Developer Reference for Intel® oneAPI Math Kernel Library - Fortran

1

For more documentation on this and other products, visit the oneAPI Documentation Library.

Intel® Math Kernel Library is now Intel® oneAPI Math Kernel Library (oneMKL).

Documentation for versions of Intel® Math Kernel Library older than 2023.0 is available for download only. See Downloadable Documentation.

What's New

C interface: *Developer Reference for Intel® oneAPI Math Kernel Library - C*

This publication describes the Fortran interface.

Basic Linear Algebra Subprograms (BLAS)	The BLAS routines provide vector, matrix-vector, and matrix-matrix operations.
Sparse BLAS	The Sparse BLAS routines provide basic operations on sparse vectors and matrices.
Sparse QR	The Sparse QR Routines provide a multifrontal sparse QR factorization method for solving a sparse system of linear equations.
LAPACK	The LAPACK routines solve systems of linear equations, least square problems, eigenvalue and singular value problems, and Sylvester's equations.
Statistical Functions	The Statistical Functions provides a set of routines implementing commonly used pseudorandom random number generators (RNG) with continuous distribution.
Direct and Iterative Sparse Solvers	Among several options for solving sparse linear systems of equations, oneMKL offers a direct sparse solver based on PARDISO*, which is referred to here as Intel MKL PARDISO.
Vector Mathematics Functions	The Vector Mathematics (VM) functions compute core mathematical functions on vector arguments.
Vector Statistics Functions	The Vector Statistics (VS) functions generate vectors of pseudorandom numbers with different types of statistical distributions and perform convolution and correlation computations.
Fourier Transform Functions	The Fourier Transform Functions offer several options for computing Fast Fourier Transforms (FFTs).

Getting Help and Support

Intel provides a support web site that contains a rich repository of self help information, including getting started tips, known product issues, product errata, license information, user forums, and more. Visit the Intel® oneAPI Math Kernel Library (oneMKL) support website athttp://www.intel.com/software/products/support/.

What's New

This Developer Reference documents Intel® oneAPI Math Kernel Library (oneMKL) release for the Fortran interface.

Intel® Math Kernel Library is now Intel® oneAPI Math Kernel Library (oneMKL). Documentation for older versions of Intel® Math Kernel Library is available for download only. For a list of available documentation downloads by product version, see these pages:

- Download Documentation for Intel® Parallel Studio XE
- Download Documentation for Intel® System Studio

The manual has been updated to reflect enhancements to the product, besides improvements and error corrections.

Product and Performance Information
Performance varies by use, configuration and other factors. Learn more at www.Intel.com/PerformanceIndex. Notice revision #20201201

Notational Conventions

This manual uses the following terms to refer to operating systems:

Windows* OS	This term refers to information that is valid on all supported Windows* operating systems.
Linux* OS	This term refers to information that is valid on all supported Linux* operating systems.
macOS*	This term refers to information that is valid on Intel®-based systems running the macOS* operating system.

This manual uses the following notational conventions:

- Routine name shorthand (for example, `?ungqr` instead of `cungqr`/`zungqr`).
- Font conventions used for distinction between the text and the code.

Routine Name Shorthand

For shorthand, names that contain a question mark "`?`" represent groups of routines with similar functionality. Each group typically consists of routines used with four basic data types: single-precision real, double-precision real, single-precision complex, and double-precision complex. The question mark is used to indicate any or all possible varieties of a function; for example:

`?swap`	Refers to all four data types of the vector-vector `?swap` routine: `sswap`, `dswap`, `cswap`, and `zswap`.

Font Conventions

The following font conventions are used:

`UPPERCASE COURIER`	Data type used in the description of input and output parameters for Fortran interface. For example, `CHARACTER*1`.
`lowercase courier`	Code examples: `a(k+i,j) = matrix(i,j)`
`lowercase courier italic`	Variables in arguments and parameters description. For example, *incx*.
`*`	Used as a multiplication symbol in code examples and equations and where required by the programming language syntax.

Overview

NOTE
This publication, the *Intel® oneAPI Math Kernel Library Developer Reference*, was previously known as the *Intel® oneAPI Math Kernel Library Reference Manual*.

Intel® oneAPI Math Kernel Library (oneMKL) is optimized for performance on Intel processors. oneMKL also runs on non-Intel x86-compatible processors.

NOTE
oneMKL provides limited input validation to minimize the performance overheads. It is your responsibility when using oneMKL to ensure that input data has the required format and does not contain invalid characters. These can cause unexpected behavior of the library. Examples of the inputs that may result in unexpected behavior:

- Not-a-number (NaN) and other special floating point values
- Large inputs may lead to accumulator overflow

As the oneMKL API accepts raw pointers, it is your application's responsibility to validate the buffer sizes before passing them to the library. The library requires subroutine and function parameters to be valid before being passed. While some oneMKL routines do limited checking of parameter errors, your application should check for NULL pointers, for example.

The Intel® oneAPI Math Kernel Library includes Fortran routines and functions optimized for Intel® processor-based computers running operating systems that support multiprocessing. In addition to the Fortran interface, Intel® oneAPI Math Kernel Library (oneMKL) includes a C-language interface for the Discrete Fourier transform functions, as well as for the Vector Mathematics and Vector Statistics functions. For hardware and software requirements to use Intel® oneAPI Math Kernel Library (oneMKL), see*Intel® oneAPI Math Kernel Library (oneMKL) Release Notes*.

NOTE
Functions calls at runtime for Intel® oneAPI Math Kernel Library (oneMKL) libraries on the Microsoft Windows* operating system can utilize the function,`LoadLibrary()`, and related loading functions in static, dynamic, and single dynamic library linking models. These functions attempt to access the loader lock which when used within or at the same time as another `DllMain`function call, can lead to a deadlock. If possible, avoid making your calls to Intel® oneAPI Math Kernel Library (oneMKL) in a`DllMain` function or at the same time as other calls to `DllMain` even on separate threads. Refer to Microsoft documentation about *DllMain* and *Dynamic-Link Library Best Practices* for more details.

BLAS Routines

The BLAS routines and functions are divided into the following groups according to the operations they perform:

- BLAS Level 1 Routines perform operations of both addition and reduction on vectors of data. Typical operations include scaling and dot products.
- BLAS Level 2 Routines perform matrix-vector operations, such as matrix-vector multiplication, rank-1 and rank-2 matrix updates, and solution of triangular systems.
- BLAS Level 3 Routines perform matrix-matrix operations, such as matrix-matrix multiplication, rank-k update, and solution of triangular systems.

Starting from release 8.0, Intel® oneAPI Math Kernel Library (oneMKL) also supports the Fortran 95 interface to the BLAS routines.

Starting from release 10.1, a number of BLAS-like Extensions are added to enable the user to perform certain data manipulation, including matrix in-place and out-of-place transposition operations combined with simple matrix arithmetic operations.

Sparse BLAS Routines

The Sparse BLAS Level 1 Routines and Functions and Sparse BLAS Level 2 and Level 3 Routinesroutines and functions operate on sparse vectors and matrices. These routines perform vector operations similar to the BLAS Level 1, 2, and 3 routines. The Sparse BLAS routines take advantage of vector and matrix sparsity: they allow you to store only non-zero elements of vectors and matrices. Intel® oneAPI Math Kernel Library (oneMKL) also supports Fortran 95 interface to Sparse BLAS routines.

Sparse QR

Sparse QRin Intel® oneAPI Math Kernel Library (oneMKL) is a set of routines used to solve sparse matrices with real coefficients and general structure. All Sparse QR routines can be divided into three steps: reordering, factorization, and solving. Currently, only CSR format is supported for the input matrix, and Sparse QR operates on the matrix handle used in all SpBLAS IE routines. (For details on how to create a matrix handle, refer tomkl-sparse-create-csr.)

LAPACK Routines

The Intel® oneAPI Math Kernel Library fully supports the LAPACK 3.7 set of computational, driver, auxiliary and utility routines.

The original versions of LAPACK from which that part of Intel® oneAPI Math Kernel Library (oneMKL) was derived can be obtained fromhttp://www.netlib.org/lapack/index.html. The authors of LAPACK are E. Anderson, Z. Bai, C. Bischof, S. Blackford, J. Demmel, J. Dongarra, J. Du Croz, A. Greenbaum, S. Hammarling, A. McKenney, and D. Sorensen.

The LAPACK routines can be divided into the following groups according to the operations they perform:

- Routines for solving systems of linear equations, factoring and inverting matrices, and estimating condition numbers (see LAPACK Routines: Linear Equations).
- Routines for solving least squares problems, eigenvalue and singular value problems, and Sylvester's equations (see LAPACK Routines: Least Squares and Eigenvalue Problems).
- Auxiliary and utility routines used to perform certain subtasks, common low-level computation or related tasks (see LAPACK Auxiliary Routines and LAPACK Utility Functions and Routines).

Starting from release 8.0, Intel® oneAPI Math Kernel Library (oneMKL) also supports the Fortran 95 interface to LAPACK computational and driver routines. This interface provides an opportunity for simplified calls of LAPACK routines with fewer required arguments.

ScaLAPACK Routines

The ScaLAPACK package (provided only for Intel® 64 architectures; see ScaLAPACK Routines) runs on distributed-memory architectures and includes routines for solving systems of linear equations, solving linear least squares problems, eigenvalue and singular value problems, as well as performing a number of related computational tasks.

The original versions of ScaLAPACK from which that part of Intel® oneAPI Math Kernel Library (oneMKL) was derived can be obtained fromhttp://www.netlib.org/scalapack/index.html. The authors of ScaLAPACK are L. Blackford, J. Choi, A.Cleary, E. D'Azevedo, J. Demmel, I. Dhillon, J. Dongarra, S. Hammarling, G. Henry, A. Petitet, K.Stanley, D. Walker, and R. Whaley.

The Intel® oneAPI Math Kernel Library (oneMKL) version of ScaLAPACK is optimized for Intel® processors and uses MPICH version of MPI as well as Intel MPI.

PBLAS Routines

The PBLAS routines perform operations with distributed vectors and matrices.

- PBLAS Level 1 Routines perform operations of both addition and reduction on vectors of data. Typical operations include scaling and dot products.
- PBLAS Level 2 Routines perform distributed matrix-vector operations, such as matrix-vector multiplication, rank-1 and rank-2 matrix updates, and solution of triangular systems.
- PBLAS Level 3 Routines perform distributed matrix-matrix operations, such as matrix-matrix multiplication, rank-*k* update, and solution of triangular systems.

Intel® oneAPI Math Kernel Library (oneMKL) provides the PBLAS routines with interface similar to the interface used in the Netlib PBLAS (part of the ScaLAPACK package, see http://www.netlib.org/scalapack/html/pblas_qref.html).

Sparse Solver Routines

Direct sparse solver routines in Intel® oneAPI Math Kernel Library (oneMKL) (seeSparse Solver Routines) solve symmetric and symmetrically-structured sparse matrices with real or complex coefficients. For symmetric matrices, these Intel® oneAPI Math Kernel Library (oneMKL) subroutines can solve both positive-definite and indefinite systems. Intel® oneAPI Math Kernel Library (oneMKL) includes a solver based on the PARDISO* sparse solver, referred to as Intel® oneAPI Math Kernel Library (oneMKL) PARDISO, as well as an alternative set of user callable direct sparse solver routines.

If you use the Intel® oneAPI Math Kernel Library (oneMKL) PARDISO sparse solver, please cite:

O.Schenk and K.Gartner. Solving unsymmetric sparse systems of linear equations with PARDISO. J. of Future Generation Computer Systems, 20(3):475-487, 2004.

Intel® oneAPI Math Kernel Library (oneMKL) provides also an iterative sparse solver (seeSparse Solver Routines) that uses Sparse BLAS level 2 and 3 routines and works with different sparse data formats.

Extended Eigensolver Routines

TheExtended Eigensolver RCI Routines is a set of high-performance numerical routines for solving standard ($Ax = \lambda x$) and generalized ($Ax = \lambda Bx$) eigenvalue problems, where A and B are symmetric or Hermitian. It yields all the eigenvalues and eigenvectors within a given search interval. It is based on the Feast algorithm, an innovative fast and stable numerical algorithm presented in [Polizzi09], which deviates fundamentally from the traditional Krylov subspace iteration based techniques (Arnoldi and Lanczos algorithms [Bai00]) or other Davidson-Jacobi techniques [Sleijpen96]. The Feast algorithm is inspired by the density-matrix representation and contour integration technique in quantum mechanics.

It is free from orthogonalization procedures. Its main computational tasks consist of solving very few inner independent linear systems with multiple right-hand sides and one reduced eigenvalue problem orders of magnitude smaller than the original one. The Feast algorithm combines simplicity and efficiency and offers

many important capabilities for achieving high performance, robustness, accuracy, and scalability on parallel architectures. This algorithm is expected to significantly augment numerical performance in large-scale modern applications.

Some of the characteristics of the Feast algorithm [Polizzi09] are:

- Converges quickly in 2-3 iterations with very high accuracy
- Naturally captures all eigenvalue multiplicities
- No explicit orthogonalization procedure
- Can reuse the basis of pre-computed subspace as suitable initial guess for performing outer-refinement iterations

  This capability can also be used for solving a series of eigenvalue problems that are close one another.
- The number of internal iterations is independent of the size of the system and the number of eigenpairs in the search interval
- The inner linear systems can be solved either iteratively (even with modest relative residual error) or directly

VM Functions

The Vector Mathematics functions (see Vector Mathematical Functions) include a set of highly optimized implementations of certain computationally expensive core mathematical functions (power, trigonometric, exponential, hyperbolic, etc.) that operate on vectors of real and complex numbers.

Application programs that might significantly improve performance with VM include nonlinear programming software, integrals computation, and many others. VM provides interfaces both for Fortran and C languages.

Statistical Functions

Vector Statistics (VS) contains three sets of functions (see Statistical Functions) providing:

- Pseudorandom, quasi-random, and non-deterministic random number generator subroutines implementing basic continuous and discrete distributions. To provide best performance, the VS subroutines use calls to highly optimized Basic Random Number Generators (BRNGs) and a set of vector mathematical functions.
- A wide variety of convolution and correlation operations.
- Initial statistical analysis of raw single and double precision multi-dimensional datasets.

Fourier Transform Functions

The Intel® oneAPI Math Kernel Library (oneMKL) multidimensional Fast Fourier Transform (FFT) functions with mixed radix support (see Fourier Transform Functions) provide uniformity of discrete Fourier transform computation and combine functionality with ease of use. Both Fortran and C interface specifications are given. There is also a cluster version of FFT functions, which runs on distributed-memory architectures and is provided only for Intel® 64 architectures.

The FFT functions provide fast computation via the FFT algorithms for arbitrary lengths. See the *Intel® oneAPI Math Kernel Library (oneMKL) Developer Guide* for the specific radices supported.

Partial Differential Equations Support

Intel® oneAPI Math Kernel Library (oneMKL) provides tools for solving Partial Differential Equations (PDE) (seePartial Differential Equations Support). These tools are Trigonometric Transform interface routines and Poisson Solver.

The Trigonometric Transform routines may be helpful to users who implement their own solvers similar to the Intel® oneAPI Math Kernel Library (oneMKL) Poisson Solver. The users can improve performance of their solvers by using fast sine, cosine, and staggered cosine transforms implemented in the Trigonometric Transform interface.

The Poisson Solver is designed for fast solving of simple Helmholtz, Poisson, and Laplace problems. The Trigonometric Transform interface, which underlies the solver, is based on the Intel® oneAPI Math Kernel Library (oneMKL) FFT interface (refer toFourier Transform Functions), optimized for Intel® processors.

Nonlinear Optimization Problem Solvers

Intel® oneAPI Math Kernel Library (oneMKL) provides Nonlinear Optimization Problem Solver routines (seeNonlinear Optimization Problem Solvers) that can be used to solve nonlinear least squares problems with or without linear (bound) constraints through the Trust-Region (TR) algorithms and compute Jacobi matrix by central differences.

Support Functions

The Intel® oneAPI Math Kernel Library (oneMKL) support functions (seeSupport Functions) are used to support the operation of the Intel® oneAPI Math Kernel Library (oneMKL) software and provide basic information on the library and library operation, such as the current library version, timing, setting and measuring of CPU frequency, error handling, and memory allocation.

Starting from release 10.0, the Intel® oneAPI Math Kernel Library (oneMKL) support functions provide additional threading control.

Starting from release 10.1, Intel® oneAPI Math Kernel Library (oneMKL) selectively supports a*Progress Routine* feature to track progress of a lengthy computation and/or interrupt the computation using a callback function mechanism. The user application can define a function called `mkl_progress`that is regularly called from the Intel® oneAPI Math Kernel Library (oneMKL) routine supporting the progress routine feature. SeeProgress Routine in Support Functions for reference. Refer to a specific LAPACK or DSS/PARDISO function description to see whether the function supports this feature or not.

BLACS Routines

The Intel® oneAPI Math Kernel Library implements routines from the BLACS (Basic Linear Algebra Communication Subprograms) package (seeBLACS Routines) that are used to support a linear algebra oriented message passing interface that may be implemented efficiently and uniformly across a large range of distributed memory platforms.

The original versions of BLACS from which that part of Intel® oneAPI Math Kernel Library (oneMKL) was derived can be obtained from http://www.netlib.org/blacs/index.html. The authors of BLACS are Jack Dongarra and R. Clint Whaley.

Data Fitting Functions

The Data Fitting component includes a set of highly-optimized implementations of algorithms for the following spline-based computations:

- spline construction
- interpolation including computation of derivatives and integration
- search

The algorithms operate on single and double vector-valued functions set in the points of the given partition. You can use Data Fitting algorithms in applications that are based on data approximation. See Data Fitting Functions for more information.

Performance Enhancements

The Intel® oneAPI Math Kernel Library has been optimized by exploiting both processor and system features and capabilities. Special care has been given to those routines that most profit from cache-management techniques. These especially include matrix-matrix operation routines such as`dgemm()`.

In addition, code optimization techniques have been applied to minimize dependencies of scheduling integer and floating-point units on the results within the processor.

The major optimization techniques used throughout the library include:

- Loop unrolling to minimize loop management costs
- Blocking of data to improve data reuse opportunities
- Copying to reduce chances of data eviction from cache
- Data prefetching to help hide memory latency
- Multiple simultaneous operations (for example, dot products in `dgemm`) to eliminate stalls due to arithmetic unit pipelines
- Use of hardware features such as the SIMD arithmetic units, where appropriate

These are techniques from which the arithmetic code benefits the most.

Product and Performance Information
Performance varies by use, configuration and other factors. Learn more at www.Intel.com/PerformanceIndex. Notice revision #20201201

Parallelism

Intel® oneAPI Math Kernel Library (oneMKL) offers performance gains through parallelism provided by the symmetric multiprocessing performance (SMP) feature. You can obtain improvements from SMP in the following ways:

- One way is based on user-managed threads in the program and further distribution of the operations over the threads based on data decomposition, domain decomposition, control decomposition, or some other parallelizing technique. Each thread can use any of the Intel® oneAPI Math Kernel Library (oneMKL) functions (except for the deprecated`?lacon` LAPACK routine) because the library has been designed to be thread-safe.
- Another method is to use the FFT and BLAS level 3 routines. They have been parallelized and require no alterations of your application to gain the performance enhancements of multiprocessing. Performance using multiple processors on the level 3 BLAS shows excellent scaling. Since the threads are called and managed within the library, the application does not need to be recompiled thread-safe (see also Fortran 95 Interface Conventions in BLAS and Sparse BLAS Routines).
- Yet another method is to use *tuned LAPACK routines*. Currently these include the single- and double precision flavors of routines for *QR* factorization of general matrices, triangular factorization of general and symmetric positive-definite matrices, solving systems of equations with such matrices, as well as solving symmetric eigenvalue problems.

For instructions on setting the number of available processors for the BLAS level 3 and LAPACK routines, see *Intel® oneAPI Math Kernel Library (oneMKL) Developer Guide*.

Performance varies by use, configuration and other factors. Learn more at www.Intel.com/PerformanceIndex. Notice revision #20201201

OpenMP* Offload

This section describes how to perform OpenMP offload computations using Intel® oneAPI Math Kernel Library.

OpenMP* Offload for Intel® oneAPI Math Kernel Library

You can use Intel® oneAPI Math Kernel Library (oneMKL) and OpenMP* offload to run standard oneMKL computations on Intel GPUs. You can find the list of oneMKL features that support OpenMP offload in the `mkl_omp_offload.f90` interface module file which includes:

- All Level 1, 2, and 3 BLAS functions, supporting both synchronous and asynchronous execution
- BLAS-like extensions: `?axpby`, `?axpy_batch_strided`, `?gemv_batch_strided`, `?dgmm_batch_strided`, `gemm_s8u8s32`, `?gemm_batch_strided`, `?trsm_batch_strided`, `?gemmt`, `mkl_?omatcopy_batch_strided`, `mkl_?imatcopy_batch_strided`, and `mkl_?omatadd_batch_strided`, supporting synchronous and asynchronous execution
- LAPACK, including LAPACK-like extensions
  - All computations on the Intel GPU (supports both synchronous and asynchronous execution):
    - `?getrf_batch_strided`
    - `?getrfnp_batch_strided`
    - `?getri`
    - `?getri_oop_batch_strided`
    - `?getrs`
    - `?getrs_batch_strided`
    - `?getrsnp_batch_strided`
    - `?gels_batch_strided`
    - `?potrf`
    - `?potri`
    - `?potrs`
    - `?trtri`
    - `?trtrs`
  - Hybrid; some computations on the Intel GPU (supports synchronous execution):
    - `?geqrf`
    - `?getrf` (all computations on the CPU for n <= 256)
    - `mkl_?getrfnp` (all computations on the CPU for n <= 512)
    - `?ormqr`, `?unmqr`
  - Interface support only; all computations on the CPU (supports synchronous execution):
    - `?gebrd`
    - `?gesvd`
    - `?orgqr`, `?ungqr`
    - `?steqr`
    - `?syev`, `?heev`
    - `?syevd`, `?heevd`
    - `?syevx`, `?heevx`
    - `?sygvd`, `?hegvd`
    - `?sygvx`, `?hegvx`
    - `?sytrd`, `?hetrd`
- FFTs through both DFTI and FFTW3 interfaces in one, two, and three dimensions.
  - For COMPLEX_STORAGE, only the DFTI_COMPLEX_COMPLEX format is currently supported on CPU and GPU devices.
  - Both synchronous and asynchronous computations are supported.
  - For R2C/C2R transforms on the GPU, only DFTI_CONJUGATE_EVEN_STORAGE=DFTI_COMPLEX_COMPLEX is supported (implying DFTI_PACKED_FORMAT=DFTI_CCE_FORMAT).

- 2D and 3D FFTs are supported using rank-2/rank-3 Fortran arrays for input and output only through Fortran OpenMP offload interface.
- **NOTE** `INCONSISTENT_CONFIGURATION` errors at compute time indicate an invalid descriptor or invalid data pointer. Double check your data mapping if you encounter such errors.

- Arbitrary strides and batch distances are not supported for multi-dimensional R2C transforms offloaded to the GPU. Considering the first dimension of the data, every element must be separated from its two nearest peers (along another dimension and/or in another batch) by a constant distance. For example, to compute a batched, two-dimensional R2C FFT of size `[N1, N2]` with input strides `[0, 1, S2]` (column-major layout with unit elementary stride and no offset), `INPUT_DISTANCE` must be equal to `N2*S2` so that every element is separated from its nearest first-dimension counterpart(s) by a distance `S2` (in this example), even across batches.
- Transforms on GPU devices may overwrite FFT-irrelevant, padding entries in the output data.

- Vector Statistics
  - Random number generators

    NOTE
    All distributions are supported. See https://www.intel.com/content/www/us/en/docs/onemkl/developer-reference-fortran/current/distribution-generators.html

    Basic random number generators:

    - VSL_BRNG_MCG31
    - VSL_BRNG_MCG59
    - VSL_BRNG_PHILOX4X32X10
    - VSL_BRNG_MRG32K3A
    - VSL_BRNG_MT19937
    - VSL_BRNG_MT2203
    - VSL_BRNG_SOBOL
  - Summary statistics

    Supports the `vsl?SSCompute` routine for the following estimates:

    - VSL_SS_MEAN
    - VSL_SS_SUM
    - VSL_SS_2R_MOM
    - VSL_SS_2R_SUM
    - VSL_SS_3R_MOM
    - VSL_SS_3R_SUM
    - VSL_SS_4R_MOM
    - VSL_SS_4R_SUM
    - VSL_SS_2C_MOM
    - VSL_SS_2C_SUM
    - VSL_SS_3C_MOM
    - VSL_SS_3C_SUM
    - VSL_SS_4C_MOM
    - VSL_SS_4C_SUM
    - VSL_SS_KURTOSIS
    - VSL_SS_SKEWNESS
    - VSL_SS_MIN
    - VSL_SS_MAX
    - VSL_SS_VARIATION

    Supported methods:

    - VSL_SS_METHOD_FAST
    - VSL_SS_METHOD_FAST_USER_MEAN

The OpenMP offload feature from Intel® oneAPI Math Kernel Library (oneMKL) allows you to run oneMKL computations on Intel GPUs through the standard oneMKL APIs within an `omp target variant dispatch` section. For example, the standard CBLAS API for single precision real data type matrix multiply is:

```
subroutine sgemm ( transa, transb, m, n, k, alpha, a, lda,        &
          &b, ldb, beta, c, ldc ) BIND(C)
       character*1,intent(in)              :: transa, transb
       integer,intent(in)                  :: m, n, k, lda, ldb, ldc
       real,intent(in)                     :: alpha, beta
       real,intent(in)                     :: a( lda, * ), b( ldb, * )
       real,intent(inout)                  :: c( ldc, * )
     end subroutine sgemm
```

If `sgemm` is called outside of an `omp target variant dispatch` section or if offload is disabled, then the CPU implementation is dispatched. If the same function is called within an `omp target variant dispatch` section and offload is possible then the GPU implementation is dispatched. By default the execution of the oneMKL function within a dispatch variant construct is synchronous, the `nowait` clause can be used on the `dispatch variant` construct to specify that asynchronous execution is desired. In that case, synchronization needs to be handled by the application using standard OpenMP synchronization functionality, for example the `omp taskwait` construct.

In order to offload to a device, arguments to the oneMKL function must be mapped to the device memory if they represent a return value (marked with `intent(out)` or `intent(inout)` in the subroutine declaration) or if they point to an array of data (such as a matrix or vector, even if it is an input array). Users must map these arguments to the device using the `omp target data` construct before calling the oneMKL routine, and in addition must use the `use_device_ptr` clause in the `omp target variant dispatch` construct to specify variables that have been mapped to device memory.

In Fortran, the OpenMP Offload interfaces have stricter type checking than the standard Fortran interfaces for the same functions. For BLAS functions and BLAS-like extensions, you can bypass this stricter type checking by changing the module that is loaded. For example, in the example below, include `use onemkl_blas_omp_offload_lp64_no_array_check` instead of `use onemkl_blas_omp_offload_lp64`.

Example

Examples for using the OpenMP offload for oneMKL are located in the Intel® oneAPI Math Kernel Library (oneMKL) installation directory, under:

```
examples/f_offload
```

```
include "mkl_omp_offload.f90"

program sgemm_example
use onemkl_blas_omp_offload_lp64
use common_blas

character*1 :: transa = 'N', transb = 'N'
integer :: i, j, m = 5, n = 3, k = 10
integer :: lda, ldb, ldc
real :: alpha = 1.0, beta = 1.0
real,allocatable :: a(:,:), b(:,:), c(:,:)

! initialize leading dimension and allocate and initialize arrays
lda = m
…
allocate(a(lda,k))
…

! initialize matrices
call sinit_matrix(transa, m, k, lda, a)
…
```

```
! Calling sgemm on the CPU using standard oneMKL Fortran interface
call sgemm(transa, transb, m, n, k, alpha, a, lda, b, ldb, beta, c, ldc)

! map the a, b and c matrices on the device memory
!$omp target data map(a,b,c)

! Calling sgemm on the GPU using standard oneMKL Fortran interface within a variant dispatch
construct
! Use the use_device_ptr clause to specify that a, b and c are device memory
!$omp target variant dispatch use_device_ptr(a,b,c)
call sgemm(transa, transb, m, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
!$omp end target variant dispatch

!$omp end target data

! Free memory
deallocate(a)
…
stop
end program
```

BLAS and Sparse BLAS Routines

Intel® oneAPI Math Kernel Library (oneMKL)implements the BLAS and Sparse BLAS routines, and BLAS-like extensions. The routine descriptions are arranged in several sections:

- BLAS Level 1 Routines (vector-vector operations)
- BLAS Level 2 Routines (matrix-vector operations)
- BLAS Level 3 Routines (matrix-matrix operations)
- Sparse BLAS Level 1 Routines (vector-vector operations).
- Sparse BLAS Level 2 and Level 3 Routines (matrix-vector and matrix-matrix operations)
- BLAS-like Extensions

The question mark in the group name corresponds to different character codes indicating the data type (`s`, `d`, `c`, and `z` or their combination); see *Routine Naming Conventions*.

When BLAS or Sparse BLAS routines encounter an error, they call the error reporting routine `xerbla`.

BLAS Routines

Naming Conventions for BLAS Routines

BLAS routine names have the following structure:

<character> <name> <mod>

The *<character>* field indicates the data type:

`s`	real, single precision
`c`	complex, single precision
`d`	real, double precision
`z`	complex, double precision

Some routines and functions can have combined character codes, such as `sc` or `dz`.

For example, the function `scasum` uses a complex input array and returns a real value.

The <*name*> field, in BLAS level 1, indicates the operation type. For example, the BLAS level 1 routines `?dot`, `?rot`, `?swap` compute a vector dot product, vector rotation, and vector swap, respectively.

In BLAS level 2 and 3, <*name*> reflects the matrix argument type:

`ge`	general matrix
`gb`	general band matrix
`sy`	symmetric matrix
`sp`	symmetric matrix (packed storage)
`sb`	symmetric band matrix
`he`	Hermitian matrix
`hp`	Hermitian matrix (packed storage)
`hb`	Hermitian band matrix
`tr`	triangular matrix
`tp`	triangular matrix (packed storage)
`tb`	triangular band matrix.

The <*mod*> field, if present, provides additional details of the operation. BLAS level 1 names can have the following characters in the <*mod*> field:

`c`	conjugated vector
`u`	unconjugated vector
`g`	Givens rotation construction
`m`	modified Givens rotation
`mg`	modified Givens rotation construction

BLAS level 2 names can have the following characters in the <*mod*> field:

`mv`	matrix-vector product
`sv`	solving a system of linear equations with a single unknown vector
`r`	rank-1 update of a matrix
`r2`	rank-2 update of a matrix.

BLAS level 3 names can have the following characters in the <*mod*> field:

`mm`	matrix-matrix product
`sm`	solving a system of linear equations with multiple unknown vectors
`rk`	rank-*k* update of a matrix
`r2k`	rank-2*k* update of a matrix.

The examples below illustrate how to interpret BLAS routine names:

`ddot`	`<d> <dot>`: real and double precision, vector-vector dot product
`cdotc`	`<c> <dot> <c>`: complex and single precision, vector-vector dot product, conjugated

`cdotu`	`<c> <dot> <u>`: complex and single precision, vector-vector dot product, unconjugated
`scasum`	`<sc> <asum>`: real and single-precision output, complex and single-precision input, sum of magnitudes of vector elements
`sgemv`	`<s> <ge> <mv>`: real and single precision, general matrix, matrix-vector product
`ztrmm`	`<z> <tr> <mm>`: complex and double precision, triangular matrix, matrix-matrix product

Sparse BLAS level 1 naming conventions are similar to those of BLAS level 1. For more information, see Naming Conventions.

Fortran 95 Interface Conventions for BLAS Routines

The Fortran 95 interface to BLAS and Sparse BLAS Level 1 routines is implemented through wrappers that call respective FORTRAN 77 routines. This interface uses features of Fortran 95 such as assumed-shape arrays and optional arguments to provide simplified calls to BLAS and Sparse BLAS Level 1 routines with fewer parameters.

For BLAS, Intel® oneAPI Math Kernel Library (oneMKL) offers two types of Fortran 95 interfaces:

- using `mkl_blas.fi` only through `include 'mkl.fi'` statement. Such interfaces allow you to make use of the original BLAS routines with all their arguments
- using `blas.f90` that includes improved interfaces. This file is used to generate the module files `blas95.mod` and `f95_precision.mod`. For details, see Fortran 95 interfaces and wrappers to LAPACK and BLAS. The module files are used to process the FORTRAN use clauses referencing the BLAS interface: `use blas95` and `use f95_precision`.

The main conventions used in Fortran 95 interface are as follows:

- The names of parameters used in Fortran 95 interface are typically the same as those used for the respective generic (FORTRAN 77) interface. In rare cases formal argument names may be different.
- Some input parameters such as array dimensions are not required in Fortran 95 and are skipped from the calling sequence. Array dimensions are reconstructed from the user data that must exactly follow the required array shape.
- A parameter can be skipped if its value is completely defined by the presence or absence of another parameter in the calling sequence, and the restored value is the only meaningful value for the skipped parameter.
- Parameters specifying the increment values *incx* and *incy* are skipped. In most cases their values are equal to 1. In Fortran 95 an increment with different value can be directly established in the corresponding parameter.
- Some generic parameters are declared as optional in Fortran 95 interface and may or may not be present in the calling sequence. A parameter can be declared optional if it satisfies one of the following conditions:

  1. It can take only a few possible values. The default value of such parameter typically is the first value in the list; all exceptions to this rule are explicitly stated in the routine description.
  2. It has a natural default value.

  Optional parameters are given in square brackets in Fortran 95 call syntax.

The particular rules used for reconstructing the values of omitted optional parameters are specific for each routine and are detailed in the respective "Fortran 95 Notes" subsection at the end of routine specification section. If this subsection is omitted, the Fortran 95 interface for the given routine does not differ from the corresponding FORTRAN 77 interface.

Note that this interface is not implemented in the current version of Sparse BLAS Level 2 and Level 3 routines.

Matrix Storage Schemes for BLAS Routines

Matrix arguments of BLAS routines can use the following storage schemes:

- *Full storage*: a matrix *A* is stored in a two-dimensional array *a*, with the matrix element A_{ij} stored in the array element `a(i,j)`.
- *Packed storage* scheme allows you to store symmetric, Hermitian, or triangular matrices more compactly: the upper or lower triangle of the matrix is packed by columns in a one-dimensional array.
- *Band storage*: a band matrix is stored compactly in a two-dimensional array: columns of the matrix are stored in the corresponding columns of the array, and *diagonals* of the matrix are stored in rows of the array.

For more information on matrix storage schemes, see Matrix Arguments in the Appendix "Routine and Function Arguments".

BLAS Level 1 Routines and Functions

BLAS Level 1 includes routines and functions, which perform vector-vector operations. The following table lists the BLAS Level 1 routine and function groups and the data types associated with them.

BLAS Level 1 Routine and Function Groups and Their Data Types

Routine or Function Group	Data Types	Description
?asum	s, d, sc, dz	Sum of vector magnitudes (functions)
?axpy	s, d, c, z	Scalar-vector product (routines)
?copy	s, d, c, z	Copy vector (routines)
?dot	s, d	Dot product (functions)
?sdot	sd, d	Dot product with double precision (functions)
?dotc	c, z	Dot product conjugated (functions)
?dotu	c, z	Dot product unconjugated (functions)
?nrm2	s, d, sc, dz	Vector 2-norm (Euclidean norm) (functions)
?rot	s, d, c, z, cs, zd	Plane rotation of points (routines)
?rotg	s, d, c, z	Generate Givens rotation of points (routines)
?rotm	s, d	Modified Givens plane rotation of points (routines)
?rotmg	s, d	Generate modified Givens plane rotation of points (routines)
?scal	s, d, c, z, cs, zd	Vector-scalar product (routines)
?swap	s, d, c, z	Vector-vector swap (routines)
i?amax	s, d, c, z	Index of the maximum absolute value element of a vector (functions)
i?amin	s, d, c, z	Index of the minimum absolute value element of a vector (functions)
?cabs1	s, d	Auxiliary functions, compute the absolute value of a complex number of single or double precision

?asum

Computes the sum of magnitudes of the vector elements.

Syntax

res = sasum(*n*, *x*, *incx*)

res = scasum(*n*, *x*, *incx*)

res = dasum(*n*, *x*, *incx*)

res = dzasum(*n*, *x*, *incx*)

res = asum(*x*)

Include Files

- mkl.fi, blas.f90

Description

The ?asum routine computes the sum of the magnitudes of elements of a real vector, or the sum of magnitudes of the real and imaginary parts of elements of a complex vector:

res = |Rex_1| + |Imx_1| + |Rex_2| + Imx_2|+ ... + |Rex_n| + |Imx_n|,

$$result = \sum_{i=1}^{n} \left(\left| \mathrm{Re}\left(X_i\right) \right| + \left| Im\left(X_i\right) \right| \right)$$

where *x* is a vector with *n* elements.

Input Parameters

n	INTEGER. Specifies the number of elements in vector *x*.
x	REAL for sasum DOUBLE PRECISION for dasum COMPLEX for scasum DOUBLE COMPLEX for dzasum Array, size at least (1 + (*n*-1)*abs(*incx*)).
incx	INTEGER. Specifies the increment for indexing vector *x*.

Output Parameters

res	REAL for sasum DOUBLE PRECISION for dasum REAL for scasum DOUBLE PRECISION for dzasum Contains the sum of magnitudes of real and imaginary parts of all elements of the vector.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine `asum` interface are the following:

x	Holds the array of size *n*.

?axpy

Computes a vector-scalar product and adds the result to a vector.

Syntax

```
call saxpy(n, a, x, incx, y, incy)
call daxpy(n, a, x, incx, y, incy)
call caxpy(n, a, x, incx, y, incy)
call zaxpy(n, a, x, incx, y, incy)
call axpy(x, y [,a])
```

Include Files

- `mkl.fi, blas.f90`

Description

The `?axpy` routines perform a vector-vector operation defined as

```
y := a*x + y
```

where:

a is a scalar

x and *y* are vectors each with a number of elements that equals *n*.

Input Parameters

n	`INTEGER`. Specifies the number of elements in vectors *x* and *y*.

a	`REAL` for `saxpy`
	`DOUBLE PRECISION` for `daxpy`
	`COMPLEX` for `caxpy`
	`DOUBLE COMPLEX` for `zaxpy`
	Specifies the scalar *a*.

x	`REAL` for `saxpy`
	`DOUBLE PRECISION` for `daxpy`
	`COMPLEX` for `caxpy`
	`DOUBLE COMPLEX` for `zaxpy`
	Array, size at least `(1 + (n-1)*abs(incx))`.

incx	`INTEGER`. Specifies the increment for the elements of *x*.
y	`REAL` for `saxpy`

	DOUBLE PRECISION for daxpy COMPLEX for caxpy DOUBLE COMPLEX for zaxpy Array, size at least (1 + (*n*-1)*abs(*incy*)).
incy	INTEGER. Specifies the increment for the elements of *y*.

Output Parameters

y	Contains the updated vector *y*.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine axpy interface are the following:

x	Holds the array of size *n*.
y	Holds the array of size *n*.
a	The default value is 1.

?copy

Copies a vector to another vector.

Syntax

```
call scopy(n, x, incx, y, incy)
call dcopy(n, x, incx, y, incy)
call ccopy(n, x, incx, y, incy)
call zcopy(n, x, incx, y, incy)
call copy(x, y)
```

Include Files

- mkl.fi, blas.f90

Description

The ?copy routines perform a vector-vector operation defined as

```
y = x,
```

where *x* and *y* are vectors.

Input Parameters

n	INTEGER. Specifies the number of elements in vectors *x* and *y*.
x	REAL for scopy

	DOUBLE PRECISION for dcopy COMPLEX for ccopy DOUBLE COMPLEX for zcopy Array, size at least (1 + (*n*-1)*abs(*incx*)).
incx	INTEGER. Specifies the increment for the elements of *x*.
y	REAL for scopy DOUBLE PRECISION for dcopy COMPLEX for ccopy DOUBLE COMPLEX for zcopy Array, size at least (1 + (*n*-1)*abs(*incy*)).
incy	INTEGER. Specifies the increment for the elements of *y*.

Output Parameters

y	Contains a copy of the vector *x* if *n* is positive. Otherwise, parameters are unaltered.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine copy interface are the following:

x	Holds the vector with the number of elements *n*.
y	Holds the vector with the number of elements *n*.

?copy_batch

Computes a group of vector copies.

Syntax

```
call scopy_batch(n_array, x_array, incx_array, y_array, incy_array, group_count, group_size_array)
call dcopy_batch(n_array, x_array, incx_array, y_array, incy_array, group_count, group_size_array)
call ccopy_batch(n_array, x_array, incx_array, y_array, incy_array, group_count, group_size_array)
call zcopy_batch(n_array, x_array, incx_array, y_array, incy_array, group_count, group_size_array)
```

Description

The ?copy_batch routines perform a series of vector copies. They are similar to their ?copy routine counterparts, but the ?copy_batch routines perform vector operations with groups of vectors. Each groups contains vectors with the same parameters (size, incrmenet), but the parameters can vary between groups.

The operation is defined as follows:

```
idx = 0
for i = 0 … group_count – 1
    n, incx, incy and group_size at position i in n_array, incx_array, incy_array and
group_size_array
    for j = 0 … group_size – 1
        x and y are vectors of size n at position idx in x_array and y_array
        y := x
        idx := idx + 1
    end for
end for
```

The number of entries in `x_array` and `y_array` is `total_batch_count`, which is the sum of all the `group_size` entries.

Input Parameters

n_array	INTEGER. Array of size `group_count`. For the group `i`, `n_i = n_array[i]` is the number of elements in the vectors `x` and `y`.
x_array	INTEGER*8 for Intel® 64 architecture INTEGER*4 for IA-32 architecture Array of size `total_batch_count` of pointers used to store `x` vectors. The array allocated for the `x` vectors of the group `i` must be of size at least `(1 + (n_i - 1)*abs(incx_i))`.
incx_array	INTEGER. Array of size `group_count`. For the group `i`, `incx_i = incx_array[i]` is the distance between consecutive entries in a vector `x`.
y_array	INTEGER*8 for Intel® 64 architecture INTEGER*4 for IA-32 architecture Array of size `total_batch_count` of pointers used to store `y` vectors. The array allocated for the `y` vectors of the group `i` must be of size at least `(1 + (n_i - 1)*abs(incy_i))`.
incy_array	INTEGER. Array of size `group_count`. For the group `i`, `incy_i = incy_array[i]` is the distance between consecutive entries in a vector `y`.
group_count	INTEGER. Number of groups. Must be at least 0.
group_size_array	INTEGER. Array of size `group_count`. The element `group_size_array[i]` is the number of vector in the group i. Each element in group_size_array must be at least 0.

Output Parameters

y_array	Array of pointers holding the `total_batch_count` copied vectors `y`.

?copy_batch_strided

Computes a group of vector copies.

Syntax

```
call scopy_batch_strided(n, x, incx, stridex, y, incy, stridey, batch_size)
call dcopy_batch_strided(n, x, incx, stridex, y, incy, stridey, batch_size)
```

```
call ccopy_batch_strided(n, x, incx, stridex, y, incy, stridey, batch_size)
call zcopy_batch_strided(n, x, incx, stridex, y, incy, stridey, batch_size)
```

Description

The ?copy_batch_strided routines perform a series of vector copies. They are similar to their ?copy routine counterparts, but the ?copy_batch_strided routines perform vector operations with a group of vectors.

All vectors x (respectively, y) have the same parameters (size, increment) and are stored at constant distance stridex (respectively, stridey) from each other. The operation is defined as follows:

```
for i = 0 … batch_size - 1
    X and Y are vectors at offset i * stridex and i * stridey in x and y
    Y = X
end for
```

Input Parameters

n	INTEGER. Number of elements in vectors x and y.
x	REAL for scopy_batch_strided DOUBLE PRECISION for dcopy_batch_strided COMPLEX for ccopy_batch_strided DOUBLE COMPLEX for zcopy_batch_strided Array of size at least stridex*batch_size holding the input x vectors.
incx	INTEGER. Specifies the increment between two consecutive elements of a single vector x.
stridex	INTEGER. Stride between two consecutive x vectors. Must be at least (1 + (n-1)*abs(incx)).
y	REAL for scopy_batch_strided DOUBLE PRECISION for dcopy_batch_strided COMPLEX for ccopy_batch_strided DOUBLE COMPLEX for zcopy_batch_strided Array of size at least stridey*batch_size holding the output y vectors.
incy	INTEGER. Specifies the increment between two consecutive elements of a single vector y.
stridey	INTEGER. Stride between two consecutive y vectors. Must be at least (1 + (n-1)*abs(incy)).
batch_size	INTEGER. Number of copy computations to perform and x and y vectors. Must be at least 0.

Output Parameters

y	Array holding the batch_size copied vectors y.

?dot

Computes a vector-vector dot product.

Syntax

res = sdot(*n*, *x*, *incx*, *y*, *incy*)

res = ddot(*n*, *x*, *incx*, *y*, *incy*)

res = dot(*x*, *y*)

Include Files

- mkl.fi, blas.f90

Description

The ?dot routines perform a vector-vector reduction operation defined as

$$res = \sum_{i=1}^{n} x_i * y_i,$$

where x_i and y_i are elements of vectors *x* and *y*.

Input Parameters

n	INTEGER. Specifies the number of elements in vectors *x* and *y*.
x	REAL for sdot DOUBLE PRECISION for ddot Array, size at least (1+(*n*-1)*abs(*incx*)).
incx	INTEGER. Specifies the increment for the elements of *x*.
y	REAL for sdot DOUBLE PRECISION for ddot Array, size at least (1+(*n*-1)*abs(*incy*)).
incy	INTEGER. Specifies the increment for the elements of *y*.

Output Parameters

res	REAL for sdot DOUBLE PRECISION for ddot Contains the result of the dot product of *x* and *y*, if *n* is positive. Otherwise, *res* contains 0.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine `dot` interface are the following:

x	Holds the vector with the number of elements *n*.
y	Holds the vector with the number of elements *n*.

?sdot

Computes a vector-vector dot product with double precision.

Syntax

```
res = sdsdot(n, sb, sx, incx, sy, incy)
res = dsdot(n, sx, incx, sy, incy)
res = sdot(sx, sy)
res = sdot(sx, sy, sb)
```

Include Files

- `mkl.fi, blas.f90`

Description

The `?sdot` routines compute the inner product of two vectors with double precision. Both routines use double precision accumulation of the intermediate results, but the `sdsdot` routine outputs the final result in single precision, whereas the `dsdot` routine outputs the double precision result. The function `sdsdot` also adds scalar value *sb* to the inner product.

Input Parameters

n	`INTEGER`. Specifies the number of elements in the input vectors *sx* and *sy*.
sb	`REAL`. Single precision scalar to be added to inner product (for the function `sdsdot` only).
sx, *sy*	`REAL`. Arrays, size at least `(1+(n -1)*abs(incx))` and `(1+(n-1)*abs(incy))`, respectively. Contain the input single precision vectors.
incx	`INTEGER`. Specifies the increment for the elements of *sx*.
incy	`INTEGER`. Specifies the increment for the elements of *sy*.

Output Parameters

res	`REAL` for `sdsdot` `DOUBLE PRECISION` for `dsdot`

Contains the result of the dot product of *sx* and *sy* (with *sb* added for `sdsdot`), if *n* is positive. Otherwise, *res* contains *sb* for `sdsdot` and `0` for `dsdot`.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine `sdot` interface are the following:

sx Holds the vector with the number of elements *n*.

sy Holds the vector with the number of elements *n*.

NOTE
Note that scalar parameter *sb* is declared as a required parameter in Fortran 95 interface for the function `sdot` to distinguish between function flavors that output final result in different precision.

?dotc

Computes a dot product of a conjugated vector with another vector.

Syntax

```
res = cdotc(n, x, incx, y, incy)
res = zdotc(n, x, incx, y, incy)
res = dotc(x, y)
```

Include Files

- `mkl.fi, blas.f90`

Description

The `?dotc` routines perform a vector-vector operation defined as:

$$res = \sum_{i=1}^{n} conjg(x_i) * y_i,$$

where x_i and y_i are elements of vectors *x* and *y*.

Input Parameters

n `INTEGER`. Specifies the number of elements in vectors *x* and *y*.

x `COMPLEX` for `cdotc`

`DOUBLE COMPLEX` for `zdotc`

	Array, size at least `(1 + (n -1)*abs(incx))`.
incx	`INTEGER`. Specifies the increment for the elements of *x*.

y	`COMPLEX` for `cdotc`
	`DOUBLE COMPLEX` for `zdotc`
	Array, size at least `(1 + (n -1)*abs(incy))`.

incy	`INTEGER`. Specifies the increment for the elements of *y*.

Output Parameters

res	`COMPLEX` for `cdotc`
	`DOUBLE COMPLEX` for `zdotc`
	Contains the result of the dot product of the conjugated *x* and unconjugated *y*, if *n* is positive. Otherwise, it contains `0`.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine `dotc` interface are the following:

x	Holds the vector with the number of elements *n*.
y	Holds the vector with the number of elements *n*.

?dotu

Computes a complex vector-vector dot product.

Syntax

```
res = cdotu(n, x, incx, y, incy)
res = zdotu(n, x, incx, y, incy)
res = dotu(x, y)
```

Include Files

- `mkl.fi, blas.f90`

Description

The `?dotu` routines perform a vector-vector reduction operation defined as

$$res = \sum_{i=1}^{n} x_i * y_i$$

where x_i and y_i are elements of complex vectors *x* and *y*.

Input Parameters

n	INTEGER. Specifies the number of elements in vectors *x* and *y*.
x	COMPLEX for cdotu DOUBLE COMPLEX for zdotu Array, size at least (1 + (*n* -1)*abs(*incx*)).
incx	INTEGER. Specifies the increment for the elements of *x*.
y	COMPLEX for cdotu DOUBLE COMPLEX for zdotu Array, size at least (1 + (*n* -1)*abs(*incy*)).
incy	INTEGER. Specifies the increment for the elements of *y*.

Output Parameters

res	COMPLEX for cdotu DOUBLE COMPLEX for zdotu Contains the result of the dot product of *x* and *y*, if *n* is positive. Otherwise, it contains 0.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine dotu interface are the following:

x	Holds the vector with the number of elements *n*.
y	Holds the vector with the number of elements *n*.

?nrm2

Computes the Euclidean norm of a vector.

Syntax

```
res = snrm2(n, x, incx)
res = dnrm2(n, x, incx)
res = scnrm2(n, x, incx)
res = dznrm2(n, x, incx)
res = nrm2(x)
```

Include Files

- mkl.fi, blas.f90

Description

The ?nrm2 routines perform a vector reduction operation defined as

```
res = ||x||,
```

where:

x is a vector,

res is a value containing the Euclidean norm of the elements of *x*.

Input Parameters

n	INTEGER. Specifies the number of elements in vector *x*.
x	REAL for snrm2 DOUBLE PRECISION for dnrm2 COMPLEX for scnrm2 DOUBLE COMPLEX for dznrm2 Array, size at least (1 + (*n* -1)*abs (*incx*)).
incx	INTEGER. Specifies the increment for the elements of *x*.

Output Parameters

res	REAL for snrm2 DOUBLE PRECISION for dnrm2 REAL for scnrm2 DOUBLE PRECISION for dznrm2 Contains the Euclidean norm of the vector *x*.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine nrm2 interface are the following:

x	Holds the vector with the number of elements *n*.

?rot

Performs rotation of points in the plane.

Syntax

```
call srot(n, x, incx, y, incy, c, s)
call drot(n, x, incx, y, incy, c, s)
call crot(n, x, incx, y, incy, c, s)
call zrot(n, x, incx, y, incy, c, s)
call csrot(n, x, incx, y, incy, c, s)
call zdrot(n, x, incx, y, incy, c, s)
call rot(x, y, c, s)
```

Description

Given two complex vectors *x* and *y*, each vector element of these vectors is replaced as follows:

```
xi = c*xi + s*yi
yi = c*yi - s*xi
```

If *s* is a complex type, each vector element is replaced as follows:

```
xi = c*xi + s*yi
yi = c*yi - conj(s)*xi
```

Input Parameters

n	INTEGER. Specifies the number of elements in vectors *x* and *y*.
x	REAL for srot DOUBLE PRECISION for drot COMPLEX for csrot DOUBLE COMPLEX for zdrot Array, size at least (1 + (*n*-1)*abs(*incx*)).
incx	INTEGER. Specifies the increment for the elements of *x*.
y	REAL for srot DOUBLE PRECISION for drot COMPLEX for csrot DOUBLE COMPLEX for zdrot Array, size at least (1 + (*n* -1)*abs(*incy*)).
incy	INTEGER. Specifies the increment for the elements of *y*.
c	REAL for srot DOUBLE PRECISION for drot REAL for csrot DOUBLE PRECISION for zdrot A scalar.
s	REAL for srot DOUBLE PRECISION for drot COMPLEX for crot DOUBLE COMPLEX for zrot REAL for csrot DOUBLE PRECISION for zdrot A scalar.

Output Parameters

x	Each element is replaced by *c*x + s*y*.

y	Each element is replaced by `c*y - s*x`, or by `c*y-conj(s)*x` if *s* is a complex type.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine `rot` interface are the following:

x	Holds the vector with the number of elements *n*.
y	Holds the vector with the number of elements *n*.

?rotg

Computes the parameters for a Givens rotation.

Syntax

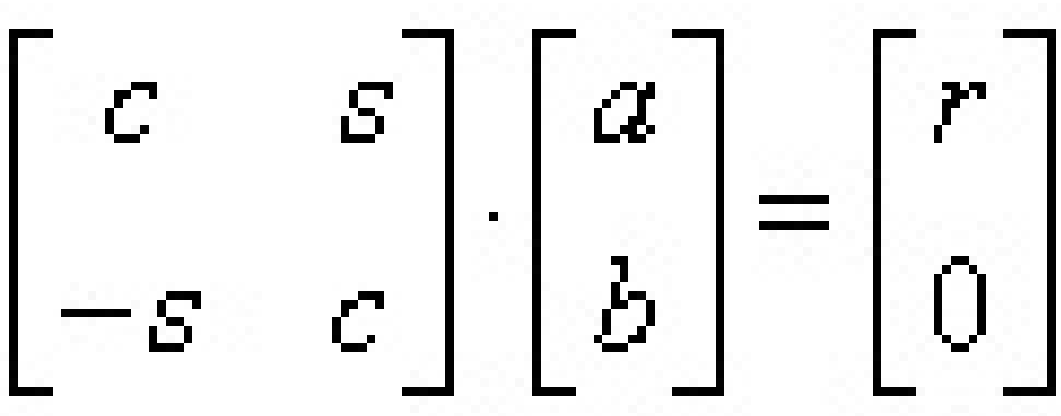
```
call srotg(a, b, c, s)
call drotg(a, b, c, s)
call crotg(a, b, c, s)
call zrotg(a, b, c, s)
call rotg(a, b, c, s)
```

Include Files

- `mkl.fi, blas.f90`

Description

Given the Cartesian coordinates `(a, b)` of a point, these routines return the parameters *c*, *s*, *r*, and *z* associated with the Givens rotation. The parameters *c* and *s* define a unitary matrix such that:



The parameter *z* is defined such that if $|a| > |b|$, *z* is *s*; otherwise if *c* is not 0 *z* is $1/c$; otherwise *z* is 1.

See a more accurate LAPACK version `?lartg`.

Input Parameters

a	REAL for srotg DOUBLE PRECISION for drotg COMPLEX for crotg DOUBLE COMPLEX for zrotg Provides the *x*-coordinate of the point p.
b	REAL for srotg DOUBLE PRECISION for drotg COMPLEX for crotg DOUBLE COMPLEX for zrotg Provides the *y*-coordinate of the point p.

Output Parameters

a	Contains the parameter *r* associated with the Givens rotation.
b	Contains the parameter *z* associated with the Givens rotation.
c	REAL for srotg DOUBLE PRECISION for drotg REAL for crotg DOUBLE PRECISION for zrotg Contains the parameter *c* associated with the Givens rotation.
s	REAL for srotg DOUBLE PRECISION for drotg COMPLEX for crotg DOUBLE COMPLEX for zrotg Contains the parameter *s* associated with the Givens rotation.

?rotm

Performs modified Givens rotation of points in the plane.

Syntax

```
call srotm(n, x, incx, y, incy, param)
call drotm(n, x, incx, y, incy, param)
call rotm(x, y, param)
```

Include Files

- mkl.fi, blas.f90

Description

Given two vectors *x* and *y*, each vector element of these vectors is replaced as follows:

$$\begin{bmatrix} x_i \\ y_i \end{bmatrix} = H \begin{bmatrix} x_i \\ y_i \end{bmatrix}$$

for *i*=1 to *n*, where *H* is a modified Givens transformation matrix whose values are stored in the `param(2)` through `param(5)` array. See discussion on the *param* argument.

Input Parameters

n
: `INTEGER`. Specifies the number of elements in vectors *x* and *y*.

x
: `REAL` for `srotm`
`DOUBLE PRECISION` for `drotm`
Array, size at least `(1 + (n -1)*abs(incx))`.

incx
: `INTEGER`. Specifies the increment for the elements of *x*.

y
: `REAL` for `srotm`
`DOUBLE PRECISION` for `drotm`
Array, size at least `(1 + (n -1)*abs(incy))`.

incy
: `INTEGER`. Specifies the increment for the elements of *y*.

param
: `REAL` for `srotm`
`DOUBLE PRECISION` for `drotm`
Array, size 5.
The elements of the *param* array are:
`param(1)` contains a switch, *flag*. `param(2-5)` contain h_{11}, h_{21}, h_{12}, and h_{22}, respectively, the components of the array *H*.
Depending on the values of *flag*, the components of *H* are set as follows:
flag = `-1.0`: $H = \begin{bmatrix} h_{11} & h_{12} \\ h_{21} & h_{22} \end{bmatrix}$
flag = `0.0`: $H = \begin{bmatrix} 1.0 & h_{12} \\ h_{21} & 1.0 \end{bmatrix}$
flag = `1.0`: $H = \begin{bmatrix} h_{11} & 1.0 \\ -1.0 & h_{22} \end{bmatrix}$
flag = `-2.0`: $H = \begin{bmatrix} 1.0 & 0.0 \\ 0.0 & 1.0 \end{bmatrix}$
In the last three cases, the matrix entries of 1.0, -1.0, and 0.0 are assumed based on the value of *flag* and are not required to be set in the *param* vector.

Output Parameters

x	Each element `x(i)` is replaced by h_{11}`*x(i) +` h_{12}`*y(i)`.
y	Each element `y(i)` is replaced by h_{21}`*x(i) +` h_{22}`*y(i)`.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine `rotm` interface are the following:

x	Holds the vector with the number of elements *n*.
y	Holds the vector with the number of elements *n*.

?rotmg

Computes the parameters for a modified Givens rotation.

Syntax

```
call srotmg(d1, d2, x1, y1, param)
call drotmg(d1, d2, x1, y1, param)
call rotmg(d1, d2, x1, y1, param)
```

Include Files

- `mkl.fi, blas.f90`

Description

Given Cartesian coordinates (*x1*, *y1*) of an input vector, these routines compute the components of a modified Givens transformation matrix *H* that zeros the *y*-component of the resulting vector:

$$\begin{bmatrix} x1 \\ 0 \end{bmatrix} = H \begin{bmatrix} x1\sqrt{d1} \\ y1\sqrt{d2} \end{bmatrix}$$

Input Parameters

d1	`REAL` for `srotmg`
	`DOUBLE PRECISION` for `drotmg`
	Provides the scaling factor for the *x*-coordinate of the input vector.

d2	`REAL` for `srotmg`
	`DOUBLE PRECISION` for `drotmg`
	Provides the scaling factor for the *y*-coordinate of the input vector.

x1	`REAL` for `srotmg`
	`DOUBLE PRECISION` for `drotmg`
	Provides the *x*-coordinate of the input vector.

y1

REAL for srotmg

DOUBLE PRECISION for drotmg

Provides the *y*-coordinate of the input vector.

Output Parameters

d1

REAL for srotmg

DOUBLE PRECISION for drotmg

Provides the first diagonal element of the updated matrix.

d2

REAL for srotmg

DOUBLE PRECISION for drotmg

Provides the second diagonal element of the updated matrix.

x1

REAL for srotmg

DOUBLE PRECISION for drotmg

Provides the *x*-coordinate of the rotated vector before scaling.

param

REAL for srotmg

DOUBLE PRECISION for drotmg

Array, size 5.

The elements of the *param* array are:

param(1) contains a switch, *flag*. the other array elements *param*(2-5) contain the components of the array *H*: h_{11}, h_{21}, h_{12}, and h_{22}, respectively.

Depending on the values of *flag*, the components of *H* are set as follows:

flag = -1.0: $H = \begin{bmatrix} h_{11} & h_{12} \\ h_{21} & h_{22} \end{bmatrix}$

flag = 0.0: $H = \begin{bmatrix} 1.0 & h_{12} \\ h_{21} & 1.0 \end{bmatrix}$

flag = 1.0: $H = \begin{bmatrix} h_{11} & 1.0 \\ -1.0 & h_{22} \end{bmatrix}$

flag = -2.0: $H = \begin{bmatrix} 1.0 & 0.0 \\ 0.0 & 1.0 \end{bmatrix}$

In the last three cases, the matrix entries of 1.0, -1.0, and 0.0 are assumed based on the value of *flag* and are not required to be set in the *param* vector.

?scal

Computes the product of a vector by a scalar.

Syntax

```
call sscal(n, a, x, incx)
call dscal(n, a, x, incx)
```

```
call cscal(n, a, x, incx)
call zscal(n, a, x, incx)
call csscal(n, a, x, incx)
call zdscal(n, a, x, incx)
call scal(x, a)
```

Include Files

- mkl.fi, blas.f90

Description

The ?scal routines perform a vector operation defined as

```
x = a*x
```

where:

a is a scalar, *x* is an *n*-element vector.

Input Parameters

n	INTEGER. Specifies the number of elements in vector *x*.
a	REAL for sscal and csscal DOUBLE PRECISION for dscal and zdscal COMPLEX for cscal DOUBLE COMPLEX for zscal Specifies the scalar *a*.
x	REAL for sscal DOUBLE PRECISION for dscal COMPLEX for cscal and csscal DOUBLE COMPLEX for zscal and zdscal Array, size at least (1 + (*n* –1)*abs(*incx*)).
incx	INTEGER. Specifies the increment for the elements of *x*.

Output Parameters

x	Updated vector x.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine scal interface are the following:

x	Holds the vector with the number of elements *n*.

?swap

Swaps a vector with another vector.

Syntax

```
call sswap(n, x, incx, y, incy)
call dswap(n, x, incx, y, incy)
call cswap(n, x, incx, y, incy)
call zswap(n, x, incx, y, incy)
call swap(x, y)
```

Include Files

- mkl.fi, blas.f90

Description

Given two vectors *x* and *y*, the ?swap routines return vectors *y* and *x* swapped, each replacing the other.

Input Parameters

n	INTEGER. Specifies the number of elements in vectors *x* and *y*.
x	REAL for sswap DOUBLE PRECISION for dswap COMPLEX for cswap DOUBLE COMPLEX for zswap Array, size at least (1 + (*n*-1)*abs(*incx*)).
incx	INTEGER. Specifies the increment for the elements of *x*.
y	REAL for sswap DOUBLE PRECISION for dswap COMPLEX for cswap DOUBLE COMPLEX for zswap Array, size at least (1 + (*n*-1)*abs(*incy*)).
incy	INTEGER. Specifies the increment for the elements of *y*.

Output Parameters

x	Contains the resultant vector *x*, that is, the input vector *y*.
y	Contains the resultant vector *y*, that is, the input vector *x*.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine `swap` interface are the following:

x	Holds the vector with the number of elements *n*.
y	Holds the vector with the number of elements *n*.

i?amax

Finds the index of the element with maximum absolute value.

Syntax

```
index = isamax(n, x, incx)
index = idamax(n, x, incx)
index = icamax(n, x, incx)
index = izamax(n, x, incx)
index = iamax(x)
```

Include Files

- `mkl.fi, blas.f90`

Description

Given a vector *x*, the `i?amax` functions return the position of the vector element `x(i)` that has the largest absolute value for real flavors, or the largest sum `|Re(x[i])|+|Im(x[i])|` for complex flavors.

If either *n* or *incx* are not positive, the routine returns `0`.

If more than one vector element is found with the same largest absolute value, the index of the first one encountered is returned.

If the vector contains `NaN` values, then the routine returns the index of the first `NaN`.

Input Parameters

n	`INTEGER`. Specifies the number of elements in vector *x*.

x	`REAL` for `isamax`
	`DOUBLE PRECISION` for `idamax`
	`COMPLEX` for `icamax`
	`DOUBLE COMPLEX` for `izamax`
	Array, size at least `(1+(n-1)*abs(incx))`.

incx	`INTEGER`. Specifies the increment for the elements of *x*.

Output Parameters

index	`INTEGER`. Contains the position of vector element that has the largest absolute value such that `x(index)` has the largest absolute value.

BLAS 95 Interface Notes

Functions and routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the function `iamax` interface are the following:

x	Holds the vector with the number of elements *n*.

i?amin

Finds the index of the element with the smallest absolute value.

Syntax

```
index = isamin(n, x, incx)
index = idamin(n, x, incx)
index = icamin(n, x, incx)
index = izamin(n, x, incx)
index = iamin(x)
```

Include Files

- `mkl.fi, blas.f90`

Description

Given a vector *x*, the `i?amin` functions return the position of the vector element `x[i]` that has the smallest absolute value for real flavors, or the smallest sum `|Re(x[i])|+|Im(x[i])|` for complex flavors.

If either *n* or *incx* are not positive, the routine returns `0`.

If more than one vector element is found with the same smallest absolute value, the index of the first one encountered is returned.

If the vector contains `NaN` values, then the routine returns the index of the first `NaN`.

Input Parameters

n	`INTEGER`. On entry, *n* specifies the number of elements in vector *x*.

x	`REAL` for `isamin`
	`DOUBLE PRECISION` for `idamin`
	`COMPLEX` for `icamin`
	`DOUBLE COMPLEX` for `izamin`
	Array, size at least `(1+(n-1)*abs(incx))`.

incx	`INTEGER`. Specifies the increment for the elements of *x*.

Output Parameters

index	`INTEGER`. Indicates the position of vector element with the smallest absolute value such that `x(index)` has the smallest absolute value.

BLAS 95 Interface Notes

Functions and routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the function `iamin` interface are the following:

x	Holds the vector with the number of elements *n*.

?cabs1

Computes absolute value of complex number.

Syntax

res = scabs1(*z*)

res = dcabs1(*z*)

res = cabs1(*z*)

Include Files

- mkl.fi, blas.f90

Description

The ?cabs1 is an auxiliary routine for a few BLAS Level 1 routines. This routine performs an operation defined as

```
res=|Re(z)|+|Im(z)|,
```

where *z* is a scalar, and *res* is a value containing the absolute value of a complex number *z*.

Input Parameters

z	COMPLEX scalar for scabs1. DOUBLE COMPLEX scalar for dcabs1.

Output Parameters

res	REAL for scabs1. DOUBLE PRECISION for dcabs1. Contains the absolute value of a complex number *z*.

BLAS Level 2 Routines

This section describes BLAS Level 2 routines, which perform matrix-vector operations. The following table lists the BLAS Level 2 routine groups and the data types associated with them.

BLAS Level 2 Routine Groups and Their Data Types

Routine Groups	Data Types	Description
?gbmv	s, d, c, z	Matrix-vector product using a general band matrix
?gemv	s, d, c, z	Matrix-vector product using a general matrix

Routine Groups	Data Types	Description
?ger	s, d	Rank-1 update of a general matrix
?gerc	c, z	Rank-1 update of a conjugated general matrix
?geru	c, z	Rank-1 update of a general matrix, unconjugated
?hbmv	c, z	Matrix-vector product using a Hermitian band matrix
?hemv	c, z	Matrix-vector product using a Hermitian matrix
?her	c, z	Rank-1 update of a Hermitian matrix
?her2	c, z	Rank-2 update of a Hermitian matrix
?hpmv	c, z	Matrix-vector product using a Hermitian packed matrix
?hpr	c, z	Rank-1 update of a Hermitian packed matrix
?hpr2	c, z	Rank-2 update of a Hermitian packed matrix
?sbmv	s, d	Matrix-vector product using symmetric band matrix
?spmv	s, d	Matrix-vector product using a symmetric packed matrix
?spr	s, d	Rank-1 update of a symmetric packed matrix
?spr2	s, d	Rank-2 update of a symmetric packed matrix
?symv	s, d	Matrix-vector product using a symmetric matrix
?syr	s, d	Rank-1 update of a symmetric matrix
?syr2	s, d	Rank-2 update of a symmetric matrix
?tbmv	s, d, c, z	Matrix-vector product using a triangular band matrix
?tbsv	s, d, c, z	Solution of a linear system of equations with a triangular band matrix
?tpmv	s, d, c, z	Matrix-vector product using a triangular packed matrix
?tpsv	s, d, c, z	Solution of a linear system of equations with a triangular packed matrix
?trmv	s, d, c, z	Matrix-vector product using a triangular matrix
?trsv	s, d, c, z	Solution of a linear system of equations with a triangular matrix

?gbmv

Computes a matrix-vector product with a general band matrix.

