zla_lin_berr

The component-wise relative backward error.

See Also

Estimates the Skeel condition number for a symmetric positive-definite matrix.

Syntax

```
call sla_porcond( uplo, n, a, lda, af, ldaf, cmode, c, info, work, iwork )
call dla_porcond( uplo, n, a, lda, af, ldaf, cmode, c, info, work, iwork )
```

Include Files

- mkl.fi

Description

The function estimates the Skeel condition number of

op(*A*) * op2(*C*)

where

the *cmode* parameter determines op2 as follows:

cmode **Value**	**op2(C)**
1	*C*
0	*I*
-1	inv(*C*)

The Skeel condition number

cond(*A*) = norminf(|inv(*A*)||*A*|)

is computed by computing scaling factors *R* such that

diag(*R*)*A*op2(*C*)

is row equilibrated and by computing the standard infinity-norm condition number.

Input Parameters

uplo CHARACTER*1. Must be 'U' or 'L'.

Specifies the triangle of A to store:

If *uplo* = 'U', the upper triangle of *A* is stored,

If *uplo* = 'L', the lower triangle of *A* is stored.

n INTEGER. The number of linear equations, that is, the order of the matrix *A*; *n*≥ 0.

a, *af*, *c*, *work*	REAL for sla_porcond DOUBLE PRECISION for dla_porcond Arrays: *a* (*lda*,*) contains the *n*-by-*n* matrix *A*. *af* (*ldaf*,*) contains the triangular factor L or U from the Cholesky factorization A = U^T*U or A = L*L^T, as computed by ?potrf. *c*, DIMENSION*n*. The vector *C* in the formula op(*A*) * op2(*C*). *work* is a workspace array of DIMENSION (3**n*). The second dimension of *a* and *af* must be at least max(1, *n*).
lda	INTEGER. The leading dimension of the array *ab*. *lda*≥max(1,*n*).
ldaf	INTEGER. The leading dimension of *af*. *ldaf*≥max(1,*n*).
cmode	INTEGER. Determines op2(*C*) in the formula op(*A*) * op2(*C*) as follows: If *cmode* = 1, op2(*C*) = *C*. If *cmode* = 0, op2(*C*) = *I*. If *cmode* = -1, op2(*C*) = inv(*C*).
iwork	INTEGER. Workspace array with DIMENSION*n*.

Output Parameters

info	INTEGER. If *info* = 0, the execution is successful. If *i* > 0, the *i*-th parameter is invalid.

Include Files

- mkl.fi

Description

The ?la_porfsx_extended subroutine improves the computed solution to a system of linear equations by performing extra-precise iterative refinement and provides error bounds and backward error estimates for the solution. The ?herfsx routine calls ?la_porfsx_extended to perform iterative refinement.

In addition to normwise error bound, the code provides maximum componentwise error bound, if possible. See comments for *err_bnds_norm* and *err_bnds_comp* for details of the error bounds.

Use ?la_porfsx_extended to set only the second fields of *err_bnds_norm* and *err_bnds_comp*.

Input Parameters

prec_type

INTEGER.

Specifies the intermediate precision to be used in refinement. The value is defined by ilaprec(p), where *p* is a CHARACTER and:

If *p* = 'S': Single.

If *p* = 'D': Double.

If *p* = 'I': Indigenous.

If *p* = 'X', 'E': Extra.

uplo

CHARACTER*1. Must be 'U' or 'L'.

Specifies the triangle of A to store:

If *uplo* = 'U', the upper triangle of *A* is stored,

If *uplo* = 'L', the lower triangle of *A* is stored.

n

INTEGER. The number of linear equations; the order of the matrix *A*; $n \geq 0$.

nrhs

INTEGER. The number of right-hand sides; the number of columns of the matrix *B*.

a, af, b, y

REAL for sla_porfsx_extended

DOUBLE PRECISION for dla_porfsx_extended

COMPLEX for cla_porfsx_extended

DOUBLE COMPLEX for zla_porfsx_extended.

Arrays: *a*(*lda*,*), *af*(*ldaf*,*), *b*(*ldb*,*), *y*(*ldy*,*).

The array *a* contains the original *n*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1,*n*).

The array *af* contains the triangular factor L or U from the Cholesky factorization as computed by ?potrf:

$A = U^T*U$ or $A = L*L^T$ for real flavors,

$A = U^H*U$ or $A = L*L^H$ for complex flavors.

The second dimension of *af* must be at least max(1,*n*).

The array *b* contains the right-hand-side of the matrix *B*. The second dimension of *b* must be at least max(1,*nrhs*).

The array *y* on entry contains the solution matrix *X* as computed by ?potrs. The second dimension of *y* must be at least max(1,*nrhs*).

lda INTEGER. The leading dimension of the array *a*; *lda*≥ max(1,*n*).

ldaf INTEGER. The leading dimension of the array *af*; *ldaf*≥ max(1,*n*).

colequ LOGICAL. If *colequ* = .TRUE., column equilibration was done to *A* before calling this routine. This is needed to compute the solution and error bounds correctly.

c REAL for sla_porfsx_extended and cla_porfsx_extended

DOUBLE PRECISION for dla_porfsx_extended and zla_porfsx_extended.

c contains the column scale factors for *A*. If *colequ* = .FALSE., *c* is not used.

If *c* is input, each element of *c* should be a power of the radix to ensure a reliable solution and error estimates. Scaling by power of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

ldb INTEGER. The leading dimension of the array *b*; *ldb*≥ max(1, *n*).

ldy INTEGER. The leading dimension of the array *y*; *ldy*≥ max(1, *n*).

n_norms INTEGER. Determines which error bounds to return. See *err_bnds_norm* and *err_bnds_comp* descriptions in *Output Arguments* section below.

If *n_norms*≥ 1, returns normwise error bounds.

If *n_norms*≥ 2, returns componentwise error bounds.

err_bnds_norm REAL for sla_porfsx_extended and cla_porfsx_extended

DOUBLE PRECISION for dla_porfsx_extended and zla_porfsx_extended.

Array, DIMENSION(*nrhs*,*n_err_bnds*). For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error.

Normwise relative error in the *i*-th solution vector is defined as follows:

$$\frac{\max_j \left| Xtrue_{ji} - X_{ji} \right|}{\max_j \left| X_{ji} \right|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.

The first index in *err_bnds_norm(i,:)* corresponds to the *i*-th right-hand side.

The second index in *err_bnds_norm(:,err)* contains the following three fields:

err=1	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for sla_porfsx_extended/cla_porfsx_extended and *sqrt*(*n*)**dlamch*(ε) for dla_porfsx_extended/zla_porfsx_extended.
err=2	"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for sla_porfsx_extended/cla_porfsx_extended and *sqrt*(*n*)**dlamch*(ε) for dla_porfsx_extended/zla_porfsx_extended. This error bound should only be trusted if the previous boolean is true.
err=3	Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for sla_porfsx_extended/cla_porfsx_extended and *sqrt*(*n*)**dlamch*(ε) for dla_porfsx_extended/zla_porfsx_extended to determine if the error estimate is "guaranteed". These reciprocal condition numbers are 1/(norm(1/z,inf)*norm(z,inf)) for some appropriately scaled matrix *Z*. Let *z=s*a*, where *s* scales each row by a power of the radix so all absolute row sums of *z* are approximately 1. Use this subroutine to set only the second field above.

err_bnds_comp

REAL for sla_porfsx_extended and cla_porfsx_extended

DOUBLE PRECISION for dla_porfsx_extended and zla_porfsx_extended.

Array, DIMENSION(*nrhs*,*n_err_bnds*). For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:

Componentwise relative error in the *i*-th solution vector:

$$\max_j \frac{\left|Xtrue_{ji} - X_{ji}\right|}{\left|X_{ji}\right|}$$

The array is indexed by the right-hand side *i*, on which the componentwise relative error depends, and by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is nit requested (*params(3)* = 0.0), then *err_bnds_comp* is not accessed. If *n_err_bnds* < 3, then at most the first *(:,n_err_bnds)* entries are returned.

The first index in *err_bnds_comp(i,:)* corresponds to the *i*-th right-hand side.

The second index in *err_bnds_comp(:,err)* contains the follwoing three fields:

err=1 — "Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for sla_porfsx_extended/cla_porfsx_extended and *sqrt*(*n*)**dlamch*(ε) for dla_porfsx_extended/zla_porfsx_extended.

err=2 — "Guaranteed" error bpound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for sla_porfsx_extended/cla_porfsx_extended and *sqrt*(*n*)**dlamch*(ε) for dla_porfsx_extended/zla_porfsx_extended. This error bound should only be trusted if the previous boolean is true.

err=3 — Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for sla_porfsx_extended/cla_porfsx_extended and *sqrt*(*n*)**dlamch*(ε) for dla_porfsx_extended/zla_porfsx_extended to determine if the error estimate is "guaranteed". These reciprocal condition numbers are 1/(norm(1/z,inf)*norm(z,inf)) for some appropriately scaled matrix *Z*.

Let *z=s**(*a**diag(*x*)), where *x* is the solution for the current right-hand side and *s* scales each row of *a**diag(*x*) by a power of the radix so all absolute row sums of *z* are approximately 1.

Use this subroutine to set only the second field above.

res, *dy*, *y_tail*

REAL for sla_porfsx_extended

DOUBLE PRECISION for dla_porfsx_extended

COMPLEX for cla_porfsx_extended

DOUBLE COMPLEX for zla_porfsx_extended.

Workspace arrays of DIMENSION*n*.

res holds the intermediate residual.

dy holds the intermediate solution.

y_tail holds the trailing bits of the intermediate solution.

ayb

REAL for sla_porfsx_extended and cla_porfsx_extended

DOUBLE PRECISION for dla_porfsx_extended and zla_porfsx_extended.

Workspace array, DIMENSION*n*.

rcond

REAL for sla_porfsx_extended and cla_porfsx_extended

DOUBLE PRECISION for dla_porfsx_extended and zla_porfsx_extended.

Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision, in particular, if *rcond* = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.

ithresh

INTEGER. The maximum number of residual computations allowed for refinement. The default is 10. For 'aggressive', set to 100 to permit convergence using approximate factorizations or factorizations other than LU. If the factorization uses a technique other than Gaussian elimination, the guarantees in *err_bnds_norm* and *err_bnds_comp* may no longer be trustworthy.

rthresh

REAL for sla_porfsx_extended and cla_porfsx_extended

DOUBLE PRECISION for dla_porfsx_extended and zla_porfsx_extended.

Determines when to stop refinement if the error estimate stops decreasing. Refinement stops when the next solution no longer satisfies

norm(dx_{*i*+1}) < *rthresh* * norm(dx_*i*)

where norm(*z*) is the infinity norm of *Z*.

rthresh satisfies

0 < *rthresh*≤ 1.

The default value is 0.5. For 'aggressive' set to 0.9 to permit convergence on extremely ill-conditioned matrices.

dz_ub

REAL for sla_porfsx_extended and cla_porfsx_extended

DOUBLE PRECISION for dla_porfsx_extended and zla_porfsx_extended.

Determines when to start considering componentwise convergence. Componentwise *dz_ub* convergence is only considered after each component of the solution *y* is stable, that is, the relative change in each component is less than *dz_ub*. The default value is 0.25, requiring the first bit to be stable.

ignore_cwise

LOGICAL

If .TRUE., the function ignores componentwise convergence. Default value is .FALSE.

Output Parameters

y

REAL for sla_porfsx_extended

DOUBLE PRECISION for dla_porfsx_extended

COMPLEX for cla_porfsx_extended

DOUBLE COMPLEX for zla_porfsx_extended.

The improved solution matrix *Y*.

berr_out

REAL for sla_porfsx_extended and cla_porfsx_extended

DOUBLE PRECISION for dla_porfsx_extended and zla_porfsx_extended.

Array, DIMENSION*nrhs*. *berr_out(j)* contains the componentwise relative backward error for right-hand-side *j* from the formula

max(*i*) (abs(*res*(*i*)) / (abs(op(*A*))*abs(*y*) + abs(*B*))(*i*))

where abs(*z*) is the componentwise absolute value of the matrix or vector *Z*. This is computed by ?la_lin_berr.

err_bnds_norm, *err_bnds_comp*

Values of the corresponding input parameters improved after iterative refinement and stored in the second column of the array (1:*nrhs*, 2). The other elements are kept unchanged.

info

INTEGER. If *info* = 0, the execution is successful. The solution to every right-hand side is guaranteed.

If *info* = -*i*, the *i*-th parameter had an illegal value.

?la_porpvgrw

Computes the reciprocal pivot growth factor `norm(A)/ norm(U)` *for a symmetric or Hermitian positive-definite matrix.*

Syntax

```
call sla_porpvgrw( uplo, ncols, a, lda, af, ldaf, work )
call dla_porpvgrw( uplo, ncols, a, lda, af, ldaf, work )
call cla_porpvgrw( uplo, ncols, a, lda, af, ldaf, work )
call zla_porpvgrw( uplo, ncols, a, lda, af, ldaf, work )
```

Include Files

- `mkl.fi`

Description

The `?la_porpvgrw` routine computes the reciprocal pivot growth factor `norm(A)/norm(U)`. The *max absolute element* norm is used. If this is much less than 1, the stability of the *LU* factorization of the equilibrated matrix *A* could be poor. This also means that the solution *X*, estimated condition numbers, and error bounds could be unreliable.

Input Parameters

uplo

`CHARACTER*1`. Must be `'U'` or `'L'`.

Specifies the triangle of A to store:

If *uplo* = `'U'`, the upper triangle of *A* is stored,

If *uplo* = `'L'`, the lower triangle of *A* is stored.

ncols

`INTEGER`. The number of columns of the matrix *A*; *ncols*≥ 0.

a, *af*

`REAL` for `sla_porpvgrw`

`DOUBLE PRECISION` for `dla_porpvgrw`

`COMPLEX` for `cla_porpvgrw`

`DOUBLE COMPLEX` for `zla_porpvgrw`.

Arrays: *a*(*lda*,*), *af*(*ldaf*,*).

The array *a* contains the input *n*-by-*n* matrix *A*. The second dimension of *a* must be at least `max(1,n)`.

The array *af* contains the triangular factor `L` or `U` from the Cholesky factorization as computed by `?potrf`:

$A = U^T*U$ or $A = L*L^T$ for real flavors,

$A = U^H*U$ or $A = L*L^H$ for complex flavors.

The second dimension of *af* must be at least `max(1,n)`.

lda

`INTEGER`. The leading dimension of *a*; *lda*≥ `max(1,n)`.

ldaf

`INTEGER`. The leading dimension of *af*; *ldaf*≥ `max(1,n)`.

work REAL for sla_porpvgrw and cla_porpvgrw

DOUBLE PRECISION for dla_porpvgrw and zla_porpvgrw.

Workspace array, dimension 2*n.

See Also

?potrf

?laqhe

Scales a Hermitian matrix.

Syntax

```
call claqhe( uplo, n, a, lda, s, scond, amax, equed )
call zlaqhe( uplo, n, a, lda, s, scond, amax, equed )
```

Include Files

- mkl.fi

Description

The routine equilibrates a Hermitian matrix *A* using the scaling factors in the vector *s*.

Input Parameters

uplo CHARACTER*1.

Specifies whether to store the upper or lower part of the Hermitian matrix *A*.

If *uplo* = 'U', the upper triangular part of *A*;

if *uplo* = 'L', the lower triangular part of *A*.

n INTEGER. The order of the matrix *A*.

$n \geq 0$.

a COMPLEX for claqhe

DOUBLE COMPLEX for zlaqhe

Array, DIMENSION (*lda*,*n*). On entry, the Hermitian matrix *A*.

If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of matrix *A* and the strictly lower triangular part of *a* is not referenced.

If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of matrix *A* and the strictly upper triangular part of *a* is not referenced.

lda INTEGER. The leading dimension of the array *a*.

$lda \geq \max(n,1)$.

s REAL for claqhe

DOUBLE PRECISION for zlaqhe

Array, DIMENSION (*n*). The scale factors for *A*.

scond

REAL for claqhe

DOUBLE PRECISION for zlaqhe

Ratio of the smallest *s*(*i*) to the largest *s*(*i*).

amax

REAL for claqhe

DOUBLE PRECISION for zlaqhe

Absolute value of largest matrix entry.

Output Parameters

a

If *equed* = 'Y', *a* contains the equilibrated matrix diag(*s*)*A*diag(*s*).

equed

CHARACTER*1.

Specifies whether or not equilibration was done.

If *equed* = 'N': No equilibration.

If *equed* = 'Y': Equilibration was done, that is, *A* has been replaced by diag(*s*)*A*diag(*s*).

Application Notes

The routine uses internal parameters *thresh*, *large*, and *small*. The parameter *thresh* is a threshold value used to decide if scaling should be done based on the ratio of the scaling factors. If *scond* < *thresh*, scaling is done.

The *large* and *small* parameters are threshold values used to decide if scaling should be done based on the absolute size of the largest matrix element. If *amax* > *large* or *amax* < *small*, scaling is done.

?laqhp

Scales a Hermitian matrix stored in packed form.

Syntax

```
call claqhp( uplo, n, ap, s, scond, amax, equed )
call zlaqhp( uplo, n, ap, s, scond, amax, equed )
```

Include Files

- mkl.fi

Description

The routine equilibrates a Hermitian matrix *A* using the scaling factors in the vector *s*.

Input Parameters

uplo

CHARACTER*1.

Specifies whether to store the upper or lower part of the Hermitian matrix *A*.

If *uplo* = 'U', the upper triangular part of *A*;

if *uplo* = 'L', the lower triangular part of *A*.

n

INTEGER. The order of the matrix *A*.

$n \geq 0$.

ap

COMPLEX for claqhp

DOUBLE COMPLEX for zlaqhp

Array, DIMENSION ($n*(n+1)/2$). The Hermitian matrix *A*.

- If *uplo* = 'U', the upper triangular part of the Hermitian matrix *A* is stored in the packed array *ap* as follows:

  ap(*i*+(*j*-1)**j*/2) = *A*(*i*,*j*) for $1 \leq i \leq j$.
- If *uplo* = 'L', the lower triangular part of Hermitian matrix *A* is stored in the packed array *ap* as follows:

  ap(*i*+(*j*-1)*(2*n*-j)/2) = *A*(*i*,*j*) for $j \leq i \leq n$.

s

REAL for claqhp

DOUBLE PRECISION for zlaqhp

Array, DIMENSION (*n*). The scale factors for *A*.

scond

REAL for claqhp

DOUBLE PRECISION for zlaqhp

Ratio of the smallest *s*(*i*) to the largest *s*(*i*).

amax

REAL for claqhp

DOUBLE PRECISION for zlaqhp

Absolute value of largest matrix entry.

Output Parameters

a

If *equed* = 'Y', *a* contains the equilibrated matrix diag(*s*)*A*diag(*s*) in the same storage format as on input.

equed

CHARACTER*1.

Specifies whether or not equilibration was done.

If *equed* = 'N': No equilibration.

If *equed* = 'Y': Equilibration was done, that is, *A* has been replaced by diag(*s*)*A*diag(*s*).

Application Notes

The routine uses internal parameters *thresh*, *large*, and *small*. The parameter *thresh* is a threshold value used to decide if scaling should be done based on the ratio of the scaling factors. If *scond* < *thresh*, scaling is done.

The *large* and *small* parameters are threshold values used to decide if scaling should be done based on the absolute size of the largest matrix element. If *amax* > *large* or *amax* < *small*, scaling is done.

?larcm

Multiplies a square real matrix by a complex matrix.

Syntax

```
call clarcm( m, n, a, lda, b, ldb, c, ldc, rwork )
call zlarcm( m, n, a, lda, b, ldb, c, ldc, rwork )
```

Description

The routine performs a simple matrix-matrix multiplication of the form

`C = A*B`,

where *A* is *m*-by-*m* and real, *B* is *m*-by-*n* and complex, and *C* is *m*-by-*n* and complex.

Input Parameters

m	INTEGER. The number of rows and columns of matrix *A* and the number of rows of matrix *C* (*m*≥ 0).
n	INTEGER. The number of columns of matrix *B* and the number of columns of matrix *C* (*n*≥ 0).
a	REAL for clarcm DOUBLE PRECISION for zlarcm Array, size (*lda*, *m*). Contains the *m*-by-*m* matrix *A*.
lda	INTEGER. The leading dimension of the array *a*, *lda*≥max(1, *m*).
b	COMPLEX for clarcm DOUBLE COMPLEX for zlarcm Array, DIMENSION(*ldb*, *n*). Contains the *m*-by-*n* matrix *B*.
ldb	INTEGER. The leading dimension of the array *b*, *ldb*≥max(1, *m*) for column-major layout; *ldb*≥max(1, *n*) for row-major layout .
ldc	INTEGER. The leading dimension of the array *c*, *ldc*≥max(1, *m*) for column-major layout; *ldc*≥max(1, *n*) for row-major layout .
rwork	REAL for clarcm DOUBLE PRECISION for zlarcm Workspace array, DIMENSION(2*m*n).

Output Parameters

c	COMPLEX for clarcm DOUBLE COMPLEX for zlarcm Array, size (*ldc*, *n*). Contains the *m*-by-*n* matrix *C*.

Return Values

This function returns a value *info*. If *info* = 0, the execution is successful. If *info* = -*i*, parameter *i* had an illegal value.

?la_gerpvgrw

Computes the reciprocal pivot growth factor `norm(A)/ norm(U)` *for a general matrix.*

Syntax

```
call sla_gerpvgrw( n, ncols, a, lda, af, ldaf )
call dla_gerpvgrw( n, ncols, a, lda, af, ldaf )
call cla_gerpvgrw( n, ncols, a, lda, af, ldaf )
call zla_gerpvgrw( n, ncols, a, lda, af, ldaf )
```

Include Files

- `mkl.fi`

Description

The `?la_gerpvgrw` routine computes the reciprocal pivot growth factor `norm(A)/norm(U)`. The *max absolute element* norm is used. If this is much less than 1, the stability of the *LU* factorization of the equilibrated matrix *A* could be poor. This also means that the solution *X*, estimated condition numbers, and error bounds could be unreliable.

Input Parameters

n	`INTEGER`. The number of linear equations, the order of the matrix *A*; *n*≥ 0.
ncols	`INTEGER`. The number of columns of the matrix *A*; *ncols*≥ 0.

a, *af*	`REAL` for `sla_gerpvgrw`
	`DOUBLE PRECISION` for `dla_gerpvgrw`
	`COMPLEX` for `cla_gerpvgrw`
	`DOUBLE COMPLEX` for `zla_gerpvgrw`.
	Arrays: `a(lda,*)`, `af(ldaf,*)`.
	The array *a* contains the input *n*-by-*n* matrix *A*. The second dimension of *a* must be at least `max(1,n)`.
	The array *af* contains the factors L and U from the factorization triangular factor `L` or `U` from the Cholesky factorization `A = P*L*U` as computed by `?getrf`. The second dimension of *af* must be at least `max(1,n)`.

lda	`INTEGER`. The leading dimension of *a*; *lda*≥ `max(1,n)`.
ldaf	`INTEGER`. The leading dimension of *af*; *ldaf*≥ `max(1,n)`.

See Also

`?getrf`

?larscl2

Performs reciprocal diagonal scaling on a vector.

Syntax

```
call slarscl2(m, n, d, x, ldx)
call dlarscl2(m, n, d, x, ldx)
call clarscl2(m, n, d, x, ldx)
call zlarscl2(m, n, d, x, ldx)
```

Include Files

- mkl.fi

Description

The ?larscl2 routines perform reciprocal diagonal scaling on a vector

$x := D^{-1}*x$,

where:

x is a vector, and

D is a diagonal matrix.

Input Parameters

m	INTEGER. Specifies the number of rows of the matrix *D* and the number of elements of the vector *x*. The value of *m* must be at least zero.
n	INTEGER. The number of columns of *D* and *x*. The value of *n* must be at least zero.
d	REAL for slarscl2 and clarscl2. DOUBLE PRECISION for dlarscl2 and zlarscl2. Array, DIMENSION*m*. Diagonal matrix *D* stored as a vector of length *m*.
x	REAL for slarscl2. DOUBLE PRECISION for dlarscl2. COMPLEX for clarscl2. DOUBLE COMPLEX for zlarscl2. Array, DIMENSION(*ldx*,*n*). The vector *x* to scale by *D*.
ldx	INTEGER. The leading dimension of the vector *x*. The value of *ldx* must be at least zero.

Output Parameters

x	Scaled vector *x*.

?lascl2

Performs diagonal scaling on a vector.

Syntax

```
call slascl2(m, n, d, x, ldx)
call dlascl2(m, n, d, x, ldx)
call clascl2(m, n, d, x, ldx)
call zlascl2(m, n, d, x, ldx)
```

Include Files

- mkl.fi

Description

The ?lascl2 routines perform diagonal scaling on a vector

x := *D***x*,

where:

x is a vector, and

D is a diagonal matrix.

Input Parameters

m	INTEGER. Specifies the number of rows of the matrix *D* and the number of elements of the vector *x*. The value of *m* must be at least zero.
n	INTEGER. The number of columns of *D* and *x*. The value of *n* must be at least zero.
d	REAL for slascl2 and clascl2. DOUBLE PRECISION for dlascl2 and zlascl2. Array, DIMENSION*m*. Diagonal matrix *D* stored as a vector of length *m*.
x	REAL for slascl2. DOUBLE PRECISION for dlascl2. COMPLEX for clascl2. DOUBLE COMPLEX for zlascl2. Array, DIMENSION(*ldx*,*n*). The vector *x* to scale by *D*.
ldx	INTEGER. The leading dimension of the vector *x*. The value of *ldx* must be at least zero.

Output Parameters

x	Scaled vector *x*.

?la_syamv

Computes a matrix-vector product using a symmetric indefinite matrix to calculate error bounds.

Syntax

```
call sla_syamv(uplo, n, alpha, a, lda, x, incx, beta, y, incy)
call dla_syamv(uplo, n, alpha, a, lda, x, incx, beta, y, incy)
call cla_syamv(uplo, n, alpha, a, lda, x, incx, beta, y, incy)
call zla_syamv(uplo, n, alpha, a, lda, x, incx, beta, y, incy)
```

Include Files

- mkl.fi

Description

The ?la_syamv routines perform a matrix-vector operation defined as

y := *alpha**abs(*A*)*abs(*x*) + *beta**abs(*y*),

where:

alpha and *beta* are scalars,

x and *y* are vectors,

A is an *n*-by-*n* Hermitian matrix.

This function is primarily used in calculating error bounds. To protect against underflow during evaluation, the function perturbs components in the resulting vector away from zero by (*n* + 1) times the underflow threshold. To prevent unnecessarily large errors for block structure embedded in general matrices, the function does not perturb *symbolically* zero components. A zero entry is considered *symbolic* if all multiplications involved in computing that entry have at least one zero multiplicand.

Input Parameters

uplo

CHARACTER*1.

Specifies whether the upper or lower triangular part of the array A is to be referenced:

If *uplo* = 'BLAS_UPPER', only the upper triangular part of A is to be referenced,

If *uplo* = 'BLAS_LOWER', only the lower triangular part of A is to be referenced.

n

INTEGER. Specifies the number of rows and columns of the matrix *A*. The value of *n* must be at least zero.

alpha

REAL for sla_syamv and cla_syamv

DOUBLE PRECISION for dla_syamv and zla_syamv.

Specifies the scalar *alpha*.

a

REAL for sla_syamv

DOUBLE PRECISION for dla_syamv

COMPLEX for cla_syamv

	DOUBLE COMPLEX for zla_syamv. Array, DIMENSION(*lda*, *). Before entry, the leading *m*-by-*n* part of the array *a* must contain the matrix of coefficients. The second dimension of *a* must be at least max(1,*n*).
lda	INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least max(1, *n*).
x	REAL for sla_syamv DOUBLE PRECISION for dla_syamv COMPLEX for cla_syamv DOUBLE COMPLEX for zla_syamv. Array, DIMENSION at least (1+(*n*–1)*abs(*incx*)). Before entry, the incremented array *x* must contain the vector *X*.
incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must be non-zero.
beta	REAL for sla_syamv and cla_syamv DOUBLE PRECISION for dla_syamv and zla_syamv Specifies the scalar *beta*. When *beta* is zero, you do not need to set *y* on input.
y	REAL for sla_syamv and cla_syamv DOUBLE PRECISION for dla_syamv and zla_syamv Array, DIMENSION at least (1 +(*n* – 1)*abs(*incy*)) otherwise. Before entry with non-zero *beta*, the incremented array *y* must contain the vector *Y*.
incy	INTEGER. Specifies the increment for the elements of *y*. The value of *incy* must be non-zero.

Output Parameters

y	Updated vector *Y*.

?la_syrcond

Estimates the Skeel condition number for a symmetric indefinite matrix.

Syntax

```
call sla_syrcond( uplo, n, a, lda, af, ldaf, ipiv, cmode, c, info, work, iwork )
call dla_syrcond( uplo, n, a, lda, af, ldaf, ipiv, cmode, c, info, work, iwork )
```

Include Files

- mkl.fi

Description

The function estimates the Skeel condition number of

`op(A) * op2(C)`

where

the *cmode* parameter determines `op2` as follows:

cmode **Value**	**op2(C)**
1	*C*
0	*I*
-1	`inv(C)`

The Skeel condition number

`cond(A) = norminf(|inv(A)||A|)`

is computed by computing scaling factors *R* such that

`diag(R)*A*op2(C)`

is row equilibrated and by computing the standard infinity-norm condition number.

Input Parameters

uplo

`CHARACTER*1`. Must be `'U'` or `'L'`.

Specifies the triangle of A to store:

If *uplo* = `'U'`, the upper triangle of *A* is stored,

If *uplo* = `'L'`, the lower triangle of *A* is stored.

n

`INTEGER`. The number of linear equations, that is, the order of the matrix *A*; *n*≥ 0.

a, *af*, *c*, *work*

`REAL` for `sla_syrcond`

`DOUBLE PRECISION` for `dla_syrcond`

Arrays:

ab (*lda*,*) contains the *n*-by-*n* matrix *A*.

af (*ldaf*,*) contains the The block diagonal matrix D and the multipliers used to obtain the factor `L` or `U` as computed by `?sytrf`.

The second dimension of *a* and *af* must be at least `max(1, n)`.

c, `DIMENSION`*n*. The vector *C* in the formula `op(A) * op2(C)`.

work is a workspace array of `DIMENSION` (3**n*).

lda

`INTEGER`. The leading dimension of the array *ab*. *lda*≥`max(1,n)`.

ldaf

`INTEGER`. The leading dimension of *af*. *ldaf*≥`max(1,n)`.

ipiv

`INTEGER`.

Array with `DIMENSION`*n*. Details of the interchanges and the block structure of D as determined by `?sytrf`.

cmode INTEGER. Determines op2(*C*) in the formula op(*A*) * op2(*C*) as follows:

If *cmode* = 1, op2(*C*) = *C*.

If *cmode* = 0, op2(*C*) = *I*.

If *cmode* = -1, op2(*C*) = inv(*C*).

iwork INTEGER. Workspace array with DIMENSION*n*.

Output Parameters

info INTEGER.

If *info* = 0, the execution is successful.

If *i* > 0, the *i*-th parameter is invalid.

Description

The function computes the infinity norm condition number of

op(*A*) * inv(diag(c))

where the *c* is a REAL vector for cla_syrcond_c and a DOUBLE PRECISION vector for zla_syrcond_c.

Input Parameters

uplo CHARACTER*1. Must be 'U' or 'L'.

Specifies the triangle of A to store:

If *uplo* = 'U', the upper triangle of *A* is stored,

If *uplo* = 'L', the lower triangle of *A* is stored.

n INTEGER. The number of linear equations, that is, the order of the matrix *A*; *n*≥ 0.

a COMPLEX for cla_syrcond_c

DOUBLE COMPLEX for zla_syrcond_c

Array, DIMENSION(*lda*, *). On entry, the *n*-by-*n* matrix A. The second dimension of *a* must be at least max(1,*n*).

lda INTEGER. The leading dimension of the array *a*. *lda*≥max(1,*n*).

af COMPLEX for cla_syrcond_c

DOUBLE COMPLEX for zla_syrcond_c

Array, DIMENSION(*ldaf*, *). The block diagonal matrix D and the multipliers used to obtain the factor U or L as computed by ?sytrf. The second dimension of *af* must be at least max(1,*n*).

ldaf INTEGER. The leading dimension of the array *af*. *ldaf*≥max(1,*n*).

ipiv INTEGER.

Array with DIMENSION*n*. Details of the interchanges and the block structure of D as determined by ?sytrf.

c REAL for cla_syrcond_c

DOUBLE PRECISION for zla_syrcond_c

Array *c* with DIMENSION*n*. The vector *c* in the formula

op(*A*) * inv(diag(*c*)).

capply LOGICAL. If .TRUE., then the function uses the vector *c* from the formula

op(*A*) * inv(diag(*c*)).

work COMPLEX for cla_syrcond_c

DOUBLE COMPLEX for zla_syrcond_c

Array DIMENSION 2**n*. Workspace.

rwork REAL for cla_syrcond_c

DOUBLE PRECISION for zla_syrcond_c

Array DIMENSION*n*. Workspace.

Output Parameters

info INTEGER.

If *info* = 0, the execution is successful.

If *i* > 0, the *i*-th parameter is invalid.

Include Files

- mkl.fi

Description

The ?la_syrfsx_extended subroutine improves the computed solution to a system of linear equations by performing extra-precise iterative refinement and provides error bounds and backward error estimates for the solution. The ?syrfsx routine calls ?la_syrfsx_extended to perform iterative refinement.

In addition to normwise error bound, the code provides maximum componentwise error bound, if possible. See comments for *err_bnds_norm* and *err_bnds_comp* for details of the error bounds.

Use ?la_syrfsx_extended to set only the second fields of *err_bnds_norm* and *err_bnds_comp*.

Input Parameters

prec_type INTEGER.

Specifies the intermediate precision to be used in refinement. The value is defined by ilaprec(p), where *p* is a CHARACTER and:

If *p* = 'S': Single.

If *p* = 'D': Double.

If *p* = 'I': Indigenous.

If *p* = 'X', 'E': Extra.

uplo — CHARACTER*1. Must be 'U' or 'L'.

Specifies the triangle of A to store:

If *uplo* = 'U', the upper triangle of *A* is stored,

If *uplo* = 'L', the lower triangle of *A* is stored.

n — INTEGER. The number of linear equations; the order of the matrix *A*; $n \geq 0$.

nrhs — INTEGER. The number of right-hand sides; the number of columns of the matrix *B*.

a, af, b, y — REAL for sla_syrfsx_extended

DOUBLE PRECISION for dla_syrfsx_extended

COMPLEX for cla_syrfsx_extended

DOUBLE COMPLEX for zla_syrfsx_extended.

Arrays: *a*(*lda*,*), *af*(*ldaf*,*), *b*(*ldb*,*), *y*(*ldy*,*).

The array *a* contains the original *n*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1,*n*).

The array *af* contains the block diagonal matrix D and the multipliers used to obtain the factor U or L as computed by ?sytrf.

The second dimension of *af* must be at least max(1,*n*).

The array *b* contains the right-hand-side of the matrix *B*. The second dimension of *b* must be at least max(1,*nrhs*).

The array *y* on entry contains the solution matrix *X* as computed by ?sytrs. The second dimension of *y* must be at least max(1,*nrhs*).

lda — INTEGER. The leading dimension of the array *a*; *lda* ≥ max(1,*n*).

ldaf — INTEGER. The leading dimension of the array *af*; *ldaf* ≥ max(1,*n*).

ipiv — INTEGER.

Array with DIMENSION*n*. Details of the interchanges and the block structure of D as determined by ?sytrf.

colequ — LOGICAL. If *colequ* = .TRUE., column equilibration was done to *A* before calling this routine. This is needed to compute the solution and error bounds correctly.

c — REAL for sla_syrfsx_extended and cla_syrfsx_extended

DOUBLE PRECISION for dla_syrfsx_extended and zla_syrfsx_extended.

c contains the column scale factors for *A*. If *colequ* = .FALSE., *c* is not used.

If *c* is input, each element of *c* should be a power of the radix to ensure a reliable solution and error estimates. Scaling by power of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

ldb — INTEGER. The leading dimension of the array *b*; *ldb*≥ max(1, *n*).

ldy — INTEGER. The leading dimension of the array *y*; *ldy*≥ max(1, *n*).

n_norms — INTEGER. Determines which error bounds to return. See *err_bnds_norm* and *err_bnds_comp* descriptions in *Output Arguments* section below.

If *n_norms*≥ 1, returns normwise error bounds.

If *n_norms*≥ 2, returns componentwise error bounds.

err_bnds_norm — REAL for sla_syrfsx_extended and cla_syrfsx_extended

DOUBLE PRECISION for dla_syrfsx_extended and zla_syrfsx_extended.

Array, DIMENSION(*nrhs*,*n_err_bnds*). For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error.

Normwise relative error in the *i*-th solution vector is defined as follows:

$$\frac{\max_j \left| Xtrue_{ji} - X_{ji} \right|}{\max_j \left| X_{ji} \right|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.

The first index in *err_bnds_norm(i,:)* corresponds to the *i*-th right-hand side.

The second index in *err_bnds_norm(:,err)* contains the following three fields:

err=1 — "Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for sla_syrfsx_extended/cla_syrfsx_extended and *sqrt*(*n*)**dlamch*(ε) for dla_syrfsx_extended/zla_syrfsx_extended.

err=2 — "Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for sla_syrfsx_extended/cla_syrfsx_extended and *sqrt*(*n*)**dlamch*(ε) for

`dla_syrfsx_extended/zla_syrfsx_extended`. This error bound should only be trusted if the previous boolean is true.

err=3 — Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for `sla_syrfsx_extended/cla_syrfsx_extended` and *sqrt*(*n*)**dlamch*(ε) for `dla_syrfsx_extended/zla_syrfsx_extended` to determine if the error estimate is "guaranteed". These reciprocal condition numbers are `1/(norm(1/z,inf)*norm(z,inf))` for some appropriately scaled matrix *Z*.

Let *z*=*s***a*, where *s* scales each row by a power of the radix so all absolute row sums of *z* are approximately 1.

Use this subroutine to set only the second field above.

err_bnds_comp — `REAL` for `sla_syrfsx_extended` and `cla_syrfsx_extended`

`DOUBLE PRECISION` for `dla_syrfsx_extended` and `zla_syrfsx_extended`.

Array, `DIMENSION(`*nrhs*`,`*n_err_bnds*`)`. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:

Componentwise relative error in the *i*-th solution vector:

$$\max_j \frac{\left|Xtrue_{ji} - X_{ji}\right|}{\left|X_{ji}\right|}$$

The array is indexed by the right-hand side *i*, on which the componentwise relative error depends, and by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is nit requested (*params(3)* = 0.0), then *err_bnds_comp* is not accessed. If *n_err_bnds* < 3, then at most the first *(:,n_err_bnds)* entries are returned.

The first index in *err_bnds_comp(i,:)* corresponds to the *i*-th right-hand side.

The second index in *err_bnds_comp(:,err)* contains the follwoing three fields:

err=1 — "Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for

		sla_syrfsx_extended/cla_syrfsx_extended and *sqrt*(*n*)**dlamch*(ε) for dla_syrfsx_extended/zla_syrfsx_extended.
	err=2	"Guaranteed" error bpound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for sla_syrfsx_extended/cla_syrfsx_extended and *sqrt*(*n*)**dlamch*(ε) for dla_syrfsx_extended/zla_syrfsx_extended. This error bound should only be trusted if the previous boolean is true.
	err=3	Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for sla_syrfsx_extended/cla_syrfsx_extended and *sqrt*(*n*)**dlamch*(ε) for dla_syrfsx_extended/zla_syrfsx_extended to determine if the error estimate is "guaranteed". These reciprocal condition numbers are 1/(norm(1/z,inf)*norm(z,inf)) for some appropriately scaled matrix *Z*. Let *z*=*s**(*a**diag(*x*)), where *x* is the solution for the current right-hand side and *s* scales each row of *a**diag(*x*) by a power of the radix so all absolute row sums of *z* are approximately 1. Use this subroutine to set only the second field above.
res, *dy*, *y_tail*		REAL for sla_syrfsx_extended DOUBLE PRECISION for dla_syrfsx_extended COMPLEX for cla_syrfsx_extended DOUBLE COMPLEX for zla_syrfsx_extended. Workspace arrays of DIMENSION*n*. *res* holds the intermediate residual. *dy* holds the intermediate solution. *y_tail* holds the trailing bits of the intermediate solution.
ayb		REAL for sla_syrfsx_extended and cla_syrfsx_extended DOUBLE PRECISION for dla_syrfsx_extended and zla_syrfsx_extended. Workspace array, DIMENSION*n*.

rcond

REAL for sla_syrfsx_extended and cla_syrfsx_extended

DOUBLE PRECISION for dla_syrfsx_extended and zla_syrfsx_extended.

Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision, in particular, if *rcond* = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.

ithresh

INTEGER. The maximum number of residual computations allowed for refinement. The default is 10. For 'aggressive', set to 100 to permit convergence using approximate factorizations or factorizations other than LU. If the factorization uses a technique other than Gaussian elimination, the guarantees in *err_bnds_norm* and *err_bnds_comp* may no longer be trustworthy.

rthresh

REAL for sla_syrfsx_extended and cla_syrfsx_extended

DOUBLE PRECISION for dla_syrfsx_extended and zla_syrfsx_extended.

Determines when to stop refinement if the error estimate stops decreasing. Refinement stops when the next solution no longer satisfies

norm(dx_{*i*+1}) < *rthresh* * norm(dx_*i*)

where norm(*z*) is the infinity norm of *Z*.

rthresh satisfies

0 < *rthresh*≤ 1.

The default value is 0.5. For 'aggressive' set to 0.9 to permit convergence on extremely ill-conditioned matrices.

dz_ub

REAL for sla_syrfsx_extended and cla_syrfsx_extended

DOUBLE PRECISION for dla_syrfsx_extended and zla_syrfsx_extended.

Determines when to start considering componentwise convergence. Componentwise *dz_ub* convergence is only considered after each component of the solution *y* is stable, that is, the relative change in each component is less than *dz_ub*. The default value is 0.25, requiring the first bit to be stable.

ignore_cwise

LOGICAL

If .TRUE., the function ignores componentwise convergence. Default value is .FALSE.

Output Parameters

y

REAL for sla_syrfsx_extended

DOUBLE PRECISION for dla_syrfsx_extended

COMPLEX for cla_syrfsx_extended

DOUBLE COMPLEX for zla_syrfsx_extended.

	The improved solution matrix *Y*.
berr_out	REAL for sla_syrfsx_extended and cla_syrfsx_extended DOUBLE PRECISION for dla_syrfsx_extended and zla_syrfsx_extended. Array, DIMENSION*nrhs*. *berr_out(j)* contains the componentwise relative backward error for right-hand-side *j* from the formula max(*i*) (abs(*res*(*i*)) / (abs(op(*A*))*abs(*y*) + abs(*B*))(*i*)) where abs(*z*) is the componentwise absolute value of the matrix or vector *Z*. This is computed by ?la_lin_berr.
err_bnds_norm, *err_bnds_comp*	Values of the corresponding input parameters improved after iterative refinement and stored in the second column of the array (1:*nrhs*, 2). The other elements are kept unchanged.
info	INTEGER. If *info* = 0, the execution is successful. The solution to every right-hand side is guaranteed. If *info* = -*i*, the *i*-th parameter had an illegal value.

?la_syrpvgrw

Computes the reciprocal pivot growth factor norm(A)/ norm(U) for a symmetric indefinite matrix.

Syntax

```
call sla_syrpvgrw( uplo, n, info, a, lda, af, ldaf, ipiv, work )
call dla_syrpvgrw( uplo, n, info, a, lda, af, ldaf, ipiv, work )
call cla_syrpvgrw( uplo, n, info, a, lda, af, ldaf, ipiv, work )
call zla_syrpvgrw( uplo, n, info, a, lda, af, ldaf, ipiv, work )
```

Include Files

- mkl.fi

Description

The ?la_syrpvgrw routine computes the reciprocal pivot growth factor norm(*A*)/norm(*U*). The *max absolute element* norm is used. If this is much less than 1, the stability of the *LU* factorization of the equilibrated matrix *A* could be poor. This also means that the solution *X*, estimated condition numbers, and error bounds could be unreliable.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Specifies the triangle of A to store: If *uplo* = 'U', the upper triangle of *A* is stored, If *uplo* = 'L', the lower triangle of *A* is stored.
n	INTEGER. The number of linear equations, the order of the matrix *A*; *n*≥ 0.
info	INTEGER. The value of INFO returned from ?sytrf, that is, the pivot in column *info* is exactly 0.
a, *af*	REAL for sla_syrpvgrw DOUBLE PRECISION for dla_syrpvgrw COMPLEX for cla_syrpvgrw DOUBLE COMPLEX for zla_syrpvgrw. Arrays: *a*(*lda*,*), *af*(*ldaf*,*). The array *a* contains the input *n*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1,*n*). The array *af* contains the block diagonal matrix D and the multipliers used to obtain the factor U or L as computed by ?sytrf. The second dimension of *af* must be at least max(1,*n*).
lda	INTEGER. The leading dimension of *a*; *lda*≥ max(1,*n*).
ldaf	INTEGER. The leading dimension of *af*; *ldaf*≥ max(1,*n*).
ipiv	INTEGER. Array, DIMENSION*n*. Details of the interchanges and the block structure of D as determined by ?sytrf.
work	REAL for sla_syrpvgrw and cla_syrpvgrw DOUBLE PRECISION for dla_syrpvgrw and zla_syrpvgrw. Workspace array, dimension 2**n*.

?sytrf

?la_wwaddw

Adds a vector into a doubled-single vector.

Syntax

```
call sla_wwaddw( n, x, y, w )
call dla_wwaddw( n, x, y, w )
call cla_wwaddw( n, x, y, w )
call zla_wwaddw( n, x, y, w )
```

Include Files

- mkl.fi

Description

The ?la_wwaddw routine adds a vector *W* into a doubled-single vector (*X, Y*). This works for all existing IBM hex and binary floating-point arithmetics, but not for decimal.

Input Parameters

n	INTEGER. The length of vectors *X, Y*, and *W* .
x, *y*, *w*	REAL for sla_wwaddw DOUBLE PRECISION for dla_wwaddw COMPLEX for cla_wwaddw DOUBLE COMPLEX for zla_wwaddw. Arrays DIMENSION*n*. *x* and *y* contain the first and second parts of the doubled-single accumulation vector, respectively. *w* contains the vector *W* to be added.

Output Parameters

x, *y*	Contain the first and second parts of the doubled-single accumulation vector, respectively, after adding the vector *W*.

mkl_?tppack

Copies a triangular/symmetric matrix or submatrix from standard full format to standard packed format.

Syntax

```
call mkl_stppack (uplo, trans, n, ap, i, j, rows, cols, a, lda, info )
call mkl_dtppack (uplo, trans, n, ap, i, j, rows, cols, a, lda, info )
call mkl_ctppack (uplo, trans, n, ap, i, j, rows, cols, a, lda, info )
call mkl_ztppack (uplo, trans, n, ap, i, j, rows, cols, a, lda, info )
call mkl_tppack (ap, i, j, rows, cols, a[, uplo] [, trans] [, info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine copies a triangular or symmetric matrix or its submatrix from standard full format to packed format

$AP_{i:i+rows-1,\ j:j+cols-1}$:= op(*A*)

Standard packed formats include:

- TP: triangular packed storage

- SP: symmetric indefinite packed storage
- HP: Hermitian indefinite packed storage
- PP: symmetric or Hermitian positive definite packed storage

Full formats include:

- GE: general
- TR: triangular
- SY: symmetric indefinite
- HE: Hermitian indefinite
- PO: symmetric or Hermitian positive definite

NOTE
Any elements of the copied submatrix rectangular outside of the triangular part of the matrix *AP* are skipped.

Input Parameters

The data types are given for the Fortran interface.

uplo	CHARACTER*1. Specifies whether the matrix *AP* is upper or lower triangular. If *uplo* = 'U', *AP* is upper triangular. If *uplo* = 'L': *AP* is lower triangular.
trans	CHARACTER*1. Specifies whether or not the copied block of *A* is transposed or not. If *trans* = 'N', no transpose: op(*A*) = *A*. If *trans* = 'T',transpose: op(*A*) = A^T. If *trans* = 'C',conjugate transpose: op(*A*) = A^H. For real data this is the same as *trans* = 'T'.
n	INTEGER. The order of the matrix *AP*; $n \geq 0$
i, j	INTEGER. Coordinates of the left upper corner of the destination submatrix in *AP*. If *uplo*='U', $1 \leq i \leq j \leq n$. If *uplo*='L', $1 \leq j \leq i \leq n$.
rows	INTEGER. Number of rows in the destination submatrix. $0 \leq rows \leq n - i + 1$.
cols	INTEGER. Number of columns in the destination submatrix. $0 \leq cols \leq n - j + 1$.
a	REAL for mkl_stppack DOUBLE PRECISION for mkl_dtppack COMPLEX for mkl_ctppack DOUBLE COMPLEX for mkl_ztppack Pointer to the source submatrix.

Array *a*(*lda*, *) contains the *rows*-by-*cols* submatrix stored as unpacked rows-by-columns if *trans* = 'N', or unpacked columns-by-rows if *trans* = 'T' or *trans* = 'C'. The size of *a* must be at least *lda***cols* for *trans* = 'N' or *lda***rows* for *trans*='T' or *trans*='C'.

NOTE
If there are elements outside of the triangular part of *AP*, they are skipped and are not copied from *a*.

lda INTEGER. The leading dimension of the array *a*.

lda≥ max(1, *rows*) for *trans* = 'N' and and *lda*≥ max(1, *cols*) for *trans*='T' or *trans*='C'.

Output Parameters

ap

`REAL` for `mkl_stppack`

`DOUBLE PRECISION` for `mkl_dtppack`

`COMPLEX` for `mkl_ctppack`

`DOUBLE COMPLEX` for `mkl_ztppack`

Array of size at least max(1, *n*(*n*+1)/2). The array *ap* contains either the upper or the lower triangular part of the matrix *AP* (as specified by *uplo*) in packed storage (see Matrix Storage Schemes). The submatrix of *ap* from row *i* to row *i* + *rows* - 1 and column *j* to column *j* + *cols* - 1 is overwritten with a copy of the source matrix.

info INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

mkl_?tpunpack

Copies a triangular/symmetric matrix or submatrix from standard packed format to full format.

Syntax

```
call mkl_stpunpack (uplo, trans, n, ap, i, j, rows, cols, a, lda, info )
call mkl_dtpunpack (uplo, trans, n, ap, i, j, rows, cols, a, lda, info )
call mkl_ctpunpack (uplo, trans, n, ap, i, j, rows, cols, a, lda, info )
call mkl_ztpunpack (uplo, trans, n, ap, i, j, rows, cols, a, lda, info )
call mkl_tpunpack (ap, i, j, rows, cols, a[, uplo] [, trans] [, info])
```

Include Files

- `mkl.fi, lapack.f90`

Description

The routine copies a triangular or symmetric matrix or its submatrix from standard packed format to full format.

$A := \mathrm{op}(AP_{i:i+rows-1,\ j:j+cols-1})$

Standard packed formats include:

- TP: triangular packed storage
- SP: symmetric indefinite packed storage
- HP: Hermitian indefinite packed storage
- PP: symmetric or Hermitian positive definite packed storage

Full formats include:

- GE: general
- TR: triangular
- SY: symmetric indefinite
- HE: Hermitian indefinite
- PO: symmetric or Hermitian positive definite

NOTE
Any elements of the copied submatrix rectangular outside of the triangular part of *AP* are skipped.

Input Parameters

The data types are given for the Fortran interface.

uplo	CHARACTER*1. Specifies whether matrix *AP* is upper or lower triangular. If *uplo* = 'U', *AP* is upper triangular. If *uplo* = 'L': *AP* is lower triangular.
trans	CHARACTER*1. Specifies whether or not the copied block of *AP* is transposed. If *trans* = 'N', no transpose: op(*AP*) = *AP*. If *trans* = 'T',transpose: op(*AP*) = AP^T. If *trans* = 'C',conjugate transpose: op(*AP*) = AP^H. For real data this is the same as *trans* = 'T'.
n	INTEGER. The order of the matrix *AP*; $n \geq 0$.
ap	REAL for mkl_stpunpack DOUBLE PRECISION for mkl_dtpunpack COMPLEX for mkl_ctpunpack DOUBLE COMPLEX for mkl_ztpunpack Array, size at least max(1, *n*(*n*+1)/2). The array *ap* contains either the upper or the lower triangular part of the matrix *AP* (as specified by *uplo*) in packed storage (see Matrix Storage Schemes). It is the source for the submatrix of *AP* from row *i* to row *i* + *rows* - 1 and column *j* to column *j* + *cols* - 1 to be copied.
i, j	INTEGER. Coordinates of left upper corner of the submatrix in *AP* to copy. If *uplo*='U', $1 \leq i \leq j \leq n$.

If *uplo*='L', 1 ≤*j*≤*i*≤*n*.

rows INTEGER. Number of rows to copy. 0 ≤*rows*≤*n* - *i* + 1.

cols INTEGER. Number of columns to copy. 0 ≤*cols*≤*n* - *j* + 1.

lda INTEGER. The leading dimension of array *a*.

lda≥ max(1,*rows*) for *trans* = 'N' and and *lda*≥ max(1,*cols*) for *trans*='T' or *trans*='C'.

Output Parameters

a `REAL` for `mkl_stpunpack`

`DOUBLE PRECISION` for `mkl_dtpunpack`

`COMPLEX` for `mkl_ctpunpack`

`DOUBLE COMPLEX` for `mkl_ztpunpack`

Pointer to the destination matrix. The size of *a* must be at least *lda***cols* for *trans* = 'N' or *lda***rows* for *trans*='T' or *trans*='C'. On exit, array *a* is overwritten with a copy of the unpacked *rows*-by-*cols* submatrix of *ap* unpacked rows-by-columns if *trans* = 'N', or unpacked columns-by-rows if *trans* = 'T' or *trans* = 'C'.

NOTE
If there are elements outside of the triangular part of *ap* indicated by *uplo*, they are skipped and are not copied to *a*.

info INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Additional LAPACK Routines

```
call clasyf_aa(uplo, j1, m, nb, a, lda, ipiv, h, ldh, work, info)
call zlasyf_aa(uplo, j1, m, nb, a, lda, ipiv, h, ldh, work, info)

```

For descriptions of these functions, please see https://www.netlib.org/lapack/explore-html/files.html.

LAPACK Utility Functions and Routines

This section describes LAPACK utility functions and routines.

Summary information about these routines is given in the following table:

LAPACK Utility Routines

Routine Name	Data Types	Description
ilaver		Returns the version of the Lapack library.
ilaenv		Environmental enquiry function which returns values for tuning algorithmic performance.
iparmq		Environmental enquiry function which returns values for tuning algorithmic performance.
ieeeck		Checks if the infinity and NaN arithmetic is safe. Called by ilaenv.
?labad	s, d	Returns the square root of the underflow and overflow thresholds if the exponent-range is very large.
?lamch	s, d	Determines machine parameters for floating-point arithmetic.
?lamc1	s, d	Called from ?lamc2. Determines machine parameters given by *beta*, *t*, *rnd*, *ieee1*.
?lamc2	s, d	Used by ?lamch. Determines machine parameters specified in its arguments list.
?lamc3	s, d	Called from ?lamc1-?lamc5. Intended to force *a* and *b* to be stored prior to doing the addition of *a* and *b*.
?lamc4	s, d	This is a service routine for ?lamc2.
?lamc5	s, d	Called from ?lamc2. Attempts to compute the largest machine floating-point number, without overflow.

Routine Name	Data Types	Description
chla_transtype		Translates a BLAST-specified integer constant to the character string specifying a transposition operation.
iladiag		Translates a character string specifying whether a matrix has a unit diagonal or not to the relevant BLAST-specified integer constant.
ilaprec		Translates a character string specifying an intermediate precision to the relevant BLAST-specified integer constant.
ilatrans		Translates a character string specifying a transposition operation to the BLAST-specified integer constant.
ilauplo		Translates a character string specifying an upper- or lower-triangular matrix to the relevant BLAST-specified integer constant.
xerbla_array		Assists other languages in calling the xerbla function.

See Also

lsame Tests two characters for equality regardless of the case.

lsamen Tests two character strings for equality regardless of the case.

second/dsecnd Returns elapsed time in seconds. Use to estimate real time between two calls to this function.

xerbla Error handling function called by BLAS, LAPACK, Vector Math, and Vector Statistics functions.

ilaver

Returns the version of the LAPACK library.

Syntax

```
call ilaver( vers_major, vers_minor, vers_patch )
```

Include Files

- mkl.fi

Description

This routine returns the version of the LAPACK library.

Output Parameters

vers_major INTEGER.

Returns the major version of the LAPACK library.

vers_minor INTEGER.

Returns the minor version from the major version of the LAPACK library.

vers_patch INTEGER.

Returns the patch version from the minor version of the LAPACK library.

ilaenv

Environmental enquiry function that returns values for tuning algorithmic performance.

Syntax

```
value = ilaenv( ispec, name, opts, n1, n2, n3, n4 )
```

Include Files

- mkl.fi

Description

The enquiry function `ilaenv` is called from the LAPACK routines to choose problem-dependent parameters for the local environment. See *ispec* below for a description of the parameters.

This version provides a set of parameters that should give good, but not optimal, performance on many of the currently available computers.

Product and Performance Information
Performance varies by use, configuration and other factors. Learn more at www.Intel.com/PerformanceIndex. Notice revision #20201201

Input Parameters

ispec

`INTEGER`.

Specifies the parameter to be returned as the value of `ilaenv`:

= 1: the optimal blocksize; if this value is 1, an unblocked algorithm will give the best performance.

= 2: the minimum block size for which the block routine should be used; if the usable block size is less than this value, an unblocked routine should be used.

= 3: the crossover point (in a block routine, for *n* less than this value, an unblocked routine should be used)

= 4: the number of shifts, used in the nonsymmetric eigenvalue routines (deprecated)

= 5: the minimum column dimension for blocking to be used; rectangular blocks must have dimension at least *k*-by-*m*, where `k` is given by `ilaenv(2,...)` and `m` by `ilaenv(5,...)`

= 6: the crossover point for the SVD (when reducing an *m*-by-*n* matrix to bidiagonal form, if `max(m,n)/min(m,n)` exceeds this value, a *QR* factorization is used first to reduce the matrix to a triangular form.)

= 7: the number of processors

= 8: the crossover point for the multishift *QR* and *QZ* methods for nonsymmetric eigenvalue problems (deprecated).

= 9: maximum size of the subproblems at the bottom of the computation tree in the divide-and-conquer algorithm (used by `?gelsd` and `?gesdd`)

=10: ieee NaN arithmetic can be trusted not to trap

=11: infinity arithmetic can be trusted not to trap

12 ≤ *ispec* ≤ 16: `?hseqr` or one of its subroutines, see `iparmq` for detailed explanation.

name — `CHARACTER*(*)`. The name of the calling subroutine, in either upper case or lower case.

opts — `CHARACTER*(*)`. The character options to the subroutine *name*, concatenated into a single character string. For example, *uplo* = 'U', *trans* = 'T', and *diag* = 'N' for a triangular routine would be specified as *opts* = 'UTN'.

NOTE
Use only uppercase characters for the *opts* string.

n1, *n2*, *n3*, *n4* — `INTEGER`. Problem dimensions for the subroutine *name*; these may not all be required.

Output Parameters

value — `INTEGER`.

If *value* ≥ 0: the value of the parameter specified by *ispec*;

If *value* = −*k* < 0: the *k*-th argument had an illegal value.

Application Notes

The following conventions have been used when calling `ilaenv` from the LAPACK routines:

1. *opts* is a concatenation of all of the character options to subroutine *name*, in the same order that they appear in the argument list for *name*, even if they are not used in determining the value of the parameter specified by *ispec*.
2. The problem dimensions *n1*, *n2*, *n3*, *n4* are specified in the order that they appear in the argument list for *name*. *n1* is used first, *n2* second, and so on, and unused problem dimensions are passed a value of -1.
3. The parameter value returned by `ilaenv` is checked for validity in the calling subroutine. For example, `ilaenv` is used to retrieve the optimal blocksize for `strtri` as follows:

```
nb = ilaenv( 1, 'strtri', uplo // diag, n, -1, -1, -1> )
if( nb.le.1 ) nb = max( 1, n )
```

See Also

?hseqr

iparmq

iparmq

Environmental enquiry function which returns values for tuning algorithmic performance.

Syntax

value = iparmq(*ispec*, *name*, *opts*, *n*, *ilo*, *ihi*, *lwork*)

Include Files

- mkl.fi

Description

The function sets problem and machine dependent parameters useful for ?hseqr and its subroutines. It is called whenever ilaenv is called with 12≤*ispec*≤16.

Input Parameters

ispec INTEGER.

Specifies the parameter to be returned as the value of iparmq:

= 12: (*inmin*) Matrices of order *nmin* or less are sent directly to ?lahqr, the implicit double shift QR algorithm. *nmin* must be at least 11.

= 13: (*inwin*) Size of the deflation window. This is best set greater than or equal to the number of simultaneous shifts *ns*. Larger matrices benefit from larger deflation windows.

= 14: (*inibl*) Determines when to stop nibbling and invest in an (expensive) multi-shift QR sweep. If the aggressive early deflation subroutine finds *ld* converged eigenvalues from an order *nw* deflation window and *ld*>(*nw***nibble*)/100, then the next QR sweep is skipped and early deflation is applied immediately to the remaining active diagonal block. Setting iparmq(*ispec*=14)=0 causes TTQRE to skip a multi-shift QR sweep whenever early deflation finds a converged eigenvalue. Setting iparmq(*ispec*=14) greater than or equal to 100 prevents TTQRE from skipping a multi-shift QR sweep.

= 15: (*nshfts*) The number of simultaneous shifts in a multi-shift QR iteration.

= 16: (*iacc22*) iparmq is set to 0, 1 or 2 with the following meanings.

0: During the multi-shift QR sweep, ?laqr5 does not accumulate reflections and does not use matrix-matrix multiply to update the far-from-diagonal matrix entries.

1: During the multi-shift QR sweep, ?laqr5 and/or ?laqr3 accumulates reflections and uses matrix-matrix multiply to update the far-from-diagonal matrix entries.

2: During the multi-shift QR sweep, ?laqr5 accumulates reflections and takes advantage of 2-by-2 block structure during matrix-matrix multiplies.

(If ?trrm is slower than ?gemm, then iparmq(*ispec*=16)=1 may be more efficient than iparmq(*ispec*=16)=2 despite the greater level of arithmetic work implied by the latter choice.)

name CHARACTER*(*). The name of the calling subroutine.

opts CHARACTER*(*). This is a concatenation of the string arguments to TTQRE.

n INTEGER. *n* is the order of the Hessenberg matrix *H*.

ilo, *ihi* INTEGER.

It is assumed that *H* is already upper triangular in rows and columns `1:ilo-1` and `ihi+1:n`.

lwork — INTEGER.

The amount of workspace available.

Output Parameters

value — INTEGER.

If *value* ≥ 0: the value of the parameter specified by *iparmq*;

If *value* = -k < 0: the k-th argument had an illegal value.

Application Notes

The following conventions have been used when calling `ilaenv` from the LAPACK routines:

1. *opts* is a concatenation of all of the character options to subroutine *name*, in the same order that they appear in the argument list for *name*, even if they are not used in determining the value of the parameter specified by *ispec*.
2. The problem dimensions *n1*, *n2*, *n3*, *n4* are specified in the order that they appear in the argument list for *name*. *n1* is used first, *n2* second, and so on, and unused problem dimensions are passed a value of -1.
3. The parameter value returned by `ilaenv` is checked for validity in the calling subroutine. For example, `ilaenv` is used to retrieve the optimal blocksize for `strtri` as follows:

```
nb = ilaenv( 1, 'strtri', uplo // diag, n, -1, -1, -1> )
if( nb.le.1 ) nb = max( 1, n )
```

ieeeck

Checks if the infinity and NaN arithmetic is safe.
Called by `ilaenv`.

Syntax

```
ival = ieeeck( ispec, zero, one )
```

Include Files

- `mkl.fi`

Description

The function `ieeeck` is called from `ilaenv` to verify that infinity and possibly `NaN` arithmetic is safe, that is, will not trap.

Input Parameters

ispec — INTEGER.

Specifies whether to test just for infinity arithmetic or both for infinity and `NaN` arithmetic:

If *ispec* = 0: Verify infinity arithmetic only.

If *ispec* = 1: Verify infinity and NaN arithmetic.

zero — REAL. Must contain the value 0.0

This is passed to prevent the compiler from optimizing away this code.

one — REAL. Must contain the value 1.0

This is passed to prevent the compiler from optimizing away this code.

Output Parameters

ival — INTEGER.

If *ival* = 0: Arithmetic failed to produce the correct answers.

If *ival* = 1: Arithmetic produced the correct answers.

?labad

Returns the square root of the underflow and overflow thresholds if the exponent-range is very large.

Syntax

```
call slabad( small, large )
call dlabad( small, large )
```

Include Files

- mkl.fi

Description

The routine takes as input the values computed by slamch/dlamch for underflow and overflow, and returns the square root of each of these values if the log of *large* is sufficiently large. This subroutine is intended to identify machines with a large exponent range, such as the Crays, and redefine the underflow and overflow limits to be the square roots of the values computed by ?lamch. This subroutine is needed because ?lamch does not compensate for poor arithmetic in the upper half of the exponent range, as is found on a Cray.

Input Parameters

small — REAL for slabad

DOUBLE PRECISION for dlabad.

The underflow threshold as computed by ?lamch.

large — REAL for slabad

DOUBLE PRECISION for dlabad.

The overflow threshold as computed by ?lamch.

Output Parameters

small — On exit, if log10(*large*) is sufficiently large, the square root of *small*, otherwise unchanged.

large — On exit, if `log10(large)` is sufficiently large, the square root of *large*, otherwise unchanged.

?lamch

Determines machine parameters for floating-point arithmetic.

Syntax

```
val = slamch( cmach )
val = dlamch( cmach )
```

Include Files

- `mkl.fi`

Description

The function `?lamch` determines single precision and double precision machine parameters.

Input Parameters

cmach — `CHARACTER*1`. Specifies the value to be returned by `?lamch`:

= 'E' or 'e', *val* = *eps*

= 'S' or 's', *val* = *sfmin*

= 'B' or 'b', *val* = *base*

= 'P' or 'p', *val* = *eps***base*

= 'n' or 'n', *val* = *t*

= 'R' or 'r', *val* = *rnd*

= 'M' or 'm', *val* = *emin*

= 'U' or 'u', *val* = *rmin*

= 'L' or 'l', *val* = *emax*

= 'O' or 'o', *val* = *rmax*

where

eps = relative machine precision;

sfmin = safe minimum, such that 1/*sfmin* does not overflow;

base = base of the machine;

prec = *eps***base*;

t = number of (base) digits in the mantissa;

rnd = 1.0 when rounding occurs in addition, 0.0 otherwise;

emin = minimum exponent before (gradual) underflow;

rmin = *underflow_threshold* - *base***(*emin*-1);

emax = largest exponent before overflow;

rmax = *overflow_threshold* - (*base****emax*)*(1-*eps*).

NOTE
You can use a character string for *cmach* instead of a single character in order to make your code more readable. The first character of the string determines the value to be returned. For example, 'Precision' is interpreted as 'p'.

Output Parameters

val
REAL for slamch
DOUBLE PRECISION for dlamch
Value returned by the function.

?lamc1

Called from ?lamc2*. Determines machine parameters given by beta, t, rnd, ieee1.*

Syntax

```
call slamc1( beta, t, rnd, ieee1 )
call dlamc1( beta, t, rnd, ieee1 )
```

Include Files

- mkl.fi

Description

The routine ?lamc1 determines machine parameters given by *beta, t, rnd, ieee1*.

Output Parameters

beta
INTEGER. The base of the machine.

t
INTEGER. The number of (*beta*) digits in the mantissa.

rnd
LOGICAL.
Specifies whether proper rounding (*rnd* = .TRUE.) or chopping (*rnd* = .FALSE.) occurs in addition. This may not be a reliable guide to the way in which the machine performs its arithmetic.

ieee1
LOGICAL.
Specifies whether rounding appears to be done in the *ieee* 'round to nearest' style.

?lamc2

Used by ?lamch*. Determines machine parameters specified in its arguments list.*

Syntax

```
call slamc2( beta, t, rnd, eps, emin, rmin, emax, rmax )
call dlamc2( beta, t, rnd, eps, emin, rmin, emax, rmax )
```

Include Files

- mkl.fi

Description

The routine ?lamc2 determines machine parameters specified in its arguments list.

Output Parameters

beta	INTEGER. The base of the machine.
t	INTEGER. The number of (*beta*) digits in the mantissa.
rnd	LOGICAL. Specifies whether proper rounding (*rnd* = .TRUE.) or chopping (*rnd* = .FALSE.) occurs in addition. This may not be a reliable guide to the way in which the machine performs its arithmetic.
eps	REAL for slamc2 DOUBLE PRECISION for dlamc2 The smallest positive number such that *fl*(1.0 - *eps*) < 1.0, where *fl* denotes the computed value.
emin	INTEGER. The minimum exponent before (gradual) underflow occurs.
rmin	REAL for slamc2 DOUBLE PRECISION for dlamc2 The smallest normalized number for the machine, given by $base^{emin-1}$, where *base* is the floating point value of *beta*.
emax	INTEGER.The maximum exponent before overflow occurs.
rmax	REAL for slamc2 DOUBLE PRECISION for dlamc2 The largest positive number for the machine, given by $base^{emax(1 - eps)}$, where *base* is the floating point value of *beta*.

?lamc3

Called from ?lamc1-?lamc5*. Intended to force a and b to be stored prior to doing the addition of a and b.*

Syntax

val = slamc3(*a*, *b*)

val = dlamc3(*a*, *b*)

Include Files

- mkl.fi

Description

The routine is intended to force *A* and *B* to be stored prior to doing the addition of *A* and *B*, for use in situations where optimizers might hold one of these in a register.

Input Parameters

a, *b*	REAL for slamc3 DOUBLE PRECISION for dlamc3 The values *a* and *b*.

Output Parameters

val	REAL for slamc3 DOUBLE PRECISION for dlamc3 The result of adding values *a* and *b*.

?lamc4

This is a service routine for ?lamc2*.*

Syntax

call slamc4(*emin*, *start*, *base*)

call dlamc4(*emin*, *start*, *base*)

Include Files

- mkl.fi

Description

This is a service routine for ?lamc2.

Input Parameters

start	REAL for slamc4 DOUBLE PRECISION for dlamc4 The starting point for determining *emin*.
base	INTEGER. The base of the machine.

Output Parameters

emin	INTEGER. The minimum exponent before (gradual) underflow, computed by setting *a = start* and dividing by *base* until the previous *a* can not be recovered.

?lamc5

Called from ?lamc2. Attempts to compute the largest machine floating-point number, without overflow.

Syntax

```
call slamc5( beta, p, emin, ieee, emax, rmax)
call dlamc5( beta, p, emin, ieee, emax, rmax)
```

Include Files

- mkl.fi

Description

The routine ?lamc5 attempts to compute *rmax*, the largest machine floating-point number, without overflow. It assumes that *emax + abs(emin)* sum approximately to a power of 2. It will fail on machines where this assumption does not hold, for example, the Cyber 205 (*emin = -28625*, *emax = 28718*). It will also fail if the value supplied for *emin* is too large (that is, too close to zero), probably with overflow.

Input Parameters

beta	INTEGER. The base of floating-point arithmetic.
p	INTEGER. The number of base *beta* digits in the mantissa of a floating-point value.
emin	INTEGER. The minimum exponent before (gradual) underflow.
ieee	LOGICAL. A logical flag specifying whether or not the arithmetic system is thought to comply with the IEEE standard.

Output Parameters

emax	INTEGER. The largest exponent before overflow.
rmax	REAL for slamc5 DOUBLE PRECISION for dlamc5 The largest machine floating-point number.

chla_transtype

Translates a BLAST-specified integer constant to the character string specifying a transposition operation.

Syntax

```
val = chla_transtype( trans )
```

Include Files

- mkl.fi

Description

The chla_transtype function translates a BLAST-specified integer constant to the character string specifying a transposition operation.

The function returns a CHARACTER*1. If the input is not an integer indicating a transposition operator, then *val* is 'X'. Otherwise, the function returns the constant value corresponding to *trans*.

Input Parameters

trans — INTEGER.

Specifies the form of the system of equations:

If *trans* = BLAS_NO_TRANS = 111: No transpose.

If *trans* = BLAS_TRANS = 112: Transpose.

If *trans* = BLAS_CONJ_TRANS = 113: Conjugate Transpose.

Output Parameters

val — CHARACTER*1

Character that specifies a transposition operation.

iladiag

Translates a character string specifying whether a matrix has a unit diagonal to the relevant BLAST-specified integer constant.

Syntax

val = iladiag(*diag*)

Include Files

- mkl.fi

Description

The iladiag function translates a character string specifying whether a matrix has a unit diagonal or not to the relevant BLAST-specified integer constant.

The function returns an INTEGER. If *val* < 0, the input is not a character indicating a unit or non-unit diagonal. Otherwise, the function returns the constant value corresponding to *diag*.

Input Parameters

diag — CHARACTER*1.

Specifies the form of the system of equations:

If *diag* = 'N': *A* is non-unit triangular.

If *diag* = 'U': *A* is unit triangular.

Output Parameters

val	INTEGER Value returned by the function.

ilaprec

Translates a character string specifying an intermediate precision to the relevant BLAST-specified integer constant.

Syntax

val = ilaprec(*prec*)

Include Files

- mkl.fi

Description

The ilaprec function translates a character string specifying an intermediate precision to the relevant BLAST-specified integer constant.

The function returns an INTEGER. If *val* < 0, the input is not a character indicating a supported intermediate precision. Otherwise, the function returns the constant value corresponding to *prec*.

Input Parameters

prec	CHARACTER*1. Specifies the form of the system of equations: If *prec* = 'S': Single. If *prec* = 'D': Double. If *prec* = 'I': Indigenous. If *prec* = 'X', 'E': Extra.

Output Parameters

val	INTEGER Value returned by the function.

ilatrans

Translates a character string specifying a transposition operation to the BLAST-specified integer constant.

Syntax

val = ilatrans(*trans*)

Include Files

- mkl.fi

Description

The `ilatrans` function translates a character string specifying a transposition operation to the BLAST-specified integer constant.

The function returns a `INTEGER`. If *val* < 0, the input is not a character indicating a transposition operator. Otherwise, the function returns the constant value corresponding to *trans*.

Input Parameters

trans — `CHARACTER*1`.

Specifies the form of the system of equations:

If *trans* = `'N'`: No transpose.

If *trans* = `'T'`: Transpose.

If *trans* = `'C'`: Conjugate Transpose.

Output Parameters

val — `INTEGER`

Character that specifies a transposition operation.

ilauplo

Translates a character string specifying an upper- or lower-triangular matrix to the relevant BLAST-specified integer constant.

Syntax

```
val = ilauplo( uplo )
```

Include Files

- `mkl.fi`

Description

The `ilauplo` function translates a character string specifying an upper- or lower-triangular matrix to the relevant BLAST-specified integer constant.

The function returns an `INTEGER`. If *val* < 0, the input is not a character indicating an upper- or lower-triangular matrix. Otherwise, the function returns the constant value corresponding to *uplo*.

Input Parameters

diag — `CHARACTER`.

Specifies the form of the system of equations:

If *diag* = `'U'`: *A* is upper triangular.

If *diag* = `'L'`: *A* is lower triangular.

Output Parameters

val — `INTEGER`

Value returned by the function.

xerbla_array

Assists other languages in calling the `xerbla` *function.*

Syntax

`call xerbla_array( srname_array, srname_len, info )`

Include Files

- `mkl.fi`

Description

The routine assists other languages in calling the error handling `xerbla` function. Rather than taking a Fortran string argument as the function name, `xerbla_array` takes an array of single characters along with the array length. The routine then copies up to 32 characters of that array into a Fortran string and passes that to `xerbla`. If called with a non-positive *`srname_len`*, the routine will call `xerbla` with a string of all blank characters.

If some macro or other device makes `xerbla_array` available to `C99` by a name `lapack_xerbla` and with a common Fortran calling convention, a `C99` program could invoke `xerbla` via:

```
{
   int flen = strlen(__func__);
   lapack_xerbla(__func__, &flen, &info);
}
```

Providing `xerbla_array` is not necessary for intercepting LAPACK errors. `xerbla_array` calls `xerbla`.

Output Parameters

`srname_array` — `CHARACTER(1)`.
Array, dimension (*`srname_len`*). The name of the routine that called `xerbla_array`.

`srname_len` — `INTEGER`.
The length of the name in *`srname_array`*.

`info` — `INTEGER`.
Position of the invalid parameter in the parameter list of the calling routine.

LAPACK Test Functions and Routines

This section describes LAPACK test functions and routines.

?latms

Generates a general m-by-n matrix with specific singular values.

Syntax

`call slatms (m, n, dist, iseed, sym, d, mode, cond, dmax, kl, ku, pack, a, lda, work, info)`

```
call dlatms (m, n, dist, iseed, sym, d, mode, cond, dmax, kl, ku, pack, a, lda, work, info)
call clatms (m, n, dist, iseed, sym, d, mode, cond, dmax, kl, ku, pack, a, lda, work, info)
call zlatms (m, n, dist, iseed, sym, d, mode, cond, dmax, kl, ku, pack, a, lda, work, info)
```

Description

The ?latms routine generates random matrices with specified singular values, or symmetric/Hermitian matrices with specified eigenvalues for testing LAPACK programs.

It applies this sequence of operations:

1. Set the diagonal to *d*, where *d* is input or computed according to *mode*, *cond*, *dmax*, and *sym* as described in Input Parameters.
2. Generate a matrix with the appropriate band structure, by one of two methods:

Method A	1. Generate a dense *m*-by-*n* matrix by multiplying *d* on the left and the right by random unitary matrices, then: 2. Reduce the bandwidth according to *kl* and *ku*, using Householder transformations.
Method B:	Convert the bandwidth-0 (i.e., diagonal) matrix to a bandwidth-1 matrix using Givens rotations, "chasing" out-of-band elements back, much as in QR; then convert the bandwidth-1 to a bandwidth-2 matrix, etc. Note that for reasonably small bandwidths (relative to *m* and *n*) this requires less storage, as a dense matrix is not generated. Also, for symmetric or Hermitian matrices, only one triangle is generated.

Method A is chosen if the bandwidth is a large fraction of the order of the matrix, and *lda* is at least *m* (so a dense matrix can be stored.) Method B is chosen if the bandwidth is small (less than (1/2)*n for symmetric or Hermitian or less than .3*n+m for nonsymmetric), or *lda* is less than *m* and not less than the bandwidth.

Pack the matrix if desired, using one of the methods specified by the *pack* parameter.

If Method B is chosen and band format is specified, then the matrix is generated in the band format and no repacking is necessary.

Input Parameters

The data types are given for the Fortran interface.

m	INTEGER. The number of rows of the matrix *A* (*m*≥ 0).
n	INTEGER. The number of columns of the matrix *A* (*n*≥ 0).
dist	CHARACTER*1. Specifies the type of distribution to be used to generate the random singular values or eigenvalues: • 'U': uniform distribution (0, 1) • 'S': symmetric uniform distribution (-1, 1) • 'N': normal distribution (0, 1)

iseed

INTEGER. Array with size 4.

Specifies the seed of the random number generator. Values should lie between 0 and 4095 inclusive, and *iseed*(4) should be odd. The random number generator uses a linear congruential sequence limited to small integers, and so should produce machine independent random numbers. The values of the array are modified, and can be used in the next call to ?latms to continue the same random number sequence.

sym

CHARACTER*1.

If *sym*='S' or 'H', the generated matrix is symmetric or Hermitian, with eigenvalues specified by *d*, *cond*, *mode*, and *dmax*; they can be positive, negative, or zero.

If *sym*='P', the generated matrix is symmetric or Hermitian, with eigenvalues (which are singular, non-negative values) specified by *d*, *cond*, *mode*, and *dmax*.

If *sym*='N', the generated matrix is nonsymmetric, with singular, non-negative values specified by *d*, *cond*, *mode*, and *dmax*.

d

REAL for slatms and clatms

DOUBLE PRECISION for dlatms and zlatms

Array, size (MIN(*m* , *n*))

This array is used to specify the singular values or eigenvalues of *A* (see the description of *sym*). If *mode*=0, then *d* is assumed to contain the eigenvalues or singular values, otherwise elements of *d* are computed according to *mode*, *cond*, and *dmax*.

mode

INTEGER. Describes how the singular/eigenvalues are specified.

- *mode* = 0: use *d* as input
- *mode* = 1: set *d*(1) = 1 and *d*(2:*n*) = 1.0/*cond*
- *mode* = 2: set *d*(1:*n* - 1) = 1 and *d*(*n*) = 1.0/*cond*
- *mode* = 3: set *d*(*i*) = $cond^{-(i - 1)/(n - 1)}$
- *mode* = 4: set *d*(*i*) = 1 - (*i* - 1)/(*n* - 1)*(1 - 1/*cond*)
- *mode* = 5: set elements of *d* to random numbers in the range (1/*cond* , 1) such that their logarithms are uniformly distributed.
- *mode* = 6: set elements of *d* to random numbers from same distribution as the rest of the matrix.

mode < 0 has the same meaning as ABS(*mode*), except that the order of the elements of *d* is reversed. Thus, if *mode* is positive, *d* has entries ranging from 1 to 1/*cond*, if negative, from 1/*cond* to 1.

If *sym*='S' or 'H', and *mode* is not 0, 6, nor -6, then the elements of *d* are also given a random sign (multiplied by +1 or -1).

cond

REAL for slatms and clatms

DOUBLE PRECISION for dlatms and zlatms

Used in setting *d* as described for the *mode* parameter. If used, *cond*≥ 1.

dmax

REAL for slatms and clatms

DOUBLE PRECISION for dlatms and zlatms

If *mode* is not -6, 0 nor 6, the contents of *d*, as computed according to *mode* and *cond*, are scaled by *dmax* / max(abs(*d*(*i*))); thus, the maximum absolute eigenvalue or singular value (the norm) is abs(*dmax*).

NOTE
dmax need not be positive: if *dmax* is negative (or zero), *d* will be scaled by a negative number (or zero).

kl INTEGER. Specifies the lower bandwidth of the matrix. For example, *kl*=0 implies upper triangular, *kl*=1 implies upper Hessenberg, and *kl* being at least *m* - 1 means that the matrix has full lower bandwidth. *kl* must equal *ku* if the matrix is symmetric or Hermitian.

ku INTEGER. Specifies the upper bandwidth of the matrix. For example, *ku*=0 implies lower triangular, *ku*=1 implies lower Hessenberg, and *ku* being at least *n* - 1 means that the matrix has full upper bandwidth. *kl* must equal *ku* if the matrix is symmetric or Hermitian.

pack CHARACTER*1. Specifies packing of matrix:

- 'N': no packing
- 'U': zero out all subdiagonal entries (if symmetric or Hermitian)
- 'L': zero out all superdiagonal entries (if symmetric or Hermitian)
- 'B': store the lower triangle in band storage scheme (only if matrix symmetric, Hermitian, or lower triangular)
- 'Q': store the upper triangle in band storage scheme (only if matrix symmetric, Hermitian, or upper triangular)
- 'Z': store the entire matrix in band storage scheme (pivoting can be provided for by using this option to store *A* in the trailing rows of the allocated storage)

Using these options, the various LAPACK packed and banded storage schemes can be obtained:

	'Z'	'B'	'Q'	'C'	'R'
GB: general band	x				
PB: symmetric positive definite band		x	x		
SB: symmetric band		x	x		
HB: Hermitian band		x	x		
TB: triangular band		x	x		
PP: symmetric positive definite packed				x	x
SP: symmetric packed				x	x
HP: Hermitian packed				x	x
TP: triangular packed				x	x

If two calls to ?latms differ only in the *pack* parameter, they generate mathematically equivalent matrices.

lda INTEGER. *lda* specifies the first dimension of *a* as declared in the calling program.

If *pack*='N', 'U', 'L', 'C', or 'R', then *lda* must be at least *m*.

If *pack*='B' or 'Q', then *lda* must be at least MIN(*kl*, *m* – 1) (which is equal to MIN(*ku*,*n* - 1)).

If *pack*='Z', *lda* must be large enough to hold the packed array: MIN(*ku*, *n* – 1) + MIN(*kl*, *m* – 1) + 1.

Output Parameters

iseed The array *iseed* contains the updated seed.

d The array *d* contains the updated seed.

> **NOTE**
> The array *d* is not modified if *mode* = 0.

a REAL for slatms

DOUBLE PRECISION for dlatms

COMPLEX for clatms

DOUBLE COMPLEX for zlatms

Array of size *lda* by *n*.

The array *a* contains the generated *m*-by-*n* matrix *A*.

a is first generated in full (unpacked) form, and then packed, if so specified by *pack*. Thus, the first *m* elements of the first *n* columns are always modified. If *pack* specifies a packed or banded storage scheme, all *lda* elements of the first *n* columns are modified; the elements of the array which do not correspond to elements of the generated matrix are set to zero.

work REAL for slatms

DOUBLE PRECISION for dlatms

COMPLEX for clatms

DOUBLE COMPLEX for zlatms

Array of size (3*MAX(*n*, *m*))

Workspace.

info INTEGER. If *info* = 0, the execution is successful.

If *info* < 0, the *i*-th parameter had an illegal value.

If *info* = -1011, memory allocation error occurred.

If *info* = 2, cannot scale to *dmax* (maximum singular value is 0).

If *info* = 3, error return from ?lagge, ?laghe, or ?lagsy.

ScaLAPACK Routines

Intel® oneAPI Math Kernel Library implements routines from the ScaLAPACK package for distributed-memory architectures. Routines are supported for both real and complex dense and band matrices to perform the tasks of solving systems of linear equations, solving linear least-squares problems, eigenvalue and singular value problems, as well as performing a number of related computational tasks.

Intel® oneAPI Math Kernel Library (oneMKL) ScaLAPACK routines are written in FORTRAN 77 with exception of a few utility routines written in C to exploit the IEEE arithmetic. All routines are available in all precision types: single precision, double precision, complexm, and double complex precision. See the`mkl_scalapack.h` header file for C declarations of ScaLAPACK routines.

> **NOTE**
> ScaLAPACK routines are provided only for Intel® 64 or Intel® Many Integrated Core architectures.

See descriptions of ScaLAPACK computational routines that perform distinct computational tasks, as well as driver routinesfor solving standard types of problems in one call. Additionally, Intel® oneAPI Math Kernel Library implements ScaLAPACKAuxiliary Routines, Utility Functions and Routines, and Matrix Redistribution/Copy Routines. The library includes routines for both real and complex data.

The `<install_directory>/examples/scalapackf` directory contains sample code demonstrating the use of ScaLAPACK routines.

Generally, ScaLAPACK runs on a network of computers using MPI as a message-passing layer and a set of prebuilt communication subprograms (BLACS), as well as a set of BLAS optimized for the target architecture. Intel® oneAPI Math Kernel Library (oneMKL) version of ScaLAPACK is optimized for Intel® processors. For the detailed system and environment requirements, see*Intel® oneAPI Math Kernel Library (oneMKL) Release Notes* and *Intel® oneAPI Math Kernel Library (oneMKL) Developer Guide*.

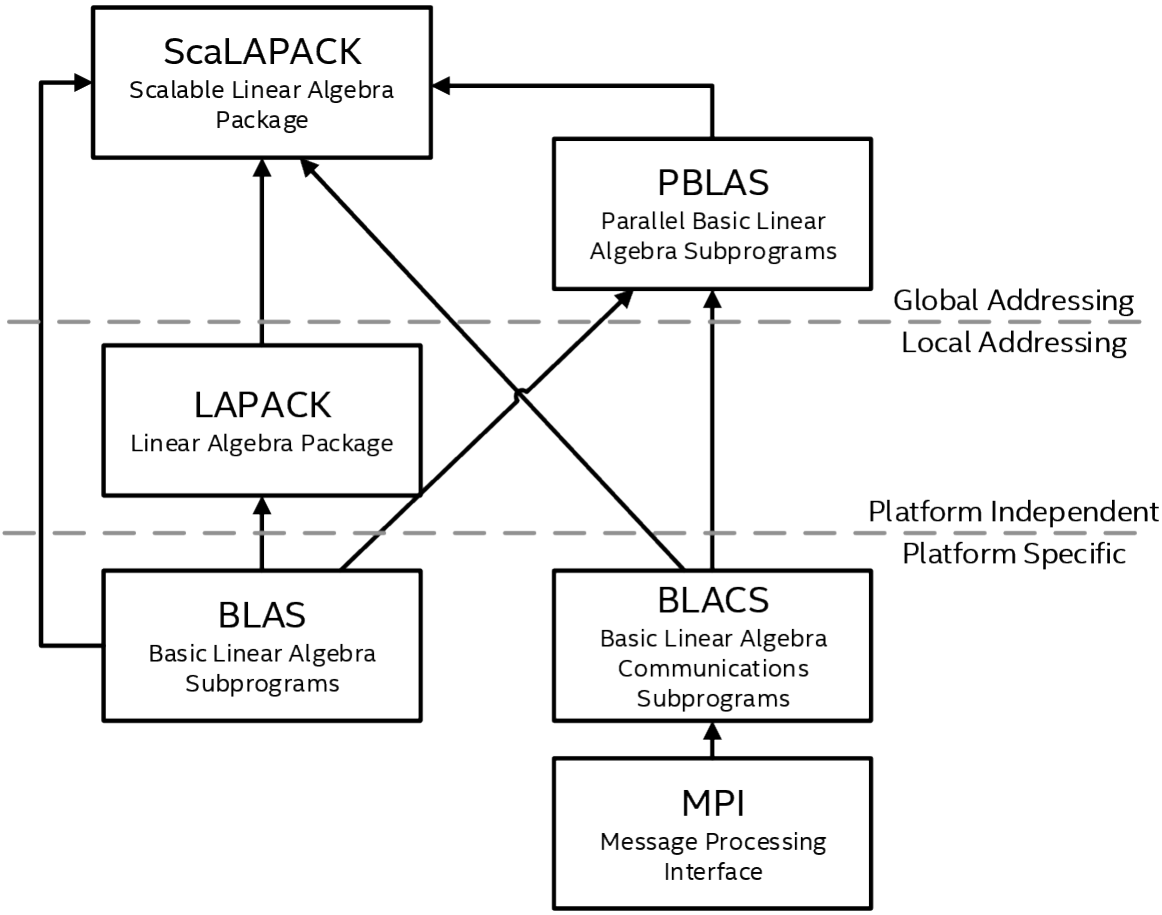
For full reference on ScaLAPACK routines and related information, see [SLUG].

Product and Performance Information
Performance varies by use, configuration and other factors. Learn more at www.Intel.com/PerformanceIndex. Notice revision #20201201

Overview of ScaLAPACK Routines

The model of the computing environment for ScaLAPACK is represented as a one-dimensional array of processes (for operations on band or tridiagonal matrices) or also a two-dimensional process grid (for operations on dense matrices). To use ScaLAPACK, all global matrices or vectors should be distributed on this array or grid prior to calling the ScaLAPACK routines.

ScaLAPACK is closely tied to other components, including BLAS, BLACS, LAPACK, and PBLAS.



ScaLAPACK Array Descriptors

ScaLAPACK uses two-dimensional block-cyclic data distribution as a layout for dense matrix computations. This distribution provides good work balance between available processors, and also allows use of BLAS Level 3 routines for optimal local computations. Information about the data distribution that is required to establish the mapping between each global matrix (array) and its corresponding process and memory location is contained in the array called the *array descriptor* associated with each global matrix. The size of the array descriptor is denoted as *dlen_*.

Let *A* be a two-dimensional block cyclicly distributed matrix with the array descriptor array `desca`. The meaning of each array descriptor element depends on the type of the matrix *A*. The tables "Array descriptor for dense matrices" and "Array descriptor for narrow-band and tridiagonal matrices" describe the meaning of each element for the different types of matrices.

Array descriptor for dense matrices (*dlen_*=9)

Element Name	Stored in	Description	Element Index Number
dtype_a	`desca`(*dtype_*)	Descriptor type (=1 for dense matrices).	1
ctxt_a	`desca`(*ctxt_*)	BLACS context handle for the process grid.	2
m_a	`desca`(*m_*)	Number of rows in the global matrix *A*.	3
n_a	`desca`(*n_*)	Number of columns in the global matrix *A*.	4
mb_a	`desca`(*mb_*)	Row blocking factor.	5

Element Name	Stored in	Description	Element Index Number
nb_a	*desca*(*nb_*)	Column blocking factor.	6
rsrc_a	*desca*(*rsrc_*)	Process row over which the first row of the global matrix *A* is distributed.	7
csrc_a	*desca*(*csrc_*)	Process column over which the first column of the global matrix *A* is distributed.	8
lld_a	*desca*(*lld_*)	Leading dimension of the local matrix *A*.	9

Array descriptor for narrow-band and tridiagonal matrices (*dlen_*=7)

Element Name	Stored in	Description	Element Index Number
dtype_a	*desca*(*dtype_*)	Descriptor type • *dtype_a*=501: 1-by-*P* grid, • *dtype_a*=502: *P*-by-1 grid.	1
ctxt_a	*desca*(*ctxt_*)	BLACS context handle indicating the BLACS process grid over which the global matrix *A* is distributed. The context itself is global, but the handle (the integer value) can vary.	2
n_a	*desca*(*n_*)	The size of the matrix dimension being distributed.	3
nb_a	*desca*(*nb_*)	The blocking factor used to distribute the distributed dimension of the matrix *A*.	4
src_a	*desca*(*src_*)	The process row or column over which the first row or column of the matrix *A* is distributed.	5
lld_a	*desca*(*lld_*)	The leading dimension of the local matrix storing the local blocks of the distributed matrix *A*. The minimum value of *lld_a* depends on *dtype_a*. • *dtype_a*=501: *lld_a*≥ max(size of undistributed dimension, 1), • *dtype_a*=502: *lld_a*≥ max(*nb_a*, 1).	6
Not applicable		Reserved for future use.	7

Similar notations are used for different matrices. For example: *lld_b* is the leading dimension of the local matrix storing the local blocks of the distributed matrix *B* and *dtype_z* is the type of the global matrix *Z*.

The number of rows and columns of a global dense matrix that a particular process in a grid receives after data distributing is denoted by $LOC_r()$ and $LOC_c()$, respectively. To compute these numbers, you can use the ScaLAPACK tool routine `numroc`.

After the block-cyclic distribution of global data is done, you may choose to perform an operation on a submatrix sub(*A*) of the global matrix *A* defined by the following 6 values (for dense matrices):

m	The number of rows of sub(*A*)
n	The number of columns of sub(*A*)
a	A pointer to the local matrix containing the entire global matrix A
ia	The row index of sub(*A*) in the global matrix *A*
ja	The column index of sub(*A*) in the global matrix *A*

desca	The array descriptor for the global matrix *A*

Naming Conventions for ScaLAPACK Routines

For each routine introduced in this chapter, you can use the ScaLAPACK name. The naming convention for ScaLAPACK routines is similar to that used for LAPACK routines. A general rule is that each routine name in ScaLAPACK, which has an LAPACK equivalent, is simply the LAPACK name prefixed by initial letter `p`.

ScaLAPACK names have the structure `p?yyzzz` or `p?yyzz`, which is described below.

The initial letter `p` is a distinctive prefix of ScaLAPACK routines and is present in each such routine.

The second symbol `?` indicates the data type:

`s`	real, single precision
`d`	real, double precision
`c`	complex, single precision
`z`	complex, double precision

The second and third letters `yy` indicate the matrix type as:

`ge`	general
`gb`	general band
`gg`	a pair of general matrices (for a generalized problem)
`dt`	general tridiagonal (diagonally dominant-like)
`db`	general band (diagonally dominant-like)
`po`	symmetric or Hermitian positive-definite
`pb`	symmetric or Hermitian positive-definite band
`pt`	symmetric or Hermitian positive-definite tridiagonal
`sy`	symmetric
`st`	symmetric tridiagonal (real)
`he`	Hermitian
`or`	orthogonal
`tr`	triangular (or quasi-triangular)
`tz`	trapezoidal
`un`	unitary

For computational routines, the last three letters **zzz** indicate the computation performed and have the same meaning as for LAPACK routines.

For driver routines, the last two letters **zz** or three letters **zzz** have the following meaning:

sv	a *simple* driver for solving a linear system
svx	an *expert* driver for solving a linear system
ls	a driver for solving a linear least squares problem
ev	a simple driver for solving a symmetric eigenvalue problem
evd	a simple driver for solving an eigenvalue problem using a divide and conquer algorithm
evx	an expert driver for solving a symmetric eigenvalue problem
svd	a driver for computing a singular value decomposition
gvx	an expert driver for solving a generalized symmetric definite eigenvalue problem

Simple driver here means that the driver just solves the general problem, whereas an *expert* driver is more versatile and can also optionally perform some related computations (such, for example, as refining the solution and computing error bounds after the linear system is solved).

ScaLAPACK Computational Routines

In the sections that follow, the descriptions of ScaLAPACK computational routines are given. These routines perform distinct computational tasks that can be used for:

- Solving Systems of Linear Equations
- Orthogonal Factorizations and LLS Problems
- Symmetric Eigenproblems
- Nonsymmetric Eigenproblems
- Singular Value Decomposition
- Generalized Symmetric-Definite Eigenproblems

See also the respective driver routines.

Systems of Linear Equations: ScaLAPACK Computational Routines

ScaLAPACK supports routines for the systems of equations with the following types of matrices:

- general
- general banded
- general diagonally dominant-like banded (including general tridiagonal)
- symmetric or Hermitian positive-definite
- symmetric or Hermitian positive-definite banded
- symmetric or Hermitian positive-definite tridiagonal

A *diagonally dominant-like* matrix is defined as a matrix for which it is known in advance that pivoting is not required in the *LU* factorization of this matrix.

For the above matrix types, the library includes routines for performing the following computations: *factoring* the matrix; *equilibrating* the matrix; *solving* a system of linear equations; *estimating the condition number* of a matrix; *refining* the solution of linear equations and computing its error bounds; *inverting* the matrix. Note that for some of the listed matrix types only part of the computational routines are provided (for example, routines that refine the solution are not provided for band or tridiagonal matrices). See Table "Computational Routines for Systems of Linear Equations" for full list of available routines.

To solve a particular problem, you can either call two or more computational routines or call a corresponding driver routine that combines several tasks in one call. Thus, to solve a system of linear equations with a general matrix, you can first call `p?getrf`(*LU* factorization) and then `p?getrs`(computing the solution). Then, you might wish to call `p?gerfs` to refine the solution and get the error bounds. Alternatively, you can just use the driver routine `p?gesvx` which performs all these tasks in one call.

Table "Computational Routines for Systems of Linear Equations" lists the ScaLAPACK computational routines for factorizing, equilibrating, and inverting matrices, estimating their condition numbers, solving systems of equations with real matrices, refining the solution, and estimating its error.

Computational Routines for Systems of Linear Equations

Matrix type, storage scheme	Factorize matrix	Equilibrate matrix	Solve system	Condition number	Estimate error	Invert matrix
general (partial pivoting)	p?getrf	p?geequ	p?getrs	p?gecon	p?gerfs	p?getri
general band (partial pivoting)	p?gbtrf		p?gbtrs			
general band (no pivoting)	p?dbtrf		p?dbtrs			
general tridiagonal (no pivoting)	p?dttrf		p?dttrs			
symmetric/Hermitian positive-definite	p?potrf	p?poequ	p?potrs	p?pocon	p?porfs	p?potri
symmetric/Hermitian positive-definite, band	p?pbtrf		p?pbtrs			
symmetric/Hermitian positive-definite, tridiagonal	p?pttrf		p?pttrs			
triangular			p?trtrs	p?trcon	p?trrfs	p?trtri

In this table ? stands for s (single precision real), d (double precision real), c (single precision complex), or z (double precision complex).

Matrix Factorization: ScaLAPACK Computational Routines

This section describes the ScaLAPACK routines for matrix factorization. The following factorizations are supported:

- LU factorization of general matrices
- LU factorization of diagonally dominant-like matrices
- Cholesky factorization of real symmetric or complex Hermitian positive-definite matrices

You can compute the factorizations using full and band storage of matrices.

p?getrf

Computes the LU factorization of a general m-by-n distributed matrix.

Syntax