Syntax

```
call sgbmv(trans, m, n, kl, ku, alpha, a, lda, x, incx, beta, y, incy)
call dgbmv(trans, m, n, kl, ku, alpha, a, lda, x, incx, beta, y, incy)
call cgbmv(trans, m, n, kl, ku, alpha, a, lda, x, incx, beta, y, incy)
call zgbmv(trans, m, n, kl, ku, alpha, a, lda, x, incx, beta, y, incy)
```

```
call gbmv(a, x, y [,kl] [,m] [,alpha] [,beta] [,trans])
```

Include Files

- mkl.fi, blas.f90

Description

The ?gbmv routines perform a matrix-vector operation defined as

y := *alpha***A***x* + *beta***y*,

or

y := *alpha***A*'**x* + *beta***y*,

or

y := *alpha* *conjg(*A*')**x* + *beta***y*,

where:

alpha and *beta* are scalars,

x and *y* are vectors,

A is an *m*-by-*n* band matrix, with *kl* sub-diagonals and *ku* super-diagonals.

Input Parameters

trans	CHARACTER*1. Specifies the operation: If *trans*= 'N' or 'n', then *y* := *alpha***A***x* + *beta***y* If *trans*= 'T' or 't', then *y* := *alpha***A*'**x* + *beta***y* If *trans*= 'C' or 'c', then *y* := *alpha* *conjg(*A*')**x* + *beta***y*
m	INTEGER. Specifies the number of rows of the matrix *A*. The value of *m* must be at least zero.
n	INTEGER. Specifies the number of columns of the matrix *A*. The value of *n* must be at least zero.
kl	INTEGER. Specifies the number of sub-diagonals of the matrix *A*. The value of *kl* must satisfy 0≤*kl*.
ku	INTEGER. Specifies the number of super-diagonals of the matrix *A*. The value of *ku* must satisfy 0≤*ku*.
alpha	REAL for sgbmv DOUBLE PRECISION for dgbmv COMPLEX for cgbmv DOUBLE COMPLEX for zgbmv Specifies the scalar *alpha*.
a	REAL for sgbmv DOUBLE PRECISION for dgbmv

COMPLEX for cgbmv

DOUBLE COMPLEX for zgbmv

Array, size (*lda*, *n*).

Before entry, the leading (*kl* + *ku* + 1) by *n* part of the array *a* must contain the matrix of coefficients. This matrix must be supplied column-by-column, with the leading diagonal of the matrix in row (*ku* + 1) of the array, the first super-diagonal starting at position 2 in row *ku*, the first sub-diagonal starting at position 1 in row (*ku* + 2), and so on. Elements in the array *a* that do not correspond to elements in the band matrix (such as the top left *ku* by *ku* triangle) are not referenced.

The following program segment transfers a band matrix from conventional full matrix storage (*matrix*) to band storage (*a*):

```
      do 20, j = 1, n
        k = ku + 1 - j
        do 10, i = max(1, j-ku), min(m, j+kl)
           a(k+i, j) = matrix(i,j)
10       continue
20    continue
```

lda — INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least (*kl* + *ku* + 1).

x — REAL for sgbmv

DOUBLE PRECISION for dgbmv

COMPLEX for cgbmv

DOUBLE COMPLEX for zgbmv

Array, size at least (1 + (*n* – 1)*abs(*incx*)) when *trans*= 'N' or 'n', and at least (1 + (*m* – 1)*abs(*incx*)) otherwise. Before entry, the array *x* must contain the vector *x*.

incx — INTEGER. Specifies the increment for the elements of *x*. *incx* must not be zero.

beta — REAL for sgbmv

DOUBLE PRECISION for dgbmv

COMPLEX for cgbmv

DOUBLE COMPLEX for zgbmv

Specifies the scalar beta. When *beta* is equal to zero, then *y* need not be set on input.

y — REAL for sgbmv

DOUBLE PRECISION for dgbmv

COMPLEX for cgbmv

DOUBLE COMPLEX for zgbmv

	Array, size at least `(1 +(m - 1)*abs(incy))` when *trans*= `'N'` or `'n'` and at least `(1 +(n - 1)*abs(incy))` otherwise. Before entry, the incremented array *y* must contain the vector *y*.
incy	`INTEGER`. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.

Output Parameters

y	Buffer holding the updated vector *y*.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine `gbmv` interface are the following:

a	Holds the array *a* of size (*kl*+*ku*+*1*, *n*). Contains a banded matrix *m***n*with *kl* lower diagonal and *ku* upper diagonal.
x	Holds the vector with the number of elements *rx*, where *rx = n* if *trans = 'N'*, *rx = m* otherwise.
y	Holds the vector with the number of elements *ry*, where *ry = m* if *trans = 'N'*, *ry = n* otherwise.
trans	Must be `'N'`, `'C'`, or `'T'`. The default value is `'N'`.
kl	If omitted, assumed *kl* = *ku*, that is, the number of lower diagonals equals the number of the upper diagonals.
ku	Restored as *ku* = *lda-kl-1*, where *lda* is the leading dimension of matrix *A*.
m	If omitted, assumed *m* = *n*, that is, a square matrix.
alpha	The default value is 1.
beta	The default value is 0.

?gemv

Computes a matrix-vector product using a general matrix.

Syntax

```
call sgemv(trans, m, n, alpha, a, lda, x, incx, beta, y, incy)
call dgemv(trans, m, n, alpha, a, lda, x, incx, beta, y, incy)
call cgemv(trans, m, n, alpha, a, lda, x, incx, beta, y, incy)
call zgemv(trans, m, n, alpha, a, lda, x, incx, beta, y, incy)
call scgemv(trans, m, n, alpha, a, lda, x, incx, beta, y, incy)
call dzgemv(trans, m, n, alpha, a, lda, x, incx, beta, y, incy)
call gemv(a, x, y [,alpha][,beta] [,trans])
```

Include Files

- mkl.fi, blas.f90

Description

The ?gemv routines perform a matrix-vector operation defined as:

y := *alpha***A***x* + *beta***y*,

or

y := *alpha***A*'**x* + *beta***y*,

or

y := *alpha**conjg(*A*')**x* + *beta***y*,

where:

alpha and *beta* are scalars,

x and *y* are vectors,

A is an *m*-by-*n* matrix.

Input Parameters

trans

CHARACTER*1 Specifies the operation:

if *trans*= 'N' or 'n', then *y* := *alpha***A***x* + *beta***y*;

if *trans*= 'T' or 't', then *y* := *alpha***A*'**x* + *beta***y*;

if *trans*= 'C' or 'c', then *y* := *alpha* *conjg(*A*')**x* + *beta***y*.

m

INTEGER. Specifies the number of rows of the matrix *A*. The value of *m* must be at least zero.

n

INTEGER. Specifies the number of columns of the matrix *A*. The value of *n* must be at least zero.

alpha

REAL for sgemv

DOUBLE PRECISION for dgemv

COMPLEX for cgemv, scgemv

DOUBLE COMPLEX for zgemv, dzgemv

Specifies the scalar *alpha*.

a

REAL for sgemv, scgemv

DOUBLE PRECISION for dgemv, dzgemv

COMPLEX for cgemv

DOUBLE COMPLEX for zgemv

Array, size (*lda*, *n*).

Before entry, the leading *m*-by-*n* part of the array *a* must contain the matrix of coefficients.

lda — INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program.

The value of *lda* must be at least `max(1, m)`.

x — REAL for sgemv

DOUBLE PRECISION for dgemv

COMPLEX for cgemv, scgemv

DOUBLE COMPLEX for zgemv, dzgemv

Array, size at least `(1+(n-1)*abs(incx))` when *trans*= 'N' or 'n' and at least `(1+(m - 1)*abs(incx))` otherwise. Before entry, the incremented array *x* must contain the vector *x*.

incx — INTEGER. Specifies the increment for the elements of *x*.

The value of *incx* must not be zero.

beta — REAL for sgemv

DOUBLE PRECISION for dgemv

COMPLEX for cgemv, scgemv

DOUBLE COMPLEX for zgemv, dzgemv

Specifies the scalar *beta*. When *beta* is set to zero, then *y* need not be set on input.

y — REAL for sgemv

DOUBLE PRECISION for dgemv

COMPLEX for cgemv, scgemv

DOUBLE COMPLEX for zgemv, dzgemv

Array, size at least `(1 +(m - 1)*abs(incy))` when *trans*= 'N' or 'n' and at least `(1 +(n - 1)*abs(incy))` otherwise. Before entry with non-zero *beta*, the incremented array *y* must contain the vector *y*.

incy — INTEGER. Specifies the increment for the elements of *y*.

The value of *incy* must not be zero.

Output Parameters

y — Updated vector *y*.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine gemv interface are the following:

a — Holds the matrix *A* of size (*m*,*n*).

x — Holds the vector with the number of elements *rx* where *rx* = *n* if *trans* = 'N', *rx* = *m* otherwise.

y	Holds the vector with the number of elements *ry* where *ry* = *m* if *trans* = 'N', *ry* = *n* otherwise.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
alpha	The default value is 1.
beta	The default value is 0.

?ger

Performs a rank-1 update of a general matrix.

Syntax

```
call sger(m, n, alpha, x, incx, y, incy, a, lda)
call dger(m, n, alpha, x, incx, y, incy, a, lda)
call ger(a, x, y [,alpha])
```

Include Files

- mkl.fi, blas.f90

Description

The ?ger routines perform a matrix-vector operation defined as

```
A := alpha*x*y'+ A,
```

where:

alpha is a scalar,

x is an *m*-element vector,

y is an *n*-element vector,

A is an *m*-by-*n* general matrix.

Input Parameters

m	INTEGER. Specifies the number of rows of the matrix *A*. The value of *m* must be at least zero.
n	INTEGER. Specifies the number of columns of the matrix *A*. The value of *n* must be at least zero.
alpha	REAL for sger DOUBLE PRECISION for dger Specifies the scalar *alpha*.
x	REAL for sger DOUBLE PRECISION for dger

	Array, size at least `(1 + (m - 1)*abs(incx))`. Before entry, the incremented array *x* must contain the *m*-element vector *x*.
incx	`INTEGER`. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.

y	`REAL` for `sger`
	`DOUBLE PRECISION` for `dger`
	Array, size at least `(1 + (n - 1)*abs(incy))`. Before entry, the incremented array *y* must contain the *n*-element vector *y*.

incy	`INTEGER`. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.

a	`REAL` for `sger`
	`DOUBLE PRECISION` for `dger`
	Array, size `(lda, n)`.
	Before entry, the leading *m*-by-*n* part of the array *a* must contain the matrix of coefficients.

lda	`INTEGER`. Specifies the leading dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least `max(1, m)`.

Output Parameters

a	Overwritten by the updated matrix.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine `ger` interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
x	Holds the vector with the number of elements *m*.
y	Holds the vector with the number of elements *n*.
alpha	The default value is 1.

?gerc

Performs a rank-1 update (conjugated) of a general matrix.

Syntax

```
call cgerc(m, n, alpha, x, incx, y, incy, a, lda)
call zgerc(m, n, alpha, x, incx, y, incy, a, lda)
call gerc(a, x, y [,alpha])
```

Include Files

- mkl.fi, blas.f90

Description

The ?gerc routines perform a matrix-vector operation defined as

```
A := alpha*x*conjg(y') + A,
```

where:

alpha is a scalar,

x is an *m*-element vector,

y is an *n*-element vector,

A is an *m*-by-*n* matrix.

Input Parameters

m	INTEGER. Specifies the number of rows of the matrix *A*. The value of *m* must be at least zero.
n	INTEGER. Specifies the number of columns of the matrix *A*. The value of *n* must be at least zero.
alpha	COMPLEX for cgerc DOUBLE COMPLEX for zgerc Specifies the scalar *alpha*.
x	COMPLEX for cgerc DOUBLE COMPLEX for zgerc Array, size at least (1 + (*m* – 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *m*-element vector *x*.
incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.
y	COMPLEX for cgerc DOUBLE COMPLEX for zgerc Array, size at least (1 + (*n* – 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the *n*-element vector *y*.
incy	INTEGER. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.
a	COMPLEX for cgerc DOUBLE COMPLEX for zgerc Array, size (*lda*, *n*). Before entry, the leading *m*-by-*n* part of the array *a* must contain the matrix of coefficients.

lda	INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least max(1, *m*).

Output Parameters

a	Overwritten by the updated matrix.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine gerc interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
x	Holds the vector with the number of elements *m*.
y	Holds the vector with the number of elements *n*.
alpha	The default value is 1.

?geru

Performs a rank-1 update (unconjugated) of a general matrix.

Syntax

```
call cgeru(m, n, alpha, x, incx, y, incy, a, lda)
call zgeru(m, n, alpha, x, incx, y, incy, a, lda)
call geru(a, x, y [,alpha])
```

Include Files

- mkl.fi, blas.f90

Description

The ?geru routines perform a matrix-vector operation defined as

```
A := alpha*x*y ' + A,
```

where:

alpha is a scalar,

x is an *m*-element vector,

y is an *n*-element vector,

A is an *m*-by-*n* matrix.

Input Parameters

m	INTEGER. Specifies the number of rows of the matrix *A*.

The value of *m* must be at least zero.

n — INTEGER. Specifies the number of columns of the matrix *A*.

The value of *n* must be at least zero.

alpha — COMPLEX for cgeru

DOUBLE COMPLEX for zgeru

Specifies the scalar *alpha*.

x — COMPLEX for cgeru

DOUBLE COMPLEX for zgeru

Array, size at least (1 + (*m* – 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *m*-element vector *x*.

incx — INTEGER. Specifies the increment for the elements of *x*.

The value of *incx* must not be zero.

y — COMPLEX for cgeru

DOUBLE COMPLEX for zgeru

Array, size at least (1 + (*n* – 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the *n*-element vector *y*.

incy — INTEGER. Specifies the increment for the elements of *y*.

The value of *incy* must not be zero.

a — COMPLEX for cgeru

DOUBLE COMPLEX for zgeru

Array, size (*lda*, *n*).

Before entry, the leading *m*-by-*n* part of the array *a* must contain the matrix of coefficients.

lda — INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program.

The value of *lda* must be at least max(1, *m*).

Output Parameters

a — Overwritten by the updated matrix.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine geru interface are the following:

a — Holds the matrix *A* of size (*m*,*n*).

x — Holds the vector with the number of elements *m*.

y — Holds the vector with the number of elements *n*.

alpha	The default value is 1.

?hbmv

Computes a matrix-vector product using a Hermitian band matrix.

Syntax

```
call chbmv(uplo, n, k, alpha, a, lda, x, incx, beta, y, incy)
call zhbmv(uplo, n, k, alpha, a, lda, x, incx, beta, y, incy)
call hbmv(a, x, y [,uplo][,alpha] [,beta])
```

Include Files

- mkl.fi, blas.f90

Description

The ?hbmv routines perform a matrix-vector operation defined as *y := alpha*A*x + beta*y*,

where:

alpha and *beta* are scalars,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* Hermitian band matrix, with *k* super-diagonals.

Input Parameters

uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the Hermitian band matrix *A* is used: If *uplo* = 'U' or 'u', then the upper triangular part of the matrix *A* is used. If *uplo* = 'L' or 'l', then the low triangular part of the matrix *A* is used.
n	INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.
k	INTEGER. For *uplo* = 'U' or 'u'Specifies the number of super-diagonals of the matrix *A*. For *uplo* = 'L' or 'l': Specifies the number of sub-diagonals of the matrix *A*. The value of *k* must satisfy $0 \le k$.
alpha	COMPLEX for chbmv DOUBLE COMPLEX for zhbmv Specifies the scalar *alpha*.
a	COMPLEX for chbmv DOUBLE COMPLEX for zhbmv Array, size (*lda*, *n*).

Before entry with *uplo* = 'U' or 'u', the leading (*k* + 1) by *n* part of the array *a* must contain the upper triangular band part of the Hermitian matrix. The matrix must be supplied column-by-column, with the leading diagonal of the matrix in row (*k* + 1) of the array, the first super-diagonal starting at position 2 in row *k*, and so on. The top left *k* by *k* triangle of the array *a* is not referenced.

The following program segment transfers the upper triangular part of a Hermitian band matrix from conventional full matrix storage (*matrix*) to band storage (*a*):

```
      do 20, j = 1, n
         m = k + 1 - j
         do 10, i = max( 1, j - k ), j
            a( m + i, j ) = matrix( i, j )
10       continue
20    continue
```

Before entry with *uplo* = 'L' or 'l', the leading (*k* + 1) by *n* part of the array *a* must contain the lower triangular band part of the Hermitian matrix, supplied column-by-column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right *k* by *k* triangle of the array *a* is not referenced.

The following program segment transfers the lower triangular part of a Hermitian band matrix from conventional full matrix storage (*matrix*) to band storage (*a*):

```
      do 20, j = 1, n
         m = 1 - j
         do 10, i = j, min( n, j + k )
            a( m + i, j ) = matrix( i, j )
10       continue
20    continue
```

The imaginary parts of the diagonal elements need not be set and are assumed to be zero.

lda — INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least (*k* + 1).

x — COMPLEX for chbmv

DOUBLE COMPLEX for zhbmv

Array, size at least (1 + (*n* – 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the vector *x*.

incx — INTEGER. Specifies the increment for the elements of *x*.

The value of *incx* must not be zero.

beta — COMPLEX for chbmv

DOUBLE COMPLEX for zhbmv

Specifies the scalar *beta*.

y — COMPLEX for chbmv

DOUBLE COMPLEX for zhbmv

	Array, size at least `(1 + (n - 1)*abs(incy))`. Before entry, the incremented array *y* must contain the vector *y*.
incy	`INTEGER`. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.

Output Parameters

y	Overwritten by the updated vector *y*.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine `hbmv` interface are the following:

a	Holds the array *a* of size (*k*+1,*n*).
x	Holds the vector with the number of elements *n*.
y	Holds the vector with the number of elements *n*.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
alpha	The default value is 1.
beta	The default value is 0.

?hemv

Computes a matrix-vector product using a Hermitian matrix.

Syntax

```
call chemv(uplo, n, alpha, a, lda, x, incx, beta, y, incy)
call zhemv(uplo, n, alpha, a, lda, x, incx, beta, y, incy)
call hemv(a, x, y [,uplo][,alpha] [,beta])
```

Include Files

- `mkl.fi, blas.f90`

Description

The `?hemv` routines perform a matrix-vector operation defined as

```
y := alpha*A*x + beta*y,
```

where:

alpha and *beta* are scalars,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* Hermitian matrix.

Input Parameters

uplo

CHARACTER*1. Specifies whether the upper or lower triangular part of the array *a* is used.

If *uplo* = 'U' or 'u', then the upper triangular of the array *a* is used.

If *uplo* = 'L' or 'l', then the low triangular of the array *a* is used.

n

INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.

alpha

COMPLEX for chemv

DOUBLE COMPLEX for zhemv

Specifies the scalar *alpha*.

a

COMPLEX for chemv

DOUBLE COMPLEX for zhemv

Array, size (*lda*, *n*).

Before entry with *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of *a* is not referenced. Before entry with *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular part of the Hermitian matrix and the strictly upper triangular part of *a* is not referenced.

The imaginary parts of the diagonal elements need not be set and are assumed to be zero.

lda

INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least max(1, *n*).

x

COMPLEX for chemv

DOUBLE COMPLEX for zhemv

Array, size at least (1 + (*n* – 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.

incx

INTEGER. Specifies the increment for the elements of *x*.

The value of *incx* must not be zero.

beta

COMPLEX for chemv

DOUBLE COMPLEX for zhemv

Specifies the scalar *beta*. When *beta* is supplied as zero then *y* need not be set on input.

y

COMPLEX for chemv

DOUBLE COMPLEX for zhemv

Array, size at least (1 + (*n* – 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the *n*-element vector *y*.

incy

INTEGER. Specifies the increment for the elements of *y*.

	The value of *incy* must not be zero.

Output Parameters

y	Overwritten by the updated vector *y*.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine `hemv` interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
x	Holds the vector with the number of elements *n*.
y	Holds the vector with the number of elements *n*.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
alpha	The default value is 1.
beta	The default value is 0.

?her

Performs a rank-1 update of a Hermitian matrix.

Syntax

```
call cher(uplo, n, alpha, x, incx, a, lda)
call zher(uplo, n, alpha, x, incx, a, lda)
call her(a, x [,uplo] [, alpha])
```

Include Files

- `mkl.fi, blas.f90`

Description

The `?her` routines perform a matrix-vector operation defined as

```
A := alpha*x*conjg(x') + A,
```

where:

alpha is a real scalar,

x is an *n*-element vector,

A is an *n*-by-*n* Hermitian matrix.

Input Parameters

uplo	`CHARACTER*1`. Specifies whether the upper or lower triangular part of the array *a* is used. If *uplo* = `'U'` or `'u'`, then the upper triangular of the array *a* is used.

If *uplo* = 'L' or 'l', then the low triangular of the array *a* is used.

n
INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.

alpha
REAL for cher

DOUBLE PRECISION for zher

Specifies the scalar *alpha*.

x
COMPLEX for cher

DOUBLE COMPLEX for zher

Array, dimension at least (1 + (*n* - 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.

incx
INTEGER. Specifies the increment for the elements of *x*.

The value of *incx* must not be zero.

a
COMPLEX for cher

DOUBLE COMPLEX for zher

Array, size (*lda*, *n*).

Before entry with *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of *a* is not referenced.

Before entry with *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular part of the Hermitian matrix and the strictly upper triangular part of *a* is not referenced.

The imaginary parts of the diagonal elements need not be set and are assumed to be zero.

lda
INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least max(1, *n*).

Output Parameters

a
With *uplo* = 'U' or 'u', the upper triangular part of the array *a* is overwritten by the upper triangular part of the updated matrix.

With *uplo* = 'L' or 'l', the lower triangular part of the array *a* is overwritten by the lower triangular part of the updated matrix.

If *alpha* is zero, matrix *A* is unchanged; otherwise, the imaginary parts of the diagonal elements are set to zero.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine her interface are the following:

a
Holds the matrix *A* of size (*n*,*n*).

x	Holds the vector with the number of elements *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.
alpha	The default value is 1.

?her2

Performs a rank-2 update of a Hermitian matrix.

Syntax

```
call cher2(uplo, n, alpha, x, incx, y, incy, a, lda)
call zher2(uplo, n, alpha, x, incx, y, incy, a, lda)
call her2(a, x, y [,uplo][,alpha])
```

Include Files

- mkl.fi, blas.f90

Description

The ?her2 routines perform a matrix-vector operation defined as

```
A := alpha *x*conjg(y') + conjg(alpha)*y *conjg(x') + A,
```

where:

alpha is scalar,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* Hermitian matrix.

Input Parameters

uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the array *a* is used. If *uplo* = 'U' or 'u', then the upper triangular of the array *a* is used. If *uplo* = 'L' or 'l', then the low triangular of the array *a* is used.
n	INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.
alpha	COMPLEX for cher2 DOUBLE COMPLEX for zher2 Specifies the scalar *alpha*.
x	COMPLEX for cher2 DOUBLE COMPLEX for zher2 Array, size at least (1 + (*n* - 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.
incx	INTEGER. Specifies the increment for the elements of *x*.

The value of *incx* must not be zero.

y

COMPLEX for cher2

DOUBLE COMPLEX for zher2

Array, size at least (1 + (*n* – 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the *n*-element vector *y*.

incy

INTEGER. Specifies the increment for the elements of *y*.

The value of *incy* must not be zero.

a

COMPLEX for cher2

DOUBLE COMPLEX for zher2

Array, size (*lda*, *n*).

Before entry with *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of *a* is not referenced.

Before entry with *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular part of the Hermitian matrix and the strictly upper triangular part of *a* is not referenced.

The imaginary parts of the diagonal elements need not be set and are assumed to be zero.

lda

INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least max(1, *n*).

Output Parameters

a

With *uplo* = 'U' or 'u', the upper triangular part of the array *a* is overwritten by the upper triangular part of the updated matrix.

With *uplo* = 'L' or 'l', the lower triangular part of the array *a* is overwritten by the lower triangular part of the updated matrix.

If *alpha* is zero, matrix *A* is unchanged; otherwise, the imaginary parts of the diagonal elements are set to zero.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine her2 interface are the following:

a

Holds the matrix *A* of size (*n*,*n*).

x

Holds the vector with the number of elements *n*.

y

Holds the vector with the number of elements *n*.

uplo

Must be 'U' or 'L'. The default value is 'U'.

alpha

The default value is 1.

?hpmv

Computes a matrix-vector product using a Hermitian packed matrix.

Syntax

```
call chpmv(uplo, n, alpha, ap, x, incx, beta, y, incy)
call zhpmv(uplo, n, alpha, ap, x, incx, beta, y, incy)
call hpmv(ap, x, y [,uplo][,alpha] [,beta])
```

Include Files

- mkl.fi, blas.f90

Description

The ?hpmv routines perform a matrix-vector operation defined as

```
y := alpha*A*x + beta*y,
```

where:

alpha and *beta* are scalars,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* Hermitian matrix, supplied in packed form.

Input Parameters

uplo

CHARACTER*1. Specifies whether the upper or lower triangular part of the matrix *A* is supplied in the packed array *ap*.

If *uplo* = 'U' or 'u', then the upper triangular part of the matrix *A* is supplied in the packed array *ap* .

If *uplo* = 'L' or 'l', then the low triangular part of the matrix *A* is supplied in the packed array *ap* .

n

INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.

alpha

COMPLEX for chpmv

DOUBLE COMPLEX for zhpmv

Specifies the scalar *alpha*.

ap

COMPLEX for chpmv

DOUBLE COMPLEX for zhpmv

Array, size at least ((*n**(*n* + 1))/2).

Before entry with *uplo* = 'U' or 'u', the array *ap* must contain the upper triangular part of the Hermitian matrix packed sequentially, column-by-column, so that *ap*(1) contains $A_{1,1}$, *ap*(2) and *ap*(3) contain $A_{1,2}$ and $A_{2,2}$ respectively, and so on. Before entry with *uplo* = 'L' or 'l', the array *ap* must contain the lower triangular part of the Hermitian matrix packed sequentially, column-by-column, so that *ap*(1) contains $A_{1,1}$, *ap*(2) and *ap*(3) contain $A_{2,1}$ and $A_{3,1}$ respectively, and so on.

	The imaginary parts of the diagonal elements need not be set and are assumed to be zero.

x	`COMPLEX` for `chpmv`
	`DOUBLE PRECISION COMPLEX` for `zhpmv`
	Array, size at least `(1 +(n - 1)*abs(incx))`. Before entry, the incremented array *x* must contain the *n*-element vector *x*.

incx	`INTEGER`. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.

beta	`COMPLEX` for `chpmv`
	`DOUBLE COMPLEX` for `zhpmv`
	Specifies the scalar *beta*.
	When *beta* is equal to zero then *y* need not be set on input.

y	`COMPLEX` for `chpmv`
	`DOUBLE COMPLEX` for `zhpmv`
	Array, size at least `(1 + (n - 1)*abs(incy))`. Before entry, the incremented array *y* must contain the *n*-element vector *y*.

incy	`INTEGER`. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.

Output Parameters

y	Overwritten by the updated vector *y*.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine `hpmv` interface are the following:

ap	Holds the array *ap* of size (*n**(n+1)/2*).
x	Holds the vector with the number of elements *n*.
y	Holds the vector with the number of elements *n*.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
alpha	The default value is 1.
beta	The default value is 0.

?hpr

Performs a rank-1 update of a Hermitian packed matrix.

Syntax

```
call chpr(uplo, n, alpha, x, incx, ap)
```

```
call zhpr(uplo, n, alpha, x, incx, ap)
call hpr(ap, x [,uplo] [, alpha])
```

Include Files

- mkl.fi, blas.f90

Description

The ?hpr routines perform a matrix-vector operation defined as

```
A := alpha*x*conjg(x') + A,
```

where:

alpha is a real scalar,

x is an *n*-element vector,

A is an *n*-by-*n* Hermitian matrix, supplied in packed form.

Input Parameters

uplo

CHARACTER*1. Specifies whether the upper or lower triangular part of the matrix *A* is supplied in the packed array *ap*.

If *uplo* = 'U' or 'u', the upper triangular part of the matrix *A* is supplied in the packed array *ap* .

If *uplo* = 'L' or 'l', the low triangular part of the matrix *A* is supplied in the packed array *ap* .

n

INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.

alpha

REAL for chpr

DOUBLE PRECISION for zhpr

Specifies the scalar *alpha*.

x

COMPLEX for chpr

DOUBLE COMPLEX for zhpr

Array, size at least (1 + (*n* – 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.

incx

INTEGER. Specifies the increment for the elements of *x*. *incx* must not be zero.

ap

COMPLEX for chpr

DOUBLE COMPLEX for zhpr

Array, size at least ((*n**(*n* + 1))/2).

Before entry with *uplo* = 'U' or 'u', the array *ap* must contain the upper triangular part of the Hermitian matrix packed sequentially, column-by-column, so that *ap*(1) contains $A_{1,1}$, *ap*(2) and *ap*(3) contain $A_{1,2}$ and $A_{2,2}$ respectively, and so on.

Before entry with *uplo* = 'L' or 'l', the array *ap* must contain the lower triangular part of the Hermitian matrix packed sequentially, column-by-column, so that *ap*(1) contains $A_{1,1}$, *ap*(2) and *ap*(3) contain $A_{2,1}$ and $A_{3,1}$ respectively, and so on.

The imaginary parts of the diagonal elements need not be set and are assumed to be zero.

Output Parameters

ap

With *uplo* = 'U' or 'u', overwritten by the upper triangular part of the updated matrix.

With *uplo* = 'L' or 'l', overwritten by the lower triangular part of the updated matrix.

If *alpha* is zero, matrix *A* is unchanged; otherwise, the imaginary parts of the diagonal elements are set to zero.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine hpr interface are the following:

ap — Holds the array *ap* of size (*n**(*n*+1)/2).

x — Holds the vector with the number of elements *n*.

uplo — Must be 'U' or 'L'. The default value is 'U'.

alpha — The default value is 1.

?hpr2

Performs a rank-2 update of a Hermitian packed matrix.

Syntax

```
call chpr2(uplo, n, alpha, x, incx, y, incy, ap)
call zhpr2(uplo, n, alpha, x, incx, y, incy, ap)
call hpr2(ap, x, y [,uplo][,alpha])
```

Include Files

- mkl.fi, blas.f90

Description

The ?hpr2 routines perform a matrix-vector operation defined as

```
A := alpha*x*conjg(y') + conjg(alpha)*y*conjg(x') + A,
```

where:

alpha is a scalar,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* Hermitian matrix, supplied in packed form.

Input Parameters

uplo

CHARACTER*1. Specifies whether the upper or lower triangular part of the matrix *A* is supplied in the packed array *ap*.

If *uplo* = 'U' or 'u', then the upper triangular part of the matrix *A* is supplied in the packed array *ap* .

If *uplo* = 'L' or 'l', then the low triangular part of the matrix *A* is supplied in the packed array *ap* .

n

INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.

alpha

COMPLEX for chpr2

DOUBLE COMPLEX for zhpr2

Specifies the scalar *alpha*.

x

COMPLEX for chpr2

DOUBLE COMPLEX for zhpr2

Array, dimension at least (1 +(*n* – 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.

incx

INTEGER. Specifies the increment for the elements of *x*.

The value of *incx* must not be zero.

y

COMPLEX for chpr2

DOUBLE COMPLEX for zhpr2

Array, size at least (1 +(*n* – 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the *n*-element vector *y*.

incy

INTEGER. Specifies the increment for the elements of *y*.

The value of *incy* must not be zero.

ap

COMPLEX for chpr2

DOUBLE COMPLEX for zhpr2

Array, size at least ((*n**(*n* + 1))/2).

Before entry with *uplo* = 'U' or 'u', the array *ap* must contain the upper triangular part of the Hermitian matrix packed sequentially, column-by-column, so that *ap*(1) contains $A_{1,1}$, *ap*(2) and *ap*(3) contain $A_{1,2}$ and $A_{2,2}$ respectively, and so on.

Before entry with *uplo* = 'L' or 'l', the array *ap* must contain the lower triangular part of the Hermitian matrix packed sequentially, column-by-column, so that *ap*(1) contains $A_{1,1}$, *ap*(2) and *ap*(3) contain $A_{2,1}$ and $A_{3,1}$ respectively, and so on.

The imaginary parts of the diagonal elements need not be set and are assumed to be zero.

Output Parameters

ap	With *uplo* = 'U' or 'u', overwritten by the upper triangular part of the updated matrix. With *uplo* = 'L' or 'l', overwritten by the lower triangular part of the updated matrix. If *alpha* is zero, matrix *A* is unchanged; otherwise, the imaginary parts of the diagonal elements need are set to zero.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine hpr2 interface are the following:

ap	Holds the array *ap* of size (*n*(n+1)/2*).
x	Holds the vector with the number of elements *n*.
y	Holds the vector with the number of elements *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.
alpha	The default value is 1.

?sbmv

Computes a matrix-vector product with a symmetric band matrix.

Syntax

```
call ssbmv(uplo, n, k, alpha, a, lda, x, incx, beta, y, incy)
call dsbmv(uplo, n, k, alpha, a, lda, x, incx, beta, y, incy)
call sbmv(a, x, y [,uplo][,alpha] [,beta])
```

Include Files

- mkl.fi,blas.f90

Description

The ?sbmv routines perform a matrix-vector operation defined as

*y := alpha*A*x + beta*y*,

where:

alpha and *beta* are scalars,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* symmetric band matrix, with *k* super-diagonals.

Input Parameters

uplo

CHARACTER*1. Specifies whether the upper or lower triangular part of the band matrix *A* is used:

if *uplo* = 'U' or 'u' - upper triangular part;

if *uplo* = 'L' or 'l' - low triangular part.

n

INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.

k

INTEGER. Specifies the number of super-diagonals of the matrix *A*.

The value of *k* must satisfy $0 \le k$.

alpha

REAL for ssbmv

DOUBLE PRECISION for dsbmv

Specifies the scalar *alpha*.

a

REAL for ssbmv

DOUBLE PRECISION for dsbmv

Array, size (*lda*, *n*). Before entry with *uplo* = 'U' or 'u', the leading (*k* + 1) by *n* part of the array *a* must contain the upper triangular band part of the symmetric matrix, supplied column-by-column, with the leading diagonal of the matrix in row (*k* + 1) of the array, the first super-diagonal starting at position 2 in row *k*, and so on. The top left *k* by *k* triangle of the array *a* is not referenced.

The following program segment transfers the upper triangular part of a symmetric band matrix from conventional full matrix storage (*matrix*) to band storage (*a*):

```
      do 20, j = 1, n
         m = k + 1 - j
         do 10, i = max( 1, j - k ), j
            a( m + i, j ) = matrix( i, j )
10       continue
20    continue
```

Before entry with *uplo* = 'L' or 'l', the leading (*k* + 1) by *n* part of the array *a* must contain the lower triangular band part of the symmetric matrix, supplied column-by-column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right *k* by *k* triangle of the array *a* is not referenced.

The following program segment transfers the lower triangular part of a symmetric band matrix from conventional full matrix storage (*matrix*) to band storage (*a*):

```
      do 20, j = 1, n
         m = 1 - j
         do 10, i = j, min( n, j + k )
            a( m + i, j ) = matrix( i, j )
10       continue
20    continue
```

lda	INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least (*k* + 1).
x	REAL for ssbmv DOUBLE PRECISION for dsbmv Array, size at least (1 + (*n* – 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the vector *x*.
incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.
beta	REAL for ssbmv DOUBLE PRECISION for dsbmv Specifies the scalar *beta*.
y	REAL for ssbmv DOUBLE PRECISION for dsbmv Array, size at least (1 + (*n* – 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the vector *y*.
incy	INTEGER. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.

Output Parameters

y	Overwritten by the updated vector *y*.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine sbmv interface are the following:

a	Holds the array *a* of size (*k*+1,*n*).
x	Holds the vector with the number of elements *n*.
y	Holds the vector with the number of elements *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.
alpha	The default value is 1.
beta	The default value is 0.

?spmv

Computes a matrix-vector product with a symmetric packed matrix.

Syntax

```
call sspmv(uplo, n, alpha, ap, x, incx, beta, y, incy)
```

```
call dspmv(uplo, n, alpha, ap, x, incx, beta, y, incy)
call spmv(ap, x, y [,uplo][,alpha] [,beta])
```

Include Files

- mkl.fi, blas.f90

Description

The ?spmv routines perform a matrix-vector operation defined as

```
y := alpha*A*x + beta*y,
```

where:

alpha and *beta* are scalars,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* symmetric matrix, supplied in packed form.

Input Parameters

uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the matrix *A* is supplied in the packed array *ap*. If *uplo* = 'U' or 'u', then the upper triangular part of the matrix *A* is supplied in the packed array *ap* . If *uplo* = 'L' or 'l', then the low triangular part of the matrix *A* is supplied in the packed array *ap* .
n	INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.
alpha	REAL for sspmv DOUBLE PRECISION for dspmv Specifies the scalar *alpha*.
ap	REAL for sspmv DOUBLE PRECISION for dspmv Array, size at least ((n*(n + 1))/2). Before entry with *uplo* = 'U' or 'u', the array *ap* must contain the upper triangular part of the symmetric matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1,1), *ap*(2) and *ap*(3) contain *a*(1,2) and *a*(2, 2) respectively, and so on. Before entry with *uplo* = 'L' or 'l', the array *ap* must contain the lower triangular part of the symmetric matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1,1), *ap*(2) and *ap*(3) contain *a*(2,1) and *a*(3,1) respectively, and so on.
x	REAL for sspmv DOUBLE PRECISION for dspmv

	Array, size at least `(1 + (n - 1)*abs(incx))`. Before entry, the incremented array *x* must contain the *n*-element vector *x*.
incx	`INTEGER`. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.

beta	`REAL` for `sspmv`
	`DOUBLE PRECISION` for `dspmv`
	Specifies the scalar *beta*.
	When *beta* is supplied as zero, then *y* need not be set on input.

y	`REAL` for `sspmv`
	`DOUBLE PRECISION` for `dspmv`
	Array, size at least `(1 + (n - 1)*abs(incy))`. Before entry, the incremented array *y* must contain the *n*-element vector *y*.

incy	`INTEGER`. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.

Output Parameters

y	Overwritten by the updated vector *y*.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine `spmv` interface are the following:

ap	Holds the array *ap* of size (*n**(n+1)/2*).
x	Holds the vector with the number of elements *n*.
y	Holds the vector with the number of elements *n*.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
alpha	The default value is 1.
beta	The default value is 0.

?spr

Performs a rank-1 update of a symmetric packed matrix.

Syntax

```
call sspr(uplo, n, alpha, x, incx, ap)
call dspr(uplo, n, alpha, x, incx, ap)
call spr(ap, x [,uplo] [, alpha])
```

Include Files

- mkl.fi, blas.f90

Description

The ?spr routines perform a matrix-vector operation defined as

```
a:= alpha*x*x'+ A,
```

where:

alpha is a real scalar,

x is an *n*-element vector,

A is an *n*-by-*n* symmetric matrix, supplied in packed form.

Input Parameters

uplo

CHARACTER*1. Specifies whether the upper or lower triangular part of the matrix *A* is supplied in the packed array *ap*.

If *uplo* = 'U' or 'u', then the upper triangular part of the matrix *A* is supplied in the packed array *ap* .

If *uplo* = 'L' or 'l', then the low triangular part of the matrix *A* is supplied in the packed array *ap* .

n

INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.

alpha

REAL for sspr

DOUBLE PRECISION for dspr

Specifies the scalar *alpha*.

x

REAL for sspr

DOUBLE PRECISION for dspr

Array, size at least (1 + (*n* - 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.

incx

INTEGER. Specifies the increment for the elements of *x*.

The value of *incx* must not be zero.

ap

REAL for sspr

DOUBLE PRECISION for dspr

Before entry with *uplo* = 'U' or 'u', the array *ap* must contain the upper triangular part of the symmetric matrix packed sequentially, column-by-column, so that *ap*(1) contains $A_{1,1}$, *ap*(2) and *ap*(3) contain $A_{1,2}$ and $A_{2,2}$ respectively, and so on.

Before entry with *uplo* = 'L' or 'l', the array *ap* must contain the lower triangular part of the symmetric matrix packed sequentially, column-by-column, so that *ap*(1) contains $A_{1,1}$, *ap*(2) and *ap*(3) contain $A_{2,1}$ and $A_{3,1}$ respectively, and so on.

Output Parameters

ap	With *uplo* = 'U' or 'u', overwritten by the upper triangular part of the updated matrix. With *uplo* = 'L' or 'l', overwritten by the lower triangular part of the updated matrix.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine spr interface are the following:

ap	Holds the array *ap* of size (*n*(n+1)/2*).
x	Holds the vector with the number of elements *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.
alpha	The default value is 1.

?spr2

Computes a rank-2 update of a symmetric packed matrix.

Syntax

```
call sspr2(uplo, n, alpha, x, incx, y, incy, ap)
call dspr2(uplo, n, alpha, x, incx, y, incy, ap)
call spr2(ap, x, y [,uplo][,alpha])
```

Include Files

- mkl.fi, blas.f90

Description

The ?spr2 routines perform a matrix-vector operation defined as

```
A:= alpha*x*y'+ alpha*y*x' + A,
```

where:

alpha is a scalar,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* symmetric matrix, supplied in packed form.

Input Parameters

uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the matrix *A* is supplied in the packed array *ap*. If *uplo* = 'U' or 'u', then the upper triangular part of the matrix *A* is supplied in the packed array *ap* .

If *uplo* = 'L' or 'l', then the low triangular part of the matrix *A* is supplied in the packed array *ap* .

n

INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.

alpha

REAL for sspr2

DOUBLE PRECISION for dspr2

Specifies the scalar *alpha*.

x

REAL for sspr2

DOUBLE PRECISION for dspr2

Array, size at least (1 + (*n* – 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.

incx

INTEGER. Specifies the increment for the elements of *x*.

The value of *incx* must not be zero.

y

REAL for sspr2

DOUBLE PRECISION for dspr2

Array, size at least (1 + (*n* – 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the *n*-element vector *y*.

incy

INTEGER. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.

ap

REAL for sspr2

DOUBLE PRECISION for dspr2

Before entry with *uplo* = 'U' or 'u', the array *ap* must contain the upper triangular part of the symmetric matrix packed sequentially, column-by-column, so that *ap*(1) contains $A_{1,1}$, *ap*(2) and *ap*(3) contain $A_{1,2}$ and $A_{2,2}$ respectively, and so on.

Before entry with *uplo* = 'L' or 'l', the array *ap* must contain the lower triangular part of the symmetric matrix packed sequentially, column-by-column, so that *ap*(1) contains $A_{1,1}$, *ap*(2) and *ap*(3) contain $A_{2,1}$ and $A_{3,1}$ respectively, and so on.

Output Parameters

ap

With *uplo* = 'U' or 'u', overwritten by the upper triangular part of the updated matrix.

With *uplo* = 'L' or 'l', overwritten by the lower triangular part of the updated matrix.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine spr2 interface are the following:

ap	Holds the array *ap* of size (*n**(*n*+1)/2).
x	Holds the vector with the number of elements *n*.
y	Holds the vector with the number of elements *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.
alpha	The default value is 1.

?symv

Computes a matrix-vector product for a symmetric matrix.

Syntax

```
call ssymv(uplo, n, alpha, a, lda, x, incx, beta, y, incy)
call dsymv(uplo, n, alpha, a, lda, x, incx, beta, y, incy)
call symv(a, x, y [,uplo][,alpha] [,beta])
```

Include Files

- mkl.fi, blas.f90

Description

The ?symv routines perform a matrix-vector operation defined as

```
y := alpha*A*x + beta*y,
```

where:

alpha and *beta* are scalars,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* symmetric matrix.

Input Parameters

uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the array *a* is used. If *uplo* = 'U' or 'u', then the upper triangular part of the array *a* is used. If *uplo* = 'L' or 'l', then the low triangular part of the array *a* is used.
n	INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.
alpha	REAL for ssymv DOUBLE PRECISION for dsymv Specifies the scalar *alpha*.
a	REAL for ssymv DOUBLE PRECISION for dsymv Array, size (*lda*, *n*).

Before entry with *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular part of the symmetric matrix *A* and the strictly lower triangular part of *a* is not referenced. Before entry with *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular part of the symmetric matrix *A* and the strictly upper triangular part of *a* is not referenced.

lda — INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least max(1, *n*).

x — REAL for ssymv

DOUBLE PRECISION for dsymv

Array, size at least (1 + (*n* – 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.

incx — INTEGER. Specifies the increment for the elements of *x*.

The value of *incx* must not be zero.

beta — REAL for ssymv

DOUBLE PRECISION for dsymv

Specifies the scalar *beta*.

When *beta* is supplied as zero, then *y* need not be set on input.

y — REAL for ssymv

DOUBLE PRECISION for dsymv

Array, size at least (1 + (*n* – 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the *n*-element vector *y*.

incy — INTEGER. Specifies the increment for the elements of *y*.

The value of *incy* must not be zero.

Output Parameters

y — Overwritten by the updated vector *y*.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine symv interface are the following:

a — Holds the matrix *A* of size (*n*,*n*).

x — Holds the vector with the number of elements *n*.

y — Holds the vector with the number of elements *n*.

uplo — Must be 'U' or 'L'. The default value is 'U'.

alpha — The default value is 1.

beta — The default value is 0.

?syr

Performs a rank-1 update of a symmetric matrix.

Syntax

```
call ssyr(uplo, n, alpha, x, incx, a, lda)
call dsyr(uplo, n, alpha, x, incx, a, lda)
call syr(a, x [,uplo] [, alpha])
```

Include Files

- mkl.fi, blas.f90

Description

The ?syr routines perform a matrix-vector operation defined as

*A := alpha*x*x' + A*,

where:

alpha is a real scalar,

x is an *n*-element vector,

A is an *n*-by-*n* symmetric matrix.

Input Parameters

uplo

CHARACTER*1. Specifies whether the upper or lower triangular part of the array *a* is used.

If *uplo* = 'U' or 'u', then the upper triangular part of the array *a* is used.

If *uplo* = 'L' or 'l', then the low triangular part of the array *a* is used.

n

INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.

alpha

REAL for ssyr

DOUBLE PRECISION for dsyr

Specifies the scalar *alpha*.

x

REAL for ssyr

DOUBLE PRECISION for dsyr

Array, size at least (1 + (*n*-1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.

incx

INTEGER. Specifies the increment for the elements of *x*.

The value of *incx* must not be zero.

a

REAL for ssyr

DOUBLE PRECISION for dsyr

Array, size (*lda*, *n*).

Before entry with *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular part of the symmetric matrix *A* and the strictly lower triangular part of *a* is not referenced.

Before entry with *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular part of the symmetric matrix *A* and the strictly upper triangular part of *a* is not referenced.

lda — INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least max(1, *n*).

Output Parameters

a — With *uplo* = 'U' or 'u', the upper triangular part of the array *a* is overwritten by the upper triangular part of the updated matrix.

With *uplo* = 'L' or 'l', the lower triangular part of the array *a* is overwritten by the lower triangular part of the updated matrix.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine syr interface are the following:

a — Holds the matrix *A* of size (*n*,*n*).

x — Holds the vector with the number of elements *n*.

uplo — Must be 'U' or 'L'. The default value is 'U'.

alpha — The default value is 1.

?syr2

Performs a rank-2 update of a symmetric matrix.

Syntax

```
call ssyr2(uplo, n, alpha, x, incx, y, incy, a, lda)
call dsyr2(uplo, n, alpha, x, incx, y, incy, a, lda)
call syr2(a, x, y [,uplo][,alpha])
```

Include Files

- mkl.fi, blas.f90

Description

The ?syr2 routines perform a matrix-vector operation defined as

```
A := alpha*x*y'+ alpha*y*x' + A,
```

where:

alpha is scalar,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* symmetric matrix.

Input Parameters

uplo
: CHARACTER*1. Specifies whether the upper or lower triangular part of the array *a* is used.

  If *uplo* = 'U' or 'u', then the upper triangular part of the array *a* is used.

  If *uplo* = 'L' or 'l', then the low triangular part of the array *a* is used.

n
: INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.

alpha
: REAL for ssyr2

  DOUBLE PRECISION for dsyr2

  Specifies the scalar *alpha*.

x
: REAL for ssyr2

  DOUBLE PRECISION for dsyr2

  Array, size at least (1 + (*n* – 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.

incx
: INTEGER. Specifies the increment for the elements of *x*.

  The value of *incx* must not be zero.

y
: REAL for ssyr2

  DOUBLE PRECISION for dsyr2

  Array, size at least (1 + (*n* – 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the *n*-element vector *y*.

incy
: INTEGER. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.

a
: REAL for ssyr2

  DOUBLE PRECISION for dsyr2

  Array, size (*lda*, *n*).

  Before entry with *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of *a* is not referenced.

  Before entry with *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of *a* is not referenced.

lda
: INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least max(1, *n*).

Output Parameters

a
: With *uplo* = 'U' or 'u', the upper triangular part of the array *a* is overwritten by the upper triangular part of the updated matrix.

With *uplo* = 'L' or 'l', the lower triangular part of the array *a* is overwritten by the lower triangular part of the updated matrix.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine syr2 interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
x	Holds the vector *x* of length *n*.
y	Holds the vector *y* of length *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.
alpha	The default value is 1.

?tbmv

Computes a matrix-vector product using a triangular band matrix.

Syntax

```
call stbmv(uplo, trans, diag, n, k, a, lda, x, incx)
call dtbmv(uplo, trans, diag, n, k, a, lda, x, incx)
call ctbmv(uplo, trans, diag, n, k, a, lda, x, incx)
call ztbmv(uplo, trans, diag, n, k, a, lda, x, incx)
call tbmv(a, x [,uplo] [, trans] [,diag])
```

Include Files

- mkl.fi, blas.f90

Description

The ?tbmv routines perform one of the matrix-vector operations defined as

x := *A***x*, or *x* := *A*'**x*, or *x* := conjg(*A*')**x*,

where:

x is an *n*-element vector,

A is an *n*-by-*n* unit, or non-unit, upper or lower triangular band matrix, with (*k* +1) diagonals.

Input Parameters

uplo	CHARACTER*1. Specifies whether the matrix *A* is an upper or lower triangular matrix: *uplo* = 'U' or 'u' if *uplo* = 'L' or 'l', then the matrix is low triangular.

trans

CHARACTER*1. Specifies the operation:

if *trans*= 'N' or 'n', then *x* := *A***x*;

if *trans*= 'T' or 't', then *x* := *A*'**x*;

if *trans*= 'C' or 'c', then *x* := conjg(*A*')**x*.

diag

CHARACTER*1. Specifies whether the matrix *A* is unit triangular:

if *uplo* = 'U' or 'u' then the matrix is unit triangular;

if *diag* = 'N' or 'n', then the matrix is not unit triangular.

n

INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.

k

INTEGER. On entry with *uplo* = 'U' or 'u' specifies the number of super-diagonals of the matrix *A*. On entry with *uplo* = 'L' or 'l', *k* specifies the number of sub-diagonals of the matrix *a*.

The value of *k* must satisfy $0 \le k$.

a

REAL for stbmv

DOUBLE PRECISION for dtbmv

COMPLEX for ctbmv

DOUBLE COMPLEX for ztbmv

Array, size (*lda*, *n*).

Before entry with *uplo* = 'U' or 'u', the leading (*k* + 1) by *n* part of the array *a* must contain the upper triangular band part of the matrix of coefficients, supplied column-by-column, with the leading diagonal of the matrix in row (*k* + 1) of the array, the first super-diagonal starting at position 2 in row *k*, and so on. The top left *k* by *k* triangle of the array *a* is not referenced. The following program segment transfers an upper triangular band matrix from conventional full matrix storage (*matrix*) to band storage (*a*):

```
      do 20, j = 1, n
         m = k + 1 - j
         do 10, i = max( 1, j - k ), j
            a( m + i, j ) = matrix( i, j )
10       continue
20    continue
```

Before entry with *uplo* = 'L' or 'l', the leading (*k* + 1) by *n* part of the array *a* must contain the lower triangular band part of the matrix of coefficients, supplied column-by-column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right *k* by *k* triangle of the array *a* is not referenced. The following program segment transfers a lower triangular band matrix from conventional full matrix storage (*matrix*) to band storage (*a*):

```
      do 20, j = 1, n
         m = 1 - j
         do 10, i = j, min( n, j + k )
```

```
            a( m + i, j ) = matrix( i, j )
10        continue
20     continue
```

Note that when *uplo* = 'U' or 'u', the elements of the array *a* corresponding to the diagonal elements of the matrix are not referenced, but are assumed to be unity.

lda — INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least (*k* + 1).

x — REAL for stbmv

DOUBLE PRECISION for dtbmv

COMPLEX for ctbmv

DOUBLE COMPLEX for ztbmv

Array, size at least (1 + (*n* – 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.

incx — INTEGER. Specifies the increment for the elements of *x*.

The value of *incx* must not be zero.

Output Parameters

x — Overwritten with the transformed vector *x*.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine tbmv interface are the following:

a — Holds the array *a* of size (*k*+1,*n*).

x — Holds the vector with the number of elements *n*.

uplo — Must be 'U' or 'L'. The default value is 'U'.

trans — Must be 'N', 'C', or 'T'.

The default value is 'N'.

diag — Must be 'N' or 'U'. The default value is 'N'.

?tbsv

Solves a system of linear equations whose coefficients are in a triangular band matrix.

Syntax

```
call stbsv(uplo, trans, diag, n, k, a, lda, x, incx)
call dtbsv(uplo, trans, diag, n, k, a, lda, x, incx)
call ctbsv(uplo, trans, diag, n, k, a, lda, x, incx)
call ztbsv(uplo, trans, diag, n, k, a, lda, x, incx)
```

```
call tbsv(a, x [,uplo] [, trans] [,diag])
```

Include Files

- mkl.fi, blas.f90

Description

The ?tbsv routines solve one of the following systems of equations:

*A*x* = *b*, or *A*'*x* = *b*, or conjg(*A*')*x* = *b*,

where:

b and *x* are *n*-element vectors,

A is an *n*-by-*n* unit, or non-unit, upper or lower triangular band matrix, with (*k* + 1) diagonals.

The routine does not test for singularity or near-singularity.

Such tests must be performed before calling this routine.

Input Parameters

uplo	CHARACTER*1. Specifies whether the matrix *A* is an upper or lower triangular matrix: if *uplo* = 'U' or 'u' the matrix is upper triangular; if *uplo* = 'L' or 'l', the matrix is low triangular.
trans	CHARACTER*1. Specifies the system of equations: if *trans*= 'N' or 'n', then *A*x* = *b*; if *trans*= 'T' or 't', then *A*'*x* = *b*; if *trans*= 'C' or 'c', then conjg(*A*')*x* = *b*.
diag	CHARACTER*1. Specifies whether the matrix *A* is unit triangular: if *diag* = 'U' or 'u' then the matrix is unit triangular; if *diag* = 'N' or 'n', then the matrix is not unit triangular.
n	INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.
k	INTEGER. On entry with *uplo* = 'U' or 'u', *k* specifies the number of super-diagonals of the matrix *A*. On entry with *uplo* = 'L' or 'l', *k* specifies the number of sub-diagonals of the matrix *A*. The value of *k* must satisfy 0≤*k*.
a	REAL for stbsv DOUBLE PRECISION for dtbsv COMPLEX for ctbsv DOUBLE COMPLEX for ztbsv Array, size (*lda*, *n*).

Before entry with *uplo* = 'U' or 'u', the leading (*k* + 1) by *n* part of the array *a* must contain the upper triangular band part of the matrix of coefficients, supplied column-by-column, with the leading diagonal of the matrix in row (*k* + 1) of the array, the first super-diagonal starting at position 2 in row *k*, and so on. The top left *k* by *k* triangle of the array *a* is not referenced.

The following program segment transfers an upper triangular band matrix from conventional full matrix storage (*matrix*) to band storage (*a*):

```
      do 20, j = 1, n
         m = k + 1 - j
         do 10, i = max( 1, j - k ), j
            a( m + i, j ) = matrix( i, j )
10       continue
20    continue
```

Before entry with *uplo* = 'L' or 'l', the leading (*k* + 1) by *n* part of the array *a* must contain the lower triangular band part of the matrix of coefficients, supplied column-by-column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right *k* by *k* triangle of the array *a* is not referenced.

The following program segment transfers a lower triangular band matrix from conventional full matrix storage (*matrix*) to band storage (*a*):

```
      do 20, j = 1, n
         m = 1 - j
         do 10, i = j, min( n, j + k )
            a( m + i, j ) = matrix( i, j )
10       continue
20    continue
```

When *diag* = 'U' or 'u', the elements of the array *a* corresponding to the diagonal elements of the matrix are not referenced, but are assumed to be unity.

lda — INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least (*k* + 1).

x — REAL for stbsv

DOUBLE PRECISION for dtbsv

COMPLEX for ctbsv

DOUBLE COMPLEX for ztbsv

Array, size at least (1 + (*n* – 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element right-hand side vector *b*.

incx — INTEGER. Specifies the increment for the elements of *x*.

The value of *incx* must not be zero.

Output Parameters

x — Overwritten with the solution vector *x*.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine `tbsv` interface are the following:

a	Holds the array *a* of size (*k*+1,*n*).
x	Holds the vector with the number of elements *n*.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
trans	Must be `'N'`, `'C'`, or `'T'`. The default value is `'N'`.
diag	Must be `'N'` or `'U'`. The default value is `'N'`.

?tpmv

Computes a matrix-vector product using a triangular packed matrix.

Syntax

```
call stpmv(uplo, trans, diag, n, ap, x, incx)
call dtpmv(uplo, trans, diag, n, ap, x, incx)
call ctpmv(uplo, trans, diag, n, ap, x, incx)
call ztpmv(uplo, trans, diag, n, ap, x, incx)
call tpmv(ap, x [,uplo] [, trans] [,diag])
```

Include Files

- `mkl.fi, blas.f90`

Description

The `?tpmv` routines perform one of the matrix-vector operations defined as

`x := A*x`, or `x := A'*x`, or `x := conjg(A')*x`,

where:

x is an *n*-element vector,

A is an *n*-by-*n* unit, or non-unit, upper or lower triangular matrix, supplied in packed form.

Input Parameters

uplo	`CHARACTER*1`. Specifies whether the matrix *A* is upper or lower triangular: *uplo* = `'U'` or `'u'` if *uplo* = `'L'` or `'l'`, then the matrix is low triangular.
trans	`CHARACTER*1`. Specifies the operation: if *trans*= `'N'` or `'n'`, then `x := A*x`;

if *trans*= 'T' or 't', then *x* := *A*'**x*;

if *trans*= 'C' or 'c', then *x* := conjg(*A*')**x*.

diag CHARACTER*1. Specifies whether the matrix *A* is unit triangular:

if *diag* = 'U' or 'u' then the matrix is unit triangular;

if *diag* = 'N' or 'n', then the matrix is not unit triangular.

n INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.

ap REAL for stpmv

DOUBLE PRECISION for dtpmv

COMPLEX for ctpmv

DOUBLE COMPLEX for ztpmv

Array, size at least ((*n**(*n* + 1))/2).

Before entry with *uplo* = 'U' or 'u', the array *ap* must contain the upper triangular matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1,1), *ap*(2) and *ap*(3) contain *a*(1,2) and *a*(2,2) respectively, and so on. Before entry with *uplo* = 'L' or 'l', the array *ap* must contain the lower triangular matrix packed sequentially, column-by-column, so that*ap*(1) contains *a*(1,1), *ap*(2) and *ap*(3) contain *a*(2,1) and *a*(3,1) respectively, and so on. When *diag* = 'U' or 'u', the diagonal elements of *a* are not referenced, but are assumed to be unity.

x REAL for stpmv

DOUBLE PRECISION for dtpmv

COMPLEX for ctpmv

DOUBLE COMPLEX for ztpmv

Array, size at least (1 + (*n* – 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.

incx INTEGER. Specifies the increment for the elements of *x*.

The value of *incx* must not be zero.

Output Parameters

x Overwritten with the transformed vector *x*.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine tpmv interface are the following:

ap Holds the array *ap* of size (*n*(n+1)/2*).

x Holds the vector with the number of elements *n*.

uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
diag	Must be 'N' or 'U'. The default value is 'N'.

?tpsv

Solves a system of linear equations whose coefficients are in a triangular packed matrix.

Syntax

```
call stpsv(uplo, trans, diag, n, ap, x, incx)
call dtpsv(uplo, trans, diag, n, ap, x, incx)
call ctpsv(uplo, trans, diag, n, ap, x, incx)
call ztpsv(uplo, trans, diag, n, ap, x, incx)
call tpsv(ap, x [,uplo] [, trans] [,diag])
```

Include Files

- mkl.fi, blas.f90

Description

The ?tpsv routines solve one of the following systems of equations

*A*x = b*, or *A'*x = b*, or conjg(*A'*)*x = b*,

where:

b and *x* are *n*-element vectors,

A is an *n*-by-*n* unit, or non-unit, upper or lower triangular matrix, supplied in packed form.

This routine does not test for singularity or near-singularity.

Such tests must be performed before calling this routine.

Input Parameters

uplo	CHARACTER*1. Specifies whether the matrix *A* is upper or lower triangular: *uplo* = 'U' or 'u' if *uplo* = 'L' or 'l', then the matrix is low triangular.
trans	CHARACTER*1. Specifies the system of equations: if *trans*= 'N' or 'n', then *A*x = b*; if *trans*= 'T' or 't', then *A'*x = b*; if *trans*= 'C' or 'c', then conjg(*A'*)*x = b*.
diag	CHARACTER*1. Specifies whether the matrix *A* is unit triangular: if *diag* = 'U' or 'u' then the matrix is unit triangular;

	if *diag* = 'N' or 'n', then the matrix is not unit triangular.
n	INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.
ap	REAL for stpsv DOUBLE PRECISION for dtpsv COMPLEX for ctpsv DOUBLE COMPLEX for ztpsv Array, size at least ((*n**(*n* + 1))/2). Before entry with *uplo* = 'U' or 'u', the array *ap* must contain the upper triangular part of the triangular matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1, 1), *ap*(2) and *ap*(3) contain *a*(1, 2) and *a*(2, 2) respectively, and so on. Before entry with *uplo* = 'L' or 'l', the array *ap* must contain the lower triangular part of the triangular matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1, 1), *ap*(2) and *ap*(3) contain *a*(2, 1) and *a*(3, 1) respectively, and so on. When *diag* = 'U' or 'u', the diagonal elements of *a* are not referenced, but are assumed to be unity.
x	REAL for stpsv DOUBLE PRECISION for dtpsv COMPLEX for ctpsv DOUBLE COMPLEX for ztpsv Array, size at least (1 + (*n* - 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element right-hand side vector *b*.
incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.

Output Parameters

x	Overwritten with the solution vector *x*.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine tpsv interface are the following:

ap	Holds the array *ap* of size (*n*(n+1)/2*).
x	Holds the vector with the number of elements *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N', 'C', or 'T'.

The default value is 'N'.

diag Must be 'N' or 'U'. The default value is 'N'.

?trmv

Computes a matrix-vector product using a triangular matrix.

Syntax

```
call strmv(uplo, trans, diag, n, a, lda, x, incx)
call dtrmv(uplo, trans, diag, n, a, lda, x, incx)
call ctrmv(uplo, trans, diag, n, a, lda, x, incx)
call ztrmv(uplo, trans, diag, n, a, lda, x, incx)
call trmv(a, x [,uplo] [, trans] [,diag])
```

Include Files

- mkl.fi, blas.f90

Description

The ?trmv routines perform one of the following matrix-vector operations defined as

x := *A***x*, or *x* := A'**x*, or *x* := conjg(*A*')**x*,

where:

x is an *n*-element vector,

A is an *n*-by-*n* unit, or non-unit, upper or lower triangular matrix.

Input Parameters

uplo CHARACTER*1. Specifies whether the matrix *A* is upper or lower triangular:

uplo = 'U' or 'u'

if *uplo* = 'L' or 'l', then the matrix is low triangular.

trans CHARACTER*1. Specifies the operation:

if *trans*= 'N' or 'n', then *x* := *A***x*;

if *trans*= 'T' or 't', then *x* := *A*'**x*;

if *trans*= 'C' or 'c', then *x* := conjg(*A*')**x*.

diag CHARACTER*1. Specifies whether the matrix *A* is unit triangular:

if *diag* = 'U' or 'u' then the matrix is unit triangular;

if *diag* = 'N' or 'n', then the matrix is not unit triangular.

n INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.

a REAL for strmv

DOUBLE PRECISION for dtrmv

	COMPLEX for ctrmv DOUBLE COMPLEX for ztrmv Array, size (*lda*, *n*). Before entry with *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular matrix and the strictly lower triangular part of *a* is not referenced. Before entry with *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular matrix and the strictly upper triangular part of *a* is not referenced. When *diag* = 'U' or 'u', the diagonal elements of *a* are not referenced either, but are assumed to be unity.
lda	INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least max(1, *n*).
x	REAL for strmv DOUBLE PRECISION for dtrmv COMPLEX for ctrmv DOUBLE COMPLEX for ztrmv Array, size at least (1 + (*n* – 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.
incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.

Output Parameters

x	Overwritten with the transformed vector *x*.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine trmv interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
x	Holds the vector with the number of elements *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
diag	Must be 'N' or 'U'. The default value is 'N'.

?trsv

Solves a system of linear equations whose coefficients are in a triangular matrix.

Syntax

```
call strsv(uplo, trans, diag, n, a, lda, x, incx)
call dtrsv(uplo, trans, diag, n, a, lda, x, incx)
call ctrsv(uplo, trans, diag, n, a, lda, x, incx)
call ztrsv(uplo, trans, diag, n, a, lda, x, incx)
call trsv(a, x [,uplo] [, trans] [,diag])
```

Include Files

- mkl.fi, blas.f90

Description

The ?trsv routines solve one of the systems of equations:

*A*x = b*, or *A'*x = b*, or conjg(*A'*)*x = b*,

where:

b and *x* are *n*-element vectors,

A is an *n*-by-*n* unit, or non-unit, upper or lower triangular matrix.

The routine does not test for singularity or near-singularity.

Such tests must be performed before calling this routine.

Input Parameters

uplo

CHARACTER*1. Specifies whether the matrix *A* is upper or lower triangular:

uplo = 'U' or 'u'

if *uplo* = 'L' or 'l', then the matrix is low triangular.

trans

CHARACTER*1. Specifies the systems of equations:

if *trans*= 'N' or 'n', then *A*x = b*;

if *trans*= 'T' or 't', then *A'*x = b*;

if *trans*= 'C' or 'c', then oconj(*A'*)*x = b*.

diag

CHARACTER*1. Specifies whether the matrix *A* is unit triangular:

if *diag* = 'U' or 'u' then the matrix is unit triangular;

if *diag* = 'N' or 'n', then the matrix is not unit triangular.

n

INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.

a

REAL for strsv

DOUBLE PRECISION for dtrsv

COMPLEX for ctrsv

DOUBLE COMPLEX for ztrsv

	Array, size `(lda, n)` . Before entry with `uplo = 'U'` or `'u'`, the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular matrix and the strictly lower triangular part of *a* is not referenced. Before entry with `uplo = 'L'` or `'l'`, the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular matrix and the strictly upper triangular part of *a* is not referenced. When `diag = 'U'` or `'u'`, the diagonal elements of *a* are not referenced either, but are assumed to be unity.
lda	`INTEGER`. Specifies the leading dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least `max(1, n)`.

x	`REAL` for `strsv`
	`DOUBLE PRECISION` for `dtrsv`
	`COMPLEX` for `ctrsv`
	`DOUBLE COMPLEX` for `ztrsv`
	Array, size at least `(1 + (n – 1)*abs(incx))`. Before entry, the incremented array *x* must contain the *n*-element right-hand side vector *b*.

incx	`INTEGER`. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.

Output Parameters

x	Overwritten with the solution vector *x*.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine `trsv` interface are the following:

a	Holds the matrix *a* of size (*n*,*n*).
x	Holds the vector with the number of elements *n*.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
trans	Must be `'N'`, `'C'`, or `'T'`. The default value is `'N'`.
diag	Must be `'N'` or `'U'`. The default value is `'N'`.

BLAS Level 3 Routines

BLAS Level 3 routines perform matrix-matrix operations. The following table lists the BLAS Level 3 routine groups and the data types associated with them.

BLAS Level 3 Routine Groups and Their Data Types

Routine Group	Data Types	Description
`?gemm`	s, d, c, z	Computes a matrix-matrix product with general matrices.