```
call psgetrf(m, n, a, ia, ja, desca, ipiv, info)
call pdgetrf(m, n, a, ia, ja, desca, ipiv, info)
call pcgetrf(m, n, a, ia, ja, desca, ipiv, info)
call pzgetrf(m, n, a, ia, ja, desca, ipiv, info)
```

Include Files

Description

The p?getrfroutine forms the *LU* factorization of a general *m*-by-*n* distributed matrix sub(*A*) = *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1) as

A = *P***L***U*

where *P* is a permutation matrix, *L* is lower triangular with unit diagonal elements (lower trapezoidal if *m*>*n*) and *U* is upper triangular (upper trapezoidal if *m* < *n*). *L* and *U* are stored in sub(*A*).

The routine uses partial pivoting, with row interchanges.

NOTE
This routine supports the Progress Routine feature. See mkl_progress for details.

Input Parameters

m (global) INTEGER. The number of rows in the distributed matrix sub(*A*); *m*≥0.

n (global) INTEGER. The number of columns in the distributed matrix sub(*A*); *n*≥0.

a (local)

REAL for psgetrf

DOUBLE PRECISION for pdgetrf

COMPLEX for pcgetrf

DOUBLE COMPLEX for pzgetrf.

Pointer into the local memory to an array of local size (*lld_a*, *LOCc*(*ja*+*n*-1)).

Contains the local pieces of the distributed matrix sub(*A*) to be factored.

ia, *ja* (global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the matrix sub(*A*), respectively.

desca (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

Output Parameters

a Overwritten by local pieces of the factors *L* and *U* from the factorization *A* = *P***L***U*. The unit diagonal elements of *L* are not stored.

ipiv (local) INTEGER Array of size *LOCr*(*m_a*)+ *mb_a*.

Contains the pivoting information: local row *i* was interchanged with global row *ipiv*(*i*). This array is tied to the distributed matrix *A*.

info (global) INTEGER.

If *info*=0, the execution is successful.

info < 0: if the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

If *info* = *i* > 0, $u_{ia+i,\ ja+j-1}$ is 0. The factorization has been completed, but the factor *U* is exactly singular. Division by zero will occur if you use the factor *U* for solving a system of linear equations.

Overview for details of ScaLAPACK array descriptor structures and related notations.

p?gbtrf

Computes the LU factorization of a general n-by-n banded distributed matrix.

Syntax

```
call psgbtrf(n, bwl, bwu, a, ja, desca, ipiv, af, laf, work, lwork, info)
call pdgbtrf(n, bwl, bwu, a, ja, desca, ipiv, af, laf, work, lwork, info)
call pcgbtrf(n, bwl, bwu, a, ja, desca, ipiv, af, laf, work, lwork, info)
call pzgbtrf(n, bwl, bwu, a, ja, desca, ipiv, af, laf, work, lwork, info)
```

Include Files

Description

The `p?gbtrf` routine computes the *LU* factorization of a general *n*-by-*n* real/complex banded distributed matrix *A*(1:*n*, *ja*:*ja*+*n*-1) using partial pivoting with row interchanges.

The resulting factorization is not the same factorization as returned from the LAPACK routine `?gbtrf`. Additional permutations are performed on the matrix for the sake of parallelism.

The factorization has the form

A(1:*n*, *ja*:*ja*+*n*-1) = *P***L***U***Q*

where *P* and *Q* are permutation matrices, and *L* and *U* are banded lower and upper triangular matrices, respectively. The matrix *Q* represents reordering of columns for the sake of parallelism, while *P* represents reordering of rows for numerical stability using classic partial pivoting.

Input Parameters

n — (global) `INTEGER`. The number of rows and columns in the distributed submatrix *A*(1:*n*, *ja*:*ja*+*n*-1); *n*≥ 0.

bwl — (global) `INTEGER`. The number of sub-diagonals within the band of *A* (0 ≤ *bwl* ≤ *n-1*).

bwu — (global) `INTEGER`. The number of super-diagonals within the band of *A* (0 ≤ *bwu* ≤ *n-1*).

a — (local)

`REAL` for `psgbtrf`

`DOUBLE PRECISION` for `pdgbtrf`

`COMPLEX` for `pcgbtrf`

`DOUBLE COMPLEX` for `pzgbtrf`.

Pointer into the local memory to an array of local size `(lld_a, LOCc(ja+n-1))` where

lld_a≥ 2*bwl + 2*bwu +1.

Contains the local pieces of the *n*-by-*n* distributed banded matrix *A*(1:*n*, *ja*:*ja*+*n*-1) to be factored.

ja

(global) INTEGER. The index in the global matrix *A* indicating the start of the matrix to be operated on (which may be either all of *A* or a submatrix of *A*).

desca

(global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

If *dtype_a* = 501, then *dlen_*≥ 7;

else if *dtype_a* = 1, then *dlen_*≥ 9.

laf

(local) INTEGER. The size of the array *af*.

Must be *laf*≥ (nb_a+*bwu*)*(*bwl*+*bwu*)+6*(*bwl*+*bwu*)*(*bwl*+2*bwu).

If *laf* is not large enough, an error code will be returned and the minimum acceptable size will be returned in *af*(1).

work

(local) Same type as *a*. Workspace array of size *lwork*.

lwork

(local or global) INTEGER. The size of the *work* array (*lwork*≥ 1). If *lwork* is too small, the minimal acceptable size will be returned in *work*(1) and an error code is returned.

Output Parameters

a

On exit, this array contains details of the factorization. Note that additional permutations are performed on the matrix, so that the factors returned are different from those returned by LAPACK.

ipiv

(local) INTEGER array.

The size of *ipiv* must be ≥*nb_a*.

Contains pivot indices for local factorizations. Note that you *should not alter* the contents of this array between factorization and solve.

af

(local)

REAL for psgbtrf

DOUBLE PRECISION for pdgbtrf

COMPLEX for pcgbtrf

DOUBLE COMPLEX for pzgbtrf.

Array of size *laf*.

Auxiliary fill-in space. The fill-in space is created in a call to the factorization routine p?gbtrf and is stored in *af*.

Note that if a linear system is to be solved using p?gbtrs after the factorization routine,*af* must not be altered after the factorization.

work(1)

On exit, *work*(1) contains the minimum value of *lwork* required.

info

(global) INTEGER.

If *info*=0, the execution is successful.

info < 0:

If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

info> 0:

If *info* = *k* ≤ NPROCS, the submatrix stored on processor *info* and factored locally was not nonsingular, and the factorization was not completed.

If *info* = *k* > NPROCS, the submatrix stored on processor *info*–NPROCS representing interactions with other processors was not nonsingular, and the factorization was not completed.

Overview for details of ScaLAPACK array descriptor structures and related notations.

p?dbtrf

Computes the LU factorization of a n-by-n diagonally dominant-like banded distributed matrix.

Syntax

```
call psdbtrf(n, bwl, bwu, a, ja, desca, af, laf, work, lwork, info)
call pddbtrf(n, bwl, bwu, a, ja, desca, af, laf, work, lwork, info)
call pcdbtrf(n, bwl, bwu, a, ja, desca, af, laf, work, lwork, info)
call pzdbtrf(n, bwl, bwu, a, ja, desca, af, laf, work, lwork, info)
```

Include Files

Description

The p?dbtrfroutine computes the LU factorization of a *n*-by-*n* real/complex diagonally dominant-like banded distributed matrix *A*(1:*n*, *ja*:*ja*+*n*-1) without pivoting.

NOTE
A matrix is called *diagonally dominant-like* if pivoting is not required for LU to be numerically stable.

Note that the resulting factorization is not the same factorization as returned from LAPACK. Additional permutations are performed on the matrix for the sake of parallelism.

Input Parameters

n
(global) INTEGER. The number of rows and columns in the distributed submatrix *A*(1:*n*, *ja*:*ja*+*n*-1); *n*≥ 0.

bwl
(global) INTEGER. The number of sub-diagonals within the band of *A* (0 ≤ *bwl* ≤ *n-1*).

bwu
(global) INTEGER. The number of super-diagonals within the band of *A* (0 ≤ *bwu* ≤ *n-1*).

a
(local)

REAL for psdbtrf

DOUBLE PRECISION for pddbtrf

COMPLEX for pcdbtrf

DOUBLE COMPLEX for pzdbtrf.

Pointer into the local memory to an array of local size (*lld_a*, *LOCc*(*ja*+*n*-1)).

Contains the local pieces of the *n*-by-*n* distributed banded matrix *A*(1:*n*, *ja*:*ja*+*n*-1) to be factored.

ja
(global) INTEGER. The index in the global matrix *A* indicating the start of the matrix to be operated on (which may be either all of *A* or a submatrix of *A*).

desca
(global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

If *dtype_a* = 501, then *dlen_*≥ 7;

else if *dtype_a* = 1, then *dlen_*≥ 9.

laf
(local) INTEGER. The size of the array *af*.

Must be *laf*≥NB*(*bwl*+*bwu*)+6*(max(*bwl*,*bwu*))^2 .

If *laf* is not large enough, an error code will be returned and the minimum acceptable size will be returned in *af*(1).

work
(local) Same type as *a*. Workspace array of size *lwork*.

lwork
(local or global) INTEGER. The size of the *work* array, must be *lwork*≥ (max(*bwl*,*bwu*))^2. If *lwork* is too small, the minimal acceptable size will be returned in *work*(1) and an error code is returned.

Output Parameters

a
On exit, this array contains details of the factorization. Note that additional permutations are performed on the matrix, so that the factors returned are different from those returned by LAPACK.

af
(local)

REAL for psdbtrf

DOUBLE PRECISION for pddbtrf

COMPLEX for pcdbtrf

DOUBLE COMPLEX for pzdbtrf.

Array of size *laf*.

Auxiliary fill-in space. The fill-in space is created in a call to the factorization routine p?dbtrf and is stored in *af*.

Note that if a linear system is to be solved using p?dbtrs after the factorization routine,*af* must not be altered after the factorization.

work(1) — On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.

info — (global) INTEGER.

If *info*=0, the execution is successful.

info < 0:

If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

info> 0:

If *info* = *k* ≤ NPROCS, the submatrix stored on processor *info* and factored locally was not diagonally dominant-like, and the factorization was not completed.

If *info* = *k* > NPROCS, the submatrix stored on processor *info*-NPROCS representing interactions with other processors was not nonsingular, and the factorization was not completed.

p?dttrf

Computes the LU factorization of a diagonally dominant-like tridiagonal distributed matrix.

Syntax

```
call psdttrf(n, dl, d, du, ja, desca, af, laf, work, lwork, info)
call pddttrf(n, dl, d, du, ja, desca, af, laf, work, lwork, info)
call pcdttrf(n, dl, d, du, ja, desca, af, laf, work, lwork, info)
call pzdttrf(n, dl, d, du, ja, desca, af, laf, work, lwork, info)
```

Include Files

Description

The p?dttrfroutine computes the *LU* factorization of an *n*-by-*n* real/complex diagonally dominant-like tridiagonal distributed matrix *A*(1:*n*, *ja*:*ja*+*n*-1) without pivoting for stability.

The resulting factorization is not the same factorization as returned from LAPACK. Additional permutations are performed on the matrix for the sake of parallelism.

The factorization has the form:

$A(1:n, ja:ja+n-1) = P*L*U*P^T$,

where P is a permutation matrix, and L and U are banded lower and upper triangular matrices, respectively.

Product and Performance Information
Performance varies by use, configuration and other factors. Learn more at www.Intel.com/PerformanceIndex. Notice revision #20201201

Input Parameters

n

(global) INTEGER. The number of rows and columns to be operated on, that is, the order of the distributed submatrix $A(1:n, ja:ja+n-1)$ ($n \geq 0$).

dl, *d*, *du*

(local)

REAL for pspttrf

DOUBLE PRECISON for pdpttrf

COMPLEX for pcpttrf

DOUBLE COMPLEX for pzpttrf.

Pointers to the local arrays of size *nb_a* each.

On entry, the array *dl* contains the local part of the global vector storing the subdiagonal elements of the matrix. Globally, *dl*(1) is not referenced, and *dl* must be aligned with *d*.

On entry, the array *d* contains the local part of the global vector storing the diagonal elements of the matrix.

On entry, the array *du* contains the local part of the global vector storing the super-diagonal elements of the matrix. *du*(*n*) is not referenced, and *du* must be aligned with *d*.

ja

(global) INTEGER. The index in the global matrix *A* indicating the start of the matrix to be operated on (which may be either all of *A* or a submatrix of *A*).

desca

(global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

If *dtype_a* = 501, then *dlen_* ≥ 7;

else if *dtype_a* = 1, then *dlen_* ≥ 9.

laf

(local) INTEGER. The size of the array *af*.

Must be *laf* ≥ 2*(NB+2) .

If *laf* is not large enough, an error code will be returned and the minimum acceptable size will be returned in *af*(1).

work

(local) Same type as *d*. Workspace array of size *lwork*.

lwork

(local or global) INTEGER. The size of the *work* array, must be at least *lwork* ≥ 8*NPCOL.

Output Parameters

dl, *d*, *du*	On exit, overwritten by the information containing the factors of the matrix.
af	(local) REAL for psdttrf DOUBLE PRECISION for pddttrf COMPLEX for pcdttrf DOUBLE COMPLEX for pzdttrf. Array of size *laf*. Auxiliary fill-in space. The fill-in space is created in a call to the factorization routine p?dttrf and is stored in *af*. Note that if a linear system is to be solved using p?dttrs after the factorization routine,*af* must not be altered.
work(1)	On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	(global) INTEGER. If *info*=0, the execution is successful. *info* < 0: If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*. *info*> 0: If *info* = *k* ≤ NPROCS, the submatrix stored on processor *info* and factored locally was not diagonally dominant-like, and the factorization was not completed. If *info* = *k* > NPROCS, the submatrix stored on processor *info*-NPROCS representing interactions with other processors was not nonsingular, and the factorization was not completed.

p?potrf

Computes the Cholesky factorization of a symmetric (Hermitian) positive-definite distributed matrix.

Syntax

```
call pspotrf(uplo, n, a, ia, ja, desca, info)
call pdpotrf(uplo, n, a, ia, ja, desca, info)
call pcpotrf(uplo, n, a, ia, ja, desca, info)
call pzpotrf(uplo, n, a, ia, ja, desca, info)
```

Include Files

Description

The p?potrfroutine computes the Cholesky factorization of a real symmetric or complex Hermitian positive-definite distributed *n*-by-*n* matrix *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1), denoted below as sub(*A*).

The factorization has the form

sub(*A*) = U^H*U if *uplo*='U', or

sub(*A*) = $L*L^H$ if *uplo*='L'

where *L* is a lower triangular matrix and *U* is upper triangular.

Input Parameters

uplo

(global) CHARACTER*1.

Indicates whether the upper or lower triangular part of sub(*A*) is stored. Must be 'U' or 'L'.

If *uplo* = 'U', the array *a* stores the upper triangular part of the matrix sub(*A*) that is factored as U^H*U.

If *uplo* = 'L', the array *a* stores the lower triangular part of the matrix sub(*A*) that is factored as $L*L^H$.

n

(global) INTEGER. The order of the distributed matrix sub(*A*) (*n*≥0).

a

(local)

REAL for pspotrf

DOUBLE PRECISON for pdpotrf

COMPLEX for pcpotrf

DOUBLE COMPLEX for pzpotrf.

Pointer into the local memory to an array of size (*lld_a*, *LOCc*(*ja*+*n*-1)).

On entry, this array contains the local pieces of the *n*-by-*n* symmetric/ Hermitian distributed matrix sub(*A*) to be factored.

Depending on *uplo*, the array *a* contains either the upper or the lower triangular part of the matrix sub(*A*) (see *uplo*).

ia, *ja*

(global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the matrix sub(*A*), respectively.

desca

(global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

Output Parameters

a

The upper or lower triangular part of *a* is overwritten by the Cholesky factor *U* or *L*, as specified by *uplo*.

info

(global) INTEGER.

If *info*=0, the execution is successful;

info < 0: if the *i*-th argument is an array, and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

If *info* = *k* >0, the leading minor of order *k*, *A*(*ia*:*ia*+*k*-1, *ja*:*ja*+*k*-1), is not positive-definite, and the factorization could not be completed.

See Also

Overview for details of ScaLAPACK array descriptor structures and related notations.

p?pbtrf

Computes the Cholesky factorization of a symmetric (Hermitian) positive-definite banded distributed matrix.

Syntax

```
call pspbtrf(uplo, n, bw, a, ja, desca, af, laf, work, lwork, info)
call pdpbtrf(uplo, n, bw, a, ja, desca, af, laf, work, lwork, info)
call pcpbtrf(uplo, n, bw, a, ja, desca, af, laf, work, lwork, info)
call pzpbtrf(uplo, n, bw, a, ja, desca, af, laf, work, lwork, info)
```

Include Files

Description

The p?pbtrfroutine computes the Cholesky factorization of an *n*-by-*n* real symmetric or complex Hermitian positive-definite banded distributed matrix *A*(1:*n*, *ja*:*ja*+*n*-1).

The resulting factorization is not the same factorization as returned from LAPACK. Additional permutations are performed on the matrix for the sake of parallelism.

The factorization has the form:

A(1:*n*, *ja*:*ja*+*n*-1) = $P*U^H*U*P^T$, if *uplo*='U', or

A(1:*n*, *ja*:*ja*+*n*-1) = $P*L*L^H*P^T$, if *uplo*='L',

where *P* is a permutation matrix and *U* and *L* are banded upper and lower triangular matrices, respectively.

Input Parameters

uplo

(global) CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', upper triangle of *A*(1:*n*, *ja*:*ja*+*n*-1) is stored;

If *uplo* = 'L', lower triangle of *A*(1:*n*, *ja*:*ja*+*n*-1) is stored.

n

(global) INTEGER. The order of the distributed submatrix *A*(1:*n*, *ja*:*ja*+*n*-1).

(*n*≥0).

bw (global) INTEGER.

The number of superdiagonals of the distributed matrix if *uplo* = 'U', or the number of subdiagonals if *uplo* = 'L' (*bw*≥0).

a (local)

REAL for pspbtrf

DOUBLE PRECISON for pdpbtrf

COMPLEX for pcpbtrf

DOUBLE COMPLEX for pzpbtrf.

Pointer into the local memory to an array of size (*lld_a*,*LOCc*(*ja*+*n*-1)).

On entry, this array contains the local pieces of the upper or lower triangle of the symmetric/Hermitian band distributed matrix *A*(1:*n*, *ja*:*ja*+*n*-1) to be factored.

ja (global) INTEGER. The index in the global matrix *A* indicating the start of the matrix to be operated on (which may be either all of *A* or a submatrix of *A*).

desca (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

If *dtype_a* = 501, then *dlen_* ≥ 7;

else if *dtype_a* = 1, then *dlen_* ≥ 9.

laf (local) INTEGER. The size of the array *af*.

Must be *laf* ≥ (NB+2*bw)*bw.

If *laf* is not large enough, an error code will be returned and the minimum acceptable size will be returned in *af*(1).

work (local) Same type as *a*. Workspace array of size *lwork*.

lwork (local or global) INTEGER. The size of the *work* array, must be *lwork*≥bw^2.

Output Parameters

a On exit, if *info*=0, contains the permuted triangular factor *U* or *L* from the Cholesky factorization of the band matrix *A*(1:*n*, *ja*:*ja*+*n*-1), as specified by *uplo*.

af (local)

REAL for pspbtrf

DOUBLE PRECISON for pdpbtrf

COMPLEX for pcpbtrf

DOUBLE COMPLEX for pzpbtrf.

Array of size *laf*. Auxiliary fill-in space. The fill-in space is created in a call to the factorization routine p?pbtrf and stored in *af*. Note that if a linear system is to be solved using p?pbtrs after the factorization routine,*af* must not be altered.

work(1) — On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.

info — (global) INTEGER.

If *info*=0, the execution is successful.

info < 0:

If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

info>0:

If *info* = *k* ≤ NPROCS, the submatrix stored on processor *info* and factored locally was not positive definite, and the factorization was not completed.

If *info* = *k* > NPROCS, the submatrix stored on processor *info*-NPROCS representing interactions with other processors was not nonsingular, and the factorization was not completed.

p?pttrf

Computes the Cholesky factorization of a symmetric (Hermitian) positive-definite tridiagonal distributed matrix.

Syntax

```
call pspttrf(n, d, e, ja, desca, af, laf, work, lwork, info)
call pdpttrf(n, d, e, ja, desca, af, laf, work, lwork, info)
call pcpttrf(n, d, e, ja, desca, af, laf, work, lwork, info)
call pzpttrf(n, d, e, ja, desca, af, laf, work, lwork, info)
```

Include Files

Description

The p?pttrfroutine computes the Cholesky factorization of an *n*-by-*n* real symmetric or complex hermitian positive-definite tridiagonal distributed matrix *A*(1:*n*, *ja*:*ja*+*n*-1).

The resulting factorization is not the same factorization as returned from LAPACK. Additional permutations are performed on the matrix for the sake of parallelism.

The factorization has the form:

A(1:*n*, *ja*:*ja*+*n*-1) = $P*L*D*L^H*P^T$, or

A(1:*n*, *ja*:*ja*+*n*-1) = $P*U^H*D*U*P^T$,

where *P* is a permutation matrix, and *U* and *L* are tridiagonal upper and lower triangular matrices, respectively.

Product and Performance Information
Performance varies by use, configuration and other factors. Learn more at www.Intel.com/PerformanceIndex.
Notice revision #20201201

Input Parameters

n	(global) INTEGER. The order of the distributed submatrix *A*(1:*n*, *ja*:*ja*+*n*-1) (*n*≥ 0).
d, *e*	(local) REAL for pspttrf DOUBLE PRECISON for pdpttrf COMPLEX for pcpttrf DOUBLE COMPLEX for pzpttrf. Pointers into the local memory to arrays of size *nb_a* each. On entry, the array *d* contains the local part of the global vector storing the main diagonal of the distributed matrix *A*. On entry, the array *e* contains the local part of the global vector storing the upper diagonal of the distributed matrix *A*.
ja	(global) INTEGER. The index in the global matrix *A* indicating the start of the matrix to be operated on (which may be either all of *A* or a submatrix of *A*).
desca	(global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*. If *dtype_a* = 501, then *dlen_*≥ 7; else if *dtype_a* = 1, then *dlen_*≥ 9.
laf	(local) INTEGER. The size of the array *af*. Must be *laf*≥*nb_a*+2. If *laf* is not large enough, an error code will be returned and the minimum acceptable size will be returned in *af*(1).
work	(local) Same type as *d* and *e*. Workspace array of size *lwork* .
lwork	(local or global) INTEGER. The size of the *work* array, must be at least *lwork*≥ 8*NPCOL.

Output Parameters

d, *e*	On exit, overwritten by the details of the factorization.

af	(local) REAL for pspttrf DOUBLE PRECISION for pdpttrf COMPLEX for pcpttrf DOUBLE COMPLEX for pzpttrf. Array of size *laf*. Auxiliary fill-in space. The fill-in space is created in a call to the factorization routine p?pttrf and stored in *af*. Note that if a linear system is to be solved using p?pttrs after the factorization routine,*af* must not be altered.
work(1)	On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	(global) INTEGER. If *info*=0, the execution is successful. *info* < 0: If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*. *info*> 0: If *info* = *k* ≤ NPROCS, the submatrix stored on processor *info* and factored locally was not positive definite, and the factorization was not completed. If *info* = *k* > NPROCS, the submatrix stored on processor *info*–NPROCS representing interactions with other processors was not nonsingular, and the factorization was not completed.

Solving Systems of Linear Equations: ScaLAPACK Computational Routines

This section describes the ScaLAPACK routines for solving systems of linear equations. Before calling most of these routines, you need to factorize the matrix of your system of equations (see Routines for Matrix Factorization in this chapter). However, the factorization is not necessary if your system of equations has a triangular matrix.

p?getrs

Solves a system of distributed linear equations with a general square matrix, using the LU factorization computed by p?getrf.

Syntax

```
call psgetrs(trans, n, nrhs, a, ia, ja, desca, ipiv, b, ib, jb, descb, info)
call pdgetrs(trans, n, nrhs, a, ia, ja, desca, ipiv, b, ib, jb, descb, info)
call pcgetrs(trans, n, nrhs, a, ia, ja, desca, ipiv, b, ib, jb, descb, info)
```

```
call pzgetrs(trans, n, nrhs, a, ia, ja, desca, ipiv, b, ib, jb, descb, info)
```

Include Files

Description

The p?getrsroutine solves a system of distributed linear equations with a general *n*-by-*n* distributed matrix sub(*A*) = *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1) using the *LU* factorization computed by p?getrf.

The system has one of the following forms specified by *trans*:

sub(*A*)**X* = sub(*B*) (no transpose),

sub(*A*)^T**X* = sub(*B*) (transpose),

sub(*A*)^H**X* = sub(*B*) (conjugate transpose),

where sub(*B*) = *B*(*ib*:*ib*+*n*-1, *jb*:*jb*+*nrhs*-1).

Before calling this routine,you must call p?getrf to compute the *LU* factorization of sub(*A*).

Input Parameters

trans	(global) CHARACTER*1. Must be 'N' or 'T' or 'C'. Indicates the form of the equations: If *trans* = 'N', then sub(*A*)**X* = sub(*B*) is solved for *X*. If *trans* = 'T', then sub(*A*)^T**X* = sub(*B*) is solved for *X*. If *trans* = 'C', then sub(*A*)^H **X* = sub(*B*) is solved for *X*.
n	(global) INTEGER. The number of linear equations; the order of the matrix sub(*A*) (*n*≥0).
nrhs	(global) INTEGER. The number of right hand sides; the number of columns of the distributed matrix sub(*B*) (*nrhs*≥0).
a, *b*	(local) REAL for psgetrs DOUBLE PRECISION for pdgetrs COMPLEX for pcgetrs DOUBLE COMPLEX for pzgetrs. Pointers into the local memory to arrays of local sizes (*lld_a*, *LOCc*(*ja*+*n*-1)) and (*lld_b*, *LOCc*(*jb*+*nrhs*-1)), respectively. On entry, the array *a* contains the local pieces of the factors *L* and *U* from the factorization sub(*A*) = *P***L***U*; the unit diagonal elements of *L* are not stored. On entry, the array *b* contains the right hand sides sub(*B*).
ia, *ja*	(global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the matrix sub(*A*), respectively.
desca	(global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

ipiv	(local) INTEGER Array of size of *LOCr(m_a) + mb_a*. Contains the pivoting information: local row *i* of the matrix was interchanged with the global row *ipiv*(*i*). This array is tied to the distributed matrix *A*.
ib, *jb*	(global) INTEGER. The row and column indices in the global matrix *B* indicating the first row and the first column of the matrix sub(*B*), respectively.
descb	(global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *B*.

Output Parameters

b	On exit, overwritten by the solution distributed matrix *X*.
info	INTEGER. If *info*=0, the execution is successful. *info* < 0: If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?gbtrs

Solves a system of distributed linear equations with a general band matrix, using the LU factorization computed by p?gbtrf.

Syntax

```
call psgbtrs(trans, n, bwl, bwu, nrhs, a, ja, desca, ipiv, b, ib, descb, af, laf, work, lwork, info)
call pdgbtrs(trans, n, bwl, bwu, nrhs, a, ja, desca, ipiv, b, ib, descb, af, laf, work, lwork, info)
call pcgbtrs(trans, n, bwl, bwu, nrhs, a, ja, desca, ipiv, b, ib, descb, af, laf, work, lwork, info)
call pzgbtrs(trans, n, bwl, bwu, nrhs, a, ja, desca, ipiv, b, ib, descb, af, laf, work, lwork, info)
```

Include Files

Description

The p?gbtrs routine solves a system of distributed linear equations with a general band distributed matrix sub(*A*) = *A*(1:*n*, *ja*:*ja*+*n*-1) using the *LU* factorization computed by p?gbtrf.

The system has one of the following forms specified by *trans*:

sub(*A*)**X* = sub(*B*) (no transpose),

sub(*A*)^T*X = sub(*B*) (transpose),

sub(*A*)^H**X* = sub(*B*) (conjugate transpose),

where sub(*B*) = *B*(*ib*:*ib*+*n*-1, 1:*nrhs*).

Before calling this routine,you must call p?gbtrf to compute the *LU* factorization of sub(*A*).

Input Parameters

trans

(global) CHARACTER*1. Must be 'N' or 'T' or 'C'.

Indicates the form of the equations:

If *trans* = 'N', then sub(*A*)**X* = sub(*B*) is solved for *X*.

If *trans* = 'T', then sub(*A*)^T**X* = sub(*B*) is solved for *X*.

If *trans* = 'C', then sub(*A*)^H **X* = sub(*B*) is solved for *X*.

n

(global) INTEGER. The number of linear equations; the order of the distributed matrix sub(*A*) (*n*≥ 0).

bwl

(global) INTEGER. The number of sub-diagonals within the band of *A*(0 ≤ *bwl* ≤ *n-1*).

bwu

(global) INTEGER. The number of super-diagonals within the band of *A*(0 ≤ *bwu* ≤ *n-1*).

nrhs

(global) INTEGER. The number of right hand sides; the number of columns of the distributed matrix sub(*B*) (*nrhs*≥ 0).

a, *b*

(local)

REAL for psgbtrs

DOUBLE PRECISION for pdgbtrs

COMPLEX for pcgbtrs

DOUBLE COMPLEX for pzgbtrs.

Pointers into the local memory to arrays of local sizes (*lld_a*,*LOCc*(*ja*+*n*-1)) and (*lld_b*,*LOCc*(*nrhs*)), respectively.

The array *a* contains details of the *LU* factorization of the distributed band matrix *A*.

On entry, the array *b* contains the local pieces of the right hand sides *B*(*ib*:*ib*+*n*-1, 1:*nrhs*).

ja

(global) INTEGER. The index in the global matrix *A* indicating the start of the matrix to be operated on (which may be either all of *A* or a submatrix of *A*).

desca

(global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

If *dtype_a* = 501, then *dlen_*≥ 7;

else if *dtype_a* = 1, then *dlen_*≥ 9.

ib

(global) INTEGER. The index in the global matrix *A* indicating the start of the matrix to be operated on (which may be either all of *A* or a submatrix of *A*).

descb

(global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

If *dtype_b* = 502, then *dlen_*≥ 7;

	else if *dtype_b* = 1, then *dlen_* ≥ 9.
laf	(local) INTEGER. The size of the array *af*.
	Must be *laf*≥*nb_a**(*bwl*+*bwu*)+6*(*bwl*+*bwu*)*(*bwl*+2**bwu*).
	If *laf* is not large enough, an error code will be returned and the minimum acceptable size will be returned in *af*(1).
work	(local) Same type as *a*. Workspace array of size *lwork*.
lwork	(local or global) INTEGER. The size of the *work* array, must be at least *lwork*≥*nrhs**(*nb_a*+2**bwl*+4**bwu*).

Output Parameters

ipiv	(local) INTEGER array.
	The size of *ipiv* must be ≥*nb_a*.
	Contains pivot indices for local factorizations. Note that you should not alter the contents of this array between factorization and solve.
b	On exit, overwritten by the local pieces of the solution distributed matrix *X*.
af	(local)
	REAL for psgbtrs
	DOUBLE PRECISION for pdgbtrs
	COMPLEX for pcgbtrs
	DOUBLE COMPLEX for pzgbtrs.
	Array of size *laf*.
	Auxiliary Fill-in space. The fill-in space is created in a call to the factorization routine p?gbtrf and is stored in *af*.
	Note that if a linear system is to be solved using p?gbtrs after the factorization routine,*af* must not be altered after the factorization.
work(1)	On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	INTEGER. If *info*=0, the execution is successful.
	info < 0:
	If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?dbtrs

Solves a system of linear equations with a diagonally dominant-like banded distributed matrix using the factorization computed by p?dbtrf.

Syntax

call psdbtrs(*trans*, *n*, *bwl*, *bwu*, *nrhs*, *a*, *ja*, *desca*, *b*, *ib*, *descb*, *af*, *laf*, *work*, *lwork*, *info*)

call pddbtrs(*trans*, *n*, *bwl*, *bwu*, *nrhs*, *a*, *ja*, *desca*, *b*, *ib*, *descb*, *af*, *laf*, *work*, *lwork*, *info*)

call pcdbtrs(*trans*, *n*, *bwl*, *bwu*, *nrhs*, *a*, *ja*, *desca*, *b*, *ib*, *descb*, *af*, *laf*, *work*, *lwork*, *info*)

call pzdbtrs(*trans*, *n*, *bwl*, *bwu*, *nrhs*, *a*, *ja*, *desca*, *b*, *ib*, *descb*, *af*, *laf*, *work*, *lwork*, *info*)

Include Files

Description

The p?dbtrsroutine solves for X one of the systems of equations:

sub(A)*X = sub(B),

(sub(A))^T*X = sub(B), or

(sub(A))^H*X = sub(B),

where sub(A) = A(1:n, ja:ja+n-1) is a diagonally dominant-like banded distributed matrix, and sub(B) denotes the distributed matrix B(ib:ib+n-1, 1:$nrhs$).

This routine uses the *LU* factorization computed by p?dbtrf.

Input Parameters

trans (global) CHARACTER*1. Must be 'N' or 'T' or 'C'.

Indicates the form of the equations:

If *trans* = 'N', then sub(A)*X = sub(B) is solved for X.

If *trans* = 'T', then (sub(A))^T*X = sub(B) is solved for X.

If *trans* = 'C', then (sub(A))^H*X = sub(B) is solved for X.

n (global) INTEGER. The order of the distributed matrix sub(A) ($n \geq 0$).

bwl (global) INTEGER. The number of subdiagonals within the band of A ($0 \leq bwl \leq n-1$).

bwu (global) INTEGER. The number of superdiagonals within the band of A ($0 \leq bwu \leq n-1$).

nrhs (global) INTEGER. The number of right hand sides; the number of columns of the distributed matrix sub(B) ($nrhs \geq 0$).

a, *b* (local)

REAL for psdbtrs

DOUBLE PRECISON for pddbtrs

COMPLEX for pcdbtrs

DOUBLE COMPLEX for pzdbtrs.

Pointers into the local memory to arrays of local sizes (*lld_a*,*LOCc*(*ja*+*n*-1)) and (*lld_b*,*LOCc*(*nrhs*)), respectively.

On entry, the array *a* contains details of the *LU* factorization of the band matrix *A*, as computed by p?dbtrf.

On entry, the array *b* contains the local pieces of the right hand side distributed matrix sub(*B*).

ja

(global) INTEGER. The index in the global matrix *A* indicating the start of the matrix to be operated on (which may be either all of *A* or a submatrix of *A*).

desca

(global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

If *dtype_a* = 501, then *dlen_* ≥ 7;

else if *dtype_a* = 1, then *dlen_* ≥ 9.

ib

(global) INTEGER. The row index in the global matrix *B* indicating the first row of the matrix to be operated on (which may be either all of *B* or a submatrix of *B*).

descb

(global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *B*.

If *dtype_b* = 502, then *dlen_* ≥ 7;

else if *dtype_b* = 1, then *dlen_* ≥ 9.

af, *work*

(local)

REAL for psdbtrs

DOUBLE PRECISION for pddbtrs

COMPLEX for pcdbtrs

DOUBLE COMPLEX for pzdbtrs.

Arrays of size *laf* and *lwork*, respectively The array *af* contains auxiliary fill-in space. The fill-in space is created in a call to the factorization routine p?dbtrf and is stored in *af*.

The array *work* is a workspace array.

laf

(local) INTEGER. The size of the array *af*.

Must be *laf*≥NB*(*bwl*+*bwu*)+6*(max(*bwl*,*bwu*))^2 .

If *laf* is not large enough, an error code will be returned and the minimum acceptable size will be returned in *af*(1).

lwork

(local or global) INTEGER. The size of the array *work*, must be at least

lwork≥ (max(*bwl*,*bwu*))^2.

Output Parameters

b

On exit, this array contains the local pieces of the solution distributed matrix *X*.

work(1)	On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	INTEGER. If *info*=0, the execution is successful. *info* < 0: If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?dttrs

Solves a system of linear equations with a diagonally dominant-like tridiagonal distributed matrix using the factorization computed by p?dttrf.

Syntax

```
call psdttrs(trans, n, nrhs, dl, d, du, ja, desca, b, ib, descb, af, laf, work, lwork, info)
call pddttrs(trans, n, nrhs, dl, d, du, ja, desca, b, ib, descb, af, laf, work, lwork, info)
call pcdttrs(trans, n, nrhs, dl, d, du, ja, desca, b, ib, descb, af, laf, work, lwork, info)
call pzdttrs(trans, n, nrhs, dl, d, du, ja, desca, b, ib, descb, af, laf, work, lwork, info)
```

Include Files

Description

The p?dttrsroutine solves for X one of the systems of equations:

sub(A)*X = sub(B),

(sub(A))^T*X = sub(B), or

(sub(A))^H*X = sub(B),

where sub(A) =A(1:n, ja:ja+n-1) is a diagonally dominant-like tridiagonal distributed matrix, and sub(B) denotes the distributed matrix B(ib:ib+n-1, 1:$nrhs$).

This routine uses the *LU* factorization computed by p?dttrf.

Input Parameters

trans	(global) CHARACTER*1. Must be 'N' or 'T' or 'C'. Indicates the form of the equations: If *trans* = 'N', then sub(A)*X = sub(B) is solved for X. If *trans* = 'T', then (sub(A))^T*X = sub(B) is solved for X. If *trans* = 'C', then (sub(A))^H*X = sub(B) is solved for X.
n	(global) INTEGER. The order of the distributed matrix sub(A) ($n \geq 0$).

nrhs (global) INTEGER. The number of right hand sides; the number of columns of the distributed matrix sub(*B*) (*nrhs*≥ 0).

dl, *d*, *du* (local)

REAL for psdttrs

DOUBLE PRECISON for pddttrs

COMPLEX for pcdttrs

DOUBLE COMPLEX for pzdttrs.

Pointers to the local arrays of size *nb_a* each.

On entry, these arrays contain details of the factorization. Globally, *dl*(1) and *du*(*n*) are not referenced; *dl* and *du* must be aligned with *d*.

ja (global) INTEGER. The index in the global matrix *A* indicating the start of the matrix to be operated on (which may be either all of *A* or a submatrix of *A*).

desca (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

If *dtype_a* = 501 or *dtype_a* = 502, then *dlen_*≥ 7;

else if *dtype_a* = 1, then *dlen_*≥ 9.

b (local) Same type as *d*.

Pointer into the local memory to an array of local size (*lld_b*,*LOCc*(*nrhs*))

On entry, the array *b* contains the local pieces of the *n*-by-*nrhs* right hand side distributed matrix sub(*B*).

ib (global) INTEGER. The row index in the global matrix *B* indicating the first row of the matrix to be operated on (which may be either all of *B* or a submatrix of *B*).

descb (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *B*.

If *dtype_b* = 502, then *dlen_*≥ 7;

else if *dtype_b* = 1, then *dlen_*≥ 9.

af, *work* (local) REAL for psdttrs

DOUBLE PRECISION for pddttrs

COMPLEX for pcdttrs

DOUBLE COMPLEX for pzdttrs.

Arrays of size *laf* and (*lwork*), respectively.

The array *af* contains auxiliary fill-in space. The fill-in space is created in a call to the factorization routine p?dttrf and is stored in *af*. If a linear system is to be solved using p?dttrs after the factorization routine,*af* must not be altered.

The array *work* is a workspace array.

laf	(local) INTEGER. The size of the array *af*. Must be *laf*≥NB*(*bwl*+*bwu*)+6*(*bwl*+*bwu*)*(*bwl*+2**bwu*). If *laf* is not large enough, an error code will be returned and the minimum acceptable size will be returned in *af*(1).
lwork	(local or global) INTEGER. The size of the array *work*, must be at least *lwork*≥ 10*NPCOL+4**nrhs*.

Output Parameters

b	On exit, this array contains the local pieces of the solution distributed matrix *X*.
work(1)	On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	INTEGER. If *info*=0, the execution is successful. *info* < 0: If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?potrs

Solves a system of linear equations with a Cholesky-factored symmetric/Hermitian distributed positive-definite matrix.

Syntax

```
call pspotrs(uplo, n, nrhs, a, ia, ja, desca, b, ib, jb, descb, info)
call pdpotrs(uplo, n, nrhs, a, ia, ja, desca, b, ib, jb, descb, info)
call pcpotrs(uplo, n, nrhs, a, ia, ja, desca, b, ib, jb, descb, info)
call pzpotrs(uplo, n, nrhs, a, ia, ja, desca, b, ib, jb, descb, info)
```

Include Files

Description

The p?potrsroutine solves for *X* a system of distributed linear equations in the form:

sub(*A*)**X* = sub(*B*) ,

where sub(*A*) = *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1) is an *n*-by-*n* real symmetric or complex Hermitian positive definite distributed matrix, and sub(*B*) denotes the distributed matrix *B*(*ib*:*ib*+*n*-1, *jb*:*jb*+*nrhs*-1).

This routine uses Cholesky factorization

sub(*A*) = U^H**U*, or sub(*A*) = *L**L^H

computed by p?potrf.

Input Parameters

uplo (global) CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', upper triangle of sub(*A*) is stored;

If *uplo* = 'L', lower triangle of sub(*A*) is stored.

n (global) INTEGER. The order of the distributed matrix sub(*A*) (*n*≥0).

nrhs (global) INTEGER. The number of right hand sides; the number of columns of the distributed matrix sub(*B*) (*nrhs*≥0).

a, *b* (local)

REAL for pspotrs

DOUBLE PRECISION for pdpotrs

COMPLEX for pcpotrs

DOUBLE COMPLEX for pzpotrs.

Pointers into the local memory to arrays of local sizes

(*lld_a*,*LOCc*(*ja*+*n*-1)) and (*lld_b*,*LOCc*(*jb*+nrhs-1)), respectively.

The array *a* contains the factors *L* or *U* from the Cholesky factorization sub(*A*) = *L***L*^{H} or sub(*A*) = *U*^{H}**U*, as computed by p?potrf.

On entry, the array *b* contains the local pieces of the right hand sides sub(*B*).

ia, *ja* (global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the matrix sub(*A*), respectively.

desca (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

ib, *jb* (global) INTEGER. The row and column indices in the global matrix *B* indicating the first row and the first column of the matrix sub(*B*), respectively.

descb (local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *B*.

Output Parameters

b Overwritten by the local pieces of the solution matrix *X*.

info INTEGER. If *info*=0, the execution is successful.

info < 0: if the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?pbtrs

Solves a system of linear equations with a Cholesky-factored symmetric/Hermitian positive-definite band matrix.

Syntax

```
call pspbtrs(uplo, n, bw, nrhs, a, ja, desca, b, ib, descb, af, laf, work, lwork, info)
call pdpbtrs(uplo, n, bw, nrhs, a, ja, desca, b, ib, descb, af, laf, work, lwork, info)
call pcpbtrs(uplo, n, bw, nrhs, a, ja, desca, b, ib, descb, af, laf, work, lwork, info)
call pzpbtrs(uplo, n, bw, nrhs, a, ja, desca, b, ib, descb, af, laf, work, lwork, info)
```

Include Files

Description

The p?pbtrsroutine solves for X a system of distributed linear equations in the form:

sub(A)*X = sub(B) ,

where sub(A) = A(1:n, ja:ja+n-1) is an n-by-n real symmetric or complex Hermitian positive definite distributed band matrix, and sub(B) denotes the distributed matrix B(ib:ib+n-1, 1:$nrhs$).

This routine uses Cholesky factorization

sub(A) = $P*U^H*U*P^T$, or sub(A) = $P*L*L^H*P^T$

computed by p?pbtrf.

Input Parameters

uplo	(global) CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', upper triangle of sub(A) is stored; If *uplo* = 'L', lower triangle of sub(A) is stored.
n	(global) INTEGER. The order of the distributed matrix sub(A) (n≥0).
bw	(global) INTEGER. The number of superdiagonals of the distributed matrix if *uplo* = 'U', or the number of subdiagonals if *uplo* = 'L' (bw≥0).
nrhs	(global) INTEGER. The number of right hand sides; the number of columns of the distributed matrix sub(B) ($nrhs$≥0).
a, *b*	(local) REAL for pspbtrs DOUBLE PRECISION for pdpbtrs COMPLEX for pcpbtrs DOUBLE COMPLEX for pzpbtrs. Pointers into the local memory to arrays of local sizes (*lld_a*, *LOCc*(*ja*+*n*-1)) and (*lld_b*, *LOCc*(*nrhs*-1)), respectively. The array *a* contains the permuted triangular factor U or L from the Cholesky factorization sub(A) = $P*U^H*U*P^T$, or sub(A) = $P*L*L^H*P^T$ of the band matrix A, as returned by p?pbtrf.

	On entry, the array *b* contains the local pieces of the *n*-by-*nrhs* right hand side distributed matrix sub(*B*).
ja	(global) INTEGER. The index in the global matrix *A* indicating the start of the matrix to be operated on (which may be either all of *A* or a submatrix of *A*).
desca	(global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*. If *dtype_a* = 501, then *dlen_* ≥ 7; else if *dtype_a* = 1, then *dlen_* ≥ 9.
ib	(global) INTEGER. The row index in the global matrix *B* indicating the first row of the matrix sub(*B*).
descb	(global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *B*. If *dtype_b* = 502, then *dlen_* ≥ 7; else if *dtype_b* = 1, then *dlen_* ≥ 9.
af, *work*	(local) Arrays, same type as *a*. The array *af* is of size *laf*. It contains auxiliary fill-in space. The fill-in space is created in a call to the factorization routine p?dbtrf and is stored in *af*. The array *work* is a workspace array of size *lwork*.
laf	(local) INTEGER. The size of the array *af*. Must be *laf*≥*nrhs*bw*. If *laf* is not large enough, an error code will be returned and the minimum acceptable size will be returned in *af*(1).
lwork	(local or global) INTEGER. The size of the array *work*, must be at least *lwork*≥bw^2.

Output Parameters

b	On exit, if *info*=0, this array contains the local pieces of the *n*-by-*nrhs* solution distributed matrix *X*.
work(1)	On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	INTEGER. If *info*=0, the execution is successful. *info* < 0: If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Overview for details of ScaLAPACK array descriptor structures and related notations.

p?pttrs

Solves a system of linear equations with a symmetric (Hermitian) positive-definite tridiagonal distributed matrix using the factorization computed by `p?pttrf`.

Syntax

```
call pspttrs(n, nrhs, d, e, ja, desca, b, ib, descb, af, laf, work, lwork, info)
call pdpttrs(n, nrhs, d, e, ja, desca, b, ib, descb, af, laf, work, lwork, info)
call pcpttrs(uplo, n, nrhs, d, e, ja, desca, b, ib, descb, af, laf, work, lwork, info)
call pzpttrs(uplo, n, nrhs, d, e, ja, desca, b, ib, descb, af, laf, work, lwork, info)
```

Include Files

Description

The `p?pttrs`routine solves for *X* a system of distributed linear equations in the form:

sub(*A*)**X* = sub(*B*) ,

where sub(*A*) = *A*(1:*n*, *ja*:*ja*+*n*-1) is an *n*-by-*n* real symmetric or complex Hermitian positive definite tridiagonal distributed matrix, and sub(*B*) denotes the distributed matrix *B*(*ib*:*ib*+*n*-1, 1:*nrhs*).

This routine uses the factorization

sub(*A*) = $P*L*D*L^H*P^T$, or sub(*A*) = $P*U^H*D*U*P^T$

computed by `p?pttrf`.

Input Parameters

uplo (global, used in complex flavors only)

`CHARACTER*1`. Must be `'U'` or `'L'`.

If *uplo* = `'U'`, upper triangle of sub(*A*) is stored;

If *uplo* = `'L'`, lower triangle of sub(*A*) is stored.

n (global) `INTEGER`. The order of the distributed matrix sub(*A*) (*n*≥0).

nrhs (global) `INTEGER`. The number of right hand sides; the number of columns of the distributed matrix sub(*B*) (*nrhs*≥0).

d, *e* (local)

`REAL` for `pspttrs`

`DOUBLE PRECISON` for `pdpttrs`

`COMPLEX` for `pcpttrs`

`DOUBLE COMPLEX` for `pzpttrs`.

Pointers into the local memory to arrays of size *nb_a* each.

These arrays contain details of the factorization as returned by `p?pttrf`

ja (global) `INTEGER`. The index in the global matrix *A* indicating the start of the matrix to be operated on (which may be either all of *A* or a submatrix of *A*).

desca (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

If *dtype_a* = 501 or *dtype_a* = 502, then *dlen_* ≥ 7;

else if *dtype_a* = 1, then *dlen_* ≥ 9.

b (local) Same type as *d*, *e*.

Pointer into the local memory to an array of local size

(*lld_b*, *LOCc*(*nrhs*)).

On entry, the array *b* contains the local pieces of the *n*-by-*nrhs* right hand side distributed matrix sub(*B*).

ib (global) INTEGER. The row index in the global matrix *B* indicating the first row of the matrix to be operated on (which may be either all of *B* or a submatrix of *B*).

descb (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *B*.

If *dtype_b* = 502, then *dlen_* ≥ 7;

else if *dtype_b* = 1, then *dlen_* ≥ 9.

af, *work* (local) REAL for pspttrs

DOUBLE PRECISION for pdpttrs

COMPLEX for pcpttrs

DOUBLE COMPLEX for pzpttrs.

Arrays of size *laf* and (*lwork*), respectively. The array *af* contains auxiliary fill-in space. The fill-in space is created in a call to the factorization routine p?pttrf and is stored in *af*.

The array *work* is a workspace array.

laf (local) INTEGER. The size of the array *af*.

Must be *laf*≥*nb_a*+2.

If *laf* is not large enough, an error code is returned and the minimum acceptable size will be returned in *af*(1).

lwork (local or global) INTEGER. The size of the array *work*, must be at least

lwork≥ (10+2**min*(100,*nrhs*))*NPCOL+4**nrhs*.

Output Parameters

b On exit, this array contains the local pieces of the solution distributed matrix *X*.

work(1)) On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.

info INTEGER. If *info*=0, the execution is successful.

info < 0:

if the *i*-th argument is an array and the *j*-th entry had an illegal value, then `info` = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then `info` = -*i*.

See Also

Overview for details of ScaLAPACK array descriptor structures and related notations.

p?trtrs

Solves a system of linear equations with a triangular distributed matrix.

Syntax

```
call pstrtrs(uplo, trans, diag, n, nrhs, a, ia, ja, desca, b, ib, jb, descb, info)
call pdtrtrs(uplo, trans, diag, n, nrhs, a, ia, ja, desca, b, ib, jb, descb, info)
call pctrtrs(uplo, trans, diag, n, nrhs, a, ia, ja, desca, b, ib, jb, descb, info)
call pztrtrs(uplo, trans, diag, n, nrhs, a, ia, ja, desca, b, ib, jb, descb, info)
```

Include Files

Description

The `p?trtrs`routine solves for *X* one of the following systems of linear equations:

sub(*A*)**X* = sub(*B*),

(sub(*A*))^T**X* = sub(*B*), or

(sub(*A*))^H**X* = sub(*B*),

where sub(*A*) = *A*(`ia`:`ia`+*n*-1, `ja`:`ja`+*n*-1) is a triangular distributed matrix of order `n`, and sub(*B*) denotes the distributed matrix *B*(`ib`:`ib`+*n*-1, `jb`:`jb`+`nrhs`-1).

A check is made to verify that sub(*A*) is nonsingular.

Input Parameters

`uplo` (global) `CHARACTER*1`. Must be `'U'` or `'L'`.

Indicates whether sub(*A*) is upper or lower triangular:

If `uplo = 'U'`, then sub(*A*) is upper triangular.

If `uplo = 'L'`, then sub(*A*) is lower triangular.

`trans` (global) `CHARACTER*1`. Must be `'N'` or `'T'` or `'C'`.

Indicates the form of the equations:

If `trans = 'N'`, then sub(*A*)**X* = sub(*B*) is solved for *X*.

If `trans = 'T'`, then sub(*A*)^T**X* = sub(*B*) is solved for *X*.

If `trans = 'C'`, then sub(*A*)^H**X* = sub(*B*) is solved for *X*.

`diag` (global) `CHARACTER*1`. Must be `'N'` or `'U'`.

If `diag = 'N'`, then sub(*A*) is not a unit triangular matrix.

If `diag = 'U'`, then sub(*A*) is unit triangular.

`n` (global) `INTEGER`. The order of the distributed matrix sub(*A*) `(n≥0)`.

nrhs (global) INTEGER. The number of right-hand sides; i.e., the number of columns of the distributed matrix sub(*B*) (*nrhs*≥0).

a, *b* (local)

REAL for pstrtrs

DOUBLE PRECISION for pdtrtrs

COMPLEX for pctrtrs

DOUBLE COMPLEX for pztrtrs.

Pointers into the local memory to arrays of local sizes (*lld_a*, *LOCc*(*ja*+*n*-1)) and (*lld_b*, *LOCc*(*jb*+nrhs-1)), respectively.

The array *a* contains the local pieces of the distributed triangular matrix sub(*A*).

If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of sub(*A*) contains the upper triangular matrix, and the strictly lower triangular part of sub(*A*) is not referenced.

If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of sub(*A*) contains the lower triangular matrix, and the strictly upper triangular part of sub(*A*) is not referenced.

If *diag* = 'U', the diagonal elements of sub(*A*) are also not referenced and are assumed to be 1.

On entry, the array *b* contains the local pieces of the right hand side distributed matrix sub(*B*).

ia, *ja* (global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the matrix sub(*A*), respectively.

desca (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

ib, *jb* (global) INTEGER. The row and column indices in the global matrix *B* indicating the first row and the first column of the matrix sub(*B*), respectively.

descb (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *B*.

Output Parameters

b On exit, if *info*=0, sub(*B*) is overwritten by the solution matrix *X*.

info INTEGER. If *info*=0, the execution is successful.

info < 0:

if the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

info> 0:

if *info* = *i*, the *i*-th diagonal element of sub(*A*) is zero, indicating that the submatrix is singular and the solutions *X* have not been computed.

Estimating the Condition Number: ScaLAPACK Computational Routines

This section describes the ScaLAPACK routines for estimating the condition number of a matrix. The condition number is used for analyzing the errors in the solution of a system of linear equations. Since the condition number may be arbitrarily large when the matrix is nearly singular, the routines actually compute the *reciprocal* condition number.

p?gecon

Estimates the reciprocal of the condition number of a general distributed matrix in either the 1-norm or the infinity-norm.

Syntax

```
call psgecon(norm, n, a, ia, ja, desca, anorm, rcond, work, lwork, iwork, liwork, info)
call pdgecon(norm, n, a, ia, ja, desca, anorm, rcond, work, lwork, iwork, liwork, info)
call pcgecon(norm, n, a, ia, ja, desca, anorm, rcond, work, lwork, rwork, lrwork, info)
call pzgecon(norm, n, a, ia, ja, desca, anorm, rcond, work, lwork, rwork, lrwork, info)
```

Include Files

Description

The p?gecon routine estimates the reciprocal of the condition number of a general distributed real/complex matrix sub(*A*) = *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1) in either the 1-norm or infinity-norm, using the *LU* factorization computed by p?getrf.

An estimate is obtained for $||(\text{sub}(A))^{-1}||$, and the reciprocal of the condition number is computed as

$$rcond = \frac{1}{\|sub(A)\| \times \|(sub(A))^{-1}\|}$$

Input Parameters

norm (global) CHARACTER*1. Must be '1' or 'O' or 'I'.

Specifies whether the 1-norm condition number or the infinity-norm condition number is required.

If *norm* = '1' or 'O', then the 1-norm is used;

If *norm* = 'I', then the infinity-norm is used.

n (global) INTEGER. The order of the distributed matrix sub(*A*) (*n*≥ 0).

a (local)

REAL for psgecon

DOUBLE PRECISION for pdgecon

COMPLEX for pcgecon

DOUBLE COMPLEX for pzgecon.

Pointer into the local memory to an array of size (*lld_a*,*LOCc*(*ja*+*n*-1)).

The array *a* contains the local pieces of the factors *L* and *U* from the factorization sub(*A*) = *P***L***U*; the unit diagonal elements of *L* are not stored.

ia, *ja* (global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the matrix sub(*A*), respectively.

desca (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

anorm (global) REAL for single precision flavors, DOUBLE PRECISION for double precision flavors.

If *norm* = '1' or 'O', the 1-norm of the original distributed matrix sub(*A*);

If *norm* = 'I', the infinity-norm of the original distributed matrix sub(*A*).

work (local)

REAL for psgecon

DOUBLE PRECISION for pdgecon

COMPLEX for pcgecon

DOUBLE COMPLEX for pzgecon.

The array *work* of size *lwork* is a workspace array.

lwork (local or global) INTEGER. The size of the array *work*.

For real flavors:

lwork must be at least

lwork≥ 2**LOCr*(*n*+mod(*ia*-1,*mb_a*))+2**LOCc*(*n*+mod(*ja*-1,*nb_a*)) +max(2, max(*nb_a**max(1, iceil(NPROW-1, NPCOL)),*LOCc*(*n* +mod(*ja*-1,*nb_a*)) + *nb_a**max(1, iceil(NPCOL-1, NPROW)))).

For complex flavors:

lwork must be at least

lwork≥ 2**LOCr*(*n*+mod(*ia*-1,*mb_a*))+max(2, max(*nb_a**iceil(NPROW-1, NPCOL),*LOCc*(*n*+mod(*ja*-1,*nb_a*))+ *nb_a**iceil(NPCOL-1, NPROW))).

LOCr and *LOCc* values can be computed using the ScaLAPACK tool function numroc; NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.

NOTE
`iceil(x,y)` is the ceiling of x/y, and `mod(x,y)` is the integer remainder of x/y.

iwork (local) INTEGER. Workspace array of size *liwork*. Used in real flavors only.

liwork (local or global) INTEGER. The size of the array *iwork*; used in real flavors only. Must be at least

liwork≥*LOCr*(*n*+mod(*ia*-1,*mb_a*)).

rwork (local) REAL for pcgecon

DOUBLE PRECISION for pzgecon

Workspace array of size *lrwork*. Used in complex flavors only.

lrwork (local or global) INTEGER. The size of the array *rwork*; used in complex flavors only. Must be at least

lrwork≥ max(1, 2**LOCc*(*n*+mod(*ja*-1,*nb_a*))).

Output Parameters

rcond (global) REAL for single precision flavors.

DOUBLE PRECISION for double precision flavors.

The reciprocal of the condition number of the distributed matrix sub(*A*). See Description.

work(1) On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.

iwork(1) On exit, *iwork*(1) contains the minimum value of *liwork* required for optimum performance (for real flavors).

rwork(1) On exit, *rwork*(1) contains the minimum value of *lrwork* required for optimum performance (for complex flavors).

info (global) INTEGER. If *info*=0, the execution is successful.

info < 0:

If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

See Also

Overview for details of ScaLAPACK array descriptor structures and related notations.

p?pocon

Estimates the reciprocal of the condition number (in the 1 - norm) of a symmetric / Hermitian positive-definite distributed matrix.

Syntax

```
call pspocon(uplo, n, a, ia, ja, desca, anorm, rcond, work, lwork, iwork, liwork, info)
```

```
call pdpocon(uplo, n, a, ia, ja, desca, anorm, rcond, work, lwork, iwork, liwork, info)
call pcpocon(uplo, n, a, ia, ja, desca, anorm, rcond, work, lwork, rwork, lrwork, info)
call pzpocon(uplo, n, a, ia, ja, desca, anorm, rcond, work, lwork, rwork, lrwork, info)
```

Include Files

Description

The p?poconroutine estimates the reciprocal of the condition number (in the 1 - norm) of a real symmetric or complex Hermitian positive definite distributed matrix sub(*A*) = *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1), using the Cholesky factorization sub(*A*) = U^H*U or sub(*A*) = $L*L^H$ computed by p?potrf.

An estimate is obtained for $||(\text{sub}(A))^{-1}||$, and the reciprocal of the condition number is computed as

$$rcond = \frac{1}{\|sub(A)\| \times \|(sub(A))^{-1}\|}$$

Input Parameters

uplo (global) CHARACTER*1. Must be 'U' or 'L'.

Specifies whether the factor stored in sub(*A*) is upper or lower triangular.

If *uplo* = 'U', sub(*A*) stores the upper triangular factor *U* of the Cholesky factorization sub(*A*) = U^H*U.

If *uplo* = 'L', sub(*A*) stores the lower triangular factor *L* of the Cholesky factorization sub(*A*) = $L*L^H$.

n (global) INTEGER. The order of the distributed matrix sub(*A*) (*n*≥0).

a (local)

REAL for pspocon

DOUBLE PRECISION for pdpocon

COMPLEX for pcpocon

DOUBLE COMPLEX for pzpocon.

Pointer into the local memory to an array of size (*lld_a*,*LOCc*(*ja*+*n*-1)).

The array *a* contains the local pieces of the factors *L* or *U* from the Cholesky factorization sub(*A*) = U^H*U, or sub(*A*) = $L*L^H$, as computed by p?potrf.

ia, *ja* (global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the matrix sub(*A*), respectively.

desca (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

anorm (global) REAL for single precision flavors,

DOUBLE PRECISION for double precision flavors.

The 1-norm of the symmetric/Hermitian distributed matrix sub(*A*).

work (local)

`REAL` for `pspocon`

`DOUBLE PRECISION` for `pdpocon`

`COMPLEX` for `pcpocon`

`DOUBLE COMPLEX` for `pzpocon`.

The array *work* of size *lwork* is a workspace array.

lwork (local or global) `INTEGER`. The size of the array *work*.

For real flavors:

lwork must be at least

lwork≥ 2**LOCr*(*n*+mod(*ia*-1,*mb_a*))+2**LOCc*(*n*+mod(*ja*-1,*nb_a*)) +max(2, max(*nb_a**iceil(NPROW-1, NPCOL),*LOCc*(*n* +mod(*ja*-1,*nb_a*))+*nb_a**iceil(NPCOL-1, NPROW))).

For complex flavors:

lwork must be at least

lwork≥ 2**LOCr*(*n*+mod(*ia*-1,*mb_a*))+max(2, max(*nb_a**max(1,iceil(NPROW-1, NPCOL)),*LOCc*(*n*+mod(*ja*-1,*nb_a*)) +*nb_a**max(1,iceil(NPCOL-1, NPROW)))).

If *lwork* = -1, then *lwork* is a global input and a workspace query is assumed. The routine only calculates the minimum and optimal size for all work arrays. Each value is returned in the first entry of the corresponding work array, and no error message is issued by `pxerbla`.

NOTE
`iceil(x,y)` is the ceiling of *x*/*y*, and `mod(x,y)` is the integer remainder of *x*/*y*.

iwork (local) `INTEGER`. Workspace array of size *liwork*. Used in real flavors only.

liwork (local or global) `INTEGER`. The size of the array *iwork*; used in real flavors only. Must be at least *liwork*≥*LOCr*(*n*+mod(*ia*-1,*mb_a*)).

If *liwork* = -1, then *liwork* is a global input and a workspace query is assumed. The routine only calculates the minimum and optimal size for all work arrays. Each value is returned in the first entry of the corresponding work array, and no error message is issued by `pxerbla`.

rwork (local) `REAL` for `pcpocon`

`DOUBLE PRECISION` for `pzpocon`

Workspace array of size *lrwork*. Used in complex flavors only.

lrwork (local or global) `INTEGER`. The size of the array *rwork*; used in complex flavors only. Must be at least *lrwork*≥ 2**LOCc*(*n*+mod(*ja*-1,*nb_a*)).

If *lrwork* = -1, then *lrwork* is a global input and a workspace query is assumed. The routine only calculates the minimum and optimal size for all work arrays. Each value is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

rcond

(global) REAL for single precision flavors.

DOUBLE PRECISION for double precision flavors.

The reciprocal of the condition number of the distributed matrix sub(*A*).

work(1)

On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.

iwork(1)

On exit, *iwork*(1) contains the minimum value of *liwork* required for optimum performance (for real flavors).

rwork(1)

On exit, *rwork*(1) contains the minimum value of *lrwork* required for optimum performance (for complex flavors).

info

(global) INTEGER. If *info*=0, the execution is successful.

info < 0:

If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

See Also

Overview for details of ScaLAPACK array descriptor structures and related notations.

p?trcon

Estimates the reciprocal of the condition number of a triangular distributed matrix in either 1-norm or infinity-norm.

Syntax

```
call pstrcon(norm, uplo, diag, n, a, ia, ja, desca, rcond, work, lwork, iwork, liwork, info)
call pdtrcon(norm, uplo, diag, n, a, ia, ja, desca, rcond, work, lwork, iwork, liwork, info)
call pctrcon(norm, uplo, diag, n, a, ia, ja, desca, rcond, work, lwork, rwork, lrwork, info)
call pztrcon(norm, uplo, diag, n, a, ia, ja, desca, rcond, work, lwork, rwork, lrwork, info)
```

Include Files

Description

The p?trconroutine estimates the reciprocal of the condition number of a triangular distributed matrix sub(*A*) = *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1), in either the 1-norm or the infinity-norm.

The norm of sub(*A*) is computed and an estimate is obtained for $||(\text{sub}(A))^{-1}||$, then the reciprocal of the condition number is computed as

$$rcond = \frac{1}{\|sub(A)\| \times \|(sub(A))^{-1}\|}$$

Input Parameters

norm (global) CHARACTER*1. Must be '1' or 'O' or 'I'.

Specifies whether the 1-norm condition number or the infinity-norm condition number is required.

If *norm* = '1' or 'O', then the 1-norm is used;

If *norm* = 'I', then the infinity-norm is used.

uplo (global) CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', sub(*A*) is upper triangular. If *uplo* = 'L', sub(*A*) is lower triangular.

diag (global) CHARACTER*1. Must be 'N' or 'U'.

If *diag* = 'N', sub(*A*) is non-unit triangular. If *diag* = 'U', sub(*A*) is unit triangular.

n (global) INTEGER. The order of the distributed matrix sub(*A*), (*n*≥0).

a (local)

REAL for pstrcon

DOUBLE PRECISION for pdtrcon

COMPLEX for pctrcon

DOUBLE COMPLEX for pztrcon.

Pointer into the local memory to an array of size (*lld_a*,*LOCc*(*ja*+*n*-1)).

The array *a* contains the local pieces of the triangular distributed matrix sub(*A*).

If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of this distributed matrix contains the upper triangular matrix, and its strictly lower triangular part is not referenced.

If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of this distributed matrix contains the lower triangular matrix, and its strictly upper triangular part is not referenced.

If *diag* = 'U', the diagonal elements of sub(*A*) are also not referenced and are assumed to be 1.

ia, *ja* (global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the matrix sub(*A*), respectively.

desca (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

work (local)

REAL for pstrcon

DOUBLE PRECISION for pdtrcon

COMPLEX for pctrcon

DOUBLE COMPLEX for pztrcon.

The array *work* of size *lwork* is a workspace array.

lwork (local or global) INTEGER. The size of the array *work*.

For real flavors:

lwork must be at least

lwork≥ 2*LOCr(*n*+mod(*ia*-1,*mb_a*))+LOCc(*n*+mod(*ja*-1,*nb_a*))
+max(2, max(*nb_a*max(1,iceil(NPROW-1, NPCOL)),

LOCc(*n*+mod(*ja*-1,*nb_a*))+*nb_a*max(1,iceil(NPCOL-1, NPROW)))).

For complex flavors:

lwork must be at least

lwork≥ 2*LOCr(*n*+mod(*ia*-1,*mb_a*))+max(2,
max(*nb_a*iceil(NPROW-1, NPCOL),

LOCc(*n*+mod(*ja*-1,*nb_a*))+*nb_a*iceil(NPCOL-1, NPROW))).

NOTE
iceil(*x*,*y*) is the ceiling of *x*/*y*, and mod(*x*,*y*) is the integer remainder of *x*/*y*.

iwork (local) INTEGER. Workspace array of size *liwork*. Used in real flavors only.

liwork (local or global) INTEGER. The size of the array *iwork*; used in real flavors only. Must be at least

liwork≥LOCr(*n*+mod(*ia*-1,*mb_a*)).

rwork (local) REAL for pcpocon

DOUBLE PRECISION for pzpocon

Workspace array of size *lrwork*. Used in complex flavors only.

lrwork (local or global) INTEGER. The size of the array *rwork*; used in complex flavors only. Must be at least

lrwork≥LOCc(*n*+mod(*ja*-1,*nb_a*)).

Output Parameters

rcond (global) REAL for single precision flavors.

DOUBLE PRECISION for double precision flavors.

	The reciprocal of the condition number of the distributed matrix sub(*A*).
work(1)	On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.
iwork(1)	On exit, *iwork*(1) contains the minimum value of *liwork* required for optimum performance (for real flavors).
rwork(1)	On exit, *rwork*(1) contains the minimum value of *lrwork* required for optimum performance (for complex flavors).
info	(global) INTEGER. If *info*=0, the execution is successful. *info* < 0: If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Refining the Solution and Estimating Its Error: ScaLAPACK Computational Routines

This section describes the ScaLAPACK routines for refining the computed solution of a system of linear equations and estimating the solution error. You can call these routines after factorizing the matrix of the system of equations and computing the solution (see Routines for Matrix Factorization and Solving Systems of Linear Equations).

p?gerfs

Improves the computed solution to a system of linear equations and provides error bounds and backward error estimates for the solution.

Syntax

```
call psgerfs(trans, n, nrhs, a, ia, ja, desca, af, iaf, jaf, descaf, ipiv, b, ib, jb,
descb, x, ix, jx, descx, ferr, berr, work, lwork, iwork, liwork, info)
```

```
call pdgerfs(trans, n, nrhs, a, ia, ja, desca, af, iaf, jaf, descaf, ipiv, b, ib, jb,
descb, x, ix, jx, descx, ferr, berr, work, lwork, iwork, liwork, info)
```

```
call pcgerfs(trans, n, nrhs, a, ia, ja, desca, af, iaf, jaf, descaf, ipiv, b, ib, jb,
descb, x, ix, jx, descx, ferr, berr, work, lwork, rwork, lrwork, info)
```

```
call pzgerfs(trans, n, nrhs, a, ia, ja, desca, af, iaf, jaf, descaf, ipiv, b, ib, jb,
descb, x, ix, jx, descx, ferr, berr, work, lwork, rwork, lrwork, info)
```

Include Files

Description

The p?gerfs routine improves the computed solution to one of the systems of linear equations

sub(*A*)*sub(*X*) = sub(*B*),

sub(*A*)^T*sub(*X*) = sub(*B*), or

sub(*A*)^H*sub(*X*) = sub(*B*) and provides error bounds and backward error estimates for the solution.

Here sub(*A*) = *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1), sub(*B*) = *B*(*ib*:*ib*+*n*-1, *jb*:*jb*+*nrhs*-1), and sub(*X*) = *X*(*ix*:*ix*+*n*-1, *jx*:*jx*+*nrhs*-1).

Input Parameters

trans

(global) CHARACTER*1. Must be 'N' or 'T' or 'C'.

Specifies the form of the system of equations:

If *trans* = 'N', the system has the form sub(*A*)*sub(*X*) = sub(*B*) (No transpose);

If *trans* = 'T', the system has the form sub(*A*)^T*sub(*X*) = sub(*B*) (Transpose);

If *trans* = 'C', the system has the form sub(*A*)^H*sub(*X*) = sub(*B*) (Conjugate transpose).

n

(global) INTEGER. The order of the distributed matrix sub(*A*) (*n*≥ 0).

nrhs

(global) INTEGER. The number of right-hand sides, i.e., the number of columns of the matrices sub(*B*) and sub(*X*) (*nrhs*≥ 0).

a, *af*, *b*, *x*

(local)

REAL for psgerfs

DOUBLE PRECISION for pdgerfs

COMPLEX for pcgerfs

DOUBLE COMPLEX for pzgerfs.

Pointers into the local memory to arrays of local sizes *a*(*lld_a*, *LOCc*(*ja*+*n*-1)), *af*(*lld_af*,*LOCc*(*jaf*+*n*-1)), *b*(*lld_b*,*LOCc*(*jb*+*nrhs*-1)), and *x*(*lld_x*,*LOCc*(*jx*+*nrhs*-1)), respectively.

The array *a* contains the local pieces of the distributed matrix sub(*A*).

The array *af* contains the local pieces of the distributed factors of the matrix sub(*A*) = *P*L*U* as computed by p?getrf.

The array *b* contains the local pieces of the distributed matrix of right hand sides sub(*B*).

On entry, the array *x* contains the local pieces of the distributed solution matrix sub(*X*).

ia, *ja*

(global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the matrix sub(*A*), respectively.

desca

(global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

iaf, *jaf*

(global) INTEGER. The row and column indices in the global matrix *AF* indicating the first row and the first column of the matrix sub(*AF*), respectively.

descaf

(global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *AF*.

ib, *jb*

(global) INTEGER. The row and column indices in the global matrix *B* indicating the first row and the first column of the matrix sub(*B*), respectively.

descb (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *B*.

ix, *jx* (global) INTEGER. The row and column indices in the global matrix *X* indicating the first row and the first column of the matrix sub(*X*), respectively.

descx (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *X*.

ipiv (local) INTEGER.

Array of size *LOCr*(*m_af*) + *mb_af*.

This array contains pivoting information as computed by p?getrf. If *ipiv*(*i*)=*j*, then the local row *i* was swapped with the global row *j*.

This array is tied to the distributed matrix *A*.

work (local)

REAL for psgerfs

DOUBLE PRECISION for pdgerfs

COMPLEX for pcgerfs

DOUBLE COMPLEX for pzgerfs.

The array *work* of size *lwork* is a workspace array.

lwork (local or global) INTEGER. The size of the array *work*.

For real flavors:

lwork must be at least

lwork≥ 3**LOCr*(*n*+mod(*ia*-1,*mb_a*))

For complex flavors:

lwork must be at least

lwork≥ 2**LOCr*(*n*+mod(*ia*-1,*mb_a*))

NOTE
mod(*x*,*y*) is the integer remainder of *x*/*y*.

iwork (local) INTEGER. Workspace array, size *liwork*. Used in real flavors only.

liwork (local or global) INTEGER. The size of the array *iwork*; used in real flavors only. Must be at least

liwork≥*LOCr*(*n*+mod(*ib*-1,*mb_b*)).

rwork (local) REAL for pcgerfs

DOUBLE PRECISION for pzgerfs

Workspace array, size *lrwork*. Used in complex flavors only.

lrwork (local or global) INTEGER. The size of the array *rwork*; used in complex flavors only. Must be at least *lrwork*≥*LOCr*(*n*+mod(*ib*-1,*mb_b*))).

Output Parameters

x	On exit, contains the improved solution vectors.
ferr, *berr*	REAL for single precision flavors. DOUBLE PRECISION for double precision flavors. Arrays of size *LOCc*(*jb*+*nrhs*-1) each. The array *ferr* contains the estimated forward error bound for each solution vector of sub(*X*). If XTRUE is the true solution corresponding to sub(*X*), *ferr* is an estimated upper bound for the magnitude of the largest element in (sub(*X*) - XTRUE) divided by the magnitude of the largest element in sub(*X*). The estimate is as reliable as the estimate for rcond, and is almost always a slight overestimate of the true error. This array is tied to the distributed matrix *X*. The array *berr* contains the component-wise relative backward error of each solution vector (that is, the smallest relative change in any entry of sub(*A*) or sub(*B*) that makes sub(*X*) an exact solution). This array is tied to the distributed matrix *X*.
work(1)	On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.
iwork(1)	On exit, *iwork*(1) contains the minimum value of *liwork* required for optimum performance (for real flavors).
rwork(1)	On exit, *rwork*(1) contains the minimum value of *lrwork* required for optimum performance (for complex flavors).
info	(global) INTEGER. If *info*=0, the execution is successful. *info* < 0: If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?porfs

Improves the computed solution to a system of linear equations with symmetric/Hermitian positive definite distributed matrix and provides error bounds and backward error estimates for the solution.

Syntax

```
call psporfs(uplo, n, nrhs, a, ia, ja, desca, af, iaf, jaf, descaf, b, ib, jb, descb, x,
ix, jx, descx, ferr, berr, work, lwork, iwork, liwork, info)
```

```
call pdporfs(uplo, n, nrhs, a, ia, ja, desca, af, iaf, jaf, descaf, b, ib, jb, descb, x,
ix, jx, descx, ferr, berr, work, lwork, iwork, liwork, info)
```

```
call pcporfs(uplo, n, nrhs, a, ia, ja, desca, af, iaf, jaf, descaf, b, ib, jb, descb, x,
ix, jx, descx, ferr, berr, work, lwork, rwork, lrwork, info)
```

```
call pzporfs(uplo, n, nrhs, a, ia, ja, desca, af, iaf, jaf, descaf, b, ib, jb, descb, x,
ix, jx, descx, ferr, berr, work, lwork, rwork, lrwork, info)
```

Include Files

Description

The p?porfsroutine improves the computed solution to the system of linear equations

sub(*A*)*sub(*X*) = sub(*B*),

where sub(*A*) = *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1) is a real symmetric or complex Hermitian positive definite distributed matrix and

sub(*B*) = *B*(*ib*:*ib*+*n*-1, *jb*:*jb*+*nrhs*-1),

sub(*X*) = *X*(*ix*:*ix*+*n*-1, *jx*:*jx*+*nrhs*-1)

are right-hand side and solution submatrices, respectively. This routine also provides error bounds and backward error estimates for the solution.

Input Parameters

uplo

(global) CHARACTER*1. Must be 'U' or 'L'.

Specifies whether the upper or lower triangular part of the symmetric/Hermitian matrix sub(*A*) is stored.

If *uplo* = 'U', sub(*A*) is upper triangular. If *uplo* = 'L', sub(*A*) is lower triangular.

n

(global) INTEGER. The order of the distributed matrix sub(*A*) (*n*≥0).

nrhs

(global) INTEGER. The number of right-hand sides, i.e., the number of columns of the matrices sub(*B*) and sub(*X*) (*nrhs*≥0).

a, *af*, *b*, *x*

(local)

REAL for psporfs

DOUBLE PRECISION for pdporfs

COMPLEX for pcporfs

DOUBLE COMPLEX for pzporfs.

Pointers into the local memory to arrays of local sizes

a(*lld_a*, *LOCc*(*ja*+*n*-1)), *af*(*lld_af*,*LOCc*(*jaf*+*n*-1)), *b*(*lld_b*,*LOCc*(*jb*+*nrhs*-1)), and *x*(*lld_x*,*LOCc*(*jx*+*nrhs*-1)), respectively.

The array *a* contains the local pieces of the *n*-by-*n* symmetric/Hermitian distributed matrix sub(*A*).

If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of sub(*A*) contains the upper triangular part of the matrix, and its strictly lower triangular part is not referenced.

If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of sub(*A*) contains the lower triangular part of the distributed matrix, and its strictly upper triangular part is not referenced.

The array *af* contains the factors *L* or *U* from the Cholesky factorization sub(*A*) = *L***L*^{H} or sub(*A*) = *U*^{H}**U*, as computed by p?potrf.

On entry, the array *b* contains the local pieces of the distributed matrix of right hand sides sub(*B*).

On entry, the array *x* contains the local pieces of the solution vectors sub(*X*).

ia, *ja* — (global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the matrix sub(*A*), respectively.

desca — (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

iaf, *jaf* — (global) INTEGER. The row and column indices in the global matrix *AF* indicating the first row and the first column of the matrix sub(*AF*), respectively.

descaf — (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *AF*.

ib, *jb* — (global) INTEGER. The row and column indices in the global matrix *B* indicating the first row and the first column of the matrix sub(*B*), respectively.

descb — (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *B*.

ix, *jx* — (global) INTEGER. The row and column indices in the global matrix *X* indicating the first row and the first column of the matrix sub(*X*), respectively.

descx — (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *X*.

work — (local)

REAL for psporfs

DOUBLE PRECISION for pdporfs

COMPLEX for pcporfs

DOUBLE COMPLEX for pzporfs.

The array *work* of size *lwork* is a workspace array.

lwork — (local) INTEGER. The size of the array *work*.

For real flavors:

lwork must be at least

lwork≥ 3**LOCr*(*n*+mod(*ia*-1,*mb_a*))

For complex flavors:

lwork must be at least

lwork≥ 2**LOCr*(*n*+mod(*ia*-1,*mb_a*))

NOTE
`mod(x,y)` is the integer remainder of x/y.

iwork (local) INTEGER. Workspace array of size *liwork*. Used in real flavors only.

liwork (local or global) INTEGER. The size of the array *iwork*; used in real flavors only. Must be at least

liwork≥*LOCr*(*n*+mod(*ib*-1,*mb_b*)).

rwork (local) REAL for pcporfs

DOUBLE PRECISION for pzporfs

Workspace array of size *lrwork*. Used in complex flavors only.

lrwork (local or global) INTEGER. The size of the array *rwork*; used in complex flavors only. Must be at least *lrwork*≥*LOCr*(*n*+mod(*ib*-1,*mb_b*))).

Output Parameters

x On exit, contains the improved solution vectors.

ferr, *berr* REAL for single precision flavors.

DOUBLE PRECISION for double precision flavors.

Arrays of size *LOCc*(*jb*+*nrhs*-1) each.

The array *ferr* contains the estimated forward error bound for each solution vector of sub(*X*).

If XTRUE is the true solution corresponding to sub(*X*), *ferr* is an estimated upper bound for the magnitude of the largest element in (sub(*X*) - XTRUE) divided by the magnitude of the largest element in sub(*X*). The estimate is as reliable as the estimate for rcond, and is almost always a slight overestimate of the true error.

This array is tied to the distributed matrix *X*.

The array *berr* contains the component-wise relative backward error of each solution vector (that is, the smallest relative change in any entry of sub(*A*) or sub(*B*) that makes sub(*X*) an exact solution). This array is tied to the distributed matrix *X*.

work(1) On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.

iwork(1) On exit, *iwork*(1) contains the minimum value of *liwork* required for optimum performance (for real flavors).

rwork(1) On exit, *rwork*(1) contains the minimum value of *lrwork* required for optimum performance (for complex flavors).

info (global) INTEGER. If *info*=0, the execution is successful.

info < 0:

If the *i*-th argument is an array and the *j*-th entry had an illegal value, then `info` = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then `info` = -*i*.

See Also

Overview for details of ScaLAPACK array descriptor structures and related notations.

p?trrfs

Provides error bounds and backward error estimates for the solution to a system of linear equations with a distributed triangular coefficient matrix.

Syntax

```
call pstrrfs(uplo, trans, diag, n, nrhs, a, ia, ja, desca, b, ib, jb, descb, x, ix, jx, descx, ferr, berr, work, lwork, iwork, liwork, info)
call pdtrrfs(uplo, trans, diag, n, nrhs, a, ia, ja, desca, b, ib, jb, descb, x, ix, jx, descx, ferr, berr, work, lwork, iwork, liwork, info)
call pctrrfs(uplo, trans, diag, n, nrhs, a, ia, ja, desca, b, ib, jb, descb, x, ix, jx, descx, ferr, berr, work, lwork, rwork, lrwork, info)
call pztrrfs(uplo, trans, diag, n, nrhs, a, ia, ja, desca, b, ib, jb, descb, x, ix, jx, descx, ferr, berr, work, lwork, rwork, lrwork, info)
```

Include Files

Description

The `p?trrfs`routine provides error bounds and backward error estimates for the solution to one of the systems of linear equations

sub(*A*)*sub(*X*) = sub(*B*),

sub(*A*)^T*sub(*X*) = sub(*B*), or

sub(*A*)^H*sub(*X*) = sub(*B*) ,

where sub(*A*) = *A*(`ia`:`ia`+*n*-1, `ja`:`ja`+*n*-1) is a triangular matrix,

sub(*B*) = *B*(`ib`:`ib`+*n*-1, `jb`:`jb`+`nrhs`-1), and

sub(*X*) = *X*(`ix`:`ix`+*n*-1, `jx`:`jx`+`nrhs`-1).

The solution matrix *X* must be computed by `p?trtrs` or some other means before entering this routine. The routine `p?trrfs` does not do iterative refinement because doing so cannot improve the backward error.

Input Parameters

`uplo`

(global) `CHARACTER*1`. Must be `'U'` or `'L'`.

If `uplo = 'U'`, sub(*A*) is upper triangular. If `uplo = 'L'`, sub(*A*) is lower triangular.

`trans`

(global) `CHARACTER*1`. Must be `'N'` or `'T'` or `'C'`.

Specifies the form of the system of equations:

If `trans = 'N'`, the system has the form sub(*A*)*sub(*X*) = sub(*B*) (No transpose);

If *trans* = 'T', the system has the form sub(*A*)^T*sub(*X*) = sub(*B*) (Transpose);

If *trans* = 'C', the system has the form sub(*A*)^H*sub(*X*) = sub(*B*) (Conjugate transpose).

diag

CHARACTER*1. Must be 'N' or 'U'.

If *diag* = 'N', then sub(*A*) is non-unit triangular.

If *diag* = 'U', then sub(*A*) is unit triangular.

n

(global) INTEGER. The order of the distributed matrix sub(*A*) (*n*≥0).

nrhs

(global) INTEGER. The number of right-hand sides, that is, the number of columns of the matrices sub(*B*) and sub(*X*) (*nrhs*≥0).

a, *b*, *x*

(local)

REAL for pstrrfs

DOUBLE PRECISION for pdtrrfs

COMPLEX for pctrrfs

DOUBLE COMPLEX for pztrrfs.

Pointers into the local memory to arrays of local sizes *a*(*lld_a*, *LOCc*(*ja*+*n*-1)), *b*(*lld_b*, *LOCc*(*jb*+*nrhs*-1)), and *x*(*lld_x*, *LOCc*(*jx*+*nrhs*-1)), respectively.

The array *a* contains the local pieces of the original triangular distributed matrix sub(*A*).

If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of sub(*A*) contains the upper triangular part of the matrix, and its strictly lower triangular part is not referenced.

If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of sub(*A*) contains the lower triangular part of the distributed matrix, and its strictly upper triangular part is not referenced.

If *diag* = 'U', the diagonal elements of sub(*A*) are also not referenced and are assumed to be 1.

On entry, the array *b* contains the local pieces of the distributed matrix of right hand sides sub(*B*).

On entry, the array *x* contains the local pieces of the solution vectors sub(*X*).

ia, *ja*

(global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the matrix sub(*A*), respectively.

desca

(global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

ib, *jb*

(global) INTEGER. The row and column indices in the global matrix *B* indicating the first row and the first column of the matrix sub(*B*), respectively.

descb (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *B*.

ix, *jx* (global) INTEGER. The row and column indices in the global matrix *X* indicating the first row and the first column of the matrix sub(*X*), respectively.

descx (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *X*.

work (local)

REAL for pstrrfs

DOUBLE PRECISION for pdtrrfs

COMPLEX for pctrrfs

DOUBLE COMPLEX for pztrrfs.

The array *work* of size *lwork* is a workspace array.

lwork (local) INTEGER. The size of the array *work*.

For real flavors:

lwork must be at least *lwork*≥ 3**LOCr*(*n*+mod(*ia*-1,*mb_a*))

For complex flavors:

lwork must be at least

lwork≥ 2**LOCr*(*n*+mod(*ia*-1,*mb_a*))

NOTE
mod(*x*,*y*) is the integer remainder of *x*/*y*.

iwork (local) INTEGER. Workspace array of size *liwork*. Used in real flavors only.

liwork (local or global) INTEGER. The size of the array *iwork*; used in real flavors only. Must be at least

liwork≥*LOCr*(*n*+mod(*ib*-1,*mb_b*)).

rwork (local) REAL for pctrrfs

DOUBLE PRECISION for pztrrfs

Workspace array of size *lrwork*. Used in complex flavors only.

lrwork (local or global) INTEGER. The size of the array *rwork*; used in complex flavors only. Must be at least *lrwork*≥*LOCr*(*n*+mod(*ib*-1,*mb_b*))).

Output Parameters

ferr, *berr* REAL for single precision flavors.

DOUBLE PRECISION for double precision flavors.

Arrays of size *LOCc*(*jb*+*nrhs*-1) each.

The array *ferr* contains the estimated forward error bound for each solution vector of sub(*X*).

If XTRUE is the true solution corresponding to sub(*X*), *ferr* is an estimated upper bound for the magnitude of the largest element in (sub(*X*) - XTRUE) divided by the magnitude of the largest element in sub(*X*). The estimate is as reliable as the estimate for rcond, and is almost always a slight overestimate of the true error.

This array is tied to the distributed matrix *X*.

The array *berr* contains the component-wise relative backward error of each solution vector (that is, the smallest relative change in any entry of sub(*A*) or sub(*B*) that makes sub(*X*) an exact solution). This array is tied to the distributed matrix *X*.

work(1) On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.

iwork(1) On exit, *iwork*(1) contains the minimum value of *liwork* required for optimum performance (for real flavors).

rwork(1) On exit, *rwork*(1) contains the minimum value of *lrwork* required for optimum performance (for complex flavors).

info (global) INTEGER. If *info*=0, the execution is successful.

info < 0:

If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Matrix Inversion: ScaLAPACK Computational Routines

This sections describes ScaLAPACK routines that compute the inverse of a matrix based on the previously obtained factorization. Note that it is not recommended to solve a system of equations $Ax = b$ by first computing A^{-1} and then forming the matrix-vector product $x = A^{-1}b$. Call a solver routine instead (see Solving Systems of Linear Equations); this is more efficient and more accurate.

p?getri

Computes the inverse of a LU-factored distributed matrix.

Syntax