Routine Group	Data Types	Description
?hemm	c, z	Computes a matrix-matrix product where one input matrix is Hermitian.
?herk	c, z	Performs a Hermitian rank-k update.
?her2k	c, z	Performs a Hermitian rank-2k update.
?symm	s, d, c, z	Computes a matrix-matrix product where one input matrix is symmetric.
?syrk	s, d, c, z	Performs a symmetric rank-k update.
?syr2k	s, d, c, z	Performs a symmetric rank-2k update.
?trmm	s, d, c, z	Computes a matrix-matrix product where one input matrix is triangular.
?trsm	s, d, c, z	Solves a triangular matrix equation.

Symmetric Multiprocessing Version of Intel® MKL

Many applications spend considerable time executing BLAS routines. This time can be scaled by the number of processors available on the system through using the symmetric multiprocessing (SMP) feature built into the Intel® oneMKL. The performance enhancements based on the parallel use of the processors are available without any programming effort on your part.

To enhance performance, the library uses the following methods:

- The BLAS functions are blocked where possible to restructure the code in a way that increases the localization of data reference, enhances cache memory use, and reduces the dependency on the memory bus.
- The code is distributed across the processors to maximize parallelism.

Product and Performance Information
Performance varies by use, configuration and other factors. Learn more at www.Intel.com/PerformanceIndex. Notice revision #20201201

?gemm

Computes a matrix-matrix product with general matrices.

Syntax

```
call sgemm(transa, transb, m, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call dgemm(transa, transb, m, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call cgemm(transa, transb, m, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call zgemm(transa, transb, m, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call scgemm(transa, transb, m, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call dzgemm(transa, transb, m, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call gemm(a, b, c [,transa][,transb] [,alpha][,beta])
```

Include Files

- mkl.fi, blas.f90

Description

The ?gemm routines compute a scalar-matrix-matrix product and add the result to a scalar-matrix product, with general matrices. The operation is defined as

```
C := alpha*op(A)*op(B) + beta*C
```

where:

op(*X*) is one of op(*X*) = *X*, or op(*X*) = X^T, or op(*X*) = X^H,

alpha and *beta* are scalars,

A, *B* and *C* are matrices:

op(*A*) is an *m*-by-*k* matrix,

op(*B*) is a *k*-by-*n* matrix,

C is an *m*-by-*n* matrix.

See also:

- ?gemm3m, BLAS-like extension routines, that use matrix multiplication for similar matrix-matrix operations

Input Parameters

transa

CHARACTER*1. Specifies the form of op(*A*) used in the matrix multiplication:

- if *transa* = 'N' or 'n', then op(*A*) = *A*;
- if *transa* = 'T' or 't', then op(*A*) = A^T;
- if *transa* = 'C' or 'c' , then op(*A*) = A^H.

transb

CHARACTER*1. Specifies the form of op(*B*) used in the matrix multiplication:

- if *transb* = 'N' or 'n', then op(*B*) = *B*;
- if *transb* = 'T' or 't', then op(*B*) = B^T;
- if *transb* = 'C' or 'c' , then op(*B*) = B^H.

m

INTEGER. Specifies the number of rows of the matrix op(*A*) and of the matrix *C*. The value of *m* must be at least zero.

n

INTEGER. Specifies the number of columns of the matrix op(*B*) and the number of columns of the matrix *C*. The value of *n* must be at least zero.

k

INTEGER. Specifies the number of columns of the matrix op(*A*) and the number of rows of the matrix op(*B*). The value of *k* must be at least zero.

alpha

REAL for sgemm

DOUBLE PRECISION for dgemm

COMPLEX for cgemm, scgemm

DOUBLE COMPLEX for zgemm, dzgemm

Specifies the scalar *alpha*.

a

REAL for sgemm, scgemm

DOUBLE PRECISION for dgemm, dzgemm

COMPLEX for cgemm

DOUBLE COMPLEX for zgemm

Array, size *lda* by *ka*, where *ka* is *k* when *transa* = 'N' or 'n', and is *m* otherwise. Before entry with *transa* = 'N' or 'n', the leading *m*-by-*k* part of the array *a* must contain the matrix *A*, otherwise the leading *k*-by-*m* part of the array *a* must contain the matrix *A*.

lda

INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program.

When *transa* = 'N' or 'n', then *lda* must be at least max(1, *m*), otherwise *lda* must be at least max(1, *k*).

b

REAL for sgemm

DOUBLE PRECISION for dgemm

COMPLEX for cgemm, scgemm

DOUBLE COMPLEX for zgemm, dzgemm

Array, size *ldb* by *kb*, where *kb* is *n* when *transa* = 'N' or 'n', and is *k* otherwise. Before entry with *transa* = 'N' or 'n', the leading *k*-by-*n* part of the array *b* must contain the matrix *B*, otherwise the leading *n*-by-*k* part of the array *b* must contain the matrix *B*.

ldb

INTEGER. Specifies the leading dimension of *b* as declared in the calling (sub)program.

When *transb* = 'N' or 'n' , then *ldb* must be at least max(1, *k*), otherwise *ldb* must be at least max(1, *n*).

beta

REAL for sgemm

DOUBLE PRECISION for dgemm

COMPLEX for cgemm, scgemm

DOUBLE COMPLEX for zgemm, dzgemm

Specifies the scalar *beta*. When *beta* is equal to zero, then *c* need not be set on input.

c

REAL for sgemm

DOUBLE PRECISION for dgemm

COMPLEX for cgemm, scgemm

DOUBLE COMPLEX for zgemm, dzgemm

Array, size *ldc* by *n*. Before entry, the leading *m*-by-*n* part of the array *c* must contain the matrix *C*, except when *beta* is equal to zero, in which case *c* need not be set on entry.

ldc

INTEGER. Specifies the leading dimension of *c* as declared in the calling (sub)program.

The value of *ldc* must be at least max(1, *m*).

Output Parameters

c Overwritten by the *m*-by-*n* matrix (*alpha**op(*A*)*op(*B*) + *beta***C*).

Example

For examples of routine usage, see these code examples in the Intel® oneAPI Math Kernel Library (oneMKL) installation directory:

- sgemm: examples\blas\source\sgemmx.f
- dgemm: examples\blas\source\dgemmx.f
- cgemm: examples\blas\source\cgemmx.f
- zgemm: examples\blas\source\zgemmx.f

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine gemm interface are the following:

a Holds the matrix *A* of size (*ma*,*ka*) where

ka = *k* if *transa*='N',

ka = *m* otherwise,

ma = *m* if *transa*='N',

ma = *k* otherwise.

b Holds the matrix *B* of size (*mb*,*kb*) where

kb = *n* if *transb* = 'N',

kb = *k* otherwise,

mb = *k* if *transb* = 'N',

mb = *n* otherwise.

c Holds the matrix *C* of size (*m*,*n*).

transa Must be 'N', 'C', or 'T'.

The default value is 'N'.

transb Must be 'N', 'C', or 'T'.

The default value is 'N'.

alpha The default value is 1.

beta The default value is 0.

?hemm

Computes a matrix-matrix product where one input matrix is Hermitian.

Syntax

```
call chemm(side, uplo, m, n, alpha, a, lda, b, ldb, beta, c, ldc)
call zhemm(side, uplo, m, n, alpha, a, lda, b, ldb, beta, c, ldc)
call hemm(a, b, c [,side][,uplo] [,alpha][,beta])
```

Include Files

- mkl.fi,blas.f90

Description

The ?hemm routines compute a scalar-matrix-matrix product using a Hermitian matrix *A* and a general matrix *B* and add the result to a scalar-matrix product using a general matrix *C*. The operation is defined as

```
C := alpha*A*B + beta*C
```

or

```
C := alpha*B*A + beta*C
```

where:

alpha and *beta* are scalars,

A is a Hermitian matrix,

B and *C* are *m*-by-*n* matrices.

Input Parameters

side

CHARACTER*1. Specifies whether the Hermitian matrix *A* appears on the left or right in the operation as follows:

if *side* = 'L' or 'l' , then *C* := *alpha*A*B + beta*C*;

if *side* = 'R' or 'r' , then *C* := *alpha*B*A + beta*C*.

uplo

CHARACTER*1. Specifies whether the upper or lower triangular part of the Hermitian matrix *A* is used:

If *uplo* = 'U' or 'u', then the upper triangular part of the Hermitian matrix *A* is used.

If *uplo* = 'L' or 'l', then the low triangular part of the Hermitian matrix *A* is used.

m

INTEGER. Specifies the number of rows of the matrix *C*.

The value of *m* must be at least zero.

n

INTEGER. Specifies the number of columns of the matrix *C*.

The value of *n* must be at least zero.

alpha

COMPLEX for chemm

DOUBLE COMPLEX for zhemm

Specifies the scalar *alpha*.

a

COMPLEX for chemm

DOUBLE COMPLEX for zhemm

Array, size (*lda*, *ka*), where *ka* is *m* when *side* = 'L' or 'l' and is *n* otherwise. Before entry with *side* = 'L' or 'l', the *m*-by-*m* part of the array *a* must contain the Hermitian matrix, such that when *uplo* = 'U' or 'u', the leading *m*-by-*m* upper triangular part of the array *a* must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of *a* is not referenced, and when *uplo* = 'L' or 'l', the leading *m*-by-*m* lower triangular part of the array *a* must contain the lower triangular part of the Hermitian matrix, and the strictly upper triangular part of *a* is not referenced.

Before entry with *side* = 'R' or 'r', the *n*-by-*n* part of the array *a* must contain the Hermitian matrix, such that when *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of *a* is not referenced, and when *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular part of the Hermitian matrix, and the strictly upper triangular part of *a* is not referenced. The imaginary parts of the diagonal elements need not be set, they are assumed to be zero.

lda

INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub) program. When *side* = 'L' or 'l' then *lda* must be at least max(1, *m*), otherwise *lda* must be at least max(1,*n*).

b

COMPLEX for chemm

DOUBLE COMPLEX for zhemm

Array, size *ldb* by *n*.

The leading *m*-by-*n* part of the array *b* must contain the matrix *B*.

ldb

INTEGER. Specifies the leading dimension of *b* as declared in the calling (sub)program.*ldb* must be at least max(1, *m*)

beta

COMPLEX for chemm

DOUBLE COMPLEX for zhemm

Specifies the scalar *beta*.

When *beta* is supplied as zero, then *c* need not be set on input.

c

COMPLEX for chemm

DOUBLE COMPLEX for zhemm

Array, size (*c*, *n*). Before entry, the leading *m*-by-*n* part of the array *c* must contain the matrix *C*, except when *beta* is zero, in which case *c* need not be set on entry.

ldc

INTEGER. Specifies the leading dimension of *c* as declared in the calling (sub)program. *ldc* must be at least max(1, *m*)

Output Parameters

c

Overwritten by the *m*-by-*n* updated matrix.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine `hemm` interface are the following:

a	Holds the matrix *A* of size (*k*,*k*) where *k = m* if *side = 'L'*, *k = n* otherwise.
b	Holds the matrix *B* of size (*m*,*n*).
c	Holds the matrix *C* of size (*m*,*n*).
side	Must be `'L'` or `'R'`. The default value is `'L'`.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
alpha	The default value is 1.
beta	The default value is 0.

?herk

Performs a Hermitian rank-k update.

Syntax

```
call cherk(uplo, trans, n, k, alpha, a, lda, beta, c, ldc)
call zherk(uplo, trans, n, k, alpha, a, lda, beta, c, ldc)
call herk(a, c [,uplo] [, trans] [,alpha][,beta])
```

Include Files

- `mkl.fi, blas.f90`

Description

The `?herk` routines perform a rank-k matrix-matrix operation using a general matrix *A* and a Hermitian matrix *C*. The operation is defined as:

$$C := alpha*A*A^H + beta*C,$$

or

$$C := alpha*A^H*A + beta*C,$$

where:

alpha and *beta* are real scalars,

C is an *n*-by-*n* Hermitian matrix,

A is an *n*-by-*k* matrix in the first case and a *k*-by-*n* matrix in the second case.

Input Parameters

uplo

CHARACTER*1. Specifies whether the upper or lower triangular part of the array *c* is used.

If *uplo* = 'U' or 'u' , then the upper triangular part of the array *c* is used.

If *uplo* = 'L' or 'l' , then the low triangular part of the array *c* is used.

trans

CHARACTER*1. Specifies the operation:

if *trans*= 'N' or 'n', then $C := alpha*A*A^H + beta*C$;

if *trans*= 'C' or 'c', then $C := alpha*A^H*A + beta*C$.

n

INTEGER. Specifies the order of the matrix *C*. The value of *n* must be at least zero.

k

INTEGER. With *trans*= 'N' or 'n', *k* specifies the number of columns of the matrix *A*, and with *trans*= 'C' or 'c', *k* specifies the number of rows of the matrix *A*.

The value of *k* must be at least zero.

alpha

REAL for cherk

DOUBLE PRECISION for zherk

Specifies the scalar *alpha*.

a

COMPLEX for cherk

DOUBLE COMPLEX for zherk

Array, size (*lda*, *ka*), where *ka* is *k* when *trans*= 'N' or 'n', and is *n* otherwise. Before entry with *trans*= 'N' or 'n', the leading *n*-by-*k* part of the array *a* must contain the matrix *a*, otherwise the leading *k*-by-*n* part of the array *a* must contain the matrix *A*.

lda

INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program. When *trans*= 'N' or 'n', then *lda* must be at least max(1, *n*), otherwise *lda* must be at least max(1, *k*).

beta

REAL for cherk

DOUBLE PRECISION for zherk

Specifies the scalar *beta*.

c

COMPLEX for cherk

DOUBLE COMPLEX for zherk

Array, size *ldc* by *n*.

Before entry with *uplo* = 'U' or 'u' , the leading *n*-by-*n* upper triangular part of the array *c* must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of *c* is not referenced.

Before entry with *uplo* = 'L' or 'l' , the leading *n*-by-*n* lower triangular part of the array *c* must contain the lower triangular part of the Hermitian matrix and the strictly upper triangular part of *c* is not referenced.

The imaginary parts of the diagonal elements need not be set, they are assumed to be zero.

ldc — INTEGER. Specifies the leading dimension of *c* as declared in the calling (sub)program. The value of *ldc* must be at least max(1, *n*).

Output Parameters

c — With *uplo* = 'U' or 'u', the upper triangular part of the array *c* is overwritten by the upper triangular part of the updated matrix.

With *uplo* = 'L' or 'l', the lower triangular part of the array *c* is overwritten by the lower triangular part of the updated matrix.

The imaginary parts of the diagonal elements are set to zero.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine herk interface are the following:

a — Holds the matrix *A* of size (*ma*,*ka*) where

ka = *k* if *trans*='N',

ka = *n* otherwise,

ma = *n* if *trans*='N',

ma = *k* otherwise.

c — Holds the matrix *C* of size (*n*,*n*).

uplo — Must be 'U' or 'L'. The default value is 'U'.

trans — Must be 'N' or 'C'. The default value is 'N'.

alpha — The default value is 1.

beta — The default value is 0.

?her2k

Performs a Hermitian rank-2k update.

Syntax

```
call cher2k(uplo, trans, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call zher2k(uplo, trans, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call her2k(a, b, c [,uplo][,trans] [,alpha][,beta])
```

Include Files

- mkl.fi, blas.f90

Description

The ?her2k routines perform a rank-2k matrix-matrix operation using general matrices *A* and *B* and a Hermitian matrix *C*. The operation is defined as

```
C := alpha*A*B^H + conjg(alpha)B*A^H + beta*C
```

or

```
C := alpha*A^H*B + conjg(alpha)*B^H*A + beta*C
```

where:

alpha is a scalar and *beta* is a real scalar.

C is an *n*-by-*n* Hermitian matrix.

A and *B* are *n*-by-*k* matrices in the first case and *k*-by-*n* matrices in the second case.

Input Parameters

uplo

CHARACTER*1. Specifies whether the upper or lower triangular part of the array *c* is used.

If *uplo* = 'U' or 'u' , then the upper triangular of the array *c* is used.

If *uplo* = 'L' or 'l' , then the low triangular of the array *c* is used.

trans

CHARACTER*1. Specifies the operation:

if*trans*= 'N' or 'n', then *C*:=*alpha***A***B*^{H} + *alpha***B***A*^{H} + *beta***C*;

if *trans*= 'C' or 'c', then *C*:=*alpha***A*^{H}**B* + *alpha***B*^{H}**A* + *beta***C*.

n

INTEGER. Specifies the order of the matrix *C*. The value of *n* must be at least zero.

k

INTEGER. With *trans*= 'N' or 'n' specifies the number of columns of the matrix *A*, and with *trans*= 'C' or 'c', *k* specifies the number of rows of the matrix *A*.

The value of *k* must be at least equal to zero.

alpha

COMPLEX for cher2k

DOUBLE COMPLEX for zher2k

Specifies the scalar *alpha*.

a

COMPLEX for cher2k

DOUBLE COMPLEX for zher2k

Array, size (*lda*, *ka*), where *ka* is *k* when *trans*= 'N' or 'n', and is *n* otherwise. Before entry with *trans*= 'N' or 'n', the leading *n*-by-*k* part of the array *a* must contain the matrix *A*, otherwise the leading *k*-by-*n* part of the array *a* must contain the matrix *A*.

lda

INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program.

When *trans*= 'N' or 'n'*trans*= 'N' or 'n', then *lda* must be at least max(1, *n*), otherwise *lda* must be at least max(1, *k*).

beta

REAL for cher2k

DOUBLE PRECISION for zher2k

Specifies the scalar *beta*.

b

`COMPLEX` for `cher2k`

`DOUBLE COMPLEX` for `zher2k`

Array, size `(ldb, kb)`, where *kb* is *k* when `trans= 'N'` or `'n'`, and is *n* otherwise. Before entry with `trans= 'N'` or `'n'`, the leading *n*-by-*k* part of the array *b* must contain the matrix *B*, otherwise the leading *k*-by-*n* part of the array *b* must contain the matrix *B*.

ldb

`INTEGER`. Specifies the leading dimension of *a* as declared in the calling (sub)program.

When `trans= 'N'` or `'n'`, then *ldb* must be at least `max(1, n)`, otherwise *ldb* must be at least `max(1, k)`.

c

`COMPLEX` for `cher2k`

`DOUBLE COMPLEX` for `zher2k`

Array, size *ldc* by *n*.

Before entry with`uplo = 'U'` or `'u'`, the leading *n*-by-*n* upper triangular part of the array *c* must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of *c* is not referenced.

Before entry with `uplo = 'L'` or `'l'`, the leading *n*-by-*n* lower triangular part of the array *c* must contain the lower triangular part of the Hermitian matrix and the strictly upper triangular part of *c* is not referenced.

The imaginary parts of the diagonal elements need not be set, they are assumed to be zero.

ldc

`INTEGER`. Specifies the leading dimension of *c* as declared in the calling (sub)program. The value of *ldc* must be at least `max(1, n)`.

Output Parameters

c

With `uplo = 'U'` or `'u'`, the upper triangular part of the array *c* is overwritten by the upper triangular part of the updated matrix.

With `uplo = 'L'` or `'l'`, the lower triangular part of the array *c* is overwritten by the lower triangular part of the updated matrix.

The imaginary parts of the diagonal elements are set to zero.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine `her2k` interface are the following:

a

Holds the matrix *A* of size (*ma*,*ka*) where

ka = *k* if *trans* = `'N'`,

ka = *n* otherwise,

ma = *n* if *trans* = `'N'`,

	ma = *k* otherwise.
b	Holds the matrix *B* of size (*mb*,*kb*) where *kb* = *k* if *trans* = 'N', *kb* = *n* otherwise, *mb* = *n* if *trans* = 'N', *mb* = *k* otherwise.
c	Holds the matrix *C* of size (*n*,*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N' or 'C'. The default value is 'N'.
alpha	The default value is 1.
beta	The default value is 0.

?symm

Computes a matrix-matrix product where one input matrix is symmetric.

Syntax

```
call ssymm(side, uplo, m, n, alpha, a, lda, b, ldb, beta, c, ldc)
call dsymm(side, uplo, m, n, alpha, a, lda, b, ldb, beta, c, ldc)
call csymm(side, uplo, m, n, alpha, a, lda, b, ldb, beta, c, ldc)
call zsymm(side, uplo, m, n, alpha, a, lda, b, ldb, beta, c, ldc)
call symm(a, b, c [,side][,uplo] [,alpha][,beta])
```

Include Files

- mkl.fi, blas.f90

Description

The ?symm routines compute a scalar-matrix-matrix product with one symmetric matrix and add the result to a scalar-matrix product . The operation is defined as

```
C := alpha*A*B + beta*C,
```

or

```
C := alpha*B*A + beta*C,
```

where:

alpha and *beta* are scalars,

A is a symmetric matrix,

B and *C* are *m*-by-*n* matrices.

Input Parameters

side

CHARACTER*1. Specifies whether the symmetric matrix *A* appears on the left or right in the operation:

if *side* = 'L' or 'l' , then *C* := *alpha***A***B* + *beta***C*;

if *side* = 'R' or 'r' , then *C* := *alpha***B***A* + *beta***C*.

uplo

CHARACTER*1. Specifies whether the upper or lower triangular part of the symmetric matrix *A* is used:

if *uplo* = 'U' or 'u', then the upper triangular part is used;

if *uplo* = 'L' or 'l', then the lower triangular part is used.

m

INTEGER. Specifies the number of rows of the matrix *C*.

The value of *m* must be at least zero.

n

INTEGER. Specifies the number of columns of the matrix *C*.

The value of *n* must be at least zero.

alpha

REAL for ssymm

DOUBLE PRECISION for dsymm

COMPLEX for csymm

DOUBLE COMPLEX for zsymm

Specifies the scalar *alpha*.

a

REAL for ssymm

DOUBLE PRECISION for dsymm

COMPLEX for csymm

DOUBLE COMPLEX for zsymm

Array, size (*lda*, *ka*) , where *ka* is *m* when *side* = 'L' or 'l' and is *n* otherwise.

Before entry with *side* = 'L' or 'l', the *m*-by-*m* part of the array *a* must contain the symmetric matrix, such that when *uplo* = 'U' or 'u', the leading *m*-by-*m* upper triangular part of the array *a* must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of *a* is not referenced, and when *side* = 'L' or 'l', the leading *m*-by-*m* lower triangular part of the array *a* must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of *a* is not referenced.

Before entry with *side* = 'R' or 'r', the *n*-by-*n* part of the array *a* must contain the symmetric matrix, such that when *uplo* = 'U' or 'u'e array *a* must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of *a* is not referenced, and when *side* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of *a* is not referenced.

lda — INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program. When *side* = 'L' or 'l' then *lda* must be at least max(1, *m*), otherwise *lda* must be at least max(1, *n*).

b — REAL for ssymm

DOUBLE PRECISION for dsymm

COMPLEX for csymm

DOUBLE COMPLEX for zsymm

Array, size *ldb* by *n*.

The leading *m*-by-*n* part of the array *b* must contain the matrix *B*.

ldb — INTEGER. Specifies the leading dimension of *b* as declared in the calling (sub)program. *ldb* must be at least max(1, *m*)

beta — REAL for ssymm

DOUBLE PRECISION for dsymm

COMPLEX for csymm

DOUBLE COMPLEX for zsymm

Specifies the scalar *beta*.

When *beta* is set to zero, then *c* need not be set on input.

c — REAL for ssymm

DOUBLE PRECISION for dsymm

COMPLEX for csymm

DOUBLE COMPLEX for zsymm

Array, size (*c*, *n*). Before entry, the leading *m*-by-*n* part of the array *c* must contain the matrix *C*, except when *beta* is zero, in which case *c* need not be set on entry.

ldc — INTEGER. Specifies the leading dimension of *c* as declared in the calling (sub)program. *ldc* must be at least max(1, *m*)

Output Parameters

c — Overwritten by the *m*-by-*n* updated matrix.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine symm interface are the following:

a — Holds the matrix *A* of size (*k*,*k*) where

k = *m* if *side* = 'L',

k = *n* otherwise.

b	Holds the matrix *B* of size (*m*,*n*).
c	Holds the matrix *C* of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
uplo	Must be 'U' or 'L'. The default value is 'U'.
alpha	The default value is 1.
beta	The default value is 0.

?syrk

Performs a symmetric rank-k update.

Syntax

```
call ssyrk(uplo, trans, n, k, alpha, a, lda, beta, c, ldc)
call dsyrk(uplo, trans, n, k, alpha, a, lda, beta, c, ldc)
call csyrk(uplo, trans, n, k, alpha, a, lda, beta, c, ldc)
call zsyrk(uplo, trans, n, k, alpha, a, lda, beta, c, ldc)
call syrk(a, c [,uplo] [, trans] [,alpha][,beta])
```

Include Files

- mkl.fi, blas.f90

Description

The ?syrk routines perform a rank-k matrix-matrix operation for a symmetric matrix *C* using a general matrix *A* . The operation is defined as:

```
C := alpha*A*A' + beta*C,
```

or

```
C := alpha*A'*A + beta*C,
```

where:

alpha and *beta* are scalars,

C is an *n*-by-*n* symmetric matrix,

A is an *n*-by-*k* matrix in the first case and a *k*-by-*n* matrix in the second case.

Input Parameters

uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the array *c* is used. If *uplo* = 'U' or 'u' , then the upper triangular part of the array *c* is used. If *uplo* = 'L' or 'l' , then the low triangular part of the array *c* is used.
trans	CHARACTER*1. Specifies the operation: if *trans*= 'N' or 'n', then *C* := *alpha*A*A'* + *beta*C*;

if *trans*= 'T' or 't', then *C* := *alpha***A*'**A* + *beta***C*;

if *trans*= 'C' or 'c', then *C* := *alpha***A*'**A* + *beta***C*.

n INTEGER. Specifies the order of the matrix *C*. The value of *n* must be at least zero.

k INTEGER. On entry with *trans*= 'N' or 'n', *k* specifies the number of columns of the matrix *a*, and on entry with *trans*= 'T', 't', 'C', or 'c' , *k* specifies the number of rows of the matrix *a*.

The value of *k* must be at least zero.

alpha REAL for ssyrk

DOUBLE PRECISION for dsyrk

COMPLEX for csyrk

DOUBLE COMPLEX for zsyrk

Specifies the scalar *alpha*.

a REAL for ssyrk

DOUBLE PRECISION for dsyrk

COMPLEX for csyrk

DOUBLE COMPLEX for zsyrk

Array, size (*lda*, *ka*), where *ka* is *k* when *trans*= 'N' or 'n', and is *n* otherwise. Before entry with *trans*= 'N' or 'n', the leading *n*-by-*k* part of the array *a* must contain the matrix *A*, otherwise the leading *k*-by-*n* part of the array *a* must contain the matrix *A*.

Array, size (*lda*, *ka*), where *ka* is *k* when *trans*= 'N' or 'n', and is *n* otherwise. Before entry with *trans*= 'N' or 'n', the leading *n*-by-*k* part of the array *a* must contain the matrix *a*, otherwise the leading *k*-by-*n* part of the array *a* must contain the matrix *A*.

lda INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program. When *trans*= 'N' or 'n', then *lda* must be at least max(1, *n*), otherwise *lda* must be at least max(1, *k*).

beta REAL for ssyrk

DOUBLE PRECISION for dsyrk

COMPLEX for csyrk

DOUBLE COMPLEX for zsyrk

Specifies the scalar *beta*.

c REAL for ssyrk

DOUBLE PRECISION for dsyrk

COMPLEX for csyrk

DOUBLE COMPLEX for zsyrk

Array, size (*ldc*, *n*). Before entry with *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *c* must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of *c* is not referenced.

Before entry with *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *c* must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of *c* is not referenced.

ldc — INTEGER. Specifies the leading dimension of *c* as declared in the calling (sub)program. The value of *ldc* must be at least max(1, *n*).

Output Parameters

c — With *uplo* = 'U' or 'u', the upper triangular part of the array *c* is overwritten by the upper triangular part of the updated matrix.

With *uplo* = 'L' or 'l', the lower triangular part of the array *c* is overwritten by the lower triangular part of the updated matrix.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine syrk interface are the following:

a — Holds the matrix *A* of size (*ma*,*ka*) where

ka = *k* if *transa*='N',

ka = *n* otherwise,

ma = *n* if *transa*='N',

ma = *k* otherwise.

c — Holds the matrix *C* of size (*n*,*n*).

uplo — Must be 'U' or 'L'. The default value is 'U'.

trans — Must be 'N', 'C', or 'T'.

The default value is 'N'.

alpha — The default value is 1.

beta — The default value is 0.

?syr2k

Performs a symmetric rank-2k update.

Syntax

```
call ssyr2k(uplo, trans, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call dsyr2k(uplo, trans, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call csyr2k(uplo, trans, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call zsyr2k(uplo, trans, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
```

```
call syr2k(a, b, c [,uplo][,trans] [,alpha][,beta])
```

Include Files

- mkl.fi, blas.f90

Description

The ?syr2k routines perform a rank-2k matrix-matrix operation for a symmetric matrix *C* using general matrices *A* and *B*The operation is defined as:

```
C := alpha*A*B' + alpha*B*A' + beta*C,
```

or

```
C := alpha*A'*B + alpha*B'*A + beta*C,
```

where:

alpha and *beta* are scalars,

C is an *n*-by-*n* symmetric matrix,

A and *B* are *n*-by-*k* matrices in the first case, and *k*-by-*n* matrices in the second case.

Input Parameters

uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the array *c* is used. If *uplo* = 'U' or 'u' , then the upper triangular part of the array *c* is used. If *uplo* = 'L' or 'l' , then the low triangular part of the array *c* is used.
trans	CHARACTER*1. Specifies the operation: if *trans*= 'N' or 'n', then *C* := *alpha*A*B'+alpha*B*A'+beta*C*; if *trans*= 'T' or 't', then *C* := *alpha*A'*B +alpha*B'*A +beta*C*; if *trans*= 'C' or 'c', then *C* := *alpha*A'*B +alpha*B'*A +beta*C*.
n	INTEGER. Specifies the order of the matrix *C*.The value of *n* must be at least zero.
k	INTEGER. On entry with *trans*= 'N' or 'n', *k* specifies the number of columns of the matrices *A* and *B*, and on entry with *trans*= 'T' or 't' or 'C' or 'c', *k* specifies the number of rows of the matrices *A* and *B*. The value of *k* must be at least zero.
alpha	REAL for ssyr2k DOUBLE PRECISION for dsyr2k COMPLEX for csyr2k DOUBLE COMPLEX for zsyr2k Specifies the scalar *alpha*.
a	REAL for ssyr2k DOUBLE PRECISION for dsyr2k

COMPLEX for csyr2k

DOUBLE COMPLEX for zsyr2k

Array, size (*lda*, *ka*), where *ka* is *k* when *trans*= 'N' or 'n', and is *n* otherwise. Before entry with *trans*= 'N' or 'n', the leading *n*-by-*k* part of the array *a* must contain the matrix *A*, otherwise the leading *k*-by-*n* part of the array *a* must contain the matrix *A*.

lda INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program.

When *trans*= 'N' or 'n'*trans*= 'N' or 'n', then *lda* must be at least max(1, *n*), otherwise *lda* must be at least max(1, *k*).

b REAL for ssyr2k

DOUBLE PRECISION for dsyr2k

COMPLEX for csyr2k

DOUBLE COMPLEX for zsyr2k

Array, size (*ldb*, *kb*), where *kb* is *k* when *trans*= 'N' or 'n', and is *n* otherwise. Before entry with *trans*= 'N' or 'n', the leading *n*-by-*k* part of the array *b* must contain the matrix *B*, otherwise the leading *k*-by-*n* part of the array *b* must contain the matrix *B*.

ldb INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program.

When *trans*= 'N' or 'n', then *ldb* must be at least max(1, *n*), otherwise *ldb* must be at least max(1, *k*).

beta REAL for ssyr2k

DOUBLE PRECISION for dsyr2k

COMPLEX for csyr2k

DOUBLE COMPLEX for zsyr2k

Specifies the scalar *beta*.

c REAL for ssyr2k

DOUBLE PRECISION for dsyr2k

COMPLEX for csyr2k

DOUBLE COMPLEX for zsyr2k

Array, size (*ldc*, *n*). Before entry with *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *c* must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of *c* is not referenced.

Before entry with *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *c* must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of *c* is not referenced.

ldc INTEGER. Specifies the leading dimension of *c* as declared in the calling (sub)program. The value of *ldc* must be at least max(1, *n*).

Output Parameters

c	With *uplo* = 'U' or 'u', the upper triangular part of the array *c* is overwritten by the upper triangular part of the updated matrix. With *uplo* = 'L' or 'l', the lower triangular part of the array *c* is overwritten by the lower triangular part of the updated matrix.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine syr2k interface are the following:

a	Holds the matrix *A* of size (*ma*,*ka*) where *ka* = *k* if *trans* = 'N', *ka* = *n* otherwise, *ma* = *n* if *trans* = 'N', *ma* = *k* otherwise.
b	Holds the matrix *B* of size (*mb*,*kb*) where *kb* = *k* if *trans* = 'N', *kb* = *n* otherwise, *mb* = *n* if *trans* = 'N', *mb* = *k* otherwise.
c	Holds the matrix *C* of size (*n*,*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
alpha	The default value is 1.
beta	The default value is 0.

?trmm

Computes a matrix-matrix product where one input matrix is triangular.

Syntax

```
call strmm(side, uplo, transa, diag, m, n, alpha, a, lda, b, ldb)
call dtrmm(side, uplo, transa, diag, m, n, alpha, a, lda, b, ldb)
call ctrmm(side, uplo, transa, diag, m, n, alpha, a, lda, b, ldb)
call ztrmm(side, uplo, transa, diag, m, n, alpha, a, lda, b, ldb)
call trmm(a, b [,side] [, uplo] [,transa][,diag] [,alpha])
```

Include Files

- mkl.fi, blas.f90

Description

The ?trmm routines compute a scalar-matrix-matrix product with one triangular matrix . The operation is defined as

```
B := alpha*op(A)*B
```

or

```
B := alpha*B*op(A)
```

where:

alpha is a scalar,

B is an *m*-by-*n* matrix,

A is a unit, or non-unit, upper or lower triangular matrix

op(*A*) is one of op(*A*) = *A*, or op(A) = *A*', or op(*A*) = conjg(*A*').

Input Parameters

side	CHARACTER*1. Specifies whether op(*A*) appears on the left or right of *B* in the operation: if *side* = 'L' or 'l' , then *B* := *alpha**op(*A*)**B*; if *side* = 'R' or 'r' , then *B* := *alpha***B**op(*A*).
uplo	CHARACTER*1. Specifies whether the matrix *A* is upper or lower triangular. *uplo* = 'U' or 'u' if *uplo* = 'L' or 'l', then the matrix is low triangular.
transa	CHARACTER*1. Specifies the form of op(*A*) used in the matrix multiplication: if *transa*= 'N' or 'n' , then op(*A*) = *A*; if *transa*= 'T' or 't' , then op(*A*) = *A*'; if *transa*= 'C' or 'c' , then op(*A*) = conjg(*A*').
diag	CHARACTER*1. Specifies whether the matrix *A* is unit triangular: if *diag* = 'U' or 'u' then the matrix is unit triangular; if *diag* = 'N' or 'n' , then the matrix is not unit triangular.
m	INTEGER. Specifies the number of rows of *B*. The value of *m* must be at least zero.
n	INTEGER. Specifies the number of columns of *B*. The value of *n* must be at least zero.
alpha	REAL for strmm DOUBLE PRECISION for dtrmm

COMPLEX for ctrmm

DOUBLE COMPLEX for ztrmm

Specifies the scalar *alpha*.

When *alpha* is zero, then *a* is not referenced and *b* need not be set before entry.

a

REAL for strmm

DOUBLE PRECISION for dtrmm

COMPLEX for ctrmm

DOUBLE COMPLEX for ztrmm

Array, size *lda* by *k*, where *k* is *m* when *side* = 'L'side or 'l' and is *n* when *side* = 'R' or 'r'. Before entry with *uplo* = 'U' or 'u', the leading *k* by *k* upper triangular part of the array *a* must contain the upper triangular matrix and the strictly lower triangular part of *a* is not referenced.

Before entry with *uplo* = 'L' or 'l', the leading *k* by *k* lower triangular part of the array *a* must contain the lower triangular matrix and the strictly upper triangular part of *a* is not referenced.

When *diag* = 'U' or 'u', the diagonal elements of *a* are not referenced either, but are assumed to be unity.

lda

INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program. When*side* = 'L' or 'l', then *lda* must be at least max(1, *m*), when *side* = 'R' or 'r', then *lda* must be at least max(1, *n*).

b

REAL for strmm

DOUBLE PRECISION for dtrmm

COMPLEX for ctrmm

DOUBLE COMPLEX for ztrmm

Array, size *ldb* by *n*. Before entry, the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.

ldb

INTEGER. Specifies the leading dimension of *b* as declared in the calling (sub)program. *ldb* must be at least max(1, *m*)

Output Parameters

b

Overwritten by the transformed matrix.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine trmm interface are the following:

a

Holds the matrix *A* of size (*k*,*k*) where

k = *m* if *side* = 'L',

	k = *n* otherwise.
b	Holds the matrix *B* of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
uplo	Must be 'U' or 'L'. The default value is 'U'.
transa	Must be 'N', 'C', or 'T'. The default value is 'N'.
diag	Must be 'N' or 'U'. The default value is 'N'.
alpha	The default value is 1.

?trsm

Solves a triangular matrix equation.

Syntax

```
call strsm(side, uplo, transa, diag, m, n, alpha, a, lda, b, ldb)
call dtrsm(side, uplo, transa, diag, m, n, alpha, a, lda, b, ldb)
call ctrsm(side, uplo, transa, diag, m, n, alpha, a, lda, b, ldb)
call ztrsm(side, uplo, transa, diag, m, n, alpha, a, lda, b, ldb)
call trsm(a, b [,side] [, uplo] [,transa][,diag] [,alpha])
```

Include Files

- mkl.fi, blas.f90

Description

The ?trsm routines solve one of the following matrix equations:

```
op(A)*X = alpha*B,
```

or

```
X*op(A) = alpha*B,
```

where:

alpha is a scalar,

X and *B* are *m*-by-*n* matrices,

A is a unit, or non-unit, upper or lower triangular matrix, and

op(*A*) is one of op(*A*) = *A*, or op(*A*) = *A*', or op(*A*) = conjg(*A*').

The matrix *B* is overwritten by the solution matrix *X*.

Input Parameters

side	CHARACTER*1. Specifies whether op(*A*) appears on the left or right of *X* in the equation: if *side* = 'L' or 'l' , then op(*A*)**X* = *alpha***B*;

if *side* = 'R' or 'r' , then *X*op(*A*) = *alpha***B*.

uplo — CHARACTER*1. Specifies whether the matrix *A* is upper or lower triangular.

uplo = 'U' or 'u'
if *uplo* = 'L' or 'l', then the matrix is low triangular.

transa — CHARACTER*1. Specifies the form of op(*A*) used in the matrix multiplication:

if *transa*= 'N' or 'n' , then op(*A*) = *A*;

if *transa*= 'T' or 't' ;

if *transa*= 'C' or 'c' , then op(*A*) = conjg(*A*').

diag — CHARACTER*1. Specifies whether the matrix *A* is unit triangular:

if *diag* = 'U' or 'u' then the matrix is unit triangular;

if *diag* = 'N' or 'n' , then the matrix is not unit triangular.

m — INTEGER. Specifies the number of rows of *B*. The value of *m* must be at least zero.

n — INTEGER. Specifies the number of columns of *B*. The value of *n* must be at least zero.

alpha — REAL for strsm

DOUBLE PRECISION for dtrsm

COMPLEX for ctrsm

DOUBLE COMPLEX for ztrsm

Specifies the scalar *alpha*.

When *alpha* is zero, then *a* is not referenced and *b* need not be set before entry.

a — REAL for strsm

DOUBLE PRECISION for dtrsm

COMPLEX for ctrsm

DOUBLE COMPLEX for ztrsm

Array, size (*lda*, *k*) , where *k* is *m* when *side* = 'L' or 'l' and is *n* when *side* = 'R' or 'r' . Before entry with *uplo* = 'U' or 'u' , the leading *k* by *k* upper triangular part of the array *a* must contain the upper triangular matrix and the strictly lower triangular part of *a* is not referenced.

Before entry with *uplo* = 'L' or 'l' lower triangular part of the array *a* must contain the lower triangular matrix and the strictly upper triangular part of *a* is not referenced.

When *diag* = 'U' or 'u' , the diagonal elements of *a* are not referenced either, but are assumed to be unity.

lda	INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program. When *side* = 'L' or 'l' , then *lda* must be at least max(1, *m*), when *side* = 'R' or 'r' , then *lda* must be at least max(1, *n*).
b	REAL for strsm DOUBLE PRECISION for dtrsm COMPLEX for ctrsm DOUBLE COMPLEX for ztrsm Array, size *ldb* by *n*. Before entry, the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.
ldb	INTEGER. Specifies the leading dimension of *b* as declared in the calling (sub)program. *ldb* must be at least max(1, *m*) .

Output Parameters

b	Overwritten by the solution matrix *X*.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine trsm interface are the following:

a	Holds the matrix *A* of size (*k*,*k*) where *k* = *m* if *side* = 'L', *k* = *n* otherwise.
b	Holds the matrix *B* of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
uplo	Must be 'U' or 'L'. The default value is 'U'.
transa	Must be 'N', 'C', or 'T'. The default value is 'N'.
diag	Must be 'N' or 'U'. The default value is 'N'.
alpha	The default value is 1.

Sparse BLAS Level 1 Routines

This section describes Sparse BLAS Level 1, an extension of BLAS Level 1 included in the Intel® oneAPI Math Kernel Library beginning with the Intel® oneAPI Math Kernel Library (oneMKL) release 2.1. Sparse BLAS Level 1 is a group of routines and functions that perform a number of common vector operations on sparse vectors stored in compressed form.

Sparse vectors are those in which the majority of elements are zeros. Sparse BLAS routines and functions are specially implemented to take advantage of vector sparsity. This allows you to achieve large savings in computer time and memory. If *nz* is the number of non-zero vector elements, the computer time taken by Sparse BLAS operations will be *O*(*nz*).

Vector Arguments

Compressed sparse vectors. Let *a* be a vector stored in an array, and assume that the only non-zero elements of *a* are the following:

$a(k_1), a(k_2), a(k_3) \ldots a(k_{nz}),$

where *nz* is the total number of non-zero elements in *a*.

In Sparse BLAS, this vector can be represented in compressed form by two arrays, *x* (values) and *indx* (indices). Each array has *nz* elements:

$x(1)=a(k_1), x(2)=a(k_2), \ldots x(nz)= a(k_{nz}),$

$indx(1)=k_1, indx(2)=k_2, \ldots indx(nz)= k_{nz}.$

Thus, a sparse vector is fully determined by the triple (*nz*, *x*, *indx*). If you pass a negative or zero value of *nz* to Sparse BLAS, the subroutines do not modify any arrays or variables.

Full-storage vectors. Sparse BLAS routines can also use a vector argument fully stored in a single array (a full-storage vector). If *y* is a full-storage vector, its elements must be stored contiguously: the first element in `y(1)`, the second in `y(2)`, and so on. This corresponds to an increment `incy = 1` in BLAS Level 1. No increment value for full-storage vectors is passed as an argument to Sparse BLAS routines or functions.

Naming Conventions for Sparse BLAS Routines

Similar to BLAS, the names of Sparse BLAS subprograms have prefixes that determine the data type involved: *s* and *d* for single- and double-precision real; *c* and *z* for single- and double-precision complex respectively.

If a Sparse BLAS routine is an extension of a "dense" one, the subprogram name is formed by appending the suffix *i* (standing for *indexed*) to the name of the corresponding "dense" subprogram. For example, the Sparse BLAS routine `saxpyi` corresponds to the BLAS routine `saxpy`, and the Sparse BLAS function `cdotci` corresponds to the BLAS function `cdotc`.

Routines and Data Types

Routines and data types supported in the Intel® oneAPI Math Kernel Library (oneMKL) implementation of Sparse BLAS are listed inTable “Sparse BLAS Routines and Their Data Types”.

Sparse BLAS Routines and Their Data Types

Routine/ Function	Data Types	Description
`?axpyi`	s, d, c, z	Scalar-vector product plus vector (routines)
`?doti`	s, d	Dot product (functions)
`?dotci`	c, z	Complex dot product conjugated (functions)
`?dotui`	c, z	Complex dot product unconjugated (functions)
`?gthr`	s, d, c, z	Gathering a full-storage sparse vector into compressed form *nz*, *x*, *indx* (routines)
`?gthrz`	s, d, c, z	Gathering a full-storage sparse vector into compressed form and assigning zeros to gathered elements in the full-storage vector (routines)
`?roti`	s, d	Givens rotation (routines)
`?sctr`	s, d, c, z	Scattering a vector from compressed form to full-storage form (routines)

BLAS Level 1 Routines That Can Work With Sparse Vectors

The following BLAS Level 1 routines will give correct results when you pass to them a compressed-form array *x*(with the increment *incx*=1):

?asum	sum of absolute values of vector elements
?copy	copying a vector
?nrm2	Euclidean norm of a vector
?scal	scaling a vector
i?amax	index of the element with the largest absolute value for real flavors, or the largest sum |Re(*x*(*i*))|+|Im(*x*(*i*))| for complex flavors.
i?amin	index of the element with the smallest absolute value for real flavors, or the smallest sum |Re(*x*(*i*))|+|Im(*x*(*i*))| for complex flavors.

The result *i* returned by i?amax and i?amin should be interpreted as index in the compressed-form array, so that the largest (smallest) value is *x*(*i*); the corresponding index in full-storage array is *indx*(*i*).

You can also call ?rotg to compute the parameters of Givens rotation and then pass these parameters to the Sparse BLAS routines ?roti.

?axpyi

Adds a scalar multiple of compressed sparse vector to a full-storage vector.

Syntax

```
call saxpyi(nz, a, x, indx, y)
call daxpyi(nz, a, x, indx, y)
call caxpyi(nz, a, x, indx, y)
call zaxpyi(nz, a, x, indx, y)
call axpyi(x, indx, y [, a])
```

Include Files

- mkl.fi, blas.f90

Description

The ?axpyi routines perform a vector-vector operation defined as

```
y := a*x + y
```

where:

a is a scalar,

x is a sparse vector stored in compressed form,

y is a vector in full storage form.

The ?axpyi routines reference or modify only the elements of *y* whose indices are listed in the array *indx*.

The values in *indx* must be distinct.

Input Parameters

nz	INTEGER. The number of elements in *x* and *indx*.
a	REAL for saxpyi DOUBLE PRECISION for daxpyi COMPLEX for caxpyi DOUBLE COMPLEX for zaxpyi Specifies the scalar *a*.
x	REAL for saxpyi DOUBLE PRECISION for daxpyi COMPLEX for caxpyi DOUBLE COMPLEX for zaxpyi Array, size at least *nz*.
indx	INTEGER. Specifies the indices for the elements of *x*. Array, size at least *nz*.
y	REAL for saxpyi DOUBLE PRECISION for daxpyi COMPLEX for caxpyi DOUBLE COMPLEX for zaxpyi Array, size at least max(*indx*(i)).

Output Parameters

y	Contains the updated vector *y*.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine axpyi interface are the following:

x	Holds the vector with the number of elements *nz*.
indx	Holds the vector with the number of elements *nz*.
y	Holds the vector with the number of elements *nz*.
a	The default value is 1.

?doti

Computes the dot product of a compressed sparse real vector by a full-storage real vector.

Syntax

res = sdoti(*nz*, *x*, *indx*, *y*)

res = ddoti(*nz*, *x*, *indx*, *y*)

res = doti(*x*, *indx*, *y*)

Include Files

- mkl.fi, blas.f90

Description

The ?doti routines return the dot product of *x* and *y* defined as

```
res = x(1)*y(indx(1)) + x(2)*y(indx(2)) +...+ x(nz)*y(indx(nz))
```

where the triple (*nz*, *x*, *indx*) defines a sparse real vector stored in compressed form, and *y* is a real vector in full storage form. The functions reference only the elements of *y* whose indices are listed in the array *indx*. The values in *indx* must be distinct.

Input Parameters

nz	INTEGER. The number of elements in *x* and *indx* .
x	REAL for sdoti DOUBLE PRECISION for ddoti Array, size at least *nz*.
indx	INTEGER. Specifies the indices for the elements of *x*. Array, size at least *nz*.
y	REAL for sdoti DOUBLE PRECISION for ddoti Array, size at least max(*indx(i)*).

Output Parameters

res	REAL for sdoti DOUBLE PRECISION for ddoti Contains the dot product of *x* and *y*, if *nz* is positive. Otherwise, *res* contains 0.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine doti interface are the following:

x	Holds the vector with the number of elements *nz*.
indx	Holds the vector with the number of elements *nz*.

y	Holds the vector with the number of elements *nz*.

?dotci

Computes the conjugated dot product of a compressed sparse complex vector with a full-storage complex vector.

Syntax

```
res = cdotci(nz, x, indx, y )
res = zdotci(nzz, x, indx, y )
res = dotci(x, indx, y)
```

Include Files

- mkl.fi, blas.f90

Description

The ?dotci routines return the dot product of *x* and *y* defined as

```
conjg(x(1))*y(indx(1)) + ... + conjg(x(nz))*y(indx(nz))
```

where the triple (*nz*, *x*, *indx*) defines a sparse complex vector stored in compressed form, and *y* is a real vector in full storage form. The functions reference only the elements of *y* whose indices are listed in the array *indx*. The values in *indx* must be distinct.

Input Parameters

nz	INTEGER. The number of elements in *x* and *indx* .
x	COMPLEX for cdotci DOUBLE COMPLEX for zdotci Array, size at least *nz*.
indx	INTEGER. Specifies the indices for the elements of *x*. Array, size at least *nz*.
y	COMPLEX for cdotci DOUBLE COMPLEX for zdotci Array, size at least max(*indx(i)*).

Output Parameters

res	COMPLEX for cdotci DOUBLE COMPLEX for zdotci Contains the conjugated dot product of *x* and *y*, if *nz* is positive. Otherwise, it contains 0.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine `dotci` interface are the following:

x	Holds the vector with the number of elements (*nz*).
indx	Holds the vector with the number of elements (*nz*).
y	Holds the vector with the number of elements (*nz*).

?dotui

Computes the dot product of a compressed sparse complex vector by a full-storage complex vector.

Syntax

```
res = cdotui(nz, x, indx, y )
res = zdotui(nzz, x, indx, y )
res = dotui(x, indx, y)
```

Include Files

- `mkl.fi, blas.f90`

Description

The `?dotui` routines return the dot product of *x* and *y* defined as

```
res = x(1)*y(indx(1)) + x(2)*y(indx(2)) +...+ x(nz)*y(indx(nz))
```

where the triple (*nz*, *x*, *indx*) defines a sparse complex vector stored in compressed form, and *y* is a real vector in full storage form. The functions reference only the elements of *y* whose indices are listed in the array *indx*. The values in *indx* must be distinct.

Input Parameters

nz	`INTEGER`. The number of elements in *x* and *indx*.

x	`COMPLEX` for `cdotui`
	`DOUBLE COMPLEX` for `zdotui`
	Array, size at least *nz*.

indx	`INTEGER`. Specifies the indices for the elements of *x*. Array, size at least *nz*.

y	`COMPLEX` for `cdotui`
	`DOUBLE COMPLEX` for `zdotui`
	Array, size at least max(*indx(i)*).

Output Parameters

res	COMPLEX for cdotui DOUBLE COMPLEX for zdotui Contains the dot product of *x* and *y*, if *nz* is positive. Otherwise, *res* contains 0.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine dotui interface are the following:

x	Holds the vector with the number of elements *nz*.
indx	Holds the vector with the number of elements *nz*.
y	Holds the vector with the number of elements *nz*.

?gthr

Gathers a full-storage sparse vector's elements into compressed form.

Syntax

```
call sgthr(nz, y, x, indx )
call dgthr(nz, y, x, indx )
call cgthr(nz, y, x, indx )
call zgthr(nz, y, x, indx )
res = gthr(x, indx, y)
```

Include Files

- mkl.fi, blas.f90

Description

The ?gthr routines gather the specified elements of a full-storage sparse vector *y* into compressed form(*nz*, *x*, *indx*). The routines reference only the elements of *y* whose indices are listed in the array *indx*:

x(*i*) = *y*(*indx*(*i*)), for *i*=1,2,... ,*nz*.

Input Parameters

nz	INTEGER. The number of elements of *y* to be gathered.
indx	INTEGER. Specifies indices of elements to be gathered. Array, size at least *nz*.
y	REAL for sgthr DOUBLE PRECISION for dgthr

	`COMPLEX` for `cgthr`
	`DOUBLE COMPLEX` for `zgthr`
	Array, size at least max(*indx(i)*).

Output Parameters

x	`REAL` for `sgthr`
	`DOUBLE PRECISION` for `dgthr`
	`COMPLEX` for `cgthr`
	`DOUBLE COMPLEX` for `zgthr`
	Array, size at least *nz*.
	Contains the vector converted to the compressed form.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine `gthr` interface are the following:

x	Holds the vector with the number of elements *nz*.
indx	Holds the vector with the number of elements *nz*.
y	Holds the vector with the number of elements *nz*.

?gthrz

Gathers a sparse vector's elements into compressed form, replacing them by zeros.

Syntax

```
call sgthrz(nz, y, x, indx )
call dgthrz(nz, y, x, indx )
call cgthrz(nz, y, x, indx )
call zgthrz(nz, y, x, indx )
res = gthrz(x, indx, y)
```

Include Files

- `mkl.fi, blas.f90`

Description

The `?gthrz` routines gather the elements with indices specified by the array *indx* from a full-storage vector *y* into compressed form (*nz*, *x*, *indx*) and overwrite the gathered elements of *y* by zeros. Other elements of *y* are not referenced or modified (see also `?gthr`).

Input Parameters

nz	INTEGER. The number of elements of *y* to be gathered.
indx	INTEGER. Specifies indices of elements to be gathered. Array, size at least *nz*.
y	REAL for sgthrz DOUBLE PRECISION for dgthrz COMPLEX for cgthrz DOUBLE COMPLEX for zgthrz Array, size at least max(*indx(i)*).

Output Parameters

x	REAL for sgthrz DOUBLE PRECISION for dgthrz COMPLEX for cgthrz DOUBLE COMPLEX for zgthrz Array, size at least *nz*. Contains the vector converted to the compressed form.
y	The updated vector *y*.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine gthrz interface are the following:

x	Holds the vector with the number of elements *nz*.
indx	Holds the vector with the number of elements *nz*.
y	Holds the vector with the number of elements *nz*.

?roti

Applies Givens rotation to sparse vectors one of which is in compressed form.

Syntax

```
call sroti(nz, x, indx, y, c, s)
call droti(nz, x, indx, y, c, s)
call roti(x, indx, y, c, s)
```

Include Files

- mkl.fi, blas.f90

Description

The ?roti routines apply the Givens rotation to elements of two real vectors, *x* (in compressed form *nz*, *x*, *indx*) and *y* (in full storage form):

```
x(i) = c*x(i) + s*y(indx(i))
```

```
y(indx(i)) = c*y(indx(i))- s*x(i)
```

The routines reference only the elements of *y* whose indices are listed in the array *indx*. The values in *indx* must be distinct.

Input Parameters

nz	INTEGER. The number of elements in *x* and *indx*.
x	REAL for sroti DOUBLE PRECISION for droti Array, size at least *nz*.
indx	INTEGER. Specifies the indices for the elements of *x*. Array, size at least *nz*.
y	REAL for sroti DOUBLE PRECISION for droti Array, size at least max(*indx(i)*).
c	REAL for sroti DOUBLE PRECISION for droti. A scalar.
s	REAL for sroti DOUBLE PRECISION for droti. A scalar.

Output Parameters

x and *y*	The updated arrays.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine roti interface are the following:

x	Holds the vector with the number of elements *nz*.
indx	Holds the vector with the number of elements *nz*.
y	Holds the vector with the number of elements *nz*.

?sctr

Converts compressed sparse vectors into full storage form.

Syntax

```
call ssctr(nz, x, indx, y )
call dsctr(nz, x, indx, y )
call csctr(nz, x, indx, y )
call zsctr(nz, x, indx, y )
call sctr(x, indx, y)
```

Include Files

- mkl.fi, blas.f90

Description

The ?sctr routines scatter the elements of the compressed sparse vector (*nz*, *x*, *indx*) to a full-storage vector *y*. The routines modify only the elements of *y* whose indices are listed in the array *indx*:

y(*indx*(*i*)) = *x*(*i*), for *i*=1,2,... ,*nz*.

Input Parameters

nz	INTEGER. The number of elements of *x* to be scattered.
indx	INTEGER. Specifies indices of elements to be scattered. Array, size at least *nz*.
x	REAL for ssctr DOUBLE PRECISION for dsctr COMPLEX for csctr DOUBLE COMPLEX for zsctr Array, size at least *nz*. Contains the vector to be converted to full-storage form.

Output Parameters

y	REAL for ssctr DOUBLE PRECISION for dsctr COMPLEX for csctr DOUBLE COMPLEX for zsctr Array, size at least max(*indx(i)*). Contains the vector *y* with updated elements.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine `sctr` interface are the following:

x	Holds the vector with the number of elements *nz*.
indx	Holds the vector with the number of elements *nz*.
y	Holds the vector with the number of elements *nz*.

Sparse BLAS Level 2 and Level 3 Routines

> **NOTE** The Intel® oneAPI Math Kernel Library (oneMKL) Sparse BLAS Level 2 and Level 3 routines are deprecated. Use the corresponding routine from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface as indicated in the description for each routine.

This section describes Sparse BLAS Level 2 and Level 3 routines included in the Intel® oneAPI Math Kernel Library (oneMKL) . Sparse BLAS Level 2 is a group of routines and functions that perform operations between a sparse matrix and dense vectors. Sparse BLAS Level 3 is a group of routines and functions that perform operations between a sparse matrix and dense matrices.

The terms and concepts required to understand the use of the Intel® oneAPI Math Kernel Library (oneMKL) Sparse BLAS Level 2 and Level 3 routines are discussed in theLinear Solvers Basics appendix.

The Sparse BLAS routines can be useful to implement iterative methods for solving large sparse systems of equations or eigenvalue problems. For example, these routines can be considered as building blocks for Iterative Sparse Solvers based on Reverse Communication Interface (RCI ISS).

Intel® oneAPI Math Kernel Library (oneMKL) provides Sparse BLAS Level 2 and Level 3 routines with typical (or conventional) interface similar to the interface used in the NIST* Sparse BLAS library [Rem05].

Some software packages and libraries (the PARDISO* Solverused in Intel® oneAPI Math Kernel Library (oneMKL),*Sparskit 2* [Saad94], the Compaq* Extended Math Library (CXML)[CXML01]) use different (early) variation of the compressed sparse row (CSR) format and support only Level 2 operations with simplified interfaces. Intel® oneAPI Math Kernel Library (oneMKL) provides an additional set of Sparse BLAS Level 2 routines with similar simplified interfaces. Each of these routines operates only on a matrix of the fixed type.

The routines described in this section support both one-based indexing and zero-based indexing of the input data (see details in the section One-based and Zero-based Indexing).

Naming Conventions in Sparse BLAS Level 2 and Level 3

Each Sparse BLAS Level 2 and Level 3 routine has a six- or eight-character base name preceded by the prefix `mkl_` or `mkl_cspblas_` .

The routines with typical (conventional) interface have six-character base names in accordance with the template:

```
mkl_<character > <data> <operation>( )
```

The routines with simplified interfaces have eight-character base names in accordance with the templates:

```
mkl_<character > <data> <mtype> <operation>( )
```

for routines with one-based indexing; and

```
mkl_cspblas_<character> <data><mtype><operation>( )
```

for routines with zero-based indexing.

The <character> field indicates the data type:

s	real, single precision
c	complex, single precision
d	real, double precision
z	complex, double precision

The <data> field indicates the sparse matrix storage format (see section Sparse Matrix Storage Formats):

coo	coordinate format
csr	compressed sparse row format and its variations
csc	compressed sparse column format and its variations
dia	diagonal format
sky	skyline storage format
bsr	block sparse row format and its variations

The <operation> field indicates the type of operation:

mv	matrix-vector product (Level 2)
mm	matrix-matrix product (Level 3)
sv	solving a single triangular system (Level 2)
sm	solving triangular systems with multiple right-hand sides (Level 3)

The field <mtype> indicates the matrix type:

ge	sparse representation of a general matrix
sy	sparse representation of the upper or lower triangle of a symmetric matrix
tr	sparse representation of a triangular matrix

Sparse Matrix Storage Formats for Sparse BLAS Routines

The current version of Intel® oneAPI Math Kernel Library (oneMKL) Sparse BLAS Level 2 and Level 3 routines support the following point entry [Duff86] storage formats for sparse matrices:

- *compressed sparse row* format (CSR) and its variations;
- *compressed sparse column* format (CSC);
- *coordinate* format;
- *diagonal* format;
- *skyline* storage format;

and one block entry storage format:

- *block sparse row* format (BSR) and its variations.

For more information see "Sparse Matrix Storage Formats" in the Appendix"Linear Solvers Basics".

Intel® oneAPI Math Kernel Library (oneMKL) provides auxiliary routines -matrix converters - that convert sparse matrix from one storage format to another.

Routines and Supported Operations

This section describes operations supported by the Intel® oneAPI Math Kernel Library (oneMKL) Sparse BLAS Level 2 and Level 3 routines. The following notations are used here:

A is a sparse matrix;
B and *C* are dense matrices;
D is a diagonal scaling matrix;
x and *y* are dense vectors;
alpha and *beta* are scalars;

`op(A)` is one of the possible operations:

`op(A)` = *A*;
`op(A)` = A^T - transpose of *A*;
`op(A)` = A^H - conjugated transpose of *A*.

`inv(op(A))` denotes the inverse of `op(A)`.

The Intel® oneAPI Math Kernel Library (oneMKL) Sparse BLAS Level 2 and Level 3 routines support the following operations:

- computing the vector product between a sparse matrix and a dense vector:

```
y := alpha*op(A)*x + beta*y
```

- solving a single triangular system:

```
y := alpha*inv(op(A))*x
```

- computing a product between sparse matrix and dense matrix:

```
C := alpha*op(A)*B + beta*C
```

- solving a sparse triangular system with multiple right-hand sides:

```
C := alpha*inv(op(A))*B
```

Intel® oneAPI Math Kernel Library (oneMKL) provides an additional set of the Sparse BLAS Level 2 routines with*simplified interfaces*. Each of these routines operates on a matrix of the fixed type. The following operations are supported:

- computing the vector product between a sparse matrix and a dense vector (for general and symmetric matrices):

```
y := op(A)*x
```

- solving a single triangular system (for triangular matrices):

```
y := inv(op(A))*x
```

Matrix type is indicated by the field <*mtype*> in the routine name (see section Naming Conventions in Sparse BLAS Level 2 and Level 3).

NOTE
The routines with simplified interfaces support only four sparse matrix storage formats, specifically:

CSR format in the 3-array variation accepted in the direct sparse solvers and in the CXML;
diagonal format accepted in the CXML;
coordinate format;
BSR format in the 3-array variation.

Note that routines with both typical (conventional) and simplified interfaces use the same computational kernels that work with certain internal data structures.

The Intel® oneAPI Math Kernel Library (oneMKL) Sparse BLAS Level 2 and Level 3 routines do not support in-place operations.

Complete list of all routines is given in the "Sparse BLAS Level 2 and Level 3 Routines".

Interface Consideration

One-Based and Zero-Based Indexing

The Intel® oneAPI Math Kernel Library (oneMKL) Sparse BLAS Level 2 and Level 3 routines support one-based and zero-based indexing of data arrays.

Routines with typical interfaces support zero-based indexing for the following sparse data storage formats: CSR, CSC, BSR, and COO. Routines with simplified interfaces support zero based indexing for the following sparse data storage formats: CSR, BSR, and COO. See the complete list of Sparse BLAS Level 2 and Level 3 Routines.

The one-based indexing uses the convention of starting array indices at 1. The zero-based indexing uses the convention of starting array indices at 0. For example, indices of the 5-element array *x* can be presented in case of one-based indexing as follows:

Element index: `1 2 3 4 5`

Element value: `1.0 5.0 7.0 8.0 9.0`

and in case of zero-based indexing as follows:

Element index: `0 1 2 3 4`

Element value: `1.0 5.0 7.0 8.0 9.0`

The detailed descriptions of the one-based and zero-based variants of the sparse data storage formats are given in the "Sparse Matrix Storage Formats" in the Appendix "Linear Solvers Basics".

Most parameters of the routines are identical for both one-based and zero-based indexing, but some of them have certain differences. The following table lists all these differences.

Parameter	One-based Indexing	Zero-based Indexing
val	Array containing non-zero elements of the matrix *A*, its length is *pntre*(m) – *pntrb*(1).	Array containing non-zero elements of the matrix *A*, its length is *pntre*(m–1) – *pntrb*(0).
pntrb	Array of length *m*. This array contains row indices, such that *pntrb*(i) – *pntrb*(1)+1 is the first index of row i in the arrays *val* and *indx*	Array of length *m*. This array contains row indices, such that *pntrb*(i) – *pntrb*(0) is the first index of row i in the arrays *val* and *indx*.
pntre	Array of length *m*. This array contains row indices, such that *pntre*(*I*) – *pntrb*(1) is the last index of row i in the arrays *val* and *indx*.	Array of length *m*. This array contains row indices, such that *pntre*(i) – *pntrb*(0)–1 is the last index of row i in the arrays *val* and *indx*.
ia	Array of length *m* + 1, containing indices of elements in the array *a*, such that *ia*(i) is the index in the array *a* of the first non-zero element from the row i. The value of the last element *ia*(*m* + 1) is equal to the number of non-zeros plus one.	Array of length *m*+1, containing indices of elements in the array *a*, such that *ia*(i) is the index in the array *a* of the first non-zero element from the row i. The value of the last element *ia*(*m*) is equal to the number of non-zeros.
ldb	Specifies the leading dimension of *b* as declared in the calling (sub)program.	Specifies the second dimension of *b* as declared in the calling (sub)program.

Parameter	One-based Indexing	Zero-based Indexing
ldc	Specifies the leading dimension of *c* as declared in the calling (sub)program.	Specifies the second dimension of *c* as declared in the calling (sub)program.

Differences Between Intel MKL and NIST* Interfaces

The Intel® oneAPI Math Kernel Library (oneMKL) Sparse BLAS Level 3 routines have the following conventional interfaces:

mkl_xyyymm(*transa*, *m*, *n*, *k*, *alpha*, *matdescra*, arg(*A*), *b*, *ldb*, *beta*, *c*, *ldc*), for matrix-matrix product;

mkl_xyyysm(*transa*, *m*, *n*, *alpha*, *matdescra*, arg(*A*), *b*, *ldb*, *c*, *ldc*), for triangular solvers with multiple right-hand sides.

Here x denotes data type, and *yyy* - sparse matrix data structure (storage format).

The analogous NIST* Sparse BLAS (NSB) library routines have the following interfaces:

xyyymm(*transa*, *m*, *n*, *k*, *alpha*, *descra*, arg(*A*), *b*, *ldb*, *beta*, *c*, *ldc*, *work*, *lwork*), for matrix-matrix product;

xyyysm(*transa*, *m*, *n*, *unitd*, *dv*, *alpha*, *descra*, arg(*A*), *b*, *ldb*, *beta*, *c*, *ldc*, *work*, *lwork*), for triangular solvers with multiple right-hand sides.

Some similar arguments are used in both libraries. The argument *transa* indicates what operation is performed and is slightly different in the NSB library (see Table "Parameter *transa*"). The arguments *m* and *k* are the number of rows and column in the matrix *A*, respectively, *n* is the number of columns in the matrix *C*. The arguments *alpha* and *beta* are scalar *alpha* and *beta* respectively (*beta*is not used in the Intel® oneAPI Math Kernel Library (oneMKL) triangular solvers.) The arguments*b* and *c* are rectangular arrays with the leading dimension *ldb* and *ldc*, respectively. arg(*A*) denotes the list of arguments that describe the sparse representation of *A*.

Parameter *transa*

	MKL interface	NSB interface	Operation
data type	CHARACTER*1	INTEGER	
value	N or n	0	op(*A*) = *A*
	T or t	1	op(*A*) = A^T
	C or c	2	op(*A*) = A^T or op(*A*) = A^H

Parameter matdescra

The parameter *matdescra* describes the relevant characteristic of the matrix *A*. This manual describes *matdescra*as an array of six elements in line with the NIST* implementation. However, only the first four elements of the array are used in the current versions of the Intel® oneAPI Math Kernel Library (oneMKL) Sparse BLAS routines. Elements*matdescra*(5) and *matdescra*(6) are reserved for future use. Note that whether *matdescra*is described in your application as an array of length 6 or 4 is of no importance because the array is declared as a pointer in the Intel® oneAPI Math Kernel Library (oneMKL) routines. To learn more about declaration of the*matdescra*array, see the Sparse BLAS examples located in the Intel® oneAPI Math Kernel Library (oneMKL) installation directory:examples/spblasf/ for Fortran . The table below lists elements of the parameter *matdescra*, their Fortran values, and their meanings. The parameter *matdescra* corresponds to the argument *descra* from NSB library.

Possible Values of the Parameter *matdescra (descra)*

	MKL interface		NSB interface	Matrix characteristics
	one-based indexing	zero-based indexing		
data type	CHARACTER	Char	INTEGER	
1st element	*matdescra*(1)	*matdescra*(0)	*descra*(1)	matrix structure
value	G	G	0	general
	S	S	1	symmetric ($A = A^T$)
	H	H	2	Hermitian ($A = (A^H)$)
	T	T	3	triangular
	A	A	4	skew(anti)-symmetric ($A = -A^T$)
	D	D	5	diagonal
2nd element	*matdescra*(2)	*matdescra*(1)	*descra*(2)	upper/lower triangular indicator
value	L	L	1	lower
	U	U	2	upper
3rd element	*matdescra*(3)	*matdescra*(2)	*descra*(3)	main diagonal type
value	N	N	0	non-unit
	U	U	1	unit
4th element	*matdescra*(4)	*matdescra*(3)	*descra*(4)	type of indexing
value	F		1	one-based indexing
		C	0	zero-based indexing

In some cases possible element values of the parameter matdescra depend on the values of other elements. The Table "Possible Combinations of Element Values of the Parameter *matdescra*" lists all possible combinations of element values for both multiplication routines and triangular solvers.

Possible Combinations of Element Values of the Parameter *matdescra*

Routines	matdescra(1)	matdescra(2)	matdescra(3)	matdescra(4)
Multiplication Routines	G	ignored	ignored	**F** (default) or C
	S or H	**L** (default)	**N** (default)	**F** (default) or C
	S or H	**L** (default)	U	**F** (default) or C
	S or H	U	**N** (default)	**F** (default) or C
	S or H	U	U	**F** (default) or C
	A	**L** (default)	ignored	**F** (default) or C
	A	U	ignored	**F** (default) or C

Routines	matdescra(1)	matdescra(2)	matdescra(3)	matdescra(4)
Multiplication Routines and Triangular Solvers	T	L	U	**F** (default) or C
	T	L	N	**F** (default) or C
	T	U	U	**F** (default) or C
	T	U	N	**F** (default) or C
	D	ignored	**N** (default)	**F** (default) or C
	D	ignored	U	**F** (default) or C

For a matrix in the skyline format with the main diagonal declared to be a unit, diagonal elements must be stored in the sparse representation even if they are zero. In all other formats, diagonal elements can be stored (if needed) in the sparse representation if they are not zero.

Operations with Partial Matrices

One of the distinctive feature of the Intel® oneAPI Math Kernel Library (oneMKL) Sparse BLAS routines is a possibility to perform operations only on partial matrices composed of certain parts (triangles and the main diagonal) of the input sparse matrix. It can be done by setting properly first three elements of the parameter`matdescra`.

An arbitrary sparse matrix *A* can be decomposed as

```
A = L + D + U
```

where *L* is the strict lower triangle of *A*, *U* is the strict upper triangle of *A*, *D* is the main diagonal.

Table "Output Matrices for Multiplication Routines" shows correspondence between the output matrices and values of the parameter `matdescra` for the sparse matrix *A* for multiplication routines.

Output Matrices for Multiplication Routines

matdescra(1)	matdescra(2)	matdescra(3)	Output Matrix
G	ignored	ignored	`alpha*op(A)*x + beta*y` *alpha**op(*A*)**B* + *beta***C*
S or H	L	N	`alpha*op(L+D+L')*x + beta*y` *alpha**op(*L*+*D*+*L*')**B* + *beta***C*
S or H	L	U	`alpha*op(L+I+L')*x + beta*y` `alpha*op(L+I+L')*B + beta*C`
S or H	U	N	`alpha*op(U'+D+U)*x + beta*y` *alpha**op(*U*'+*D*+*U*)**B* + *beta***C*
S or H	U	U	`alpha*op(U'+I+U)*x + beta*y` *alpha**op(*U*'+*I*+*U*)**B* + *beta***C*
T	L	U	`alpha*op(L+I)*x + beta*y` *alpha**op(*L*+*I*)**B* + *beta***C*
T	L	N	`alpha*op(L+D)*x + beta*y` *alpha**op(*L*+*D*)**B* + *beta***C*
T	U	U	`alpha*op(U+I)*x + beta*y`

matdescra(1)	matdescra(2)	matdescra(3)	Output Matrix
			*alpha**op(*U+I*)**B* + *beta***C*
T	U	N	`alpha*op(U+D)*x + beta*y` *alpha**op(*U+D*)**B* + *beta***C*
A	L	ignored	`alpha*op(L-L')*x + beta*y` *alpha**op(*L-L'*)**B* + *beta***C*
A	U	ignored	`alpha*op(U-U')*x + beta*y` *alpha**op(*U-U'*)**B* + *beta***C*
D	ignored	N	`alpha*D*x + beta*y` *alpha***D***B* + *beta***C*
D	ignored	U	`alpha*x + beta*y` *alpha***B* + *beta***C*

Table "Output Matrices for Triangular Solvers" shows correspondence between the output matrices and values of the parameter `matdescra` for the sparse matrix *A* for triangular solvers.

Output Matrices for Triangular Solvers

matdescra(1)	matdescra(2)	matdescra(3)	Output Matrix
T	L	N	`alpha*inv(op(L))*x` *alpha**inv(op(*L*))**B*
T	L	U	`alpha*inv(op(L))*x` *alpha**inv(op(*L*))**B*
T	U	N	`alpha*inv(op(U))*x` *alpha**inv(op(*U*))**B*
T	U	U	`alpha*inv(op(U))*x` *alpha**inv(op(*U*))**B*
D	ignored	N	`alpha*inv(D)*x` *alpha**inv(*D*)**B*
D	ignored	U	`alpha*x` *alpha***B*

Sparse BLAS Level 2 and Level 3 Routines.

> **NOTE** The Intel® oneAPI Math Kernel Library (oneMKL) Sparse BLAS Level 2 and Level 3 routines are deprecated. Use the corresponding routine from the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface as indicated in the description for each routine.

Table "Sparse BLAS Level 2 and Level 3 Routines" lists the sparse BLAS Level 2 and Level 3 routines described in more detail later in this section.

Sparse BLAS Level 2 and Level 3 Routines

Routine/Function	Description

Routine/Function	Description
Simplified interface, one-based indexing	
mkl_?csrgemv	Computes matrix - vector product of a sparse general matrix in the CSR format (3-array variation)
mkl_?bsrgemv	Computes matrix - vector product of a sparse general matrix in the BSR format (3-array variation).
mkl_?coogemv	Computes matrix - vector product of a sparse general matrix in the coordinate format.
mkl_?diagemv	Computes matrix - vector product of a sparse general matrix in the diagonal format.
mkl_?csrsymv	Computes matrix - vector product of a sparse symmetrical matrix in the CSR format (3-array variation)
mkl_?bsrsymv	Computes matrix - vector product of a sparse symmetrical matrix in the BSR format (3-array variation).
mkl_?coosymv	Computes matrix - vector product of a sparse symmetrical matrix in the coordinate format.
mkl_?diasymv	Computes matrix - vector product of a sparse symmetrical matrix in the diagonal format.
mkl_?csrtrsv	Triangular solvers with simplified interface for a sparse matrix in the CSR format (3-array variation).
mkl_?bsrtrsv	Triangular solver with simplified interface for a sparse matrix in the BSR format (3-array variation).
mkl_?cootrsv	Triangular solvers with simplified interface for a sparse matrix in the coordinate format.
mkl_?diatrsv	Triangular solvers with simplified interface for a sparse matrix in the diagonal format.
Simplified interface, zero-based indexing	
mkl_cspblas_?csrgemv	Computes matrix - vector product of a sparse general matrix in the CSR format (3-array variation) with zero-based indexing.
mkl_cspblas_?bsrgemv	Computes matrix - vector product of a sparse general matrix in the BSR format (3-array variation)with zero-based indexing.
mkl_cspblas_?coogemv	Computes matrix - vector product of a sparse general matrix in the coordinate format with zero-based indexing.
mkl_cspblas_?csrsymv	Computes matrix - vector product of a sparse symmetrical matrix in the CSR format (3-array variation) with zero-based indexing
mkl_cspblas_?bsrsymv	Computes matrix - vector product of a sparse symmetrical matrix in the BSR format (3-array variation) with zero-based indexing.

Routine/Function	Description
mkl_cspblas_?coosymv	Computes matrix - vector product of a sparse symmetrical matrix in the coordinate format with zero-based indexing.
mkl_cspblas_?csrtrsv	Triangular solvers with simplified interface for a sparse matrix in the CSR format (3-array variation) with zero-based indexing.
mkl_cspblas_?bsrtrsv	Triangular solver with simplified interface for a sparse matrix in the BSR format (3-array variation) with zero-based indexing.
mkl_cspblas_?cootrsv	Triangular solver with simplified interface for a sparse matrix in the coordinate format with zero-based indexing.
Typical (conventional) interface, one-based and zero-based indexing	
mkl_?csrmv	Computes matrix - vector product of a sparse matrix in the CSR format.
mkl_?bsrmv	Computes matrix - vector product of a sparse matrix in the BSR format.
mkl_?cscmv	Computes matrix - vector product for a sparse matrix in the CSC format.
mkl_?coomv	Computes matrix - vector product for a sparse matrix in the coordinate format.
mkl_?csrsv	Solves a system of linear equations for a sparse matrix in the CSR format.
mkl_?bsrsv	Solves a system of linear equations for a sparse matrix in the BSR format.
mkl_?cscsv	Solves a system of linear equations for a sparse matrix in the CSC format.
mkl_?coosv	Solves a system of linear equations for a sparse matrix in the coordinate format.
mkl_?csrmm	Computes matrix - matrix product of a sparse matrix in the CSR format
mkl_?bsrmm	Computes matrix - matrix product of a sparse matrix in the BSR format.
mkl_?cscmm	Computes matrix - matrix product of a sparse matrix in the CSC format
mkl_?coomm	Computes matrix - matrix product of a sparse matrix in the coordinate format.
mkl_?csrsm	Solves a system of linear matrix equations for a sparse matrix in the CSR format.
mkl_?bsrsm	Solves a system of linear matrix equations for a sparse matrix in the BSR format.
mkl_?cscsm	Solves a system of linear matrix equations for a sparse matrix in the CSC format.

Routine/Function	Description
mkl_?coosm	Solves a system of linear matrix equations for a sparse matrix in the coordinate format.
Typical (conventional) interface, one-based indexing	
mkl_?diamv	Computes matrix - vector product of a sparse matrix in the diagonal format.
mkl_?skymv	Computes matrix - vector product for a sparse matrix in the skyline storage format.
mkl_?diasv	Solves a system of linear equations for a sparse matrix in the diagonal format.
mkl_?skysv	Solves a system of linear equations for a sparse matrix in the skyline format.
mkl_?diamm	Computes matrix - matrix product of a sparse matrix in the diagonal format.
mkl_?skymm	Computes matrix - matrix product of a sparse matrix in the skyline storage format.
mkl_?diasm	Solves a system of linear matrix equations for a sparse matrix in the diagonal format.
mkl_?skysm	Solves a system of linear matrix equations for a sparse matrix in the skyline storage format.
Auxiliary routines	
Matrix converters	
mkl_?dnscsr	Converts a sparse matrix in uncompressed representation to CSR format (3-array variation) and vice versa.
mkl_?csrcoo	Converts a sparse matrix in CSR format (3-array variation) to coordinate format and vice versa.
mkl_?csrbsr	Converts a sparse matrix in CSR format to BSR format (3-array variations) and vice versa.
mkl_?csrcsc	Converts a sparse matrix in CSR format to CSC format and vice versa (3-array variations).
mkl_?csrdia	Converts a sparse matrix in CSR format (3-array variation) to diagonal format and vice versa.
mkl_?csrsky	Converts a sparse matrix in CSR format (3-array variation) to sky line format and vice versa.
Operations on sparse matrices	
mkl_?csradd	Computes the sum of two sparse matrices stored in the CSR format (3-array variation) with one-based indexing.
mkl_?csrmultcsr	Computes the product of two sparse matrices stored in the CSR format (3-array variation) with one-based indexing.

Routine/Function	Description
mkl_?csrmultd	Computes product of two sparse matrices stored in the CSR format (3-array variation) with one-based indexing. The result is stored in the dense matrix.

mkl_?csrgemv

Computes matrix - vector product of a sparse general matrix stored in the CSR format (3-array variation) with one-based indexing (deprecated).

Syntax

```
call mkl_scsrgemv(transa, m, a, ia, ja, x, y)
call mkl_dcsrgemv(transa, m, a, ia, ja, x, y)
call mkl_ccsrgemv(transa, m, a, ia, ja, x, y)
call mkl_zcsrgemv(transa, m, a, ia, ja, x, y)
```

Include Files

- mkl.fi

Description

This routine is deprecated. Use mkl_sparse_?_mvfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_?csrgemv routine performs a matrix-vector operation defined as

```
y := A*x
```

or

```
y := A^T*x,
```

where:

x and *y* are vectors,

A is an *m*-by-*m* sparse square matrix in the CSR format (3-array variation), A^T is the transpose of *A*.

> **NOTE**
> This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation. If *transa* = 'N' or 'n', then as *y* := *A*x* If *transa* = 'T' or 't' or 'C' or 'c', then *y* := A^T*x,
m	INTEGER. Number of rows of the matrix *A*.

a

REAL for mkl_scsrgemv.

DOUBLE PRECISION for mkl_dcsrgemv.

COMPLEX for mkl_ccsrgemv.

DOUBLE COMPLEX for mkl_zcsrgemv.

Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.

ia

INTEGER. Array of length *m* + 1, containing indices of elements in the array *a*, such that *ia*(*i*) is the index in the array *a* of the first non-zero element from the row *i*. The value of the last element *ia*(*m* + 1) is equal to the number of non-zeros plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.

ja

INTEGER. Array containing the column indices for each non-zero element of the matrix *A*.

Its length is equal to the length of the array *a*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.

x

REAL for mkl_scsrgemv.

DOUBLE PRECISION for mkl_dcsrgemv.

COMPLEX for mkl_ccsrgemv.

DOUBLE COMPLEX for mkl_zcsrgemv.

Array, size is *m*.

On entry, the array *x* must contain the vector *x*.

Output Parameters

y

REAL for mkl_scsrgemv.

DOUBLE PRECISION for mkl_dcsrgemv.

COMPLEX for mkl_ccsrgemv.

DOUBLE COMPLEX for mkl_zcsrgemv.

Array, size at least *m*.

On exit, the array *y* must contain the vector *y*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_scsrgemv(transa, m, a, ia, ja, x, y)
   CHARACTER*1  transa
   INTEGER      m
   INTEGER      ia(*), ja(*)
   REAL       a(*), x(*), y(*)
```

```
SUBROUTINE mkl_dcsrgemv(transa, m, a, ia, ja, x, y)
   CHARACTER*1  transa
   INTEGER      m
   INTEGER      ia(*), ja(*)
   DOUBLE PRECISION       a(*), x(*), y(*)

SUBROUTINE mkl_ccsrgemv(transa, m, a, ia, ja, x, y)
   CHARACTER*1  transa
   INTEGER      m
   INTEGER      ia(*), ja(*)
   COMPLEX       a(*), x(*), y(*)

SUBROUTINE mkl_zcsrgemv(transa, m, a, ia, ja, x, y)
   CHARACTER*1  transa
   INTEGER           m
   INTEGER           ia(*), ja(*)
   DOUBLE COMPLEX    a(*), x(*), y(*)
```

mkl_?bsrgemv

Computes matrix - vector product of a sparse general matrix stored in the BSR format (3-array variation) with one-based indexing (deprecated).

Syntax

```
call mkl_sbsrgemv(transa, m, lb, a, ia, ja, x, y)
call mkl_dbsrgemv(transa, m, lb, a, ia, ja, x, y)
call mkl_cbsrgemv(transa, m, lb, a, ia, ja, x, y)
call mkl_zbsrgemv(transa, m, lb, a, ia, ja, x, y)
```

Include Files

Description

This routine is deprecated. Use mkl_sparse_?_mvfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_?bsrgemv routine performs a matrix-vector operation defined as

$y := A*x$

or

$y := A^{T}*x$,

where:

x and *y* are vectors,

A is an *m*-by-*m* block sparse square matrix in the BSR format (3-array variation), A^T is the transpose of *A*.

NOTE
This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa

CHARACTER*1. Specifies the operation.

If *transa* = 'N' or 'n', then the matrix-vector product is computed as *y* := *A***x*

If *transa* = 'T' or 't' or 'C' or 'c', then the matrix-vector product is computed as *y* := A^T**x*,

m

INTEGER. Number of block rows of the matrix *A*.

lb

INTEGER. Size of the block in the matrix *A*.

a

REAL for mkl_sbsrgemv.

DOUBLE PRECISION for mkl_dbsrgemv.

COMPLEX for mkl_cbsrgemv.

DOUBLE COMPLEX for mkl_zbsrgemv.

Array containing elements of non-zero blocks of the matrix *A*. Its length is equal to the number of non-zero blocks in the matrix *A* multiplied by *lb***lb*. Refer to *values* array description in BSR Format for more details.

ia

INTEGER. Array of length (*m* + 1), containing indices of block in the array *a*, such that *ia*(*i*) is the index in the array *a* of the first non-zero element from the row *i*. The value of the last element *ia*(*m* + 1) is equal to the number of non-zero blocks plus one. Refer to *rowIndex* array description in BSR Format for more details.

ja

INTEGER. Array containing the column indices for each non-zero block in the matrix *A*.

Its length is equal to the number of non-zero blocks of the matrix *A*. Refer to *columns* array description in BSR Format for more details.

x

REAL for mkl_sbsrgemv.

DOUBLE PRECISION for mkl_dbsrgemv.

COMPLEX for mkl_cbsrgemv.

DOUBLE COMPLEX for mkl_zbsrgemv.

Array, size (*m***lb*).

On entry, the array *x* must contain the vector *x*.

Output Parameters

y	REAL for mkl_sbsrgemv. DOUBLE PRECISION for mkl_dbsrgemv. COMPLEX for mkl_cbsrgemv. DOUBLE COMPLEX for mkl_zbsrgemv. Array, size at least (*m***lb*). On exit, the array *y* must contain the vector *y*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_sbsrgemv(transa, m, lb, a, ia, ja, x, y)
   CHARACTER*1  transa
   INTEGER      m, lb
   INTEGER      ia(*), ja(*)
   REAL          a(*), x(*), y(*)

SUBROUTINE mkl_dbsrgemv(transa, m, lb, a, ia, ja, x, y)
   CHARACTER*1  transa
   INTEGER      m, lb
   INTEGER      ia(*), ja(*)
   DOUBLE PRECISION     a(*), x(*), y(*)

SUBROUTINE mkl_cbsrgemv(transa, m, lb, a, ia, ja, x, y)
   CHARACTER*1  transa
   INTEGER      m, lb
   INTEGER      ia(*), ja(*)
   COMPLEX       a(*), x(*), y(*)

SUBROUTINE mkl_zbsrgemv(transa, m, lb, a, ia, ja, x, y)
   CHARACTER*1  transa
   INTEGER      m, lb
   INTEGER      ia(*), ja(*)
   DOUBLE COMPLEX       a(*), x(*), y(*)
```

mkl_?coogemv

Computes matrix-vector product of a sparse general matrix stored in the coordinate format with one-based indexing (deprecated).

Syntax

```
call mkl_scoogemv(transa, m, val, rowind, colind, nnz, x, y)
call mkl_dcoogemv(transa, m, val, rowind, colind, nnz, x, y)
call mkl_ccoogemv(transa, m, val, rowind, colind, nnz, x, y)
call mkl_zcoogemv(transa, m, val, rowind, colind, nnz, x, y)
```

Include Files

Description

This routine is deprecated. Use mkl_sparse_?_mvfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_?coogemv routine performs a matrix-vector operation defined as

```
y := A*x
```

or

```
y := A^T*x,
```

where:

x and *y* are vectors,

A is an *m*-by-*m* sparse square matrix in the coordinate format, A^T is the transpose of *A*.

> **NOTE**
> This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation. If *transa* = 'N' or 'n', then the matrix-vector product is computed as *y* := *A***x* If *transa* = 'T' or 't' or 'C' or 'c', then the matrix-vector product is computed as *y* := A^T**x*,
m	INTEGER. Number of rows of the matrix *A*.
val	REAL for mkl_scoogemv. DOUBLE PRECISION for mkl_dcoogemv. COMPLEX for mkl_ccoogemv. DOUBLE COMPLEX for mkl_zcoogemv. Array of length *nnz*, contains non-zero elements of the matrix *A* in the arbitrary order.

Refer to *values* array description in Coordinate Format for more details.

rowind INTEGER. Array of length *nnz*, contains the row indices for each non-zero element of the matrix *A*.

Refer to *rows* array description in Coordinate Format for more details.

colind INTEGER. Array of length *nnz*, contains the column indices for each non-zero element of the matrix *A*. Refer to *columns* array description in Coordinate Format for more details.

nnz INTEGER. Specifies the number of non-zero element of the matrix *A*.

Refer to *nnz* description in Coordinate Format for more details.

x REAL for mkl_scoogemv.

DOUBLE PRECISION for mkl_dcoogemv.

COMPLEX for mkl_ccoogemv.

DOUBLE COMPLEX for mkl_zcoogemv.

Array, size is *m*.

One entry, the array *x* must contain the vector *x*.

Output Parameters

y REAL for mkl_scoogemv.

DOUBLE PRECISION for mkl_dcoogemv.

COMPLEX for mkl_ccoogemv.

DOUBLE COMPLEX for mkl_zcoogemv.

Array, size at least *m*.

On exit, the array *y* must contain the vector *y*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_scoogemv(transa, m, val, rowind, colind, nnz, x, y)

  CHARACTER*1   transa
  INTEGER       m, nnz
  INTEGER       rowind(*), colind(*)
  DOUBLE COMPLEX        val(*), x(*), y(*)
```

mkl_?diagemv

Computes matrix - vector product of a sparse general matrix stored in the diagonal format with one-based indexing (deprecated).

Syntax

```
call mkl_sdiagemv(transa, m, val, lval, idiag, ndiag, x, y)
call mkl_ddiagemv(transa, m, val, lval, idiag, ndiag, x, y)
call mkl_cdiagemv(transa, m, val, lval, idiag, ndiag, x, y)
call mkl_zdiagemv(transa, m, val, lval, idiag, ndiag, x, y)
```

Include Files

- mkl.fi

Description

This routine is deprecated. Use mkl_sparse_?_mvfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_?diagemv routine performs a matrix-vector operation defined as

```
y := A*x
```

or

```
y := A^T*x,
```

where:

x and *y* are vectors,

A is an *m*-by-*m* sparse square matrix in the diagonal storage format, A^T is the transpose of *A*.

NOTE
This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa

CHARACTER*1. Specifies the operation.

If *transa* = 'N' or 'n', then $y := A*x$

If *transa* = 'T' or 't' or 'C' or 'c', then $y := A^{T}*x$,

m

INTEGER. Number of rows of the matrix *A*.

val

REAL for mkl_sdiagemv.

DOUBLE PRECISION for mkl_ddiagemv.

COMPLEX for mkl_ccsrgemv.

DOUBLE COMPLEX for mkl_zdiagemv.

Two-dimensional array of size *lval***ndiag*, contains non-zero diagonals of the matrix *A*. Refer to *values* array description in Diagonal Storage Scheme for more details.

lval

INTEGER. Leading dimension of *val*$lval \geq m$. Refer to *lval* description in Diagonal Storage Scheme for more details.

idiag

INTEGER. Array of length *ndiag*, contains the distances between main diagonal and each non-zero diagonals in the matrix *A*.

Refer to *distance* array description in Diagonal Storage Scheme for more details.

ndiag

INTEGER. Specifies the number of non-zero diagonals of the matrix *A*.

x

REAL for mkl_sdiagemv.

DOUBLE PRECISION for mkl_ddiagemv.

COMPLEX for mkl_ccsrgemv.

DOUBLE COMPLEX for mkl_zdiagemv.

Array, size is *m*.

On entry, the array *x* must contain the vector *x*.

Output Parameters

y

REAL for mkl_sdiagemv.

DOUBLE PRECISION for mkl_ddiagemv.

COMPLEX for mkl_ccsrgemv.

DOUBLE COMPLEX for mkl_zdiagemv.

Array, size at least *m*.

On exit, the array *y* must contain the vector *y*.

Interfaces

FORTRAN 77:

  CHARACTER*1   transa
  INTEGER       m, lval, ndiag
  INTEGER      idiag(*)
  DOUBLE COMPLEX        val(lval,*), x(*), y(*)
```

mkl_?csrsymv

Computes matrix - vector product of a sparse symmetrical matrix stored in the CSR format (3-array variation) with one-based indexing (deprecated).

Syntax

```
call mkl_scsrsymv(uplo, m, a, ia, ja, x, y)
call mkl_dcsrsymv(uplo, m, a, ia, ja, x, y)
call mkl_ccsrsymv(uplo, m, a, ia, ja, x, y)
call mkl_zcsrsymv(uplo, m, a, ia, ja, x, y)
```

Include Files

- mkl.fi

Description

This routine is deprecated. Use mkl_sparse_?_mvfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?csrsymv` routine performs a matrix-vector operation defined as

```
y := A*x
```

where:

x and *y* are vectors,

A is an upper or lower triangle of the symmetrical sparse matrix in the CSR format (3-array variation).

> **NOTE**
> This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

uplo

`CHARACTER*1`. Specifies whether the upper or low triangle of the matrix *A* is used.

If *uplo* = `'U'` or `'u'`, then the upper triangle of the matrix *A* is used.

If *uplo* = `'L'` or `'l'`, then the low triangle of the matrix *A* is used.

m

`INTEGER`. Number of rows of the matrix *A*.

a

`REAL` for `mkl_scsrsymv`.

`DOUBLE PRECISION` for `mkl_dcsrsymv`.

`COMPLEX` for `mkl_ccsrsymv`.

`DOUBLE COMPLEX` for `mkl_zcsrsymv`.

Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.

ia

`INTEGER`. Array of length *m* + 1, containing indices of elements in the array *a*, such that *ia*(*i*) is the index in the array *a* of the first non-zero element from the row *i*. The value of the last element *ia*(*m* + 1) is equal to the number of non-zeros plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.

ja

`INTEGER`. Array containing the column indices for each non-zero element of the matrix *A*.

Its length is equal to the length of the array *a*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.

x

`REAL` for `mkl_scsrsymv`.

DOUBLE PRECISION for mkl_dcsrsymv.

COMPLEX for mkl_ccsrsymv.

DOUBLE COMPLEX for mkl_zcsrsymv.

Array, size is m.

On entry, the array x must contain the vector x.

Output Parameters

y

REAL for mkl_scsrsymv.

DOUBLE PRECISION for mkl_dcsrsymv.

COMPLEX for mkl_ccsrsymv.

DOUBLE COMPLEX for mkl_zcsrsymv.

Array, size at least m.

On exit, the array y must contain the vector y.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_scsrsymv(uplo, m, a, ia, ja, x, y)
   CHARACTER*1  uplo
   INTEGER      m
   INTEGER      ia(*), ja(*)
   REAL           a(*), x(*), y(*)

SUBROUTINE mkl_dcsrsymv(uplo, m, a, ia, ja, x, y)
   CHARACTER*1  uplo
   INTEGER      m
   INTEGER      ia(*), ja(*)
   DOUBLE PRECISION       a(*), x(*), y(*)

SUBROUTINE mkl_ccsrsymv(uplo, m, a, ia, ja, x, y)
   CHARACTER*1  uplo
   INTEGER      m
   INTEGER      ia(*), ja(*)
   COMPLEX       a(*), x(*), y(*)
```

```
SUBROUTINE mkl_zcsrsymv(uplo, m, a, ia, ja, x, y)
   CHARACTER*1  uplo
   INTEGER      m
   INTEGER      ia(*), ja(*)
   DOUBLE COMPLEX       a(*), x(*), y(*)
```

mkl_?bsrsymv

Computes matrix-vector product of a sparse symmetrical matrix stored in the BSR format (3-array variation) with one-based indexing (deprecated).

Syntax

```
call mkl_sbsrsymv(uplo, m, lb, a, ia, ja, x, y)
call mkl_dbsrsymv(uplo, m, lb, a, ia, ja, x, y)
call mkl_cbsrsymv(uplo, m, lb, a, ia, ja, x, y)
call mkl_zbsrsymv(uplo, m, lb, a, ia, ja, x, y)
```

Include Files

- mkl.fi

Description

This routine is deprecated. Use mkl_sparse_?_mvfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_?bsrsymv routine performs a matrix-vector operation defined as

```
y := A*x
```

where:

x and *y* are vectors,

A is an upper or lower triangle of the symmetrical sparse matrix in the BSR format (3-array variation).

> **NOTE**
> This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

uplo — CHARACTER*1. Specifies whether the upper or low triangle of the matrix *A* is considered.

If *uplo* = 'U' or 'u', then the upper triangle of the matrix *A* is used.

If *uplo* = 'L' or 'l', then the low triangle of the matrix *A* is used.

m INTEGER. Number of block rows of the matrix *A*.

lb INTEGER. Size of the block in the matrix *A*.

a REAL for mkl_sbsrsymv.

DOUBLE PRECISION for mkl_dbsrsymv.

COMPLEX for mkl_cbsrsymv.

DOUBLE COMPLEX for mkl_zcsrgemv.

Array containing elements of non-zero blocks of the matrix *A*. Its length is equal to the number of non-zero blocks in the matrix *A* multiplied by *lb***lb*. Refer to *values* array description in BSR Format for more details.

ia INTEGER. Array of length (*m* + 1), containing indices of block in the array *a*, such that *ia*(*i*) is the index in the array *a* of the first non-zero element from the row *i*. The value of the last element *ia*(*m* + 1) is equal to the number of non-zero blocks plus one. Refer to *rowIndex* array description in BSR Format for more details.

ja INTEGER. Array containing the column indices for each non-zero block in the matrix *A*.

Its length is equal to the number of non-zero blocks of the matrix *A*. Refer to *columns* array description in BSR Format for more details.

x REAL for mkl_sbsrsymv.

DOUBLE PRECISION for mkl_dbsrsymv.

COMPLEX for mkl_cbsrsymv.

DOUBLE COMPLEX for mkl_zcsrgemv.

Array, size (*m***lb*).

On entry, the array *x* must contain the vector *x*.

Output Parameters

y REAL for mkl_sbsrsymv.

DOUBLE PRECISION for mkl_dbsrsymv.

COMPLEX for mkl_cbsrsymv.

DOUBLE COMPLEX for mkl_zcsrgemv.

Array, size at least (*m***lb*).

On exit, the array *y* must contain the vector *y*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_sbsrsymv(uplo, m, lb, a, ia, ja, x, y)
   CHARACTER*1  uplo
   INTEGER      m, lb
   INTEGER      ia(*), ja(*)
   REAL          a(*), x(*), y(*)

SUBROUTINE mkl_dbsrsymv(uplo, m, lb, a, ia, ja, x, y)
   CHARACTER*1  uplo
   INTEGER      m, lb
   INTEGER      ia(*), ja(*)
   DOUBLE PRECISION       a(*), x(*), y(*)

SUBROUTINE mkl_cbsrsymv(uplo, m, lb, a, ia, ja, x, y)
   CHARACTER*1  uplo
   INTEGER      m, lb
   INTEGER      ia(*), ja(*)
   COMPLEX    a(*), x(*), y(*)

SUBROUTINE mkl_zbsrsymv(uplo, m, lb, a, ia, ja, x, y)
   CHARACTER*1  uplo
   INTEGER      m, lb
   INTEGER      ia(*), ja(*)
   DOUBLE COMPLEX       a(*), x(*), y(*)
```

mkl_?coosymv

Computes matrix - vector product of a sparse symmetrical matrix stored in the coordinate format with one-based indexing (deprecated).

Syntax

```
call mkl_scoosymv(uplo, m, val, rowind, colind, nnz, x, y)
call mkl_dcoosymv(uplo, m, val, rowind, colind, nnz, x, y)
call mkl_ccoosymv(uplo, m, val, rowind, colind, nnz, x, y)
call mkl_zcoosymv(uplo, m, val, rowind, colind, nnz, x, y)
```

Include Files

- mkl.fi

Description

This routine is deprecated. Use mkl_sparse_?_mvfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?coosymv` routine performs a matrix-vector operation defined as

```
y := A*x
```

where:

x and *y* are vectors,

A is an upper or lower triangle of the symmetrical sparse matrix in the coordinate format.

> **NOTE**
> This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

uplo

`CHARACTER*1`. Specifies whether the upper or low triangle of the matrix *A* is used.

If *uplo* = `'U'` or `'u'`, then the upper triangle of the matrix *A* is used.

If *uplo* = `'L'` or `'l'`, then the low triangle of the matrix *A* is used.

m

`INTEGER`. Number of rows of the matrix *A*.

val

`REAL` for `mkl_scoosymv`.

`DOUBLE PRECISION` for `mkl_dcoosymv`.

`COMPLEX` for `mkl_ccoosymv`.

`DOUBLE COMPLEX` for `mkl_zcoosymv`.

Array of length *nnz*, contains non-zero elements of the matrix *A* in the arbitrary order.

Refer to *values* array description in Coordinate Format for more details.

rowind

`INTEGER`. Array of length *nnz*, contains the row indices for each non-zero element of the matrix *A*.

Refer to *rows* array description in Coordinate Format for more details.

colind

`INTEGER`. Array of length *nnz*, contains the column indices for each non-zero element of the matrix *A*. Refer to *columns* array description in Coordinate Format for more details.

nnz

`INTEGER`. Specifies the number of non-zero element of the matrix *A*.

Refer to *nnz* description in Coordinate Format for more details.

x

`REAL` for `mkl_scoosymv`.

`DOUBLE PRECISION` for `mkl_dcoosymv`.

COMPLEX for mkl_ccoosymv.

DOUBLE COMPLEX for mkl_zcoosymv.

Array, size is m.

On entry, the array x must contain the vector x.

Output Parameters

y

REAL for mkl_scoosymv.

DOUBLE PRECISION for mkl_dcoosymv.

COMPLEX for mkl_ccoosymv.

DOUBLE COMPLEX for mkl_zcoosymv.

Array, size at least m.

On exit, the array y must contain the vector y.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_scoosymv(uplo, m, val, rowind, colind, nnz, x, y)
  CHARACTER*1   uplo
  INTEGER       m, nnz
  INTEGER       rowind(*), colind(*)
  REAL           val(*), x(*), y(*)

SUBROUTINE mkl_dcoosymv(uplo, m, val, rowind, colind, nnz, x, y)
  CHARACTER*1   uplo
  INTEGER       m, nnz
  INTEGER       rowind(*), colind(*)
  DOUBLE PRECISION     val(*), x(*), y(*)

SUBROUTINE mkl_cdcoosymv(uplo, m, val, rowind, colind, nnz, x, y)
  CHARACTER*1   uplo
  INTEGER       m, nnz
  INTEGER       rowind(*), colind(*)
  COMPLEX     val(*), x(*), y(*)

SUBROUTINE mkl_zcoosymv(uplo, m, val, rowind, colind, nnz, x, y)
  CHARACTER*1   uplo
  INTEGER       m, nnz
  INTEGER       rowind(*), colind(*)
  DOUBLE COMPLEX        val(*), x(*), y(*)
```

mkl_?diasymv

Computes matrix - vector product of a sparse symmetrical matrix stored in the diagonal format with one-based indexing (deprecated).

Syntax

```
call mkl_sdiasymv(uplo, m, val, lval, idiag, ndiag, x, y)
call mkl_ddiasymv(uplo, m, val, lval, idiag, ndiag, x, y)
call mkl_cdiasymv(uplo, m, val, lval, idiag, ndiag, x, y)
call mkl_zdiasymv(uplo, m, val, lval, idiag, ndiag, x, y)
```

Include Files

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

uplo	CHARACTER*1. Specifies whether the upper or low triangle of the matrix *A* is used. If *uplo* = 'U' or 'u', then the upper triangle of the matrix *A* is used. If *uplo* = 'L' or 'l', then the low triangle of the matrix *A* is used.
m	INTEGER. Number of rows of the matrix *A*.
val	REAL for mkl_sdiasymv. DOUBLE PRECISION for mkl_ddiasymv. COMPLEX for mkl_cdiasymv. DOUBLE COMPLEX for mkl_zdiasymv.

	Two-dimensional array of size *lval* by *ndiag*, contains non-zero diagonals of the matrix *A*. Refer to *values* array description in Diagonal Storage Scheme for more details.
lval	INTEGER. Leading dimension of *val*, *lval*≥*m*. Refer to *lval* description in Diagonal Storage Scheme for more details.
idiag	INTEGER. Array of length *ndiag*, contains the distances between main diagonal and each non-zero diagonals in the matrix *A*. Refer to *distance* array description in Diagonal Storage Scheme for more details.
ndiag	INTEGER. Specifies the number of non-zero diagonals of the matrix *A*.
x	REAL for mkl_sdiasymv. DOUBLE PRECISION for mkl_ddiasymv. COMPLEX for mkl_cdiasymv. DOUBLE COMPLEX for mkl_zdiasymv. Array, size is *m*. On entry, the array *x* must contain the vector *x*.

Output Parameters

y	REAL for mkl_sdiasymv. DOUBLE PRECISION for mkl_ddiasymv. COMPLEX for mkl_cdiasymv. DOUBLE COMPLEX for mkl_zdiasymv. Array, size at least *m*. On exit, the array *y* must contain the vector *y*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_sdiasymv(uplo, m, val, lval, idiag, ndiag, x, y)
  CHARACTER*1   uplo

  INTEGER      idiag(*)
  DOUBLE PRECISION      val(lval,*), x(*), y(*)
```

```
SUBROUTINE mkl_cdiasymv(uplo, m, val, lval, idiag, ndiag, x, y)
  CHARACTER*1   uplo
  INTEGER       m, lval, ndiag
  INTEGER      idiag(*)
  COMPLEX    val(lval,*), x(*), y(*)

SUBROUTINE mkl_zdiasymv(uplo, m, val, lval, idiag, ndiag, x, y)
  CHARACTER*1   uplo
  INTEGER       m, lval, ndiag
  INTEGER      idiag(*)
  DOUBLE COMPLEX        val(lval,*), x(*), y(*)
```

mkl_?csrtrsv

Triangular solvers with simplified interface for a sparse matrix in the CSR format (3-array variation) with one-based indexing (deprecated).

Syntax

```
call mkl_scsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
call mkl_dcsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
call mkl_ccsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
call mkl_zcsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
```

Include Files

- mkl.fi

Description

This routine is deprecated. Use mkl_sparse_?_trsvfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_?csrtrsv routine solves a system of linear equations with matrix-vector operations for a sparse matrix stored in the CSR format (3 array variation):

$A*y = x$

or

$A^T*y = x$,

where:

x and y are vectors,

A is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, A^T is the transpose of A.

NOTE
This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

uplo

CHARACTER*1. Specifies whether the upper or low triangle of the matrix *A* is used.

If *uplo* = 'U' or 'u', then the upper triangle of the matrix *A* is used.

If *uplo* = 'L' or 'l', then the low triangle of the matrix *A* is used.

transa

CHARACTER*1. Specifies the system of linear equations.

If *transa* = 'N' or 'n', then $A*y = x$

If *transa* = 'T' or 't' or 'C' or 'c', then $A^T*y = x$,

diag

CHARACTER*1. Specifies whether *A* is unit triangular.

If *diag* = 'U' or 'u', then *A* is a unit triangular.

If *diag* = 'N' or 'n', then *A* is not unit triangular.

m

INTEGER. Number of rows of the matrix *A*.

a

REAL for mkl_scsrtrmv.

DOUBLE PRECISION for mkl_dcsrtrmv.

COMPLEX for mkl_ccsrtrmv.

DOUBLE COMPLEX for mkl_zcsrtrmv.

Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.

NOTE
The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right).

No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.

ia

INTEGER. Array of length *m* + 1, containing indices of elements in the array *a*, such that *ia*(*i*) is the index in the array *a* of the first non-zero element from the row *i*. The value of the last element *ia*(*m* + 1) is equal to the number of non-zeros plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.

ja

INTEGER. Array containing the column indices for each non-zero element of the matrix *A*.

Its length is equal to the length of the array *a*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.

NOTE
Column indices must be sorted in increasing order for each row.

x REAL for mkl_scsrtrmv.
DOUBLE PRECISION for mkl_dcsrtrmv.
COMPLEX for mkl_ccsrtrmv.
DOUBLE COMPLEX for mkl_zcsrtrmv.
Array, size is *m*.
On entry, the array *x* must contain the vector *x*.

Output Parameters

y REAL for mkl_scsrtrmv.
DOUBLE PRECISION for mkl_dcsrtrmv.
COMPLEX for mkl_ccsrtrmv.
DOUBLE COMPLEX for mkl_zcsrtrmv.
Array, size at least *m*.
Contains the vector *y*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_scsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
   CHARACTER*1  uplo, transa, diag
   INTEGER      m
   INTEGER      ia(*), ja(*)
   REAL          a(*), x(*), y(*)

SUBROUTINE mkl_dcsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
   CHARACTER*1  uplo, transa, diag
   INTEGER      m
   INTEGER      ia(*), ja(*)
   DOUBLE PRECISION     a(*), x(*), y(*)

SUBROUTINE mkl_ccsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
   CHARACTER*1  uplo, transa, diag
   INTEGER      m
   INTEGER      ia(*), ja(*)
   COMPLEX     a(*), x(*), y(*)
```

```
SUBROUTINE mkl_zcsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
   CHARACTER*1  uplo, transa, diag
   INTEGER      m
   INTEGER      ia(*), ja(*)
   DOUBLE COMPLEX      a(*), x(*), y(*)
```

mkl_?bsrtrsv

Triangular solver with simplified interface for a sparse matrix stored in the BSR format (3-array variation) with one-based indexing (deprecated).

Syntax

```
call mkl_sbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
call mkl_dbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
call mkl_cbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
call mkl_zbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
```

Include Files

- mkl.fi

Description

This routine is deprecated. Use mkl_sparse_?_trsvfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_?bsrtrsv routine solves a system of linear equations with matrix-vector operations for a sparse matrix stored in the BSR format (3-array variation) :

```
y := A*x
```

or

```
y := A^T*x,
```

where:

x and *y* are vectors,

A is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, A^T is the transpose of *A*.

> **NOTE**
> This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

uplo CHARACTER*1. Specifies the upper or low triangle of the matrix *A* is used.

If *uplo* = 'U' or 'u', then the upper triangle of the matrix *A* is used.

If *uplo* = 'L' or 'l', then the low triangle of the matrix *A* is used.

transa CHARACTER*1. Specifies the operation.

If *transa* = 'N' or 'n', then the matrix-vector product is computed as *y* := *A***x*

If *transa* = 'T' or 't' or 'C' or 'c', then the matrix-vector product is computed as *y* := A^T**x*.

diag CHARACTER*1. Specifies whether *A* is a unit triangular matrix.

If *diag* = 'U' or 'u', then *A* is a unit triangular.

If *diag* = 'N' or 'n', then *A* is not a unit triangular.

m INTEGER. Number of block rows of the matrix *A*.

lb INTEGER. Size of the block in the matrix *A*.

a REAL for mkl_sbsrtrsv.

DOUBLE PRECISION for mkl_dbsrtrsv.

COMPLEX for mkl_cbsrtrsv.

DOUBLE COMPLEX for mkl_zbsrtrsv.

Array containing elements of non-zero blocks of the matrix *A*. Its length is equal to the number of non-zero blocks in the matrix *A* multiplied by *lb***lb*. Refer to *values* array description in BSR Format for more details.

NOTE
The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right).

No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.

ia INTEGER. Array of length (*m* + 1), containing indices of block in the array *a*, such that *ia*(*I*) is the index in the array *a* of the first non-zero element from the row *I*. The value of the last element *ia*(*m* + 1) is equal to the number of non-zero blocks plus one. Refer to *rowIndex* array description in BSR Format for more details.

ja INTEGER.

Array containing the column indices for each non-zero block in the matrix *A*.

Its length is equal to the number of non-zero blocks of the matrix *A*. Refer to *columns* array description in BSR Format for more details.

x REAL for mkl_sbsrtrsv.

DOUBLE PRECISION for mkl_dbsrtrsv.

COMPLEX for mkl_cbsrtrsv.

DOUBLE COMPLEX for mkl_zbsrtrsv.

Array, size (*m***lb*).

On entry, the array *x* must contain the vector *x*.

Output Parameters

y

REAL for mkl_sbsrtrsv.

DOUBLE PRECISION for mkl_dbsrtrsv.

COMPLEX for mkl_cbsrtrsv.

DOUBLE COMPLEX for mkl_zbsrtrsv.

Array, size at least (*m***lb*).

On exit, the array *y* must contain the vector *y*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_sbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
   CHARACTER*1  uplo, transa, diag
   INTEGER      m, lb
   INTEGER      ia(*), ja(*)
   REAL          a(*), x(*), y(*)

SUBROUTINE mkl_dbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)

   CHARACTER*1  uplo, transa, diag
   INTEGER      m, lb
   INTEGER      ia(*), ja(*)
   COMPLEX       a(*), x(*), y(*)

SUBROUTINE mkl_zbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
   CHARACTER*1  uplo, transa, diag
   INTEGER      m, lb
   INTEGER      ia(*), ja(*)
   DOUBLE COMPLEX       a(*), x(*), y(*)
```

mkl_?cootrsv

Triangular solvers with simplified interface for a sparse matrix in the coordinate format with one-based indexing (deprecated).

Syntax

```
call mkl_scootrsv(uplo, transa, diag, m, val, rowind, colind, nnz, x, y)
call mkl_dcootrsv(uplo, transa, diag, m, val, rowind, colind, nnz, x, y)
call mkl_ccootrsv(uplo, transa, diag, m, val, rowind, colind, nnz, x, y)
call mkl_zcootrsv(uplo, transa, diag, m, val, rowind, colind, nnz, x, y)
```

Include Files

- mkl.fi

Description

This routine is deprecated. Use mkl_sparse_?_trsvfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_?cootrsv routine solves a system of linear equations with matrix-vector operations for a sparse matrix stored in the coordinate format:

$A*y = x$

or

$A^T*y = x$,

where:

x and *y* are vectors,

A is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, A^T is the transpose of *A*.

NOTE
This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

uplo — CHARACTER*1. Specifies whether the upper or low triangle of the matrix *A* is considered.

If *uplo* = 'U' or 'u', then the upper triangle of the matrix *A* is used.

If *uplo* = 'L' or 'l', then the low triangle of the matrix *A* is used.

transa — CHARACTER*1. Specifies the system of linear equations.

If *transa* = 'N' or 'n', then $A*y = x$

If *transa* = 'T' or 't' or 'C' or 'c', then $A^T*y = x$,

diag — CHARACTER*1. Specifies whether *A* is unit triangular.

If *diag* = 'U' or 'u', then *A* is unit triangular.

If *diag* = 'N' or 'n', then *A* is not unit triangular.

m INTEGER. Number of rows of the matrix *A*.

val REAL for mkl_scootrsv.

DOUBLE PRECISION for mkl_dcootrsv.

COMPLEX for mkl_ccootrsv.

DOUBLE COMPLEX for mkl_zcootrsv.

Array of length *nnz*, contains non-zero elements of the matrix *A* in the arbitrary order.

Refer to *values* array description in Coordinate Format for more details.

rowind INTEGER. Array of length *nnz*, contains the row indices for each non-zero element of the matrix *A*.

Refer to *rows* array description in Coordinate Format for more details.

colind INTEGER. Array of length *nnz*, contains the column indices for each non-zero element of the matrix *A*. Refer to *columns* array description in Coordinate Format for more details.

nnz INTEGER. Specifies the number of non-zero element of the matrix *A*.

Refer to *nnz* description in Coordinate Format for more details.

x REAL for mkl_scootrsv.

DOUBLE PRECISION for mkl_dcootrsv.

COMPLEX for mkl_ccootrsv.

DOUBLE COMPLEX for mkl_zcootrsv.

Array, size is *m*.

On entry, the array *x* must contain the vector *x*.

Output Parameters

y REAL for mkl_scootrsv.

DOUBLE PRECISION for mkl_dcootrsv.

COMPLEX for mkl_ccootrsv.

DOUBLE COMPLEX for mkl_zcootrsv.

Array, size at least *m*.

Contains the vector *y*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_scootrsv(uplo, transa, diag, m, val, rowind, colind, nnz, x, y)
  CHARACTER*1   uplo, transa, diag

mkl_?diatrsv

Triangular solvers with simplified interface for a sparse matrix in the diagonal format with one-based indexing (deprecated).

Syntax

```
call mkl_sdiatrsv(uplo, transa, diag, m, val, lval, idiag, ndiag, x, y)
call mkl_ddiatrsv(uplo, transa, diag, m, val, lval, idiag, ndiag, x, y)
call mkl_cdiatrsv(uplo, transa, diag, m, val, lval, idiag, ndiag, x, y)
call mkl_zdiatrsv(uplo, transa, diag, m, val, lval, idiag, ndiag, x, y)
```

Include Files

- mkl.fi

Description

This routine is deprecated. Use mkl_sparse_?_trsvfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?diatrsv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix stored in the diagonal format:

$A*y = x$

or

$A^T*y = x$,

where:

x and *y* are vectors,

A is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, A^T is the transpose of *A*.

NOTE
This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

uplo

`CHARACTER*1`. Specifies whether the upper or low triangle of the matrix *A* is used.

If *uplo* = `'U'` or `'u'`, then the upper triangle of the matrix *A* is used.

If *uplo* = `'L'` or `'l'`, then the low triangle of the matrix *A* is used.

transa

`CHARACTER*1`. Specifies the system of linear equations.

If *transa* = `'N'` or `'n'`, then $A*y = x$

If *transa* = `'T'` or `'t'` or `'C'` or `'c'`, then $A^T*y = x$,

diag

`CHARACTER*1`. Specifies whether *A* is unit triangular.

If *diag* = `'U'` or `'u'`, then *A* is unit triangular.

If *diag* = `'N'` or `'n'`, then *A* is not unit triangular.

m

`INTEGER`. Number of rows of the matrix *A*.

val

`REAL` for `mkl_sdiatrsv`.

`DOUBLE PRECISION` for `mkl_ddiatrsv`.

`COMPLEX` for `mkl_cdiatrsv`.

`DOUBLE COMPLEX` for `mkl_zdiatrsv`.

Two-dimensional array of size *lval* by *ndiag*, contains non-zero diagonals of the matrix *A*. Refer to *values* array description in Diagonal Storage Scheme for more details.

lval INTEGER. Leading dimension of *val*, *lval*≥*m*. Refer to *lval* description in Diagonal Storage Scheme for more details.

idiag INTEGER. Array of length *ndiag*, contains the distances between main diagonal and each non-zero diagonals in the matrix *A*.

NOTE
All elements of this array must be sorted in increasing order.

Refer to *distance* array description in Diagonal Storage Scheme for more details.

ndiag INTEGER. Specifies the number of non-zero diagonals of the matrix *A*.

x REAL for mkl_sdiatrsv.

DOUBLE PRECISION for mkl_ddiatrsv.

COMPLEX for mkl_cdiatrsv.

DOUBLE COMPLEX for mkl_zdiatrsv.

Array, size is *m*.

On entry, the array *x* must contain the vector *x*.

Output Parameters

y REAL for mkl_sdiatrsv.

DOUBLE PRECISION for mkl_ddiatrsv.

COMPLEX for mkl_cdiatrsv.

DOUBLE COMPLEX for mkl_zdiatrsv.

Array, size at least *m*.

Contains the vector *y*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_sdiatrsv(uplo, transa, diag, m, val, lval, idiag, ndiag, x, y)
  CHARACTER*1   uplo, transa, diag
  INTEGER       m, lval, ndiag
  INTEGER       indiag(*)
  REAL            val(lval,*), x(*), y(*)
```

```
SUBROUTINE mkl_ddiatrsv(uplo, transa, diag, m, val, lval, idiag, ndiag, x, y)
  CHARACTER*1   uplo, transa, diag
  INTEGER       m, lval, ndiag
  INTEGER       indiag(*)
  DOUBLE PRECISION       val(lval,*), x(*), y(*)

SUBROUTINE mkl_cdiatrsv(uplo, transa, diag, m, val, lval, idiag, ndiag, x, y)
  CHARACTER*1   uplo, transa, diag
  INTEGER       m, lval, ndiag
  INTEGER       indiag(*)
  COMPLEX     val(lval,*), x(*), y(*)

SUBROUTINE mkl_zdiatrsv(uplo, transa, diag, m, val, lval, idiag, ndiag, x, y)
  CHARACTER*1   uplo, transa, diag
  INTEGER       m, lval, ndiag
  INTEGER       indiag(*)
  DOUBLE COMPLEX        val(lval,*), x(*), y(*)
```

mkl_cspblas_?csrgemv

Computes matrix - vector product of a sparse general matrix stored in the CSR format (3-array variation) with zero-based indexing (deprecated).

Syntax

```
call mkl_cspblas_scsrgemv(transa, m, a, ia, ja, x, y)
call mkl_cspblas_dcsrgemv(transa, m, a, ia, ja, x, y)
call mkl_cspblas_ccsrgemv(transa, m, a, ia, ja, x, y)
call mkl_cspblas_zcsrgemv(transa, m, a, ia, ja, x, y)
```

Include Files

- mkl.fi

Description

This routine is deprecated. Use mkl_sparse_?_mvfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_cspblas_?csrgemv routine performs a matrix-vector operation defined as

$y := A*x$

or

$y := A^{T}*x$,

where:

x and *y* are vectors,

A is an *m*-by-*m* sparse square matrix in the CSR format (3-array variation) with zero-based indexing, A^T is the transpose of *A*.

NOTE
This routine supports only zero-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa

`CHARACTER*1`. Specifies the operation.

If *transa* = `'N'` or `'n'`, then the matrix-vector product is computed as *y* := *A***x*

If *transa* = `'T'` or `'t'` or `'C'` or `'c'`, then the matrix-vector product is computed as *y* := A^T**x*,

m

`INTEGER`. Number of rows of the matrix *A*.

a

`REAL` for `mkl_cspblas_scsrgemv`.

`DOUBLE PRECISION` for `mkl_cspblas_dcsrgemv`.

`COMPLEX` for `mkl_cspblas_ccsrgemv`.

`DOUBLE COMPLEX` for `mkl_cspblas_zcsrgemv`.

Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.

ia

`INTEGER`. Array of length *m* + 1, containing indices of elements in the array *a*, such that *ia*(*I*) is the index in the array *a* of the first non-zero element from the row *I*. The value of the last element *ia*(*m*) is equal to the number of non-zeros. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.

ja

`INTEGER`. Array containing the column indices for each non-zero element of the matrix *A*.

Its length is equal to the length of the array *a*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.

x

`REAL` for `mkl_cspblas_scsrgemv`.

`DOUBLE PRECISION` for `mkl_cspblas_dcsrgemv`.

`COMPLEX` for `mkl_cspblas_ccsrgemv`.

`DOUBLE COMPLEX` for `mkl_cspblas_zcsrgemv`.

Array, size is *m*.

One entry, the array *x* must contain the vector *x*.

Output Parameters

y	REAL for mkl_cspblas_scsrgemv. DOUBLE PRECISION for mkl_cspblas_dcsrgemv. COMPLEX for mkl_cspblas_ccsrgemv. DOUBLE COMPLEX for mkl_cspblas_zcsrgemv. Array, size at least *m*. On exit, the array *y* must contain the vector *y*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_cspblas_scsrgemv(transa, m, a, ia, ja, x, y)
   CHARACTER*1  transa
   INTEGER      m
   INTEGER      ia(*), ja(*)
   REAL           a(*), x(*), y(*)

SUBROUTINE mkl_cspblas_dcsrgemv(transa, m, a, ia, ja, x, y)
   CHARACTER*1  transa
   INTEGER      m
   INTEGER      ia(*), ja(*)
   DOUBLE PRECISION       a(*), x(*), y(*)

SUBROUTINE mkl_cspblas_ccsrgemv(transa, m, a, ia, ja, x, y)
   CHARACTER*1  transa
   INTEGER      m
   INTEGER      ia(*), ja(*)
   COMPLEX       a(*), x(*), y(*)

SUBROUTINE mkl_cspblas_zcsrgemv(transa, m, a, ia, ja, x, y)
   CHARACTER*1  transa
   INTEGER      m
   INTEGER      ia(*), ja(*)
   DOUBLE COMPLEX      a(*), x(*), y(*)
```

mkl_cspblas_?bsrgemv

Computes matrix - vector product of a sparse general matrix stored in the BSR format (3-array variation) with zero-based indexing (deprecated).

Syntax

```
call mkl_cspblas_sbsrgemv(transa, m, lb, a, ia, ja, x, y)
call mkl_cspblas_dbsrgemv(transa, m, lb, a, ia, ja, x, y)
call mkl_cspblas_cbsrgemv(transa, m, lb, a, ia, ja, x, y)
call mkl_cspblas_zbsrgemv(transa, m, lb, a, ia, ja, x, y)
```

Description

This routine is deprecated. Use mkl_sparse_?_mvfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_cspblas_?bsrgemv routine performs a matrix-vector operation defined as

$y := A*x$

or

$y := A^{T}*x$,

where:

x and *y* are vectors,

A is an *m*-by-*m* block sparse square matrix in the BSR format (3-array variation) with zero-based indexing, A^{T} is the transpose of *A*.

> **NOTE**
> This routine supports only zero-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation. If *transa* = 'N' or 'n', then the matrix-vector product is computed as *y* := *A***x* If *transa* = 'T' or 't' or 'C' or 'c', then the matrix-vector product is computed as $y := A^{T}*x$,
m	INTEGER. Number of block rows of the matrix *A*.
lb	INTEGER. Size of the block in the matrix *A*.
a	REAL for mkl_cspblas_sbsrgemv. DOUBLE PRECISION for mkl_cspblas_dbsrgemv. COMPLEX for mkl_cspblas_cbsrgemv. DOUBLE COMPLEX for mkl_cspblas_zbsrgemv.

Array containing elements of non-zero blocks of the matrix *A*. Its length is equal to the number of non-zero blocks in the matrix *A* multiplied by `lb*lb`. Refer to `values` array description in BSR Format for more details.

ia — `INTEGER`. Array of length `(m + 1)`, containing indices of block in the array `a`, such that `ia(i)` is the index in the array `a` of the first non-zero element from the row *i*. The value of the last element `ia(m + 1)` is equal to the number of non-zero blocks. Refer to `rowIndex` array description in BSR Format for more details.

ja — `INTEGER`. Array containing the column indices for each non-zero block in the matrix *A*.

Its length is equal to the number of non-zero blocks of the matrix *A*. Refer to `columns` array description in BSR Format for more details.

x — `REAL` for `mkl_cspblas_sbsrgemv`.

`DOUBLE PRECISION` for `mkl_cspblas_dbsrgemv`.

`COMPLEX` for `mkl_cspblas_cbsrgemv`.

`DOUBLE COMPLEX` for `mkl_cspblas_zbsrgemv`.

Array, size `(m*lb)`.

On entry, the array `x` must contain the vector *x*.

Output Parameters

y — `REAL` for `mkl_cspblas_sbsrgemv`.

`DOUBLE PRECISION` for `mkl_cspblas_dbsrgemv`.

`COMPLEX` for `mkl_cspblas_cbsrgemv`.

`DOUBLE COMPLEX` for `mkl_cspblas_zbsrgemv`.

Array, size at least `(m*lb)`.

On exit, the array `y` must contain the vector *y*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_cspblas_sbsrgemv(transa, m, lb, a, ia, ja, x, y)
   CHARACTER*1  transa
   INTEGER      m, lb
   INTEGER      ia(*), ja(*)
   REAL          a(*), x(*), y(*)
```

```
SUBROUTINE mkl_cspblas_dbsrgemv(transa, m, lb, a, ia, ja, x, y)
   CHARACTER*1  transa
   INTEGER      m, lb
   INTEGER      ia(*), ja(*)
   DOUBLE PRECISION       a(*), x(*), y(*)

Description

This routine is deprecated. Use mkl_sparse_?_mvfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_cspblas_dcoogemv routine performs a matrix-vector operation defined as

$y := A*x$

or

$y := A^{T}*x$,

where:

x and *y* are vectors,

A is an *m*-by-*m* sparse square matrix in the coordinate format with zero-based indexing, A^T is the transpose of *A*.

NOTE
This routine supports only zero-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa

`CHARACTER*1`. Specifies the operation.

If *transa* = `'N'` or `'n'`, then the matrix-vector product is computed as *y* := *A***x*

If *transa* = `'T'` or `'t'` or `'C'` or `'c'`, then the matrix-vector product is computed as *y* := A^T**x*.

m

`INTEGER`. Number of rows of the matrix *A*.

val

`REAL` for `mkl_cspblas_scoogemv`.

`DOUBLE PRECISION` for `mkl_cspblas_dcoogemv`.

`COMPLEX` for `mkl_cspblas_ccoogemv`.

`DOUBLE COMPLEX` for `mkl_cspblas_zcoogemv`.

Array of length *nnz*, contains non-zero elements of the matrix *A* in the arbitrary order.

Refer to *values* array description in Coordinate Format for more details.

rowind

`INTEGER`. Array of length *nnz*, contains the row indices for each non-zero element of the matrix *A*.

Refer to *rows* array description in Coordinate Format for more details.

colind

`INTEGER`. Array of length *nnz*, contains the column indices for each non-zero element of the matrix *A*. Refer to *columns* array description in Coordinate Format for more details.

nnz

`INTEGER`. Specifies the number of non-zero element of the matrix *A*.

Refer to *nnz* description in Coordinate Format for more details.

x

`REAL` for `mkl_cspblas_scoogemv`.

`DOUBLE PRECISION` for `mkl_cspblas_dcoogemv`.

`COMPLEX` for `mkl_cspblas_ccoogemv`.

`DOUBLE COMPLEX` for `mkl_cspblas_zcoogemv`.

Array, size is *m*.

On entry, the array *x* must contain the vector *x*.

Output Parameters

y	REAL for mkl_cspblas_scoogemv. DOUBLE PRECISION for mkl_cspblas_dcoogemv. COMPLEX for mkl_cspblas_ccoogemv. DOUBLE COMPLEX for mkl_cspblas_zcoogemv. Array, size at least *m*. On exit, the array *y* must contain the vector *y*.

  DOUBLE COMPLEX       val(*), x(*), y(*)
```

mkl_cspblas_?csrsymv

Computes matrix-vector product of a sparse symmetrical matrix stored in the CSR format (3-array variation) with zero-based indexing (deprecated).

Syntax

```
call mkl_cspblas_scsrsymv(uplo, m, a, ia, ja, x, y)
call mkl_cspblas_dcsrsymv(uplo, m, a, ia, ja, x, y)
call mkl_cspblas_ccsrsymv(uplo, m, a, ia, ja, x, y)
call mkl_cspblas_zcsrsymv(uplo, m, a, ia, ja, x, y)
```

Include Files

- mkl.fi

Description

This routine is deprecated. Use mkl_sparse_?_mvfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_cspblas_?csrsymv routine performs a matrix-vector operation defined as

```
y := A*x
```

where:

x and *y* are vectors,

A is an upper or lower triangle of the symmetrical sparse matrix in the CSR format (3-array variation) with zero-based indexing.

> **NOTE**
> This routine supports only zero-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

uplo

CHARACTER*1. Specifies whether the upper or low triangle of the matrix *A* is used.

If *uplo* = 'U' or 'u', then the upper triangle of the matrix *A* is used.

If *uplo* = 'L' or 'l', then the low triangle of the matrix *A* is used.

m

INTEGER. Number of rows of the matrix *A*.

a

REAL for mkl_cspblas_scsrsymv.

DOUBLE PRECISION for mkl_cspblas_dcsrsymv.

COMPLEX for mkl_cspblas_ccsrsymv.

DOUBLE COMPLEX for mkl_cspblas_zcsrsymv.

Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.

ia — INTEGER. Array of length *m* + 1, containing indices of elements in the array *a*, such that *ia*(*i*) is the index in the array *a* of the first non-zero element from the row *i*. The value of the last element *ia*(*m* + 1) is equal to the number of non-zeros. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.

ja — INTEGER. Array containing the column indices for each non-zero element of the matrix *A*.

Its length is equal to the length of the array *a*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.

x — REAL for mkl_cspblas_scsrsymv.

DOUBLE PRECISION for mkl_cspblas_dcsrsymv.

COMPLEX for mkl_cspblas_ccsrsymv.

DOUBLE COMPLEX for mkl_cspblas_zcsrsymv.

Array, size is *m*.

On entry, the array *x* must contain the vector *x*.

Output Parameters

y — REAL for mkl_cspblas_scsrsymv.

DOUBLE PRECISION for mkl_cspblas_dcsrsymv.

COMPLEX for mkl_cspblas_ccsrsymv.

DOUBLE COMPLEX for mkl_cspblas_zcsrsymv.

Array, size at least *m*.

On exit, the array *y* must contain the vector *y*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_cspblas_scsrsymv(uplo, m, a, ia, ja, x, y)
   CHARACTER*1  uplo
   INTEGER      m
   INTEGER      ia(*), ja(*)
   REAL         a(*), x(*), y(*)

SUBROUTINE mkl_cspblas_dcsrsymv(uplo, m, a, ia, ja, x, y)
   CHARACTER*1        uplo

Description

This routine is deprecated. Use mkl_sparse_?_mvfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_cspblas_?coosymv routine performs a matrix-vector operation defined as

```
y := A*x
```

where:

x and *y* are vectors,

A is an upper or lower triangle of the symmetrical sparse matrix in the coordinate format with zero-based indexing.

NOTE
This routine supports only zero-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

uplo

CHARACTER*1. Specifies whether the upper or low triangle of the matrix *A* is used.

If *uplo* = 'U' or 'u', then the upper triangle of the matrix *A* is used.

If *uplo* = 'L' or 'l', then the low triangle of the matrix *A* is used.

m

INTEGER. Number of rows of the matrix *A*.

val

REAL for mkl_cspblas_scoosymv.

DOUBLE PRECISION for mkl_cspblas_dcoosymv.

COMPLEX for mkl_cspblas_ccoosymv.

DOUBLE COMPLEX for mkl_cspblas_zcoosymv.

Array of length *nnz*, contains non-zero elements of the matrix *A* in the arbitrary order.

Refer to *values* array description in Coordinate Format for more details.

rowind

INTEGER. Array of length *nnz*, contains the row indices for each non-zero element of the matrix *A*.

Refer to *rows* array description in Coordinate Format for more details.

colind

INTEGER. Array of length *nnz*, contains the column indices for each non-zero element of the matrix *A*. Refer to *columns* array description in Coordinate Format for more details.

nnz

INTEGER. Specifies the number of non-zero element of the matrix *A*.

Refer to *nnz* description in Coordinate Format for more details.

x

REAL for mkl_cspblas_scoosymv.

DOUBLE PRECISION for mkl_cspblas_dcoosymv.

COMPLEX for mkl_cspblas_ccoosymv.

DOUBLE COMPLEX for mkl_cspblas_zcoosymv.

Array, size is *m*.

On entry, the array *x* must contain the vector *x*.

Output Parameters

y

REAL for mkl_cspblas_scoosymv.

DOUBLE PRECISION for mkl_cspblas_dcoosymv.

COMPLEX for mkl_cspblas_ccoosymv.

DOUBLE COMPLEX for mkl_cspblas_zcoosymv.

Array, size at least *m*.

On exit, the array *y* must contain the vector *y*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_cspblas_scoosymv(uplo, m, val, rowind, colind, nnz, x, y)
  CHARACTER*1   uplo
  INTEGER       m, nnz
  INTEGER       rowind(*), colind(*)
  REAL           val(*), x(*), y(*)

SUBROUTINE mkl_cspblas_dcoosymv(uplo, m, val, rowind, colind, nnz, x, y)

  INTEGER       m, nnz
  INTEGER       rowind(*), colind(*)
  DOUBLE COMPLEX      val(*), x(*), y(*)
```

mkl_cspblas_?csrtrsv

Triangular solvers with simplified interface for a sparse matrix in the CSR format (3-array variation) with zero-based indexing (deprecated).

Syntax

```
call mkl_cspblas_scsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
call mkl_cspblas_dcsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
call mkl_cspblas_ccsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
call mkl_cspblas_zcsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
```

Include Files

- mkl.fi

Description

This routine is deprecated. Use mkl_sparse_?_trsvfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_cspblas_?csrtrsv routine solves a system of linear equations with matrix-vector operations for a sparse matrix stored in the CSR format (3-array variation) with zero-based indexing:

$A*y = x$

or

$A^T*y = x$,

where:

x and *y* are vectors,

A is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, A^T is the transpose of *A*.

NOTE
This routine supports only zero-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

uplo — CHARACTER*1. Specifies whether the upper or low triangle of the matrix *A* is used.