```
call psgetri(n, a, ia, ja, desca, ipiv, work, lwork, iwork, liwork, info)
call pdgetri(n, a, ia, ja, desca, ipiv, work, lwork, iwork, liwork, info)
call pcgetri(n, a, ia, ja, desca, ipiv, work, lwork, iwork, liwork, info)
call pzgetri(n, a, ia, ja, desca, ipiv, work, lwork, iwork, liwork, info)
```

Include Files

Description

The p?getriroutine computes the inverse of a general distributed matrix sub(*A*) = *A*(*ia*:*ia*+*n*-1, *ja*:*ja* +*n*-1) using the *LU* factorization computed by p?getrf. This method inverts *U* and then computes the inverse of sub(*A*) by solving the system

inv(sub(*A*))**L* = *inv*(*U*)

for *inv*(sub(*A*)).

Input Parameters

n

(global) INTEGER. The number of rows and columns to be operated on, that is, the order of the distributed matrix sub(*A*) (*n*≥0).

a

(local)

REAL for psgetri

DOUBLE PRECISION for pdgetri

COMPLEX for pcgetri

DOUBLE COMPLEX for pzgetri.

Pointer into the local memory to an array of local size (*lld_a*,*LOCc*(*ja* +*n*-1)).

On entry, the array *a* contains the local pieces of the *L* and *U* obtained by the factorization sub(*A*) = *P*L*U* computed by p?getrf.

ia, *ja*

(global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the matrix sub(*A*), respectively.

desca

(global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

work

(local)

REAL for psgetri

DOUBLE PRECISION for pdgetri

COMPLEX for pcgetri

DOUBLE COMPLEX for pzgetri.

The array *work* of size *lwork* is a workspace array.

lwork

(local) INTEGER. The size of the array *work*. *lwork* must be at least

lwork≥*LOCr*(*n*+mod(*ia*-1,*mb_a*))**nb_a*.

NOTE
mod(*x*,*y*) is the integer remainder of *x*/*y*.

The array *work* is used to keep at most an entire column block of sub(*A*).

iwork

(local) INTEGER. Workspace array used for physically transposing the pivots, size *liwork*.

liwork

(local or global) INTEGER. The size of the array *iwork*.

The minimal value *liwork* of is determined by the following code:

```
if NPROW == NPCOL then
liwork = LOCc(n_a + mod(ja-1,nb_a))+ nb_a
else
liwork = LOCc(n_a + mod(ja-1,nb_a)) +
max(ceil(ceil(LOCr(m_a)/mb_a)/(lcm/NPROW)),nb_a)
end if
```

where lcm is the least common multiple of process rows and columns (NPROW and NPCOL).

Output Parameters

ipiv

(local) INTEGER.

Array of size *LOCr*(*m_a*)+ *mb_a*.

This array contains the pivoting information.

If *ipiv*(*i*)=*j*, then the local row *i* was swapped with the global row *j*.

This array is tied to the distributed matrix *A*.

work(1)

On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.

iwork(1)

On exit, *iwork*(1) contains the minimum value of *liwork* required for optimum performance.

info

(global) INTEGER. If *info*=0, the execution is successful.

info < 0:

If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

info> 0:

If *info* = *i*, *U*(*i*,*i*) is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, and division by zero will occur if it is used to solve a system of equations.

p?potri

Computes the inverse of a symmetric/Hermitian positive definite distributed matrix.

Syntax

```
call pspotri(uplo, n, a, ia, ja, desca, info)
call pdpotri(uplo, n, a, ia, ja, desca, info)
```

```
call pcpotri(uplo, n, a, ia, ja, desca, info)
call pzpotri(uplo, n, a, ia, ja, desca, info)
```

Include Files

Description

The p?potriroutine computes the inverse of a real symmetric or complex Hermitian positive definite distributed matrix sub(*A*) = *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1) using the Cholesky factorization sub(*A*) = U^H*U or sub(*A*) = $L*L^H$ computed by p?potrf.

Input Parameters

uplo — (global) CHARACTER*1. Must be 'U' or 'L'.

Specifies whether the upper or lower triangular part of the symmetric/Hermitian matrix sub(*A*) is stored.

If *uplo* = 'U', upper triangle of sub(*A*) is stored. If *uplo* = 'L', lower triangle of sub(*A*) is stored.

n — (global) INTEGER. The number of rows and columns to be operated on, that is, the order of the distributed matrix sub(*A*) (*n*≥0).

a — (local)

REAL for pspotri

DOUBLE PRECISION for pdpotri

COMPLEX for pcpotri

DOUBLE COMPLEX for pzpotri.

Pointer into the local memory to an array of local size (*lld_a*,*LOCc*(*ja*+*n*-1)).

On entry, the array *a* contains the local pieces of the triangular factor *U* or *L* from the Cholesky factorization sub(*A*) = U^H*U, or sub(*A*) = $L*L^H$, as computed by p?potrf.

ia, *ja* — (global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the matrix sub(*A*), respectively.

desca — (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

Output Parameters

a — On exit, overwritten by the local pieces of the upper or lower triangle of the (symmetric/Hermitian) inverse of sub(*A*).

info — (global) INTEGER. If *info*=0, the execution is successful.

info < 0:

If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

info> 0:

If *info* = *i*, the element (*i*, *i*) of the factor *U* or *L* is zero, and the inverse could not be computed.

Overview for details of ScaLAPACK array descriptor structures and related notations.

p?trtri

Computes the inverse of a triangular distributed matrix.

Syntax

```
call pstrtri(uplo, diag, n, a, ia, ja, desca, info)
call pdtrtri(uplo, diag, n, a, ia, ja, desca, info)
call pctrtri(uplo, diag, n, a, ia, ja, desca, info)
call pztrtri(uplo, diag, n, a, ia, ja, desca, info)
```

Include Files

Description

The p?trtriroutine computes the inverse of a real or complex upper or lower triangular distributed matrix sub(*A*) = *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1).

Input Parameters

uplo

(global) CHARACTER*1. Must be 'U' or 'L'.

Specifies whether the distributed matrix sub(*A*) is upper or lower triangular.

If *uplo* = 'U', sub(*A*) is upper triangular.

If *uplo* = 'L', sub(*A*) is lower triangular.

diag

CHARACTER*1. Must be 'N' or 'U'.

Specifies whether or not the distributed matrix sub(*A*) is unit triangular.

If *diag* = 'N', then sub(*A*) is non-unit triangular.

If *diag* = 'U', then sub(*A*) is unit triangular.

n

(global) INTEGER. The number of rows and columns to be operated on, that is, the order of the distributed matrix sub(*A*) (*n*≥0).

a

(local)

REAL for pstrtri

DOUBLE PRECISION for pdtrtri

COMPLEX for pctrtri

DOUBLE COMPLEX for pztrtri.

Pointer into the local memory to an array of local size (*lld_a*,*LOCc*(*ja*+*n*-1)).

The array *a* contains the local pieces of the triangular distributed matrix sub(*A*).

If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of sub(*A*) contains the upper triangular matrix to be inverted, and the strictly lower triangular part of sub(*A*) is not referenced.

If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of sub(*A*) contains the lower triangular matrix, and the strictly upper triangular part of sub(*A*) is not referenced.

ia, *ja* — (global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the matrix sub(*A*), respectively.

desca — (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

Output Parameters

a — On exit, overwritten by the (triangular) inverse of the original matrix.

info — (global) INTEGER. If *info*=0, the execution is successful.

info < 0:

If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

info> 0:

If *info* = *k*, *A*(*ia*+*k*-1, *ja*+*k*-1) is exactly zero. The triangular matrix sub(*A*) is singular and its inverse cannot be computed.

Matrix Equilibration: ScaLAPACK Computational Routines

ScaLAPACK routines described in this section are used to compute scaling factors needed to equilibrate a matrix. Note that these routines do not actually scale the matrices.

p?geequ

Computes row and column scaling factors intended to equilibrate a general rectangular distributed matrix and reduce its condition number.

Syntax

```
call psgeequ(m, n, a, ia, ja, desca, r, c, rowcnd, colcnd, amax, info)
call pdgeequ(m, n, a, ia, ja, desca, r, c, rowcnd, colcnd, amax, info)
call pcgeequ(m, n, a, ia, ja, desca, r, c, rowcnd, colcnd, amax, info)
call pzgeequ(m, n, a, ia, ja, desca, r, c, rowcnd, colcnd, amax, info)
```

Include Files

Description

The p?geequroutine computes row and column scalings intended to equilibrate an *m*-by-*n* distributed matrix sub(*A*) = *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1) and reduce its condition number. The output array *r* returns the row scale factors r_i , and the array *c* returns the column scale factors c_j . These factors are chosen to try to make the largest element in each row and column of the matrix *B* with elements $b_{ij}=r_i*a_{ij}*c_j$ have absolute value 1.

r_i and c_j are restricted to be between *SMLNUM* = smallest safe number and *BIGNUM* = largest safe number. Use of these scaling factors is not guaranteed to reduce the condition number of sub(*A*) but works well in practice.

SMLNUM and *BIGNUM* are parameters representing machine precision. You can use the ?lamch routines to compute them. For example, compute single precision values of *SMLNUM* and *BIGNUM* as follows:

```
SMLNUM = slamch ('s')
BIGNUM = 1 / SMLNUM
```

The auxiliary function p?laqge uses scaling factors computed by p?geequ to scale a general rectangular matrix.

Input Parameters

m
(global) INTEGER. The number of rows to be operated on, that is, the number of rows of the distributed matrix sub(*A*) (*m*≥ 0).

n
(global) INTEGER. The number of columns to be operated on, that is, the number of columns of the distributed matrix sub(*A*) (*n*≥ 0).

a
(local)

REAL for psgeequ

DOUBLE PRECISION for pdgeequ

COMPLEX for pcgeequ

DOUBLE COMPLEX for pzgeequ .

Pointer into the local memory to an array of local size (*lld_a*,*LOCc*(*ja*+*n*-1)).

The array *a* contains the local pieces of the *m*-by-*n* distributed matrix whose equilibration factors are to be computed.

ia, *ja*
(global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the matrix sub(*A*), respectively.

desca
(global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

Output Parameters

r, *c*
(local) REAL for single precision flavors;

DOUBLE PRECISION for double precision flavors.

Arrays of sizes *LOCr*(*m_a*) and *LOCc*(*n_a*), respectively.

If *info* = 0, or *info*>*ia*+*m*-1, the array *r*(*ia*:*ia*+*m*-1) contains the row scale factors for sub(*A*). *r* is aligned with the distributed matrix *A*, and replicated across every process column. *r* is tied to the distributed matrix *A*.

If *info* = 0, the array *c* (*ja*:*ja*+*n*-1) contains the column scale factors for sub(*A*). *c* is aligned with the distributed matrix *A*, and replicated down every process row. *c* is tied to the distributed matrix *A*.

rowcnd, *colcnd*

(global) REAL for single precision flavors;

DOUBLE PRECISION for double precision flavors.

If *info* = 0 or *info*>*ia*+*m*-1, *rowcnd* contains the ratio of the smallest *r*(*i*) to the largest *r*(*i*) (i*a* ≤ *i* ≤ *ia*+*m*-1). If *rowcnd*≥ 0.1 and *amax* is neither too large nor too small, it is not worth scaling by *r*(*ia*:*ia*+*m*-1).

If *info* = 0, *colcnd* contains the ratio of the smallest *c*(*j*) to the largest *c*(*j*) (*ja* ≤ *j* ≤ *ja*+*n*-1).

If *colcnd*≥ 0.1, it is not worth scaling by *c*(*ja*:*ja*+*n*-1).

amax

(global) REAL for single precision flavors;

DOUBLE PRECISION for double precision flavors.

Absolute value of the largest matrix element. If *amax* is very close to overflow or very close to underflow, the matrix should be scaled.

info

(global) INTEGER. If *info*=0, the execution is successful.

info < 0:

If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

info> 0:

If *info* = *i* and

i ≤ *m*, the *i*-th row of the distributed matrix

sub(*A*) is exactly zero;

i>*m*, the (*i* - *m*)-th column of the distributed

matrix sub(*A*) is exactly zero.

Overview for details of ScaLAPACK array descriptor structures and related notations.

p?poequ

Computes row and column scaling factors intended to equilibrate a symmetric (Hermitian) positive definite distributed matrix and reduce its condition number.

Syntax

```
call pspoequ(n, a, ia, ja, desca, sr, sc, scond, amax, info)
call pdpoequ(n, a, ia, ja, desca, sr, sc, scond, amax, info)
call pcpoequ(n, a, ia, ja, desca, sr, sc, scond, amax, info)
```

```
call pzpoequ(n, a, ia, ja, desca, sr, sc, scond, amax, info)
```

Include Files

Description

The p?poequ routine computes row and column scalings intended to equilibrate a real symmetric or complex Hermitian positive definite distributed matrix sub(*A*) = *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1) and reduce its condition number (with respect to the two-norm). The output arrays *sr* and *sc* return the row and column scale factors

$$s(i) = \frac{1}{\sqrt{a_{i,i}}}$$

These factors are chosen so that the scaled distributed matrix *B* with elements $b_{ij}=s(i)*a_{ij}*s(j)$ has ones on the diagonal.

This choice of *sr* and *sc* puts the condition number of *B* within a factor *n* of the smallest possible condition number over all possible diagonal scalings.

The auxiliary function p?laqsy uses scaling factors computed by p?geequ to scale a general rectangular matrix.

Input Parameters

n

(global) INTEGER. The number of rows and columns to be operated on, that is, the order of the distributed matrix sub(*A*) (*n*≥0).

a

(local)

REAL for pspoequ

DOUBLE PRECISION for pdpoequ

COMPLEX for pcpoequ

DOUBLE COMPLEX for pzpoequ.

Pointer into the local memory to an array of local size (*lld_a*,*LOCc*(*ja*+*n*-1)).

The array *a* contains the *n*-by-*n* symmetric/Hermitian positive definite distributed matrix sub(*A*) whose scaling factors are to be computed. Only the diagonal elements of sub(*A*) are referenced.

ia, *ja*

(global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the matrix sub(*A*), respectively.

desca

(global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

Output Parameters

sr, *sc*

(local)

REAL for single precision flavors;

DOUBLE PRECISION for double precision flavors.

Arrays of sizes *LOCr(m_a)* and *LOCc(n_a)*, respectively.

If *info* = 0, the array *sr(ia:ia+n-1)* contains the row scale factors for sub(*A*). *sr* is aligned with the distributed matrix *A*, and replicated across every process column. *sr* is tied to the distributed matrix *A*.

If *info* = 0, the array *sc(ja:ja+n-1)* contains the column scale factors for sub(*A*). *sc* is aligned with the distributed matrix *A*, and replicated down every process row. *sc* is tied to the distributed matrix *A*.

scond (global)

REAL for single precision flavors;

DOUBLE PRECISION for double precision flavors.

If *info* = 0, *scond* contains the ratio of the smallest *sr*(*i*) (or *sc*(*j*)) to the largest *sr*(*i*) (or *sc*(*j*)), with

ia≤i≤*ia+n-1* and *ja*≤j≤*ja+n-1*.

If *scond*≥ 0.1 and *amax* is neither too large nor too small, it is not worth scaling by *sr* (or *sc*).

amax (global)

REAL for single precision flavors;

DOUBLE PRECISION for double precision flavors.

Absolute value of the largest matrix element. If *amax* is very close to overflow or very close to underflow, the matrix should be scaled.

info (global) INTEGER.

If *info*=0, the execution is successful.

info < 0:

If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

info> 0:

If *info* = *k*, the *k*-th diagonal entry of sub(*A*) is nonpositive.

Orthogonal Factorizations: ScaLAPACK Computational Routines

This section describes the ScaLAPACK routines for the *QR(RQ)* and *LQ(QL)* factorization of matrices. Routines for the *RZ* factorization as well as for generalized *QR* and *RQ* factorizations are also included. For the mathematical definition of the factorizations, see the respective LAPACK sections or refer to [SLUG].

Table "Computational Routines for Orthogonal Factorizations" lists ScaLAPACK routines that perform orthogonal factorization of matrices.

Computational Routines for Orthogonal Factorizations

Matrix type, factorization	Factorize without pivoting	Factorize with pivoting	Generate matrix Q	Apply matrix Q
general matrices, QR factorization	p?geqrf	p?geqpf	p?orgqr p?ungqr	p?ormqr p?unmqr
general matrices, RQ factorization	p?gerqf		p?orgrq p?ungrq	p?ormrq p?unmrq
general matrices, LQ factorization	p?gelqf		p?orglq p?unglq	p?ormlq p?unmlq
general matrices, QL factorization	p?geqlf		p?orgql p?ungql	p?ormql p?unmql
trapezoidal matrices, RZ factorization	p?tzrzf			p?ormrz p?unmrz
pair of matrices, generalized QR factorization	p?ggqrf			
pair of matrices, generalized RQ factorization	p?ggrqf			

p?geqrf

Computes the QR factorization of a general m-by-n matrix.

Syntax

```
call psgeqrf(m, n, a, ia, ja, desca, tau, work, lwork, info)
call pdgeqrf(m, n, a, ia, ja, desca, tau, work, lwork, info)
call pcgeqrf(m, n, a, ia, ja, desca, tau, work, lwork, info)
call pzgeqrf(m, n, a, ia, ja, desca, tau, work, lwork, info)
```

Include Files

Description

The `p?geqrf` routine forms the *QR* factorization of a general *m*-by-*n* distributed matrix sub(*A*)= *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1) as

A=*Q***R*.

Input Parameters

m (global) `INTEGER`. The number of rows in the distributed matrix sub(*A*); (*m*≥ 0).

n (global) INTEGER. The number of columns in the distributed matrix sub(*A*); (*n*≥ 0).

a (local)

REAL for psgeqrf

DOUBLE PRECISION for pdgeqrf

COMPLEX for pcgeqrf

DOUBLE COMPLEX for pzgeqrf.

Pointer into the local memory to an array of local size (*lld_a*,*LOCc*(*ja*+*n*-1)).

Contains the local pieces of the distributed matrix sub(*A*) to be factored.

ia, *ja* (global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the submatrix *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1), respectively.

desca (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*

work (local).

REAL for psgeqrf

DOUBLE PRECISION for pdgeqrf.

COMPLEX for pcgeqrf.

DOUBLE COMPLEX for pzgeqrf

Workspace array of size *lwork*.

lwork (local or global) INTEGER, size of *work*, must be at least *lwork*≥*nb_a* * (*mp*0+*nq*0+*nb_a*), where

iroff = mod(*ia*-1, *mb_a*), *icoff* = mod(*ja*-1, *nb_a*),

iarow = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW),

iacol = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL),

*mp*0 = numroc(*m*+*iroff*, *mb_a*, MYROW, *iarow*, NPROW),

*nq*0 = numroc(*n*+*icoff*, *nb_a*, MYCOL, *iacol*, NPCOL), and numroc, indxg2p are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.

If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a	The elements on and above the diagonal of sub(*A*) contain the min(*m*,*n*)-by-*n* upper trapezoidal matrix *R* (*R* is upper triangular if *m*≥*n*); the elements below the diagonal, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors (see *Application Notes* below).

tau	(local)
	`REAL` for `psgeqrf`
	`DOUBLE PRECISION` for `pdgeqrf`
	`COMPLEX` for `pcgeqrf`
	`DOUBLE COMPLEX` for `pzgeqrf`.
	Array of size *LOCc*(*ja*+min(*m*,*n*)−1).
	Contains the scalar factor of elementary reflectors. *tau* is tied to the distributed matrix *A*.

work(1)	On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	(global) `INTEGER`. = 0, the execution is successful. < 0, if the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Application Notes

The matrix *Q* is represented as a product of elementary reflectors

Q = *H*(*ja*)**H*(*ja*+*1*)*...**H*(*ja*+*k*-1),

where *k* = min(*m*,*n*).

Each *H*(*i*) has the form

H(*i*) = *I* - *tau***v***v'*

where *tau* is a real/complex scalar, and *v* is a real/complex vector with *v*(1:*i*-1) = 0 and *v*(*i*) = 1; *v*(*i*+*1*:*m*) is stored on exit in *A*(*ia*+*i*:*ia*+m-1, *ja*+*i*-1), and *tau* in *tau*(*ja*+*i*-1).

See Also

Overview for details of ScaLAPACK array descriptor structures and related notations.

p?geqpf

Computes the QR factorization of a general m-by-n matrix with pivoting.

Syntax

```
call psgeqpf(m, n, a, ia, ja, desca, ipiv, tau, work, lwork, info)
call pdgeqpf(m, n, a, ia, ja, desca, ipiv, tau, work, lwork, info)
call pcgeqpf(m, n, a, ia, ja, desca, ipiv, tau, work, lwork, rwork, lrwork, info)
call pzgeqpf(m, n, a, ia, ja, desca, ipiv, tau, work, lwork, rwork, lrwork, info)
```

Include Files

Description

The p?geqpf routine forms the *QR* factorization with column pivoting of a general *m*-by-*n* distributed matrix sub(*A*)= *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1) as

sub(*A*)*P*=*Q*R.

Input Parameters

m (global) INTEGER. The number of rows in the matrix sub(*A*) (*m*≥ 0).

n (global) INTEGER. The number of columns in the matrix sub(*A*) (*n*≥ 0).

a (local)

REAL for psgeqpf

DOUBLE PRECISION for pdgeqpf

COMPLEX for pcgeqpf

DOUBLE COMPLEX for pzgeqpf.

Pointer into the local memory to an array of local size (*lld_a*,*LOCc*(*ja*+*n*-1)).

Contains the local pieces of the distributed matrix sub(*A*) to be factored.

ia, *ja* (global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the submatrix *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1), respectively.

desca (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

work (local).

REAL for psgeqpf

DOUBLE PRECISION for pdgeqpf.

COMPLEX for pcgeqpf.

DOUBLE COMPLEX for pzgeqpf

Workspace array of size *lwork*.

lwork (local or global) INTEGER, size of *work*, must be at least

For real flavors:

lwork≥max(3,*mp*0+*nq*0) + *LOCc* (*ja*+*n*-*1*) + *nq*0.

For complex flavors:

lwork≥max(3,*mp*0+*nq*0) .

Here

iroff = mod(*ia*-1, *mb_a*), *icoff* = mod(*ja*-1, *nb_a*),

iarow = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW),

iacol = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL),

*mp*0 = numroc(*m*+*iroff*, *mb_a*, MYROW, *iarow*, NPROW),

*nq*0 = numroc(*n*+*icoff*, *nb_a*, MYCOL, *iacol*, NPCOL),

LOCc (*ja*+*n*-1) = numroc(*ja*+*n*-1, *nb_a*, MYCOL,*csrc_a*, NPCOL),
and numroc, indxg2p are ScaLAPACK tool functions.

You can determine MYROW, MYCOL, NPROW and NPCOL by calling the blacs_gridinfosubroutine.

If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

rwork (local).

REAL for pcgeqpf.

DOUBLE PRECISION for pzgeqpf.

Workspace array of size *lrwork* (complex flavors only).

lrwork (local or global) INTEGER, size of *rwork* (complex flavors only). The value of *lrwork* must be at least

lwork≥*LOCc* (*ja*+*n*-1) + *nq*0 .

Here

iroff = mod(*ia*-1, *mb_a*), *icoff* = mod(*ja*-1, *nb_a*),

iarow = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW),

iacol = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL),

*mp*0 = numroc(*m*+*iroff*, *mb_a*, MYROW, *iarow*, NPROW),

*nq*0 = numroc(*n*+*icoff*, *nb_a*, MYCOL, *iacol*, NPCOL),

LOCc (*ja*+*n*-1) = numroc(*ja*+*n*-1, *nb_a*, MYCOL,*csrc_a*, NPCOL),
and numroc, indxg2p are ScaLAPACK tool functions.

You can determine MYROW, MYCOL, NPROW and NPCOL by calling the blacs_gridinfosubroutine.

If *lrwork* = -1, then *lrwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a The elements on and above the diagonal of sub(*A*)contain the min(*m*,*n*)-by-*n* upper trapezoidal matrix *R* (*R* is upper triangular if *m*≥*n*); the elements below the diagonal, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors (see *Application Notes* below).

ipiv (local) INTEGER. Array of size *LOCc*(*ja*+*n*-1).

ipiv(*i*) = *k*, the local *i*-th column of sub(*A*)**P* was the global *k*-th column of sub(*A*). *ipiv* is tied to the distributed matrix *A*.

tau	(local)
	`REAL` for `psgeqpf`
	`DOUBLE PRECISION` for `pdgeqpf`
	`COMPLEX` for `pcgeqpf`
	`DOUBLE COMPLEX` for `pzgeqpf`.
	Array of size *LOCc*(*ja*+min(*m*, *n*)-1).
	Contains the scalar factor *tau* of elementary reflectors. *tau* is tied to the distributed matrix *A*.

work(1)	On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.
rwork(1)	On exit, *rwork*(1) contains the minimum value of *lrwork* required for optimum performance.
info	(global) `INTEGER`. = 0, the execution is successful. < 0, if the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Application Notes

The matrix *Q* is represented as a product of elementary reflectors

Q = *H*(1)**H*(2)*...**H*(*k*)

where *k* = min(*m*,*n*).

Each *H*(*i*) has the form

H = *I* - *tau***v***v'*

where *tau* is a real/complex scalar, and *v* is a real/complex vector with *v*(1:*i*-1) = 0 and *v*(*i*) = 1; *v*(*i*+*1*:*m*) is stored on exit in *A*(*ia*+*i*:*ia*+m-1, *ja*+*i*-1).

The matrix *P* is represented in *ipiv* as follows: if *ipiv*(*j*)= *i* then the *j*-th column of *P* is the *i*-th canonical unit vector.

Overview for details of ScaLAPACK array descriptor structures and related notations.

p?orgqr

Generates the orthogonal matrix Q of the QR factorization formed by `p?geqrf`.

Syntax

```
call psorgqr(m, n, k, a, ia, ja, desca, tau, work, lwork, info)
call pdorgqr(m, n, k, a, ia, ja, desca, tau, work, lwork, info)
```

Include Files

Description

The p?orgqrroutine generates the whole or part of *m*-by-*n* real distributed matrix *Q* denoting *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1) with orthonormal columns, which is defined as the first *n* columns of a product of *k* elementary reflectors of order *m*

Q= *H*(1)**H*(2)*...**H*(*k*)

as returned by p?geqrf.

Input Parameters

m — (global) INTEGER. The number of rows in the matrix sub(*Q*) (*m*≥ 0).

n — (global) INTEGER. The number of columns in the matrix sub(*Q*) (*m*≥*n*≥ 0).

k — (global) INTEGER. The number of elementary reflectors whose product defines the matrix *Q* (*n*≥*k*≥ 0).

a — (local)

REAL for psorgqr

DOUBLE PRECISION for pdorgqr

Pointer into the local memory to an array of local size (*lld_a*, *LOCc*(*ja*+*n*-1)). The *j*-th column must contain the vector that defines the elementary reflector *H*(*j*), *ja*≤ *j* ≤ *ja* +*k*-1, as returned by p?geqrf in the *k* columns of its distributed matrix argument *A*(*ia*:*, *ja*:*ja*+*k*-1).

ia, *ja* — (global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the submatrix *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1), respectively.

desca — (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

tau — (local)

REAL for psorgqr

DOUBLE PRECISION for pdorgqr

Array of size *LOCc*(*ja*+*k*-1).

Contains the scalar factor *tau*(*j*) of elementary reflectors *H*(*j*) as returned by p?geqrf. *tau* is tied to the distributed matrix *A*.

work — (local)

REAL for psorgqr

DOUBLE PRECISION for pdorgqr

Workspace array of size of *lwork*.

lwork — (local or global) INTEGER, size of *work*.

Must be at least *lwork*≥*nb_a**(*nqa*0 + *mpa*0 + *nb_a*), where

iroffa = mod(*ia*-1, *mb_a*), *icoffa* = mod(*ja*-1, *nb_a*),

iarow = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW),

iacol = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL),

*mpa*0 = numroc(*m*+*iroffa*, *mb_a*, MYROW, *iarow*, NPROW),

*nqa*0 = numroc(*n*+*icoffa*, *nb_a*, MYCOL, *iacol*, NPCOL);

indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.

If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a — Contains the local pieces of the *m*-by-*n* distributed matrix Q.

work(1) — On exit, (1) contains the minimum value of *lwork* required for optimum performance.

info — (global) INTEGER.

= 0: the execution is successful.

< 0: if the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?ungqr

Generates the complex unitary matrix Q of the QR factorization formed by p?geqrf.

Syntax

```
call pcungqr(m, n, k, a, ia, ja, desca, tau, work, lwork, info)
call pzungqr(m, n, k, a, ia, ja, desca, tau, work, lwork, info)
```

Include Files

Description

This routine generates the whole or part of *m*-by-*n* complex distributed matrix *Q* denoting *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1) with orthonormal columns, which is defined as the first *n* columns of a product of *k* elementary reflectors of order *m*

Q = *H*(1)**H*(2)*...**H*(*k*)

as returned by p?geqrf.

Input Parameters

m — (global) INTEGER. The number of rows in the matrix sub(*Q*); (*m*≥0).

n — (global) INTEGER. The number of columns in the matrix sub(*Q*) (*m*≥*n*≥0).

k (global) INTEGER. The number of elementary reflectors whose product defines the matrix *Q* (*n*≥*k*≥0).

a (local)

COMPLEX for pcungqr

DOUBLE COMPLEX for pzungqr

Pointer into the local memory to an array of size (*lld_a*, *LOCc*(*ja*+*n*-1)). The *j*-th column must contain the vector that defines the elementary reflector *H*(*j*), *ja*≤ *j*≤ *ja* +*k*-1, as returned by p?geqrf in the *k* columns of its distributed matrix argument *A*(*ia*:*, *ja*:*ja*+*k*-1).

ia, *ja* (global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the submatrix *A*, respectively.

desca (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

tau (local)

COMPLEX for pcungqr

DOUBLE COMPLEX for pzungqr

Array of size *LOCc*(*ja*+*k*-1).

Contains the scalar factor *tau*(*j*) of elementary reflectors *H*(*j*) as returned by p?geqrf. *tau* is tied to the distributed matrix *A*.

work (local)

COMPLEX for pcungqr

DOUBLE COMPLEX for pzungqr

Workspace array of size of *lwork*.

lwork (local or global) INTEGER, size of *work*, must be at least *lwork*≥*nb_a**(*nqa*0 + *mpa*0 + *nb_a*), where

iroffa = mod(*ia*-1, *mb_a*),

icoffa = mod(*ja*-1, *nb_a*),

iarow = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW),

iacol = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL),

*mpa*0 = numroc(*m*+*iroffa*, *mb_a*, MYROW, *iarow*, NPROW),

*nqa*0 = numroc(*n*+*icoffa*, *nb_a*, MYCOL, *iacol*, NPCOL)

indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.

If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a	Contains the local pieces of the *m*-by-*n* distributed matrix *Q*.
work(1)	On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	(global) INTEGER. = 0: the execution is successful. < 0: if the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?ormqr

Multiplies a general matrix by the orthogonal matrix Q of the QR factorization formed by p?geqrf.

Syntax

call psormqr(*side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

call pdormqr(*side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

Include Files

Description

The p?ormqrroutine overwrites the general real *m*-by-*n* distributed matrix sub (*C*) = *C*(*ic*:*ic*+*m*-1,*jc*:*jc*+*n*-1) with

	side ='L'	*side* ='R'
trans = 'N':	*Q**sub(*C*)	sub(*C*)**Q*
trans = 'T':	Q^T*sub(*C*)	sub(*C*)*Q^T

where *Q* is a real orthogonal distributed matrix defined as the product of *k* elementary reflectors

Q = *H*(1) *H*(2)... *H*(*k*)

as returned by p?geqrf. *Q* is of order *m* if *side* = 'L' and of order *n* if *side* = 'R'.

Input Parameters

side	(global) CHARACTER ='L': *Q* or Q^T is applied from the left. ='R': *Q* or Q^T is applied from the right.
trans	(global) CHARACTER ='N', no transpose, *Q* is applied. ='T', transpose, Q^T is applied.

m (global) INTEGER. The number of rows in the distributed matrix sub(*C*) (*m*≥0).

n (global) INTEGER. The number of columns in the distributed matrix sub(*C*) (*n*≥0).

k (global) INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. Constraints:

If *side* = 'L', *m*≥*k*≥0

If *side* = 'R', *n*≥*k*≥0.

a (local)

REAL for psormqr

DOUBLE PRECISION for pdormqr.

Pointer into the local memory to an array of size (*lld_a*, *LOCc*(*ja*+*n*-1)). The *j*-th column must contain the vector that defines the elementary reflector *H*(*j*), *ja*≤*j*≤*ja*+*k*-1, as returned by p?geqrf in the *k* columns of its distributed matrix argument *A*(*ia*:*, *ja*:*ja*+*k*-1). *A*(*ia*:*, *ja*:*ja*+*k*-1) is modified by the routine but restored on exit.

If *side* = 'L', *lld_a* ≥ max(1, *LOCr*(*ia*+*m*-1))

If *side* = 'R', *lld_a* ≥ max(1, *LOCr*(*ia*+*n*-1))

ia, *ja* (global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the submatrix *A*, respectively.

desca (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

tau (local)

REAL for psormqr

DOUBLE PRECISION for pdormqr

Array of size *LOCc*(*ja*+*k*-1).

Contains the scalar factor *tau*(*j*) of elementary reflectors *H*(*j*) as returned by p?geqrf. *tau* is tied to the distributed matrix *A*.

c (local)

REAL for psormqr

DOUBLE PRECISION for pdormqr

Pointer into the local memory to an array of local size (*lld_c*, *LOCc*(*jc*+*n*-1)).

Contains the local pieces of the distributed matrix sub(*C*) to be factored.

ic, *jc* (global) INTEGER. The row and column indices in the global matrix *C* indicating the first row and the first column of the matrix sub(*C*), respectively.

descc (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *C*.

work

(local)

REAL for psormqr

DOUBLE PRECISION for pdormqr.

Workspace array of size of *lwork*.

lwork

(local or global) INTEGER, size of *work*, must be at least:

if *side* = 'L',

lwork≥max((*nb_a**(*nb_a*-1))/2, (*nqc*0+*mpc*0)**nb_a*) + *nb_a***nb_a*

else if *side* = 'R',

lwork≥max((*nb_a**(*nb_a*-1))/2, (*nqc*0+max(*npa*0+numroc(numroc(*n*+*icoffc*, *nb_a*, 0, 0, NPCOL), *nb_a*, 0, 0, *lcmq*), *mpc*0))**nb_a*) + *nb_a***nb_a*

end if

where

lcmq = *lcm*/NPCOL with *lcm* = ilcm(NPROW, NPCOL),

iroffa = mod(*ia*-1, *mb_a*),

icoffa = mod(*ja*-1, *nb_a*),

iarow = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW),

*npa*0= numroc(*n*+*iroffa*, *mb_a*, MYROW, *iarow*, NPROW),

iroffc = mod(*ic*-1, *mb_c*),

icoffc = mod(*jc*-1, *nb_c*),

icrow = indxg2p(*ic*, *mb_c*, MYROW, *rsrc_c*, NPROW),

iccol = indxg2p(*jc*, *nb_c*, MYCOL, *csrc_c*, NPCOL),

*mpc*0= numroc(*m*+*iroffc*, *mb_c*, MYROW, *icrow*, NPROW),

*nqc*0= numroc(*n*+*icoffc*, *nb_c*, MYCOL, *iccol*, NPCOL),

ilcm, indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.

If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

c

Overwritten by the product Q*sub(C), or Q^T*sub(C), or sub(C)*Q^T, or sub(C)*Q.

work(1)

On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.

info

(global) INTEGER.

= 0: the execution is successful.

< 0: if the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?unmqr

Multiplies a complex matrix by the unitary matrix Q of the QR factorization formed by p?geqrf.

Syntax

call pcunmqr(*side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

call pzunmqr(*side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

Include Files

Description

This routine overwrites the general complex *m*-by-*n* distributed matrix sub (*C*) = *C*(*ic*:*ic*+*m*-1,*jc*:*jc*+*n*-1) with

	side ='L'	*side* ='R'
trans = 'N':	*Q**sub(*C*)	sub(*C*)**Q*
trans = 'T':	Q^H*sub(*C*)	sub(*C*)*Q^H

where *Q* is a complex unitary distributed matrix defined as the product of *k* elementary reflectors

Q = *H*(1) *H*(2)... *H*(*k*) as returned by p?geqrf. *Q* is of order *m* if *side* = 'L' and of order *n* if *side* ='R'.

Input Parameters

side (global) CHARACTER

='L': *Q* or Q^H is applied from the left.

='R': *Q* or Q^H is applied from the right.

trans (global) CHARACTER

='N', no transpose, *Q* is applied.

='C', conjugate transpose, Q^H is applied.

m (global) INTEGER. The number of rows in the distributed matrix sub(*C*) (*m*≥0).

n (global) INTEGER. The number of columns in the distributed matrix sub(*C*) (*n*≥0).

k (global) INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. Constraints:

If *side* = 'L', *m*≥*k*≥0

If *side* = 'R', *n*≥*k*≥0.

a (local)

COMPLEX for pcunmqr

DOUBLE COMPLEX for pzunmqr.

Pointer into the local memory to an array of size (*lld_a*,*LOCc*(*ja*+*k*-1)). The *j*-th column must contain the vector that defines the elementary reflector *H*(*j*), *ja*≤*j*≤*ja*+*k*-1, as returned by p?geqrf in the *k* columns of its distributed matrix argument *A*(*ia*:*, *ja*:*ja*+*k*-1). *A*(*ia*:*, *ja*:*ja*+*k*-1) is modified by the routine but restored on exit.

If *side* = 'L', *lld_a* ≥ max(1, *LOCr*(*ia*+*m*-1))

If *side* = 'R', *lld_a* ≥ max(1, *LOCr*(*ia*+*n*-1))

ia, *ja* (global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the submatrix *A*, respectively.

desca (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

tau (local)

COMPLEX for pcunmqr

DOUBLE COMPLEX for pzunmqr

Array of size *LOCc*(*ja*+*k*-1).

Contains the scalar factor *tau*(*j*) of elementary reflectors *H*(*j*) as returned by p?geqrf. *tau* is tied to the distributed matrix *A*.

c (local)

COMPLEX for pcunmqr

DOUBLE COMPLEX for pzunmqr.

Pointer into the local memory to an array of local size (*lld_c*,*LOCc*(*jc* +*n*-1)).

Contains the local pieces of the distributed matrix sub(*C*) to be factored.

ic, *jc* (global) INTEGER. The row and column indices in the global matrix *C* indicating the first row and the first column of the submatrix *C*, respectively.

descc (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *C*.

work (local)

COMPLEX for pcunmqr

DOUBLE COMPLEX for pzunmqr.

Workspace array of size of *lwork*.

lwork (local or global) INTEGER, size of *work*, must be at least:

If *side* = 'L',

lwork≥max((*nb_a**(*nb_a*-1))/2, (*nqc*0 + *mpc*0)**nb_a*) + *nb_a***nb_a*

else if *side* = 'R',

lwork≥max((*nb_a**(*nb_a*-1))/2, (*nqc*0 + max(*npa*0 + numroc(numroc(*n*+*icoffc*, *nb_a*, 0, 0, NPCOL), *nb_a*, 0, 0, *lcmq*), *mpc*0))**nb_a*) + *nb_a***nb_a*

end if

where

lcmq = *lcm*/NPCOL with *lcm* = ilcm (NPROW, NPCOL),

iroffa = mod(*ia*-1, *mb_a*),

Overview for details of ScaLAPACK array descriptor structures and related notations.

p?gelqf

Computes the LQ factorization of a general rectangular matrix.

Syntax

```
call psgelqf(m, n, a, ia, ja, desca, tau, work, lwork, info)
call pdgelqf(m, n, a, ia, ja, desca, tau, work, lwork, info)
call pcgelqf(m, n, a, ia, ja, desca, tau, work, lwork, info)
call pzgelqf(m, n, a, ia, ja, desca, tau, work, lwork, info)
```

Include Files

Description

The p?gelqf routine computes the *LQ* factorization of a real/complex distributed *m*-by-*n* matrix sub(*A*)= *A*(*ia*:*ia*+*m*-1,*ja*:*ja*+*n*-1) = *L***Q*.

Input Parameters

m

(global) INTEGER. The number of rows in the distributed submatrix sub(*A*) (*m*≥ 0).

n

(global) INTEGER. The number of columns in the distributed submatrix sub(*A*) (*n*≥ 0).

a

(local)

REAL for psgelqf

DOUBLE PRECISION for pdgelqf

COMPLEX for pcgelqf

DOUBLE COMPLEX for pzgelqf

Pointer into the local memory to an array of local size (*lld_a*,*LOCc*(*ja*+*n*-1)).

Contains the local pieces of the distributed matrix sub(*A*) to be factored.

ia, *ja*

(global) INTEGER. The row and column indices in the global array *A* indicating the first row and the first column of the submatrix *A*(*ia*:*ia*+*m*-1,*ja*:*ja*+*n*-1), respectively.

desca

(global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

work

(local)

REAL for psgelqf

DOUBLE PRECISION for pdgelqf

COMPLEX for pcgelqf

DOUBLE COMPLEX for pzgelqf

Workspace array of size of *lwork*.

lwork

(local or global) INTEGER, size of *work*, must be at least *lwork*≥*mb_a**(*mp*0 + *nq*0 + *mb_a*), where

iroff = mod(*ia*-1, *mb_a*),

icoff = mod(*ja*-1, *nb_a*),

iarow = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW),

iacol = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL),

*mp*0 = numroc(*m*+*iroff*, *mb_a*, MYROW, *iarow*, NPROW),

*nq*0 = numroc(*n*+*icoff*, *nb_a*, MYCOL, *iacol*, NPCOL)

indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.

NOTE
mod(*x*,*y*) is the integer remainder of *x*/*y*.

If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a

The elements on and below the diagonal of sub(*A*) contain the *m*-by-min(*m*,*n*) lower trapezoidal matrix *L* (*L* is lower trapezoidal if *m* ≤ *n*); the elements above the diagonal, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors (see *Application Notes* below).

tau

(local)

REAL for psgelqf

DOUBLE PRECISION for pdgelqf

COMPLEX for pcgelqf

DOUBLE COMPLEX for pzgelqf

Array of size *LOCr*(*ia*+min(*m*, *n*)-1).

Contains the scalar factors of elementary reflectors. *tau* is tied to the distributed matrix *A*.

work(1)

On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.

info

(global) INTEGER.

= 0: the execution is successful.

< 0: if the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Application Notes

The matrix *Q* is represented as a product of elementary reflectors

Q = *H*(*ia*+*k*-1)**H*(*ia*+*k*-2)*...**H*(*ia*),

where $k = \min(m, n)$

Each $H(i)$ has the form

$H(i) = I - tau*v*v'$

where *tau* is a real/complex scalar, and *v* is a real/complex vector with $v(1:i-1) = 0$ and $v(i) = 1$; $v(i+1:n)$ is stored on exit in $A(ia+i-1, ja+i:ja+n-1)$, and *tau* in $tau(ia+i-1)$.

See Also

Overview for details of ScaLAPACK array descriptor structures and related notations.

p?orglq

Generates the real orthogonal matrix Q of the LQ factorization formed by p?gelqf*.*

Syntax

```
call psorglq(m, n, k, a, ia, ja, desca, tau, work, lwork, info)
call pdorglq(m, n, k, a, ia, ja, desca, tau, work, lwork, info)
```

Include Files

Description

The p?orglq routine generates the whole or part of m-by-n real distributed matrix *Q* denoting $A(ia:ia+m-1, ja:ja+n-1)$ with orthonormal rows, which is defined as the first m rows of a product of k elementary reflectors of order n

$Q = H(k)*...* H(2)* H(1)$

as returned by p?gelqf.

Input Parameters

m	(global) INTEGER. The number of rows in the matrix sub(*Q*); $(m \geq 0)$.
n	(global) INTEGER. The number of columns in the matrix sub(*Q*) $(n \geq m \geq 0)$.
k	(global) INTEGER. The number of elementary reflectors whose product defines the matrix *Q* $(m \geq k \geq 0)$.
a	(local) REAL for psorglq DOUBLE PRECISION for pdorglq Pointer into the local memory to an array of local size $(lld\_a, LOCc(ja+n-1))$. On entry, the *i*-th row must contain the vector that defines the elementary reflector $H(i)$, $ia \leq i \leq ia+k-1$, as returned by p?gelqf in the k rows of its distributed matrix argument $A(ia:ia+k-1, ja:*)$.
ia, ja	(global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the submatrix $A(ia:ia+m-1, ja:ja+n-1)$, respectively.
$desca$	(global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

work (local)

REAL for psorglq

DOUBLE PRECISION for pdorglq

Workspace array of size of *lwork*.

lwork (local or global) INTEGER, size of *work*, must be at least *lwork*≥*mb_a**(*mpa*0+*nqa*0+*mb_a*), where

iroffa = mod(*ia*-1, *mb_a*),

icoffa = mod(*ja*-1, *nb_a*),

iarow = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW),

iacol = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL),

*mpa*0 = numroc(*m*+*iroffa*, *mb_a*, MYROW, *iarow*, NPROW),

*nqa*0 = numroc(*n*+*icoffa*, *nb_a*, MYCOL, *iacol*, NPCOL)

NOTE
mod(*x*,*y*) is the integer remainder of *x*/*y*.

indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.

If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a Contains the local pieces of the *m*-by-*n* distributed matrix *Q* to be factored.

tau (local)

REAL for psorglq

DOUBLE PRECISION for pdorglq

Array of size *LOCr*(*ia*+*k*-1).

Contains the scalar factors *tau*(*j*) of elementary reflectors *H*(*j*). *tau* is tied to the distributed matrix *A*.

work(1) On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.

info (global) INTEGER.

= 0: the execution is successful.

< 0: if the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?unglq

Generates the unitary matrix Q of the LQ factorization formed by p?gelqf.

Syntax