If *uplo* = 'U' or 'u', then the upper triangle of the matrix *A* is used.

If *uplo* = 'L' or 'l', then the low triangle of the matrix *A* is used.

transa CHARACTER*1. Specifies the system of linear equations.

If *transa* = 'N' or 'n', then $A*y = x$

If *transa* = 'T' or 't' or 'C' or 'c', then $A^{T}*y = x$,

diag CHARACTER*1. Specifies whether matrix *A* is unit triangular.

If *diag* = 'U' or 'u', then *A* is unit triangular.

If *diag* = 'N' or 'n', then *A* is not unit triangular.

m INTEGER. Number of rows of the matrix *A*.

a REAL for mkl_cspblas_scsrtrsv.

DOUBLE PRECISION for mkl_cspblas_dcsrtrsv.

COMPLEX for mkl_cspblas_ccsrtrsv.

DOUBLE COMPLEX for mkl_cspblas_zcsrtrsv.

Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.

NOTE
The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right).

No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.

ia INTEGER. Array of length *m*+1, containing indices of elements in the array *a*, such that *ia*(*i*) is the index in the array *a* of the first non-zero element from the row *i*. The value of the last element *ia*(*m*) is equal to the number of non-zeros. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.

ja INTEGER. Array containing the column indices for each non-zero element of the matrix *A*.

Its length is equal to the length of the array *a*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.

NOTE
Column indices must be sorted in increasing order for each row.

x REAL for mkl_cspblas_scsrtrsv.

DOUBLE PRECISION for mkl_cspblas_dcsrtrsv.

COMPLEX for mkl_cspblas_ccsrtrsv.

DOUBLE COMPLEX for mkl_cspblas_zcsrtrsv.

Array, size is *m*.

On entry, the array *x* must contain the vector *x*.

Output Parameters

y

REAL for mkl_cspblas_scsrtrsv.

DOUBLE PRECISION for mkl_cspblas_dcsrtrsv.

COMPLEX for mkl_cspblas_ccsrtrsv.

DOUBLE COMPLEX for mkl_cspblas_zcsrtrsv.

Array, size at least *m*.

Contains the vector *y*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_cspblas_scsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
   CHARACTER*1  uplo, transa, diag
   INTEGER      m
   INTEGER      ia(*), ja(*)
   REAL          a(*), x(*), y(*)

SUBROUTINE mkl_cspblas_dcsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
   CHARACTER*1  uplo, transa, diag
   INTEGER      m
   INTEGER      ia(*), ja(*)
   DOUBLE PRECISION     a(*), x(*), y(*)

SUBROUTINE mkl_cspblas_ccsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
   CHARACTER*1  uplo, transa, diag
   INTEGER      m
   INTEGER      ia(*), ja(*)
   COMPLEX       a(*), x(*), y(*)

SUBROUTINE mkl_cspblas_zcsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
   CHARACTER*1  uplo, transa, diag
   INTEGER      m
   INTEGER      ia(*), ja(*)
   DOUBLE COMPLEX       a(*), x(*), y(*)
```

mkl_cspblas_?bsrtrsv

Triangular solver with simplified interface for a sparse matrix stored in the BSR format (3-array variation) with zero-based indexing (deprecated).

Syntax

```
call mkl_cspblas_sbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
call mkl_cspblas_dbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
call mkl_cspblas_cbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
call mkl_cspblas_zbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
```

Include Files

- mkl.fi

Description

This routine is deprecated. Use mkl_sparse_?_trsvfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_cspblas_?bsrtrsv routine solves a system of linear equations with matrix-vector operations for a sparse matrix stored in the BSR format (3-array variation) with zero-based indexing:

```
y := A*x
```

or

```
y := A^T*x,
```

where:

x and *y* are vectors,

A is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, A^T is the transpose of *A*.

> **NOTE**
> This routine supports only zero-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

uplo

CHARACTER*1. Specifies the upper or low triangle of the matrix *A* is used.

If *uplo* = 'U' or 'u', then the upper triangle of the matrix *A* is used.

If *uplo* = 'L' or 'l', then the low triangle of the matrix *A* is used.

transa

CHARACTER*1. Specifies the operation.

If *transa* = 'N' or 'n', then the matrix-vector product is computed as *y* := *A*x*

If *transa* = 'T' or 't' or 'C' or 'c', then the matrix-vector product is computed as *y* := A^T*x.

diag CHARACTER*1. Specifies whether matrix *A* is unit triangular or not.

If *diag* = 'U' or 'u', *A* is unit triangular.

If *diag* = 'N' or 'n', *A* is not unit triangular.

m INTEGER. Number of block rows of the matrix *A*.

lb INTEGER. Size of the block in the matrix *A*.

a REAL for mkl_cspblas_sbsrtrsv.

DOUBLE PRECISION for mkl_cspblas_dbsrtrsv.

COMPLEX for mkl_cspblas_cbsrtrsv.

DOUBLE COMPLEX for mkl_cspblas_zbsrtrsv.

Array containing elements of non-zero blocks of the matrix *A*. Its length is equal to the number of non-zero blocks in the matrix *A* multiplied by *lb*lb*. Refer to *values* array description in BSR Format for more details.

NOTE
The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right).

No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.

ia INTEGER. Array of length (*m* + 1), containing indices of block in the array *a*, such that *ia*(*I*) is the index in the array *a* of the first non-zero element from the row *I*. The value of the last element *ia*(*m* + 1) is equal to the number of non-zero blocks. Refer to *rowIndex* array description in BSR Format for more details.

ja INTEGER. Array containing the column indices for each non-zero block in the matrix *A*.

Its length is equal to the number of non-zero blocks of the matrix *A*. Refer to *columns* array description in BSR Format for more details.

x REAL for mkl_cspblas_sbsrtrsv.

DOUBLE PRECISION for mkl_cspblas_dbsrtrsv.

COMPLEX for mkl_cspblas_cbsrtrsv.

DOUBLE COMPLEX for mkl_cspblas_zbsrtrsv.

Array, size (*m*lb*).

On entry, the array *x* must contain the vector *x*.

Output Parameters

y REAL for mkl_cspblas_sbsrtrsv.

DOUBLE PRECISION for mkl_cspblas_dbsrtrsv.

COMPLEX for mkl_cspblas_cbsrtrsv.

DOUBLE COMPLEX for mkl_cspblas_zbsrtrsv.

Array, size at least (*m***lb*).

On exit, the array *y* must contain the vector *y*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_cspblas_sbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
   CHARACTER*1  uplo, transa, diag
   INTEGER      m, lb
   INTEGER      ia(*), ja(*)
   REAL          a(*), x(*), y(*)

SUBROUTINE mkl_cspblas_dbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
   CHARACTER*1  uplo, transa, diag
   INTEGER      m, lb
   INTEGER      ia(*), ja(*)
   DOUBLE PRECISION       a(*), x(*), y(*)

SUBROUTINE mkl_cspblas_cbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
   CHARACTER*1  uplo, transa, diag
   INTEGER      m, lb
   INTEGER      ia(*), ja(*)
   COMPLEX       a(*), x(*), y(*)

SUBROUTINE mkl_cspblas_zbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
   CHARACTER*1  uplo, transa, diag
   INTEGER      m, lb
   INTEGER      ia(*), ja(*)
   DOUBLE COMPLEX      a(*), x(*), y(*)
```

mkl_cspblas_?cootrsv

Triangular solvers with simplified interface for a sparse matrix in the coordinate format with zero-based indexing (deprecated).

Syntax

```
call mkl_cspblas_scootrsv(uplo, transa, diag, m, val, rowind, colind, nnz, x, y)
call mkl_cspblas_dcootrsv(uplo, transa, diag, m, val, rowind, colind, nnz, x, y)
call mkl_cspblas_ccootrsv(uplo, transa, diag, m, val, rowind, colind, nnz, x, y)
call mkl_cspblas_zcootrsv(uplo, transa, diag, m, val, rowind, colind, nnz, x, y)
```

Include Files

- mkl.fi

Description

This routine is deprecated. Use mkl_sparse_?_trsvfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_cspblas_?cootrsv routine solves a system of linear equations with matrix-vector operations for a sparse matrix stored in the coordinate format with zero-based indexing:

$A*y = x$

or

$A^T*y = x$,

where:

x and *y* are vectors,

A is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, A^T is the transpose of *A*.

NOTE
This routine supports only zero-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

uplo
CHARACTER*1. Specifies whether the upper or low triangle of the matrix *A* is considered.
If *uplo* = 'U' or 'u', then the upper triangle of the matrix *A* is used.
If *uplo* = 'L' or 'l', then the low triangle of the matrix *A* is used.

transa
CHARACTER*1. Specifies the system of linear equations.
If *transa* = 'N' or 'n', then $A*y = x$
If *transa* = 'T' or 't' or 'C' or 'c', then $A^T*y = x$,

diag
CHARACTER*1. Specifies whether *A* is unit triangular.
If *diag* = 'U' or 'u', then *A* is unit triangular.
If *diag* = 'N' or 'n', then *A* is not unit triangular.

m
INTEGER. Number of rows of the matrix *A*.

val
REAL for mkl_cspblas_scootrsv.
DOUBLE PRECISION for mkl_cspblas_dcootrsv.
COMPLEX for mkl_cspblas_ccootrsv.
DOUBLE COMPLEX for mkl_cspblas_zcootrsv.

Array of length *nnz*, contains non-zero elements of the matrix *A* in the arbitrary order.

Refer to *values* array description in Coordinate Format for more details.

rowind INTEGER. Array of length *nnz*, contains the row indices for each non-zero element of the matrix *A*.

Refer to *rows* array description in Coordinate Format for more details.

colind INTEGER. Array of length *nnz*, contains the column indices for each non-zero element of the matrix *A*. Refer to *columns* array description in Coordinate Format for more details.

nnz INTEGER. Specifies the number of non-zero element of the matrix *A*.

Refer to *nnz* description in Coordinate Format for more details.

x REAL for mkl_cspblas_scootrsv.

DOUBLE PRECISION for mkl_cspblas_dcootrsv.

COMPLEX for mkl_cspblas_ccootrsv.

DOUBLE COMPLEX for mkl_cspblas_zcootrsv.

Array, size is *m*.

On entry, the array *x* must contain the vector *x*.

Output Parameters

y REAL for mkl_cspblas_scootrsv.

DOUBLE PRECISION for mkl_cspblas_dcootrsv.

COMPLEX for mkl_cspblas_ccootrsv.

DOUBLE COMPLEX for mkl_cspblas_zcootrsv.

Array, size at least *m*.

Contains the vector *y*.

Interfaces

```

mkl_?csrmv

Computes matrix - vector product of a sparse matrix stored in the CSR format (deprecated).

Syntax

```
call mkl_scsrmv(transa, m, k, alpha, matdescra, val, indx, pntrb, pntre, x, beta, y)
call mkl_dcsrmv(transa, m, k, alpha, matdescra, val, indx, pntrb, pntre, x, beta, y)
call mkl_ccsrmv(transa, m, k, alpha, matdescra, val, indx, pntrb, pntre, x, beta, y)
call mkl_zcsrmv(transa, m, k, alpha, matdescra, val, indx, pntrb, pntre, x, beta, y)
```

Include Files

- mkl.fi

Description

This routine is deprecated. Use mkl_sparse_?_mvfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_?csrmv routine performs a matrix-vector operation defined as

$y := alpha*A*x + beta*y$

or

$y := alpha*A^{T}*x + beta*y,$

where:

alpha and *beta* are scalars,

x and *y* are vectors,

A is an *m*-by-*k* sparse matrix in the CSR format, A^T is the transpose of *A*.

NOTE
This routine supports a CSR format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa

`CHARACTER*1`. Specifies the operation.

If *transa* = `'N'` or `'n'`, then *y* := *alpha***A***x* + *beta***y*

If *transa* = `'T'` or `'t'` or `'C'` or `'c'`, then *y* := *alpha***A*^{T}**x* + *beta***y*,

m

`INTEGER`. Number of rows of the matrix *A*.

k

`INTEGER`. Number of columns of the matrix *A*.

alpha

`REAL` for `mkl_scsrmv`.

`DOUBLE PRECISION` for `mkl_dcsrmv`.

`COMPLEX` for `mkl_ccsrmv`.

`DOUBLE COMPLEX` for `mkl_zcsrmv`.

Specifies the scalar *alpha*.

matdescra

`CHARACTER`. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter *matdescra* (*descra*)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter *matdescra*".

val

`REAL` for `mkl_scsrmv`.

`DOUBLE PRECISION` for `mkl_dcsrmv`.

`COMPLEX` for `mkl_ccsrmv`.

`DOUBLE COMPLEX` for `mkl_zcsrmv`.

Array containing non-zero elements of the matrix *A*.

For one-based indexing its length is *pntre*`(m)` - *pntrb*`(1)`.

For zero-based indexing its length is *pntre*`(m-1)` - *pntrb*`(0)`.

Refer to *values* array description in CSR Format for more details.

indx

`INTEGER`. Array containing the column indices for each non-zero element of the matrix *A*.

Its length is equal to length of the *val* array.

Refer to *columns* array description in CSR Format for more details.

pntrb

INTEGER. Array of length *m*.

For one-based indexing this array contains row indices, such that *pntrb*(*i*) – *pntrb*(1) + 1 is the first index of row *i* in the arrays *val* and *indx*.

For zero-based indexing this array contains row indices, such that *pntrb*(*i*) – *pntrb*(0) is the first index of row *i* in the arrays *val* and *indx*.

Refer to *pointerb* array description in CSR Format for more details.

pntre

INTEGER. Array of length *m*.

For one-based indexing this array contains row indices, such that *pntre*(*i*) – *pntrb*(1) is the last index of row *i* in the arrays *val* and *indx*.

For zero-based indexing this array contains row indices, such that *pntre*(*i*) – *pntrb*(0)–1 is the last index of row *i* in the arrays *val* and *indx*.

Refer to *pointerE* array description in CSR Format for more details.

x

REAL for mkl_scsrmv.

DOUBLE PRECISION for mkl_dcsrmv.

COMPLEX for mkl_ccsrmv.

DOUBLE COMPLEX for mkl_zcsrmv.

Array, size at least *k* if *transa* = 'N' or 'n' and at least *m* otherwise. On entry, the array *x* must contain the vector *x*.

beta

REAL for mkl_scsrmv.

DOUBLE PRECISION for mkl_dcsrmv.

COMPLEX for mkl_ccsrmv.

DOUBLE COMPLEX for mkl_zcsrmv.

Specifies the scalar *beta*.

y

REAL for mkl_scsrmv.

DOUBLE PRECISION for mkl_dcsrmv.

COMPLEX for mkl_ccsrmv.

DOUBLE COMPLEX for mkl_zcsrmv.

Array, size at least *m* if *transa* = 'N' or 'n' and at least *k* otherwise. On entry, the array *y* must contain the vector *y*.

Output Parameters

y

Overwritten by the updated vector *y*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_scsrmv(transa, m, k, alpha, matdescra, val, indx,
 pntrb, pntre, x, beta, y)
  CHARACTER*1   transa

  DOUBLE COMPLEX        val(*), x(*), y(*)
```

mkl_?bsrmv

Computes matrix - vector product of a sparse matrix stored in the BSR format (deprecated).

Syntax

```
call mkl_sbsrmv(transa, m, k, lb, alpha, matdescra, val, indx, pntrb, pntre, x, beta, y)
call mkl_dbsrmv(transa, m, k, lb, alpha, matdescra, val, indx, pntrb, pntre, x, beta, y)
call mkl_cbsrmv(transa, m, k, lb, alpha, matdescra, val, indx, pntrb, pntre, x, beta, y)
call mkl_zbsrmv(transa, m, k, lb, alpha, matdescra, val, indx, pntrb, pntre, x, beta, y)
```

Include Files

- mkl.fi

Description

This routine is deprecated. Use mkl_sparse_?_mvfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_?bsrmv routine performs a matrix-vector operation defined as

```
y := alpha*A*x + beta*y
```

or

```
y := alpha*A^T*x + beta*y,
```

where:

alpha and *beta* are scalars,

x and *y* are vectors,

A is an *m*-by-*k* block sparse matrix in the BSR format, A^T is the transpose of *A*.

NOTE
This routine supports a BSR format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa — CHARACTER*1. Specifies the operation.

If *transa* = 'N' or 'n', then the matrix-vector product is computed as *y := alpha*A*x + beta*y*

If *transa* = 'T' or 't' or 'C' or 'c', then the matrix-vector product is computed as *y := alpha*A^T*x + beta*y*,

m — INTEGER. Number of block rows of the matrix *A*.

k — INTEGER. Number of block columns of the matrix *A*.

lb	INTEGER. Size of the block in the matrix *A*.
alpha	REAL for mkl_sbsrmv. DOUBLE PRECISION for mkl_dbsrmv. COMPLEX for mkl_cbsrmv. DOUBLE COMPLEX for mkl_zbsrmv. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter *matdescra* (*descra*)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter *matdescra*".
val	REAL for mkl_sbsrmv. DOUBLE PRECISION for mkl_dbsrmv. COMPLEX for mkl_cbsrmv. DOUBLE COMPLEX for mkl_zbsrmv. Array containing elements of non-zero blocks of the matrix *A*. Its length is equal to the number of non-zero blocks in the matrix *A* multiplied by *lb*lb*. Refer to *values* array description in BSR Format for more details.
indx	INTEGER. Array containing the column indices for each non-zero block in the matrix *A*. Its length is equal to the number of non-zero blocks in the matrix *A*. Refer to *columns* array description in BSR Format for more details.
pntrb	INTEGER. Array of length *m*. For one-based indexing: this array contains row indices, such that *pntrb*(*i*) – *pntrb*(1) + 1 is the first index of block row *i* in the array *indx*. For zero-based indexing: this array contains row indices, such that *pntrb*(*i*) – *pntrb*(0) is the first index of block row *i* in the array *indx* Refer to *pointerB* array description in BSR Format for more details.
pntre	INTEGER. Array of length *m*. For one-based indexing this array contains row indices, such that *pntre*(*i*) – *pntrb*(1) is the last index of block row *i* in the array *indx*. For zero-based indexing this array contains row indices, such that *pntre*(*i*) – *pntrb*(0) – 1 is the last index of block row *i* in the array *indx*. Refer to *pointerE* array description in BSR Format for more details.
x	REAL for mkl_sbsrmv. DOUBLE PRECISION for mkl_dbsrmv.

COMPLEX for mkl_cbsrmv.

DOUBLE COMPLEX for mkl_zbsrmv.

Array, size at least (*k***lb*) if *transa* = 'N' or 'n', and at least (*m***lb*) otherwise. On entry, the array *x* must contain the vector *x*.

beta

REAL for mkl_sbsrmv.

DOUBLE PRECISION for mkl_dbsrmv.

COMPLEX for mkl_cbsrmv.

DOUBLE COMPLEX for mkl_zbsrmv.

Specifies the scalar *beta*.

y

REAL for mkl_sbsrmv.

DOUBLE PRECISION for mkl_dbsrmv.

COMPLEX for mkl_cbsrmv.

DOUBLE COMPLEX for mkl_zbsrmv.

Array, size at least (*m***lb*) if *transa* = 'N' or 'n', and at least (*k***lb*) otherwise. On entry, the array *y* must contain the vector *y*.

Output Parameters

y

Overwritten by the updated vector *y*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_sbsrmv(transa, m, k, lb, alpha, matdescra, val, indx,
pntrb, pntre, x, beta, y)
  CHARACTER*1   transa
  CHARACTER     matdescra(*)
  INTEGER       m, k, lb
  INTEGER       indx(*), pntrb(m), pntre(m)
  REAL          alpha, beta
  REAL          val(*), x(*), y(*)
```

```
SUBROUTINE mkl_dbsrmv(transa, m, k, lb, alpha, matdescra, val, indx,

  INTEGER       m, k, lb
  INTEGER       indx(*), pntrb(m), pntre(m)
  DOUBLE COMPLEX        alpha, beta
  DOUBLE COMPLEX        val(*), x(*), y(*)
```

mkl_?cscmv

Computes matrix-vector product for a sparse matrix in the CSC format (deprecated).

Syntax

```
call mkl_scscmv(transa, m, k, alpha, matdescra, val, indx, pntrb, pntre, x, beta, y)
call mkl_dcscmv(transa, m, k, alpha, matdescra, val, indx, pntrb, pntre, x, beta, y)
call mkl_ccscmv(transa, m, k, alpha, matdescra, val, indx, pntrb, pntre, x, beta, y)
call mkl_zcscmv(transa, m, k, alpha, matdescra, val, indx, pntrb, pntre, x, beta, y)
```

Include Files

- mkl.fi

Description

This routine is deprecated. Use mkl_sparse_?_mvfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?cscmv` routine performs a matrix-vector operation defined as

```
y := alpha*A*x + beta*y
```

or

```
y := alpha*A^T*x + beta*y,
```

where:

alpha and *beta* are scalars,

x and *y* are vectors,

A is an *m*-by-*k* sparse matrix in compressed sparse column (CSC) format, A^T is the transpose of *A*.

> **NOTE**
> This routine supports CSC format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa

`CHARACTER*1`. Specifies the operation.

If *transa* = `'N'` or `'n'`, then *y* := *alpha**A*x + *beta**y*

If *transa* = `'T'` or `'t'` or `'C'` or `'c'`, then *y* := *alpha**A^T*x + *beta**y*,

m

`INTEGER`. Number of rows of the matrix *A*.

k

`INTEGER`. Number of columns of the matrix *A*.

alpha

`REAL` for `mkl_scscmv`.

`DOUBLE PRECISION` for `mkl_dcscmv`.

`COMPLEX` for `mkl_ccscmv`.

`DOUBLE COMPLEX` for `mkl_zcscmv`.

Specifies the scalar *alpha*.

matdescra

`CHARACTER`. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter *matdescra* (*descra*)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter *matdescra*".

val

`REAL` for `mkl_scscmv`.

`DOUBLE PRECISION` for `mkl_dcscmv`.

`COMPLEX` for `mkl_ccscmv`.

DOUBLE COMPLEX for mkl_zcscmv.

Array containing non-zero elements of the matrix *A*.

For one-based indexing its length is pntre(*k*) – *pntrb*(1).

For zero-based indexing its length is *pntre*(*m*–1) – *pntrb*(0).

Refer to *values* array description in CSC Format for more details.

indx INTEGER. Array containing the row indices for each non-zero element of the matrix *A*.

Its length is equal to length of the *val* array.

Refer to *rows* array description in CSC Format for more details.

pntrb INTEGER. Array of length *k*.

For one-based indexing this array contains column indices, such that *pntrb*(*i*) – *pntrb*(1) + 1 is the first index of column *i* in the arrays *val* and *indx*.

For zero-based indexing this array contains column indices, such that *pntrb*(*i*) – *pntrb*(0) is the first index of column *i* in the arrays *val* and *indx*.

Refer to *pointerb* array description in CSC Format for more details.

pntre INTEGER. Array of length *k*.

For one-based indexing this array contains column indices, such that *pntre*(*i*) – *pntrb*(1) is the last index of column *i* in the arrays *val* and *indx*.

For zero-based indexing this array contains column indices, such that *pntre*(*i*) – *pntrb*(1) – 1 is the last index of column *i* in the arrays *val* and *indx*.

Refer to *pointerE* array description in CSC Format for more details.

x REAL for mkl_scscmv.

DOUBLE PRECISION for mkl_dcscmv.

COMPLEX for mkl_ccscmv.

DOUBLE COMPLEX for mkl_zcscmv.

Array, size at least *k* if *transa* = 'N' or 'n' and at least *m* otherwise. On entry, the array *x* must contain the vector *x*.

beta REAL for mkl_scscmv.

DOUBLE PRECISION for mkl_dcscmv.

COMPLEX for mkl_ccscmv.

DOUBLE COMPLEX for mkl_zcscmv.

Specifies the scalar *beta*.

y REAL for mkl_scscmv.

DOUBLE PRECISION for mkl_dcscmv.

COMPLEX for mkl_ccscmv.

DOUBLE COMPLEX for mkl_zcscmv.

Array, size at least *m* if *transa* = 'N' or 'n' and at least *k* otherwise. On entry, the array *y* must contain the vector *y*.

Output Parameters

y — Overwritten by the updated vector *y*.

Interfaces

FORTRAN 77:

```

mkl_?coomv

Computes matrix - vector product for a sparse matrix in the coordinate format (deprecated).

Syntax

```
call mkl_scoomv(transa, m, k, alpha, matdescra, val, rowind, colind, nnz, x, beta, y)
call mkl_dcoomv(transa, m, k, alpha, matdescra, val, rowind, colind, nnz, x, beta, y)
call mkl_ccoomv(transa, m, k, alpha, matdescra, val, rowind, colind, nnz, x, beta, y)
call mkl_zcoomv(transa, m, k, alpha, matdescra, val, rowind, colind, nnz, x, beta, y)
```

Include Files

- mkl.fi

Description

This routine is deprecated. Use mkl_sparse_?_mvfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_?coomv routine performs a matrix-vector operation defined as

```
y := alpha*A*x + beta*y
```

or

```
y := alpha*A^T*x + beta*y,
```

where:

alpha and *beta* are scalars,

x and *y* are vectors,

A is an *m*-by-*k* sparse matrix in compressed coordinate format, A^T is the transpose of *A*.

NOTE
This routine supports a coordinate format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation. If *transa* = 'N' or 'n', then $y := alpha*A*x + beta*y$ If *transa* = 'T' or 't' or 'C' or 'c', then $y := alpha*A^{T}*x + beta*y$,
m	INTEGER. Number of rows of the matrix *A*.
k	INTEGER. Number of columns of the matrix *A*.
alpha	REAL for mkl_scoomv. DOUBLE PRECISION for mkl_dcoomv. COMPLEX for mkl_ccoomv. DOUBLE COMPLEX for mkl_zcoomv. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter *matdescra* (*descra*)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter *matdescra*".
val	REAL for mkl_scoomv. DOUBLE PRECISION for mkl_dcoomv. COMPLEX for mkl_ccoomv. DOUBLE COMPLEX for mkl_zcoomv. Array of length *nnz*, contains non-zero elements of the matrix *A* in the arbitrary order. Refer to *values* array description in Coordinate Format for more details.
rowind	INTEGER. Array of length *nnz*, contains the row indices for each non-zero element of the matrix *A*. Refer to *rows* array description in Coordinate Format for more details.
colind	INTEGER. Array of length *nnz*, contains the column indices for each non-zero element of the matrix *A*. Refer to *columns* array description in Coordinate Format for more details.
nnz	INTEGER. Specifies the number of non-zero element of the matrix *A*. Refer to *nnz* description in Coordinate Format for more details.
x	REAL for mkl_scoomv. DOUBLE PRECISION for mkl_dcoomv. COMPLEX for mkl_ccoomv.

DOUBLE COMPLEX for mkl_zcoomv.

Array, size at least *k* if *transa* = 'N' or 'n' and at least *m* otherwise. On entry, the array *x* must contain the vector *x*.

beta

REAL for mkl_scoomv.

DOUBLE PRECISION for mkl_dcoomv.

COMPLEX for mkl_ccoomv.

DOUBLE COMPLEX for mkl_zcoomv.

Specifies the scalar *beta*.

y

REAL for mkl_scoomv.

DOUBLE PRECISION for mkl_dcoomv.

COMPLEX for mkl_ccoomv.

DOUBLE COMPLEX for mkl_zcoomv.

Array, size at least *m* if *transa* = 'N' or 'n' and at least *k* otherwise. On entry, the array *y* must contain the vector *y*.

Output Parameters

y

Overwritten by the updated vector *y*.

Interfaces

FORTRAN 77:

mkl_?csrsv

Solves a system of linear equations for a sparse matrix in the CSR format (deprecated).

Syntax

```
call mkl_scsrsv(transa, m, alpha, matdescra, val, indx, pntrb, pntre, x, y)
call mkl_dcsrsv(transa, m, alpha, matdescra, val, indx, pntrb, pntre, x, y)
call mkl_ccsrsv(transa, m, alpha, matdescra, val, indx, pntrb, pntre, x, y)
call mkl_zcsrsv(transa, m, alpha, matdescra, val, indx, pntrb, pntre, x, y)
```

Include Files

- mkl.fi

Description

This routine is deprecated. Use mkl_sparse_?_trsvfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_?csrsv routine solves a system of linear equations with matrix-vector operations for a sparse matrix in the CSR format:

```
y := alpha*inv(A)*x
```

or

```
y := alpha*inv(A^T)*x,
```

where:

alpha is scalar, *x* and *y* are vectors, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, A^T is the transpose of *A*.

NOTE
This routine supports a CSR format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa

`CHARACTER*1`. Specifies the system of linear equations.

If *transa* = `'N'` or `'n'`, then *y* := *alpha**inv(*A*)**x*

If *transa* = `'T'` or `'t'` or `'C'` or `'c'`, then *y* := *alpha**inv(A^T)**x*,

m

`INTEGER`. Number of columns of the matrix *A*.

alpha

`REAL` for `mkl_scsrsv`.

`DOUBLE PRECISION` for `mkl_dcsrsv`.

`COMPLEX` for `mkl_ccsrsv`.

`DOUBLE COMPLEX` for `mkl_zcsrsv`.

Specifies the scalar *alpha*.

matdescra

`CHARACTER`. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter *matdescra* (*descra*)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter *matdescra*".

val

`REAL` for `mkl_scsrsv`.

`DOUBLE PRECISION` for `mkl_dcsrsv`.

`COMPLEX` for `mkl_ccsrsv`.

`DOUBLE COMPLEX` for `mkl_zcsrsv`.

Array containing non-zero elements of the matrix *A*.

For one-based indexing its length is *pntre*(m) – *pntrb*(1).

For zero-based indexing its length is *pntre*(m-1) – *pntrb*(0).

Refer to *values* array description in CSR Format for more details.

NOTE
The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right).

No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.

indx

`INTEGER`. Array containing the column indices for each non-zero element of the matrix *A*.

Its length is equal to length of the *val* array.

Refer to *columns* array description in CSR Format for more details.

NOTE
Column indices must be sorted in increasing order for each row.

pntrb

INTEGER. Array of length *m*.

For one-based indexing this array contains row indices, such that *pntrb*(*i*) – *pntrb*(1) + 1 is the first index of row *i* in the arrays *val* and *indx*.

For zero-based indexing this array contains row indices, such that *pntrb*(*i*) – *pntrb*(0) is the first index of row *i* in the arrays *val* and *indx*.

Refer to *pointerb* array description in CSR Format for more details.

pntre

INTEGER. Array of length *m*.

For one-based indexing this array contains row indices, such that *pntre*(*i*) – *pntrb*(1) is the last index of row *i* in the arrays *val* and *indx*.

For zero-based indexing this array contains row indices, such that *pntre*(*i*) – *pntrb*(0) – 1 is the last index of row *i* in the arrays *val* and *indx*.

Refer to *pointerE* array description in CSR Format for more details.

x

REAL for mkl_scsrsv.

DOUBLE PRECISION for mkl_dcsrsv.

COMPLEX for mkl_ccsrsv.

DOUBLE COMPLEX for mkl_zcsrsv.

Array, size at least *m*.

On entry, the array *x* must contain the vector *x*. The elements are accessed with unit increment.

y

REAL for mkl_scsrsv.

DOUBLE PRECISION for mkl_dcsrsv.

COMPLEX for mkl_ccsrsv.

DOUBLE COMPLEX for mkl_zcsrsv.

Array, size at least *m*.

On entry, the array *y* must contain the vector *y*. The elements are accessed with unit increment.

Output Parameters

y

Contains solution vector *x*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_scsrsv(transa, m, alpha, matdescra, val, indx, pntrb, pntre, x, y)

  DOUBLE COMPLEX        val(*)
  DOUBLE COMPLEX        x(*), y(*)
```

mkl_?bsrsv

Solves a system of linear equations for a sparse matrix in the BSR format (deprecated).

Syntax

```
call mkl_sbsrsv(transa, m, lb, alpha, matdescra, val, indx, pntrb, pntre, x, y)
call mkl_dbsrsv(transa, m, lb, alpha, matdescra, val, indx, pntrb, pntre, x, y)
call mkl_cbsrsv(transa, m, lb, alpha, matdescra, val, indx, pntrb, pntre, x, y)
call mkl_zbsrsv(transa, m, lb, alpha, matdescra, val, indx, pntrb, pntre, x, y)
```

Include Files

- mkl.fi

Description

This routine is deprecated. Use mkl_sparse_?_trsvfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_?bsrsv routine solves a system of linear equations with matrix-vector operations for a sparse matrix in the BSR format:

```
y := alpha*inv(A)*x
```

or

```
y := alpha*inv(A^T)* x,
```

where:

alpha is scalar, *x* and *y* are vectors, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, A^T is the transpose of *A*.

> **NOTE**
> This routine supports a BSR format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation. If *transa* = 'N' or 'n', then *y* := *alpha**inv(*A*)**x* If *transa* = 'T' or 't' or 'C' or 'c', then *y* := *alpha**inv(A^T)* *x*,
m	INTEGER. Number of block columns of the matrix *A*.
lb	INTEGER. Size of the block in the matrix *A*.
alpha	REAL for mkl_sbsrsv. DOUBLE PRECISION for mkl_dbsrsv.

`COMPLEX` for `mkl_cbsrsv`.

`DOUBLE COMPLEX` for `mkl_zbsrsv`.

Specifies the scalar *alpha*.

matdescra

`CHARACTER`. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter *matdescra* (*descra*)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter *matdescra*".

val

`REAL` for `mkl_sbsrsv`.

`DOUBLE PRECISION` for `mkl_dbsrsv`.

`COMPLEX` for `mkl_cbsrsv`.

`DOUBLE COMPLEX` for `mkl_zbsrsv`.

Array containing elements of non-zero blocks of the matrix *A*. Its length is equal to the number of non-zero blocks in the matrix *A* multiplied by *lb*lb*.

Refer to the *values* array description in BSR Format for more details.

NOTE
The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right).

No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.

indx

`INTEGER`. Array containing the column indices for each non-zero block in the matrix *A*.

Its length is equal to the number of non-zero blocks in the matrix *A*.

Refer to the *columns* array description in BSR Format for more details.

pntrb

`INTEGER`. Array of length *m*.

For one-based indexing: this array contains row indices, such that *pntrb*(*i*) – *pntrb*(1) + 1 is the first index of block row *i* in the array *indx*.

For zero-based indexing: this array contains row indices, such that *pntrb*(*i*) – *pntrb*(0) is the first index of block row *i* in the array *indx*.

Refer to *pointerB* array description in BSR Format for more details.

pntre

`INTEGER`. Array of length *m*.

For one-based indexing this array contains row indices, such that *pntre*(*i*) – *pntrb*(1) is the last index of block row *i* in the array *indx*.

For zero-based indexing this array contains row indices, such that *pntre*(*i*) – *pntrb*(0) – 1 is the last index of block row *i* in the array *indx*.

Refer to *pointerE* array description in BSR Format for more details.

x

REAL for mkl_sbsrsv.

DOUBLE PRECISION for mkl_dbsrsv.

COMPLEX for mkl_cbsrsv.

DOUBLE COMPLEX for mkl_zbsrsv.

Array, size at least (*m***lb*).

On entry, the array *x* must contain the vector *x*. The elements are accessed with unit increment.

y

REAL for mkl_sbsrsv.

DOUBLE PRECISION for mkl_dbsrsv.

COMPLEX for mkl_cbsrsv.

DOUBLE COMPLEX for mkl_zbsrsv.

Array, size at least (*m***lb*).

On entry, the array *y* must contain the vector *y*. The elements are accessed with unit increment.

Output Parameters

y

Contains solution vector *x*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_sbsrsv(transa, m, lb, alpha, matdescra, val, indx, pntrb, pntre, x, y)
  CHARACTER*1   transa

```

mkl_?cscsv

Solves a system of linear equations for a sparse matrix in the CSC format (deprecated).

Syntax

call mkl_scscsv(*transa*, *m*, *alpha*, *matdescra*, *val*, *indx*, *pntrb*, *pntre*, *x*, *y*)

call mkl_dcscsv(*transa*, *m*, *alpha*, *matdescra*, *val*, *indx*, *pntrb*, *pntre*, *x*, *y*)

call mkl_ccscsv(*transa*, *m*, *alpha*, *matdescra*, *val*, *indx*, *pntrb*, *pntre*, *x*, *y*)

call mkl_zcscsv(*transa*, *m*, *alpha*, *matdescra*, *val*, *indx*, *pntrb*, *pntre*, *x*, *y*)

Include Files

- mkl.fi

Description

This routine is deprecated. Use mkl_sparse_?_trsvfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_?cscsv routine solves a system of linear equations with matrix-vector operations for a sparse matrix in the CSC format:

```
y := alpha*inv(A)*x
```

or

```
y := alpha*inv(A^T)* x,
```

where:

alpha is scalar, *x* and *y* are vectors, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, A^T is the transpose of *A*.

> **NOTE**
> This routine supports a CSC format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa

CHARACTER*1. Specifies the operation.

If *transa* = 'N' or 'n', then *y* := *alpha*inv(*A*)*x*

If *transa*= 'T' or 't' or 'C' or 'c', then *y* := *alpha*inv(A^T)* *x*,

m

INTEGER. Number of columns of the matrix *A*.

alpha

REAL for mkl_scscsv.

DOUBLE PRECISION for mkl_dcscsv.

COMPLEX for mkl_ccscsv.

DOUBLE COMPLEX for mkl_zcscsv.

Specifies the scalar *alpha*.

matdescra

CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter *matdescra* (*descra*)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter *matdescra*".

val

REAL for mkl_scscsv.

DOUBLE PRECISION for mkl_dcscsv.

COMPLEX for mkl_ccscsv.

DOUBLE COMPLEX for mkl_zcscsv.

Array containing non-zero elements of the matrix *A*.

For one-based indexing its length is *pntre*(*m*) – *pntrb*(1).

For zero-based indexing its length is *pntre*(*m*–1) – *pntrb*(0).

Refer to *values* array description in CSC Format for more details.

NOTE
The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right).

No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.

indx INTEGER. Array containing the row indices for each non-zero element of the matrix *A*.

Its length is equal to length of the *val* array.

Refer to *columns* array description in CSC Format for more details.

NOTE
Row indices must be sorted in increasing order for each column.

pntrb INTEGER. Array of length *m*.

For one-based indexing this array contains column indices, such that *pntrb*(*i*) – *pntrb*(1) + 1 is the first index of column *i* in the arrays *val* and *indx*.

For zero-based indexing this array contains column indices, such that *pntrb*(*i*) – *pntrb*(0) is the first index of column *i* in the arrays *val* and *indx*.

Refer to *pointerb* array description in CSC Format for more details.

pntre INTEGER. Array of length *m*.

For one-based indexing this array contains column indices, such that *pntre*(*i*) – *pntrb*(1) is the last index of column *i* in the arrays *val* and *indx*.

For zero-based indexing this array contains column indices, such that *pntre*(*i*) – *pntrb*(1) – 1 is the last index of column *i* in the arrays *val* and *indx*.

Refer to *pointerE* array description in CSC Format for more details.

x REAL for mkl_scscsv.

DOUBLE PRECISION for mkl_dcscsv.

COMPLEX for mkl_ccscsv.

DOUBLE COMPLEX for mkl_zcscsv.

Array, size at least *m*.

On entry, the array *x* must contain the vector *x*. The elements are accessed with unit increment.

y

`REAL` for `mkl_scscsv`.

`DOUBLE PRECISION` for `mkl_dcscsv`.

`COMPLEX` for `mkl_ccscsv`.

`DOUBLE COMPLEX` for `mkl_zcscsv`.

Array, size at least *m*.

On entry, the array *y* must contain the vector *y*. The elements are accessed with unit increment.

Output Parameters

y

Contains the solution vector *x*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_scscsv(transa, m, alpha, matdescra, val, indx, pntrb, pntre, x, y)
  CHARACTER*1   transa
  CHARACTER     matdescra(*)
  INTEGER       m
  INTEGER       indx(*), pntrb(m), pntre(m)
  REAL          alpha
  REAL          val(*)
  REAL          x(*), y(*)

SUBROUTINE mkl_dcscsv(transa, m, alpha, matdescra, val, indx, pntrb, pntre, x, y)
  CHARACTER*1   transa
  CHARACTER     matdescra(*)
  INTEGER       m
  INTEGER       indx(*), pntrb(m), pntre(m)
  DOUBLE PRECISION        alpha
  DOUBLE PRECISION        val(*)
  DOUBLE PRECISION        x(*), y(*)
```

```

  DOUBLE COMPLEX        val(*)
  DOUBLE COMPLEX        x(*), y(*)
```

mkl_?coosv

Solves a system of linear equations for a sparse matrix in the coordinate format (deprecated).

Syntax

```
call mkl_scoosv(transa, m, alpha, matdescra, val, rowind, colind, nnz, x, y)
call mkl_dcoosv(transa, m, alpha, matdescra, val, rowind, colind, nnz, x, y)
call mkl_ccoosv(transa, m, alpha, matdescra, val, rowind, colind, nnz, x, y)
call mkl_zcoosv(transa, m, alpha, matdescra, val, rowind, colind, nnz, x, y)
```

Include Files

- mkl.fi

Description

This routine is deprecated. Use mkl_sparse_?_trsvfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_?coosv routine solves a system of linear equations with matrix-vector operations for a sparse matrix in the coordinate format:

```
y := alpha*inv(A)*x
```

or

```
y := alpha*inv(A^T)*x,
```

where:

alpha is scalar, *x* and *y* are vectors, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, A^T is the transpose of *A*.

NOTE
This routine supports a coordinate format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa
CHARACTER*1. Specifies the system of linear equations.
If *transa* = 'N' or 'n', then *y* := *alpha**inv(*A*)**x*
If *transa* = 'T' or 't' or 'C' or 'c', then *y* := *alpha**inv(A^T)* *x*,

m
INTEGER. Number of rows of the matrix *A*.

alpha
REAL for mkl_scoosv.
DOUBLE PRECISION for mkl_dcoosv.
COMPLEX for mkl_ccoosv.
DOUBLE COMPLEX for mkl_zcoosv.
Specifies the scalar *alpha*.

matdescra
CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter *matdescra* (*descra*)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter *matdescra*".

val
REAL for mkl_scoosv.
DOUBLE PRECISION for mkl_dcoosv.
COMPLEX for mkl_ccoosv.
DOUBLE COMPLEX for mkl_zcoosv.
Array of length *nnz*, contains non-zero elements of the matrix *A* in the arbitrary order.
Refer to *values* array description in Coordinate Format for more details.

rowind
INTEGER. Array of length *nnz*, contains the row indices for each non-zero element of the matrix *A*.
Refer to *rows* array description in Coordinate Format for more details.

colind
INTEGER. Array of length *nnz*, contains the column indices for each non-zero element of the matrix *A*.
Refer to *columns* array description in Coordinate Format for more details.

nnz	INTEGER. Specifies the number of non-zero element of the matrix *A*. Refer to *nnz* description in Coordinate Format for more details.
x	REAL for mkl_scoosv. DOUBLE PRECISION for mkl_dcoosv. COMPLEX for mkl_ccoosv. DOUBLE COMPLEX for mkl_zcoosv. Array, size at least *m*. On entry, the array *x* must contain the vector *x*. The elements are accessed with unit increment.
y	REAL for mkl_scoosv. DOUBLE PRECISION for mkl_dcoosv. COMPLEX for mkl_ccoosv. DOUBLE COMPLEX for mkl_zcoosv. Array, size at least *m*. On entry, the array *y* must contain the vector *y*. The elements are accessed with unit increment.

Output Parameters

y	Contains solution vector *x*.

Interfaces

FORTRAN 77:

```

mkl_?csrmm

Computes matrix - matrix product of a sparse matrix stored in the CSR format (deprecated).

Syntax

call mkl_scsrmm(*transa*, *m*, *n*, *k*, *alpha*, *matdescra*, *val*, *indx*, *pntrb*, *pntre*, *b*, *ldb*, *beta*, *c*, *ldc*)

call mkl_dcsrmm(*transa*, *m*, *n*, *k*, *alpha*, *matdescra*, *val*, *indx*, *pntrb*, *pntre*, *b*, *ldb*, *beta*, *c*, *ldc*)

call mkl_ccsrmm(*transa*, *m*, *n*, *k*, *alpha*, *matdescra*, *val*, *indx*, *pntrb*, *pntre*, *b*, *ldb*, *beta*, *c*, *ldc*)

call mkl_zcsrmm(*transa*, *m*, *n*, *k*, *alpha*, *matdescra*, *val*, *indx*, *pntrb*, *pntre*, *b*, *ldb*, *beta*, *c*, *ldc*)

Include Files

- mkl.fi

Description

This routine is deprecated. Use Use mkl_sparse_?_mmfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_?csrmm routine performs a matrix-matrix operation defined as

```
C := alpha*A*B + beta*C
```

or

```
C := alpha*A^T*B + beta*C
```

or

```
C := alpha*A^H*B + beta*C,
```

where:

alpha and *beta* are scalars,

B and *C* are dense matrices, *A* is an *m*-by-*k* sparse matrix in compressed sparse row (CSR) format, A^T is the transpose of *A*, and A^H is the conjugate transpose of *A*.

> **NOTE**
> This routine supports a CSR format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa
CHARACTER*1. Specifies the operation.
If *transa* = 'N' or 'n', then *C* := *alpha**A*B + *beta**C*,
If *transa* = 'T' or 't', then *C* := *alpha**A^T*B + *beta**C*,
If *transa* = 'C' or 'c', then *C* := *alpha**A^H*B + *beta**C*.

m
INTEGER. Number of rows of the matrix *A*.

n
INTEGER. Number of columns of the matrix *C*.

k
INTEGER. Number of columns of the matrix *A*.

alpha
REAL for mkl_scsrmm.
DOUBLE PRECISION for mkl_dcsrmm.
COMPLEX for mkl_ccsrmm.
DOUBLE COMPLEX for mkl_zcsrmm.
Specifies the scalar *alpha*.

matdescra — CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter *matdescra* (*descra*)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter *matdescra*".

val — REAL for mkl_scsrmm.

DOUBLE PRECISION for mkl_dcsrmm.

COMPLEX for mkl_ccsrmm.

DOUBLE COMPLEX for mkl_zcsrmm.

Array containing non-zero elements of the matrix *A*.

For one-based indexing its length is *pntre*(m) – *pntrb*(1).

For zero-based indexing its length is *pntre*(–1) – *pntrb*(0).

Refer to *values* array description in CSR Format for more details.

indx — INTEGER. Array containing the column indices for each non-zero element of the matrix *A*.

Its length is equal to length of the *val* array.

Refer to *columns* array description in CSR Format for more details.

pntrb — INTEGER. Array of length *m*.

For one-based indexing this array contains row indices, such that *pntrb*(*I*) – *pntrb*(1) + 1 is the first index of row *I* in the arrays *val* and *indx*.

For zero-based indexing this array contains row indices, such that *pntrb*(*I*) – *pntrb*(0) is the first index of row *I* in the arrays *val* and *indx*.

Refer to *pointerb* array description in CSR Format for more details.

pntre — INTEGER. Array of length *m*.

For one-based indexing this array contains row indices, such that *pntre*(*I*) – *pntrb*(1) is the last index of row *I* in the arrays *val* and *indx*.

For zero-based indexing this array contains row indices, such that *pntre*(*I*) – *pntrb*(0) – 1 is the last index of row *I* in the arrays *val* and *indx*.

Refer to *pointerE* array description in CSR Format for more details.

b — REAL for mkl_scsrmm.

DOUBLE PRECISION for mkl_dcsrmm.

COMPLEX for mkl_ccsrmm.

DOUBLE COMPLEX for mkl_zcsrmm.

Array, size *ldb* by at least *n* for non-transposed matrix *A* and at least *m* for transposed for one-based indexing, and (at least *k* for non-transposed matrix *A* and at least *m* for transposed, *ldb*) for zero-based indexing.

On entry with *transa*='N' or 'n', the leading *k*-by-*n* part of the array *b* must contain the matrix *B*, otherwise the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.

ldb — INTEGER. Specifies the leading dimension of *b* for one-based indexing, and the second dimension of *b* for zero-based indexing, as declared in the calling (sub)program.

beta — REAL for mkl_scsrmm.

DOUBLE PRECISION for mkl_dcsrmm.

COMPLEX for mkl_ccsrmm.

DOUBLE COMPLEX for mkl_zcsrmm.

Specifies the scalar *beta*.

c — REAL for mkl_scsrmm.

DOUBLE PRECISION for mkl_dcsrmm.

COMPLEX for mkl_ccsrmm.

DOUBLE COMPLEX for mkl_zcsrmm.

Array, size *ldc* by *n* for one-based indexing, and (*m*, *ldc*) for zero-based indexing.

On entry, the leading *m*-by-*n* part of the array *c* must contain the matrix *C*, otherwise the leading *k*-by-*n* part of the array *c* must contain the matrix *C*.

ldc — INTEGER. Specifies the leading dimension of *c* for one-based indexing, and the second dimension of *c* for zero-based indexing, as declared in the calling (sub)program.

Output Parameters

c — Overwritten by the matrix (*alpha***A***B* + *beta** *C*), (*alpha***A*^{T}**B* + *beta***C*), or (*alpha***A*^{H}**B* + *beta***C*).

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_dcsrmm(transa, m, n, k, alpha, matdescra, val, indx,
pntrb, pntre, b, ldb, beta, c, ldc)

Description

This routine is deprecated. Use Use mkl_sparse_?_mmfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_?bsrmm routine performs a matrix-matrix operation defined as

```
C := alpha*A*B + beta*C
```

or

```
C := alpha*A^T*B + beta*C
```

or

```
C := alpha*A^H*B + beta*C,
```

where:

alpha and *beta* are scalars,

B and *C* are dense matrices, *A* is an *m*-by-*k* sparse matrix in block sparse row (BSR) format, A^T is the transpose of *A*, and A^H is the conjugate transpose of *A*.

> **NOTE**
> This routine supports a BSR format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa

CHARACTER*1. Specifies the operation.

If *transa* = 'N' or 'n', then the matrix-matrix product is computed as *C* := *alpha***A***B* + *beta***C*

If *transa* = 'T' or 't', then the matrix-vector product is computed as *C* := *alpha***A*^{T}**B* + *beta***C*

If *transa* = 'C' or 'c', then the matrix-vector product is computed as *C* := *alpha***A*^{H}**B* + *beta***C*,

m

INTEGER. Number of block rows of the matrix *A*.

n

INTEGER. Number of columns of the matrix *C*.

k

INTEGER. Number of block columns of the matrix *A*.

lb

INTEGER. Size of the block in the matrix *A*.

alpha

REAL for mkl_sbsrmm.

DOUBLE PRECISION for mkl_dbsrmm.

COMPLEX for mkl_cbsrmm.

DOUBLE COMPLEX for mkl_zbsrmm.

Specifies the scalar *alpha*.

matdescra CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter *matdescra* (*descra*)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter *matdescra*".

val REAL for mkl_sbsrmm.

DOUBLE PRECISION for mkl_dbsrmm.

COMPLEX for mkl_cbsrmm.

DOUBLE COMPLEX for mkl_zbsrmm.

Array containing elements of non-zero blocks of the matrix *A*. Its length is equal to the number of non-zero blocks in the matrix *A* multiplied by *lb*lb*. Refer to the *values* array description in BSR Format for more details.

indx INTEGER. Array containing the column indices for each non-zero block in the matrix *A*.

Its length is equal to the number of non-zero blocks in the matrix *A*. Refer to the *columns* array description in BSR Format for more details.

pntrb INTEGER. Array of length *m*.

For one-based indexing: this array contains row indices, such that *pntrb*(*I*) – *pntrb*(1) + 1 is the first index of block row *I* in the array *indx*.

For zero-based indexing: this array contains row indices, such that *pntrb*(*I*) – *pntrb*(0) is the first index of block row *I* in the array *indx*.

Refer to *pointerB* array description in BSR Format for more details.

pntre INTEGER. Array of length *m*.

For one-based indexing this array contains row indices, such that *pntre*(*I*) – *pntrb*(1) is the last index of block row *I* in the array *indx*.

For zero-based indexing this array contains row indices, such that *pntre*(*I*) – *pntrb*(0) – 1 is the last index of block row *I* in the array *indx*.

Refer to *pointerE* array description in BSR Format for more details.

b REAL for mkl_sbsrmm.

DOUBLE PRECISION for mkl_dbsrmm.

COMPLEX for mkl_cbsrmm.

DOUBLE COMPLEX for mkl_zbsrmm.

Array, size *ldb* by at least *n* for non-transposed matrix *A* and at least *m* for transposed for one-based indexing, and (at least *k* for non-transposed matrix *A* and at least *m* for transposed, *ldb*) for zero-based indexing.

	On entry with *transa*='N' or 'n', the leading *n*-by-*k* block part of the array *b* must contain the matrix *B*, otherwise the leading *m*-by-*n* block part of the array *b* must contain the matrix *B*.
ldb	INTEGER. Specifies the leading dimension (in blocks) of *b* as declared in the calling (sub)program.
beta	REAL for mkl_sbsrmm. DOUBLE PRECISION for mkl_dbsrmm. COMPLEX for mkl_cbsrmm. DOUBLE COMPLEX for mkl_zbsrmm. Specifies the scalar *beta*.
c	REAL for mkl_sbsrmm. DOUBLE PRECISION for mkl_dbsrmm. COMPLEX for mkl_cbsrmm. DOUBLE COMPLEX for mkl_zbsrmm. Array, size (*ldc*, *n*) for one-based indexing, size (*k*, *ldc*) for zero-based indexing. On entry, the leading *m*-by-*n* block part of the array *c* must contain the matrix *C*, otherwise the leading *n*-by-*k* block part of the array *c* must contain the matrix *C*.
ldc	INTEGER. Specifies the leading dimension (in blocks) of *c* as declared in the calling (sub)program.

Output Parameters

c	Overwritten by the matrix (*alpha***A***B* + *beta***C*) or (*alpha***A*^{T}**B* + *beta***C*) or (*alpha***A*^{H}**B* + *beta***C*).

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_sbsrmm(transa, m, n, k, lb, alpha, matdescra, val,
 indx, pntrb, pntre, b, ldb, beta, c, ldc)

```

mkl_?cscmm

Computes matrix-matrix product of a sparse matrix stored in the CSC format (deprecated).

Syntax

call mkl_scscmm(*transa*, *m*, *n*, *k*, *alpha*, *matdescra*, *val*, *indx*, *pntrb*, *pntre*, *b*, *ldb*, *beta*, *c*, *ldc*)

call mkl_dcscmm(*transa*, *m*, *n*, *k*, *alpha*, *matdescra*, *val*, *indx*, *pntrb*, *pntre*, *b*, *ldb*, *beta*, *c*, *ldc*)

call mkl_ccscmm(*transa*, *m*, *n*, *k*, *alpha*, *matdescra*, *val*, *indx*, *pntrb*, *pntre*, *b*, *ldb*, *beta*, *c*, *ldc*)

call mkl_zcscmm(*transa*, *m*, *n*, *k*, *alpha*, *matdescra*, *val*, *indx*, *pntrb*, *pntre*, *b*, *ldb*, *beta*, *c*, *ldc*)

Description

This routine is deprecated. Use Use mkl_sparse_?_mmfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_?cscmm routine performs a matrix-matrix operation defined as

```
C := alpha*A*B + beta*C
```

or

```
C := alpha*A^T*B + beta*C,
```

or

```
C := alpha*A^H*B + beta*C,
```

where:

alpha and *beta* are scalars,

B and *C* are dense matrices, *A* is an *m*-by-*k* sparse matrix in compressed sparse column (CSC) format, A^T is the transpose of *A*, and A^H is the conjugate transpose of *A*.

NOTE
This routine supports CSC format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa

CHARACTER*1. Specifies the operation.

If *transa* = 'N' or 'n', then *C* := *alpha*A* B + beta*C*

If *transa* = 'T' or 't', then *C* := *alpha*A^T*B + beta*C*,

If *transa* ='C' or 'c', then *C* := *alpha*A^H*B + beta*C*

m

INTEGER. Number of rows of the matrix *A*.

n

INTEGER. Number of columns of the matrix *C*.

k

INTEGER. Number of columns of the matrix *A*.

alpha

REAL for mkl_scscmm.

DOUBLE PRECISION for mkl_dcscmm.

COMPLEX for mkl_ccscmm.

DOUBLE COMPLEX for mkl_zcscmm.

Specifies the scalar *alpha*.

matdescra

CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter *matdescra* (*descra*)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter *matdescra*".

val

REAL for mkl_scscmm.

DOUBLE PRECISION for mkl_dcscmm.

COMPLEX for mkl_ccscmm.

DOUBLE COMPLEX for mkl_zcscmm.

Array containing non-zero elements of the matrix *A*.

For one-based indexing its length is *pntrb*(*k*) – *pntrb*(1).

For zero-based indexing its length is *pntre*(*m*–1) – *pntrb*(0).

Refer to *values* array description in CSC Format for more details.

indx

INTEGER. Array containing the row indices for each non-zero element of the matrix *A*.

Its length is equal to length of the *val* array.

Refer to *rows* array description in CSC Format for more details.

pntrb

INTEGER. Array of length *k*.

For one-based indexing this array contains column indices, such that *pntrb*(*i*) – *pntrb*(1) + 1 is the first index of column *i* in the arrays *val* and *indx*.

For zero-based indexing this array contains column indices, such that *pntrb*(*i*) – *pntrb*(0) is the first index of column *i* in the arrays *val* and *indx*.

Refer to *pointerb* array description in CSC Format for more details.

pntre

INTEGER. Array of length *k*.

For one-based indexing this array contains column indices, such that *pntre*(*i*) – *pntrb*(1) is the last index of column *i* in the arrays *val* and *indx*.

For zero-based indexing this array contains column indices, such that *pntre*(*i*) – *pntrb*(1) – 1 is the last index of column *i* in the arrays *val* and *indx*.

Refer to *pointerE* array description in CSC Format for more details.

b

REAL for mkl_scscmm.

DOUBLE PRECISION for mkl_dcscmm.

COMPLEX for mkl_ccscmm.

DOUBLE COMPLEX for mkl_zcscmm.

Array, size *ldb* by at least *n* for non-transposed matrix *A* and at least *m* for transposed for one-based indexing, and (at least *k* for non-transposed matrix *A* and at least *m* for transposed, *ldb*) for zero-based indexing.

On entry with *transa* = 'N' or 'n', the leading *k*-by-*n* part of the array *b* must contain the matrix *B*, otherwise the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.

ldb — INTEGER. Specifies the leading dimension of *b* for one-based indexing, and the second dimension of *b* for zero-based indexing, as declared in the calling (sub)program.

beta — REAL*8. Specifies the scalar *beta*.

c — REAL for mkl_scscmm.

DOUBLE PRECISION for mkl_dcscmm.

COMPLEX for mkl_ccscmm.

DOUBLE COMPLEX for mkl_zcscmm.

Array, size *ldc* by *n* for one-based indexing, and (*m*, *ldc*) for zero-based indexing.

On entry, the leading *m*-by-*n* part of the array *c* must contain the matrix *C*, otherwise the leading *k*-by-*n* part of the array *c* must contain the matrix *C*.

ldc — INTEGER. Specifies the leading dimension of *c* for one-based indexing, and the second dimension of *c* for zero-based indexing, as declared in the calling (sub)program.

Output Parameters

c — Overwritten by the matrix (*alpha***A***B* + *beta** *C*) or (*alpha***A*^{T}**B* + *beta***C*) or (*alpha***A*^{H}**B* + *beta***C*).

Interfaces

FORTRAN 77:

Description

This routine is deprecated. Use Use mkl_sparse_?_mmfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_?coomm routine performs a matrix-matrix operation defined as

```
C := alpha*A*B + beta*C
```

or

```
C := alpha*A^T*B + beta*C,
```

or

```
C := alpha*A^H*B + beta*C,
```

where:

alpha and *beta* are scalars,

B and *C* are dense matrices, *A* is an *m*-by-*k* sparse matrix in the coordinate format, A^T is the transpose of *A*, and A^H is the conjugate transpose of *A*.

> **NOTE**
> This routine supports a coordinate format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa

CHARACTER*1. Specifies the operation.

If *transa* = 'N' or 'n', then *C* := *alpha***A***B* + *beta***C*

If *transa* = 'T' or 't', then *C* := *alpha***A*^{T}**B* + *beta***C*,

If *transa* = 'C' or 'c', then *C* := *alpha***A*^{H}**B* + *beta***C*.

m

INTEGER. Number of rows of the matrix *A*.

n

INTEGER. Number of columns of the matrix *C*.

k

INTEGER. Number of columns of the matrix *A*.

alpha

REAL for mkl_scoomm.

DOUBLE PRECISION for mkl_dcoomm.

COMPLEX for mkl_ccoomm.

DOUBLE COMPLEX for mkl_zcoomm.

Specifies the scalar *alpha*.

matdescra

CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter *matdescra* (*descra*)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter *matdescra*".

val

REAL for mkl_scoomm.

DOUBLE PRECISION for mkl_dcoomm.

COMPLEX for mkl_ccoomm.

DOUBLE COMPLEX for mkl_zcoomm.

Array of length *nnz*, contains non-zero elements of the matrix *A* in the arbitrary order.

Refer to *values* array description in Coordinate Format for more details.

rowind

INTEGER. Array of length *nnz*, contains the row indices for each non-zero element of the matrix *A*.

Refer to *rows* array description in Coordinate Format for more details.

colind

INTEGER. Array of length *nnz*, contains the column indices for each non-zero element of the matrix *A*.

Refer to *columns* array description in Coordinate Format for more details.

nnz

INTEGER. Specifies the number of non-zero element of the matrix *A*.

Refer to *nnz* description in Coordinate Format for more details.

b

REAL for mkl_scoomm.

DOUBLE PRECISION for mkl_dcoomm.

COMPLEX for mkl_ccoomm.

DOUBLE COMPLEX for mkl_zcoomm.

Array, size *ldb* by at least *n* for non-transposed matrix *A* and at least *m* for transposed for one-based indexing, and (at least *k* for non-transposed matrix *A* and at least *m* for transposed, *ldb*) for zero-based indexing.

On entry with *transa* = 'N' or 'n', the leading *k*-by-*n* part of the array *b* must contain the matrix *B*, otherwise the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.

ldb

INTEGER. Specifies the leading dimension of *b* for one-based indexing, and the second dimension of *b* for zero-based indexing, as declared in the calling (sub)program.

beta

REAL for mkl_scoomm.

DOUBLE PRECISION for mkl_dcoomm.

COMPLEX for mkl_ccoomm.

DOUBLE COMPLEX for mkl_zcoomm.

Specifies the scalar *beta*.

c	REAL for mkl_scoomm. DOUBLE PRECISION for mkl_dcoomm. COMPLEX for mkl_ccoomm. DOUBLE COMPLEX for mkl_zcoomm. Array, size *ldc* by *n* for one-based indexing, and (*m*, *ldc*) for zero-based indexing. On entry, the leading *m*-by-*n* part of the array *c* must contain the matrix *C*, otherwise the leading *k*-by-*n* part of the array *c* must contain the matrix *C*.
ldc	INTEGER. Specifies the leading dimension of *c* for one-based indexing, and the second dimension of *c* for zero-based indexing, as declared in the calling (sub)program.

Output Parameters

c	Overwritten by the matrix (*alpha*A*B + beta*C*), (*alpha*A*^{T}**B + beta*C*), or (*alpha*A*^{H}**B + beta*C*).

Interfaces

FORTRAN 77:

```

mkl_?csrsm

Solves a system of linear matrix equations for a sparse matrix in the CSR format (deprecated).

Syntax

```
call mkl_scsrsm(transa, m, n, alpha, matdescra, val, indx, pntrb, pntre, b, ldb, c, ldc)
call mkl_dcsrsm(transa, m, n, alpha, matdescra, val, indx, pntrb, pntre, b, ldb, c, ldc)
call mkl_ccsrsm(transa, m, n, alpha, matdescra, val, indx, pntrb, pntre, b, ldb, c, ldc)
call mkl_zcsrsm(transa, m, n, alpha, matdescra, val, indx, pntrb, pntre, b, ldb, c, ldc)
```

Include Files

- mkl.fi

Description

This routine is deprecated. Use mkl_sparse_?_trsmfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_?csrsm routine solves a system of linear equations with matrix-matrix operations for a sparse matrix in the CSR format:

```
C := alpha*inv(A)*B
```

or

```
C := alpha*inv(A^T)*B,
```

where:

alpha is scalar, *B* and *C* are dense matrices, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, A^T is the transpose of *A*.

NOTE
This routine supports a CSR format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa

`CHARACTER*1`. Specifies the system of linear equations.

If *transa* = `'N'` or `'n'`, then *C* := *alpha**inv(*A*)**B*

If *transa* = `'T'` or `'t'` or `'C'` or `'c'`, then *C* := *alpha**inv(A^T)**B*,

m

`INTEGER`. Number of columns of the matrix *A*.

n

`INTEGER`. Number of columns of the matrix *C*.

alpha

`REAL` for `mkl_scsrsm`.

`DOUBLE PRECISION` for `mkl_dcsrsm`.

`COMPLEX` for `mkl_ccsrsm`.

`DOUBLE COMPLEX` for `mkl_zcsrsm`.

Specifies the scalar *alpha*.

matdescra

`CHARACTER`. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter *matdescra* (*descra*)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter *matdescra*".

val

`REAL` for `mkl_scsrsm`.

`DOUBLE PRECISION` for `mkl_dcsrsm`.

`COMPLEX` for `mkl_ccsrsm`.

`DOUBLE COMPLEX` for `mkl_zcsrsm`.

Array containing non-zero elements of the matrix *A*.

For one-based indexing its length is *pntre*(m) – *pntrb*(1).

For zero-based indexing its length is *pntre*(m–1) – *pntrb*(0).

Refer to *values* array description in CSR Format for more details.

NOTE
The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right).

No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.

indx INTEGER. Array containing the column indices for each non-zero element of the matrix *A*.

Its length is equal to length of the *val* array.

Refer to *columns* array description in CSR Format for more details.

NOTE
Column indices must be sorted in increasing order for each row.

pntrb INTEGER. Array of length *m*.

For one-based indexing this array contains row indices, such that *pntrb*(*i*) – *pntrb*(1) + 1 is the first index of row *i* in the arrays *val* and *indx*.

For zero-based indexing this array contains row indices, such that *pntrb*(*i*) – *pntrb*(0) is the first index of row *i* in the arrays *val* and *indx*.

Refer to *pointerb* array description in CSR Format for more details.

pntre INTEGER. Array of length *m*.

For one-based indexing this array contains row indices, such that *pntre*(*i*) – *pntrb*(1) is the last index of row *i* in the arrays *val* and *indx*.

For zero-based indexing this array contains row indices, such that *pntre*(*i*) – *pntrb*(0) – 1 is the last index of row *i* in the arrays *val* and *indx*.

Refer to *pointerE* array description in CSR Format for more details.

b REAL for mkl_scsrsm.

DOUBLE PRECISION for mkl_dcsrsm.

COMPLEX for mkl_ccsrsm.

DOUBLE COMPLEX for mkl_zcsrsm.

Array, size (*ldb*, *n*) for one-based indexing, and (*m*, *ldb*) for zero-based indexing.

On entry the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.

ldb INTEGER. Specifies the leading dimension of *b* for one-based indexing, and the second dimension of *b* for zero-based indexing, as declared in the calling (sub)program.

ldc INTEGER. Specifies the leading dimension of *c* for one-based indexing, and the second dimension of *c* for zero-based indexing, as declared in the calling (sub)program.

Output Parameters

c REAL*8.

Array, size *ldc* by *n* for one-based indexing, and (*m*, *ldc*) for zero-based indexing.

The leading *m*-by-*n* part of the array *c* contains the output matrix *C*.

Description

This routine is deprecated. Use mkl_sparse_?_trsmfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_?cscsm routine solves a system of linear equations with matrix-matrix operations for a sparse matrix in the CSC format:

$C := alpha*inv(A)*B$

or

$C := alpha*inv(A^T)*B$,

where:

alpha is scalar, *B* and *C* are dense matrices, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, A^T is the transpose of *A*.

> **NOTE**
> This routine supports a CSC format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa
CHARACTER*1. Specifies the system of equations.
If *transa* = 'N' or 'n', then *C* := *alpha**inv(*A*)**B*
If *transa* = 'T' or 't' or 'C' or 'c', then *C* := *alpha**inv(A^T)**B*,

m
INTEGER. Number of columns of the matrix *A*.

n
INTEGER. Number of columns of the matrix *C*.

alpha
REAL for mkl_scscsm.
DOUBLE PRECISION for mkl_dcscsm.
COMPLEX for mkl_ccscsm.
DOUBLE COMPLEX for mkl_zcscsm.
Specifies the scalar *alpha*.

matdescra
CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter *matdescra* (*descra*)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter *matdescra*".

val
REAL for mkl_scscsm.
DOUBLE PRECISION for mkl_dcscsm.
COMPLEX for mkl_ccscsm.
DOUBLE COMPLEX for mkl_zcscsm.
Array containing non-zero elements of the matrix *A*.
For one-based indexing its length is *pntre*(*k*) - *pntrb*(1).
For zero-based indexing its length is *pntre*(*m*-1) - *pntrb*(0).
Refer to *values* array description in CSC Format for more details.