```
call pcunglq(m, n, k, a, ia, ja, desca, tau, work, lwork, info)
call pzunglq(m, n, k, a, ia, ja, desca, tau, work, lwork, info)
```

Include Files

Description

This routine generates the whole or part of m-by-n complex distributed matrix Q denoting $A(ia{:}ia+m-1, ja{:}ja+n-1)$ with orthonormal rows, which is defined as the first m rows of a product of k elementary reflectors of order n

$Q = (H(k))^H ... *(H(2))^H*(H(1))^H$ as returned by p?gelqf.

Input Parameters

m	(global) INTEGER. The number of rows in the matrix sub(Q) ($m \geq 0$).
n	(global) INTEGER. The number of columns in the matrix sub(Q) ($n \geq m \geq 0$).
k	(global) INTEGER. The number of elementary reflectors whose product defines the matrix Q ($m \geq k \geq 0$).
a	(local) COMPLEX for pcunglq DOUBLE COMPLEX for pzunglq Pointer into the local memory to an array of local size (lld_a, $LOCc(ja+n-1)$). On entry, the i-th row must contain the vector that defines the elementary reflector $H(i)$, $ia \leq i \leq ia+k-1$, as returned by p?gelqf in the k rows of its distributed matrix argument $A(ia{:}ia+k-1, ja{:}*)$.
ia, *ja*	(global) INTEGER. The row and column indices in the global matrix A indicating the first row and the first column of the submatrix $A(ia{:}ia+m-1, ja{:}ja+n-1)$, respectively.
desca	(global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix A.
tau	(local) COMPLEX for pcunglq DOUBLE COMPLEX for pzunglq Array of size $LOCr(ia+k-1)$. Contains the scalar factors $tau(j)$ of elementary reflectors $H(j)$. tau is tied to the distributed matrix A.
work	(local) COMPLEX for pcunglq DOUBLE COMPLEX for pzunglq

Workspace array of size of *lwork*.

lwork

(local or global) INTEGER, size of *work*, must be at least *lwork*≥*mb_a**(*mpa*0+*nqa*0+*mb_a*), where

iroffa = mod(*ia*-1, *mb_a*),

icoffa = mod(*ja*-1, *nb_a*),

iarow = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW),

iacol = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL),

*mpa*0 = numroc(*m*+*iroffa*, *mb_a*, MYROW, *iarow*, NPROW),

*nqa*0 = numroc(*n*+*icoffa*, *nb_a*, MYCOL, *iacol*, NPCOL)

indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.

NOTE
mod(*x*,*y*) is the integer remainder of *x*/*y*.

If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a

Contains the local pieces of the *m*-by-*n* distributed matrix *Q* to be factored.

work(1)

On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.

info

(global) INTEGER.

= 0: the execution is successful.

< 0: if the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?ormlq

Multiplies a general matrix by the orthogonal matrix Q of the LQ factorization formed by p?gelqf.

Syntax

call psormlq(*side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *work*, *lwork*, *info*)

call pdormlq(*side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *work*, *lwork*, *info*)

Include Files

Description

The p?ormlq routine overwrites the general real *m*-by-*n* distributed matrix sub(*C*) = *C*(*ic*:*ic*+*m*-1,*jc*:*jc*+*n*-1) with

	side ='L'	*side* ='R'
trans = 'N':	*Q**sub(*C*)	sub(*C*)**Q*
trans = 'T':	Q^T*sub(*C*)	sub(*C*)*Q^T

where *Q* is a real orthogonal distributed matrix defined as the product of *k* elementary reflectors

Q = *H*(*k*)...*H*(2) *H*(1)

as returned by p?gelqf. *Q* is of order *m* if *side* = 'L' and of order *n* if *side* = 'R'.

Input Parameters

side (global) CHARACTER

='L': *Q* or Q^T is applied from the left.

='R': *Q* or Q^T is applied from the right.

trans (global) CHARACTER

='N', no transpose, *Q* is applied.

='T', transpose, Q^T is applied.

m (global) INTEGER. The number of rows in the distributed matrix sub(*C*) (*m*≥0).

n (global) INTEGER. The number of columns in the distributed matrix sub(*C*) (*n*≥0).

k (global) INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. Constraints:

If *side* = 'L', *m*≥*k*≥0

If *side* = 'R', *n*≥*k*≥0.

a (local)

REAL for psormlq

DOUBLE PRECISION for pdormlq.

Pointer into the local memory to an array of size (*lld_a*,*LOCc*(*ja*+*m*-1)), if *side* = 'L' and (*lld_a*,*LOCc*(*ja*+*n*-1)), if *side* = 'R'. The *i*-th row must contain the vector that defines the elementary reflector *H*(*i*), *ia*≤*i*≤*ia*+*k*-1, as returned by p?gelqf in the *k* rows of its distributed matrix argument *A*(*ia*:*ia*+*k*-1, *ja*:*).

A(*ia*:*ia*+*k*-1, *ja*:*) is modified by the routine but restored on exit.

ia, *ja* (global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the submatrix *A*, respectively.

desca (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

tau (local)

REAL for psormlq

DOUBLE PRECISION for pdormlq

Array of size *LOCc*(*ja*+*k*-1).

Contains the scalar factor *tau*(*j*) of elementary reflectors *H*(*j*) as returned by p?gelqf. *tau* is tied to the distributed matrix *A*.

c (local)

REAL for psormlq

DOUBLE PRECISION for pdormlq

Pointer into the local memory to an array of local size (*lld_c*,*LOCc*(*jc* +*n*-1)).

Contains the local pieces of the distributed matrix sub(*C*) to be factored.

ic, *jc* (global) INTEGER. The row and column indices in the global matrix *C* indicating the first row and the first column of the submatrix *C*, respectively.

descc (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *C*.

work (local)

REAL for psormlq

DOUBLE PRECISION for pdormlq.

Workspace array of size of *lwork*.

lwork (local or global) INTEGER, size of the array *work*; must be at least:

If *side* = 'L',

lwork≥max((*mb_a**(*mb_a*-1))/2, (*mpc*0+max*mqa*0)+ numroc(numroc(*m* + *iroffc*, *mb_a*, 0, 0, NPROW), *mb_a*, 0, 0, *lcmp*), *nqc*0))* *mb_a*) + *mb_a*mb_a*

else if *side* = 'R',

lwork≥max((*mb_a** (*mb_a*-1))/2, (*mpc*0+nqc0)*mb_a + *mb_a*mb_a*

end if

where

lcmp = *lcm*/NPROW with *lcm* = ilcm (NPROW, NPCOL),

iroffa = mod(*ia*-1, *mb_a*),

icoffa = mod(*ja*-1, *nb_a*),

iacol = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL),

*mqa*0 = *numroc*(*m*+*icoffa*, *nb_a*, MYCOL, *iacol*, NPCOL),

iroffc = mod(*ic*-1, *mb_c*),

icoffc = *mod*(*jc*-1, *nb_c*),

icrow = indxg2p(*ic*, *mb_c*, MYROW, *rsrc_c*, NPROW),

iccol = indxg2p(*jc*, *nb_c*, MYCOL, *csrc_c*, NPCOL),

*mpc*0 = numroc(*m*+*iroffc*, *mb_c*, MYROW, *icrow*, NPROW),

*nqc*0 = numroc(*n*+*icoffc*, *nb_c*, MYCOL, *iccol*, NPCOL),

NOTE
mod(*x*,*y*) is the integer remainder of *x*/*y*.

ilcm, indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.

If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

c — Overwritten by the product *Q**sub(*C*), or *Q*' *sub (*C*), or sub(*C*)**Q*', or sub(*C*)**Q*

work(1) — On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.

info — (global) INTEGER.

= 0: the execution is successful.

< 0: if the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?unmlq

Multiplies a general matrix by the unitary matrix Q of the LQ factorization formed by p?gelqf.

Syntax

call pcunmlq(*side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

call pzunmlq(*side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

Include Files

Description

This routine overwrites the general complex *m*-by-*n* distributed matrix sub(*C*) = *C*(*ic*:*ic*+*m*-1,*jc*:*jc*+*n*-1) with

side ='L' *side* ='R'

trans = 'N':	Q*sub(C)	sub(C)*Q
trans = 'T':	Q^H*sub(C)	sub(C)*Q^H

where Q is a complex unitary distributed matrix defined as the product of k elementary reflectors

$Q = H(k)' \ldots H(2)' H(1)'$

as returned by p?gelqf. Q is of order m if $side$ = 'L' and of order n if $side$ = 'R'.

Input Parameters

side
(global) CHARACTER
='L': Q or Q^H is applied from the left.
='R': Q or Q^H is applied from the right.

trans
(global) CHARACTER
='N', no transpose, Q is applied.
='C', conjugate transpose, Q^H is applied.

m
(global) INTEGER. The number of rows in the distributed matrix sub(C) ($m \geq 0$).

n
(global) INTEGER. The number of columns in the distributed matrix sub(C) ($n \geq 0$).

k
(global) INTEGER. The number of elementary reflectors whose product defines the matrix Q. Constraints:
If $side$ = 'L', $m \geq k \geq 0$
If $side$ = 'R', $n \geq k \geq 0$.

a
(local)
COMPLEX for pcunmlq
DOUBLE COMPLEX for pzunmlq.
Pointer into the local memory to an array of size (lld_a, $LOCc(ja+m-1)$), if $side$ = 'L' and (lld_a, $LOCc(ja+n-1)$), if $side$ = 'R', where $lld\_a \geq \max(1, LOCr(ia+k-1))$. The i-th column must contain the vector that defines the elementary reflector $H(i)$, $ia \leq i \leq ia+k-1$, as returned by p?gelqf in the k rows of its distributed matrix argument $A(ia:ia+k-1, ja:*)$. $A(ia:ia+k-1, ja:*)$ is modified by the routine but restored on exit.

ia, *ja*
(global) INTEGER. The row and column indices in the global matrix A indicating the first row and the first column of the submatrix A, respectively.

desca
(global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix A.

tau
(local)
COMPLEX for pcunmlq
DOUBLE COMPLEX for pzunmlq
Array of size $LOCc(ia+k-1)$.

Contains the scalar factor *tau*(*j*) of elementary reflectors *H*(*j*) as returned by p?gelqf. *tau* is tied to the distributed matrix *A*.

c

(local)

COMPLEX for pcunmlq

DOUBLE COMPLEX for pzunmlq.

Pointer into the local memory to an array of local size (*lld_c*,*LOCc*(*jc*+*n*-1)).

Contains the local pieces of the distributed matrix sub(*C*) to be factored.

ic, *jc*

(global) INTEGER. The row and column indices in the global matrix *C* indicating the first row and the first column of the submatrix *C*, respectively.

descc

(global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *C*.

work

(local)

COMPLEX for pcunmlq

DOUBLE COMPLEX for pzunmlq.

Workspace array of size of *lwork*.

lwork

(local or global) INTEGER, size of the array *work*; must be at least:

If *side* = 'L',

lwork≥max((*mb_a**(*mb_a*-1))/2, (*mpc*0 + max*mqa*0)+ numroc(numroc(*m* + *iroffc*, *mb_a*, 0, 0, NPROW), *mb_a*, 0, 0, *lcmp*), *nqc*0))**mb_a*) + *mb_a***mb_a*

else if *side* = 'R',

lwork≥max((*mb_a** (*mb_a*-1))/2, (*mpc*0 + nqc0)**mb_a* + *mb_a***mb_a*

end if

where

lcmp = *lcm*/NPROW with *lcm* = ilcm (NPROW, NPCOL),

iroffa = mod(*ia*-1, *mb_a*),

icoffa = mod(*ja*-1, *nb_a*),

iacol = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL),

*mqa*0 = *numroc*(m + *icoffa*, *nb_a*, MYCOL, *iacol*, NPCOL),

iroffc = mod(*ic*-1, *mb_c*),

icoffc = *mod*(*jc*-1, *nb_c*),

icrow = indxg2p(*ic*, *mb_c*, MYROW, *rsrc_c*, NPROW),

iccol = indxg2p(*jc*, *nb_c*, MYCOL, *csrc_c*, NPCOL),

*mpc*0 = numroc(*m*+*iroffc*, *mb_c*, MYROW, *icrow*, NPROW),

*nqc*0 = numroc(*n*+*icoffc*, *nb_c*, MYCOL, *iccol*, NPCOL),

NOTE
`mod(x,y)` is the integer remainder of *x*/*y*.

`ilcm`, `indxg2p` and `numroc` are ScaLAPACK tool functions; `MYROW`, `MYCOL`, `NPROW` and `NPCOL` can be determined by calling the subroutine `blacs_gridinfo`.

If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by `pxerbla`.

Output Parameters

c — Overwritten by the product *Q**sub(*C*), or *Q'**sub (*C*), or sub(*C*)**Q'*, or sub(*C*)**Q*

work(1) — On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.

info — (global) `INTEGER`.

= 0: the execution is successful.

< 0: if the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?geqlf

Computes the QL factorization of a general matrix.

Syntax

```
call psgeqlf(m, n, a, ia, ja, desca, tau, work, lwork, info)
call pdgeqlf(m, n, a, ia, ja, desca, tau, work, lwork, info)
call pcgeqlf(m, n, a, ia, ja, desca, tau, work, lwork, info)
call pzgeqlf(m, n, a, ia, ja, desca, tau, work, lwork, info)
```

Include Files

Description

The `p?geqlf` routine forms the *QL* factorization of a real/complex distributed *m*-by-*n* matrix sub(*A*)= *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1) = *Q***L*.

Input Parameters

m — (global) `INTEGER`. The number of rows in the matrix sub(*Q*); (*m*≥ 0).

n — (global) `INTEGER`. The number of columns in the matrix sub(*Q*) (*n*≥ 0).

a (local)

REAL for psgeqlf

DOUBLE PRECISION for pdgeqlf

COMPLEX for pcgeqlf

DOUBLE COMPLEX for pzgeqlf

Pointer into the local memory to an array of local size (*lld_a*,*LOCc*(*ja*+*n*-1)). Contains the local pieces of the distributed matrix sub(*A*) to be factored.

ia, *ja* (global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the submatrix *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1), respectively.

desca (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

work (local)

REAL for psgeqlf

DOUBLE PRECISION for pdgeqlf

COMPLEX for pcgeqlf

DOUBLE COMPLEX for pzgeqlf

Workspace array of size of *lwork*.

lwork (local or global) INTEGER, size of *work*, must be at least *lwork*≥*nb_a**(*mp*0 + *nq*0 + *nb_a*), where

iroff = mod(*ia*-1, *mb_a*),

icoff = mod(*ja*-1, *nb_a*),

iarow = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW),

iacol = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL),

*mp*0 = numroc(*m*+*iroff*, *mb_a*, MYROW, *iarow*, NPROW),

*nq*0 = numroc(*n*+*icoff*, *nb_a*, MYCOL, *iacol*, NPCOL)

NOTE
mod(*x*,*y*) is the integer remainder of *x*/*y*.

numroc and indxg2p are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.

If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a	On exit, if *m*≥*n*, the lower triangle of the distributed submatrix *A*(*ia*+*m*-*n*:*ia*+*m*-1, *ja*:*ja*+*n*-1) contains the *n*-by-*n* lower triangular matrix *L*; if *m*≤*n*, the elements on and below the (*n* - *m*)-th superdiagonal contain the *m*-by-*n* lower trapezoidal matrix *L*; the remaining elements, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors (see *Application Notes* below).

tau	(local)
	`REAL` for `psgeqlf`
	`DOUBLE PRECISION` for `pdgeqlf`
	`COMPLEX` for `pcgeqlf`
	`DOUBLE COMPLEX` for `pzgeqlf`
	Array of size *LOCc*(*ja*+*n*-1).
	Contains the scalar factors of elementary reflectors. *tau* is tied to the distributed matrix *A*.

work(1)	On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	(global) `INTEGER`. `= 0`: the execution is successful. `< 0`: if the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Application Notes

The matrix *Q* is represented as a product of elementary reflectors

Q = *H*(*ja*+*k*-1)*...**H*(*ja*+1)**H*(*ja*)

where *k* = `min`(*m*,*n*)

Each *H*(*i*) has the form

H(i) = *I* - *tau***v***v'*

where *tau* is a real/complex scalar, and *v* is a real/complex vector with *v*(*m*-*k*+*i*+1:*m*) = 0 and *v*(*m*-*k*+*i*) = 1; *v*(1:*m*-*k*+*i*-1) is stored on exit in *A*(*ia*:*ia*+*m*-*k*+*i*-2, *ja*+*n*-*k*+*i*-1), and *tau* in *tau*(*ja*+*n*-*k*+*i*-1).

See Also

Overview for details of ScaLAPACK array descriptor structures and related notations.

p?orgql

Generates the orthogonal matrix Q of the QL factorization formed by `p?geqlf`.

Syntax

```
call psorgql(m, n, k, a, ia, ja, desca, tau, work, lwork, info)
call pdorgql(m, n, k, a, ia, ja, desca, tau, work, lwork, info)
```

Include Files

Description

The p?orgql routine generates the whole or part of *m*-by-*n* real distributed matrix *Q* denoting *A*(*ia*:*ia* +*m*-1,*ja*:*ja*+*n*-1) with orthonormal rows, which is defined as the first *m* rows of a product of *k* elementary reflectors of order *n*

Q = *H*(*k*)*...*H*(2)*H*(1)

as returned by p?geqlf.

Input Parameters

m	(global) INTEGER. The number of rows in the matrix sub(*Q*), (*m*≥0).
n	(global) INTEGER. The number of columns in the matrix sub(*Q*), (*m*≥*n*≥0).
k	(global) INTEGER. The number of elementary reflectors whose product defines the matrix *Q* (*n*≥*k*≥0).
a	(local) REAL for psorgql DOUBLE PRECISION for pdorgql Pointer into the local memory to an array of local size (*lld_a*, *LOCc*(*ja* +*n*-1)). On entry, the *j*-th column must contain the vector that defines the elementary reflector *H*(*j*),*ja*+*n*-*k*≤*j*≤*ja*+*n*-1, as returned by p?geqlf in the *k* columns of its distributed matrix argument *A*(*ia*:*,*ja*+*n*-*k*:*ja*+*n*-1).
ia, *ja*	(global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the submatrix *A*(*ia*:*ia* +*m*-1,*ja*:*ja*+*n*-1), respectively.
desca	(global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.
tau	(local) REAL for psorgql DOUBLE PRECISION for pdorgql Array of size *LOCc*(*ja*+*n*-1). Contains the scalar factors *tau*(*j*) of elementary reflectors *H*(*j*). *tau* is tied to the distributed matrix *A*.
work	(local) REAL for psorgql DOUBLE PRECISION for pdorgql Workspace array of size of *lwork*.
lwork	(local or global) INTEGER, size of *work*, must be at least *lwork*≥*nb_a*(*nqa*0+*mpa*0+*nb_a*), where *iroffa* = mod(*ia*-1, *mb_a*),

```
icoffa = mod(ja-1, nb_a),
iarow = indxg2p(ia, mb_a, MYROW, rsrc_a, NPROW),
iacol = indxg2p(ja, nb_a, MYCOL, csrc_a, NPCOL),
mpa0 = numroc(m+iroffa, mb_a, MYROW, iarow, NPROW),
nqa0 = numroc(n+icoffa, nb_a, MYCOL, iacol, NPCOL)
```

NOTE
`mod(x,y)` is the integer remainder of x/y.

`indxg2p` and `numroc` are ScaLAPACK tool functions; `MYROW`, `MYCOL`, `NPROW` and `NPCOL` can be determined by calling the subroutine `blacs_gridinfo`.

If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a
Contains the local pieces of the *m*-by-*n* distributed matrix *Q* to be factored.

work(1)
On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.

info
(global) INTEGER.

= 0: the execution is successful.

< 0: if the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Overview for details of ScaLAPACK array descriptor structures and related notations.

p?ungql

Generates the unitary matrix Q of the QL factorization formed by p?geqlf.

Syntax

```
call pcungql(m, n, k, a, ia, ja, desca, tau, work, lwork, info)
call pzungql(m, n, k, a, ia, ja, desca, tau, work, lwork, info)
```

Include Files

Description

This routine generates the whole or part of *m*-by-*n* complex distributed matrix *Q* denoting *A*(*ia*:*ia*+*m*-1,*ja*:*ja*+*n*-1) with orthonormal rows, which is defined as the first *n* columns of a product of *k* elementary reflectors of order *m*

$Q = (H(k))^H ... *(H(2))^H*(H(1))^H$ as returned by p?geqlf.

Input Parameters

m (global) INTEGER. The number of rows in the matrix sub(*Q*) (*m*≥0).

n (global) INTEGER. The number of columns in the matrix sub(*Q*) (*m*≥*n*≥0).

k (global) INTEGER. The number of elementary reflectors whose product defines the matrix *Q* (*n*≥*k*≥0).

a (local)

COMPLEX for pcungql

DOUBLE COMPLEX for pzungql

Pointer into the local memory to an array of local size (*lld_a*, *LOCc*(*ja*+*n*-1)). On entry, the *j*-th column must contain the vector that defines the elementary reflector *H*(*j*), *ja*+*n*-*k*≤ *j*≤ *ja*+*n*-1, as returned by p?geqlf in the *k* columns of its distributed matrix argument *A*(*ia*:*, *ja*+*n*-*k*: *ja*+*n*-1).

ia, *ja* (global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the submatrix *A*(*ia*:*ia*+*m*-1,*ja*:*ja*+*n*-1), respectively.

desca (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

tau (local)

COMPLEX for pcungql

DOUBLE COMPLEX for pzungql

Array of size *LOCr*(*ia*+*n*-1).

Contains the scalar factors *tau*(*j*) of elementary reflectors *H*(*j*). *tau* is tied to the distributed matrix *A*.

work (local)

COMPLEX for pcungql

DOUBLE COMPLEX for pzungql

Workspace array of size of *lwork*.

lwork (local or global) INTEGER, size of *work*, must be at least *lwork*≥*nb_a**(*nqa*0 + *mpa*0 + *nb_a*), where

iroffa = mod(*ia*-1, *mb_a*),

icoffa = mod(*ja*-1, *nb_a*),

iarow = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW),

iacol = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL),

*mpa*0 = numroc(*m*+*iroffa*, *mb_a*, MYROW, *iarow*, NPROW),

*nqa*0 = numroc(*n*+*icoffa*, *nb_a*, MYCOL, *iacol*, NPCOL)

indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.

If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a — Contains the local pieces of the *m*-by-*n* distributed matrix *Q* to be factored.

work(1) — On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.

info — (global) INTEGER.

= 0: the execution is successful.

< 0: if the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?ormql

Multiplies a general matrix by the orthogonal matrix Q of the QL factorization formed by p?geqlf.

Syntax

```
call psormql(side, trans, m, n, k, a, ia, ja, desca, tau, c, ic, jc, descc, work, lwork, info)
call pdormql(side, trans, m, n, k, a, ia, ja, desca, tau, c, ic, jc, descc, work, lwork, info)
```

Include Files

Description

The p?ormqlroutine overwrites the general real *m*-by-*n* distributed matrix sub(*C*) = *C*(*ic*:*ic*+*m*-1,*jc*:*jc*+*n*-1) with

	side ='L'	*side* ='R'
trans = 'N':	*Q**sub(*C*)	sub(*C*)**Q*
trans = 'T':	Q^T*sub(*C*)	sub(*C*)*Q^T

where *Q* is a real orthogonal distributed matrix defined as the product of *k* elementary reflectors

Q = *H*(*k*)' ... *H*(2)' *H*(1)'

as returned by p?geqlf. *Q* is of order *m* if *side* = 'L' and of order *n* if *side* = 'R'.

Input Parameters

side — (global) CHARACTER

='L': *Q* or Q^T is applied from the left.

='R': Q or Q^T is applied from the right.

trans (global) CHARACTER

='N', no transpose, Q is applied.

='T', transpose, Q^T is applied.

m (global) INTEGER. The number of rows in the distributed matrix sub(C), ($m \geq 0$).

n (global) INTEGER. The number of columns in the distributed matrix sub(C), ($n \geq 0$).

k (global) INTEGER. The number of elementary reflectors whose product defines the matrix Q. Constraints:

If *side* = 'L', $m \geq k \geq 0$

If *side* = 'R', $n \geq k \geq 0$.

a (local)

REAL for psormql

DOUBLE PRECISION for pdormql.

Pointer into the local memory to an array of size (*lld_a*,*LOCc*(*ja*+*k*-1)). The j-th column must contain the vector that defines the elementary reflector $H(j)$, $ja \leq j \leq ja+k-1$, as returned by p?gelqf in the k columns of its distributed matrix argument $A(ia{:}*, ja{:}ja+k-1)$. $A(ia{:}*, ja{:}ja+k-1)$ is modified by the routine but restored on exit.

If *side* = 'L',*lld_a* ≥ max(1, *LOCr*(*ia*+*m*-1)),

If *side* = 'R', *lld_a* ≥ max(1, *LOCr*(*ia*+*n*-1)).

ia, *ja* (global) INTEGER. The row and column indices in the global matrix A indicating the first row and the first column of the submatrix A, respectively.

desca (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix A.

tau (local)

REAL for psormql

DOUBLE PRECISION for pdormql.

Array of size *LOCc*(*ja*+*n*-1).

Contains the scalar factor *tau*(j) of elementary reflectors $H(j)$ as returned by p?geqlf. *tau* is tied to the distributed matrix A.

c (local)

REAL for psormql

DOUBLE PRECISION for pdormql.

Pointer into the local memory to an array of local size (*lld_c*,*LOCc*(*jc*+*n*-1)).

Contains the local pieces of the distributed matrix sub(C) to be factored.

ic, *jc* (global) INTEGER. The row and column indices in the global matrix *C* indicating the first row and the first column of the submatrix *C*, respectively.

descc (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *C*.

work (local)

REAL for psormql

DOUBLE PRECISION for pdormql.

Workspace array of size of *lwork*.

lwork (local or global) INTEGER, dimension of *work*, must be at least:

If *side* = 'L',

lwork≥max((*nb_a**(*nb_a*-1))/2, (*nqc*0+mpc0)**nb_a* + *nb_a***nb_a*

else if *side* ='R',

lwork≥max((*nb_a**(*nb_a*-1))/2, (*nqc*0+max(*npa*0 + numroc(numroc(*n*+*icoffc*, *nb_a*, 0, 0, NPCOL), *nb_a*, 0, 0, *lcmq*), *mpc*0))**nb_a*) + *nb_a***nb_a*

end if

where

lcmq = *lcm*/NPCOL with *lcm* = ilcm (NPROW, NPCOL),

iroffa = mod(*ia*-1, *mb_a*),

icoffa = mod(*ja*-1, *nb_a*),

iarow = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW),

*npa*0= *numroc*(*n* + *iroffa*, *mb_a*, MYROW, *iarow*, NPROW),

iroffc = mod(*ic*-1, *mb_c*),

icoffc = *mod*(*jc*-1, *nb_c*),

icrow = indxg2p(*ic*, *mb_c*, MYROW, *rsrc_c*, NPROW),

iccol = indxg2p(*jc*, *nb_c*, MYCOL, *csrc_c*, NPCOL),

*mpc*0 = numroc(*m*+*iroffc*, *mb_c*, MYROW, *icrow*, NPROW),

*nqc*0 = numroc(*n*+*icoffc*, *nb_c*, MYCOL, *iccol*, NPCOL),

NOTE
mod(*x*,*y*) is the integer remainder of *x*/*y*.

ilcm, indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.

If *lwork* = –1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

c	Overwritten by the product *Q** sub(*C*), or *Q*'*sub (*C*), or sub(*C*)* *Q*', or sub(*C*)* *Q*
work(1)	On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	(global) INTEGER. = 0: the execution is successful. < 0: if the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?unmql

Multiplies a general matrix by the unitary matrix Q of the QL factorization formed by p?geqlf.

Syntax

```
call pcunmql(side, trans, m, n, k, a, ia, ja, desca, tau, c, ic, jc, descc, work, lwork, info)
```

```
call pzunmql(side, trans, m, n, k, a, ia, ja, desca, tau, c, ic, jc, descc, work, lwork, info)
```

Include Files

Description

This routine overwrites the general complex *m*-by-*n* distributed matrix sub(*C*) = *C*(*ic*:*ic*+*m*-1,*jc*:*jc*+*n*-1) with

	side ='L'	*side* ='R'
trans = 'N':	*Q**sub(*C*)	sub(*C*)**Q*
trans = 'C':	Q^H*sub(*C*)	sub(*C*)*Q^H

where *Q* is a complex unitary distributed matrix defined as the product of *k* elementary reflectors

Q = *H*(*k*)' ... *H*(2)' *H*(1)'

as returned by p?geqlf. *Q* is of order *m* if *side* = 'L' and of order *n* if *side* = 'R'.

Input Parameters

side	(global) CHARACTER ='L': *Q* or Q^H is applied from the left. ='R': *Q* or Q^H is applied from the right.
trans	(global) CHARACTER ='N', no transpose, *Q* is applied.

='C', conjugate transpose, Q^H is applied.

m (global) INTEGER. The number of rows in the distributed matrix sub(*C*) (*m*≥0).

n (global) INTEGER. The number of columns in the distributed matrix sub(*C*) (*n*≥0).

k (global) INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. Constraints:

If *side* = 'L', *m*≥*k*≥0

If *side* = 'R', *n*≥*k*≥0.

a (local)

COMPLEX for pcunmql

DOUBLE COMPLEX for pzunmql.

Pointer into the local memory to an array of size (*lld_a*,*LOCc*(*ja*+*k*-1)). The *j*-th column must contain the vector that defines the elementary reflector *H*(*j*), *ja*≤*j*≤*ja*+*k*-1, as returned by p?geqlf in the *k* columns of its distributed matrix argument *A*(*ia*:*, *ja*:*ja*+*k*-1). *A*(*ia*:*, *ja*:*ja*+*k*-1) is modified by the routine but restored on exit.

If *side* = 'L',*lld_a* ≥ max(1, *LOCr*(*ia*+*m*-1)),

If *side* = 'R', *lld_a* ≥ max(1, *LOCr*(*ia*+*n*-1)).

ia, *ja* (global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the submatrix *A*, respectively.

desca (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

tau (local)

COMPLEX for pcunmql

DOUBLE COMPLEX for pzunmql

Array of size *LOCc*(*ia*+*n*-1).

Contains the scalar factor *tau*(*j*) of elementary reflectors *H*(*j*) as returned by p?geqlf. *tau* is tied to the distributed matrix *A*.

c (local)

COMPLEX for pcunmql

DOUBLE COMPLEX for pzunmql.

Pointer into the local memory to an array of local size (*lld_c*,*LOCc*(*jc*+*n*-1)).

Contains the local pieces of the distributed matrix sub(*C*) to be factored.

ic, *jc* (global) INTEGER. The row and column indices in the global matrix *C* indicating the first row and the first column of the submatrix *C*, respectively.

descc (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *C*.

work (local)

COMPLEX for pcunmql

DOUBLE COMPLEX for pzunmql.

Workspace array of size of *lwork*.

lwork (local or global) INTEGER, size of *work*, must be at least:

If *side* = 'L',

lwork≥max((*nb_a** (*nb_a*-1))/2, (*nqc*0+mpc0)**nb_a* + *nb_a***nb_a*

else if *side* ='R',

p?gerqf

Computes the RQ factorization of a general rectangular matrix.

Syntax

```
call psgerqf(m, n, a, ia, ja, desca, tau, work, lwork, info)
call pdgerqf(m, n, a, ia, ja, desca, tau, work, lwork, info)
call pcgerqf(m, n, a, ia, ja, desca, tau, work, lwork, info)
call pzgerqf(m, n, a, ia, ja, desca, tau, work, lwork, info)
```

Include Files

Description

The p?gerqf routine forms the *QR* factorization of a general *m*-by-*n* distributed matrix sub(*A*)= *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1) as

A= *R***Q*

Input Parameters

m — (global) INTEGER. The number of rows in the distributed matrix sub(*A*); (*m*≥0).

n — (global) INTEGER. The number of columns in the distributed matrix sub(*A*); (*n*≥0).

a — (local)

REAL for psgeqrf

DOUBLE PRECISION for pdgeqrf

COMPLEX for pcgeqrf

DOUBLE COMPLEX for pzgeqrf.

Pointer into the local memory to an array of local size (*lld_a*,*LOCc*(*ja*+*n*-1)).

Contains the local pieces of the distributed matrix sub(*A*) to be factored.

ia, *ja* (global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the submatrix *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1), respectively.

desca (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*

work (local).

REAL for psgeqrf

DOUBLE PRECISION for pdgeqrf.

COMPLEX for pcgeqrf.

DOUBLE COMPLEX for pzgeqrf

Workspace array of size *lwork*.

lwork (local or global) INTEGER, size of *work*, must be at least *lwork*≥*mb_a**(*mp*0+*nq*0+*mb_a*), where

iroff = mod(*ia*-1, *mb_a*),

icoff = mod(*ja*-1, *nb_a*),

iarow = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW),

iacol = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL),

*mp*0 = numroc(*m*+*iroff*, *mb_a*, MYROW, *iarow*, NPROW),

NOTE
mod(*x*,*y*) is the integer remainder of *x*/*y*.

*nq*0 = numroc(*n*+*icoff*, *nb_a*, MYCOL, *iacol*, NPCOL) and numroc, indxg2p are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.

If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a On exit, if *m*≤*n*, the upper triangle of *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1) contains the *m*-by-*m* upper triangular matrix *R*; if *m*≥*n*, the elements on and above the (*m* - *n*)-th subdiagonal contain the *m*-by-*n* upper trapezoidal matrix *R*; the

	remaining elements, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors (see *Application Notes* below).
tau	(local) REAL for psgeqrf DOUBLE PRECISION for pdgeqrf COMPLEX for pcgeqrf DOUBLE COMPLEX for pzgeqrf. Array of size *LOCr*(*ia*+*m*-1). Contains the scalar factor of elementary reflectors. *tau* is tied to the distributed matrix *A*.
work(1)	On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	(global) INTEGER. = 0, the execution is successful. < 0, if the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Application Notes

The matrix *Q* is represented as a product of elementary reflectors

Q = *H*(*ia*)**H*(*ia*+1)*...**H*(*ia*+*k*-1),

where *k* = min(*m*,*n*).

Each *H*(*i*) has the form

H(*i*) = *I* - *tau***v***v'*

where *tau* is a real/complex scalar, and *v* is a real/complex vector with *v*(*n*-*k*+*i*+1:*n*) = 0 and *v*(*n*-*k*+*i*) = 1; *v*(1:*n*-*k*+*i*-1) is stored on exit in *A*(*ia*+*m*-*k*+*i*-1,*ja*:*ja*+*n*-*k*+*i*-2), and *tau* in *tau*(*ia*+*m*-*k*+*i*-1).

p?orgrq

Generates the orthogonal matrix Q of the RQ factorization formed by p?gerqf.

Syntax

```
call psorgrq(m, n, k, a, ia, ja, desca, tau, work, lwork, info)
call pdorgrq(m, n, k, a, ia, ja, desca, tau, work, lwork, info)
```

Include Files

Description

The p?orgrqroutine generates the whole or part of *m*-by-*n* real distributed matrix *Q* denoting *A*(*ia*:*ia* +*m*-1,*ja*:*ja*+*n*-1) with orthonormal rows that is defined as the last *m* rows of a product of *k* elementary reflectors of order *n*

Q= *H*(1)**H*(2)*...**H*(*k*)

as returned by p?gerqf.

Input Parameters

m — (global) INTEGER. The number of rows in the matrix sub(*Q*), (*m*≥0).

n — (global) INTEGER. The number of columns in the matrix sub(*Q*), (*n*≥*m*≥0).

k — (global) INTEGER. The number of elementary reflectors whose product defines the matrix *Q* (*m*≥*k*≥0).

a — (local)

REAL for psorgrq

DOUBLE PRECISION for pdorgrq

Pointer into the local memory to an array of local size (*lld_a*, *LOCc*(*ja* +*n*-1)). The *i*-th row must contain the vector that defines the elementary reflector *H*(*i*), *ia*≤i≤*ia*+*m*-1, as returned by p?gerqf in the *k* rows of its distributed matrix argument *A*(*ia*+*m*-*k*:*ia*+*m*-1, *ja*:*).

ia, *ja* — (global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the submatrix *A*, respectively.

desca — (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

tau — (local)

REAL for psorgrq

DOUBLE PRECISION for pdorgrq

Array of size *LOCc*(*ja*+*k*-1).

Contains the scalar factor *tau*(*i*) of elementary reflectors *H*(*i*) as returned by p?gerqf. *tau* is tied to the distributed matrix *A*.

work — (local)

REAL for psorgrq

DOUBLE PRECISION for pdorgrq

Workspace array of size of *lwork*.

lwork — (local or global) INTEGER, size of *work*, must be at least *lwork*≥*mb_a**(*mpa*0 + *nqa*0 + *mb_a*), where

iroffa = mod(*ia*-1, *mb_a*),

icoffa = mod(*ja*-1, *nb_a*),

iarow = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW),

iacol = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL),

*mpa*0 = numroc(*m*+*iroffa*, *mb_a*, MYROW, *iarow*, NPROW),

*nqa*0 = numroc(*n*+*icoffa*, *nb_a*, MYCOL, *iacol*, NPCOL)

indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.

NOTE
mod(*x*,*y*) is the integer remainder of *x*/*y*.

If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a — Contains the local pieces of the *m*-by-*n* distributed matrix Q.

work(1) — On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.

info — (global) INTEGER.

= 0: the execution is successful.

< 0: if the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?ungrq

Generates the unitary matrix Q of the RQ factorization formed by p?gerqf.

Syntax

```
call pcungrq(m, n, k, a, ia, ja, desca, tau, work, lwork, info)
call pzungrq(m, n, k, a, ia, ja, desca, tau, work, lwork, info)
```

Include Files

Description

This routine generates the *m*-by-*n* complex distributed matrix *Q* denoting *A*(*ia*:*ia*+*m*-1,*ja*:*ja*+*n*-1) with orthonormal rows, which is defined as the last *m* rows of a product of *k* elementary reflectors of order *n*

$Q = (H(1))^H*(H(2))^H*...*(H(k))^H$ as returned by p?gerqf.

Input Parameters

m — (global) INTEGER. The number of rows in the matrix sub(*Q*); (*m*≥0).

n (global) INTEGER. The number of columns in the matrix sub(*Q*) (*n*≥*m*≥0).

k (global) INTEGER. The number of elementary reflectors whose product defines the matrix *Q* (*m*≥*k*≥0).

a (local)

COMPLEX for pcungrq

DOUBLE COMPLEX for pzungrqc

Pointer into the local memory to an array of size (*lld_a*, *LOCc*(*ja*+*n*-1)). The *i*-th row must contain the vector that defines the elementary reflector *H*(*i*), *ia*+*m*-*k*≤*i*≤*ia*+*m*-1, as returned by p?gerqf in the *k* rows of its distributed matrix argument *A*(*ia*+*m*-*k*:*ia*+*m*-1, *ja*:*).

ia, *ja* (global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the submatrix *A*, respectively.

desca (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

tau (local)

COMPLEX for pcungrq

DOUBLE COMPLEX for pzungrq

Array of size *LOCr*(*ia*+*m*-1).

Contains the scalar factor *tau*(*i*) of elementary reflectors *H*(*i*) as returned by p?gerqf. *tau* is tied to the distributed matrix *A*.

work (local)

COMPLEX for pcungrq

DOUBLE COMPLEX for pzungrq

Workspace array of size of *lwork*.

lwork (local or global) INTEGER, size of *work*, must be at least *lwork*≥*mb_a**(*mpa*0 +*nqa*0+*mb_a*), where

iroffa = mod(*ia*-1, *mb_a*),

icoffa = mod(*ja*-1, *nb_a*),

iarow = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW),

iacol = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL),

*mpa*0 = numroc(*m*+*iroffa*, *mb_a*, MYROW, *iarow*, NPROW),

*nqa*0 = numroc(*n*+*icoffa*, *nb_a*, MYCOL, *iacol*, NPCOL)

NOTE
mod(*x*,*y*) is the integer remainder of *x*/*y*.

indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.

If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a — Contains the local pieces of the *m*-by-*n* distributed matrix *Q*.

work(1) — On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.

info — (global) INTEGER.

= 0: the execution is successful.

< 0: if the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?ormr3

Applies an orthogonal distributed matrix to a general m-by-n distributed matrix.

Syntax

```
call psormr3 (side, trans, m, n, k, l, a, ia, ja, desca, tau, c, ic, jc, descc, work, lwork, info )
```

```
call pdormr3 (side, trans, m, n, k, l, a, ia, ja, desca, tau, c, ic, jc, descc, work, lwork, info )
```

Description

p?ormr3 overwrites the general real *m*-by-*n* distributed matrix sub(*C*) = *C*(*ic*:*ic*+*m*-1,*jc*:*jc*+*n*-1) with

	side = 'L'	*side* = 'R'
trans = 'N'	*Q* * sub(*C*)	*sub(C)* * *Q*
trans = 'T'	Q^T * sub(*C*) *Q* * sub(*C*)	sub(*C*) * Q^T

where *Q* is a real orthogonal distributed matrix defined as the product of *k* elementary reflectors

Q = H(1) H(2) . . . H(*k*)

as returned by p?tzrzf. *Q* is of order *m* if *side* = 'L' and of order *n* if *side* = 'R'.

Input Parameters

side — (global)

CHARACTER.

= 'L': apply *Q* or Q^T from the Left;

= 'R': apply Q or Q^T from the Right.

trans (global)

CHARACTER.

= 'N': No transpose, apply Q;

= 'T': Transpose, apply Q^T.

m (global)

INTEGER.

The number of rows to be operated on i.e the number of rows of the distributed submatrix sub(*C*). *m* >= 0.

n (global)

INTEGER.

The number of columns to be operated on i.e the number of columns of the distributed submatrix sub(*C*). *n* >= 0.

k (global)

INTEGER.

The number of elementary reflectors whose product defines the matrix Q.

If *side* = 'L', *m* >= *k* >= 0,

if *side* = 'R', *n* >= *k* >= 0.

l (global)

INTEGER.

The columns of the distributed submatrix sub(*A*) containing the meaningful part of the Householder reflectors.

If *side* = 'L', *m* >= *l* >= 0,

if *side* = 'R', *n* >= *l* >= 0.

a (local)

`REAL` for `psormr3`

`DOUBLE PRECISION` for `pdormr3`

Pointer into the local memory to an array of size `(lld_a,LOCc(ja+m-1))` if *side*='L', and `(lld_a,LOCc(ja+n-1))` if *side*='R', where *lld_a* >= MAX(1,LOCr(*ia*+*k*-1));

On entry, the *i*-th row must contain the vector which defines the elementary reflector H(*i*), *ia* <= *i* <= *ia*+*k*-1, as returned by `p?tzrzf` in the *k* rows of its distributed matrix argument *A*(*ia*:*ia*+*k*-1,*ja*:*).

A(*ia*:*ia*+*k*-1,*ja*:*) is modified by the routine but restored on exit.

ia (global)

INTEGER.

The row index in the global array *a* indicating the first row of sub(*A*).

ja (global)

INTEGER.

The column index in the global array *a* indicating the first column of sub(*A*).

desca (global and local)

INTEGER.

Array of size *dlen_*.

The array descriptor for the distributed matrix *A*.

tau (local)

REAL for psormr3

DOUBLE PRECISION for pdormr3

Array, size LOCc(*ia*+*k*-1).

This array contains the scalar factors *tau*(i) of the elementary reflectors H(i) as returned by p?tzrzf. *tau* is tied to the distributed matrix *A*.

c (local)

REAL for psormr3

DOUBLE PRECISION for pdormr3

Pointer into the local memory to an array of size (*lld_c*,*LOCc*(*jc*+*n*-1)) .

On entry, the local pieces of the distributed matrix sub(*C*).

ic (global)

INTEGER.

The row index in the global array *c* indicating the first row of sub(*C*).

jc (global)

INTEGER.

The column index in the global array *c* indicating the first column of sub(*C*).

descc (global and local)

INTEGER.

Array of size *dlen_*.

The array descriptor for the distributed matrix *C*.

work (local)

REAL for psormr3

DOUBLE PRECISION for pdormr3

Array, size (*lwork*)

lwork (local)

INTEGER.

The size of the array *work*.

lwork is local input and must be at least

If *side* = 'L', *lwork* >= *MpC0* + MAX(MAX(1, *NqC0*), numroc(numroc(*m* +*IROFFC*,*mb_a*,0,0,*NPROW*),*mb_a*,0,0,*NqC0*));

if *side* = 'R', *lwork* >= *NqC0* + MAX(1, *MpC0*);

where *LCMP* = *LCM* / *NPROW*

LCM = iclm(*NPROW*, *NPCOL*),

IROFFC = MOD(*ic*-1, *mb_c*),

ICOFFC = MOD(*jc*-1, *nb_c*),

ICROW = indxg2p(*ic*, *mb_c*, *MYROW*, *rsrc_c*, *NPROW*),

ICCOL = indxg2p(*jc*, *nb_c*, *MYCOL*, *csrc_c*, *NPCOL*),

MpC0 = numroc(*m*+*IROFFC*, *mb_c*, *MYROW*, *ICROW*, *NPROW*),

NqC0 = numroc(*n*+*ICOFFC*, *nb_c*, *MYCOL*, *ICCOL*, *NPCOL*),

ilcm, indxg2p, and numroc are ScaLAPACK tool functions;

MYROW, *MYCOL*, *NPROW* and *NPCOL* can be determined by calling the subroutine blacs_gridinfo.

If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

c

On exit, sub(*C*) is overwritten by *Q**sub(*C*) or *Q*'*sub(*C*) or sub(*C*)**Q*' or sub(*C*)**Q*.

work

On exit, *work*(1) returns the minimal and optimal *lwork*.

info

(local)

INTEGER.

= 0: successful exit

< 0: If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Application Notes

Alignment requirements

The distributed submatrices *A*(*ia*:*, *ja*:*) and *C*(*ic*:*ic*+*m*-1,*jc*:*jc*+*n*-1) must verify some alignment properties, namely the following expressions should be true:

If *side* = 'L',

(*nb_a* = *mb_c* .AND. ICOFFA = *IROFFC*)

If *side* = 'R',

(*nb_a* = *nb_c* .AND. ICOFFA = *ICOFFC* .AND. IACOL = *ICCOL*)

p?unmr3

Applies an orthogonal distributed matrix to a general m-by-n distributed matrix.

Syntax

```
call pcunmr3 (side, trans, m, n, k, l, a, ia, ja, desca, tau, c, ic, jc, descc, work, lwork, info )
```

```
call pzunmr3 (side, trans, m, n, k, l, a, ia, ja, desca, tau, c, ic, jc, descc, work, lwork, info )
```

Description

p?unmr3 overwrites the general complex *m*-by-*n* distributed matrix sub(*C*) = *C*(*ic*:*ic*+*m*-1,*jc*:*jc*+*n*-1) with

	side = 'L'	*side* = 'R'
trans = 'N':	*Q* * sub(*C*)	sub(*C*) * *Q*
trans = 'C':	Q^H * sub(*C*)	sub(*C*) * Q^H

where *Q* is a complex unitary distributed matrix defined as the product of *k* elementary reflectors

Q = H(1)' H(2)' . . . H(*k*)'

as returned by p?tzrzf. *Q* is of order *m* if *side* = 'L' and of order *n* if *side* = 'R'.

Input Parameters

side (global)

CHARACTER.

= 'L': apply *Q* or Q^H from the Left;

= 'R': apply *Q* or Q^H from the Right.

trans (global)

CHARACTER.

= 'N': No transpose, apply *Q*;

= 'C': Conjugate transpose, apply Q^H.

m (global)

INTEGER.

The number of rows to be operated on i.e the number of rows of the distributed submatrix sub(*C*). *m* >= 0.

n (global)

INTEGER.

The number of columns to be operated on i.e the number of columns of the distributed submatrix sub(*C*). *n* >= 0.

k (global)

INTEGER.

The number of elementary reflectors whose product defines the matrix *Q*.

If *side* = 'L', *m* >= *k* >= 0, if *side* = 'R', *n* >= *k* >= 0.

l (global)

INTEGER.

The columns of the distributed submatrix *sub(A)* containing the meaningful part of the Householder reflectors.

If *side* = 'L', *m* >= *l* >= 0, if *side* = 'R', *n* >= *l* >= 0.

a (local)

COMPLEX for pcunmr3

DOUBLE COMPLEX for pzunmr3

Pointer into the local memory to an array of size (*lld_a*,*LOCc*(*ja*+*m*-1)) if *side*='L', and (*lld_a*,*LOCc*(*ja*+*n*-1)) if *side*='R', where *lld_a* >= MAX(1,LOCr(*ia*+*k*-1));

On entry, the i-th row must contain the vector which defines the elementary reflector H(i), *ia* <= i <= *ia*+*k*-1, as returned by p?tzrzf in the *k* rows of its distributed matrix argument *A*(*ia*:*ia*+*k*-1,*ja*:*).

A(*ia*:*ia*+*k*-1,*ja*:*) is modified by the routine but restored on exit.

ia (global)

INTEGER.

The row index in the global array *a* indicating the first row of *sub(A)*.

ja (global)

INTEGER.

The column index in the global array *a* indicating the first column of *sub(A)*.

desca (global and local)

INTEGER.

Array of size *dlen_*.

The array descriptor for the distributed matrix *A*.

tau (local)

COMPLEX for pcunmr3

DOUBLE COMPLEX for pzunmr3

Array, size LOCc(*ia*+*k*-1).

This array contains the scalar factors *tau*(i) of the elementary reflectors H(i) as returned by p?tzrzf. *tau* is tied to the distributed matrix *A*.

c (local)

COMPLEX for pcunmr3

DOUBLE COMPLEX for pzunmr3

Pointer into the local memory to an array of size (*lld_c*,*LOCc*(*jc*+*n*-1)) .

On entry, the local pieces of the distributed matrix sub(*C*).

ic (global)

INTEGER.

The row index in the global array *c* indicating the first row of sub(*C*).

jc (global)

INTEGER.

The column index in the global array *c* indicating the first column of sub(*C*).

descc (global and local)

INTEGER.

Array of size *dlen_*.

The array descriptor for the distributed matrix *C*.

work (local)

COMPLEX for pcunmr3

DOUBLE COMPLEX for pzunmr3

Array, size (*lwork*)

On exit, *work*(1) returns the minimal and optimal *lwork*.

lwork (local or global)

INTEGER.

The size of the array *work*.

lwork is local input and must be at least

If *side* = 'L', *lwork* >= MpC0 + MAX(MAX(1, NqC0), numroc(numroc(*m* +IROFFC,*mb_a*,0,0,NPROW),*mb_a*,0,0,LCMP));

if *side* = 'R', *lwork* >= NqC0 + MAX(1, MpC0);

where LCMP = LCM / NPROW with LCM = ICLM(NPROW, NPCOL),

IROFFC = MOD(*ic*-1, MB_C), ICOFFC = MOD(*jc*-1, *nb_c*),

ICROW = indxg2p(*ic*, MB_C, MYROW, *rsrc_c*, NPROW),

ICCOL = indxg2p(*jc*, *nb_c*, MYCOL, *csrc_c*, NPCOL),

MpC0 = numroc(*m*+IROFFC, MB_C, MYROW, ICROW, NPROW),

NqC0 = numroc(*n*+ICOFFC, *nb_c*, MYCOL, ICCOL, NPCOL),

ilcm, indxg2p, and numroc are ScaLAPACK tool functions;

MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.

If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

c	On exit, sub(*C*) is overwritten by *Q**sub(*C*) or *Q*'*sub(*C*) or sub(*C*)**Q*' or sub(*C*)**Q*.
work	(local) COMPLEX for pcunmr3 DOUBLE COMPLEX for pzunmr3 Array, size (*lwork*) On exit, *work*(1) returns the minimal and optimal *lwork*.
info	(local) INTEGER. = 0: successful exit < 0: If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Application Notes

Alignment requirements

The distributed submatrices *A*(*ia*:*, *ja*:*) and *C*(*ic*:*ic*+*m*-1,*jc*:*jc*+*n*-1) must verify some alignment properties, namely the following expressions should be true:

If *side* = 'L', (*nb_a* = MB_C and ICOFFA = IROFFC)

If *side* = 'R', (*nb_a* = *nb_c* and ICOFFA = ICOFFC and IACOL = ICCOL)

p?ormrq

Multiplies a general matrix by the orthogonal matrix Q of the RQ factorization formed by p?gerqf.

Syntax

call psormrq(*side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

call pdormrq(*side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

Include Files

Description

The p?ormrqroutine overwrites the general real *m*-by-*n* distributed matrix sub (*C*) = *C*(*ic*:*ic*+*m*-1,*jc*:*jc*+*n*-1) with

	side ='L'	*side* ='R'
trans = 'N':	*Q**sub(*C*)	sub(*C*)**Q*
trans = 'T':	Q^T*sub(*C*)	sub(*C*)*Q^T

where *Q* is a real orthogonal distributed matrix defined as the product of *k* elementary reflectors

Q = *H*(1) *H*(2)... *H*(*k*)

as returned by p?gerqf. *Q* is of order *m* if *side* = 'L' and of order *n* if *side* = 'R'.

Input Parameters

side (global) CHARACTER

='L': *Q* or Q^T is applied from the left.

='R': *Q* or Q^T is applied from the right.

trans (global) CHARACTER

='N', no transpose, *Q* is applied.

='T', transpose, Q^T is applied.

m (global) INTEGER. The number of rows in the distributed matrix sub(*C*) (*m*≥0).

n (global) INTEGER. The number of columns in the distributed matrix sub(*C*) (*n*≥0).

k (global) INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. Constraints:

If *side* = 'L', *m*≥*k*≥0

If *side* = 'R', *n*≥*k*≥0.

a (local)

REAL for psormqr

DOUBLE PRECISION for pdormqr.

Pointer into the local memory to an array of size (*lld_a*,*LOCc*(*ja*+*m*-1)) if *side* = 'L', and (*lld_a*,*LOCc*(*ja*+*n*-1)) if *side* = 'R'.

The *i*-th row must contain the vector that defines the elementary reflector *H*(*i*), *ia*≤*i*≤*ia*+*k*-1, as returned by p?gerqf in the *k* rows of its distributed matrix argument *A*(*ia*:*ia*+*k*-1, *ja*:*). *A*(*ia*:*ia*+*k*-1, *ja*:*) is modified by the routine but restored on exit.

ia, *ja* (global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the submatrix *A*, respectively.

desca (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

tau (local)

REAL for psormqr

DOUBLE PRECISION for pdormqr

Array of size *LOCc*(*ja*+*k*-1).

Contains the scalar factor *tau*(*i*) of elementary reflectors *H*(*i*) as returned by p?gerqf. *tau* is tied to the distributed matrix *A*.

c (local)

REAL for psormrq

DOUBLE PRECISION for pdormrq

Pointer into the local memory to an array of local size (*lld_c*,*LOCc*(*jc*+*n*-1)).

Contains the local pieces of the distributed matrix sub(*C*) to be factored.

ic, *jc*

(global) INTEGER. The row and column indices in the global matrix *C* indicating the first row and the first column of the matrix sub(*C*), respectively.

descc

(global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *C*.

work

(local)

REAL for psormrq

DOUBLE PRECISION for pdormrq.

Workspace array of size of *lwork*.

lwork

(local or global) INTEGER, size of *work*, must be at least:

If *side* = 'L',

lwork≥max((*mb_a**(*mb_a*-1))/2, (*mpc*0 + max(*mqa*0 + numroc(numroc(*n*+*iroffc*, *mb_a*, 0, 0, NPROW), *mb_a*, 0, 0, *lcmp*), *nqc*0))**mb_a*) + *mb_a***mb_a*

else if *side* ='R',

lwork≥max((*mb_a**(*mb_a*-1))/2, (*mpc*0 + *nqc*0)**mb_a*) + *mb_a***mb_a*

end if

where

lcmp = *lcm*/NPROW with *lcm* = ilcm (NPROW, NPCOL),

iroffa = mod(*ia*-1, *mb_a*),

icoffa = mod(*ja*-1, *nb_a*),

iacol = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL),

*mqa*0 = numroc(*n*+*icoffa*, *nb_a*, MYCOL, *iacol*, NPCOL),

iroffc = mod(*ic*-1, *mb_c*),

icoffc = *mod*(*jc*-1, *nb_c*),

icrow = indxg2p(*ic*, *mb_c*, MYROW, *rsrc_c*, NPROW),

iccol = indxg2p(*jc*, *nb_c*, MYCOL, *csrc_c*, NPCOL),

*mpc*0 = numroc(*m*+*iroffc*, *mb_c*, MYROW, *icrow*, NPROW),

*nqc*0 = numroc(*n*+*icoffc*, *nb_c*, MYCOL, *iccol*, NPCOL),

NOTE
mod(*x*,*y*) is the integer remainder of *x*/*y*.

ilcm, indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.

If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

c — Overwritten by the product *Q** sub(*C*), or *Q*'*sub (*C*), or sub(*C*)* *Q*', or sub(*C*)* *Q*

work(1) — On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.

info — (global) INTEGER.

= 0: the execution is successful.

< 0: if the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?unmrq

Multiplies a general matrix by the unitary matrix Q of the RQ factorization formed by p?gerqf.

Syntax

```
call pcunmrq(side, trans, m, n, k, a, ia, ja, desca, tau, c, ic, jc, descc, work, lwork, info)
```

```
call pzunmrq(side, trans, m, n, k, a, ia, ja, desca, tau, c, ic, jc, descc, work, lwork, info)
```

Include Files

Description

This routine overwrites the general complex *m*-by-*n* distributed matrix sub (*C*) = *C*(*ic*:*ic*+*m*-1,*jc*:*jc*+*n*-1) with

	side ='L'	*side* ='R'
trans = 'N':	*Q**sub(*C*)	sub(*C*)**Q*
trans = 'C':	Q^H*sub(*C*)	sub(*C*)*Q^H

where *Q* is a complex unitary distributed matrix defined as the product of *k* elementary reflectors

Q = *H*(1)' *H*(2)'... *H*(*k*)'

as returned by p?gerqf. *Q* is of order *m* if *side* = 'L' and of order *n* if *side* = 'R'.

Input Parameters

side — (global) CHARACTER

='L': *Q* or Q^H is applied from the left.

='R': Q or Q^H is applied from the right.

trans (global) CHARACTER

='N', no transpose, Q is applied.

='C', conjugate transpose, Q^H is applied.

m (global) INTEGER. The number of rows in the distributed matrix sub(C) , ($m \geq 0$).

n (global) INTEGER. The number of columns in the distributed matrix sub(C), ($n \geq 0$).

k (global) INTEGER. The number of elementary reflectors whose product defines the matrix Q. Constraints:

If *side* = 'L', $m \geq k \geq 0$

If *side* = 'R', $n \geq k \geq 0$.

a (local)

COMPLEX for pcunmrq

DOUBLE COMPLEX for pzunmrq.

Pointer into the local memory to an array of size (*lld_a*, *LOCc*(*ja*+*m*-1)) if *side* = 'L', and (*lld_a*, *LOCc*(*ja*+*n*-1)) if *side* = 'R'. The i-th row must contain the vector that defines the elementary reflector $H(i)$, $ia \leq i \leq ia+k-1$, as returned by p?gerqf in the k rows of its distributed matrix argument $A(ia:ia+k-1, ja:*)$. $A(ia:ia+k-1, ja:*)$ is modified by the routine but restored on exit.

ia, *ja* (global) INTEGER. The row and column indices in the global matrix A indicating the first row and the first column of the submatrix A, respectively.

desca (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix A.

tau (local)

COMPLEX for pcunmrq

DOUBLE COMPLEX for pzunmrq

Array of size *LOCc*(*ja*+*k*-1).

Contains the scalar factor *tau*(i) of elementary reflectors $H(i)$ as returned by p?gerqf. *tau* is tied to the distributed matrix A.

c (local)

COMPLEX for pcunmrq

DOUBLE COMPLEX for pzunmrq.

Pointer into the local memory to an array of local size (*lld_c*, *LOCc*(*jc*+*n*-1)).

Contains the local pieces of the distributed matrix sub(C) to be factored.

ic, *jc*

(global) INTEGER. The row and column indices in the global matrix *C* indicating the first row and the first column of the submatrix *C*, respectively.

descc

(global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *C*.

work

(local)

COMPLEX for pcunmrq

DOUBLE COMPLEX for pzunmrq.

Workspace array of size of *lwork*.

lwork

(local or global) INTEGER, size of *work*, must be at least:

If *side* = 'L',

lwork≥max((*mb_a**(*mb_a*-1))/2, (*mpc*0 + max(*mqa*0+numroc(numroc(*n*+*iroffc*, *mb_a*, 0, 0, NPROW), *mb_a*, 0, 0, *lcmp*), *nqc*0))**mb_a*) + *mb_a***mb_a*

else if *side* = 'R',

lwork≥max((*mb_a**(*mb_a*-1))/2, (*mpc*0 + *nqc*0)**mb_a*) + *mb_a***mb_a*

end if

where

lcmp = *lcm*/NPROW with *lcm* = ilcm(NPROW, NPCOL),

iroffa = mod(*ia*-1, *mb_a*),

icoffa = mod(*ja*-1, *nb_a*),

iacol = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL),

*mqa*0 = numroc(*m*+*icoffa*, *nb_a*, MYCOL, *iacol*, NPCOL),

iroffc = mod(*ic*-1, *mb_c*),

icoffc = *mod*(*jc*-1, *nb_c*),

Description

The p?tzrzfroutine reduces the *m*-by-*n* (*m* ≤ *n*) real/complex upper trapezoidal matrix sub(*A*)= *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1) to upper triangular form by means of orthogonal/unitary transformations. The upper trapezoidal matrix *A* is factored as

A = (*R* 0)**Z*,

where *Z* is an *n*-by-*n* orthogonal/unitary matrix and *R* is an *m*-by-*m* upper triangular matrix.

Input Parameters

m	(global) INTEGER. The number of rows in the matrix sub(*A*); (*m*≥0).
n	(global) INTEGER. The number of columns in the matrix sub(*A*) (*n*≥0).
a	(local) REAL for pstzrzf DOUBLE PRECISION for pdtzrzf. COMPLEX for pctzrzf. DOUBLE COMPLEX for pztzrzf.

Pointer into the local memory to an array of size (*lld_a*,*LOCc*(*ja*+*n*-1)). Contains the local pieces of the *m*-by-*n* distributed matrix sub (*A*) to be factored.

ia, *ja*

(global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the submatrix *A*, respectively.

desca

(global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

work

(local)

REAL for pstzrzf

DOUBLE PRECISION for pdtzrzf.

COMPLEX for pctzrzf.

DOUBLE COMPLEX for pztzrzf.

Workspace array of size of *lwork*.

lwork

(local or global) INTEGER, size of *work*, must be at least *lwork*≥*mb_a**(*mp*0+*nq*0+*mb_a*), where

iroff = mod(*ia*-1, *mb_a*),

icoff = mod(*ja*-1, *nb_a*),

iarow = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW),

iacol = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL),

*mp*0 = numroc (*m*+*iroff*, *mb_a*, MYROW, *iarow*, NPROW),

*nq*0 = numroc (*n*+*icoff*, *nb_a*, MYCOL, *iacol*, NPCOL)

NOTE
mod(*x*,*y*) is the integer remainder of *x*/*y*.

indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.

If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a

On exit, the leading *m*-by-*m* upper triangular part of sub(*A*) contains the upper triangular matrix *R*, and elements *m*+1 to *n* of the first *m* rows of sub (*A*), with the array *tau*, represent the orthogonal/unitary matrix *Z* as a product of *m* elementary reflectors.

work(1)

On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.

tau

(local)

REAL for pstzrzf

DOUBLE PRECISION for pdtzrzf.

COMPLEX for pctzrzf.

DOUBLE COMPLEX for pztzrzf.

Array of size *LOCr*(*ia*+*m*-1).

Contains the scalar factor of elementary reflectors. *tau* is tied to the distributed matrix *A*.

info (global) INTEGER.

= 0: the execution is successful.

< 0:if the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Application Notes

The factorization is obtained by the Householder's method. The *k*-th transformation matrix, *Z*(*k*), which is or whose conjugate transpose is used to introduce zeros into the (*m* - *k* +1)-th row of sub(*A*), is given in the form

$$Z(k) = \begin{bmatrix} I & 0 \\ 0 & T(k) \end{bmatrix}$$

where

T(*k*) = *i* - *tau***u*(*k*)**u*(*k*)',

$$u(k) = \begin{bmatrix} 1 \\ 0 \\ z(k) \end{bmatrix}$$

tau is a scalar and *Z*(*k*) is an (*n* - *m*) element vector. *tau* and *Z*(*k*) are chosen to annihilate the elements of the *k*-th row of sub(*A*). The scalar *tau* is returned in the *k*-th element of *tau* and the vector *u*(*k*) in the *k*-th row of sub(*A*), such that the elements of *Z*(*k*) are in *a*(*k*, *m* + 1),..., *a*(*k*, *n*). The elements of *R* are returned in the upper triangular part of sub(*A*). *Z* is given by

Z = *Z*(1) * *Z*(2) *... * *Z*(*m*).

p?ormrz

Multiplies a general matrix by the orthogonal matrix from a reduction to upper triangular form formed by p?tzrzf*.*

Syntax

```
call psormrz(side, trans, m, n, k, l, a, ia, ja, desca, tau, c, ic, jc, descc, work, lwork, info)
```

```
call pdormrz(side, trans, m, n, k, l, a, ia, ja, desca, tau, c, ic, jc, descc, work,
lwork, info)
```

Include Files

Description

This routine overwrites the general real *m*-by-*n* distributed matrix sub(*C*) = *C*(*ic*:*ic*+*m*-1,*jc*:*jc*+*n*-1) with

	side ='L'	*side* ='R'
trans = 'N':	*Q**sub(*C*)	sub(*C*)**Q*
trans = 'T':	Q^T*sub(*C*)	sub(*C*)*Q^T

where *Q* is a real orthogonal distributed matrix defined as the product of *k* elementary reflectors

Q = *H*(1) *H*(2)... *H*(*k*)

as returned by p?tzrzf. *Q* is of order *m* if *side* = 'L' and of order *n* if *side* = 'R'.

Input Parameters

side (global) CHARACTER

='L': *Q* or Q^T is applied from the left.

='R': *Q* or Q^T is applied from the right.

trans (global) CHARACTER

='N', no transpose, *Q* is applied.

='T', transpose, Q^T is applied.

m (global) INTEGER. The number of rows in the distributed matrix sub(*C*) (*m*≥0).

n (global) INTEGER. The number of columns in the distributed matrix sub(*C*) (*n*≥0).

k (global) INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. Constraints:

If *side* = 'L', *m* ≥ *k* ≥0

If *side* = 'R', *n* ≥ *k* ≥0.

l (global)

The columns of the distributed matrix sub(*A*) containing the meaningful part of the Householder reflectors.

If *side* = 'L', *m* ≥ *l* ≥0

If *side* = 'R', *n* ≥ *l* ≥0.

a (local)

REAL for psormrz

DOUBLE PRECISION for pdormrz.

Pointer into the local memory to an array of size (*lld_a*,*LOCc*(*ja*+*m*-1)) if *side* = 'L', and (*lld_a*,*LOCc*(*ja*+*n*-1)) if *side* = 'R', where *lld_a* ≥ max(1,*LOCr*(*ia*+*k*-1)).

The *i*-th row must contain the vector that defines the elementary reflector *H*(*i*), *ia*≤*i*≤*ia*+*k*-1, as returned by p?tzrzf in the *k* rows of its distributed matrix argument *A*(*ia*:*ia*+*k*-1, *ja*:*). *A*(*ia*:*ia*+*k*-1, *ja*:*) is modified by the routine but restored on exit.

ia, *ja*

(global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the submatrix *A*, respectively.

desca

(global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

tau

(local)

REAL for psormrz

DOUBLE PRECISION for pdormrz

Array of size *LOCc*(*ia*+*k*-1).

Contains the scalar factor *tau*(*i*) of elementary reflectors *H*(*i*) as returned by p?tzrzf. *tau* is tied to the distributed matrix *A*.

c

(local)

REAL for psormrz

DOUBLE PRECISION for pdormrz

Pointer into the local memory to an array of local size (*lld_c*,*LOCc*(*jc* +*n*-1)).

Contains the local pieces of the distributed matrix sub(*C*) to be factored.

ic, *jc*

(global) INTEGER. The row and column indices in the global matrix *C* indicating the first row and the first column of the submatrix *C*, respectively.

descc

(global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *C*.

work

(local)

REAL for psormrz

DOUBLE PRECISION for pdormrz.

Workspace array of size of *lwork*.

lwork

(local or global) INTEGER, size of *work*, must be at least:

If *side* = 'L',

lwork≥max((*mb_a**(*mb_a*-1))/2, (*mpc*0 + max(*mqa*0 + numroc(numroc(*n*+*iroffc*, *mb_a*, 0, 0, NPROW), *mb_a*, 0, 0, *lcmp*), *nqc*0))*mb_a) + *mb_a**mb_a

else if *side* ='R',

lwork≥max((*mb_a**(*mb_a*-1))/2, (*mpc*0 + *nqc*0)*mb_a) + *mb_a**mb_a

end if

where

lcmp = *lcm*/NPROW with *lcm* = ilcm (NPROW, NPCOL),

iroffa = mod(*ia*-1, *mb_a*), *icoffa* = mod(*ja*-1, *nb_a*),

iacol = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL),

*mqa*0 = numroc(*n*+*icoffa*, *nb_a*, MYCOL, *iacol*, NPCOL),

iroffc = mod(*ic*-1, *mb_c*),

icoffc = *mod*(*jc*-1, *nb_c*),

icrow = indxg2p(*ic*, *mb_c*, MYROW, *rsrc_c*, NPROW),

iccol = indxg2p(*jc*, *nb_c*, MYCOL, *csrc_c*, NPCOL),

*mpc*0 = numroc(*m*+*iroffc*, *mb_c*, MYROW, *icrow*, NPROW),

*nqc*0 = numroc(*n*+*icoffc*, *nb_c*, MYCOL, *iccol*, NPCOL),

NOTE
mod(*x*,*y*) is the integer remainder of *x*/*y*.

ilcm, indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.

If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

c — Overwritten by the product *Q**sub(*C*), or *Q*'*sub (*C*), or sub(*C*)**Q*', or sub(*C*)**Q*

work(1) — On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.

info — (global) INTEGER.

= 0: the execution is successful.

< 0: if the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?unmrz

Multiplies a general matrix by the unitary transformation matrix from a reduction to upper triangular form determined by p?tzrzf.

Syntax

call pcunmrz(*side*, *trans*, *m*, *n*, *k*, *l*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

call pzunmrz(*side*, *trans*, *m*, *n*, *k*, *l*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

Include Files

Description

This routine overwrites the general complex *m*-by-*n* distributed matrix sub (*C*) = *C*(*ic*:*ic*+*m*-1,*jc*:*jc*+*n*-1) with

	side ='L'	*side* ='R'
trans = 'N':	*Q**sub(*C*)	sub(*C*)**Q*
trans = 'C':	Q^H*sub(*C*)	sub(*C*)*Q^H

where *Q* is a complex unitary distributed matrix defined as the product of *k* elementary reflectors

Q = *H*(1)' *H*(2)'... *H*(*k*)'

as returned by pctzrzf/pztzrzf. *Q* is of order *m* if *side* = 'L' and of order *n* if *side* = 'R'.

Input Parameters

side (global) CHARACTER

='L': *Q* or Q^H is applied from the left.

='R': *Q* or Q^H is applied from the right.

trans (global) CHARACTER

='N', no transpose, *Q* is applied.

='C', conjugate transpose, Q^H is applied.

m (global) INTEGER. The number of rows in the distributed matrix sub(*C*), (*m*≥0).

n (global) INTEGER. The number of columns in the distributed matrix sub(*C*), (*n*≥0).

k (global) INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. Constraints:

If *side* = 'L', *m*≥*k*≥0

If *side* = 'R', *n*≥*k*≥0.

l (global) INTEGER. The columns of the distributed matrix sub(*A*) containing the meaningful part of the Householder reflectors.

If *side* = 'L', *m*≥*l*≥0

If *side* = 'R', *n*≥*l*≥0.

a (local)

COMPLEX for pcunmrz

DOUBLE COMPLEX for pzunmrz.

Pointer into the local memory to an array of size (*lld_a*,*LOCc*(*ja*+*m*-1)) if *side* = 'L', and (*lld_a*,*LOCc*(*ja*+*n*-1)) if *side* = 'R', where *lld_a* ≥ max(1, *LOCr*(*ja*+*k*-1)). The *i*-th row must contain the vector that defines the elementary reflector *H*(*i*), *ia*≤*i*≤*ia*+*k*-1, as returned by p?gerqf in the *k* rows of its distributed matrix argument *A*(*ia*:*ia*+*k*-1, *ja*:*). *A*(*ia*:*ia*+*k*-1, *ja*:*) is modified by the routine but restored on exit.

ia, *ja*

(global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the submatrix *A*, respectively.

desca

(global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

tau

(local)

COMPLEX for pcunmrz

DOUBLE COMPLEX for pzunmrz

Array of size *LOCc*(*ia*+*k*-1).

Contains the scalar factor *tau*(*i*) of elementary reflectors *H*(*i*) as returned by p?gerqf. *tau* is tied to the distributed matrix *A*.

c

(local)

COMPLEX for pcunmrz

DOUBLE COMPLEX for pzunmrz.

Pointer into the local memory to an array of local size (*lld_c*,*LOCc*(*jc*+*n*-1)).

Contains the local pieces of the distributed matrix sub(*C*) to be factored.

ic, *jc*

(global) INTEGER. The row and column indices in the global matrix *C* indicating the first row and the first column of the submatrix *C*, respectively.

descc

(global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *C*.

work

(local)

COMPLEX for pcunmrz

DOUBLE COMPLEX for pzunmrz.

Workspace array of size *lwork*.

lwork

(local or global) INTEGER, size of *work*, must be at least:

If *side* = 'L',

lwork≥max((*mb_a**(*mb_a*-1))/2, (*mpc*0+max(*mqa*0+numroc(numroc(*n*+*iroffc*, *mb_a*, 0, 0, NPROW), *mb_a*, 0, 0, *lcmp*), *nqc*0))**mb_a*) + *mb_a***mb_a*

else if *side* ='R',

lwork≥max((*mb_a**(*mb_a*-1))/2, (*mpc*0+*nqc*0)**mb_a*) + *mb_a***mb_a*

end if

where

lcmp = *lcm*/NPROW with *lcm* = ilcm(NPROW, NPCOL),

Overview for details of ScaLAPACK array descriptor structures and related notations.

p?ggqrf

Computes the generalized QR factorization.

Syntax

call psggqrf(*n*, *m*, *p*, *a*, *ia*, *ja*, *desca*, *taua*, *b*, *ib*, *jb*, *descb*, *taub*, *work*, *lwork*, *info*)

```
call pdggqrf(n, m, p, a, ia, ja, desca, taua, b, ib, jb, descb, taub, work, lwork, info)
call pcggqrf(n, m, p, a, ia, ja, desca, taua, b, ib, jb, descb, taub, work, lwork, info)
call pzggqrf(n, m, p, a, ia, ja, desca, taua, b, ib, jb, descb, taub, work, lwork, info)
```

Include Files

Description

The p?ggqrfroutine forms the generalized *QR* factorization of an *n*-by-*m* matrix

sub(*A*) = *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*m*-1)

and an *n*-by-*p* matrix

sub(*B*) = *B*(*ib*:*ib*+*n*-1, *jb*:*jb*+*p*-1):

as

sub(A) = *Q***R*, sub(*B*) = *Q***T***Z*,

where *Q* is an *n*-by-*n* orthogonal/unitary matrix, *Z* is a *p*-by-*p* orthogonal/unitary matrix, and *R* and *T* assume one of the forms:

If $n \geq m$

$$R = \begin{pmatrix} R_{11} \\ 0 \end{pmatrix} \begin{matrix} m \\ n-m \end{matrix}$$
$$m$$

or if $n < m$

$$R = \begin{pmatrix} R_{11} & R_{12} \end{pmatrix} \begin{matrix} n \\ \end{matrix}$$
$$n \quad m-n$$

where R_{11} is upper triangular, and

$$T = \begin{pmatrix} 0 & T_{12} \end{pmatrix} \begin{matrix} n, \text{ if } n \leq p, \\ \end{matrix}$$
$$p-n \quad n$$

$$\text{or } T = \begin{pmatrix} T_{11} \\ T_{21} \end{pmatrix} \begin{pmatrix} n-p \\ p \end{pmatrix}, \text{ if } n > p,$$
$$p$$

where T_{12} or T_{21} is an upper triangular matrix.

In particular, if sub(*B*) is square and nonsingular, the *GQR* factorization of sub(*A*) and sub(*B*) implicitly gives the *QR* factorization of inv (sub(*B*))* sub (*A*):

inv(sub(*B*))*sub(*A*) = Z^H*(inv(*T*)**R*)

Input Parameters

n (global) INTEGER. The number of rows in the distributed matrices sub (*A*) and sub(*B*) (*n*≥0).

m (global) INTEGER. The number of columns in the distributed matrix sub(*A*) (*m*≥0).

p INTEGER. The number of columns in the distributed matrix sub(*B*) (*p*≥0).

a (local)

REAL for psggqrf

DOUBLE PRECISION for pdggqrf

COMPLEX for pcggqrf

DOUBLE COMPLEX for pzggqrf.

Pointer into the local memory to an array of size (*lld_a*,*LOCc*(*ja*+*m*-1)). Contains the local pieces of the *n*-by-*m* matrix sub(*A*) to be factored.

ia, *ja* (global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the submatrix *A*, respectively.

desca (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

b (local)

REAL for psggqrf

DOUBLE PRECISION for pdggqrf

COMPLEX for pcggqrf

DOUBLE COMPLEX for pzggqrf.

Pointer into the local memory to an array of size (*lld_b*,*LOCc*(*jb*+*p*-1)). Contains the local pieces of the *n*-by-*p* matrix sub(*B*) to be factored.

ib, *jb* (global) INTEGER. The row and column indices in the global matrix *B* indicating the first row and the first column of the submatrix *B*, respectively.

descb (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix B.

work (local)

REAL for psggqrf

DOUBLE PRECISION for pdggqrf

COMPLEX for pcggqrf

DOUBLE COMPLEX for pzggqrf.

Workspace array of size of *lwork*.

lwork (local or global) INTEGER. Sze of *work*, must be at least

lwork≥max(*nb_a**(*npa*0+*mqa*0+*nb_a*), max((*nb_a**(*nb_a*-1))/2, (*pqb*0+*npb*0)**nb_a*)+*nb_a***nb_a*, *mb_b**(*npb*0+*pqb*0+*mb_b*)),

where

iroffa = mod(*ia*-1, *mb_A*),

icoffa = mod(*ja*-1, *nb_a*),

iarow = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW),

iacol = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL),

npa0 = numroc (*n*+*iroffa*, *mb_a*, MYROW, *iarow*, NPROW),

mqa0 = numroc (*m*+*icoffa*, *nb_a*, MYCOL, *iacol*, NPCOL)

iroffb = mod(*ib*-1, *mb_b*),

icoffb = mod(*jb*-1, *nb_b*),

ibrow = indxg2p(*ib*, *mb_b*, MYROW, *rsrc_b*, NPROW),

ibcol = indxg2p(*jb*, *nb_b*, MYCOL, *csrc_b*, NPCOL),

npb0 = numroc (*n*+*iroffa*, *mb_b*, MYROW, *Ibrow*, NPROW),

pqb0 = numroc(*m*+*icoffb*, *nb_b*, MYCOL, *ibcol*, NPCOL)

NOTE
mod(*x*,*y*) is the integer remainder of *x*/*y*.

and numroc, indxg2p are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.

If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a

On exit, the elements on and above the diagonal of sub (*A*) contain the min(*n*, *m*)-by-*m* upper trapezoidal matrix *R* (*R* is upper triangular if *n*≥*m*); the elements below the diagonal, with the array *taua*, represent the orthogonal/unitary matrix *Q* as a product of min(*n*, *m*) elementary reflectors. (See Application Notes below).

taua, *taub*

(local)

REAL for psggqrf

DOUBLE PRECISION for pdggqrf

COMPLEX for pcggqrf

DOUBLE COMPLEX for pzggqrf.

Arrays of size *LOCc*(*ja*+min(*n*,*m*)-1) for *taua* and *LOCr*(*ib*+*n*-1) for *taub*.

The array *taua* contains the scalar factors of the elementary reflectors which represent the orthogonal/unitary matrix *Q*. *taua* is tied to the distributed matrix *A*. (See Application Notes below).

	The array *taub* contains the scalar factors of the elementary reflectors which represent the orthogonal/unitary matrix *Z*. *taub* is tied to the distributed matrix *B*. (See Application Notes below).
work(1)	On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	(global) INTEGER. = 0: the execution is successful. < 0: if the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Application Notes

The matrix *Q* is represented as a product of elementary reflectors

Q = *H*(*ja*)**H*(*ja*+1)*...**H*(*ja*+*k*-1),

where *k*= min(*n*,*m*).

Each *H*(*i*) has the form

H(*i*) = *i* - *taua***v***v'*

where *taua* is a real/complex scalar, and *v* is a real/complex vector with *v*(1:*i*-1) = 0 and *v*(*i*) = 1; v(*i*+1:*n*) is stored on exit in *A*(*ia*+*i*:*ia*+*n*-1, *ja*+*i*-1) , and *taua* in *taua*(*ja*+*i*-1).To form *Q* explicitly, use ScaLAPACK subroutine p?orgqr/p?ungqr. To use *Q* to update another matrix, use ScaLAPACK subroutine p?ormqr/p?unmqr.

The matrix *Z* is represented as a product of elementary reflectors

Z = *H*(*ib*)**H*(*ib*+1)*...**H*(*ib*+*k*-1), where *k*= min(*n*,*p*).

Each *H*(*i*) has the form

H(*i*) = *i* - *taub***v***v'*

where *taub* is a real/complex scalar, and *v* is a real/complex vector with *v*(*p*-*k*+*i*+1:*p*) = 0 and *v*(*p*-*k*+*i*) = 1; *v*(1:*p*-*k*+*i*-1) is stored on exit in *B*(*ib*+*n*-*k*+*i*-1,*jb*:*jb*+*p*-*k*+*i*-2), and *taub* in *taub*(*ib*+*n*-*k*+*i*-1). To form *Z* explicitly, use ScaLAPACK subroutine p?orgrq/p?ungrq. To use *Z* to update another matrix, use ScaLAPACK subroutine p?ormrq/p?unmrq.

call pzggrqf(m, p, n, a, ia, ja, desca, taua, b, ib, jb, descb, taub, work, lwork, info)
```

Include Files

Description

The p?ggrqfroutine forms the generalized *RQ* factorization of an *m*-by-*n* matrix sub(*A*) = *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1) and a *p*-by-*n* matrix sub(*B*) = *B*(*ib*:*ib*+*p*-1, *jb*:*jb*+*n*-1):

sub(*A*) = *R***Q*, sub(*B*) = *Z***T***Q*,

where *Q* is an *n*-by-*n* orthogonal/unitary matrix, *Z* is a *p*-by-*p* orthogonal/unitary matrix, and *R* and *T* assume one of the forms:

$$R = \begin{matrix} m \\ \\ \end{matrix} \begin{matrix} \begin{pmatrix} 0 & R_{12} \end{pmatrix}, \text{ if } m \le n, \\ n-m \quad m \end{matrix}$$

or

$$R = \begin{matrix} \begin{pmatrix} R_{11} \\ R_{12} \end{pmatrix} \begin{matrix} m-n \\ n \end{matrix} \\ n \end{matrix}, \text{ if } m > n$$

where R_{11} or R_{21} is upper triangular, and

$$T = \begin{matrix} \begin{pmatrix} T_{11} \\ 0 \end{pmatrix} \begin{matrix} n \\ p-n \end{matrix} \\ n \end{matrix}, \text{ if } p \ge n$$

or

$$T = \begin{matrix} p \\ \\ \end{matrix} \begin{matrix} \begin{pmatrix} T_{11} & T_{12} \end{pmatrix}, \text{ if } p < n, \\ p \quad n-p \end{matrix}$$

where T_{11} is upper triangular.

In particular, if sub(*B*) is square and nonsingular, the *GRQ* factorization of sub(*A*) and sub(*B*) implicitly gives the *RQ* factorization of sub (*A*)*inv(sub(*B*)):

```
sub(A)*inv(sub(B))= (R*inv(T))*Z'
```

where inv(sub(*B*)) denotes the inverse of the matrix sub(*B*), and *Z*′ denotes the transpose (conjugate transpose) of matrix *Z*.

Input Parameters

m	(global) INTEGER. The number of rows in the distributed matrices sub (*A*) (*m*≥0).
p	INTEGER. The number of rows in the distributed matrix sub(*B*) (*p*≥0).
n	(global) INTEGER. The number of columns in the distributed matrices sub(*A*) and sub(*B*) (*n*≥0).
a	(local)

REAL for psggrqf

DOUBLE PRECISION for pdggrqf

COMPLEX for pcggrqf

DOUBLE COMPLEX for pzggrqf.

Pointer into the local memory to an array of size (*lld_a*,*LOCc*(*ja*+n-1)). Contains the local pieces of the *m*-by-*n* distributed matrix sub(*A*) to be factored.

ia, *ja* (global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the submatrix *A*, respectively.

desca (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

b (local)

REAL for psggrqf

DOUBLE PRECISION for pdggrqf

COMPLEX for pcggrqf

DOUBLE COMPLEX for pzggrqf.

Pointer into the local memory to an array of size (*lld_b*,*LOCc*(*jb*+*n*-1)).

Contains the local pieces of the *p*-by-*n* matrix sub(*B*) to be factored.

ib, *jb* (global) INTEGER. The row and column indices in the global matrix *B* indicating the first row and the first column of the submatrix *B*, respectively.

descb (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *B*.

work (local)

REAL for psggrqf

DOUBLE PRECISION for pdggrqf

COMPLEX for pcggrqf

DOUBLE COMPLEX for pzggrqf.

Workspace array of size of *lwork*.

lwork (local or global) INTEGER.

Size of *work*, must be at least *lwork*≥max(*mb_a**(*mpa*0+*nqa*0+*mb_a*), max((*mb_a**(*mb_a*-1))/2, (*ppb*0+*nqb*0)**mb_a*) + *mb_a***mb_a*, *nb_b**(*ppb*0+*nqb*0+*nb_b*)), where

iroffa = mod(*ia*-1, *mb_A*),

icoffa = mod(*ja*-1, *nb_a*),

iarow = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW),

iacol = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL),

mpa0 = *numroc* (*m*+*iroffa*, *mb_a*, MYROW, *iarow*, NPROW),

nqa0 = *numroc* (*m*+*icoffa*, *nb_a*, MYCOL, *iacol*, NPCOL)

iroffb = mod(*ib*-*1*, *mb_b*),

icoffb = mod(*jb*-*1*, *nb_b*),

ibrow = indxg2p(*ib*, *mb_b*, MYROW, *rsrc_b*, NPROW),

ibcol = indxg2p(*jb*, *nb_b*, MYCOL, *csrc_b*, NPCOL),

ppb0 = numroc (*p*+*iroffb*, *mb_b*, MYROW, *ibrow*,NPROW),

nqb0 = numroc (*n*+*icoffb*, *nb_b*, MYCOL, *ibcol*,NPCOL)

NOTE
mod(*x*,*y*) is the integer remainder of *x*/*y*.

and numroc, indxg2p are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.

If *lwork* = –1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a

On exit, if *m*≤*n*, the upper triangle of *A*(*ia*:*ia*+*m*-1, *ja*+*n*-*m*:*ja*+*n*-1) contains the *m*-by-*m* upper triangular matrix *R*; if *m*≥*n*, the elements on and above the (*m*-*n*)-th subdiagonal contain the *m*-by-*n* upper trapezoidal matrix *R*; the remaining elements, with the array *taua*, represent the orthogonal/unitary matrix *Q* as a product of min(*n*,*m*) elementary reflectors (see *Application Notes* below).

taua, *taub*

(local)

REAL for psggqrf

DOUBLE PRECISION for pdggqrf

COMPLEX for pcggqrf

DOUBLE COMPLEX for pzggqrf.

Arrays of size *LOCr*(*ia*+*m*-1)for *taua* and *LOCc*(*jb*+min(p,*n*)-1) for *taub*.

The array *taua* contains the scalar factors of the elementary reflectors which represent the orthogonal/unitary matrix *Q*. *taua* is tied to the distributed matrix *A*.(See *Application Notes* below).

The array *taub* contains the scalar factors of the elementary reflectors which represent the orthogonal/unitary matrix *Z*. *taub* is tied to the distributed matrix *B*. (See *Application Notes* below).

work(1)

On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.

info

(global) INTEGER.

= 0: the execution is successful.

< 0: if the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Application Notes

The matrix *Q* is represented as a product of elementary reflectors

Q = *H*(*ia*)**H*(*ia*+1)*...**H*(*ia*+*k*-1),

where *k*= min(*m*,*n*).

Each *H*(*i*) has the form

H(*i*) = *i* - *taua***v***v*'

where *taua* is a real/complex scalar, and *v* is a real/complex vector with *v*(*n*-*k*+*i*+1:*n*) = 0 and *v*(*n*-*k*+*i*) = 1; v(1:*n*-*k*+*i*-1) is stored on exit in *A*(*ia*+*m*-*k*+*i*-1, *ja*:*ja*+*n*-*k*+*i*-2), and *taua* in *taua*(*ia*+*m*-*k*+*i*-1). To form *Q* explicitly, use ScaLAPACK subroutine p?orgrq/p?ungrq. To use *Q* to update another matrix, use ScaLAPACK subroutine p?ormrq/p?unmrq.

The matrix *Z* is represented as a product of elementary reflectors

Z = *H*(*jb*)**H*(*jb*+1)*...**H*(*jb*+*k*-1), where *k*= min(*p*,*n*).

Each *H*(*i*) has the form

H(*i*) = *i* - *taub***v***v*'

where *taub* is a real/complex scalar, and *v* is a real/complex vector with *v*(1:*i*-1) = 0 and *v*(*i*)= 1; *v*(*i*+1:*p*) is stored on exit in *B*(*ib*+*i*:*ib*+*p*-1,*jb*+*i*-1), and *taub* in *taub*(*jb*+*i*-1). To form *Z* explicitly, use ScaLAPACK subroutine p?orgqr/p?ungqr. To use *Z* to update another matrix, use ScaLAPACK subroutine p?ormqr/p?unmqr.

Symmetric Eigenvalue Problems: ScaLAPACK Computational Routines

To solve a symmetric eigenproblem with ScaLAPACK, you usually need to reduce the matrix to real tridiagonal form *T* and then find the eigenvalues and eigenvectors of the tridiagonal matrix *T*. ScaLAPACK includes routines for reducing the matrix to a tridiagonal form by an orthogonal (or unitary) similarity transformation $A = QTQ^H$ as well as for solving tridiagonal symmetric eigenvalue problems. These routines are listed in Table "Computational Routines for Solving Symmetric Eigenproblems".

There are different routines for symmetric eigenproblems, depending on whether you need eigenvalues only or eigenvectors as well, and on the algorithm used (either the *QTQ* algorithm, or bisection followed by inverse iteration).

Computational Routines for Solving Symmetric Eigenproblems

Operation	Dense symmetric/ Hermitian matrix	Orthogonal/unitary matrix	Symmetric tridiagonal matrix
Reduce to tridiagonal form $A = QTQ^H$	p?sytrd/p?hetrd		
Multiply matrix after reduction		p?ormtr/p?unmtr	
Find all eigenvalues and eigenvectors of a tridiagonal matrix *T* by a *QTQ* method			steqr2*
Find selected eigenvalues of a tridiagonal matrix *T* via bisection			p?stebz

Operation	Dense symmetric/ Hermitian matrix	Orthogonal/unitary matrix	Symmetric tridiagonal matrix
Find selected eigenvectors of a tridiagonal matrix *T* by inverse iteration			p?stein

* This routine is described as part of auxiliary ScaLAPACK routines.

p?syngst

Reduces a complex Hermitian-definite generalized eigenproblem to standard form.

Syntax

```
call pssyngst (ibtype, uplo, n, a, ia, ja, desca, b, ib, jb, descb, scale, work, lwork, info )
```

```
call pdsyngst (ibtype, uplo, n, a, ia, ja, desca, b, ib, jb, descb, scale, work, lwork, info )
```

Description

p?syngst reduces a complex Hermitian-definite generalized eigenproblem to standard form.

p?syngst performs the same function as p?hegst, but is based on rank 2K updates, which are faster and more scalable than triangular solves (the basis of p?syngst).

p?syngst calls p?hegst when *uplo*='U', hence p?hengst provides improved performance only when *uplo*='L', *ibtype*=1.

p?syngst also calls p?hegst when insufficient workspace is provided, hence p?syngst provides improved performance only when *lwork* >= 2 * NP0 * NB + NQ0 * NB + NB * NB

In the following sub(*A*) denotes *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1) and sub(*B*) denotes *B*(*ib*:*ib*+*n*-1, *jb*:*jb* +*n*-1).

If *ibtype* = 1, the problem is sub(*A*)*x = lambda*sub(*B*)*x, and sub(*A*) is overwritten by inv(U^H)*sub(*A*)*inv(*U*) or inv(*L*)*sub(*A*)*inv(L^H)

If *ibtype* = 2 or 3, the problem is sub(*A*)*sub(*B*)*x = lambda*x or sub(*B*)*sub(*A*)*x = lambda*x, and sub(*A*) is overwritten by *U**sub(*A*)*U^H or L^H*sub(*A*)**L*.

sub(*B*) must have been previously factorized as U^H**U* or *L*L^H by p?potrf.