NOTE
The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right).
No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.

indx
INTEGER. Array containing the row indices for each non-zero element of the matrix *A*. Its length is equal to length of the *val* array.
Refer to *rows* array description in CSC Format for more details.

NOTE
Row indices must be sorted in increasing order for each column.

pntrb
INTEGER. Array of length *m*.

For one-based indexing this array contains column indices, such that *pntrb*(*I*) – *pntrb*(1) + 1 is the first index of column *I* in the arrays *val* and *indx*.

For zero-based indexing this array contains column indices, such that *pntrb*(*I*) – *pntrb*(0) is the first index of column *I* in the arrays *val* and *indx*.

Refer to *pointerb* array description in CSC Format for more details.

pntre

INTEGER. Array of length *m*.

For one-based indexing this array contains column indices, such that *pntre*(*I*) – *pntrb*(1) is the last index of column *I* in the arrays *val* and *indx*.

For zero-based indexing this array contains column indices, such that *pntre*(*I*) – *pntrb*(1)–1 is the last index of column *I* in the arrays *val* and *indx*.

Refer to *pointerE* array description in CSC Format for more details.

b

REAL for mkl_scscsm.

DOUBLE PRECISION for mkl_dcscsm.

COMPLEX for mkl_ccscsm.

DOUBLE COMPLEX for mkl_zcscsm.

Array, size *ldb* by *n* for one-based indexing, and (*m*, *ldb*) for zero-based indexing.

On entry the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.

ldb

INTEGER. Specifies the leading dimension of *b* for one-based indexing, and the second dimension of *b* for zero-based indexing, as declared in the calling (sub)program.

ldc

INTEGER. Specifies the leading dimension of *c* for one-based indexing, and the second dimension of *c* for zero-based indexing, as declared in the calling (sub)program.

Output Parameters

c

REAL for mkl_scscsm.

DOUBLE PRECISION for mkl_dcscsm.

COMPLEX for mkl_ccscsm.

DOUBLE COMPLEX for mkl_zcscsm.

Array, size *ldc* by *n* for one-based indexing, and (*m*, *ldc*) for zero-based indexing.

The leading *m*-by-*n* part of the array *c* contains the output matrix *C*.

Interfaces

FORTRAN 77:

Description

This routine is deprecated. Use mkl_sparse_?_trsmfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_?coosm routine solves a system of linear equations with matrix-matrix operations for a sparse matrix in the coordinate format:

$C := alpha*inv(A)*B$

or

$C := alpha*inv(A^T)*B$,

where:

alpha is scalar, *B* and *C* are dense matrices, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, A^T is the transpose of *A*.

NOTE
This routine supports a coordinate format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa

CHARACTER*1. Specifies the system of linear equations.

If *transa* = 'N' or 'n', then the matrix-matrix product is computed as $C := alpha*inv(A)*B$

If *transa* = 'T' or 't' or 'C' or 'c', then the matrix-vector product is computed as $C := alpha*inv(A^T)*B$,

m	INTEGER. Number of rows of the matrix *A*.
n	INTEGER. Number of columns of the matrix *C*.
alpha	REAL for mkl_scoosm. DOUBLE PRECISION for mkl_dcoosm. COMPLEX for mkl_ccoosm. DOUBLE COMPLEX for mkl_zcoosm. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter *matdescra* (*descra*)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter *matdescra*".
val	REAL for mkl_scoosm. DOUBLE PRECISION for mkl_dcoosm. COMPLEX for mkl_ccoosm. DOUBLE COMPLEX for mkl_zcoosm. Array of length *nnz*, contains non-zero elements of the matrix *A* in the arbitrary order. Refer to *values* array description in Coordinate Format for more details.
rowind	INTEGER. Array of length *nnz*, contains the row indices for each non-zero element of the matrix *A*. Refer to *rows* array description in Coordinate Format for more details.
colind	INTEGER. Array of length *nnz*, contains the column indices for each non-zero element of the matrix *A*. Refer to *columns* array description in Coordinate Format for more details.
nnz	INTEGER. Specifies the number of non-zero element of the matrix *A*. Refer to *nnz* description in Coordinate Format for more details.
b	REAL for mkl_scoosm. DOUBLE PRECISION for mkl_dcoosm. COMPLEX for mkl_ccoosm. DOUBLE COMPLEX for mkl_zcoosm. Array, size *ldb* by *n* for one-based indexing, and (*m*, *ldb*) for zero-based indexing. Before entry the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.

ldb INTEGER. Specifies the leading dimension of *b* for one-based indexing, and the second dimension of *b* for zero-based indexing, as declared in the calling (sub)program.

ldc INTEGER. Specifies the leading dimension of *c* for one-based indexing, and the second dimension of *c* for zero-based indexing, as declared in the calling (sub)program.

Output Parameters

c REAL for mkl_scoosm.

DOUBLE PRECISION for mkl_dcoosm.

COMPLEX for mkl_ccoosm.

DOUBLE COMPLEX for mkl_zcoosm.

Array, size *ldc* by *n* for one-based indexing, and (*m*, *ldc*) for zero-based indexing.

The leading *m*-by-*n* part of the array *c* contains the output matrix *C*.

Interfaces

FORTRAN 77:

```

```

mkl_?bsrsm

Solves a system of linear matrix equations for a sparse matrix in the BSR format (deprecated).

Syntax

`call mkl_scsrsm(`*transa, m, n, lb, alpha, matdescra, val, indx, pntrb, pntre, b, ldb, c, ldc*`)`

`call mkl_dcsrsm(`*transa, m, n, lb, alpha, matdescra, val, indx, pntrb, pntre, b, ldb, c, ldc*`)`

`call mkl_ccsrsm(`*transa, m, n, lb, alpha, matdescra, val, indx, pntrb, pntre, b, ldb, c, ldc*`)`

`call mkl_zcsrsm(`*transa, m, n, lb, alpha, matdescra, val, indx, pntrb, pntre, b, ldb, c, ldc*`)`

Include Files

- `mkl.fi`

Description

This routine is deprecated. Use mkl_sparse_?_trsmfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The `mkl_?bsrsm` routine solves a system of linear equations with matrix-matrix operations for a sparse matrix in the BSR format:

$C := alpha*\mathrm{inv}(A)*B$

or

$C := alpha*\mathrm{inv}(A^T)*B,$

where:

alpha is scalar, *B* and *C* are dense matrices, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, A^T is the transpose of *A*.

NOTE
This routine supports a BSR format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa

`CHARACTER*1`. Specifies the operation.

If *transa* = `'N'` or `'n'`, then the matrix-matrix product is computed as *C* := *alpha*`*inv(`*A*`)*`*B*.

If *transa* = `'T'` or `'t'` or `'C'` or `'c'`, then the matrix-vector product is computed as *C* := *alpha*`*inv(`A^T`)*`*B*.

m

`INTEGER`. Number of block columns of the matrix *A*.

n

`INTEGER`. Number of columns of the matrix *C*.

lb

`INTEGER`. Size of the block in the matrix *A*.

alpha

`REAL` for `mkl_sbsrsm`.

`DOUBLE PRECISION` for `mkl_dbsrsm`.

`COMPLEX` for `mkl_cbsrsm`.

`DOUBLE COMPLEX` for `mkl_zbsrsm`.

Specifies the scalar *alpha*.

matdescra

`CHARACTER`. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter *matdescra* (*descra*)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter *matdescra*".

val

`REAL` for `mkl_sbsrsm`.

`DOUBLE PRECISION` for `mkl_dbsrsm`.

`COMPLEX` for `mkl_cbsrsm`.

`DOUBLE COMPLEX` for `mkl_zbsrsm`.

Array containing elements of non-zero blocks of the matrix *A*. Its length is equal to the number of non-zero blocks in the matrix *A* multiplied by *lb*`*`*lb*. Refer to the *values* array description in BSR Format for more details.

NOTE
The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right).

No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.

indx INTEGER. Array containing the column indices for each non-zero element of the matrix *A*.

Its length is equal to the number of non-zero blocks in the matrix *A*.

Refer to the *columns* array description in BSR Format for more details.

pntrb INTEGER. Array of length *m*.

For one-based indexing: this array contains row indices, such that *pntrb*(*i*) – *pntrb*(1) + 1 is the first index of block row *i* in the array *indx*.

For zero-based indexing: this array contains row indices, such that *pntrb*(*i*) – *pntrb*(0) is the first index of block row *i* in the array *indx*.

Refer to *pointerB* array description in BSR Format for more details.

pntre INTEGER. Array of length *m*.

For one-based indexing this array contains row indices, such that *pntre*(*i*) – *pntrb*(1) is the last index of block row *i* in the array *indx*.

For zero-based indexing this array contains row indices, such that *pntre*(*i*) – *pntrb*(0) – 1 is the last index of block row *i* in the array *indx*.

Refer to *pointerE* array description in BSR Format for more details.

b REAL for mkl_sbsrsm.

DOUBLE PRECISION for mkl_dbsrsm.

COMPLEX for mkl_cbsrsm.

DOUBLE COMPLEX for mkl_zbsrsm.

Array, size (*ldb*, *n*) for one-based indexing, size (*m*, *ldb*) for zero-based indexing.

On entry the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.

ldb INTEGER. Specifies the leading dimension (in blocks) of *b* as declared in the calling (sub)program.

ldc INTEGER. Specifies the leading dimension (in blocks) of *c* as declared in the calling (sub)program.

Output Parameters

c REAL for mkl_sbsrsm.

DOUBLE PRECISION for mkl_dbsrsm.

`COMPLEX` for `mkl_cbsrsm`.

`DOUBLE COMPLEX` for `mkl_zbsrsm`.

Array, size `(ldc, n)` for one-based indexing, size `(m, ldc)` for zero-based indexing.

The leading *m*-by-*n* part of the array *c* contains the output matrix *C*.

Interfaces

FORTRAN 77:

```

  INTEGER       m, n, lb, ldb, ldc
  INTEGER       indx(*), pntrb(m), pntre(m)
  DOUBLE COMPLEX        alpha
  DOUBLE COMPLEX        val(*), b(ldb,*), c(ldc,*)
```

mkl_?diamv

Computes matrix - vector product for a sparse matrix in the diagonal format with one-based indexing (deprecated).

Syntax

```
call mkl_sdiamv(transa, m, k, alpha, matdescra, val, lval, idiag, ndiag, x, beta, y)
call mkl_ddiamv(transa, m, k, alpha, matdescra, val, lval, idiag, ndiag, x, beta, y)
call mkl_cdiamv(transa, m, k, alpha, matdescra, val, lval, idiag, ndiag, x, beta, y)
call mkl_zdiamv(transa, m, k, alpha, matdescra, val, lval, idiag, ndiag, x, beta, y)
```

Include Files

- mkl.fi

Description

This routine is deprecated. Use mkl_sparse_?_mvfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_?diamv routine performs a matrix-vector operation defined as

```
y := alpha*A*x + beta*y
```

or

```
y := alpha*A^T*x + beta*y,
```

where:

alpha and *beta* are scalars,

x and *y* are vectors,

A is an *m*-by-*k* sparse matrix stored in the diagonal format, A^T is the transpose of *A*.

NOTE
This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa

CHARACTER*1. Specifies the operation.

If *transa* = 'N' or 'n', then $y := alpha*A*x + beta*y$,

If *transa* = 'T' or 't' or 'C' or 'c', then $y := alpha*A^{T}*x + beta*y$.

m

INTEGER. Number of rows of the matrix *A*.

k

INTEGER. Number of columns of the matrix *A*.

alpha

REAL for mkl_sdiamv.

DOUBLE PRECISION for mkl_ddiamv.

COMPLEX for mkl_cdiamv.

DOUBLE COMPLEX for mkl_zdiamv.

Specifies the scalar *alpha*.

matdescra

CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter *matdescra* (*descra*)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter *matdescra*".

val

REAL for mkl_sdiamv.

DOUBLE PRECISION for mkl_ddiamv.

COMPLEX for mkl_cdiamv.

DOUBLE COMPLEX for mkl_zdiamv.

Two-dimensional array of size *lval* by *ndiag*, contains non-zero diagonals of the matrix *A*. Refer to *values* array description in Diagonal Storage Scheme for more details.

lval

INTEGER. Leading dimension of *val*, $lval \geq m$. Refer to *lval* description in Diagonal Storage Scheme for more details.

idiag

INTEGER. Array of length *ndiag*, contains the distances between main diagonal and each non-zero diagonals in the matrix *A*.

Refer to *distance* array description in Diagonal Storage Scheme for more details.

ndiag

INTEGER. Specifies the number of non-zero diagonals of the matrix *A*.

x

REAL for mkl_sdiamv.

DOUBLE PRECISION for mkl_ddiamv.

COMPLEX for mkl_cdiamv.

DOUBLE COMPLEX for mkl_zdiamv.

	Array, size at least *k* if *transa* = 'N' or 'n', and at least *m* otherwise. On entry, the array *x* must contain the vector *x*.
beta	REAL for mkl_sdiamv. DOUBLE PRECISION for mkl_ddiamv. COMPLEX for mkl_cdiamv. DOUBLE COMPLEX for mkl_zdiamv. Specifies the scalar *beta*.
y	REAL for mkl_sdiamv. DOUBLE PRECISION for mkl_ddiamv. COMPLEX for mkl_cdiamv. DOUBLE COMPLEX for mkl_zdiamv. Array, size at least *m* if *transa* = 'N' or 'n', and at least *k* otherwise. On entry, the array *y* must contain the vector *y*.

Output Parameters

y	Overwritten by the updated vector *y*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_sdiamv(transa, m, k, alpha, matdescra, val, lval, idiag,
ndiag, x, beta, y)

Description

This routine is deprecated. Use mkl_sparse_?_mvfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_?skymv routine performs a matrix-vector operation defined as

$y := alpha*A*x + beta*y$

or

$y := alpha*A^{T}*x + beta*y,$

where:

alpha and *beta* are scalars,

x and *y* are vectors,

A is an *m*-by-*k* sparse matrix stored using the skyline storage scheme, A^T is the transpose of *A*.

NOTE
This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa

`CHARACTER*1`. Specifies the operation.

If *transa* = `'N'` or `'n'`, then *y* := *alpha***A***x* + *beta***y*

If *transa* = `'T'` or `'t'` or `'C'` or `'c'`, then *y* := *alpha***A*^{T}**x* + *beta***y*,

m

`INTEGER`. Number of rows of the matrix *A*.

k

`INTEGER`. Number of columns of the matrix *A*.

alpha

`REAL` for `mkl_sskymv`.

`DOUBLE PRECISION` for `mkl_dskymv`.

`COMPLEX` for `mkl_cskymv`.

`DOUBLE COMPLEX` for `mkl_zskymv`.

Specifies the scalar *alpha*.

matdescra

`CHARACTER`. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter *matdescra* (*descra*)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter *matdescra*".

NOTE
General matrices (*matdescra*`(1)='G'`) is not supported.

val

`REAL` for `mkl_sskymv`.

`DOUBLE PRECISION` for `mkl_dskymv`.

`COMPLEX` for `mkl_cskymv`.

`DOUBLE COMPLEX` for `mkl_zskymv`.

Array containing the set of elements of the matrix *A* in the skyline profile form.

If *matdescrsa*`(2)= 'L'`, then *val* contains elements from the low triangle of the matrix *A*.

If *matdescrsa*(2)= 'U', then *val* contains elements from the upper triangle of the matrix *A*.

Refer to *values* array description in Skyline Storage Scheme for more details.

pntr

INTEGER. Array of length (*m* + 1) for lower triangle, and (*k* + 1) for upper triangle.

It contains the indices specifying in the *val* the positions of the first element in each row (column) of the matrix *A*. Refer to *pointers* array description in Skyline Storage Scheme for more details.

x

REAL for mkl_sskymv.

DOUBLE PRECISION for mkl_dskymv.

COMPLEX for mkl_cskymv.

DOUBLE COMPLEX for mkl_zskymv.

Array, size at least *k* if *transa* = 'N' or 'n' and at least *m* otherwise. On entry, the array *x* must contain the vector *x*.

beta

REAL for mkl_sskymv.

DOUBLE PRECISION for mkl_dskymv.

COMPLEX for mkl_cskymv.

DOUBLE COMPLEX for mkl_zskymv.

Specifies the scalar *beta*.

y

REAL for mkl_sskymv.

DOUBLE PRECISION for mkl_dskymv.

COMPLEX for mkl_cskymv.

DOUBLE COMPLEX for mkl_zskymv.

Array, size at least *m* if *transa* = 'N' or 'n' and at least *k* otherwise. On entry, the array *y* must contain the vector *y*.

Output Parameters

y

Overwritten by the updated vector *y*.

Interfaces

FORTRAN 77:

```

Description

This routine is deprecated. Use mkl_sparse_?_trsvfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_?diasv routine solves a system of linear equations with matrix-vector operations for a sparse matrix stored in the diagonal format:

$y := alpha*inv(A)*x$

or

$y := alpha*inv(A^T)* x,$

where:

alpha is scalar, *x* and *y* are vectors, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, A^T is the transpose of *A*.

> **NOTE**
> This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa

CHARACTER*1. Specifies the system of linear equations.

If *transa* = 'N' or 'n', then $y := alpha*inv(A)*x$

If *transa* = 'T' or 't' or 'C' or 'c', then $y := alpha*inv(A^T)*x$,

m

INTEGER. Number of rows of the matrix *A*.

alpha

REAL for mkl_sdiasv.

DOUBLE PRECISION for mkl_ddiasv.

COMPLEX for mkl_cdiasv.

DOUBLE COMPLEX for mkl_zdiasv.

Specifies the scalar *alpha*.

matdescra
CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter *matdescra* (*descra*)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter *matdescra*".

val
REAL for mkl_sdiasv.

DOUBLE PRECISION for mkl_ddiasv.

COMPLEX for mkl_cdiasv.

DOUBLE COMPLEX for mkl_zdiasv.

Two-dimensional array of size *lval* by *ndiag*, contains non-zero diagonals of the matrix *A*. Refer to *values* array description in Diagonal Storage Scheme for more details.

lval
INTEGER. Leading dimension of *val*, *lval*≥*m*. Refer to *lval* description in Diagonal Storage Scheme for more details.

idiag
INTEGER. Array of length *ndiag*, contains the distances between main diagonal and each non-zero diagonals in the matrix *A*.

NOTE
All elements of this array must be sorted in increasing order.

Refer to *distance* array description in Diagonal Storage Scheme for more details.

ndiag
INTEGER. Specifies the number of non-zero diagonals of the matrix *A*.

x
REAL for mkl_sdiasv.

DOUBLE PRECISION for mkl_ddiasv.

COMPLEX for mkl_cdiasv.

DOUBLE COMPLEX for mkl_zdiasv.

Array, size at least *m*.

On entry, the array *x* must contain the vector *x*. The elements are accessed with unit increment.

y
REAL for mkl_sdiasv.

DOUBLE PRECISION for mkl_ddiasv.

COMPLEX for mkl_cdiasv.

DOUBLE COMPLEX for mkl_zdiasv.

Array, size at least *m*.

On entry, the array *y* must contain the vector *y*. The elements are accessed with unit increment.

Output Parameters

y	Contains solution vector *x*.

Interfaces

FORTRAN 77:

```

Description

This routine is deprecated. Use mkl_sparse_?_trsvfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_?skysv routine solves a system of linear equations with matrix-vector operations for a sparse matrix in the skyline storage format:

```
y := alpha*inv(A)*x
```

or

```
y := alpha*inv(A^T)*x,
```

where:

alpha is scalar, *x* and *y* are vectors, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, A^T is the transpose of *A*.

> **NOTE**
> This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa

CHARACTER*1. Specifies the system of linear equations.

If *transa* = 'N' or 'n', then *y* := *alpha*inv(*A*)*x*

If *transa* = 'T' or 't' or 'C' or 'c', then *y* := *alpha*inv(A^T)* *x*,

m

INTEGER. Number of rows of the matrix *A*.

alpha

REAL for mkl_sskysv.

DOUBLE PRECISION for mkl_dskysv.

COMPLEX for mkl_cskysv.

DOUBLE COMPLEX for mkl_zskysv.

Specifies the scalar *alpha*.

matdescra

CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter *matdescra* (*descra*)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter *matdescra*".

NOTE
General matrices (*matdescra*(1)='G') is not supported.

val

REAL for mkl_sskysv.

DOUBLE PRECISION for mkl_dskysv.

COMPLEX for mkl_cskysv.

DOUBLE COMPLEX for mkl_zskysv.

Array containing the set of elements of the matrix *A* in the skyline profile form.

If *matdescra*(2)= 'L', then *val* contains elements from the low triangle of the matrix *A*.

If *matdescra*(2)= 'U', then *val* contains elements from the upper triangle of the matrix *A*.

Refer to *values* array description in Skyline Storage Scheme for more details.

pntr

INTEGER. Array of length (*m* + 1) for lower triangle, and (*k* + 1) for upper triangle.

It contains the indices specifying in the *val* the positions of the first element in each row (column) of the matrix *A*. Refer to *pointers* array description in Skyline Storage Scheme for more details.

x

REAL for mkl_sskysv.

DOUBLE PRECISION for mkl_dskysv.

COMPLEX for mkl_cskysv.

DOUBLE COMPLEX for mkl_zskysv.

Array, size at least *m*.

On entry, the array *x* must contain the vector *x*. The elements are accessed with unit increment.

y

REAL for mkl_sskysv.

DOUBLE PRECISION for mkl_dskysv.

COMPLEX for mkl_cskysv.

DOUBLE COMPLEX for mkl_zskysv.

Array, size at least *m*.

	On entry, the array *y* must contain the vector *y*. The elements are accessed with unit increment.

Output Parameters

y	Contains solution vector *x*.

Interfaces

Description

This routine is deprecated. Use Use mkl_sparse_?_mmfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_?diamm routine performs a matrix-matrix operation defined as

```
C := alpha*A*B + beta*C
```

or

```
C := alpha*A^T*B + beta*C,
```

or

```
C := alpha*A^H*B + beta*C,
```

where:

alpha and *beta* are scalars,

B and *C* are dense matrices, *A* is an *m*-by-*k* sparse matrix in the diagonal format, A^T is the transpose of *A*, and A^H is the conjugate transpose of *A*.

NOTE
This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa
CHARACTER*1. Specifies the operation.
If *transa* = 'N' or 'n', then $C := alpha*A*B + beta*C$,
If *transa* = 'T' or 't', then $C := alpha*A^{T}*B + beta*C$,
If *transa* = 'C' or 'c', then $C := alpha*A^{H}*B + beta*C$.

m
INTEGER. Number of rows of the matrix *A*.

n
INTEGER. Number of columns of the matrix *C*.

k
INTEGER. Number of columns of the matrix *A*.

alpha
REAL for mkl_sdiamm.
DOUBLE PRECISION for mkl_ddiamm.
COMPLEX for mkl_cdiamm.
DOUBLE COMPLEX for mkl_zdiamm.
Specifies the scalar *alpha*.

matdescra
CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter *matdescra* (*descra*)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter *matdescra*".

val
REAL for mkl_sdiamm.
DOUBLE PRECISION for mkl_ddiamm.
COMPLEX for mkl_cdiamm.
DOUBLE COMPLEX for mkl_zdiamm.
Two-dimensional array of size *lval* by *ndiag*, contains non-zero diagonals of the matrix *A*. Refer to *values* array description in Diagonal Storage Scheme for more details.

lval
INTEGER. Leading dimension of *val*, *lval*≥*m*. Refer to *lval* description in Diagonal Storage Scheme for more details.

idiag
INTEGER. Array of length *ndiag*, contains the distances between main diagonal and each non-zero diagonals in the matrix *A*.
Refer to *distance* array description in Diagonal Storage Scheme for more details.

ndiag
INTEGER. Specifies the number of non-zero diagonals of the matrix *A*.

b

REAL for mkl_sdiamm.

DOUBLE PRECISION for mkl_ddiamm.

COMPLEX for mkl_cdiamm.

DOUBLE COMPLEX for mkl_zdiamm.

Array, size (*ldb*, *n*).

On entry with *transa* = 'N' or 'n', the leading *k*-by-*n* part of the array *b* must contain the matrix *B*, otherwise the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.

ldb

INTEGER. Specifies the leading dimension of *b* as declared in the calling (sub)program.

beta

REAL for mkl_sdiamm.

DOUBLE PRECISION for mkl_ddiamm.

COMPLEX for mkl_cdiamm.

DOUBLE COMPLEX for mkl_zdiamm.

Specifies the scalar *beta*.

c

REAL for mkl_sdiamm.

DOUBLE PRECISION for mkl_ddiamm.

COMPLEX for mkl_cdiamm.

DOUBLE COMPLEX for mkl_zdiamm.

Array, size *ldc* by *n*.

On entry, the leading *m*-by-*n* part of the array *c* must contain the matrix *C*, otherwise the leading *k*-by-*n* part of the array *c* must contain the matrix *C*.

ldc

INTEGER. Specifies the leading dimension of *c* as declared in the calling (sub)program.

Output Parameters

c

Overwritten by the matrix (*alpha***A***B* + *beta***C*), (*alpha***A*^{T}**B* + *beta***C*), or (*alpha***A*^{H}**B* + *beta***C*).

Interfaces

FORTRAN 77:

Description

This routine is deprecated. Use Use mkl_sparse_?_mmfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_?skymm routine performs a matrix-matrix operation defined as

$C := alpha*A*B + beta*C$

or

$C := alpha*A^{T}*B + beta*C,$

or

$C := alpha*A^{H}*B + beta*C,$

where:

alpha and *beta* are scalars,

B and *C* are dense matrices, *A* is an *m*-by-*k* sparse matrix in the skyline storage format, A^{T} is the transpose of *A*, and A^{H} is the conjugate transpose of *A*.

NOTE
This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa — CHARACTER*1. Specifies the operation.

If *transa* = 'N' or 'n', then $C := alpha*A*B + beta*C$,

If *transa* = 'T' or 't', then $C := alpha*A^{T}*B + beta*C$,

If *transa* = 'C' or 'c', then $C := alpha*A^{H}*B + beta*C$.

m — INTEGER. Number of rows of the matrix *A*.

n — INTEGER. Number of columns of the matrix *C*.

k — INTEGER. Number of columns of the matrix *A*.

alpha — REAL for mkl_sskymm.

DOUBLE PRECISION for mkl_dskymm.

COMPLEX for mkl_cskymm.

DOUBLE COMPLEX for mkl_zskymm.

Specifies the scalar *alpha*.

matdescra — CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter *matdescra* (*descra*)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter *matdescra*".

NOTE
General matrices (*matdescra* (1)='G') is not supported.

val — REAL for mkl_sskymm.

DOUBLE PRECISION for mkl_dskymm.

COMPLEX for mkl_cskymm.

DOUBLE COMPLEX for mkl_zskymm.

Array containing the set of elements of the matrix *A* in the skyline profile form.

If *matdescrsa*(2)= 'L', then *val* contains elements from the low triangle of the matrix *A*.

If *matdescrsa*(2)= 'U', then *val* contains elements from the upper triangle of the matrix *A*.

Refer to *values* array description in Skyline Storage Scheme for more details.

pntr — INTEGER. Array of length (*m* + 1) for lower triangle, and (*k* + 1) for upper triangle.

It contains the indices specifying the positions of the first element of the matrix *A* in each row (for the lower triangle) or column (for upper triangle) in the *val* array. Refer to *pointers* array description in Skyline Storage Scheme for more details.

b — REAL for mkl_sskymm.

DOUBLE PRECISION for mkl_dskymm.

COMPLEX for mkl_cskymm.

DOUBLE COMPLEX for mkl_zskymm.

Array, size (*ldb*, *n*).

On entry with *transa* = 'N' or 'n', the leading *k*-by-*n* part of the array *b* must contain the matrix *B*, otherwise the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.

ldb — INTEGER. Specifies the leading dimension of *b* as declared in the calling (sub)program.

beta — REAL for mkl_sskymm.

DOUBLE PRECISION for mkl_dskymm.

COMPLEX for mkl_cskymm.

DOUBLE COMPLEX for mkl_zskymm.

Specifies the scalar *beta*.

c — REAL for mkl_sskymm.

DOUBLE PRECISION for mkl_dskymm.

COMPLEX for mkl_cskymm.

DOUBLE COMPLEX for mkl_zskymm.

Array, size *ldc* by *n*.

On entry, the leading *m*-by-*n* part of the array *c* must contain the matrix *C*, otherwise the leading *k*-by-*n* part of the array *c* must contain the matrix *C*.

ldc — INTEGER. Specifies the leading dimension of *c* as declared in the calling (sub)program.

Output Parameters

c — Overwritten by the matrix (*alpha***A***B* + *beta***C*), (*alpha***A*^{T}**B* + *beta***C*), or (*alpha***A*^{H}**B* + *beta***C*).

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_sskymm(transa, m, n, k, alpha, matdescra, val, pntr, b,
 ldb, beta, c, ldc)
  CHARACTER*1   transa
  CHARACTER     matdescra(*)
  INTEGER       m, n, k, ldb, ldc
  INTEGER       pntr(*)
  REAL          alpha, beta
  REAL          val(*), b(ldb,*), c(ldc,*)
```

```
SUBROUTINE mkl_dskymm(transa, m, n, k, alpha, matdescra, val, pntr, b,

  DOUBLE COMPLEX        val(*), b(ldb,*), c(ldc,*)
```

mkl_?diasm

Solves a system of linear matrix equations for a sparse matrix in the diagonal format with one-based indexing (deprecated).

Syntax

```
call mkl_sdiasm(transa, m, n, alpha, matdescra, val, lval, idiag, ndiag, b, ldb, c, ldc)
call mkl_ddiasm(transa, m, n, alpha, matdescra, val, lval, idiag, ndiag, b, ldb, c, ldc)
call mkl_cdiasm(transa, m, n, alpha, matdescra, val, lval, idiag, ndiag, b, ldb, c, ldc)
call mkl_zdiasm(transa, m, n, alpha, matdescra, val, lval, idiag, ndiag, b, ldb, c, ldc)
```

- mkl.fi

Description

This routine is deprecated. Use mkl_sparse_?_trsmfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_?diasm routine solves a system of linear equations with matrix-matrix operations for a sparse matrix in the diagonal format:

```
C := alpha*inv(A)*B
```

or

```
C := alpha*inv(A^T)*B,
```

where:

alpha is scalar, *B* and *C* are dense matrices, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, A^T is the transpose of *A*.

> **NOTE**
> This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the system of linear equations. If *transa* = 'N' or 'n', then *C* := *alpha*inv(*A*)*B*, If *transa* = 'T' or 't' or 'C' or 'c', then *C* := *alpha*inv(A^T)*B*.
m	INTEGER. Number of rows of the matrix *A*.
n	INTEGER. Number of columns of the matrix *C*.
alpha	REAL for mkl_sdiasm. DOUBLE PRECISION for mkl_ddiasm. COMPLEX for mkl_cdiasm. DOUBLE COMPLEX for mkl_zdiasm. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter *matdescra* (*descra*)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter *matdescra*".
val	REAL for mkl_sdiasm.

DOUBLE PRECISION for mkl_ddiasm.

COMPLEX for mkl_cdiasm.

DOUBLE COMPLEX for mkl_zdiasm.

Two-dimensional array of size *lval* by *ndiag*, contains non-zero diagonals of the matrix *A*. Refer to *values* array description in Diagonal Storage Scheme for more details.

lval INTEGER. Leading dimension of *val*, *lval*≥*m*. Refer to *lval* description in Diagonal Storage Scheme for more details.

idiag INTEGER. Array of length *ndiag*, contains the distances between main diagonal and each non-zero diagonals in the matrix *A*.

> **NOTE**
> All elements of this array must be sorted in increasing order.

Refer to *distance* array description in Diagonal Storage Scheme for more details.

ndiag INTEGER. Specifies the number of non-zero diagonals of the matrix *A*.

b REAL for mkl_sdiasm.

DOUBLE PRECISION for mkl_ddiasm.

COMPLEX for mkl_cdiasm.

DOUBLE COMPLEX for mkl_zdiasm.

Array, size (*ldb*, *n*).

On entry the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.

ldb INTEGER. Specifies the leading dimension of *b* as declared in the calling (sub)program.

ldc INTEGER. Specifies the leading dimension of *c* as declared in the calling (sub)program.

Output Parameters

c REAL for mkl_sdiasm.

DOUBLE PRECISION for mkl_ddiasm.

COMPLEX for mkl_cdiasm.

DOUBLE COMPLEX for mkl_zdiasm.

Array, size *ldc* by *n*.

The leading *m*-by-*n* part of the array *c* contains the matrix *C*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_sdiasm(transa, m, n, alpha, matdescra, val, lval, idiag,
 ndiag, b, ldb, c, ldc)
  CHARACTER*1   transa
  CHARACTER     matdescra(*)
  INTEGER       m, n, ldb, ldc, lval, ndiag
  INTEGER      idiag(*)
  REAL          alpha
  REAL          val(lval,*), b(ldb,*), c(ldc,*)

SUBROUTINE mkl_ddiasm(transa, m, n, alpha, matdescra, val, lval, idiag,
 ndiag, b, ldb, c, ldc)
  CHARACTER*1   transa
  CHARACTER     matdescra(*)
  INTEGER       m, n, ldb, ldc, lval, ndiag
  INTEGER      idiag(*)
  DOUBLE PRECISION        alpha
  DOUBLE PRECISION        val(lval,*), b(ldb,*), c(ldc,*)

SUBROUTINE mkl_cdiasm(transa, m, n, alpha, matdescra, val, lval, idiag,

  INTEGER       m, n, ldb, ldc, lval, ndiag
  INTEGER      idiag(*)
  DOUBLE COMPLEX        alpha
  DOUBLE COMPLEX        val(lval,*), b(ldb,*), c(ldc,*)
```

mkl_?skysm

Solves a system of linear matrix equations for a sparse matrix stored using the skyline storage scheme with one-based indexing (deprecated).

Syntax

```
call mkl_sskysm(transa, m, n, alpha, matdescra, val, pntr, b, ldb, c, ldc)
call mkl_dskysm(transa, m, n, alpha, matdescra, val, pntr, b, ldb, c, ldc)
call mkl_cskysm(transa, m, n, alpha, matdescra, val, pntr, b, ldb, c, ldc)
call mkl_zskysm(transa, m, n, alpha, matdescra, val, pntr, b, ldb, c, ldc)
```

Include Files

- mkl.fi

Description

This routine is deprecated. Use mkl_sparse_?_trsmfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_?skysm routine solves a system of linear equations with matrix-matrix operations for a sparse matrix in the skyline storage format:

```
C := alpha*inv(A)*B
```

or

```
C := alpha*inv(A^T)*B,
```

where:

alpha is scalar, *B* and *C* are dense matrices, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, A^T is the transpose of *A*.

> **NOTE**
> This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the system of linear equations. If *transa* = 'N' or 'n', then *C* := *alpha*inv(*A*)*B*, If *transa* = 'T' or 't' or 'C' or 'c', then *C* := *alpha*inv(A^T)*B*,
m	INTEGER. Number of rows of the matrix *A*.
n	INTEGER. Number of columns of the matrix *C*.
alpha	REAL for mkl_sskysm.

DOUBLE PRECISION for mkl_dskysm.

COMPLEX for mkl_cskysm.

DOUBLE COMPLEX for mkl_zskysm.

Specifies the scalar *alpha*.

matdescra

CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table "Possible Values of the Parameter *matdescra* (*descra*)". Possible combinations of element values of this parameter are given in Table "Possible Combinations of Element Values of the Parameter *matdescra*".

NOTE
General matrices (*matdescra*(1)='G') is not supported.

val

REAL for mkl_sskysm.

DOUBLE PRECISION for mkl_dskysm.

COMPLEX for mkl_cskysm.

DOUBLE COMPLEX for mkl_zskysm.

Array containing the set of elements of the matrix *A* in the skyline profile form.

If *matdescrsa*(2)= 'L', then *val* contains elements from the low triangle of the matrix *A*.

If *matdescrsa*(2)= 'U', then *val* contains elements from the upper triangle of the matrix *A*.

Refer to *values* array description in Skyline Storage Scheme for more details.

pntr

INTEGER. Array of length (*m* + 1) for lower triangle, and (*n* + 1) for upper triangle.

It contains the indices specifying the positions of the first element of the matrix *A* in each row (for the lower triangle) or column (for upper triangle) in the *val* array. Refer to *pointers* array description in Skyline Storage Scheme for more details.

b

REAL for mkl_sskysm.

DOUBLE PRECISION for mkl_dskysm.

COMPLEX for mkl_cskysm.

DOUBLE COMPLEX for mkl_zskysm.

Array, size (*ldb*, *n*).

On entry the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.

ldb

INTEGER. Specifies the leading dimension of *b* as declared in the calling (sub)program.

ldc INTEGER. Specifies the leading dimension of *c* as declared in the calling (sub)program.

Output Parameters

c REAL for mkl_sskysm.

DOUBLE PRECISION for mkl_dskysm.

COMPLEX for mkl_cskysm.

DOUBLE COMPLEX for mkl_zskysm.

Array, size *ldc* by *n*.

The leading *m*-by-*n* part of the array *c* contains the matrix *C*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_sskysm(transa, m, n, alpha, matdescra, val, pntr, b, ldb, c, ldc)
  CHARACTER*1   transa
  CHARACTER     matdescra(*)
  INTEGER       m, n, ldb, ldc
  INTEGER       pntr(*)
  REAL          alpha
  REAL          val(*), b(ldb,*), c(ldc,*)

SUBROUTINE mkl_dskysm(transa, m, n, alpha, matdescra, val, pntr, b, ldb, c, ldc)
  CHARACTER*1   transa
  CHARACTER     matdescra(*)
  INTEGER       m, n, ldb, ldc
  INTEGER       pntr(*)
  DOUBLE PRECISION        alpha
  DOUBLE PRECISION        val(*), b(ldb,*), c(ldc,*)

SUBROUTINE mkl_cskysm(transa, m, n, alpha, matdescra, val, pntr, b, ldb, c, ldc)
  CHARACTER*1   transa
  CHARACTER     matdescra(*)
  INTEGER       m, n, ldb, ldc
  INTEGER       pntr(*)
  COMPLEX        alpha
  COMPLEX        val(*), b(ldb,*), c(ldc,*)
```

```
SUBROUTINE mkl_zskysm(transa, m, n, alpha, matdescra, val, pntr, b, ldb, c, ldc)
  CHARACTER*1   transa
  CHARACTER     matdescra(*)
  INTEGER       m, n, ldb, ldc
  INTEGER       pntr(*)
  DOUBLE COMPLEX        alpha
  DOUBLE COMPLEX        val(*), b(ldb,*), c(ldc,*)
```

mkl_?dnscsr

Convert a sparse matrix in uncompressed representation to the CSR format and vice versa (deprecated).

Syntax

```
call mkl_sdnscsr(job, m, n, adns, lda, acsr, ja, ia, info)
call mkl_ddnscsr(job, m, n, adns, lda, acsr, ja, ia, info)
call mkl_cdnscsr(job, m, n, adns, lda, acsr, ja, ia, info)
call mkl_zdnscsr(job, m, n, adns, lda, acsr, ja, ia, info)
```

Include Files

- mkl.fi

Description

This routine is deprecated. Use the matrix manipulation routinesfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

This routine converts a sparse matrix *A* between formats: stored as a rectangular array (dense representation) and stored using compressed sparse row (CSR) format (3-array variation).

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

job — INTEGER

Array, contains the following conversion parameters:

- *job*(1): Conversion type.
  - If *job*(1)=0, the rectangular matrix *A* is converted to the CSR format;
  - if *job*(1)=1, the rectangular matrix *A* is restored from the CSR format.
- *job*(2): index base for the rectangular matrix *A*.

- If *job*(2)=0, zero-based indexing for the rectangular matrix *A* is used;
- if *job*(2)=1, one-based indexing for the rectangular matrix *A* is used.

- *job*(3): Index base for the matrix in CSR format.
  - If *job*(3)=0, zero-based indexing for the matrix in CSR format is used;
  - if *job*(3)=1, one-based indexing for the matrix in CSR format is used.
- *job*(4): Portion of matrix.
  - If *job*(4)=0, *adns* is a lower triangular part of matrix *A*;
  - If *job*(4)=1, *adns* is an upper triangular part of matrix *A*;
  - If *job*(4)=2, *adns* is a whole matrix *A*.
- *job*(5)=*nzmax*: maximum number of the non-zero elements allowed if *job*(1)=0.
- *job*(6): job indicator for conversion to CSR format.
  - If *job*(6)=0, only array *ia* is generated for the output storage.
  - If *job*(6)>0, arrays *acsr*, *ia*, *ja* are generated for the output storage.

m — INTEGER. Number of rows of the matrix *A*.

n — INTEGER. Number of columns of the matrix *A*.

adns — (input/output)

REAL for mkl_sdnscsr.

DOUBLE PRECISION for mkl_ddnscsr.

COMPLEX for mkl_cdnscsr.

DOUBLE COMPLEX for mkl_zdnscsr.

If the conversion type is from uncompressed to CSR, on input *adns* contains an uncompressed (dense) representation of matrix *A*.

lda — INTEGER. Specifies the leading dimension of *adns* as declared in the calling (sub)program.

For zero-based indexing of *A*, *lda* must be at least max(1, *n*).

For one-based indexing of *A*, *lda* must be at least max(1, *m*).

acsr — (input/output)

REAL for mkl_sdnscsr.

DOUBLE PRECISION for mkl_ddnscsr.

COMPLEX for mkl_cdnscsr.

DOUBLE COMPLEX for mkl_zdnscsr.

If conversion type is from CSR to uncompressed, on input *acsr* contains the non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.

ja (input/output)INTEGER. If conversion type is from CSR to uncompressed, on input *ja* contains the column indices for each non-zero element of the matrix *A*.

Its length is equal to the length of the array *acsr*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.

ia (input/output)INTEGER. Array of length *m* + 1.

If conversion type is from CSR to uncompressed, on input *ia* contains indices of elements in the array *acsr*, such that *ia*(*i*) is the index in the array *acsr* of the first non-zero element from the row *i*.

The value of*ia*(*m* + 1) is equal to the number of non-zeros plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.

Output Parameters

adns If conversion type is from CSR to uncompressed, on output *adns* contains the uncompressed (dense) representation of matrix *A*.

acsr, *ja*, *ia* If conversion type is from uncompressed to CSR, on output *acsr*, *ja*, and *ia* contain the compressed sparse row (CSR) format (3-array variation) of matrix *A* (see Sparse Matrix Storage Formats for a description of the storage format).

info INTEGER. Integer info indicator only for restoring the matrix *A* from the CSR format.

If *info*=0, the execution is successful.

If *info*=*i*, the routine is interrupted processing the *i*-th row because there is no space in the arrays *acsr* and *ja* according to the value *nzmax*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_sdnscsr(job, m, n, adns, lda, acsr, ja, ia, info)
  INTEGER       job(8)
  INTEGER       m, n, lda, info
  INTEGER      ja(*), ia(m+1)
  REAL         adns(*), acsr(*)

SUBROUTINE mkl_ddnscsr(job, m, n, adns, lda, acsr, ja, ia, info)
  INTEGER       job(8)
  INTEGER       m, n, lda, info
  INTEGER      ja(*), ia(m+1)
  DOUBLE PRECISION       adns(*), acsr(*)
```

```
SUBROUTINE mkl_cdnscsr(job, m, n, adns, lda, acsr, ja, ia, info)
  INTEGER       job(8)
  INTEGER       m, n, lda, info
  INTEGER      ja(*), ia(m+1)
  COMPLEX      adns(*), acsr(*)

SUBROUTINE mkl_zdnscsr(job, m, n, adns, lda, acsr, ja, ia, info)
  INTEGER       job(8)
  INTEGER       m, n, lda, info
  INTEGER      ja(*), ia(m+1)
  DOUBLE COMPLEX      adns(*), acsr(*)
```

mkl_?csrcoo

Converts a sparse matrix in the CSR format to the coordinate format and vice versa (deprecated).

Syntax

```
call mkl_scsrcoo(job, n, acsr, ja, ia, nnz, acoo, rowind, colind, info)
call mkl_dcsrcoo(job, n, acsr, ja, ia, nnz, acoo, rowind, colind, info)
call mkl_ccsrcoo(job, n, acsr, ja, ia, nnz, acoo, rowind, colind, info)
call mkl_zcsrcoo(job, n, acsr, ja, ia, nnz, acoo, rowind, colind, info)
```

Include Files

Description

This routine is deprecated. Use the matrix manipulation routinesfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

This routine converts a sparse matrix *A* stored in the compressed sparse row (CSR) format (3-array variation) to coordinate format and vice versa.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

job — INTEGER

Array, contains the following conversion parameters:

job(1)

If *job*(1)=0, the matrix in the CSR format is converted to the coordinate format;

if *job*(1)=1, the matrix in the coordinate format is converted to the CSR format.

if *job*(1)=2, the matrix in the coordinate format is converted to the CSR format, and the column indices in CSR representation are sorted in the increasing order within each row.

job(2)

If *job*(2)=0, zero-based indexing for the matrix in CSR format is used;

if *job*(2)=1, one-based indexing for the matrix in CSR format is used.

job(3)

If *job*(3)=0, zero-based indexing for the matrix in coordinate format is used;

if *job*(3)=1, one-based indexing for the matrix in coordinate format is used.

job(5)

job(5)=*nzmax* - maximum number of the non-zero elements allowed if *job*(1)=0.

job(6) - job indicator.

For conversion to the coordinate format:

If *job*(6)=1, only array *rowind* is filled in for the output storage.

If *job*(6)=2, arrays *rowind*, *colind* are filled in for the output storage.

If *job*(6)=3, all arrays *rowind*, *colind*, *acoo* are filled in for the output storage.

For conversion to the CSR format:

If *job*(6)=0, all arrays *acsr*, *ja*, *ia* are filled in for the output storage.

If *job*(6)=1, only array *ia* is filled in for the output storage.

If *job*(6)=2, then it is assumed that the routine already has been called with the *job*(6)=1, and the user allocated the required space for storing the output arrays *acsr* and *ja*.

n — INTEGER. Dimension of the matrix *A*.

nnz — INTEGER. Specifies the number of non-zero elements of the matrix *A* for *job*(1)≠0.

Refer to *nnz* description in Coordinate Format for more details.

acsr — (input/output)

REAL for mkl_scsrcoo.

DOUBLE PRECISION for mkl_dcsrcoo.

COMPLEX for mkl_ccsrcoo.

DOUBLE COMPLEX for mkl_zcsrcoo.

Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.

ja (input/output) INTEGER. Array containing the column indices for each non-zero element of the matrix *A*.

Its length is equal to the length of the array *acsr*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.

ia (input/output)INTEGER. Array of length *n* + 1, containing indices of elements in the array *acsr*, such that *ia*(*i*) is the index in the array *acsr* of the first non-zero element from the row *i*. The value of the last element *ia*(*n* + 1) is equal to the number of non-zeros plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.

acoo (input/output)

REAL for mkl_scsrcoo.

DOUBLE PRECISION for mkl_dcsrcoo.

COMPLEX for mkl_ccsrcoo.

DOUBLE COMPLEX for mkl_zcsrcoo.

Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.

rowind (input/output)INTEGER. Array of length *nnz*, contains the row indices for each non-zero element of the matrix *A*.

Refer to *rows* array description in Coordinate Format for more details.

colind (input/output)INTEGER. Array of length *nnz*, contains the column indices for each non-zero element of the matrix *A*. Refer to *columns* array description in Coordinate Format for more details.

Output Parameters

nnz Returns the number of converted elements of the matrix *A* for *job*(1)=0.

info INTEGER. Integer info indicator only for converting the matrix *A* from the CSR format.

If *info*=0, the execution is successful.

If *info*=1, the routine is interrupted because there is no space in the arrays *acoo*, *rowind*, *colind* according to the value *nzmax*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_scsrcoo(job, n, acsr, ja, ia, nnz, acoo, rowind, colind, info)
  INTEGER      job(8)
  INTEGER      n, nnz, info
  INTEGER      ja(*), ia(n+1), rowind(*), colind(*)
  REAL         acsr(*), acoo(*)

SUBROUTINE mkl_dcsrcoo(job, n, acsr, ja, ia, nnz, acoo, rowind, colind, info)
  INTEGER      job(8)
  INTEGER      n, nnz, info
  INTEGER      ja(*), ia(n+1), rowind(*), colind(*)
  DOUBLE PRECISION       acsr(*), acoo(*)

SUBROUTINE mkl_ccsrcoo(job, n, acsr, ja, ia, nnz, acoo, rowind, colind, info)
  INTEGER      job(8)
  INTEGER      n, nnz, info
  INTEGER      ja(*), ia(n+1), rowind(*), colind(*)
  COMPLEX      acsr(*), acoo(*)

SUBROUTINE mkl_zcsrcoo(job, n, acsr, ja, ia, nnz, acoo, rowind, colind, info)
  INTEGER      job(8)
  INTEGER      n, nnz, info
  INTEGER      ja(*), ia(n+1), rowind(*), colind(*)
  DOUBLE COMPLEX      acsr(*), acoo(*)
```

mkl_?csrbsr

Converts a square sparse matrix in the CSR format to the BSR format and vice versa (deprecated).

Syntax

```
call mkl_scsrbsr(job, m, mblk, ldabsr, acsr, ja, ia, absr, jab, iab, info)
call mkl_dcsrbsr(job, m, mblk, ldabsr, acsr, ja, ia, absr, jab, iab, info)
call mkl_ccsrbsr(job, m, mblk, ldabsr, acsr, ja, ia, absr, jab, iab, info)
call mkl_zcsrbsr(job, m, mblk, ldabsr, acsr, ja, ia, absr, jab, iab, info)
```

Include Files

Description

This routine is deprecated. Use the matrix manipulation routinesfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

This routine converts a square sparse matrix *A* stored in the compressed sparse row (CSR) format (3-array variation) to the block sparse row (BSR) format and vice versa.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

job — INTEGER

Array, contains the following conversion parameters:

job(1)

If *job*(1)=0, the matrix in the CSR format is converted to the BSR format;

if *job*(1)=1, the matrix in the BSR format is converted to the CSR format.

job(2)

If *job*(2)=0, zero-based indexing for the matrix in CSR format is used;

if *job*(2)=1, one-based indexing for the matrix in CSR format is used.

job(3)

If *job*(3)=0, zero-based indexing for the matrix in the BSR format is used;

if *job*(3)=1, one-based indexing for the matrix in the BSR format is used.

job(4) is only used for conversion to CSR format. By default, the converter saves the blocks without checking whether an element is zero or not. If *job*(4)=1, then the converter only saves non-zero elements in blocks.

job(6) - job indicator.

For conversion to the BSR format:

If *job*(6)=0, only arrays *jab*, *iab* are generated for the output storage.

If *job*(6)>0, all output arrays *absr*, *jab*, and *iab* are filled in for the output storage.

If *job*(6)=-1, *iab*(1) returns the number of non-zero blocks.

For conversion to the CSR format:

If *job*(6)=0, only arrays *ja*, *ia* are generated for the output storage.

m — INTEGER. Actual row dimension of the matrix *A* for convert to the BSR format; block row dimension of the matrix *A* for convert to the CSR format.

mblk — INTEGER. Size of the block in the matrix *A*.

ldabsr — INTEGER. Leading dimension of the array *absr* as declared in the calling program. *ldabsr* must be greater than or equal to *mblk*mblk*.

acsr — (input/output)

REAL for mkl_scsrbsr.

DOUBLE PRECISION for mkl_dcsrbsr.

COMPLEX for mkl_ccsrbsr.

DOUBLE COMPLEX for mkl_zcsrbsr.

Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.

ja (input/output)INTEGER. Array containing the column indices for each non-zero element of the matrix *A*.

Its length is equal to the length of the array *acsr*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.

ia (input/output)INTEGER. Array of length *m + 1*, containing indices of elements in the array *acsr*, such that *ia(I)* is the index in the array *acsr* of the first non-zero element from the row *I*. The value of the last element*ia(m + 1)* is equal to the number of non-zeros plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.

absr (input/output)

REAL for mkl_scsrbsr.

DOUBLE PRECISION for mkl_dcsrbsr.

COMPLEX for mkl_ccsrbsr.

DOUBLE COMPLEX for mkl_zcsrbsr.

Array containing elements of non-zero blocks of the matrix *A*. Its length is equal to the number of non-zero blocks in the matrix *A* multiplied by *mblk*mblk*. Refer to *values* array description in BSR Format for more details.

jab (input/output)INTEGER. Array containing the column indices for each non-zero block of the matrix *A*.

Its length is equal to the number of non-zero blocks of the matrix *A*. Refer to *columns* array description in BSR Format for more details.

iab (input/output)INTEGER. Array of length *(m + 1)*, containing indices of blocks in the array *absr*, such that *iab(i)* is the index in the array *absr* of the first non-zero element from the *i*-th row . The value of the last element*iab(m + 1)* is equal to the number of non-zero blocks plus one. Refer to *rowIndex* array description in BSR Format for more details.

Output Parameters

info INTEGER. Integer info indicator only for converting the matrix *A* from the CSR format.

If *info*=0, the execution is successful.

If *info*=1, it means that *mblk* is equal to 0.

If *info*=2, it means that *ldabsr* is less than *mblk*mblk* and there is no space for all blocks.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_scsrbsr(job, m, mblk, ldabsr, acsr, ja, ia, absr, jab, iab, info)
  INTEGER      job(8)
  INTEGER      m, mblk, ldabsr, info
  INTEGER      ja(*), ia(m+1), jab(*), iab(*)
  REAL         acsr(*), absr(ldabsr,*)

SUBROUTINE mkl_dcsrbsr(job, m, mblk, ldabsr, acsr, ja, ia, absr, jab, iab, info)
  INTEGER      job(8)
  INTEGER      m, mblk, ldabsr, info
  INTEGER      ja(*), ia(m+1), jab(*), iab(*)
  DOUBLE PRECISION       acsr(*), absr(ldabsr,*)

SUBROUTINE mkl_ccsrbsr(job, m, mblk, ldabsr, acsr, ja, ia, absr, jab, iab, info)
  INTEGER      job(8)
  INTEGER      m, mblk, ldabsr, info
  INTEGER      ja(*), ia(m+1), jab(*), iab(*)
  COMPLEX       acsr(*), absr(ldabsr,*)

SUBROUTINE mkl_zcsrbsr(job, m, mblk, ldabsr, acsr, ja, ia, absr, jab, iab, info)
  INTEGER      job(8)
  INTEGER      m, mblk, ldabsr, info
  INTEGER      ja(*), ia(m+1), jab(*), iab(*)
  DOUBLE COMPLEX       acsr(*), absr(ldabsr,*)
```

mkl_?csrcsc

Converts a square sparse matrix in the CSR format to the CSC format and vice versa (deprecated).

Syntax

```
call mkl_scsrcsc(job, m, acsr, ja, ia, acsc, ja1, ia1, info)
call mkl_dcsrcsc(job, m, acsr, ja, ia, acsc, ja1, ia1, info)
call mkl_ccsrcsc(job, m, acsr, ja, ia, acsc, ja1, ia1, info)
call mkl_zcsrcsc(job, m, acsr, ja, ia, acsc, ja1, ia1, info)
```

Include Files

- mkl.fi

Description

This routine is deprecated. Use the matrix manipulation routinesfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

This routine converts a square sparse matrix *A* stored in the compressed sparse row (CSR) format (3-array variation) to the compressed sparse column (CSC) format and vice versa.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

job INTEGER

Array, contains the following conversion parameters:

job(1)

If *job*(1)=0, the matrix in the CSR format is converted to the CSC format;

if *job*(1)=1, the matrix in the CSC format is converted to the CSR format.

job(2)

If *job*(2)=0, zero-based indexing for the matrix in CSR format is used;

if *job*(2)=1, one-based indexing for the matrix in CSR format is used.

job(3)

If *job*(3)=0, zero-based indexing for the matrix in the CSC format is used;

if *job*(3)=1, one-based indexing for the matrix in the CSC format is used.

job(6) - job indicator.

For conversion to the CSC format:

If *job*(6)=0, only arrays *ja1*, *ia1* are filled in for the output storage.

If *job*(6)≠0, all output arrays *acsc*, *ja1*, and *ia1* are filled in for the output storage.

For conversion to the CSR format:

If *job*(6)=0, only arrays *ja*, *ia* are filled in for the output storage.

If *job*(6)≠0, all output arrays *acsr*, *ja*, and *ia* are filled in for the output storage.

m INTEGER. Dimension of the square matrix *A*.

acsr (input/output)

REAL for mkl_scsrcsc.

DOUBLE PRECISION for mkl_dcsrcsc.

COMPLEX for mkl_ccsrcsc.

DOUBLE COMPLEX for mkl_zcsrcsc.

Array containing non-zero elements of the square matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.

ja (input/output)INTEGER. Array containing the column indices for each non-zero element of the matrix *A*.

Its length is equal to the length of the array *acsr*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.

ia (input/output)INTEGER. Array of length *m* + 1, containing indices of elements in the array *acsr*, such that *ia*(*i*) is the index in the array *acsr* of the first non-zero element from the row *i*. The value of the last element*ia*(*m* + 1) is equal to the number of non-zeros plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.

acsc (input/output)

REAL for mkl_scsrcsc.

DOUBLE PRECISION for mkl_dcsrcsc.

COMPLEX for mkl_ccsrcsc.

DOUBLE COMPLEX for mkl_zcsrcsc.

Array containing non-zero elements of the square matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.

ja1 (input/output)INTEGER. Array containing the row indices for each non-zero element of the matrix *A*.

Its length is equal to the length of the array *acsc*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.

ia1 (input/output)INTEGER. Array of length *m* + 1, containing indices of elements in the array *acsc*, such that *ia1*(*i*) is the index in the array *acsc* of the first non-zero element from the column *i*. The value of the last element *ia1*(*m* + 1) is equal to the number of non-zeros plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.

Output Parameters

info INTEGER. This parameter is not used now.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_scsrcsc(job, m, acsr, ja, ia, acsc, ja1, ia1, info)
  INTEGER      job(8)
  INTEGER      m, info
  INTEGER      ja(*), ia(m+1), ja1(*), ia1(m+1)
  REAL         acsr(*), acsc(*)
```

```
SUBROUTINE mkl_dcsrcsc(job, m, acsr, ja, ia, acsc, ja1, ia1, info)
  INTEGER      job(8)
  INTEGER      m, info
  INTEGER      ja(*), ia(m+1), ja1(*), ia1(m+1)
  DOUBLE PRECISION       acsr(*), acsc(*)

SUBROUTINE mkl_ccsrcsc(job, m, acsr, ja, ia, acsc, ja1, ia1, info)
  INTEGER      job(8)
  INTEGER      m, info
  INTEGER      ja(*), ia(m+1), ja1(*), ia1(m+1)
  COMPLEX      acsr(*), acsc(*)

SUBROUTINE mkl_zcsrcsc(job, m, acsr, ja, ia, acsc, ja1, ia1, info)
  INTEGER      job(8)
  INTEGER      m, info
  INTEGER      ja(*), ia(m+1), ja1(*), ia1(m+1)
  DOUBLE COMPLEX        acsr(*), acsc(*)
```

mkl_?csrdia

Converts a sparse matrix in the CSR format to the diagonal format and vice versa (deprecated).

Syntax

`call mkl_scsrdia(job, m, acsr, ja, ia, adia, ndiag, distance, idiag, acsr_rem, ja_rem, ia_rem, info)`

`call mkl_dcsrdia(job, m, acsr, ja, ia, adia, ndiag, distance, idiag, acsr_rem, ja_rem, ia_rem, info)`

`call mkl_ccsrdia(job, m, acsr, ja, ia, adia, ndiag, distance, idiag, acsr_rem, ja_rem, ia_rem, info)`

`call mkl_zcsrdia(job, m, acsr, ja, ia, adia, ndiag, distance, idiag, acsr_rem, ja_rem, ia_rem, info)`

Include Files

- `mkl.fi`

Description

This routine is deprecated. Use the matrix manipulation routinesfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

This routine converts a sparse matrix *A* stored in the compressed sparse row (CSR) format (3-array variation) to the diagonal format and vice versa.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

job

INTEGER

Array, contains the following conversion parameters:

job(1)

If *job*(1)=0, the matrix in the CSR format is converted to the diagonal format;

if *job*(1)=1, the matrix in the diagonal format is converted to the CSR format.

job(2)

If *job*(2)=0, zero-based indexing for the matrix in CSR format is used;

if *job*(2)=1, one-based indexing for the matrix in CSR format is used.

job(3)

If *job*(3)=0, zero-based indexing for the matrix in the diagonal format is used;

if *job*(3)=1, one-based indexing for the matrix in the diagonal format is used.

job(6) - job indicator.

For conversion to the diagonal format:

If *job*(6)=0, diagonals are not selected internally, and *acsr_rem*, *ja_rem*, *ia_rem* are not filled in for the output storage.

If *job*(6)=1, diagonals are not selected internally, and *acsr_rem*, *ja_rem*, *ia_rem* are filled in for the output storage.

If *job*(6)=10, diagonals are selected internally, and *acsr_rem*, *ja_rem*, *ia_rem* are not filled in for the output storage.

If *job*(6)=11, diagonals are selected internally, and *csr_rem*, *ja_rem*, *ia_rem* are filled in for the output storage.

For conversion to the CSR format:

If *job*(6)=0, each entry in the array *adia* is checked whether it is zero. Zero entries are not included in the array *acsr*.

If *job*(6)≠0, each entry in the array *adia* is not checked whether it is zero.

m

INTEGER. Dimension of the matrix *A*.

acsr

(input/output)

REAL for mkl_scsrdia.

DOUBLE PRECISION for mkl_dcsrdia.

COMPLEX for mkl_ccsrdia.

DOUBLE COMPLEX for mkl_zcsrdia.

Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.

ja (input/output)INTEGER. Array containing the column indices for each non-zero element of the matrix *A*.

Its length is equal to the length of the array *acsr*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.

ia (input/output)INTEGER. Array of length *m* + 1, containing indices of elements in the array *acsr*, such that *ia*(*i*) is the index in the array *acsr* of the first non-zero element from the row *i*. The value of the last element*ia*(*m* + 1) is equal to the number of non-zeros plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.

adia (input/output)

REAL for mkl_scsrdia.

DOUBLE PRECISION for mkl_dcsrdia.

COMPLEX for mkl_ccsrdia.

DOUBLE COMPLEX for mkl_zcsrdia.

Array of size (*ndiag* x *idiag*) containing diagonals of the matrix *A*.

The key point of the storage is that each element in the array *adia* retains the row number of the original matrix. To achieve this diagonals in the lower triangular part of the matrix are padded from the top, and those in the upper triangular part are padded from the bottom.

ndiag INTEGER.

Specifies the leading dimension of the array *adia* as declared in the calling (sub)program, must be at least max(1, *m*).

distance INTEGER.

Array of length *idiag*, containing the distances between the main diagonal and each non-zero diagonal to be extracted. The distance is positive if the diagonal is above the main diagonal, and negative if the diagonal is below the main diagonal. The main diagonal has a distance equal to zero.

idiag INTEGER.

Number of diagonals to be extracted. For conversion to diagonal format on return this parameter may be modified.

acsr_rem, *ja_rem*, *ia_rem* Remainder of the matrix in the CSR format if it is needed for conversion to the diagonal format.

Output Parameters

info INTEGER. This parameter is not used now.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_scsrdia(job, m, acsr, ja, ia, adia, ndiag, distance, idiag, acsr_rem, ja_rem,
ia_rem, info)

  INTEGER      job(8)

  INTEGER      m, info, ndiag, idiag

  INTEGER      ja(*), ia(m+1), distance(*), ja_rem(*), ia_rem(*)

  REAL         acsr(*), adia(*), acsr_rem(*)

SUBROUTINE mkl_dcsrdia(job, m, acsr, ja, ia, adia, ndiag, distance, idiag, acsr_rem, ja_rem,
ia_rem, info)

  INTEGER      job(8)

  INTEGER      m, info, ndiag, idiag

  INTEGER      ja(*), ia(m+1), distance(*), ja_rem(*), ia_rem(*)

  DOUBLE PRECISION       acsr(*), adia(*), acsr_rem(*)

SUBROUTINE mkl_ccsrdia(job, m, acsr, ja, ia, adia, ndiag, distance, idiag, acsr_rem, ja_rem,
ia_rem, info)

  INTEGER      job(8)

  INTEGER      m, info, ndiag, idiag

  INTEGER      ja(*), ia(m+1), distance(*), ja_rem(*), ia_rem(*)

  COMPLEX      acsr(*), adia(*), acsr_rem(*)

SUBROUTINE mkl_zcsrdia(job, m, acsr, ja, ia, adia, ndiag, distance, idiag, acsr_rem, ja_rem,
ia_rem, info)

  INTEGER      job(8)

  INTEGER      m, info, ndiag, idiag

  INTEGER      ja(*), ia(m+1), distance(*), ja_rem(*), ia_rem(*)

  DOUBLE COMPLEX       acsr(*), adia(*), acsr_rem(*)
```

mkl_?csrsky

Converts a sparse matrix in CSR format to the skyline format and vice versa (deprecated).

Syntax

```
call mkl_scsrsky(job, m, acsr, ja, ia, asky, pointers, info)

call mkl_dcsrsky(job, m, acsr, ja, ia, asky, pointers, info)

call mkl_ccsrsky(job, m, acsr, ja, ia, asky, pointers, info)

call mkl_zcsrsky(job, m, acsr, ja, ia, asky, pointers, info)
```

Include Files

Description

This routine is deprecated. Use the matrix manipulation routinesfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

This routine converts a sparse matrix *A* stored in the compressed sparse row (CSR) format (3-array variation) to the skyline format and vice versa.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

job INTEGER

Array, contains the following conversion parameters:

job(1)

If *job*(1)=0, the matrix in the CSR format is converted to the skyline format;

if *job*(1)=1, the matrix in the skyline format is converted to the CSR format.

job(2)

If *job*(2)=0, zero-based indexing for the matrix in CSR format is used;

if *job*(2)=1, one-based indexing for the matrix in CSR format is used.

job(3)

If *job*(3)=0, zero-based indexing for the matrix in the skyline format is used;

if *job*(3)=1, one-based indexing for the matrix in the skyline format is used.

job(4)

For conversion to the skyline format:

If *job*(4)=0, the upper part of the matrix *A* in the CSR format is converted.

If *job*(4)=1, the lower part of the matrix *A* in the CSR format is converted.

For conversion to the CSR format:

If *job*(4)=0, the matrix is converted to the upper part of the matrix *A* in the CSR format.

If *job*(4)=1, the matrix is converted to the lower part of the matrix *A* in the CSR format.

job(5)

job(5)=*nzmax* - maximum number of the non-zero elements of the matrix *A* if *job*(1)=0.

job(6) - job indicator.

Only for conversion to the skyline format:

If *job*(6)=0, only arrays *pointers* is filled in for the output storage.

If *job*(6)=1, all output arrays *asky* and *pointers* are filled in for the output storage.

m INTEGER. Dimension of the matrix *A*.

acsr (input/output)

REAL for mkl_scsrsky.

DOUBLE PRECISION for mkl_dcsrsky.

COMPLEX for mkl_ccsrsky.

DOUBLE COMPLEX for mkl_zcsrsky.

Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.

ja (input/output)INTEGER. Array containing the column indices for each non-zero element of the matrix *A*.

Its length is equal to the length of the array *acsr*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.

ia (input/output)INTEGER. Array of length *m* + 1, containing indices of elements in the array *acsr*, such that *ia*(*i*) is the index in the array *acsr* of the first non-zero element from the row *i*. The value of the last element*ia*(*m* + 1) is equal to the number of non-zeros plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.

asky (input/output)

REAL for mkl_scsrsky.

DOUBLE PRECISION for mkl_dcsrsky.

COMPLEX for mkl_ccsrsky.

DOUBLE COMPLEX for mkl_zcsrsky.

Array, for a lower triangular part of *A* it contains the set of elements from each row starting from the first none-zero element to and including the diagonal element. For an upper triangular matrix it contains the set of elements from each column of the matrix starting with the first non-zero element down to and including the diagonal element. Encountered zero elements are included in the sets. Refer to *values* array description in Skyline Storage Format for more details.

pointers (input/output)INTEGER.

Array with dimension (*m*+1), where *m* is number of rows for lower triangle (columns for upper triangle), *pointers*(*i*) – *pointers*(1) + 1 gives the index of element in the array *asky* that is first non-zero element in row

(column)*i* . The value of *pointers*(*m* + 1) is set to *nnz* + *pointers*(1), where *nnz* is the number of elements in the array *asky*. Refer to *pointers* array description in Skyline Storage Format for more details

Output Parameters

info INTEGER. Integer info indicator only for converting the matrix *A* from the CSR format.

If *info*=0, the execution is successful.