Input Parameters

ibtype (global)

INTEGER.

= 1: compute inv(U^H)*sub(*A*)*inv(*U*) or inv(*L*)*sub(*A*)*inv(L^H);

= 2 or 3: compute *U*sub(*A*)*U^H or L^H*sub(*A*)**L*.

uplo (global)

CHARACTER.

= 'U': Upper triangle of sub(*A*) is stored and sub(*B*) is factored as U^H**U*;

= 'L': Lower triangle of sub(*A*) is stored and sub(*B*) is factored as *L*L^H.

n (global)

INTEGER.

The order of the matrices sub(*A*) and sub(*B*). *n* >= 0.

a (local)

REAL for pssyngst

DOUBLE PRECISION for pdsyngst

Pointer into the local memory to an array of size (*lld_a*,*LOCc*(*ja*+*n*-1)).

On entry, this array contains the local pieces of the *n*-by-*n* Hermitian distributed matrix sub(*A*). If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of sub(*A*) contains the upper triangular part of the matrix, and its strictly lower triangular part is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of sub(*A*) contains the lower triangular part of the matrix, and its strictly upper triangular part is not referenced.

ia (global)

INTEGER.

A's global row index, which points to the beginning of the submatrix which is to be operated on.

ja (global)

INTEGER.

A's global column index, which points to the beginning of the submatrix which is to be operated on.

desca (global and local)

INTEGER.

Array of size *dlen_*.

The array descriptor for the distributed matrix *A*.

b (local)

REAL for pssyngst

DOUBLE PRECISION for pdsyngst

Pointer into the local memory to an array of size (*lld_b*,*LOCc*(*jb*+*n*-1)).

On entry, this array contains the local pieces of the triangular factor from the Cholesky factorization of sub(*B*), as returned by p?potrf.

ib (global)

INTEGER.

B's global row index, which points to the beginning of the submatrix which is to be operated on.

jb (global)

INTEGER.

B's global column index, which points to the beginning of the submatrix which is to be operated on.

descb (global and local)

INTEGER.

Array of size *dlen_*.

The array descriptor for the distributed matrix *B*.

work (local)

REAL for pssyngst

DOUBLE PRECISION for pdsyngst

Array, size (*lwork*)

lwork (local or global)

INTEGER.

The size of the array *work*.

lwork is local input and must be at least *lwork* >= MAX(NB * (NP0 +1), 3 * NB)

When *ibtype* = 1 and *uplo* = 'L', p?syngst provides improved performance when *lwork* >= 2 * NP0 * NB + NQ0 * NB + NB * NB,

where NB = *mb_a* = *nb_a*,

NP0 = numroc(*n*, NB, 0, 0, NPROW),

NQ0 = numroc(*n*, NB, 0, 0, NPROW),

numroc is a ScaLAPACK tool functions

MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.

If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a On exit, if *info* = 0, the transformed matrix, stored in the same format as sub(*A*).

scale (global)

REAL for pssyngst

DOUBLE PRECISION for pdsyngst

Amount by which the eigenvalues should be scaled to compensate for the scaling performed in this routine. At present, *scale* is always returned as 1.0, it is returned here to allow for future enhancement.

work (local)

REAL for pssyngst

DOUBLE PRECISION for pdsyngst

Array, size (*lwork*)

On exit, `work(1)` returns the minimal and optimal `lwork`.

`info` (global)

INTEGER.

= 0: successful exit

< 0: If the *i*-th argument is an array and the *j*-th entry had an illegal value, then `info` = -(*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then `info` = -*i*.

p?syntrd

Reduces a real symmetric matrix to symmetric tridiagonal form.

Syntax

```
call pssyntrd (uplo, n, a, ia, ja, desca, d, e, tau, work, lwork, info )
call pdsyntrd (uplo, n, a, ia, ja, desca, d, e, tau, work, lwork, info )
```

Description

`p?syntrd` is a prototype version of `p?sytrd` which uses tailored codes (either the serial, `?sytrd`, or the parallel code, `p?syttrd`) when the workspace provided by the user is adequate.

`p?syntrd` reduces a real symmetric matrix sub(*A*) to symmetric tridiagonal form *T* by an orthogonal similarity transformation:

Q' * sub(*A*) * *Q* = *T*, where sub(*A*) = *A*(`ia`:`ia`+`n`-1,`ja`:`ja`+`n`-1).

Features

`p?syntrd` is faster than `p?sytrd` on almost all matrices, particularly small ones (i.e. `n` < 500 * sqrt(P)), provided that enough workspace is available to use the tailored codes.

The tailored codes provide performance that is essentially independent of the input data layout.

The tailored codes place no restrictions on `ia`, `ja`, MB or NB. At present, `ia`, `ja`, MB and NB are restricted to those values allowed by `p?hetrd` to keep the interface simple (see the Application Notes section for more information about the restrictions).

Input Parameters

`uplo` (global)

CHARACTER.

Specifies whether the upper or lower triangular part of the symmetric matrix sub(*A*) is stored:

= 'U': Upper triangular

= 'L': Lower triangular

`n` (global)

INTEGER.

The number of rows and columns to be operated on, i.e. the order of the distributed submatrix sub(*A*). `n` >= 0.

`a` (local)

REAL for pssyntrd

DOUBLE PRECISION for pdsyntrd

Pointer into the local memory to an array of size (*lld_a*,*LOCc*(*ja*+*n*-1)).

On entry, this array contains the local pieces of the symmetric distributed matrix sub(*A*). If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of sub(*A*) contains the upper triangular part of the matrix, and its strictly lower triangular part is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of sub(*A*) contains the lower triangular part of the matrix, and its strictly upper triangular part is not referenced.

ia

(global)

INTEGER.

The row index in the global array *a* indicating the first row of sub(*A*).

ja

(global)

INTEGER.

The column index in the global array *a* indicating the first column of sub(*A*).

desca

(global and local)

INTEGER.

Array of size *dlen_*.

The array descriptor for the distributed matrix *A*.

work

(local)

REAL for pssyntrd

DOUBLE PRECISION for pdsyntrd

Array, size (*lwork*)

lwork

(local or global)

INTEGER.

The size of the array *work*.

lwork is local input and must be at least *lwork* >= MAX(NB * (NP +1), 3 * NB)

For optimal performance, greater workspace is needed, i.e.

lwork >= 2*(*ANB*+1)*(4**NPS*+2) + (*NPS* + 4) * *NPS*

ANB = pjlaenv(*ICTXT*, 3, 'p?syttrd', 'L', 0, 0, 0, 0)

ICTXT = *desca*(*ctxt_*)

SQNPC = INT(sqrt(REAL(*NPROW* * *NPCOL*)))

numroc is a ScaLAPACK tool function.

pjlaenv is a ScaLAPACK environmental inquiry function.

NPROW and *NPCOL* can be determined by calling the subroutine blacs_gridinfo.

Output Parameters

a

On exit, if *uplo* = 'U', the diagonal and first superdiagonal of sub(*A*) are overwritten by the corresponding elements of the tridiagonal matrix *T*, and the elements above the first superdiagonal, with the array *tau*, represent the orthogonal matrix *Q* as a product of elementary reflectors; if *uplo* = 'L', the diagonal and first subdiagonal of sub(*A*) are overwritten by the corresponding elements of the tridiagonal matrix *T*, and the elements below the first subdiagonal, with the array *tau*, represent the orthogonal matrix *Q* as a product of elementary reflectors. See **Further Details**.

d

(local)

`REAL` for `pssyntrd`

`DOUBLE PRECISION` for `pdsyntrd`

Array, size LOCc(*ja*+*n*-1)

The diagonal elements of the tridiagonal matrix *T*: *d*(i) = *A*(i,i). *d* is tied to the distributed matrix *A*.

e

(local)

`REAL` for `pssyntrd`

`DOUBLE PRECISION` for `pdsyntrd`

Array, size LOCc(*ja*+*n*-1) if *uplo* = 'U', LOCc(*ja*+*n*-2) otherwise.

The off-diagonal elements of the tridiagonal matrix *T*: *e*(i) = *A*(i,i+1) if *uplo* = 'U', *e*(i) = *A*(i+1,i) if *uplo* = 'L'. *e* is tied to the distributed matrix *A*.

tau

(local)

`REAL` for `pssyntrd`

`DOUBLE PRECISION` for `pdsyntrd`

Array, size LOCc(*ja*+*n*-1).

This array contains the scalar factors *tau* of the elementary reflectors. *tau* is tied to the distributed matrix *A*.

work

(local)

`REAL` for `pssyntrd`

`DOUBLE PRECISION` for `pdsyntrd`

Array, size (*lwork*)

On exit, *work*`(1)` returns the optimal *lwork*.

info

(global)

INTEGER.

= 0: successful exit

< 0: If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Application Notes

If *uplo* = 'U', the matrix *Q* is represented as a product of elementary reflectors

Q = H(*n*-1) . . . H(2) H(1).

Each H(i) has the form

H(i) = I - *tau* * v * v', where *tau* is a complex scalar, and v is a complex vector with v(i+1:*n*) = 0 and v(i) = 1; v(1:i-1) is stored on exit in *A*(*ia*:*ia*+i-2,*ja*+i), and *tau* in *tau*(*ja*+i-1).

If *uplo* = 'L', the matrix *Q* is represented as a product of elementary reflectors

Q = H(1) H(2) . . . H(*n*-1).

Each H(i) has the form

H(i) = I - *tau* * v * v', where *tau* is a complex scalar, and v is a complex vector with v(1:i) = 0 and v(i+1) = 1; v(i+2:*n*) is stored on exit in *A*(*ia*+i+1:*ia*+*n*-1,*ja*+i-1), and *tau* in *tau*(*ja*+i-1).

The contents of sub(*A*) on exit are illustrated by the following examples with *n* = 5:

if *uplo* = 'U':

$$\begin{pmatrix} d & e & v2 & v3 & v4 \\ & d & e & v3 & v4 \\ & & d & e & v3 \\ & & & d & e \\ & & & & d \end{pmatrix}$$

if *uplo* = 'L':

$$\begin{pmatrix} d & & & & \\ e & d & & & \\ v1 & e & d & & \\ v1 & v2 & e & d & \\ v1 & v2 & v3 & e & d \end{pmatrix}$$

where *d* and *e* denote diagonal and off-diagonal elements of *T*, and *vi* denotes an element of the vector defining H(*i*).

Alignment requirements

The distributed submatrix sub(*A*) must verify some alignment properties, namely the following expression should be true:

(*mb_a* = *nb_a* and *IROFFA* = *ICOFFA* and *IROFFA* = 0) with *IROFFA* = mod(*ia*-1, *mb_a*), and *ICOFFA* = mod(*ja*-1, *nb_a*).

p?sytrd

Reduces a symmetric matrix to real symmetric tridiagonal form by an orthogonal similarity transformation.

Syntax

```
call pssytrd(uplo, n, a, ia, ja, desca, d, e, tau, work, lwork, info)
```

```
call pdsytrd(uplo, n, a, ia, ja, desca, d, e, tau, work, lwork, info)
```

Include Files

Description

The p?sytrd routine reduces a real symmetric matrix sub(*A*) to symmetric tridiagonal form *T* by an orthogonal similarity transformation:

Q'*sub(*A*)**Q* = *T*,

where sub(*A*) = *A*(*ia*:*ia*+*n*-1,*ja*:*ja*+*n*-1).

Input Parameters

uplo (global) CHARACTER.

Specifies whether the upper or lower triangular part of the symmetric matrix sub(*A*) is stored:

If *uplo* = 'U', upper triangular

If *uplo* = 'L', lower triangular

n (global) INTEGER. The order of the distributed matrix sub(*A*) (*n*≥0).

a (local)

REAL for pssytrd

DOUBLE PRECISION for pdsytrd.

Pointer into the local memory to an array of size (*lld_a*, *LOCc*(*ja*+*n*-1)). On entry, this array contains the local pieces of the symmetric distributed matrix sub(*A*).

If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of sub(*A*) contains the upper triangular part of the matrix, and its strictly lower triangular part is not referenced.

If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of sub(*A*) contains the lower triangular part of the matrix, and its strictly upper triangular part is not referenced. See *Application Notes* below.

ia, *ja* (global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the submatrix *A*, respectively.

desca (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

work (local)

REAL for pssytrd

DOUBLE PRECISION for pdsytrd.

Workspace array of size *lwork*.

lwork (local or global) INTEGER, size of *work*, must be at least:

lwork ≥ max(NB*(*np* +1), 3*NB),

where NB = *mb_a* = *nb_a*,

np = numroc(*n*, NB, MYROW, *iarow*, NPROW),

iarow = indxg2p(*ia*, NB, MYROW, *rsrc_a*, NPROW).

indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.

If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a

On exit, if *uplo* = 'U', the diagonal and first superdiagonal of sub(*A*) are overwritten by the corresponding elements of the tridiagonal matrix *T*, and the elements above the first superdiagonal, with the array *tau*, represent the orthogonal matrix *Q* as a product of elementary reflectors; if *uplo* = 'L', the diagonal and first subdiagonal of sub(*A*) are overwritten by the corresponding elements of the tridiagonal matrix *T*, and the elements below the first subdiagonal, with the array *tau*, represent the orthogonal matrix *Q* as a product of elementary reflectors. See *Application Notes* below.

d

(local)

REAL for pssytrd

DOUBLE PRECISION for pdsytrd.

Arrays of size *LOCc*(*ja*+*n*-1) .The diagonal elements of the tridiagonal matrix *T*:

d(*i*)= *A*(*i*,*i*).

d is tied to the distributed matrix *A*.

e

(local)

REAL for pssytrd

DOUBLE PRECISION for pdsytrd.

Arrays of size *LOCc*(*ja*+*n*-1) if *uplo* = 'U', *LOCc*(*ja*+*n*-2) otherwise.

The off-diagonal elements of the tridiagonal matrix *T*:

e(*i*)= *A*(*i*,*i*+1) if *uplo* = 'U',

e(*i*) = *A*(*i*+1,*i*) if *uplo* = 'L'.

e is tied to the distributed matrix *A*.

tau

(local)

REAL for pssytrd

DOUBLE PRECISION for pdsytrd.

Arrays of size *LOCc*(*ja*+*n*-1). This array contains the scalar factors of the elementary reflectors. *tau* is tied to the distributed matrix *A*.

work(1)

On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.

info

(global) INTEGER.

= 0: the execution is successful.

< 0: if the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Application Notes

If *uplo* = 'U', the matrix *Q* is represented as a product of elementary reflectors

Q = *H*(*n*-1)... *H*(2) *H*(1).

Each *H*(*i*) has the form

H(*i*) = *i* - *tau* * *v* * *v*',

where *tau* is a real scalar, and *v* is a real vector with *v*(*i*+1:*n*) = 0 and *v*(*i*) = 1; *v*(1:*i*-1) is stored on exit in *A*(*ia*:*ia*+*i*-2, *ja*+*i*), and *tau* in *tau*(*ja*+*i*-1).

If *uplo* = 'L', the matrix *Q* is represented as a product of elementary reflectors

Q = *H*(1) *H*(2)... *H*(*n*-1).

Each *H*(*i*) has the form

H(*i*) = *i* - *tau* * *v* * *v*',

where *tau* is a real scalar, and *v* is a real vector with *v*(1:*i*) = 0 and *v*(*i*+1) = 1; *v*(*i*+2:*n*) is stored on exit in *A*(*ia*+*i*+1:*ia*+*n*-1,*ja*+*i*-1), and *tau* in *tau*(*ja*+*i*-1).

The contents of sub(*A*) on exit are illustrated by the following examples with *n* = 5:

If *uplo* = 'U':

$$\begin{bmatrix} d & e & v2 & v3 & v4 \\ & d & e & v3 & v4 \\ & & d & e & v4 \\ & & & d & e \\ & & & & d \end{bmatrix}$$

If *uplo* = 'L':

$$\begin{bmatrix} d & & & & \\ e & d & & & \\ v1 & e & d & & \\ v1 & v2 & e & d & \\ v1 & v2 & v3 & e & d \end{bmatrix}$$

where *d* and *e* denote diagonal and off-diagonal elements of *T*, and *vi* denotes an element of the vector defining *H*(*i*).

Overview for details of ScaLAPACK array descriptor structures and related notations.

p?ormtr

Multiplies a general matrix by the orthogonal transformation matrix from a reduction to tridiagonal form determined by `p?sytrd`.

Syntax

`call psormtr(side, uplo, trans, m, n, a, ia, ja, desca, tau, c, ic, jc, descc, work, lwork, info)`

`call pdormtr(side, uplo, trans, m, n, a, ia, ja, desca, tau, c, ic, jc, descc, work, lwork, info)`

Include Files

Description

This routine overwrites the general real distributed *m*-by-*n* matrix sub(*C*) = *C*(*ic*:*ic*+*m*-1,*jc*:*jc*+*n*-1) with

	side ='L'	*side* ='R'
trans = 'N':	*Q**sub(*C*)	sub(*C*)**Q*
trans = 'T':	Q^T*sub(*C*)	sub(*C*)*Q^T

where *Q* is a real orthogonal distributed matrix of order *nq*, with *nq* = *m* if *side* = 'L' and *nq* = *n* if *side* = 'R'.

Q is defined as the product of *nq* elementary reflectors, as returned by `p?sytrd`.

If *uplo* = 'U', *Q* = *H*(*nq*-1)... *H*(2) *H*(1);

If *uplo* = 'L', *Q* = *H*(1) *H*(2)... *H*(*nq*-1).

Input Parameters

side (global) CHARACTER

='L': *Q* or Q^T is applied from the left.

='R': *Q* or Q^T is applied from the right.

trans (global) CHARACTER

='N', no transpose, *Q* is applied.

='T', transpose, Q^T is applied.

uplo (global) CHARACTER.

= 'U': Upper triangle of *A*(*ia*:*, *ja*:*) contains elementary reflectors from `p?sytrd`;

= 'L': Lower triangle of *A*(*ia*:*,*ja*:*) contains elementary reflectors from `p?sytrd`

m (global) INTEGER. The number of rows in the distributed matrix sub(*C*) (*m*≥0).

n (global) INTEGER. The number of columns in the distributed matrix sub(*C*) (*n*≥0).

a (local)

REAL for psormtr

DOUBLE PRECISION for pdormtr.

Pointer into the local memory to an array of size (*lld_a*,*LOCc*(*ja*+*m*-1)) if *side* = 'L', and (*lld_a*,*LOCc*(*ja*+*n*-1)) if *side* = 'R'.

Contains the vectors that define the elementary reflectors, as returned by p?sytrd.

If *side*='L', *lld_a* ≥ max(1,*LOCr*(*ia*+*m*-1));

If *side* ='R', *lld_a* ≥ max(1, *LOCr*(*ia*+*n*-1)).

ia, *ja*

(global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the submatrix *A*, respectively.

desca

(global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

tau

(local)

REAL for psormtr

DOUBLE PRECISION for pdormtr.

Array of size of *ltau* where

if *side* = 'L' and *uplo* = 'U', *ltau* = *LOCc*(*m_a*),

if *side* = 'L' and *uplo* = 'L', *ltau* = *LOCc*(*ja*+*m*-2),

if *side* = 'R' and *uplo* = 'U', *ltau* = *LOCc*(*n_a*),

if *side* = 'R' and *uplo* = 'L', *ltau* = *LOCc*(*ja*+*n*-2).

tau(*i*) must contain the scalar factor of the elementary reflector *H*(*i*), as returned by p?sytrd. *tau* is tied to the distributed matrix *A*.

c

(local) REAL for psormtr

DOUBLE PRECISION for pdormtr.

Pointer into the local memory to an array of size (*lld_c*,*LOCc*(*jc*+*n*-1)). Contains the local pieces of the distributed matrix sub (*C*).

ic, *jc*

(global) INTEGER. The row and column indices in the global matrix *C* indicating the first row and the first column of the submatrix *C*, respectively.

descc

(global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *C*.

work

(local)

REAL for psormtr

DOUBLE PRECISION for pdormtr.

Workspace array of size *lwork*.

lwork

(local or global) INTEGER, size of *work*, must be at least:

if *uplo* = 'U',

iaa= *ia*; *jaa*= *ja*+1, *icc*= *ic*; *jcc*= *jc*;

else *uplo* = 'L',

iaa= *ia*+1, *jaa*= *ja*;

If *side* = 'L',

icc= *ic*+1; *jcc*= *jc*;

else *icc*= *ic*; *jcc*= *jc*+1;

end if

end if

If *side* = 'L',

mi= *m*-1; *ni*= *n*

lwork ≥ max((*nb_a**(*nb_a*-1))/2, (*nqc*0 + *mpc*0)**nb_a*) + *nb_a***nb_a*

else

If *side* = 'R',

mi= *m*; *mi* = *n*-1;

lwork≥max((*nb_a**(*nb_a*-1))/2, (*nqc*0 + max(*npa*0+numroc(numroc(*ni*+*icoffc*, *nb_a*, 0, 0, NPCOL), *nb_a*, 0, 0, *lcmq*), *mpc*0))**nb_a*)+ *nb_a***nb_a*

end if

where *lcmq* = *lcm*/NPCOL with *lcm* = ilcm(NPROW, NPCOL),

iroffa = mod(*iaa*-1, *mb_a*),

icoffa = mod(*jaa*-1, *nb_a*),

iarow = indxg2p(*iaa*, *mb_a*, MYROW, *rsrc_a*, NPROW),

*npa*0 = numroc(*ni*+*iroffa*, *mb_a*, MYROW, *iarow*, NPROW),

iroffc = mod(*icc*-1, *mb_c*),

icoffc = mod(*jcc*-1, *nb_c*),

icrow = indxg2p(*icc*, *mb_c*, MYROW, *rsrc_c*, NPROW),

iccol = indxg2p(*jcc*, *nb_c*, MYCOL, *csrc_c*, NPCOL),

*mpc*0 = numroc(*mi*+*iroffc*, *mb_c*, MYROW, *icrow*, NPROW),

*nqc*0 = numroc(*ni*+*icoffc*, *nb_c*, MYCOL, *iccol*, NPCOL),

NOTE
mod(*x*,*y*) is the integer remainder of *x*/*y*.

ilcm, indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo. If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

c	Overwritten by the product *Q**sub(*C*), or *Q'**sub(*C*), or sub(*C*)**Q'*, or sub(*C*)**Q*.
work(1)	On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	(global) INTEGER. = 0: the execution is successful. < 0: if the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?hengst

Reduces a complex Hermitian-definite generalized eigenproblem to standard form.

Syntax

```
call pchengst (ibtype, uplo, n, a, ia, ja, desca, b, ib, jb, descb, scale, work, lwork, info )
```

```
call pzhengst (ibtype, uplo, n, a, ia, ja, desca, b, ib, jb, descb, scale, work, lwork, info )
```

Description

p?hengst reduces a complex Hermitian-definite generalized eigenproblem to standard form.

p?hengst performs the same function as p?hegst, but is based on rank 2K updates, which are faster and more scalable than triangular solves (the basis of p?hengst).

p?hengst calls p?hegst when *uplo*='U', hence p?hengst provides improved performance only when *uplo*='L' and *ibtype*=1.

p?hengst also calls p?hegst when insufficient workspace is provided, hence p?hengst provides improved performance only when *lwork* is sufficient (as described in the parameter descriptions).

In the following sub(*A*) denotes the submatrix *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1) and sub(*B*) denotes the submatrix *B*(*ib*:*ib*+*n*-1, *jb*:*jb*+*n*-1).

If *ibtype* = 1, the problem is sub(*A*)*x = lambda*sub(*B*)*x, and sub(*A*) is overwritten by inv(U^H)*sub(*A*)*inv(*U*) or inv(*L*)*sub(*A*)*inv(L^H)

If *ibtype* = 2 or 3, the problem is sub(*A*)*sub(*B*)*x = lambda*x or sub(*B*)*sub(*A*)*x = lambda*x, and sub(*A*) is overwritten by *U**sub(*A*)*U^H or L^H*sub(*A*)**L*.

sub(*B*) must have been previously factorized as U^H**U* or *L**L^H by p?potrf.

Input Parameters

ibtype	(global) INTEGER. = 1: compute inv(U^H)*sub(*A*)*inv(*U*) or inv(*L*)*sub(*A*)*inv(L^H);

= 2 or 3: compute U*sub(A)*U^H or L^H*sub(A)*L.

uplo (global)

CHARACTER.

= 'U': Upper triangle of sub(A) is stored and sub(B) is factored as U^H*U;

= 'L': Lower triangle of sub(A) is stored and sub(B) is factored as $L*L^H$.

n (global)

INTEGER.

The order of the matrices sub(A) and sub(B). *n* >= 0.

a (local)

`COMPLEX` for `pchengst`

`DOUBLE COMPLEX` for `pzhengst`

Pointer into the local memory to an array of size `(lld_a,LOCc(ja+n-1))`.

On entry, this array contains the local pieces of the *n*-by-*n* Hermitian distributed matrix sub(A). If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of sub(A) contains the upper triangular part of the matrix, and its strictly lower triangular part is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of sub(A) contains the lower triangular part of the matrix, and its strictly upper triangular part is not referenced.

ia (global)

INTEGER.

Global row index of matrix A, which points to the beginning of the submatrix on which to operate.

ja (global)

INTEGER.

Global column index of matrix A, which points to the beginning of the submatrix on which to operate.

desca (global and local)

INTEGER.

Array of size *dlen_*.

The array descriptor for the distributed matrix A.

b (local)

`COMPLEX` for `pchengst`

`DOUBLE COMPLEX` for `pzhengst`

Pointer into the local memory to an array of size `(lld_b,LOCc(jb+n-1))`.

ib (global)

INTEGER.

Global row index of matrix *B*, which points to the beginning of the submatrix on which to operate.

jb

(global)

INTEGER.

Global column index of matrix *B*, which points to the beginning of the submatrix on which to operate.

descb

(global and local)

INTEGER.

Array of size *dlen_*.

The array descriptor for the distributed matrix *B*.

work

(local)

`COMPLEX` for `pchengst`

`DOUBLE COMPLEX` for `pzhengst`

Array, size (*lwork*)

On exit, *work*(1) returns the minimal and optimal *lwork*.

lwork

(local)

INTEGER.

The size of the array *work*.

lwork is local input and must be at least *lwork* >= MAX(NB * (NP0 +1), 3 * NB).

When *ibtype* = 1 and *uplo* = 'L', `p?hengst` provides improved performance when *lwork* >= 2 * *NP0* * *NB* + *NQ0* * *NB* + *NB* * *NB*, where *NB* = *mb_a* = *nb_a*, *NP0* = `numroc`(*n*, *NB*, 0, 0, `NPROW`), *NQ0* = `numroc`(*n*, *NB*, 0, 0, `NPROW`), and `numroc` is a ScaLAPACK tool function.

`MYROW`, `MYCOL`, `NPROW` and `NPCOL` can be determined by calling the subroutine `blacs_gridinfo`.

If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by `pxerbla`.

Output Parameters

a

On exit, if *info* = 0, the transformed matrix, stored in the same format as sub(*A*).

scale

(global)

`REAL` for `pchengst`

`DOUBLE PRECISION` for `pzhengst`

Amount by which the eigenvalues should be scaled to compensate for the scaling performed in this routine.

scale is always returned as 1.0.

work On exit, *work*(1) returns the minimal and optimal *lwork*.

info (global)

INTEGER.

= 0: successful exit

< 0: If the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = -(*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?hentrd

Reduces a complex Hermitian matrix to Hermitian tridiagonal form.

Syntax

```
call pchentrd (uplo, n, a, ia, ja, desca, d, e, tau, work, lwork, rwork, lrwork, info )
call pzhentrd (uplo, n, a, ia, ja, desca, d, e, tau, work, lwork, rwork, lrwork, info )
```

Description

p?hentrd is a prototype version of p?hetrd which uses tailored codes (either the serial, ?hetrd, or the parallel code, p?hettrd) when adequate workspace is provided.

p?hentrd reduces a complex Hermitian matrix sub(*A*) to Hermitian tridiagonal form *T* by an unitary similarity transformation:

Q' * sub(*A*) * *Q* = *T*, where sub(*A*) = *A*(*ia*:*ia*+*n*-1,*ja*:*ja*+*n*-1).

p?hentrd is faster than p?hetrd on almost all matrices, particularly small ones (i.e. *n* < 500 * sqrt(P)), provided that enough workspace is available to use the tailored codes.

The tailored codes provide performance that is essentially independent of the input data layout.

The tailored codes place no restrictions on *ia*, *ja*, MB or NB. At present, *ia*, *ja*, MB and NB are restricted to those values allowed by p?hetrd to keep the interface simple (see the Application Notes section for more information about the restrictions).

Input Parameters

uplo (global)

CHARACTER.

Specifies whether the upper or lower triangular part of the Hermitian matrix sub(*A*) is stored:

= 'U': Upper triangular

= 'L': Lower triangular

n (global)

INTEGER.

The number of rows and columns to be operated on, i.e. the order of the distributed submatrix sub(*A*). *n* >= 0.

a (local)

COMPLEX for pchentrd

DOUBLE COMPLEX for pzhentrd

Pointer into the local memory to an array of size (*lld_a*,*LOCc*(*ja*+*n*-1)).

On entry, this array contains the local pieces of the Hermitian distributed matrix sub(*A*). If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of sub(*A*) contains the upper triangular part of the matrix, and its strictly lower triangular part is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of sub(*A*) contains the lower triangular part of the matrix, and its strictly upper triangular part is not referenced.

ia (global)

INTEGER.

The row index in the global array *a* indicating the first row of sub(*A*).

ja (global)

INTEGER.

The column index in the global array *a* indicating the first column of sub(*A*).

desca (global and local)

INTEGER.

Array of size *dlen_*.

The array descriptor for the distributed matrix *A*.

work (local)

COMPLEX for pchentrd

DOUBLE COMPLEX for pzhentrd

Array, size (*lwork*)

lwork (local or global)

INTEGER.

The size of the array *work*.

lwork is local input and must be at least *lwork* >= MAX(NB * (NP +1), 3 * NB).

For optimal performance, greater workspace is needed:

lwork >= 2*(*ANB*+1)*(4**NPS*+2) + (*NPS* + 4) * *NPS*

ANB = pjlaenv(*ICTXT*, 3, 'p?hettrd', 'L', 0, 0, 0, 0)

ICTXT = *desca*(*ctxt_*)

SQNPC = INT(sqrt(REAL(*NPROW* * *NPCOL*)))

NPS = MAX(numroc(*n*, 1, 0, 0, *SQNPC*), 2**ANB*)

numroc is a ScaLAPACK tool function.

pjlaenv is a ScaLAPACK environmental inquiry function.

NPROW and *NPCOL* can be determined by calling the subroutine blacs_gridinfo.

rwork (local)

COMPLEX for pchentrd

DOUBLE COMPLEX for pzhentrd

Array, size (*lrwork*)

lrwork (local or global)

INTEGER.

The size of the array *rwork*.

lrwork is local input and must be at least *lrwork* >= 1.

For optimal performance, greater workspace is needed, i.e. *lrwork* >= MAX(2 * *n*)

Output Parameters

a On exit, if *uplo* = 'U', the diagonal and first superdiagonal of sub(*A*) are overwritten by the corresponding elements of the tridiagonal matrix *T*, and the elements above the first superdiagonal, with the array *tau*, represent the unitary matrix *Q* as a product of elementary reflectors; if *uplo* = 'L', the diagonal and first subdiagonal of sub(*A*) are overwritten by the corresponding elements of the tridiagonal matrix *T*, and the elements below the first subdiagonal, with the array *tau*, represent the unitary matrix *Q* as a product of elementary reflectors. See Application Notes.

d (local)

REAL for pchentrd

DOUBLE PRECISION for pzhentrd

Array, size LOCc(*ja*+*n*-1)

The diagonal elements of the tridiagonal matrix *T*: *d*(*i*) = *A*(*i*,*i*). *d* is tied to the distributed matrix *A*.

e (local)

REAL for pchentrd

DOUBLE PRECISION for pzhentrd

Array, size LOCc(*ja*+*n*-1) if *uplo* = 'U', LOCc(*ja*+*n*-2) otherwise.

The off-diagonal elements of the tridiagonal matrix *T*: *e*(*i*) = *A*(*i*,*i*+1) if *uplo* = 'U', *e*(*i*) = *A*(*i*+1,*i*) if *uplo* = 'L'. *e* is tied to the distributed matrix *A*.

tau (local)

COMPLEX for pchentrd

DOUBLE COMPLEX for pzhentrd

Array, size LOCc(*ja*+*n*-1).

This array contains the scalar factors *tau* of the elementary reflectors. *tau* is tied to the distributed matrix *A*.

work	On exit, *work*(1) returns the optimal *lwork*.
rwork	On exit, *rwork*(1) returns the optimal *lrwork*.
info	(global) INTEGER. = 0: successful exit < 0: If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Application Notes

If *uplo* = 'U', the matrix *Q* is represented as a product of elementary reflectors

Q = H(*n*-1) . . . H(2) H(1).

Each H(i) has the form

H(i) = I - *tau* * v * v', where *tau* is a complex scalar, and v is a complex vector with v(i+1:*n*) = 0 and v(i) = 1; v(1:i-1) is stored on exit in *A*(*ia*:*ia*+i-2,*ja*+i), and *tau* in *tau*(*ja*+i-1).

If *uplo* = 'L', the matrix *Q* is represented as a product of elementary reflectors

Q = H(1) H(2) . . . H(*n*-1).

Each H(i) has the form

H(i) = I - *tau* * v * v', where *tau* is a complex scalar, and v is a complex vector with v(1:i) = 0 and v(i+1) = 1; v(i+2:*n*) is stored on exit in *A*(*ia*+i+1:*ia*+*n*-1,*ja*+i-1), and *tau* in *tau*(*ja*+i-1).

The contents of sub(*A*) on exit are illustrated by the following examples with *n* = 5:

if *uplo* = 'U':

$$\begin{pmatrix} d & e & v2 & v3 & v4 \\ & d & e & v3 & v4 \\ & & d & e & v3 \\ & & & d & e \\ & & & & d \end{pmatrix}$$

if *uplo* = 'L':

$$\begin{pmatrix} d & & & & \\ e & d & & & \\ v1 & e & d & & \\ v1 & v2 & e & d & \\ v1 & v2 & v3 & e & d \end{pmatrix}$$

where *d* and *e* denote diagonal and off-diagonal elements of *T*, and *vi* denotes an element of the vector defining H(*i*).

Alignment requirements

The distributed submatrix sub(*A*) must verify some alignment properties, namely the following expression should be true:

(*mb_a* = *nb_a* and *IROFFA* = *ICOFFA* and *IROFFA* = 0) with *IROFFA* = mod(*ia*-1, *mb_a*), and *ICOFFA* = mod(*ja*-1, *nb_a*).

p?hetrd

Reduces a Hermitian matrix to Hermitian tridiagonal form by a unitary similarity transformation.

Syntax

```
call pchetrd(uplo, n, a, ia, ja, desca, d, e, tau, work, lwork, info)
call pzhetrd(uplo, n, a, ia, ja, desca, d, e, tau, work, lwork, info)
```

Include Files

Description

The `p?hetrd` routine reduces a complex Hermitian matrix sub(*A*) to Hermitian tridiagonal form *T* by a unitary similarity transformation:

Q'*sub(*A*)**Q* = *T*

where sub(*A*) = *A*(*ia*:*ia*+*n*-1,*ja*:*ja*+*n*-1).

Input Parameters

uplo — (global) `CHARACTER`.

Specifies whether the upper or lower triangular part of the Hermitian matrix sub(*A*) is stored:

If *uplo* = `'U'`, upper triangular

If *uplo* = `'L'`, lower triangular

n — (global) `INTEGER`. The order of the distributed matrix sub(*A*) (*n*≥0).

a — (local)

`COMPLEX` for `pchetrd`

`DOUBLE COMPLEX` for `pzhetrd`.

Pointer into the local memory to an array of size (*lld_a*,*LOCc*(*ja*+*n*-1)). On entry, this array contains the local pieces of the Hermitian distributed matrix sub(*A*).

If *uplo* = `'U'`, the leading *n*-by-*n* upper triangular part of sub(*A*) contains the upper triangular part of the matrix, and its strictly lower triangular part is not referenced.

If *uplo* = `'L'`, the leading *n*-by-*n* lower triangular part of sub(*A*) contains the lower triangular part of the matrix, and its strictly upper triangular part is not referenced. (see *Application Notes* below).

ia, *ja* — (global) `INTEGER`. The row and column indices in the global matrix *A* indicating the first row and the first column of the submatrix *A*, respectively.

desca — (global and local) `INTEGER` array of size *dlen_*. The array descriptor for the distributed matrix *A*.

work — (local)

`COMPLEX` for `pchetrd`

`DOUBLE COMPLEX` for `pzhetrd`.

Workspace array of size *lwork*.

lwork

(local or global) INTEGER, size of *work*, must be at least:

lwork≥max(NB*(*np* +1), 3*NB)

where NB = *mb_a* = *nb_a*,

np = numroc(*n*, NB, MYROW, *iarow*, NPROW),

iarow = indxg2p(*ia*, NB, MYROW, *rsrc_a*, NPROW).

indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.

If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a

On exit,

If *uplo* = 'U', the diagonal and first superdiagonal of sub(*A*) are overwritten by the corresponding elements of the tridiagonal matrix *T*, and the elements above the first superdiagonal, with the array *tau*, represent the unitary matrix *Q* as a product of elementary reflectors;if *uplo* = 'L', the diagonal and first subdiagonal of sub(*A*) are overwritten by the corresponding elements of the tridiagonal matrix *T*, and the elements below the first subdiagonal, with the array *tau*, represent the unitary matrix *Q* as a product of elementary reflectors (see *Application Notes* below).

d

(local)

REAL for pchetrd

DOUBLE PRECISION for pzhetrd.

Arrays of size *LOCc*(*ja*+*n*-1). The diagonal elements of the tridiagonal matrix *T*:

d(*i*)= *A*(*i*,*i*).

d is tied to the distributed matrix *A*.

e

(local)

REAL for pchetrd

DOUBLE PRECISION for pzhetrd.

Arrays of size *LOCc*(*ja*+*n*-1) if *uplo* = 'U'; *LOCc*(*ja*+*n*-2) - otherwise.

The off-diagonal elements of the tridiagonal matrix *T*:

e(*i*)= *A*(*i*,*i*+1) if *uplo* = 'U',

e(*i*) = *A*(*i*+1,*i*) if *uplo* = 'L'.

e is tied to the distributed matrix *A*.

tau

(local) COMPLEX for pchetrd

DOUBLE COMPLEX for pzhetrd.

	Array of size `LOCc(ja+n-1)`. This array contains the scalar factors of the elementary reflectors. `tau` is tied to the distributed matrix *A*.
`work(1)`	On exit `work(1)` contains the minimum value of `lwork` required for optimum performance.
`info`	(global) `INTEGER`. `= 0`: the execution is successful. `< 0`: if the *i*-th argument is an array and the *j*-th entry had an illegal value, then `info` = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then `info` = -*i*.

Application Notes

If `uplo = 'U'`, the matrix *Q* is represented as a product of elementary reflectors

Q = *H*(`n`-1)*...**H*(2)**H*(1).

Each *H*(*i*) has the form

H(*i*) = *i* - *tau***v***v*',

where *tau* is a complex scalar, and *v* is a complex vector with *v*(*i*+1:`n`) = 0 and *v*(*i*) = 1; *v*(1:*i*-1) is stored on exit in *A*(`ia`:`ia`+*i*-2, `ja`+*i*), and *tau* in `tau`(`ja`+*i*-1).

If `uplo = 'L'`, the matrix *Q* is represented as a product of elementary reflectors

Q = *H*(1)**H*(2)*...**H*(`n`-1).

Each *H*(*i*) has the form

H(*i*) = *i* - *tau***v***v*',

where *tau* is a complex scalar, and *v* is a complex vector with *v*(1:*i*) = 0 and *v*(*i*+1) = 1; *v*(*i*+2:`n`) is stored on exit in *A*(`ia`+*i*+1:`ia`+`n`-1,`ja`+*i*-1), and *tau* in `tau`(`ja`+*i*-1).

The contents of sub(*A*) on exit are illustrated by the following examples with `n = 5`:

If `uplo = 'U'`:

$$\begin{bmatrix} d & e & v2 & v3 & v4 \\ & d & e & v3 & v4 \\ & & d & e & v4 \\ & & & d & e \\ & & & & d \end{bmatrix}$$

If `uplo = 'L'`:

$$\begin{bmatrix} d & & & & \\ e & d & & & \\ v1 & e & d & & \\ v1 & v2 & e & d & \\ v1 & v2 & v3 & e & d \end{bmatrix}$$

where *d* and *e* denote diagonal and off-diagonal elements of *T*, and *vi* denotes an element of the vector defining *H*(*i*).

p?unmtr

Multiplies a general matrix by the unitary transformation matrix from a reduction to tridiagonal form determined by `p?hetrd`.

Syntax

`call pcunmtr(side, uplo, trans, m, n, a, ia, ja, desca, tau, c, ic, jc, descc, work, lwork, info)`

`call pzunmtr(side, uplo, trans, m, n, a, ia, ja, desca, tau, c, ic, jc, descc, work, lwork, info)`

Include Files

Description

This routine overwrites the general complex distributed *m*-by-*n* matrix sub(*C*) = *C*(*ic*:*ic*+*m*-1,*jc*:*jc*+*n*-1) with

	side = 'L'	*side* = 'R'
trans = 'N':	*Q**sub(*C*)	sub(*C*)**Q*
trans = 'C':	Q^H*sub(*C*)	sub(*C*)*Q^H

where *Q* is a complex unitary distributed matrix of order *nq*, with *nq* = *m* if *side* = 'L' and *nq* = *n* if *side* = 'R'.

Q is defined as the product of *nq*-1 elementary reflectors, as returned by `p?hetrd`.

If *uplo* = 'U', *Q* = *H*(*nq*-1)... *H*(2) *H*(1);

If *uplo* = 'L', *Q* = *H*(1) *H*(2)... *H*(*nq*-1).

Input Parameters

side (global) CHARACTER

='L': *Q* or Q^H is applied from the left.

='R': *Q* or Q^H is applied from the right.

trans (global) CHARACTER

='N', no transpose, *Q* is applied.

='C', conjugate transpose, Q^H is applied.

uplo (global) CHARACTER.

= 'U': Upper triangle of *A*(*ia*:*, *ja*:*) contains elementary reflectors from p?hetrd;

= 'L': Lower triangle of *A*(*ia*:*,*ja*:*) contains elementary reflectors from p?hetrd

m (global) INTEGER. The number of rows in the distributed matrix sub(*C*) (*m*≥0).

n (global) INTEGER. The number of columns in the distributed matrix sub(*C*) (*n*≥0).

a (local)

REAL for pcunmtr

DOUBLE PRECISION for pzunmtr.

Pointer into the local memory to an array of size (*lld_a*,*LOCc*(*ja*+*m*-1)) if *side* = 'L', and (*lld_a*,*LOCc*(*ja*+*n*-1)) if *side* = 'R'.

Contains the vectors which define the elementary reflectors, as returned by p?hetrd.

If *side*='L', *lld_a* ≥ max(1,*LOCr*(*ia*+*m*-1));

If *side* ='R', *lld_a* ≥ max(1,*LOCr*(*ia*+*n*-1)).

ia, *ja* (global) INTEGER. The row and column indices in the global matrix *A* indicating the first row and the first column of the submatrix *A*, respectively.

desca (global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *A*.

tau (local)

COMPLEX for pcunmtr

DOUBLE COMPLEX for pzunmtr.

Array of size of *ltau* where

If *side* = 'L' and *uplo* = 'U', *ltau* = *LOCc*(*m_a*),

if *side* = 'L' and *uplo* = 'L', *ltau* = *LOCc*(*ja*+*m*-2),

if *side* = 'R' and *uplo* = 'U', *ltau* = *LOCc*(*n_a*),

if *side* = 'R' and *uplo* = 'L', *ltau* = *LOCc*(*ja*+*n*-2).

tau(*i*) must contain the scalar factor of the elementary reflector *H*(*i*), as returned by p?hetrd. *tau* is tied to the distributed matrix *A*.

c (local) COMPLEX for pcunmtr

DOUBLE COMPLEX for pzunmtr.

Pointer into the local memory to an array of size (*lld_c*,*LOCc*(*jc*+*n*-1)). Contains the local pieces of the distributed matrix sub (*C*).

ic, *jc*

(global) INTEGER. The row and column indices in the global matrix *C* indicating the first row and the first column of the submatrix *C*, respectively.

descc

(global and local) INTEGER array of size *dlen_*. The array descriptor for the distributed matrix *C*.

work

(local)

COMPLEX for pcunmtr

DOUBLE COMPLEX for pzunmtr.

Workspace array of size *lwork*.

lwork

(local or global) INTEGER, size of *work*, must be at least:

If *uplo* = 'U',

iaa= *ia*; *jaa*= *ja*+1, *icc*= *ic*; *jcc*= *jc*;

else *uplo* = 'L',

iaa= *ia*+1, *jaa*= *ja*;

If *side* = 'L',

icc= *ic*+1; *jcc*= *jc*;

else *icc*= *ic*; *jcc*= *jc*+1;

end if

end if

If *side* = 'L',

mi= *m*-1; *ni*= *n*

lwork ≥ max((*nb_a**(*nb_a*-1))/2, (*nqc*0 + *mpc*0)**nb_a*) + *nb_a***nb_a*

else

If *side* = 'R',

mi= *m*; *mi* = *n*-1;

lwork ≥ max((*nb_a**(*nb_a*-1))/2, (*nqc*0 + max(*npa*0+numroc(numroc(*ni*+*icoffc*, *nb_a*, 0, 0, NPCOL), *nb_a*, 0, 0, *lcmq*), *mpc*0))**nb_a*) + *nb_a***nb_a*

end if

where *lcmq* = *lcm*/NPCOL with *lcm* = ilcm(NPROW, NPCOL),

iroffa = mod(*iaa*-1, *mb_a*),

icoffa = mod(*jaa*-1, *nb_a*),

iarow = indxg2p(*iaa*, *mb_a*, MYROW, *rsrc_a*, NPROW),

*npa*0 = numroc(*ni*+*iroffa*, *mb_a*, MYROW, *iarow*, NPROW),

iroffc = mod(*icc*-1, *mb_c*),

icoffc = mod(*jcc*-1, *nb_c*),

icrow = indxg2p(*icc*, *mb_c*, MYROW, *rsrc_c*, NPROW),

iccol = indxg2p(*jcc*, *nb_c*, MYCOL, *csrc_c*, NPCOL),

*mpc*0 = numroc(*mi*+*iroffc*, *mb_c*, MYROW, *icrow*, NPROW),

*nqc*0 = numroc(*ni*+*icoffc*, *nb_c*, MYCOL, *iccol*, NPCOL),

NOTE
mod(*x*,*y*) is the integer remainder of *x*/*y*.

ilcm, indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo. If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

c — Overwritten by the product *Q**sub(*C*), or *Q'**sub(*C*), or sub(*C*)**Q',* or sub(*C*)**Q*.

work(1) — On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.

info — (global) INTEGER.

= 0: the execution is successful.

< 0: if the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.