If *info*=1, the routine is interrupted because there is no space in the array *asky* according to the value *nzmax*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_scsrsky(job, m, acsr, ja, ia, asky, pointers, info)
  INTEGER      job(8)
  INTEGER      m, info
  INTEGER      ja(*), ia(m+1), pointers(m+1)
  REAL         acsr(*), asky(*)

SUBROUTINE mkl_dcsrsky(job, m, acsr, ja, ia, asky, pointers, info)
  INTEGER      job(8)
  INTEGER      m, info
  INTEGER      ja(*), ia(m+1), pointers(m+1)
  DOUBLE PRECISION       acsr(*), asky(*)

SUBROUTINE mkl_ccsrsky(job, m, acsr, ja, ia, asky, pointers, info)
  INTEGER      job(8)
  INTEGER      m, info
  INTEGER      ja(*), ia(m+1), pointers(m+1)
  COMPLEX      acsr(*), asky(*)

SUBROUTINE mkl_zcsrsky(job, m, acsr, ja, ia, asky, pointers, info)
  INTEGER      job(8)
  INTEGER      m, info
  INTEGER      ja(*), ia(m+1), pointers(m+1)
  DOUBLE COMPLEX       acsr(*), asky(*)
```

mkl_?csradd

Computes the sum of two matrices stored in the CSR format (3-array variation) with one-based indexing (deprecated).

Syntax

```
call mkl_scsradd(trans, request, sort, m, n, a, ja, ia, beta, b, jb, ib, c, jc, ic, nzmax, info)
call mkl_dcsradd(trans, request, sort, m, n, a, ja, ia, beta, b, jb, ib, c, jc, ic, nzmax, info)
call mkl_ccsradd(trans, request, sort, m, n, a, ja, ia, beta, b, jb, ib, c, jc, ic, nzmax, info)
call mkl_zcsradd(trans, request, sort, m, n, a, ja, ia, beta, b, jb, ib, c, jc, ic, nzmax, info)
```

Include Files

- mkl.fi

Description

This routine is deprecated. Use mkl_sparse_?_addfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_?csradd routine performs a matrix-matrix operation defined as

```
C := A+beta*op(B)
```

where:

A, *B*, *C* are the sparse matrices in the CSR format (3-array variation).

op(*B*) is one of op(*B*) = *B*, or op(*B*) = B^T, or op(*B*) = B^H

beta is a scalar.

The routine works correctly if and only if the column indices in sparse matrix representations of matrices *A* and *B* are arranged in the increasing order for each row. If not, use the parameter *sort* (see below) to reorder column indices and the corresponding elements of the input matrices.

NOTE
This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

trans CHARACTER*1. Specifies the operation.

If *trans* = 'N' or 'n', then *C* := *A*+*beta***B*

If *trans* = 'T' or 't', then *C* := *A*+*beta***B*^{T}

If *trans* = 'C' or 'c', then *C* := *A*+*beta***B*^{H}.

request INTEGER.

If *request*=0, the routine performs addition. The memory for the output arrays *ic*, *jc*, *c* must be allocated beforehand.

If *request*=1, the routine only computes the values of the array *ic* of length *m* + 1. The memory for the *ic* array must be allocated beforehand. On exit the value *ic*(*m*+1) – 1 is the actual number of the elements in the arrays *c* and *jc*.

If *request*=2, after the routine is called previously with the parameter *request*=1 and after the output arrays *jc* and *c* are allocated in the calling program with length at least *ic*(*m*+1) – 1, the routine performs addition.

sort INTEGER. Specifies the type of reordering. If this parameter is not set (default), the routine does not perform reordering.

If *sort*=1, the routine arranges the column indices *ja* for each row in the increasing order and reorders the corresponding values of the matrix *A* in the array *a*.

If *sort*=2, the routine arranges the column indices *jb* for each row in the increasing order and reorders the corresponding values of the matrix *B* in the array *b*.

If *sort*=3, the routine performs reordering for both input matrices *A* and *B*.

m INTEGER. Number of rows of the matrix *A*.

n INTEGER. Number of columns of the matrix *A*.

a REAL for mkl_scsradd.

DOUBLE PRECISION for mkl_dcsradd.

COMPLEX for mkl_ccsradd.

DOUBLE COMPLEX for mkl_zcsradd.

Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.

ja INTEGER. Array containing the column indices for each non-zero element of the matrix *A*. For each row the column indices must be arranged in the increasing order.

The length of this array is equal to the length of the array *a*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.

ia INTEGER. Array of length *m* + 1, containing indices of elements in the array *a*, such that *ia*(*i*) is the index in the array *a* of the first non-zero element from the row *i*. The value of the last element *ia*(*m* + 1) is equal to the number of non-zero elements of the matrix *A* plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.

beta REAL for mkl_scsradd.

DOUBLE PRECISION for mkl_dcsradd.

COMPLEX for mkl_ccsradd.

DOUBLE COMPLEX for mkl_zcsradd.

Specifies the scalar *beta*.

b

REAL for mkl_scsradd.

DOUBLE PRECISION for mkl_dcsradd.

COMPLEX for mkl_ccsradd.

DOUBLE COMPLEX for mkl_zcsradd.

Array containing non-zero elements of the matrix *B*. Its length is equal to the number of non-zero elements in the matrix *B*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.

jb

INTEGER. Array containing the column indices for each non-zero element of the matrix *B*. For each row the column indices must be arranged in the increasing order.

The length of this array is equal to the length of the array *b*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.

ib

INTEGER. Array of length *m* + 1 when *trans* = 'N' or 'n', or *n* + 1 otherwise.

This array contains indices of elements in the array *b*, such that *ib*(*i*) is the index in the array *b* of the first non-zero element from the row *i*. The value of the last element *ib*(*m* + 1) or *ib*(*n* + 1) is equal to the number of non-zero elements of the matrix *B* plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.

nzmax

INTEGER. The length of the arrays *c* and *jc*.

This parameter is used only if *request*=0. The routine stops calculation if the number of elements in the result matrix *C* exceeds the specified value of *nzmax*.

Output Parameters

c

REAL for mkl_scsradd.

DOUBLE PRECISION for mkl_dcsradd.

COMPLEX for mkl_ccsradd.

DOUBLE COMPLEX for mkl_zcsradd.

Array containing non-zero elements of the result matrix *C*. Its length is equal to the number of non-zero elements in the matrix *C*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.

jc

INTEGER. Array containing the column indices for each non-zero element of the matrix *C*.

The length of this array is equal to the length of the array *c*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.

ic INTEGER. Array of length *m* + 1, containing indices of elements in the array *c*, such that *ic*(*i*) is the index in the array *c* of the first non-zero element from the row *i*. The value of the last element *ic*(*m* + 1) is equal to the number of non-zero elements of the matrix *C* plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.

info INTEGER.

If *info*=0, the execution is successful.

If *info*=*I*>0, the routine stops calculation in the *I*-th row of the matrix *C* because number of elements in *C* exceeds *nzmax*.

If *info*=-1, the routine calculates only the size of the arrays *c* and *jc* and returns this value plus 1 as the last element of the array *ic*.

Interfaces

FORTRAN 77:

```

```

mkl_?csrmultcsr

Computes product of two sparse matrices stored in the CSR format (3-array variation) with one-based indexing (deprecated).

Syntax

```
call mkl_scsrmultcsr(trans, request, sort, m, n, k, a, ja, ia, b, jb, ib, c, jc, ic, nzmax, info)
call mkl_dcsrmultcsr(trans, request, sort, m, n, k, a, ja, ia, b, jb, ib, c, jc, ic, nzmax, info)
call mkl_ccsrmultcsr(trans, request, sort, m, n, k, a, ja, ia, b, jb, ib, c, jc, ic, nzmax, info)
call mkl_zcsrmultcsr(trans, request, sort, m, n, k, a, ja, ia, b, jb, ib, c, jc, ic, nzmax, info)
```

Include Files

- mkl.fi

Description

This routine is deprecated. Use mkl_sparse_spmmfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_?csrmultcsr routine performs a matrix-matrix operation defined as

```
C := op(A)*B
```

where:

A, *B*, *C* are the sparse matrices in the CSR format (3-array variation);

op(*A*) is one of op(*A*) = *A*, or op(*A*) =A^T, or op(*A*) = A^H .

You can use the parameter *sort* to perform or not perform reordering of non-zero entries in input and output sparse matrices. The purpose of reordering is to rearrange non-zero entries in compressed sparse row matrix so that column indices in compressed sparse representation are sorted in the increasing order for each row.

The following table shows correspondence between the value of the parameter *sort* and the type of reordering performed by this routine for each sparse matrix involved:

Value of the parameter *sort*	**Reordering of *A* (arrays** *a*, *ja*, *ia***)**	**Reordering of *B* (arrays** *b*, *ja*, *ib***)**	**Reordering of *C* (arrays** *c*, *jc*, *ic***)**
1	yes	no	yes
2	no	yes	yes
3	yes	yes	yes
4	yes	no	no
5	no	yes	no
6	yes	yes	no
7	no	no	no
arbitrary value not equal to 1, 2,..., 7	no	no	yes

NOTE
This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

trans

CHARACTER*1. Specifies the operation.

If *trans* = 'N' or 'n', then $C := A*B$

If *trans* = 'T' or 't' or 'C' or 'c', then $C := A^{T}*B$.

request

INTEGER.

If *request*=0, the routine performs multiplication, the memory for the output arrays *ic*, *jc*, *c* must be allocated beforehand.

If *request*=1, the routine computes only values of the array *ic* of length *m* + 1, the memory for this array must be allocated beforehand. On exit the value *ic*(*m*+1) – 1 is the actual number of the elements in the arrays *c* and *jc*.

If *request*=2, the routine has been called previously with the parameter *request*=1, the output arrays *jc* and *c* are allocated in the calling program and they are of the length *ic*(*m*+1) – 1 at least.

sort

INTEGER. Specifies whether the routine performs reordering of non-zeros entries in input and/or output sparse matrices (see table above).

m

INTEGER. Number of rows of the matrix *A*.

n

INTEGER. Number of columns of the matrix *A*.

k

INTEGER. Number of columns of the matrix *B*.

a

REAL for mkl_scsrmultcsr.

DOUBLE PRECISION for mkl_dcsrmultcsr.

COMPLEX for mkl_ccsrmultcsr.

DOUBLE COMPLEX for mkl_zcsrmultcsr.

Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.

ja

INTEGER. Array containing the column indices for each non-zero element of the matrix *A*. For each row the column indices must be arranged in the increasing order.

The length of this array is equal to the length of the array *a*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.

ia

INTEGER. Array of length *m* + 1.

This array contains indices of elements in the array *a*, such that *ia(i)* is the index in the array *a* of the first non-zero element from the row *i*. The value of the last element *ia(m + 1)* is equal to the number of non-zero elements of the matrix *A* plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.

b

REAL for mkl_scsrmultcsr.

DOUBLE PRECISION for mkl_dcsrmultcsr.

COMPLEX for mkl_ccsrmultcsr.

DOUBLE COMPLEX for mkl_zcsrmultcsr.

Array containing non-zero elements of the matrix *B*. Its length is equal to the number of non-zero elements in the matrix *B*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.

jb

INTEGER. Array containing the column indices for each non-zero element of the matrix *B*. For each row the column indices must be arranged in the increasing order.

The length of this array is equal to the length of the array *b*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.

ib

INTEGER. Array of length *n + 1* when *trans = 'N'* or *'n'*, or *m + 1* otherwise.

This array contains indices of elements in the array *b*, such that *ib(i)* is the index in the array *b* of the first non-zero element from the row *i*. The value of the last element *ib(n + 1)* or *ib(m + 1)* is equal to the number of non-zero elements of the matrix *B* plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.

nzmax

INTEGER. The length of the arrays *c* and *jc*.

This parameter is used only if *request*=0. The routine stops calculation if the number of elements in the result matrix *C* exceeds the specified value of *nzmax*.

Output Parameters

c

REAL for mkl_scsrmultcsr.

DOUBLE PRECISION for mkl_dcsrmultcsr.

COMPLEX for mkl_ccsrmultcsr.

DOUBLE COMPLEX for mkl_zcsrmultcsr.

Array containing non-zero elements of the result matrix *C*. Its length is equal to the number of non-zero elements in the matrix *C*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.

jc

INTEGER. Array containing the column indices for each non-zero element of the matrix *C*.

The length of this array is equal to the length of the array *c*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.

ic INTEGER. Array of length *m* + 1 when *trans* = 'N' or 'n', or *n* + 1 otherwise.

This array contains indices of elements in the array *c*, such that *ic*(*i*) is the index in the array *c* of the first non-zero element from the row *i*. The value of the last element *ic*(*m* + 1) or *ic*(*n* + 1) is equal to the number of non-zero elements of the matrix *C* plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.

info INTEGER.

If *info*=0, the execution is successful.

If *info*=*I*>0, the routine stops calculation in the *I*-th row of the matrix *C* because number of elements in *C* exceeds *nzmax*.

If *info*=-1, the routine calculates only the size of the arrays *c* and *jc* and returns this value plus 1 as the last element of the array *ic*.

Interfaces

FORTRAN 77:

```

   DOUBLE COMPLEX       a(*), b(*), c(*)
```

mkl_?csrmultd

Computes product of two sparse matrices stored in the CSR format (3-array variation) with one-based indexing. The result is stored in the dense matrix (deprecated).

Syntax

```
call mkl_scsrmultd(trans, m, n, k, a, ja, ia, b, jb, ib, c, ldc)
call mkl_dcsrmultd(trans, m, n, k, a, ja, ia, b, jb, ib, c, ldc)
call mkl_ccsrmultd(trans, m, n, k, a, ja, ia, b, jb, ib, c, ldc)
call mkl_zcsrmultd(trans, m, n, k, a, ja, ia, b, jb, ib, c, ldc)
```

Include Files

- mkl.fi

Description

This routine is deprecated. Use mkl_sparse_?_spmmdfrom the Intel® oneAPI Math Kernel Library (oneMKL) Inspector-executor Sparse BLAS interface instead.

The mkl_?csrmultd routine performs a matrix-matrix operation defined as

```
C := op(A)*B
```

where:

A, *B* are the sparse matrices in the CSR format (3-array variation), *C* is dense matrix;

op(*A*) is one of op(*A*) = *A*, or op(*A*) = A^T, or op(*A*) = A^H .

The routine works correctly if and only if the column indices in sparse matrix representations of matrices *A* and *B* are arranged in the increasing order for each row.

> **NOTE**
> This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

trans CHARACTER*1. Specifies the operation.

If *trans* = 'N' or 'n', then *C* := *A***B*

If *trans* = 'T' or 't' or 'C' or 'c', then *C* := A^T**B*.

m INTEGER. Number of rows of the matrix *A*.

n INTEGER. Number of columns of the matrix *A*.

k INTEGER. Number of columns of the matrix *B*.

a REAL for mkl_scsrmultd.

DOUBLE PRECISION for mkl_dcsrmultd.

COMPLEX for mkl_ccsrmultd.

DOUBLE COMPLEX for mkl_zcsrmultd.

Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.

ja INTEGER. Array containing the column indices for each non-zero element of the matrix *A*. For each row the column indices must be arranged in the increasing order.

The length of this array is equal to the length of the array *a*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.

ia INTEGER. Array of length *m* + 1 when *trans* = 'N' or 'n', or *n* + 1 otherwise.

This array contains indices of elements in the array *a*, such that *ia*(*i*) is the index in the array *a* of the first non-zero element from the row *i*. The value of the last element *ia*(*m* + 1) or *ia*(*n* + 1) is equal to the number of non-zero elements of the matrix *A* plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.

b REAL for mkl_scsrmultd.

DOUBLE PRECISION for mkl_dcsrmultd.

COMPLEX for mkl_ccsrmultd.

DOUBLE COMPLEX for mkl_zcsrmultd.

Array containing non-zero elements of the matrix *B*. Its length is equal to the number of non-zero elements in the matrix *B*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.

jb INTEGER. Array containing the column indices for each non-zero element of the matrix *B*. For each row the column indices must be arranged in the increasing order.

The length of this array is equal to the length of the array *b*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.

ib INTEGER. Array of length *m* + 1.

This array contains indices of elements in the array *b*, such that *ib(i)* is the index in the array *b* of the first non-zero element from the row *i*. The value of the last element *ib(m + 1)* is equal to the number of non-zero elements of the matrix *B* plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.

Output Parameters

c

REAL for mkl_scsrmultd.

DOUBLE PRECISION for mkl_dcsrmultd.

COMPLEX for mkl_ccsrmultd.

DOUBLE COMPLEX for mkl_zcsrmultd.

Array containing non-zero elements of the result matrix *C*.

ldc

INTEGER. Specifies the leading dimension of the dense matrix *C* as declared in the calling (sub)program. Must be at least max(*m*, 1) when *trans* = 'N' or 'n', or max(1, *n*) otherwise.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_scsrmultd( trans, m, n, k, a, ja, ia, b, jb, ib, c, ldc)
   CHARACTER*1  trans
   INTEGER       m, n, k, ldc
   INTEGER       ja(*), jb(*), ia(*), ib(*)

   INTEGER       m, n, k, ldc
   INTEGER       ja(*), jb(*), ia(*), ib(*)
   COMPLEX     a(*), b(*), c(ldc, *)
```

```
SUBROUTINE mkl_zcsrmultd( trans, m, n, k, a, ja, ia, b, jb, ib, c, ldc)
   CHARACTER*1  trans
   INTEGER       m, n, k, ldc
   INTEGER       ja(*), jb(*), ia(*), ib(*)
   DOUBLE COMPLEX      a(*), b(*), c(ldc, *)
```

Sparse QR Routines

Sparse QR routines and their data types

Routine or function group	Data types	Description
mkl_sparse_set_qr_hint		Enables a pivot strategy for an ill-conditioned matrix.
mkl_sparse_?_qr	s,d	Calculates the solution of a sparse system of linear equations using QR factorization.
mkl_sparse_qr_reorder		Performs reordering and symbolic analysis of the matrix *A*.
mkl_sparse_?_qr_factorize	s,d	Performs numerical factorization of the matrix *A*.
mkl_sparse_?_qr_solve	s,d	Solves the system *A*x = b* using QR factorization of the matrix *A*.
mkl_sparse_?_qr_qmult	s,d	Performs *x := Q^(-1)*b*.
mkl_sparse_?_qr_rsolve	s,d	Performs *x := R^(-1)*b*.

NOTE The underdetermined systems of equations are not supported. The number of columns should be less or equal to the number or rows.

For more information about the workflow of sparse QR functionality, refer to oneMKL Sparse QR solver. Multifrontal Sparse QR Factorization Method for Solving a Sparse System of Linear Equations.

mkl_sparse_set_qr_hint

Define the pivot strategy for further calls of `mkl_sparse_?_qr`.

Syntax

```
stat = mkl_sparse_set_qr_hint ( A, hint )
```

Include Files

- `mkl_sparse_qr.f90`

Description

You can use this routine to enable a pivot strategy in the case of an ill-conditioned matrix.

Input Parameters

A — `SPARSE_MATRIX_T`

Handle containing a sparse matrix in an internal data structure.

hint — `C_INT`

Value specifying whether to use pivoting.

NOTE The only value currently supported is SPARSE_QR_WITH_PIVOTS, which enables the use of a pivot strategy for an ill-conditioned matrix.

Output Parameters

stat INTEGER

Value indicating whether the operation was successful, and if not, why:

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_?_qr

Computes the QR decomposition for the matrix of a sparse linear system and calculates the solution.

Syntax

```
stat = mkl_sparse_d_qr (operation, A, descr, layout, *columns, x, *ldx, b, ldb)
stat = mkl_sparse_s_qr (operation, A, descr, layout, x, columns, ldx, b, ldb)
```

Include Files

- mkl_sparse_qr.f90

Description

The mkl_sparse_?_qr routine computes the QR decomposition for the matrix of a sparse linear system $A*x = b$, so that $A = Q*R$ where Q is the orthogonal matrix and R is upper triangular, and calculates the solution.

NOTE
Currently, mkl_sparse_?_qr supports only square and overdetermined systems. For underdetermined systems you can manually transpose the system matrix and use QR decomposition for A^T to get the minimum-norm solution for the original underdetermined system.

NOTE Currently, mkl_sparse_?_qr supports only CSR format for the input matrix, non-transpose operation, and single right-hand side.

Input Parameters

operation C_INT

Specifies the operation to perform.

> **NOTE** Currently, the only suppored value is SPARSE_OPERATION_NON_TRANSPOSE (non-transpose case; that is, *A*x* = *b* is solved).

A SPARSE_MATRIX_T

Handle containing a sparse matrix in an internal data structure.

descr MATRIX_DESCR

Structure specifying sparse matrix properties. Only the parameters listed here are currently supported.

type Specifies the type of sparse matrix.

> **NOTE** Currently, the only supported value is SPARSE_MATRIX_TYPE_GENERAL (the matrix is processed as-is).

layout C_INT

Describes the storage scheme for the dense matrix:

SPARSE_LAYOUT_COLUMN_MAJOR	Storage of elements uses column-major layout.
SPARSE_LAYOUT_ROW_MAJOR	Storage of elements uses row-major layout.

x C_FLOAT for mkl_sparse_s_qr; C_DOUBLE for mkl_sparse_d_qr

Array with a size of at least *rows***cols*:

	layout = SPARSE_LAYOUT_COLUMN_MAJOR	*layout* = SPARSE_LAYOUT_ROW_MAJOR
rows (number of rows in *x*)	*ldx*	Number of columns in *A*
cols (number of columns in *x*)	*columns*	*ldx*

columns C_INT

Number of columns in matrix *b*.

ldx C_INT

Specifies the leading dimension of matrix *x*.

b C_FLOAT for mkl_sparse_s_qr; C_DOUBLE for mkl_sparse_d_qr

Array with a size of at least *rows***cols*:

	layout = SPARSE_LAYOUT_COLUMN_MAJOR	*layout* = SPARSE_LAYOUT_ROW_MAJOR
rows (number of rows in *b*)	*ldb*	Number of columns in *A*
cols (number of columns in *b*)	*columns*	*ldb*

ldb

C_INT

Specifies the leading dimension of matrix *b*.

Output Parameters

x

C_FLOAT for mkl_sparse_s_qr; C_DOUBLE for mkl_sparse_d_qr

Overwritten by the updated matrix *y*.

stat

INTEGER

Value indicating whether the operation was successful, and if not, why:

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_qr_reorder

Reordering step of SPARSE QR solver.

Syntax

```
stat = mkl_sparse_qr_reorder ( A, descr )
```

Include Files

- mkl_sparse_qr.f90

Description

The mkl_sparse_qr_reorder routine performs ordering and symbolic analysis of matrix *A*.

NOTE Currently, `mkl_sparse_qr_reorder` supports only general structure and CSR format for the input matrix.

Input Parameters

A `SPARSE_MATRIX_T`

Handle containing a sparse matrix in an internal data structure.

descr `MATRIX_DESCR`

Structure specifying sparse matrix properties. Only the parameters listed here are currently supported.

Output Parameters

stat `INTEGER`

Value indicating whether the operation was successful, and if not, why:

`SPARSE_STATUS_SUCCESS`	The operation was successful.
`SPARSE_STATUS_NOT_INITIALIZED`	The routine encountered an empty handle or matrix array.
`SPARSE_STATUS_ALLOC_FAILED`	Internal memory allocation failed.
`SPARSE_STATUS_INVALID_VALUE`	The input parameters contain an invalid value.
`SPARSE_STATUS_EXECUTION_FAILED`	Execution failed.
`SPARSE_STATUS_INTERNAL_ERROR`	An error in algorithm implementation occurred.
`SPARSE_STATUS_NOT_SUPPORTED`	The requested operation is not supported.

mkl_sparse_?_qr_factorize

Factorization step of the SPARSE QR solver.

Syntax

```
stat = mkl_sparse_d_qr_factorize (A, alt_values)
stat = mkl_sparse_s_qr_factorize (A, alt_values)
```

Include Files

- `mkl_sparse_qr.f90`

Description

The `mkl_sparse_?_qr_factorize` routine performs numerical factorization of matrix *A*. Prior to calling this routine, the `mkl_sparse_?_qr_reorder` routine must be called for the matrix handle *A*. For more information about the workflow of sparse QR functionality, refer to oneMKL Sparse QR solver. Multifrontal Sparse QR Factorization Method for Solving a Sparse System of Linear Equations.

NOTE Currently, `mkl_sparse_?_qr_factorize` supports only CSR format for the input matrix.

Input Parameters

A — SPARSE_MATRIX_T

Handle containing a sparse matrix in an internal data structure.

alt_values — C_FLOAT for mkl_sparse_s_qr_factorize; C_DOUBLE for mkl_sparse_d_qr_factorize

Array with alternative values. Must be the size of the non-zeroes in the initial input matrix. When passed to the routine, these values will be used during the factorization step instead of the values stored in handle *A*.

Output Parameters

stat — INTEGER

Value indicating whether the operation was successful, and if not, why:

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_?_qr_solve

Solving step of the SPARSE QR solver.

Syntax

```
stat = mkl_sparse_d_qr_solve (operation, A, alt_values, layout, x, columns, ldx, b, ldb)
stat = mkl_sparse_s_qr_solve (operation, A, alt_values, layout, x, columns, ldx, b, ldb)
```

Include Files

- mkl_sparse_qr.f90

Description

The mkl_sparse_?_qr_solve routine computes the solution of sparse systems of linear equations *A*x* = *b*. Prior to calling this routine, the mkl_sparse_?_qr_factorize routine must be called for the matrix handle *A*. For more information about the workflow of sparse QR functionality, refer to oneMKL Sparse QR solver. Multifrontal Sparse QR Factorization Method for Solving a Sparse System of Linear Equations.

NOTE
Currently, `mkl_sparse_?_qr_solve` supports only CSR format for the input matrix, non-transpose operation, and single right-hand side.

Alternative values are not supported and must be set to NULL.

Input Parameters

operation

`C_INT`

Specifies the operation to perform.

NOTE Currently, the only supported value is `SPARSE_OPERATION_NON_TRANSPOSE` (non-transpose case; that is, *A*x = b* is solved).

A

`SPARSE_MATRIX_T`

Handle containing a sparse matrix in an internal data structure.

alt_values

`C_FLOAT` for `mkl_sparse_s_qr_solve`; `C_DOUBLE` for `mkl_sparse_d_qr_solve`

Reserved for future use.

layout

`C_INT`

Describes the storage scheme for the dense matrix:

`SPARSE_LAYOUT_COLUMN_MAJOR`	Storage of elements uses column-major layout.
`SPARSE_LAYOUT_ROW_MAJOR`	Storage of elements uses row-major layout.

x

`C_FLOAT` for `mkl_sparse_s_qr`; `C_DOUBLE` for `mkl_sparse_d_qr`

Array with a size of at least *rows*cols*:

	layout = `SPARSE_LAYOUT_COLUMN_MAJOR`	*layout* = `SPARSE_LAYOUT_ROW_MAJOR`
rows (number of rows in *x*)	*ldx*	Number of columns in *A*
cols (number of columns in *x*)	*columns*	*ldx*

columns

`C_INT`

Number of columns in matrix *b*.

ldx

`C_INT`

Specifies the leading dimension of matrix *x*.

b

`C_FLOAT for mkl_sparse_s_qr; C_DOUBLE for mkl_sparse_d_qr`

Array with a size of at least *rows*cols*:

	layout = SPARSE_LAYOUT_COLUMN_MAJOR	*layout* = SPARSE_LAYOUT_ROW_MAJOR
rows (number of rows in *b*)	*ldb*	Number of columns in *A*
cols (number of columns in *b*)	*columns*	*ldb*

ldb C_INT

Specifies the leading dimension of matrix *b*.

Output Parameters

x C_FLOAT for mkl_sparse_s_qr; C_DOUBLE for mkl_sparse_d_qr

Contains the solution of system *A*x = b*.

stat INTEGER

Value indicating whether the operation was successful, and if not, why:

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_?_qr_qmult

First stage of the solving step of the SPARSE QR solver.

Syntax

```
stat = mkl_sparse_d_qr_qmult (operation, A, layout, x, columns, ldx, b, ldb)
stat = mkl_sparse_s_qr_qmult (operation, A, layout, x, columns, ldx, b, ldb)
```

Include Files

- mkl_sparse_qr.f90

Description

The mkl_sparse_?_qr_qmult routine computes multiplication of inversed matrix *Q* and right-hand side matrix *b*. This routine can be used to perform the solving step in two separate calls as an alternative to a single call of mkl_sparse_?_qr_solve.

NOTE Currently, `mkl_sparse_?_qr_qmult` supports only CSR format for the input matrix, non-transpose operation, and single right-hand side.

Input Parameters

operation

`C_INT`

Specifies the operation to perform.

NOTE Currently, the only supported value is `SPARSE_OPERATION_NON_TRANSPOSE` (non-transpose case; that is, *A*x = b* is solved).

A

`SPARSE_MATRIX_T`

Handle containing a sparse matrix in an internal data structure.

layout

`C_INT`

Describes the storage scheme for the dense matrix:

`SPARSE_LAYOUT_COLUMN_MAJOR`	Storage of elements uses column-major layout.
`SPARSE_LAYOUT_ROW_MAJOR`	Storage of elements uses row-major layout.

x

`C_FLOAT` for `mkl_sparse_s_qr`; `C_DOUBLE` for `mkl_sparse_d_qr`

Array with a size of at least *rows*cols*:

	layout = SPARSE_LAYOUT_COLUMN_MAJOR	*layout* = SPARSE_LAYOUT_ROW_MAJOR
rows (number of rows in *x*)	*ldx*	Number of columns in *A*
cols (number of columns in *x*)	*columns*	*ldx*

columns

`C_INT`

Number of columns in matrix *b*.

ldx

`C_INT`

Specifies the leading dimension of matrix *x*.

b

`C_FLOAT for mkl_sparse_s_qr; C_DOUBLE for mkl_sparse_d_qr`

Array with a size of at least *rows*cols*:

	layout = SPARSE_LAYOUT_COLUMN_MAJOR	*layout* = SPARSE_LAYOUT_ROW_MAJOR

rows (number of rows in *b*)	*ldb*	Number of columns in *A*
cols (number of columns in *b*)	*columns*	*ldb*

ldb C_INT

Specifies the leading dimension of matrix *b*.

Output Parameters

x C_FLOAT for mkl_sparse_s_qr; C_DOUBLE for mkl_sparse_d_qr

Overwritten by the updated matrix $x = Q^{-1}*b$.

stat INTEGER

Value indicating whether the operation was successful, and if not, why:

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_?_qr_rsolve

Second stage of the solving step of the SPARSE QR solver.

Syntax

```
stat = mkl_sparse_d_qr_rsolve (operation, A, layout, x, columns, ldx, b, ldb)
stat = mkl_sparse_s_qr_rsolve (operation, A, layout, x, columns, ldx, b, ldb)
```

Include Files

- mkl_sparse_qr.f90

Description

The mkl_sparse_?_qr_rsolve routine computes the solution of $A*x = b$.

NOTE Currently, `mkl_sparse_?_qr_rsolve` supports only CSR format for the input matrix, non-transpose operation, and single right-hand side.

Input Parameters

operation

`C_INT`

Specifies the operation to perform.

NOTE Currently, the only supported value is `SPARSE_OPERATION_NON_TRANSPOSE` (non-transpose case; that is, *A*x = b* is solved).

A

`SPARSE_MATRIX_T`

Handle containing a sparse matrix in an internal data structure.

layout

`C_INT`

Describes the storage scheme for the dense matrix:

`SPARSE_LAYOUT_COLUMN_MAJOR`	Storage of elements uses column-major layout.
`SPARSE_LAYOUT_ROW_MAJOR`	Storage of elements uses row-major layout.

x

`C_FLOAT` for `mkl_sparse_s_qr`; `C_DOUBLE` for `mkl_sparse_d_qr`

Array with a size of at least *rows*cols*:

	layout = SPARSE_LAYOUT_COLUMN_MAJOR	*layout* = SPARSE_LAYOUT_ROW_MAJOR
rows (number of rows in *x*)	*ldx*	Number of columns in *A*
cols (number of columns in *x*)	*columns*	*ldx*

columns

`C_INT`

Number of columns in matrix *b*.

ldx

`C_INT`

Specifies the leading dimension of matrix *x*.

b

`C_FLOAT for mkl_sparse_s_qr; C_DOUBLE for mkl_sparse_d_qr`

Array with a size of at least *rows*cols*:

	layout = SPARSE_LAYOUT_COLUMN_MAJOR	*layout* = SPARSE_LAYOUT_ROW_MAJOR

rows (number of rows in `b`)	`ldb`	Number of columns in `A`
cols (number of columns in `b`)	`columns`	`ldb`

`ldb`

`C_INT`

Specifies the leading dimension of matrix `b`.

Output Parameters

`x`

`C_FLOAT` for `mkl_sparse_s_qr`; `C_DOUBLE` for `mkl_sparse_d_qr`

Contains the solution of the triangular system *R*x = b*.

`stat`

`INTEGER`

Value indicating whether the operation was successful, and if not, why:

`SPARSE_STATUS_SUCCESS`	The operation was successful.
`SPARSE_STATUS_NOT_INITIALIZED`	The routine encountered an empty handle or matrix array.
`SPARSE_STATUS_ALLOC_FAILED`	Internal memory allocation failed.
`SPARSE_STATUS_INVALID_VALUE`	The input parameters contain an invalid value.
`SPARSE_STATUS_EXECUTION_FAILED`	Execution failed.
`SPARSE_STATUS_INTERNAL_ERROR`	An error in algorithm implementation occurred.
`SPARSE_STATUS_NOT_SUPPORTED`	The requested operation is not supported.

Inspector-executor Sparse BLAS Routines

The inspector-executor API for Sparse BLAS divides operations into two stages: analysis and execution. During the initial analysis stage, the API inspects the matrix sparsity pattern and applies matrix structure changes. In the execution stage, subsequent routine calls reuse this information in order to improve performance.

The inspector-executor API supports key Sparse BLAS operations for iterative sparse solvers:

- Sparse matrix-vector multiplication
- Sparse matrix-matrix multiplication with a sparse or dense result
- Solution of triangular systems
- Sparse matrix addition

Naming Conventions in Inspector-Executor Sparse BLAS Routines

The Inspector-Executor Sparse BLAS API routine names use the following convention:

```
mkl_sparse_[<character>_]<operation>[_<format>]
```

The <*character*> field indicates the data type:

s	real, single precision
c	complex, single precision
d	real, double precision
z	complex, double precision

The data type is included in the name only if the function accepts dense matrix or scalar floating point parameters.

The <*operation*> field indicates the type of operation:

create	create matrix handle
copy	create a copy of matrix handle
convert	convert matrix between sparse formats
export	export matrix from internal representation to CSR or BSR format
destroy	frees memory allocated for matrix handle
set_<*op*>_hint	provide information about number of upcoming compute operations and operation type for optimization purposes, where <*op*> is mv, sv, mm, sm, dotmv, symgs, or memory
optimize	analyze the matrix using hints and store optimization information in matrix handle
mv	compute sparse matrix-vector product
mm	compute sparse matrix by dense matrix product (batch mv)
set_value	change a value in a matrix
spmm/spmmd	compute sparse matrix by sparse matrix product and store the result as a sparse/dense matrix
trsv	solve a triangular system
trsm	solve a triangular system with multiple right-hand sides
add	compute sum of two sparse matrices
symgs	compute a symmetric Gauss-Zeidel preconditioner
symgs_mv	compute a symmetric Gauss-Zeidel preconditioner with a final matrix-vector multiplication
sorv	computes forward, backward sweeps or symmetric successive over-relaxation preconditioner
sypr	compute the symmetric or Hermitian product of sparse matrices and store the result as a sparse matrix
syprd	compute the symmetric or Hermitian product of sparse and dense matrices and store the result as a dense matrix

`syrk`	compute the product of sparse matrix with its transposed matrix and store the result as a sparse matrix
`syrkd`	compute the product of sparse matrix with its transposed matrix and store the result as a dense matrix
`order`	perform ordering of column indexes of the matrix in CSR format
`dotmv`	compute a sparse matrix-vector product with dot product

The `<format>` field indicates the sparse matrix storage format:

`coo`	coordinate format
`bsr`	block sparse row format plus variations. Fill out either rows_start and rows_end (for 4-arrays representation) or rowIndex array (for 3-array BSR/CSR).
`csr`	compressed sparse row format plus variations. Fill out either `rows_start` and `rows_end` (for 4-arrays representation) or `rowIndex` array (for 3-array BSR/CSR).
`csc`	compressed sparse column format plus variations. Fill out either `cols_start` and `cols_end` (for 4-arrays representation) or `colIndex` array (for 3 array CSC).

The format is included in the function name only if the function parameters include an explicit sparse matrix in one of the conventional sparse matrix formats.

Sparse Matrix Storage Formats for Inspector-executor Sparse BLAS Routines

Inspector-executor Sparse BLAS routines support four conventional sparse matrix storage formats:

- compressed sparse row format (CSR) plus variations
- compressed sparse column format (CSC) plus variations
- coordinate format (COO)
- block sparse row format (BSR) plus variations

Computational routines operate on a matrix handle that stores a matrix in CSR or BSR formats. Other formats should be converted to CSR or BSR format before calling any computational routines. For more information see Sparse Matrix Storage Formats.

Supported Inspector-executor Sparse BLAS Operations

The Inspector-executor Sparse BLAS API can perform several operations involving sparse matrices. These notations are used in the description of the operations:

- *A*, *G*, *V* are sparse matrices
- *B* and *C* are dense matrices
- *x* and *y* are dense vectors
- *alpha* and *beta* are scalars

`op(A)` represents a possible transposition of matrix *A*

`op(A)` = *A*
`op(A)` = A^T - transpose of *A*
`op(A)` = A^H - conjugate transpose of *A*

`op(A)`$^{-1}$ denotes the inverse of `op(A)`.

The Inspector-executor Sparse BLAS routines support the following operations:

- computing the vector product between a sparse matrix and a dense vector:

```
y := alpha*op(A)*x + beta*y
```

- solving a single triangular system:

```
y := alpha*inv(op(A))*x
```

- computing a product between a sparse matrix and a dense matrix:

```
C := alpha*op(A)*B + beta*C
```

- computing a product between sparse matrices with a sparse result:

```
V := alpha*op(A)*op(G)
```

- computing a product between sparse matrices with a dense result:

```
C := alpha*op(A)*op(G)
```

- computing a sum of sparse matrices with a sparse result:

```
V := alpha*op(A) + G
```

- solving a sparse triangular system with multiple right-hand sides:

```
C := alpha*inv(op(A))*B
```

Two-stage Algorithm in Inspector-Executor Sparse BLAS Routines

You can use a two-stage algorithm in Inspector-executor Sparse BLAS routines which produce a sparse matrix. The applicable routines are:

- mkl_sparse_sp2m (BSR/CSR/CSC formats)
- mkl_sparse_sypr (CSR format)

The two-stage algorithm allows you to split computations into stages. The main purpose of the splitting is to provide an estimate for the memory required for the output prior to allocating the largest part of the memory (for the indices and values of the non-zero elements). Additionally, the two-stage approach extends the functionality and allows more complex usage models.

NOTE The multistage approach currently does not allow you to allocate memory for the output matrix outside oneMKL.

In the two-stage algorithm:

1. The first stage allocates data which is necessary for the memory estimation (arrays *rows_start*/*rows_end* or *cols_start*/*cols_end* depending on the format, (see Sparse Matrix Storage Formats) and computes the number of entries or the full structure of the matrix.

   NOTE The format of the output is decided internally but can be checked using the export functionality `mkl_sparse_?_export_<format>`.

2. The second stage allocates data and computes column or row indices (depending on the format) of non-zero elements and/or values of the output matrix.

Specifying the stage for execution is supported through the *sparse_request_t* parameter in the API with the following options:

Values for *sparse_request_t* parameter

Value	Description
SPARSE_STAGE_NNZ_COUNT	Allocates and computes only the *rows_start*/*rows_end* (CSR/BSR format) or *cols_start*/*cols_end* (CSC format) arrays for the output matrix. After this stage, by calling `mkl_sparse_?_export_<format>`, you can obtain the number of non-zeros in the output matrix and calculate the amount of memory required for the output matrix.

Value	Description
SPARSE_STAGE_FINALIZE_MULT_NO_VAL	Allocates and computes row/column indices provided that *rows_start*/*rows_end* or *cols_start*/*cols_end* have already been computed in a prior call with the request *SPARSE_STAGE_NNZ_COUNT*. The values of the output matrix are not computed.
SPARSE_STAGE_FINALIZE_MULT	Depending on the state of the output matrix *C* on entry to the routine, this stage does one of the following: • Allocates and computes row/column indices and values of nonzero elements, if only *rows_start*/*rows_end* or *cols_start*/*cols_end* are present • allocates and computes values of nonzero elements, if *rows_start*/*rows_end* or *cols_start*/*cols_end* and row/column indices of non-zero elements are present
SPARSE_STAGE_FULL_MULT_NO_VAL	Allocates and computes the output matrix structure in a single step. The values of the output matrix are not computed.
SPARSE_STAGE_FULL_MULT	Allocates and computes the entire output matrix (structure and values) in a single step.

The example below shows how you can use the two-stage approach for estimating the memory requirements for the output matrix in CSR format:

First stage (`sparse_request_t` = *SPARSE_STAGE_NNZ_COUNT*)

1. The routine mkl_sparse_sp2m is called with the request parameter *SPARSE_STAGE_NNZ_COUNT*.
2. The arrays `rows_start` and `rows_end` are exported using the mkl_sparse_x_export_csr routine.
3. These arrays are used to calculate the number of non-zeros (nnz) of the resulting output matrix.

Note that by the end of the first stage, the arrays associated with column indices and values of the output matrix have not been allocated or computed yet.

```
sparse_matrix_t csrC = NULL;
status = mkl_sparse_sp2m (opA, descrA, csrA, opB, descrB, csrB, SPARSE_STAGE_NNZ_COUNT, &csrC);

/* optional calculation of nnz in the output matrix for getting a memory estimate */

status = mkl_sparse_?_export_csr (csrC, &indexing, &nrows, &ncols, &rows_start, &rows_end,
&col_indx, &values);

MKL_INT nnz = rows_end[nrows-1] - rows_start[0];
```

Second stage (`sparse_request_t` = *SPARSE_STAGE_FINALIZE_MULT*)

This stage allocates and computes the remaining output arrays (associated with column indices and values of output matrix entries) and completes the matrix-matrix multiplication.

```
status = mkl_sparse_sp2m (opA, descrA, csrA, opB, descrB, csrB, SPARSE_STAGE_FINALIZE_MULT,
&csrC);
```

When the two-stage approach is not needed, you can perform both stages in a single call:

Single stage operation (`sparse_request_t` = *SPARSE_STAGE_FULL_MULT*)

```
status = mkl_sparse_sp2m (opA, descrA, csrA, opB, descrB, csrB, SPARSE_STAGE_FULL_MULT, &csrC);
```

Matrix Manipulation Routines

The Matrix Manipulation Routines table lists the matrix manipulation routines and the data types associated with them.

Matrix Manipulation Routines and Their Data Types

Routine or Function Group	Data Types	Description
mkl_sparse_?_create_csr	s, d, c, z	Creates a handle for a CSR-format matrix.
mkl_sparse_?_create_csc	s, d, c, z	Creates a handle for a CSC format matrix.
mkl_sparse_?_create_coo	s, d, c, z	Creates a handle for a matrix in COO format.
mkl_sparse_?_create_bsr	s, d, c, z	Creates a handle for a matrix in BSR format.
mkl_sparse_copy	NA	Creates a copy of a matrix handle.
mkl_sparse_destroy	NA	Frees memory allocated for matrix handle.
mkl_sparse_convert_csr	NA	Converts internal matrix representation to CSR format.
mkl_sparse_convert_bsr	NA	Converts internal matrix representation to BSR format or changes BSR block size.
mkl_sparse_?_export_csr	s, d, c, z	Exports CSR matrix from internal representation.
mkl_sparse_?_export_csc	s, d, c, z	Exports CSC matrix from internal representation.
mkl_sparse_?_export_bsr	s, d, c, z	Exports BSR matrix from internal representation.
mkl_sparse_?_set_value	s, d, c, z	Changes a single value of matrix in internal representation.
mkl_sparse_?_update_values	s, d, c, z	Changes all or selected matrix values in internal representation.
mkl_sparse_order	NA	Performs ordering of column indexes of the matrix in CSR format.

mkl_sparse_?_create_csr

Creates a handle for a CSR-format matrix.

Syntax

```
stat = mkl_sparse_s_create_csr (A, indexing, rows, cols, rows_start, rows_end, col_indx, values)
stat = mkl_sparse_d_create_csr (A, indexing, rows, cols, rows_start, rows_end, col_indx, values)
stat = mkl_sparse_c_create_csr (A, indexing, rows, cols, rows_start, rows_end, col_indx, values)
stat = mkl_sparse_z_create_csr (A, indexing, rows, cols, rows_start, rows_end, col_indx, values)
```

Include Files

- mkl_spblas.f90

Description

The mkl_sparse_?_create_csr routine creates a handle for an *m*-by-*k* matrix *A* in CSR format.

> **NOTE**
> The input arrays provided are left unchanged except for the call to mkl_sparse_order, which performs ordering of column indexes of the matrix. To avoid any changes to the input data, use mkl_sparse_copy.

Input Parameters

indexing

sparse_index_base_t.

Indicates how input arrays are indexed.

SPARSE_INDEX_BASE_ZERO	Zero-based (C-style) indexing: indices start at 0.
SPARSE_INDEX_BASE_ONE	One-based (Fortran-style) indexing: indices start at 1.

rows

C_INT.

Number of rows of matrix *A*.

cols

C_INT.

Number of columns of matrix *A*.

rows_start

C_INT.

Array of length at least *rows*. This array contains row indices, such that *rows_start*(*i*) - *indexing* is the first index of row *i* in the arrays *values* and *col_indx*. The value of *indexing* is 0 for zero-based indexing and 1 for one-based indexing.

Refer to *pointerB* array description in CSR Format for more details.

rows_end

C_INT.

Array of at least length *rows*. This array contains row indices, such that *rows_end*(*i*) - *indexing* – 1 is the last index of row *i* in the arrays *values* and *col_indx*. The value of *indexing* is 0 for zero-based indexing and 1 for one-based indexing.

Refer to *pointerE* array description in CSR Format for more details.

col_indx

C_INT .

For one-based indexing, array containing the column indices plus one for each non-zero element of the matrix *A*. For zero-based indexing, array containing the column indices for each non-zero element of the matrix *A*. Its length is at least *rows_end*(*rows* – 1) - *indexing*.

The value of *indexing* is 0 for zero-based indexing and 1 for one-based indexing.

values

C_FLOAT for mkl_sparse_s_create_csr

C_DOUBLE for mkl_sparse_d_create_csr

C_FLOAT_COMPLEX for mkl_sparse_c_create_csr

C_DOUBLE_COMPLEX for mkl_sparse_z_create_csr

Array containing non-zero elements of the matrix *A*. Its length is equal to length of the *col_indx* array.

Refer to *values* array description in CSR Format for more details.

Output Parameters

A

SPARSE_MATRIX_T.

Handle containing internal data for subsequent Inspector-executor Sparse BLAS operations.

stat

INTEGER

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_?_create_csc

Creates a handle for a CSC format matrix.

Syntax

stat = mkl_sparse_s_create_csc (*A*, *indexing*, *rows*, *cols*, *cols_start*, *cols_end*, *row_indx*, *values*)

stat = mkl_sparse_d_create_csc (*A*, *indexing*, *rows*, *cols*, *cols_start*, *cols_end*, *row_indx*, *values*)stat = mkl_sparse_c_create_csc (*A*, *indexing*, *rows*, *cols*, *cols_start*, *cols_end*, *row_indx*, *values*)stat = mkl_sparse_z_create_csc (*A*, *indexing*, *rows*, *cols*, *cols_start*, *cols_end*, *row_indx*, *values*)

Include Files

- mkl_spblas.f90

Description

The `mkl_sparse_?_create_csc` routine creates a handle for an *m*-by-*k* matrix *A* in CSC format.

> **NOTE**
> The input arrays provided are left unchanged except for the call to mkl_sparse_order, which performs ordering of column indexes of the matrix. To avoid any changes to the input data, use mkl_sparse_copy.

Input Parameters

indexing

`sparse_index_base_t`.

Indicates how input arrays are indexed.

`SPARSE_INDEX_BASE_ZERO`	Zero-based (C-style) indexing: indices start at 0.
`SPARSE_INDEX_BASE_ONE`	One-based (Fortran-style) indexing: indices start at 1.

rows

`C_INT`.

Number of rows of the matrix *A*.

cols

`C_INT`.

Number of columns of the matrix *A*.

cols_start

`C_INT`.

Array of length at least *m*. This array contains col indices, such that *cols_start*(*i*) - *ind* is the first index of col *i* in the arrays *values* and *row_indx*. *ind* takes 0 for zero-based indexing and 1 for one-based indexing.

Refer to *pointerB* array description in CSC Format for more details.

cols_end

`C_INT`.

Array of at least length *m*. This array contains col indices, such that *cols_end*(*i*) - *ind* – 1 is the last index of col *i* in the arrays *values* and *row_indx*. *ind* takes 0 for zero-based indexing and 1 for one-based indexing.

Refer to *pointerE* array description in CSC Format for more details.

row_indx

`C_INT`.

For one-based indexing, array containing the row indices plus one for each non-zero element of the matrix *A*. For zero-based indexing, array containing the row indices for each non-zero element of the matrix *A*. Its length is at least *cols_end*(*cols* – 1) - *ind*. *ind* takes 0 for zero-based indexing and 1 for one-based indexing.

values

`C_FLOAT` for `mkl_sparse_s_create_csc`

`C_DOUBLE` for `mkl_sparse_d_create_csc`

`C_FLOAT_COMPLEX` for `mkl_sparse_c_create_csc`

C_DOUBLE_COMPLEX for mkl_sparse_z_create_csc

Array containing non-zero elements of the matrix *A*. Its length is equal to length of the *row_indx* array.

Refer to *values* array description in CSC Format for more details.

Output Parameters

A SPARSE_MATRIX_T.

Handle containing internal data.

stat INTEGER

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_?_create_coo

Creates a handle for a matrix in COO format.

Syntax

```
stat = mkl_sparse_s_create_coo (A, indexing, rows, cols, nnz, row_indx, col_indx, values)
stat = mkl_sparse_d_create_coo (A, indexing, rows, cols, nnz, row_indx, col_indx, values)
stat = mkl_sparse_c_create_coo (A, indexing, rows, cols, nnz, row_indx, col_indx, values)
stat = mkl_sparse_z_create_coo (A, indexing, rows, cols, nnz, row_indx, col_indx, values)
```

Include Files

- mkl_spblas.f90

Description

The mkl_sparse_?_create_coo routine creates a handle for an *m*-by-*k* matrix *A* in COO format.

NOTE
The input arrays provided are left unchanged except for the call to mkl_sparse_order, which performs ordering of column indexes of the matrix. To avoid any changes to the input data, use mkl_sparse_copy.

Input Parameters

indexing

sparse_index_base_t.

Indicates how input arrays are indexed.

SPARSE_INDEX_BASE_ZERO	Zero-based (C-style) indexing: indices start at 0.
SPARSE_INDEX_BASE_ONE	One-based (Fortran-style) indexing: indices start at 1.

rows

C_INT.

Number of rows of matrix *A*.

cols

C_INT.

Number of columns of matrix *A*.

nnz

C_INT.

Specifies the number of non-zero elements of the matrix *A*.

Refer to *nnz* description in Coordinate Format for more details.

row_indx

C_INT.

Array of length *nnz*, containing the row indices for each non-zero element of matrix *A*.

Refer to *rows* array description in Coordinate Format for more details.

col_indx

C_INT.

Array of length *nnz*, containing the column indices for each non-zero element of matrix *A*.

Refer to *columns* array description in Coordinate Format for more details.

values

C_FLOAT for mkl_sparse_s_create_coo

C_DOUBLE for mkl_sparse_d_create_coo

C_FLOAT_COMPLEX for mkl_sparse_c_create_coo

C_DOUBLE_COMPLEX for mkl_sparse_z_create_coo

Array of length *nnz*, containing the non-zero elements of matrix *A* in arbitrary order.

Refer to *values* array description in Coordinate Format for more details.

Output Parameters

A

SPARSE_MATRIX_T.

Handle containing internal data.

stat INTEGER

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_?_create_bsr

Creates a handle for a matrix in BSR format.

Syntax

```
stat = mkl_sparse_s_create_bsr (A, indexing, block_layout, rows, cols, block_size, rows_start, rows_end, col_indx, values)
stat = mkl_sparse_d_create_bsr (A, indexing, block_layout, rows, cols, block_size, rows_start, rows_end, col_indx, values)
stat = mkl_sparse_c_create_bsr (A, indexing, block_layout, rows, cols, block_size, rows_start, rows_end, col_indx, values)
stat = mkl_sparse_z_create_bsr (A, indexing, block_layout, rows, cols, block_size, rows_start, rows_end, col_indx, values)
```

Include Files

- mkl_spblas.f90

Description

The mkl_sparse_?_create_bsr routine creates a handle for an *m*-by-*k* matrix *A* in BSR format.

NOTE
The input arrays provided are left unchanged except for the call to mkl_sparse_order, which performs ordering of column indexes of the matrix. To avoid any changes to the input data, use mkl_sparse_copy.

Input Parameters

indexing sparse_index_base_t.

Indicates how input arrays are indexed.

SPARSE_INDEX_BASE_ZERO	Zero-based (C-style) indexing: indices start at 0.
SPARSE_INDEX_BASE_ONE	One-based (Fortran-style) indexing: indices start at 1.

block_layout

sparse_index_base_t.

Specifies layout of blocks:

SPARSE_LAYOUT_ROW_MAJOR	Storage of elements of blocks uses row major layout.
SPARSE_LAYOUT_COLUMN_MAJOR	Storage of elements of blocks uses column major layout.

rows

C_INT.

Number of block rows of matrix *A*.

cols

C_INT.

Number of block columns of matrix *A*.

block_size

C_INT.

Size of blocks in matrix *A*.

rows_start

C_INT.

Array of length *m*. This array contains row indices, such that *rows_start*(*i*) - *ind* is the first index of block row *i* in the arrays *values* and *col_indx*. *ind* takes 0 for zero-based indexing and 1 for one-based indexing.

Refer to *pointerB* array description in CSR Format for more details.

rows_end

C_INT.

Array of length *m*. This array contains row indices, such that *rows_end*(*i*) - *ind*– 1 is the last index of block row *i* in the arrays *values* and *col_indx*. *ind* takes 0 for zero-based indexing and 1 for one-based indexing.

Refer to *pointerE* array description in CSR Format for more details.

col_indx

C_INT.

For one-based indexing, array containing the column indices plus one for each non-zero block of the matrix *A*. For zero-based indexing, array containing the column indices for each non-zero block of the matrix *A*. Its length is *rows_end*(*rows* – 1) - *ind*. *ind* takes 0 for zero-based indexing and 1 for one-based indexing.

values

C_FLOAT for mkl_sparse_s_create_bsr

C_DOUBLE for mkl_sparse_d_create_bsr

C_FLOAT_COMPLEX for mkl_sparse_c_create_bsr

C_DOUBLE_COMPLEX for mkl_sparse_z_create_bsr

Array containing non-zero elements of the matrix *A*. Its length is equal to length of the *col_indx* array multiplied by *block_size***block_size*.

Refer to the *values* array description in BSR Format for more details.

Output Parameters

A — SPARSE_MATRIX_T.

Handle containing internal data.

stat — INTEGER

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_copy

Creates a copy of a matrix handle.

Syntax

```
stat = mkl_sparse_copy (source, descr, dest)
```

Include Files

- mkl_spblas.f90

Description

The mkl_sparse_copy routine creates a copy of a matrix handle.

> **NOTE**
> Currently, the mkl_sparse_copy routine does not support the descriptor argument and creates an exact (deep) copy of the input matrix.

Input Parameters

source — SPARSE_MATRIX_T.

Specifies handle containing internal data.

descr

`MATRIX_DESCR`.

Descriptor specifying sparse matrix properties.

type - Specifies the type of a sparse matrix:

`SPARSE_MATRIX_TYPE_GENERAL`	The matrix is processed as is.
`SPARSE_MATRIX_TYPE_SYMMETRIC`	The matrix is symmetric (only the requested triangle is processed).
`SPARSE_MATRIX_TYPE_HERMITIAN`	The matrix is Hermitian (only the requested triangle is processed).
`SPARSE_MATRIX_TYPE_TRIANGULAR`	The matrix is triangular (only the requested triangle is processed).
`SPARSE_MATRIX_TYPE_DIAGONAL`	The matrix is diagonal (only diagonal elements are processed).
`SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR`	The matrix is block-triangular (only requested triangle is processed). Applies to BSR format only.
`SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL`	The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only.

mode - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:

`SPARSE_FILL_MODE_LOWER`	The lower triangular matrix part is processed.
`SPARSE_FILL_MODE_UPPER`	The upper triangular matrix part is processed.

diag - Specifies diagonal type for non-general matrices:

`SPARSE_DIAG_NON_UNIT`	Diagonal elements might not be equal to one.
`SPARSE_DIAG_UNIT`	Diagonal elements are equal to one.

Output Parameters

dest

`SPARSE_MATRIX_T` for `mkl_sparse_copy`

Handle containing internal data.

stat

`INTEGER`

Value indicating whether the operation was successful or not, and why:

`SPARSE_STATUS_SUCCESS`	The operation was successful.
`SPARSE_STATUS_NOT_INITIALIZED`	The routine encountered an empty handle or matrix array.

SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_destroy

Frees memory allocated for matrix handle.

Syntax

```
stat = mkl_sparse_destroy (A)
```

Include Files

- mkl_spblas.f90

Description

The mkl_sparse_destroy routine frees memory allocated for matrix handle.

NOTE
You must free memory allocated for matrices after completing use of them. The mkl_sparse_destroy routine provides a utility to do so.

Input Parameters

A SPARSE_MATRIX_T.

Handle containing internal data.

Output Parameters

stat INTEGER

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.

SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_convert_csr

Converts internal matrix representation to CSR format.

Syntax

```
stat = mkl_sparse_convert_csr (source, operation, dest)
```

Include Files

- mkl_spblas.f90

Description

The mkl_sparse_convert_csr routine converts internal matrix representation to CSR format.

When the source matrix is in COO format, the routine performs a sum reduction on duplicate elements.

Input Parameters

source SPARSE_MATRIX_T.

Handle containing internal data.

operation C_INT.

Specifies operation op() on input matrix.

SPARSE_OPERATION_NON_TRANSPOSE	Non-transpose, op(*A*) = *A*.
SPARSE_OPERATION_TRANSPOSE	Transpose, op(*A*) = A^T.
SPARSE_OPERATION_CONJUGATE_TRANSPOSE	Conjugate transpose, op(*A*) = A^H.

Output Parameters

dest SPARSE_MATRIX_T.

Handle containing internal data.

stat INTEGER

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.

SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_convert_bsr

Converts internal matrix representation to BSR format or changes BSR block size.

Syntax

```
stat = mkl_sparse_convert_bsr (source, block_size, block_layout, operation, dest)
```

Include Files

- mkl_spblas.f90

Description

The mkl_sparse_convert_bsr routine converts internal matrix representation to BSR format or changes BSR block size.

When the source matrix is in COO format, the routine performs a sum reduction on duplicate elements.

Input Parameters

source

SPARSE_MATRIX_T.

Handle containing internal data.

block_size

C_INT.

Size of the block in the output structure.

block_layout

sparse_index_base_t.

Specifies layout of blocks:

SPARSE_LAYOUT_ROW_MAJOR	Storage of elements of blocks uses row major layout.
SPARSE_LAYOUT_COLUMN_MAJOR	Storage of elements of blocks uses column major layout.

operation

C_INT.

Specifies operation op() on input matrix.

SPARSE_OPERATION_NON_TRANSPOSE	Non-transpose, op(*A*) = *A*.

SPARSE_OPERATION_TRANSPOSE	Transpose, op(*A*) = A^T.
SPARSE_OPERATION_CONJUGATE_TRANSPOSE	Conjugate transpose, op(*A*) = A^H.

Output Parameters

dest

SPARSE_MATRIX_T.

Handle containing internal data.

stat

INTEGER

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_?_export_csr

Exports CSR matrix from internal representation.

Syntax

```
stat = mkl_sparse_s_export_csr (source, indexing, rows, cols, rows_start, rows_end, col_indx, values)
stat = mkl_sparse_d_export_csr (source, indexing, rows, cols, rows_start, rows_end, col_indx, values)
stat = mkl_sparse_c_export_csr (source, indexing, rows, cols, rows_start, rows_end, col_indx, values)
stat = mkl_sparse_z_export_csr (source, indexing, rows, cols, rows_start, rows_end, col_indx, values)
```

Include Files

- mkl_spblas.f90

Description

If the matrix specified by the *source* handle is in CSR format, the `mkl_sparse_?_export_csr` routine exports an *m*-by-*k* matrix *A* in CSR format matrix from the internal representation. The routine returns pointers to the internal representation and does not allocate additional memory.

If the matrix is not already in CSR format, the routine returns `SPARSE_STATUS_INVALID_VALUE`.

Input Parameters

source `SPARSE_MATRIX_T`.

Handle containing internal data.

Output Parameters

indexing `sparse_index_base_t`.

Indicates how input arrays are indexed.

`SPARSE_INDEX_BASE_ZERO`	Zero-based (C-style) indexing: indices start at 0.
`SPARSE_INDEX_BASE_ONE`	One-based (Fortran-style) indexing: indices start at 1.

rows `C_INT`.

Number of rows of the matrix *source*.

cols `C_INT`.

Number of columns of the matrix *source*.

rows_start `C_INT`.

Pointer to array of length *m*. This array contains row indices, such that *rows_start*(*i*) - *ind* is the first index of row *i* in the arrays *values* and *col_indx*. *ind* takes 0 for zero-based indexing and 1 for one-based indexing.

Refer to *pointerB* array description in CSR Format for more details.

rows_end `C_INT`.

Pointer to array of length *m*. This array contains row indices, such that *rows_end*(*i*) - *ind* - 1 is the last index of row *i* in the arrays *values* and *col_indx*. *ind* takes 0 for zero-based indexing and 1 for one-based indexing.

Refer to *pointerE* array description in CSR Format for more details.

col_indx `C_INT`.

For one-based indexing, pointer to array containing the column indices plus one for each non-zero element of the matrix *source*. For zero-based indexing, pointer to array containing the column indices for each non-zero element of the matrix *source*. Its length is *rows_end*(*rows* – 1) - *ind*. *ind* takes 0 for zero-based indexing and 1 for one-based indexing.

values `C_FLOAT` for `mkl_sparse_s_export_csr`

C_DOUBLE for mkl_sparse_d_export_csr

C_FLOAT_COMPLEX for mkl_sparse_c_export_csr

C_DOUBLE_COMPLEX for mkl_sparse_z_export_csr

Pointer to array containing non-zero elements of the matrix *A*. Its length is equal to length of the *col_indx* array.

Refer to *values* array description in CSR Format for more details.

Output Parameters

stat INTEGER

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_?_export_csc

Exports CSC matrix from internal representation.

Syntax

```
stat = mkl_sparse_s_export_csc (source, indexing, rows, cols, cols_start, cols_end, row_indx, values)
stat = mkl_sparse_d_export_csc (source, indexing, rows, cols, cols_start, cols_end, row_indx, values)
stat = mkl_sparse_c_export_csc (source, indexing, rows, cols, cols_start, cols_end, row_indx, values)
stat = mkl_sparse_z_export_csc (source, indexing, rows, cols, cols_start, cols_end, row_indx, values)
```

Include Files

- mkl_spblas.f90

Description

If the matrix specified by the *source* handle is in CSC format, the mkl_sparse_?_export_csc routine exports an *m*-by-*k* matrix *A* in CSC format matrix from the internal representation. The routine returns pointers to the internal representation and does not allocate additional memory.

If the matrix is not already in CSC format, the routine returns SPARSE_STATUS_INVALID_VALUE.

Input Parameters

source SPARSE_MATRIX_T.

Handle containing internal data.

Output Parameters

indexing sparse_index_base_t.

Indicates how input arrays are indexed.

SPARSE_INDEX_BASE_ZERO	Zero-based (C-style) indexing: indices start at 0.
SPARSE_INDEX_BASE_ONE	One-based (Fortran-style) indexing: indices start at 1.

rows C_INT.

Number of rows of the matrix *source*.

cols C_INT.

Number of columns of the matrix *source*.

cols_start C_INT.

Array of length *m*. This array contains column indices, such that *cols_start*(*i*) - *cols_start*(1) is the first index of column *i* in the arrays *values* and *row_indx*.

Refer to *pointerb* array description in csc Format for more details.

cols_end C_INT.

Pointer to array of length *m*. This array contains row indices, such that *cols_end*(*i*) - *cols_start*(1) - 1 is the last index of column *i* in the arrays *values* and *row_indx*.

Refer to *pointerE* array description in csc Format for more details.

row_indx C_INT.

For one-based indexing, pointer to array containing the row indices plus one for each non-zero element of the matrix *source*. For zero-based indexing, pointer to array containing the row indices for each non-zero element of the matrix *source*. Its length is *cols_end*(*cols* – 1) - *cols_start*(1).

values C_FLOAT for mkl_sparse_s_export_csc

C_DOUBLE for mkl_sparse_d_export_csc

C_FLOAT_COMPLEX for mkl_sparse_c_export_csc

C_DOUBLE_COMPLEX for mkl_sparse_z_export_csc

Pointer to array containing non-zero elements of the matrix *A*. Its length is equal to length of the *row_indx* array.

Refer to *values* array description in csc Format for more details.

Output Parameters

stat INTEGER

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_?_export_bsr

Exports BSR matrix from internal representation.

Syntax

```
stat = mkl_sparse_s_export_bsr (source, indexing, block_layout, rows, cols, block_size, rows_start, rows_end, col_indx, values)
stat = mkl_sparse_d_export_bsr (source, indexing, block_layout, rows, cols, block_size, rows_start, rows_end, col_indx, values)
stat = mkl_sparse_c_export_bsr (source, indexing, block_layout, rows, cols, block_size, rows_start, rows_end, col_indx, values)
stat = mkl_sparse_z_export_bsr (source, indexing, block_layout, rows, cols, block_size, rows_start, rows_end, col_indx, values)
```

Include Files

- mkl_spblas.f90

Description

If the matrix specified by the *source* handle is in BSR format, the mkl_sparse_?_export_bsr routine exports an (*block_size* * *rows*)-by-(*block_size* * *cols*) matrix *A* in BSR format from the internal representation. The routine returns pointers to the internal representation and does not allocate additional memory.

If the matrix is not already in BSR format, the routine returns SPARSE_STATUS_INVALID_VALUE.

Input Parameters

source SPARSE_MATRIX_T.

Handle containing internal data.

Output Parameters

indexing

`sparse_index_base_t`.

Indicates how input arrays are indexed.

`SPARSE_INDEX_BASE_ZERO`	Zero-based (C-style) indexing: indices start at 0.
`SPARSE_INDEX_BASE_ONE`	One-based (Fortran-style) indexing: indices start at 1.

block_layout

`sparse_index_base_t`.

Specifies layout of blocks:

`SPARSE_LAYOUT_ROW_MAJOR`	Storage of elements of blocks uses row major layout.
`SPARSE_LAYOUT_COLUMN_MAJOR`	Storage of elements of blocks uses column major layout.

rows

`C_INT`.

Number of block rows of the matrix *source*.

cols

`C_INT`.

Number of block columns of matrix *source*.

block_size

`C_INT`.

Size of the square block in matrix *source*.

rows_start

`C_INT`.

Pointer to array of length *rows*. This array contains row indices, such that *rows_start*(*i*) - *ind* is the first index of block row *i* in the arrays *values* and *col_indx*. *ind* takes 0 for zero-based indexing and 1 for one-based indexing.

Refer to *pointerB* array description in BSR Format for more details.

rows_end

`C_INT`.

Pointer to array of length *rows*. This array contains row indices, such that *rows_end*(*i*) - *ind* - 1 is the last index of block row *i* in the arrays *values* and *col_indx*. *ind* takes 0 for zero-based indexing and 1 for one-based indexing.

Refer to *pointerE* array description in BSR Format for more details.

col_indx

`C_INT`.

For one-based indexing, pointer to array containing the column indices plus one for each non-zero blocks of the matrix *source*. For zero-based indexing, pointer to array containing the column indices for each non-zero blocks of the matrix *source*. Its length is *rows_end*(*rows* – 1) - *ind*(1). *ind* takes 0 for zero-based indexing and 1 for one-based indexing.

values

`C_FLOAT` for `mkl_sparse_s_export_bsr`

`C_DOUBLE` for `mkl_sparse_d_export_bsr`

C_FLOAT_COMPLEX for mkl_sparse_c_export_bsr

C_DOUBLE_COMPLEX for mkl_sparse_z_export_bsr

Pointer to array containing non-zero elements of matrix *source*. Its length is equal to length of the *col_indx* array multiplied by *block_size***block_size*.

Refer to the *values* array description in BSR Format for more details.

Output Parameters

stat INTEGER

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_?_set_value

Changes a single value of matrix in internal representation.

Syntax

```
stat = mkl_sparse_s_set_value (A , row, col, value);
stat = mkl_sparse_d_set_value (A, row, col, value );
stat = mkl_sparse_c_set_value (A , row, col, value);
stat = mkl_sparse_z_set_value (A , row, col, value);
```

Include Files

- mkl_spblas.f90

Description

Use the mkl_sparse_?_set_value routine to change a single value of a matrix in the internal Inspector-executor Sparse BLAS format. The value should already be presented in a matrix structure.

Input Parameters

A SPARSE_MATRIX_T.

Specifies handle containing internal data.

row C_INT .

Indicates row of matrix in which to set value.

col C_INT .

Indicates column of matrix in which to set value.

value C_FLOAT for mkl_sparse_s_create_csr

C_DOUBLE for mkl_sparse_d_create_csr

C_FLOAT_COMPLEX for mkl_sparse_c_create_csr

C_DOUBLE_COMPLEX for mkl_sparse_z_create_csr

Indicates value

Output Parameters

A Handle containing modified internal data.

stat INTEGER.

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.

mkl_sparse_?_update_values

Changes all or selected matrix values in internal representation.

Syntax

NOTE
This routine is supported for sparse matrices in BSR format only.

```
status = mkl_sparse_s_update_values (A, values, indx, indy, values)
status = mkl_sparse_d_update_values (A, values, indx, indy, values)
status = mkl_sparse_c_update_values (A, values, indx, indy, values)
status = mkl_sparse_z_update_values (A, values, indx, indy, values)
```

Include Files

- mkl_spblas.f90

Description

Use the `mkl_sparse_?_update_values` routine to change all or selected values of a matrix in the internal Inspector-Executor Sparse BLAS format.

The values to be updated should already be present in the matrix structure.

- To change selected values, you must provide an array values (with new values) and also the corresponding row and column indices for each value via *indx* and *indy* arrays as well as the overall number of changed elements *nvalues*.

  So that, for example, to change A(0, 0) to 1 and A(0, 1) to 2, pass the following input parameters: *nvalues* = 2, *indx* = {0, 0}, *indy* = {0, 1} and *values* = {1, 2}.
- To change all the values in the matrix, provide the *values* array and explicitly set *nvalues* to 0 or the actual number of non zero elements. There is no need to supply *indx* and *indy* arrays.

Input Parameters

A

`SPARSE_MATRIX_T`.

Specifies handle containing internal data.

nvalues

`C_INT` .

Total number of elements changed.

indx

`C_INT` .

Row indices for the new values.

> **NOTE**
> Currently, only updating the full matrix is supported. Set *indx* and *indy* as NULL.

indy

`C_INT` .

Column indices for the new values.

> **NOTE**
> Currently, only updating the full matrix is supported. Set *indx* and *indy* as NULL.

values

`C_FLOAT` for `mkl_sparse_s_update_values`

`C_DOUBLE` for `mkl_sparse_d_update_values`

`C_FLOAT_COMPLEX` for `mkl_sparse_c_update_values`

`C_DOUBLE_COMPLEX` for `mkl_sparse_z_update_values`

New values.

Output Parameters

A

`SPARSE_MATRIX_T`.

Handle containing modified internal data.

status

`INTEGER`

Value indicating whether the operation was successful or not, and why.

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_order

Performs ordering of column indexes of the matrix in CSR format

Syntax

```
stat = mkl_sparse_order(csrA)
```

Include Files

- mkl_spblas.f90

Description

Use the mkl_sparse_order routine to perform ordering of column indexes of the matrix in CSR format.

Input Parameters

csrA	SPARSE_MATRIX_T. CSR data

Output Parameters

csrA	Handle containing modified internal data.
stat	INTEGER. Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.

SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.

Inspector-Executor Sparse BLAS Analysis Routines

Analysis Routines and Their Data Types

Routine or Function Group	Description
mkl_sparse_set_lu_smoother_hint	Provides and estimate of the number and type of upcoming calls to LU smoother functionality.
mkl_sparse_set_mv_hint	Provides estimate of number and type of upcoming matrix-vector operations.
mkl_sparse_set_sv_hint	Provides estimate of number and type of upcoming triangular system solver operations.
mkl_sparse_set_mm_hint	Provides estimate of number and type of upcoming matrix-matrix multiplication operations.
mkl_sparse_set_sm_hint	Provides estimate of number and type of upcoming triangular matrix solve with multiple right hand sides operations.
mkl_sparse_set_dotmv_hint	Sets estimate of the number and type of upcoming matrix-vector operations.
mkl_sparse_set_symgs_hint	Sets estimate of number and type of upcoming `mkl_sparse_?_symgs` operations.
mkl_sparse_set_sorv_hint	Sets estimate of number and type of upcoming `mkl_sparse_?_symgs` operations.
mkl_sparse_set_memory_hint	Provides memory requirements for performance optimization purposes.
mkl_sparse_optimize	Analyzes matrix structure and performs optimizations using the hints provided in the handle.

mkl_sparse_set_lu_smoother_hint

Provides an estimate of the number and type of upcoming calls to LU smoother functionality.

Syntax

```
status = mkl_sparse_set_lu_smoother_hint (A, operation, descr, expected_calls)
```

Include Files

- `mkl_spblas.f90`

Description

The `mkl_sparse_set_lu_smoother_hint` function provides subsequent Inspector-Executor Sparse BLAS calls an estimate of the number of upcoming calls to the `lu_smoother` routine that ultimately may influence the optimizations applied and specifies whether or not to perform an operation on the matrix.

Product and Performance Information
Performance varies by use, configuration and other factors. Learn more at www.Intel.com/PerformanceIndex. Notice revision #20201201

Input Parameters

operation

`C_INT` .

Specifies the operation *op()* on input matrix.

`SPARSE_OPERATION_NON_TRANSPOSE`	Non-transpose, `op(A)` = A.
`SPARSE_OPERATION_TRANSPOSE`	Transpose, `op(A)` = A^T.
`SPARSE_OPERATION_CONJUGATE_TRANSPOSE`	Conjugate transpose, `op(A)` = A^H.

descr

`MATRIX_DESCR` .

Structure specifying sparse matrix properties.

`sparse_matrix_type_t`*type* - Specifies the type of a sparse matrix:

`SPARSE_MATRIX_TYPE_GENERAL`	The matrix is processed as is.
`SPARSE_MATRIX_TYPE_SYMMETRIC`	The matrix is symmetric (only the requested triangle is processed).
`SPARSE_MATRIX_TYPE_HERMITIAN`	The matrix is Hermitian (only the requested triangle is processed).
`SPARSE_MATRIX_TYPE_TRIANGULAR`	The matrix is triangular (only the requested triangle is processed).
`SPARSE_MATRIX_TYPE_DIAGONAL`	The matrix is diagonal (only diagonal elements are processed).
`SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR`	The matrix is block-triangular (only the requested triangle is processed). Applies to BSR format only.
`SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL`	The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only.

`sparse_fill_mode_t`*mode* - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:

	`SPARSE_FILL_MODE_LOWER` The lower triangular matrix part is processed. `SPARSE_FILL_MODE_UPPER` The upper triangular matrix part is processed. `sparse_diag_type_t`*diag* - Specifies the diagonal type for non-general matrices: `SPARSE_DIAG_NON_UNIT` Diagonal elements might not be equal to one. `SPARSE_DIAG_UNIT` Diagonal elements are equal to one.
expected_calls	`C_INT` . Number of expected calls to execution routine.
A	`SPARSE_MATRIX_T`. Handle containing internal data.
status	`INTEGER` Value indicating whether the operation was successful or not, and why. `SPARSE_STATUS_SUCCESS` The operation was successful. `SPARSE_STATUS_NOT_INITIALIZED` The routine encountered an empty handle or matrix array. `SPARSE_STATUS_ALLOC_FAILED` Internal memory allocation failed. `SPARSE_STATUS_INVALID_VALUE` The input parameters contain an invalid value. `SPARSE_STATUS_EXECUTION_FAILED` Execution failed. `SPARSE_STATUS_INTERNAL_ERROR` An error in algorithm implementation occurred. `SPARSE_STATUS_NOT_SUPPORTED` The requested operation is not supported.

mkl_sparse_set_mv_hint

Provides estimate of number and type of upcoming matrix-vector operations.

Syntax

```
stat = mkl_sparse_set_mv_hint (A, operation, descr, expected_calls)
```

Include Files

- `mkl_spblas.f90`

Description

Use the `mkl_sparse_set_mv_hint` routine to provide the Inspector-executor Sparse BLAS API an estimate of the number of upcoming matrix-vector multiplication operations for performance optimization, and specify whether or not to perform an operation on the matrix.

Product and Performance Information
Performance varies by use, configuration and other factors. Learn more at www.Intel.com/PerformanceIndex. Notice revision #20201201

Input Parameters

operation

C_INT.

Specifies operation op() on input matrix.

SPARSE_OPERATION_NON_TRANSPOSE	Non-transpose, op(*A*) = *A*.
SPARSE_OPERATION_TRANSPOSE	Transpose, op(*A*) = A^T.
SPARSE_OPERATION_CONJUGATE_TRANSPOSE	Conjugate transpose, op(*A*) = A^H.

descr

MATRIX_DESCR.

Descriptor specifying sparse matrix properties.

type - Specifies the type of a sparse matrix:

SPARSE_MATRIX_TYPE_GENERAL	The matrix is processed as is.
SPARSE_MATRIX_TYPE_SYMMETRIC	The matrix is symmetric (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_HERMITIAN	The matrix is Hermitian (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_TRIANGULAR	The matrix is triangular (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_DIAGONAL	The matrix is diagonal (only diagonal elements are processed).
SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR	The matrix is block-triangular (only requested triangle is processed). Applies to BSR format only.
SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL	The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only.

mode - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:

SPARSE_FILL_MODE_LOWER	The lower triangular matrix part is processed.
SPARSE_FILL_MODE_UPPER	The upper triangular matrix part is processed.

diag - Specifies diagonal type for non-general matrices:

	SPARSE_DIAG_NON_UNIT	Diagonal elements might not be equal to one.
	SPARSE_DIAG_UNIT	Diagonal elements are equal to one.
expected_calls	C_INT.	
	Number of expected calls to execution routine.	

Output Parameters

A	SPARSE_MATRIX_T.	
	Handle containing internal data.	
stat	INTEGER	
	Value indicating whether the operation was successful or not, and why:	
	SPARSE_STATUS_SUCCESS	The operation was successful.
	SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
	SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
	SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
	SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
	SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
	SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_set_sv_hint

Provides estimate of number and type of upcoming triangular system solver operations.

Syntax

```
stat = mkl_sparse_set_sv_hint (A, operation, descr, expected_calls)
```

Include Files

- mkl_spblas.f90

Description

The mkl_sparse_set_sv_hint routine provides an estimate of the number of upcoming triangular system solver operations and type of these operations for performance optimization.

Product and Performance Information
Performance varies by use, configuration and other factors. Learn more at www.Intel.com/PerformanceIndex.

Product and Performance Information
Notice revision #20201201

Input Parameters

operation C_INT.

Specifies operation op() on input matrix.

SPARSE_OPERATION_NON_TRANSPOSE	Non-transpose, op(*A*) = *A*.
SPARSE_OPERATION_TRANSPOSE	Transpose, op(*A*) = A^T.
SPARSE_OPERATION_CONJUGATE_TRANSPOSE	Conjugate transpose, op(*A*) = A^H.

descr MATRIX_DESCR.

Descriptor specifying sparse matrix properties.

type - Specifies the type of a sparse matrix:

SPARSE_MATRIX_TYPE_GENERAL	The matrix is processed as is.
SPARSE_MATRIX_TYPE_SYMMETRIC	The matrix is symmetric (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_HERMITIAN	The matrix is Hermitian (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_TRIANGULAR	The matrix is triangular (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_DIAGONAL	The matrix is diagonal (only diagonal elements are processed).
SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR	The matrix is block-triangular (only requested triangle is processed). Applies to BSR format only.
SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL	The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only.

mode - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:

SPARSE_FILL_MODE_LOWER	The lower triangular matrix part is processed.
SPARSE_FILL_MODE_UPPER	The upper triangular matrix part is processed.

diag - Specifies diagonal type for non-general matrices:

SPARSE_DIAG_NON_UNIT	Diagonal elements might not be equal to one.
SPARSE_DIAG_UNIT	Diagonal elements are equal to one.

expected_calls C_INT.

Number of expected calls to execution routine.

Output Parameters

A SPARSE_MATRIX_T.

Handle containing internal data.

stat INTEGER

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_set_mm_hint

Provides estimate of number and type of upcoming matrix-matrix multiplication operations.

Syntax

```
stat = mkl_sparse_set_mm_hint (A, operation, descr, layout, dense_matrix_size, expected_calls)
```

Include Files

- mkl_spblas.f90

Description

The mkl_sparse_set_mm_hint routine provides an estimate of the number of upcoming matrix-matrix multiplication operations and type of these operations for performance optimization purposes.

Input Parameters

operation

C_INT.

Specifies operation op() on input matrix.

SPARSE_OPERATION_NON_TRANSPOSE	Non-transpose, op(*A*) = *A*.
SPARSE_OPERATION_TRANSPOSE	Transpose, op(*A*) = A^T.
SPARSE_OPERATION_CONJUGATE_TRANSPOSE	Conjugate transpose, op(*A*) = A^H.

descr

MATRIX_DESCR.

Descriptor specifying sparse matrix properties.

type - Specifies the type of a sparse matrix:

SPARSE_MATRIX_TYPE_GENERAL	The matrix is processed as is.
SPARSE_MATRIX_TYPE_SYMMETRIC	The matrix is symmetric (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_HERMITIAN	The matrix is Hermitian (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_TRIANGULAR	The matrix is triangular (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_DIAGONAL	The matrix is diagonal (only diagonal elements are processed).
SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR	The matrix is block-triangular (only requested triangle is processed). Applies to BSR format only.
SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL	The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only.

mode - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:

SPARSE_FILL_MODE_LOWER	The lower triangular matrix part is processed.
SPARSE_FILL_MODE_UPPER	The upper triangular matrix part is processed.

diag - Specifies diagonal type for non-general matrices:

SPARSE_DIAG_NON_UNIT	Diagonal elements might not be equal to one.
SPARSE_DIAG_UNIT	Diagonal elements are equal to one.

layout

C_INT.

Specifies layout of elements:

	`SPARSE_LAYOUT_COLUMN_MAJOR` Storage of elements uses column major layout.
	`SPARSE_LAYOUT_ROW_MAJOR` Storage of elements uses row major layout.
dense_matrix_size	`C_INT`. Number of columns in dense matrix.
expected_calls	`C_INT`. Number of expected calls to execution routine.

Output Parameters

A	`SPARSE_MATRIX_T`. Handle containing internal data.
stat	`INTEGER` Value indicating whether the operation was successful or not, and why:

`SPARSE_STATUS_SUCCESS`	The operation was successful.
`SPARSE_STATUS_NOT_INITIALIZED`	The routine encountered an empty handle or matrix array.
`SPARSE_STATUS_ALLOC_FAILED`	Internal memory allocation failed.
`SPARSE_STATUS_INVALID_VALUE`	The input parameters contain an invalid value.
`SPARSE_STATUS_EXECUTION_FAILED`	Execution failed.
`SPARSE_STATUS_INTERNAL_ERROR`	An error in algorithm implementation occurred.
`SPARSE_STATUS_NOT_SUPPORTED`	The requested operation is not supported.

mkl_sparse_set_sm_hint

Provides estimate of number and type of upcoming triangular matrix solve with multiple right hand sides operations.

Syntax

`stat = mkl_sparse_set_sm_hint (A, operation, descr, layout, dense_matrix_size, expected_calls)`

Include Files

- `mkl_spblas.f90`

Description

The `mkl_sparse_set_sm_hint` routine provides an estimate of the number of upcoming triangular matrix solve with multiple right hand sides operations and type of these operations for performance optimization purposes.

Product and Performance Information
Performance varies by use, configuration and other factors. Learn more at www.Intel.com/PerformanceIndex. Notice revision #20201201

Input Parameters

operation

`C_INT`.

Specifies operation `op()` on input matrix.

`SPARSE_OPERATION_NON_TRANSPOSE`	Non-transpose, `op(`A`) = `A.
`SPARSE_OPERATION_TRANSPOSE`	Transpose, `op(`A`) = `A^T.
`SPARSE_OPERATION_CONJUGATE_TRANSPOSE`	Conjugate transpose, `op(`A`) = `A^H.

descr

`MATRIX_DESCR`.

Descriptor specifying sparse matrix properties.

type - Specifies the type of a sparse matrix:

`SPARSE_MATRIX_TYPE_GENERAL`	The matrix is processed as is.
`SPARSE_MATRIX_TYPE_SYMMETRIC`	The matrix is symmetric (only the requested triangle is processed).
`SPARSE_MATRIX_TYPE_HERMITIAN`	The matrix is Hermitian (only the requested triangle is processed).
`SPARSE_MATRIX_TYPE_TRIANGULAR`	The matrix is triangular (only the requested triangle is processed).
`SPARSE_MATRIX_TYPE_DIAGONAL`	The matrix is diagonal (only diagonal elements are processed).
`SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR`	The matrix is block-triangular (only requested triangle is processed). Applies to BSR format only.
`SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL`	The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only.

mode - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:

	SPARSE_FILL_MODE_LOWER — The lower triangular matrix part is processed.
	SPARSE_FILL_MODE_UPPER — The upper triangular matrix part is processed.
	diag - Specifies diagonal type for non-general matrices:
	SPARSE_DIAG_NON_UNIT — Diagonal elements might not be equal to one.
	SPARSE_DIAG_UNIT — Diagonal elements are equal to one.
layout	C_INT.
	Specifies layout of elements:
	SPARSE_LAYOUT_COLUMN_MAJOR — Storage of elements uses column major layout.
	SPARSE_LAYOUT_ROW_MAJOR — Storage of elements uses row major layout.
dense_matrix_size	C_INT.
	Number of right-hand-side.
expected_calls	C_INT.
	Number of expected calls to execution routine.

Output Parameters

A	SPARSE_MATRIX_T.
	Handle containing internal data.
stat	INTEGER
	Value indicating whether the operation was successful or not, and why:
	SPARSE_STATUS_SUCCESS — The operation was successful.
	SPARSE_STATUS_NOT_INITIALIZED — The routine encountered an empty handle or matrix array.
	SPARSE_STATUS_ALLOC_FAILED — Internal memory allocation failed.
	SPARSE_STATUS_INVALID_VALUE — The input parameters contain an invalid value.
	SPARSE_STATUS_EXECUTION_FAILED — Execution failed.
	SPARSE_STATUS_INTERNAL_ERROR — An error in algorithm implementation occurred.
	SPARSE_STATUS_NOT_SUPPORTED — The requested operation is not supported.

mkl_sparse_set_dotmv_hint

Sets estimate of the number and type of upcoming matrix-vector operations.

Syntax

```
stat = mkl_sparse_set_dotmv_hint (A, operation, descr, layout, expected_calls)
```

Include Files

- mkl_spblas.f90

Description

Use the mkl_sparse_set_dotmv_hint routine to provide the Inspector-executor Sparse BLAS API an estimate of the number of upcoming matrix-vector multiplication operations for performance optimization, and specify whether or not to perform an operation on the matrix.

Input Parameters

operation

C_INT.

Specifies the operation performed on matrix *A*.

If *operation* = SPARSE_OPERATION_NON_TRANSPOSE, op(*A*) = *A*.

If *operation* = SPARSE_OPERATION_TRANSPOSE, op(*A*) = A^T.

If *operation* = SPARSE_OPERATION_CONJUGATE_TRANSPOSE, op(*A*) = A^H.

descr

MATRIX_DESCR.

Descriptor specifying sparse matrix properties.

type - Specifies the type of a sparse matrix:

SPARSE_MATRIX_TYPE_GENERAL	The matrix is processed as is.
SPARSE_MATRIX_TYPE_SYMMETRIC	The matrix is symmetric (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_HERMITIAN	The matrix is Hermitian (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_TRIANGULAR	The matrix is triangular (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_DIAGONAL	The matrix is diagonal (only diagonal elements are processed).
SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR	The matrix is block-triangular (only requested triangle is processed). Applies to BSR format only.
SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL	The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only.

mode - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:

	`SPARSE_FILL_MODE_LOWER` The lower triangular matrix part is processed. `SPARSE_FILL_MODE_UPPER` The upper triangular matrix part is processed. *diag* - Specifies diagonal type for non-general matrices: `SPARSE_DIAG_NON_UNIT` Diagonal elements might not be equal to one. `SPARSE_DIAG_UNIT` Diagonal elements are equal to one.
expected_calls	`C_INT`. Expected number of calls to the execution routine.

Output Parameters

A	`SPARSE_MATRIX_T`. Handle containing internal data.
stat	`INTEGER` Value indicating whether the operation was successful or not, and why: `SPARSE_STATUS_SUCCESS` The operation was successful. `SPARSE_STATUS_NOT_INITIALIZED` The routine encountered an empty handle or matrix array. `SPARSE_STATUS_ALLOC_FAILED` Internal memory allocation failed. `SPARSE_STATUS_INVALID_VALUE` The input parameters contain an invalid value. `SPARSE_STATUS_EXECUTION_FAILED` Execution failed. `SPARSE_STATUS_INTERNAL_ERROR` An error in algorithm implementation occurred. `SPARSE_STATUS_NOT_SUPPORTED` The requested operation is not supported.

mkl_sparse_set_symgs_hint

Syntax

Sets estimate of number and type of upcoming `mkl_sparse_?_symgs` operations.

`stat =mkl_sparse_set_symgs_hint (A, operation, descr, layout, dense_matrix_size, expected_calls)`

Include Files

- `mkl_spblas.f90`

Description

Use the `mkl_sparse_set_symgs_hint` routine to provide the Inspector-executor Sparse BLAS API an estimate of the number of upcoming symmetric Gauss-Zeidel preconditioner operations for performance optimization, and specify whether or not to perform an operation on the matrix.

Input Parameters

operation

`C_INT`.

Specifies the operation performed on matrix *A*.

If *operation* = `SPARSE_OPERATION_NON_TRANSPOSE`, `op(`*A*`) = `*A*.

If *operation* = `SPARSE_OPERATION_TRANSPOSE`, `op(`*A*`) = `A^T.

If *operation* = `SPARSE_OPERATION_CONJUGATE_TRANSPOSE`, `op(`*A*`) = `A^H.

descr

`MATRIX_DESCR`.

Descriptor specifying sparse matrix properties.

type - Specifies the type of a sparse matrix:

`SPARSE_MATRIX_TYPE_GENERAL`	The matrix is processed as is.
`SPARSE_MATRIX_TYPE_SYMMETRIC`	The matrix is symmetric (only the requested triangle is processed).
`SPARSE_MATRIX_TYPE_HERMITIAN`	The matrix is Hermitian (only the requested triangle is processed).
`SPARSE_MATRIX_TYPE_TRIANGULAR`	The matrix is triangular (only the requested triangle is processed).
`SPARSE_MATRIX_TYPE_DIAGONAL`	The matrix is diagonal (only diagonal elements are processed).
`SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR`	The matrix is block-triangular (only requested triangle is processed). Applies to BSR format only.
`SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL`	The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only.

mode - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:

`SPARSE_FILL_MODE_LOWER`	The lower triangular matrix part is processed.
`SPARSE_FILL_MODE_UPPER`	The upper triangular matrix part is processed.

diag - Specifies diagonal type for non-general matrices:

`SPARSE_DIAG_NON_UNIT`	Diagonal elements might not be equal to one.
`SPARSE_DIAG_UNIT`	Diagonal elements are equal to one.

diag

`C_INT`.

Specifies diagonal type for non-general matrices

mode C_INT.

Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices.

type C_INT.

Specifies the type of a sparse matrix.

expected_calls C_INT.

Estimate of the number to the execution routine.

Output Parameters

A SPARSE_MATRIX_T.

Handle containing internal data.

stat INTEGER

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_set_sorv_hint

Sets an estimate of the number and type of upcoming mkl_sparse_?_sorv *operations.*

Syntax

```
stat = sparse_status_t mkl_sparse_set_sorv_hint(type, A, descr, expected_calls)
```

Include Files

- mkl_spblas.f90

Description

Use the `mkl_sparse_set_sorv_hint` routine to provide the Inspector-Executor Sparse BLAS API an estimate of the number of upcoming forward/backward sweeps or symmetric SOR preconditioner operations for performance optimization.

Product and Performance Information
Performance varies by use, configuration and other factors. Learn more at www.Intel.com/PerformanceIndex. Notice revision #20201201

Input Parameters

type `SPARSE_MATRIX_T`.

Specifies the operation performed by the SORV preconditioner.

`SPARSE_SOR_FORWARD` Performs forward sweep as defined by:

$$(\omega*L+D)*x\text{^}1 = (D-\omega*D-\omega*U)*x\text{^}0 + \omega*b$$

`SPARSE_SOR_BACKWARD` Performs backward sweep as defined by:

$$(\omega*U+D)*x\text{^}1 = (D-\omega*D-\omega*L)*x\text{^}0 + \omega*b$$

`SPARSE_SOR_SYMMETRIC` Preconditioner matrix could be expressed as:

$$\frac{\omega}{2-\omega}\left(\frac{1}{\omega}D+L\right)D^{-1}\left(\frac{1}{\omega}D+L\right)^{T}$$

descr `MATRIX_DESCR`.

Structure specifying sparse matrix properties.

`SPARSE_MATRIX_T type` Specifies the type of a sparse matrix:

- `SPARSE_MATRIX_TYPE_GENERAL`

  The matrix is processed as-is.
- `SPARSE_MATRIX_TYPE_SYMMETRIC`

  The matrix is symmetric (only the requested triangle is processed).
- `SPARSE_MATRIX_TYPE_HERMITIAN`

  The matrix is Hermitian (only the requested triangle is processed).
- `SPARSE_MATRIX_TYPE_TRIANGULAR`

  The matrix is triangular (only the requested triangle is processed).
- `SPARSE_MATRIX_TYPE_DIAGONAL`

  The matrix is diagonal (only diagonal elements are processed).
- `SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR`

The matrix is block-triangular (only requested triangle is processed). Applies to BSR format only.

- `SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL`

  The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only.

`C_INT mode` — Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:

- `SPARSE_FILL_MODE_LOWER`

  The lower triangular matrix part is processed.
- `SPARSE_FILL_MODE_UPPER`

  The upper triangular matrix part is processed.

`SPARSE_MATRIX_TYPE_DIAGONAL diag` — Specifies diagonal type for non-general matrices:

- `SPARSE_DIAG_NON_UNIT`

  Diagonal elements might not be equal to one.
- `SPARSE_DIAG_UNIT`

  Diagonal elements are equal to one.

A — `SPARSE_MATRIX_T`.

Handle containing internal data.

expected_calls — `INTEGER`.

Estimate of the number of calls to the execution routine.

Output Parameters

A — `SPARSE_MATRIX_T`.

Handle containing internal data.

stat — `INTEGER`

Value indicating whether the operation was successful or not, and why:

`SPARSE_STATUS_SUCCESS`	The operation was successful.
`SPARSE_STATUS_NOT_INITIALIZED`	The routine encountered an empty handle or matrix array.
`SPARSE_STATUS_ALLOC_FAILED`	Internal memory allocation failed.
`SPARSE_STATUS_INVALID_VALUE`	The input parameters contain an invalid value.

SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_set_memory_hint

Provides memory requirements for performance optimization purposes.

Syntax

`stat = mkl_sparse_set_memory_hint (A, policy)`

Include Files

- `mkl_spblas.f90`

Description

The `mkl_sparse_set_memory_hint` routine allocates additional memory for further performance optimization purposes.

Product and Performance Information

Performance varies by use, configuration and other factors. Learn more at www.Intel.com/PerformanceIndex.

Notice revision #20201201

Input Parameters

policy — C_INT.

Specify memory utilization policy for optimization routine using these types:

SPARSE_MEMORY_NONE	Routine can allocate memory only for auxiliary structures (such as for workload balancing); the amount of memory is proportional to vector size.
SPARSE_MEMORY_AGGRESSIVE	Default. Routine can allocate memory up to the size of matrix *A* for converting into the appropriate sparse format.

Output Parameters

A — SPARSE_MATRIX_T.

Handle containing internal data.

stat — INTEGER

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_optimize

Analyzes matrix structure and performs optimizations using the hints provided in the handle.

Syntax

```
stat = mkl_sparse_optimize (A)
```

Include Files

- mkl_spblas.f90

Description

The mkl_sparse_optimize routine analyzes matrix structure and performs optimizations using the hints provided in the handle. Generally, specifying a higher number of expected operations allows for more aggressive and time consuming optimizations.

Product and Performance Information

Performance varies by use, configuration and other factors. Learn more at www.Intel.com/PerformanceIndex.

Notice revision #20201201

Input Parameters

A SPARSE_MATRIX_T.

Handle containing internal data.

Output Parameters

stat INTEGER

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS	The operation was successful.

SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

Inspector-Executor Sparse BLAS Execution Routines

Execution Routines and Their Data Types

Routine or Function Group	Data Types	Description
mkl_sparse_?_lu_smoother	s, d, c, z	Computes an action of a preconditioner which corresponds to the approximate matrix decomposition A ≈ (L+D)*E*(U+D) for the system Ax = b
mkl_sparse_?_mv	s, d, c, z	Computes a sparse matrix-vector product.
mkl_sparse_?_trsv	s, d, c, z	Solves a system of linear equations for a square sparse matrix.
mkl_sparse_?_mm	s, d, c, z	Computes the product of a sparse matrix and a dense matrix and stores the result as a dense matrix.
mkl_sparse_?_trsm	s, d, c, z	Solves a system of linear equations with multiple right-hand sides for a square sparse matrix.
mkl_sparse_?_add	s, d, c, z	Computes the sum of two sparse matrices. The result is stored in a newly allocated sparse matrix.
mkl_sparse_spmm	s, d, c, z	Computes the product of two sparse matrices and stores the result in a newly allocated sparse matrix.
mkl_sparse_?_spmmd	s, d, c, z	Computes the product of two sparse matrices and stores the result as a dense matrix.
mkl_sparse_sp2m	s, d, c, z	Computes the product of two sparse matrices (support operations on both matrices) and stores the result in a newly allocated sparse matrix.
mkl_sparse_?_sp2md	s, d, c, z	Computes the product of two sparse matrices (support operations on both matrices) and stores the result as a dense matrix.
mkl_sparse_sypr	s, d, c, z	Computes the symmetric product of three sparse matrices and stores the result in a newly allocated sparse matrix.
mkl_sparse_?_syprd	s, d, c, z	Computes the symmetric triple product of a sparse matrix and a dense matrix and stores the result as a dense matrix.

Routine or Function Group	Data Types	Description
mkl_sparse_?_symgs	s, d, c, z	Computes an action of a symmetric Gauss-Seidel preconditioner.
mkl_sparse_?_symgs_mv	s, d, c, z	Computes an action of a symmetric Gauss-Seidel preconditioner followed by a matrix-vector multiplication at the end.
mkl_sparse_?_syrkd	s, d, c, z	Computes the product of sparse matrix with its transpose (or conjugate transpose) and stores the result as a dense matrix.
mkl_sparse_syrk	s, d, c, z	Computes the product of a sparse matrix with its transpose (or conjugate transpose) and stores the result in a newly allocated sparse matrix.
mkl_sparse_?_dotmv	s, d, c, z	Computes a sparse matrix-vector product followed by a dot product.

mkl_sparse_?_lu_smoother

Computes an action of a preconditioner which corresponds to the approximate matrix decomposition $A \approx (L+D) \times E \times (U+D)$ *for the system* $Ax = b$ *(see description below).*

Syntax

```
status = mkl_sparse_s_lu_smoother (op, A, indx, descr, diag, approx_diag_inverse, x, b)
status = mkl_sparse_d_lu_smoother (op, A, indx, descr, diag, approx_diag_inverse, x, b)
status = mkl_sparse_c_lu_smoother (op, A, indx, descr, diag, approx_diag_inverse, x, b)
status = mkl_sparse_z_lu_smoother (op, A, indx, descr, diag, approx_diag_inverse, x, b)
```

Include Files

- mkl_spblas.f90

Description

This routine computes an update for an iterative solution *x* of the system *Ax=b* by means of applying one iteration of an approximate preconditioner which is based on the following approximation:

$A \sim (L+D) * E * (U+D)$, where *E* is an approximate inverse of the diagonal (using exact inverse will result in Gauss-Seidel preconditioner), *L* and *U* are lower/upper triangular parts of *A*, *D* is the diagonal (block diagonal in case of BSR format) of *A*.

The mkl_sparse_?_lu_smoother routine performs these operations:

```
r = b - A*x    /* 1. Computes the residual */
(L + D)*E*(U + D)*dx = r    /* 2. Finds the update dx by solving the system */
y = x + dx    /* 3. Performs an update */
```

This is also equal to the Symmetric Gauss-Seidel operation in the case of a CSR format and 1x1 diagonal blocks:

```
(L + D)*x^1 = b - U*x  /* Lower solve for intermediate x^1 */
(U + D)*x = b - L*x^1  /* Upper solve */
```

NOTE
This routine is supported only for non-transpose operation, real data types, and CSR/BSR sparse formats. In a BSR format, both diagonal values and approximate diagonal inverse arrays should be passed explicitly. For CSR format, diagonal values should be passed explicitly.

Input Parameters

operation

C_INT .

Specifies the operation performed on matrix *A*.

SPARSE_OPERATION_NON_TRANSPOSE, op(A) := A	**NOTE** Transpose and conjugate transpose (SPARSE_OPERATION_TRANSPOSE and SPARSE_OPERATION_CONJUGATE_TRANSPOSE) are not supported.
	Non-transpose, op(*A*) = *A*.

A

SPARSE_MATRIX_T.

Handle which contains the sparse matrix *A*.

descr

MATRIX_DESCR.

Structure specifying sparse matrix properties.

sparse_matrix_type_t*type* - Specifies the type of a sparse matrix:

SPARSE_MATRIX_TYPE_GENERAL	The matrix is processed as is.
SPARSE_MATRIX_TYPE_SYMMETRIC	The matrix is symmetric (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_HERMITIAN	The matrix is Hermitian (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_TRIANGULAR	The matrix is triangular (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_DIAGONAL	The matrix is diagonal (only diagonal elements are processed).
SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR	The matrix is block-triangular (only the requested triangle is processed). Applies to BSR format only.
SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL	The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only.

sparse_fill_mode_t*mode* - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:

SPARSE_FILL_MODE_LOWER	The lower triangular matrix part is processed.
SPARSE_FILL_MODE_UPPER	The upper triangular matrix part is processed.

sparse_diag_type_t*diag* - Specifies the diagonal type for non-general matrices:

SPARSE_DIAG_NON_UNIT	Diagonal elements might not be equal to one.
SPARSE_DIAG_UNIT	Diagonal elements are equal to one.

NOTE
Only SPARSE_MATRIX_TYPE_GENERAL is supported.

diag

C_FLOAT for mkl_sparse_s_lu_smoother

C_DOUBLE for mkl_sparse_d_lu_smoother

C_FLOAT_COMPLEX for mkl_sparse_c_lu_smoother

C_DOUBLE_COMPLEX for mkl_sparse_z_lu_smoother

Array of size at least *m*, where *m* is the number of rows (or nrows * block_size * block_size in case of BSR format) of matrix *A*.

The array *diag* must contain the diagonal values of matrix *A*.

approx_diag_inverse

C_FLOAT for mkl_sparse_s_lu_smoother

C_DOUBLE for mkl_sparse_d_lu_smoother

C_FLOAT_COMPLEX for mkl_sparse_c_lu_smoother

C_DOUBLE_COMPLEX for mkl_sparse_z_lu_smoother

Array of size at least *m*, where *m* is the number of rows (or the number of rows * block_size * block_size in case of BSR format) of matrix *A*.

The array *approx_diag_inverse* will be used as *E*, approximate inverse of the diagonal of the matrix *A*.

x

C_FLOAT for mkl_sparse_s_lu_smoother

C_DOUBLE for mkl_sparse_d_lu_smoother

C_FLOAT_COMPLEX for mkl_sparse_c_lu_smoother

C_DOUBLE_COMPLEX for mkl_sparse_z_lu_smoother

Array of size at least *k*, where *k* is the number of columns (or columns * block_size in case of BSR format) of matrix *A*.

On entry, the array *x* must contain the input vector.

b

C_FLOAT for mkl_sparse_s_lu_smoother

C_DOUBLE for mkl_sparse_d_lu_smoother

C_FLOAT_COMPLEX for mkl_sparse_c_lu_smoother

C_DOUBLE_COMPLEX for mkl_sparse_z_lu_smoother

Array of size at least *m*, where *m* is the number of rows (or rows * block_size in case of BSR format) of matrix *A*. The array *b* must contain the values of the right-hand side of the system.

Output Parameters

x

`C_FLOAT` for `mkl_sparse_s_lu_smoother`

`C_DOUBLE` for `mkl_sparse_d_lu_smoother`

`C_FLOAT_COMPLEX` for `mkl_sparse_c_lu_smoother`

`C_DOUBLE_COMPLEX` for `mkl_sparse_z_lu_smoother`

Overwritten by the computed vector *y*.

status

`INTEGER`

Value indicating whether the operation was successful or not, and why.

`SPARSE_STATUS_SUCCESS`	The operation was successful.
`SPARSE_STATUS_NOT_INITIALIZED`	The routine encountered an empty handle or matrix array.
`SPARSE_STATUS_ALLOC_FAILED`	Internal memory allocation failed.
`SPARSE_STATUS_INVALID_VALUE`	The input parameters contain an invalid value.
`SPARSE_STATUS_EXECUTION_FAILED`	Execution failed.
`SPARSE_STATUS_INTERNAL_ERROR`	An error in algorithm implementation occurred.
`SPARSE_STATUS_NOT_SUPPORTED`	The requested operation is not supported.

mkl_sparse_?_mv

Computes a sparse matrix- vector product.

Syntax

```
stat = mkl_sparse_s_mv (operation, alpha, A, descr, x, beta, y)
stat = mkl_sparse_d_mv (operation, alpha, A, descr, x, beta, y)
stat = mkl_sparse_c_mv (operation, alpha, A, descr, x, beta, y)
stat = mkl_sparse_z_mv (operation, alpha, A, descr, x, beta, y)
```

Include Files

- `mkl_spblas.f90`

Description

The `mkl_sparse_?_mv` routine computes a sparse matrix-dense vector product defined as

```
y := alpha*op(A)*x + beta*y
```

where:

alpha and *beta* are scalars, *x* and *y* are vectors, and *A* is a sparse matrix handle of a matrix with *m* rows and *k* columns, and `op` is a matrix modifier for matrix *A*.

Input Parameters

operation

`C_INT`.

Specifies operation `op()` on input matrix.

`SPARSE_OPERATION_NON_TRANSPOSE`	Non-transpose, `op(A) = A`.
`SPARSE_OPERATION_TRANSPOSE`	Transpose, `op(A) =` A^T.
`SPARSE_OPERATION_CONJUGATE_TRANSPOSE`	Conjugate transpose, `op(A) =` A^H.

alpha

`C_FLOAT` for `mkl_sparse_s_mv`

`C_DOUBLE` for `mkl_sparse_d_mv`

`C_FLOAT_COMPLEX` for `mkl_sparse_c_mv`

`C_DOUBLE_COMPLEX` for `mkl_sparse_z_mv`

Specifies the scalar *alpha*.

A

`SPARSE_MATRIX_T`.

Handle which contains the input matrix *A*.

descr

`MATRIX_DESCR`.

Descriptor specifying sparse matrix properties.

type - Specifies the type of a sparse matrix:

`SPARSE_MATRIX_TYPE_GENERAL`	The matrix is processed as is.
`SPARSE_MATRIX_TYPE_SYMMETRIC`	The matrix is symmetric (only the requested triangle is processed).
`SPARSE_MATRIX_TYPE_HERMITIAN`	The matrix is Hermitian (only the requested triangle is processed).
`SPARSE_MATRIX_TYPE_TRIANGULAR`	The matrix is triangular (only the requested triangle is processed).
`SPARSE_MATRIX_TYPE_DIAGONAL`	The matrix is diagonal (only diagonal elements are processed).
`SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR`	The matrix is block-triangular (only requested triangle is processed). Applies to BSR format only.
`SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL`	The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only.

mode - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:

	`SPARSE_FILL_MODE_LOWER` The lower triangular matrix part is processed. `SPARSE_FILL_MODE_UPPER` The upper triangular matrix part is processed. *diag* - Specifies diagonal type for non-general matrices: `SPARSE_DIAG_NON_UNIT` Diagonal elements might not be equal to one. `SPARSE_DIAG_UNIT` Diagonal elements are equal to one.

x	`C_FLOAT` for `mkl_sparse_s_mv`
	`C_DOUBLE` for `mkl_sparse_d_mv`
	`C_FLOAT_COMPLEX` for `mkl_sparse_c_mv`
	`C_DOUBLE_COMPLEX` for `mkl_sparse_z_mv`
	Array of size equal to the number of columns, *k* of *A* if *operation* = `SPARSE_OPERATION_NON_TRANSPOSE` and at least the number of rows, *m*, of *A* otherwise. On entry, the array must contain the vector *x*.

beta	`C_FLOAT` for `mkl_sparse_s_mv`
	`C_DOUBLE` for `mkl_sparse_d_mv`
	`C_FLOAT_COMPLEX` for `mkl_sparse_c_mv`
	`C_DOUBLE_COMPLEX` for `mkl_sparse_z_mv`
	Specifies the scalar *beta*.

y	`C_FLOAT` for `mkl_sparse_s_mv`
	`C_DOUBLE` for `mkl_sparse_d_mv`
	`C_FLOAT_COMPLEX` for `mkl_sparse_c_mv`
	`C_DOUBLE_COMPLEX` for `mkl_sparse_z_mv`
	Array with size at least *m* if *operation*=`SPARSE_OPERATION_NON_TRANSPOSE` and at least *k* otherwise. On entry, the array *y* must contain the vector *y*. Array of size equal to the number of rows, *m* of *A* if *operation* = `SPARSE_OPERATION_NON_TRANSPOSE` and at least the number of columns, *k*, of *A* otherwise. On entry, the array *y* must contain the vector *y*.

Output Parameters

y	`C_FLOAT` for `mkl_sparse_s_mv`
	`C_DOUBLE` for `mkl_sparse_d_mv`
	`C_FLOAT_COMPLEX` for `mkl_sparse_c_mv`
	`C_DOUBLE_COMPLEX` for `mkl_sparse_z_mv`
	Overwritten by the updated vector *y*.

stat	`INTEGER` Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_?_trsv

Solves a system of linear equations for a triangular sparse matrix.

Syntax

```
stat = mkl_sparse_s_trsv (operation, alpha, A, descr, x, y)
stat = mkl_sparse_d_trsv (operation, alpha, A, descr, x, y)
stat = mkl_sparse_c_trsv (operation, alpha, A, descr, x, y)
stat = mkl_sparse_z_trsv (operation, alpha, A, descr, x, y)
```

Include Files

- mkl_spblas.f90

Description

The mkl_sparse_?_trsv routine solves a system of linear equations for a matrix:

```
op(A)*y = alpha * x
```

where *A* is a triangular sparse matrix , op is a matrix modifier for matrix *A*, *alpha* is a scalar, and *x* and *y* are vectors .

NOTE
For sparse matrices in the BSR format, the supported combinations of (*indexing*,*block_layout*) are:

- (SPARSE_INDEX_BASE_ZERO, SPARSE_LAYOUT_ROW_MAJOR)
- (SPARSE_INDEX_BASE_ONE, SPARSE_LAYOUT_COLUMN_MAJOR)

Input Parameters

operation	C_INT. Specifies operation op() on input matrix.

	`SPARSE_OPERATION_NON_TRANSPOSE` Non-transpose, op(*A*) = *A*. `SPARSE_OPERATION_TRANSPOSE` Transpose, op(*A*) = A^T. `SPARSE_OPERATION_CONJUGATE_TRANSPOSE` Conjugate transpose, op(*A*) = A^H.

alpha	`C_FLOAT` for `mkl_sparse_s_trsv`
	`C_DOUBLE` for `mkl_sparse_d_trsv`
	`C_FLOAT_COMPLEX` for `mkl_sparse_c_trsv`
	`C_DOUBLE_COMPLEX` for `mkl_sparse_z_trsv`
	Specifies the scalar *alpha*.

A	`SPARSE_MATRIX_T`. Handle which contains the input matrix *A*.
descr	`MATRIX_DESCR`. Descriptor specifying sparse matrix properties. *type* - Specifies the type of a sparse matrix: `SPARSE_MATRIX_TYPE_GENERAL` The matrix is processed as is. `SPARSE_MATRIX_TYPE_SYMMETRIC` The matrix is symmetric (only the requested triangle is processed). `SPARSE_MATRIX_TYPE_HERMITIAN` The matrix is Hermitian (only the requested triangle is processed). `SPARSE_MATRIX_TYPE_TRIANGULAR` The matrix is triangular (only the requested triangle is processed). `SPARSE_MATRIX_TYPE_DIAGONAL` The matrix is diagonal (only diagonal elements are processed). `SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR` The matrix is block-triangular (only requested triangle is processed). Applies to BSR format only. `SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL` The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only. *mode* - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices: `SPARSE_FILL_MODE_LOWER` The lower triangular matrix part is processed. `SPARSE_FILL_MODE_UPPER` The upper triangular matrix part is processed. *diag* - Specifies diagonal type for non-general matrices:

	`SPARSE_DIAG_NON_UNIT` Diagonal elements might not be equal to one. `SPARSE_DIAG_UNIT` Diagonal elements are equal to one.

x	`C_FLOAT` for `mkl_sparse_s_trsv`
	`C_DOUBLE` for `mkl_sparse_d_trsv`
	`C_FLOAT_COMPLEX` for `mkl_sparse_c_trsv`
	`C_DOUBLE_COMPLEX` for `mkl_sparse_z_trsv`
	Array of size at least *m*, where *m* is the number of rows of matrix *A*. On entry, the array must contain the vector *x*.

Output Parameters

y	`C_FLOAT` for `mkl_sparse_s_trsv`
	`C_DOUBLE` for `mkl_sparse_d_trsv`
	`C_FLOAT_COMPLEX` for `mkl_sparse_c_trsv`
	`C_DOUBLE_COMPLEX` for `mkl_sparse_z_trsv`
	Array of size at least *m* containing the solution to the system of linear equations.

stat	`INTEGER` Value indicating whether the operation was successful or not, and why: `SPARSE_STATUS_SUCCESS` The operation was successful. `SPARSE_STATUS_NOT_INITIALIZED` The routine encountered an empty handle or matrix array. `SPARSE_STATUS_ALLOC_FAILED` Internal memory allocation failed. `SPARSE_STATUS_INVALID_VALUE` The input parameters contain an invalid value. `SPARSE_STATUS_EXECUTION_FAILED` Execution failed. `SPARSE_STATUS_INTERNAL_ERROR` An error in algorithm implementation occurred. `SPARSE_STATUS_NOT_SUPPORTED` The requested operation is not supported.

mkl_sparse_?_mm

Computes the product of a sparse matrix and a dense matrix and stores the result as a dense matrix.

Syntax

```
stat = mkl_sparse_s_mm (operation, alpha, A, descr, layout, B, columns, ldb, beta, C, ldc)
stat = mkl_sparse_d_mm (operation, alpha, A, descr, layout, B, columns, ldb, beta, C, ldc)
```

```
stat = mkl_sparse_c_mm (operation, alpha, A, descr, layout, B, columns, ldb, beta, C, ldc)
stat = mkl_sparse_z_mm (operation, alpha, A, descr, layout, B, columns, ldb, beta, C, ldc)
```

Include Files

- mkl_spblas.f90

Description

The mkl_sparse_?_mm routine performs a matrix-matrix operation:

```
C := alpha*op(A)*B + beta*C
```

where *alpha* and *beta* are scalars, *A* is a sparse matrix, op is a matrix modifier for matrix *A*, and *B* and *C* are dense matrices.

The mkl_sparse_?_mm and mkl_sparse_?_trsm routines support these configurations:

	Column-major dense matrix: *layout* = SPARSE_LAYOUT_COLUMN_MAJOR	Row-major dense matrix: *layout* = SPARSE_LAYOUT_ROW_MAJOR
0-based sparse matrix: SPARSE_INDEX_BASE_ZERO	CSR BSR: general non-transposed matrix multiplication only	All formats
1-based sparse matrix: SPARSE_INDEX_BASE_ONE	All formats	CSR BSR: general non-transposed matrix multiplication only

NOTE
For sparse matrices in the BSR format, the supported combinations of (*indexing*,*block_layout*) are:

- (SPARSE_INDEX_BASE_ZERO, SPARSE_LAYOUT_ROW_MAJOR)
- (SPARSE_INDEX_BASE_ONE, SPARSE_LAYOUT_COLUMN_MAJOR)

Input Parameters

operation

C_INT.

Specifies operation op() on input matrix.

SPARSE_OPERATION_NON_TRANSPOSE	Non-transpose, op(*A*) = *A*.
SPARSE_OPERATION_TRANSPOSE	Transpose, op(*A*) = A^T.
SPARSE_OPERATION_CONJUGATE_TRANSPOSE	Conjugate transpose, op(*A*) = A^H.

alpha

C_FLOAT for mkl_sparse_s_mm

C_DOUBLE for mkl_sparse_d_mm

`C_FLOAT_COMPLEX` for `mkl_sparse_c_mm`

`C_DOUBLE_COMPLEX` for `mkl_sparse_z_mm`

Specifies the scalar *alpha*.

A

`SPARSE_MATRIX_T`.

Handle which contains the sparse matrix *A*.

descr

`MATRIX_DESCR`.

Descriptor specifying sparse matrix properties.

type - Specifies the type of a sparse matrix:

`SPARSE_MATRIX_TYPE_GENERAL`	The matrix is processed as is.
`SPARSE_MATRIX_TYPE_SYMMETRIC`	The matrix is symmetric (only the requested triangle is processed).
`SPARSE_MATRIX_TYPE_HERMITIAN`	The matrix is Hermitian (only the requested triangle is processed).
`SPARSE_MATRIX_TYPE_TRIANGULAR`	The matrix is triangular (only the requested triangle is processed).
`SPARSE_MATRIX_TYPE_DIAGONAL`	The matrix is diagonal (only diagonal elements are processed).
`SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR`	The matrix is block-triangular (only requested triangle is processed). Applies to BSR format only.
`SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL`	The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only.

mode - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:

`SPARSE_FILL_MODE_LOWER`	The lower triangular matrix part is processed.
`SPARSE_FILL_MODE_UPPER`	The upper triangular matrix part is processed.

diag - Specifies diagonal type for non-general matrices:

`SPARSE_DIAG_NON_UNIT`	Diagonal elements might not be equal to one.
`SPARSE_DIAG_UNIT`	Diagonal elements are equal to one.

layout

`C_INT`.

Describes the storage scheme for the dense matrix:

`SPARSE_LAYOUT_COLUMN_MAJOR`	Storage of elements uses column major layout.
`SPARSE_LAYOUT_ROW_MAJOR`	Storage of elements uses row major layout.

B

C_FLOAT for mkl_sparse_s_mm

C_DOUBLE for mkl_sparse_d_mm

C_FLOAT_COMPLEX for mkl_sparse_c_mm

C_DOUBLE_COMPLEX for mkl_sparse_z_mm

Array of size at least *rows***cols*.

	layout = SPARSE_LAYOUT_COLUMN_MAJOR	*layout* = SPARSE_LAYOUT_ROW_MAJOR
rows (number of rows in *B*)	*ldb*	If op(*A*) = *A*, number of columns in A If op(*A*) = A^T, number of rows in A
cols (number of columns in *B*)	*columns*	*ldb*

columns

C_INT.

Number of columns of matrix *C*.

ldb

C_INT.

Specifies the leading dimension of matrix *B*.

beta

C_FLOAT for mkl_sparse_s_mm

C_DOUBLE for mkl_sparse_d_mm

C_FLOAT_COMPLEX for mkl_sparse_c_mm

C_DOUBLE_COMPLEX for mkl_sparse_z_mm

Specifies the scalar *beta*

C

C_FLOAT for mkl_sparse_s_mm

C_DOUBLE for mkl_sparse_d_mm

C_FLOAT_COMPLEX for mkl_sparse_c_mm

C_DOUBLE_COMPLEX for mkl_sparse_z_mm

Array of size at least *rows***cols*, where

	layout = SPARSE_LAYOUT_COLUMN_MAJOR	*layout* = SPARSE_LAYOUT_ROW_MAJOR
rows (number of rows in *C*)	*ldc*	If op(*A*) = *A*, number of rows in A If op(*A*) = A^T, number of columns in A
cols (number of columns in *C*)	*columns*	*ldc*

ldc	Specifies the leading dimension of matrix *C*.

Output Parameters

C	C_FLOAT for mkl_sparse_s_mm C_DOUBLE for mkl_sparse_d_mm C_FLOAT_COMPLEX for mkl_sparse_c_mm C_DOUBLE_COMPLEX for mkl_sparse_z_mm Overwritten by the updated matrix *C*.
stat	INTEGER Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_?_trsm

Solves a system of linear equations with multiple right hand sides for a triangular sparse matrix.

Syntax

```
stat = mkl_sparse_s_trsm (operation, alpha, A, descr, layout, x, columns, ldx, y, ldy)
stat = mkl_sparse_d_trsm (operation, alpha, A, descr, layout, x, columns, ldx, y, ldy)
stat = mkl_sparse_c_trsm (operation, alpha, A, descr, layout, x, columns, ldx, y, ldy)
stat = mkl_sparse_z_trsm (operation, alpha, A, descr, layout, x, columns, ldx, y, ldy)
```

Include Files

- mkl_spblas.f90

Description

The mkl_sparse_?_trsm routine solves a system of linear equations with multiple right hand sides for a triangular sparse matrix:

```
Y := alpha*inv(op(A))*X
```

where:

alpha is a scalar, *X* and *Y* are dense matrices, *A* is a sparse matrix, and `op` is a matrix modifier for matrix *A*.

The `mkl_sparse_?_mm` and `mkl_sparse_?_trsm` routines support these configurations:

	Column-major dense matrix: *layout* = SPARSE_LAYOUT_COLUMN_MAJOR	Row-major dense matrix: *layout* = SPARSE_LAYOUT_ROW_MAJOR
0-based sparse matrix: SPARSE_INDEX_BASE_ZERO	CSR BSR: general non-transposed matrix multiplication only	All formats
1-based sparse matrix: SPARSE_INDEX_BASE_ONE	All formats	CSR BSR: general non-transposed matrix multiplication only

NOTE
For sparse matrices in the BSR format, the supported combinations of (*indexing*,*block_layout*) are:

- (SPARSE_INDEX_BASE_ZERO, SPARSE_LAYOUT_ROW_MAJOR)
- (SPARSE_INDEX_BASE_ONE, SPARSE_LAYOUT_COLUMN_MAJOR)

Input Parameters

operation

C_INT.

Specifies operation `op()` on input matrix.

SPARSE_OPERATION_NON_TRANSPOSE	Non-transpose, op(*A*) = *A*.
SPARSE_OPERATION_TRANSPOSE	Transpose, op(*A*) = A^T.
SPARSE_OPERATION_CONJUGATE_TRANSPOSE	Conjugate transpose, op(*A*) = A^H.

alpha

C_FLOAT for `mkl_sparse_s_trsm`

C_DOUBLE for `mkl_sparse_d_trsm`

C_FLOAT_COMPLEX for `mkl_sparse_c_trsm`

C_DOUBLE_COMPLEX for `mkl_sparse_z_trsm`

Specifies the scalar *alpha*.

A

SPARSE_MATRIX_T.

Handle which contains the sparse matrix *A*.

descr

MATRIX_DESCR.

Descriptor specifying sparse matrix properties.

type - Specifies the type of a sparse matrix:

SPARSE_MATRIX_TYPE_GENERAL	The matrix is processed as is.

SPARSE_MATRIX_TYPE_SYMMETRIC	The matrix is symmetric (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_HERMITIAN	The matrix is Hermitian (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_TRIANGULAR	The matrix is triangular (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_DIAGONAL	The matrix is diagonal (only diagonal elements are processed).
SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR	The matrix is block-triangular (only requested triangle is processed). Applies to BSR format only.
SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL	The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only.

mode - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:

SPARSE_FILL_MODE_LOWER	The lower triangular matrix part is processed.
SPARSE_FILL_MODE_UPPER	The upper triangular matrix part is processed.

diag - Specifies diagonal type for non-general matrices:

SPARSE_DIAG_NON_UNIT	Diagonal elements might not be equal to one.
SPARSE_DIAG_UNIT	Diagonal elements are equal to one.

layout

C_INT.

Describes the storage scheme for the dense matrix:

SPARSE_LAYOUT_COLUMN_MAJOR	Storage of elements uses column major layout.
SPARSE_LAYOUT_ROW_MAJOR	Storage of elements uses row major layout.

x

C_FLOAT for mkl_sparse_s_trsm

C_DOUBLE for mkl_sparse_d_trsm

C_FLOAT_COMPLEX for mkl_sparse_c_trsm

C_DOUBLE_COMPLEX for mkl_sparse_z_trsm

Array of size at least *rows**cols*.

	layout = SPARSE_LAYOUT_COLUMN_MAJOR	*layout* = SPARSE_LAYOUT_ROW_MAJOR
rows (number of rows in *x*)	*ldx*	number of rows in A

cols (number of columns in *x*)	*columns*	*ldx*

On entry, the array *x* must contain the matrix *X*.

columns

C_INT.

Number of columns in matrix *Y*.

ldx

C_INT.

Specifies the leading dimension of matrix *X*.

y

C_FLOAT for mkl_sparse_s_trsm

C_DOUBLE for mkl_sparse_d_trsm

C_FLOAT_COMPLEX for mkl_sparse_c_trsm

C_DOUBLE_COMPLEX for mkl_sparse_z_trsm

Array of size at least *rows***cols*, where

	layout = SPARSE_LAYOUT_COLUMN_MAJOR	*layout* = SPARSE_LAYOUT_ROW_MAJOR
rows (number of rows in *y*)	*ldy*	number of rows in A
cols (number of columns in *y*)	*columns*	*ldy*

Output Parameters

y

C_FLOAT for mkl_sparse_s_trsm

C_DOUBLE for mkl_sparse_d_trsm

C_FLOAT_COMPLEX for mkl_sparse_c_trsm

C_DOUBLE_COMPLEX for mkl_sparse_z_trsm

Overwritten by the updated matrix *Y*.

stat

INTEGER

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.

SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_?_add

Computes the sum of two sparse matrices. The result is stored in a newly allocated sparse matrix.

Syntax

```
stat = mkl_sparse_s_add (operation, A, alpha, B, C)
stat = mkl_sparse_d_add (operation, A, alpha, B, C)
stat = mkl_sparse_c_add (operation, A, alpha, B, C)
stat = mkl_sparse_z_add (operation, A, alpha, B, C)
```

Include Files

- mkl_spblas.f90

Description

The mkl_sparse_?_add routine performs a matrix-matrix operation:

```
C := alpha*op(A) + B
```

where *alpha* is a scalar, *op* is a matrix modifier, and *A*, *B*, and *C* are sparse matrices.

NOTE
This routine is only supported for sparse matrices in CSR and BSR formats. It is not supported for COO or CSC formats.

Input Parameters

A

SPARSE_MATRIX_T.

Handle which contains the sparse matrix *A*.

alpha

C_FLOAT for mkl_sparse_s_add

C_DOUBLE for mkl_sparse_d_add

C_FLOAT_COMPLEX for mkl_sparse_c_add

C_DOUBLE_COMPLEX for mkl_sparse_z_add

Specifies the scalar *alpha*.

operation

C_INT.

Specifies operation op() on input matrix.

SPARSE_OPERATION_NON_TRANSPOSE	Non-transpose, op(*A*) = *A*.
SPARSE_OPERATION_TRANSPOSE	Transpose, op(*A*) = A^T.

	SPARSE_OPERATION_CONJUGATE_TRANSPOSE	Conjugate transpose, op(*A*) = A^H.
B	SPARSE_MATRIX_T.	
	Handle which contains the sparse matrix *B*.	

Output Parameters

C	SPARSE_MATRIX_T.	
	Handle which contains the resulting sparse matrix.	
stat	INTEGER	
	Value indicating whether the operation was successful or not, and why:	
	SPARSE_STATUS_SUCCESS	The operation was successful.
	SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
	SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
	SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
	SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
	SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
	SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_spmm

Computes the product of two sparse matrices. The result is stored in a newly allocated sparse matrix.

Syntax

```
stat = mkl_sparse_spmm (operation, A, B, C)
```

Include Files

- mkl_spblas.f90

Description

The mkl_sparse_spmm routine performs a matrix-matrix operation:

```
C := op(A) *B
```

where *A*, *B*, and *C* are sparse matrices and *op* is a matrix modifier for matrix *A*.

Notes

- This routine is supported only for sparse matrices in CSC, CSR, and BSR formats. It is not supported for sparse matrices in COO format.
- The column indices of the output matrix (if in CSR format) can appear unsorted due to the algorithm chosen internally. To ensure sorted column indices (if that is important), call mkl_sparse_order().

Input Parameters

operation C_INT.

Specifies operation op() on input matrix.

SPARSE_OPERATION_NON_TRANSPOSE	Non-transpose, op(*A*) = *A*.
SPARSE_OPERATION_TRANSPOSE	Transpose, op(*A*) = A^T.
SPARSE_OPERATION_CONJUGATE_TRANSPOSE	Conjugate transpose, op(*A*) = A^H.

A SPARSE_MATRIX_T.

Handle which contains the sparse matrix *A*.

B SPARSE_MATRIX_T.

Handle which contains the sparse matrix *B*.

Output Parameters

C SPARSE_MATRIX_T.

Handle which contains the resulting sparse matrix.

stat INTEGER

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_?_spmmd

Computes the product of two sparse matrices and stores the result as a dense matrix.

Syntax

```
stat = mkl_sparse_s_spmmd (operation, A, B, layout, C, ldc)
stat = mkl_sparse_d_spmmd (operation, A, B, layout, C, ldc)
stat = mkl_sparse_c_spmmd (operation, A, B, layout, C, ldc)
stat = mkl_sparse_z_spmmd (operation, A, B, layout, C, ldc)
```

Include Files

- mkl_spblas.f90

Description

The mkl_sparse_?_spmmd routine performs a matrix-matrix operation:

```
C := op(A)*B
```

where *A* and *B* are sparse matrices, *op* is a matrix modifier for matrix *A*, and *C* is a dense matrix.

> **NOTE**
> This routine is not supported for sparse matrices in the COO format. For sparse matrices in BSR format, these combinations of (*indexing*, *block_layout*) are supported:
>
> - (SPARSE_INDEX_BASE_ZERO, SPARSE_LAYOUT_ROW_MAJOR)
> - (SPARSE_INDEX_BASE_ONE, SPARSE_LAYOUT_COLUMN_MAJOR)

Input Parameters

operation

C_INT.

Specifies operation op() on input matrix.

SPARSE_OPERATION_NON_TRANSPOSE	Non-transpose, op(*A*) = *A*.
SPARSE_OPERATION_TRANSPOSE	Transpose, op(*A*) = A^T.
SPARSE_OPERATION_CONJUGATE_TRANSPOSE	Conjugate transpose, op(*A*) = A^H.

A

SPARSE_MATRIX_T.

Handle which contains the sparse matrix *A*.

B

SPARSE_MATRIX_T.

Handle which contains the sparse matrix *B*.

layout

C_INT.

Describes the storage scheme for the dense matrix:

SPARSE_LAYOUT_COLUMN_MAJOR	Storage of elements uses column major layout.

	`SPARSE_LAYOUT_ROW_MAJOR` Storage of elements uses row major layout.
ldC	`C_INT`. Leading dimension of matrix *C*.

Output Parameters

C	`C_FLOAT` for `mkl_sparse_s_spmmd`
	`C_DOUBLE` for `mkl_sparse_d_spmmd`
	`C_FLOAT_COMPLEX` for `mkl_sparse_c_spmmd`
	`C_DOUBLE_COMPLEX` for `mkl_sparse_z_spmmd`
	Resulting dense matrix.

stat	`INTEGER` Value indicating whether the operation was successful or not, and why:

`SPARSE_STATUS_SUCCESS`	The operation was successful.
`SPARSE_STATUS_NOT_INITIALIZED`	The routine encountered an empty handle or matrix array.
`SPARSE_STATUS_ALLOC_FAILED`	Internal memory allocation failed.
`SPARSE_STATUS_INVALID_VALUE`	The input parameters contain an invalid value.
`SPARSE_STATUS_EXECUTION_FAILED`	Execution failed.
`SPARSE_STATUS_INTERNAL_ERROR`	An error in algorithm implementation occurred.
`SPARSE_STATUS_NOT_SUPPORTED`	The requested operation is not supported.

mkl_sparse_sp2m

Computes the product of two sparse matrices. The result is stored in a newly allocated sparse matrix.

Syntax

```
stat = mkl_sparse_sp2m (opA, descrA, A, opB, descrB, B, request, C)
```

Include Files

- `mkl_spblas.f90`

Description

The `mkl_sparse_sp2m` routine performs a matrix-matrix operation:

```
C := opA(A) *opB(B)
```

where *A*,`B`, and *C* are sparse matrices, *opA* and *opB* are matrix modifiers for matrices *A* and *B*, respectively.

NOTE
The column indices of the output matrix (if in CSR format) can appear unsorted due to the algorithm chosen internally. To ensure sorted column indices (if that is important), call mkl_sparse_order().

Input Parameters

opA

C_INT.

Specifies operation on input matrix.

SPARSE_OPERATION_NON_TRANSPOSE	Non-transpose, op(A)=A
SPARSE_OPERATION_TRANSPOSE	Transpose, op(A)=A^T
SPARSE_OPERATION_CONJUGATE_TRANSPOSE	Conjugate transpose, op(A)=A^H

opB

C_INT.

Specifies operation on input matrix.

SPARSE_OPERATION_NON_TRANSPOSE	Non-transpose, op(B)=B
SPARSE_OPERATION_TRANSPOSE	Transpose, op(B)=B^T
SPARSE_OPERATION_CONJUGATE_TRANSPOSE	Conjugate transpose, op(B)=B^H

descrA

MATRIX_DESCR.

Structure that specifies sparse matrix properties.

NOTE Currently, only SPARSE_MATRIX_TYPE_GENERAL is supported.

sparse_matrix_type_t*type* specifies the type of sparse matrix.

SPARSE_MATRIX_TYPE_GENERAL	The matrix is processed as is.
SPARSE_MATRIX_TYPE_SYMMETRIC	The matrix is symmetric (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_HERMITIAN	The matrix is Hermitian (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_TRIANGULAR	The matrix is triangular (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_DIAGONAL	The matrix is diagonal (only diagonal elements are processed).
SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR	The matrix is block-triangular (only the requested triangle is processed). This applies to BSR format only.

SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL	The matrix is block-diagonal (only the requested triangle is processed). This applies to BSR format only.

sparse_fill_mode_t*mode* specifies the triangular matrix portion for symmetric, Hermitian, triangular, and block-triangular matrices.

SPARSE_FILL_MODE_LOWER	The lower triangular matrix is processed.
SPARSE_FILL_MODE_UPPER	The upper triangular matrix is processed.

sparse_diag_type_t*diag* specifies the type of diagonal for non-general matrices.

SPARSE_DIAG_NON_UNIT	Diagonal elements must not be equal to 1.
SPARSE_DIAG_UNIT	Diagonal elements are equal to 1.

descrB

C_INT.

Structure that specifies sparse matrix properties.

NOTE Currently, only SPARSE_MATRIX_TYPE_GENERAL is supported.

sparse_matrix_type_t*type* specifies the type of sparse matrix.

SPARSE_MATRIX_TYPE_GENERAL	The matrix is processed as is.
SPARSE_MATRIX_TYPE_SYMMETRIC	The matrix is symmetric (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_HERMITIAN	The matrix is Hermitian (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_TRIANGULAR	The matrix is triangular (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_DIAGONAL	The matrix is diagonal (only diagonal elements are processed).
SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR	The matrix is block-triangular (only the requested triangle is processed). This applies to BSR format only.
SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL	The matrix is block-diagonal (only the requested triangle is processed). This applies to BSR format only.

sparse_fill_mode_t*mode* specifies the triangular matrix portion for symmetric, Hermitian, triangular, and block-triangular matrices.

SPARSE_FILL_MODE_LOWER	The lower triangular matrix is processed.
SPARSE_FILL_MODE_UPPER	The upper triangular matrix is processed.

`sparse_diag_type_t`*diag* specifies the type of diagonal for non-general matrices.

SPARSE_DIAG_NON_UNIT	Diagonal elements must not be equal to 1.
SPARSE_DIAG_UNIT	Diagonal elements are equal to 1.

A

`SPARSE_MATRIX_T`.

Handle which contains the sparse matrix *A*.

B

`SPARSE_MATRIX_T`.

Handle which contains the sparse matrix *B*.

request

`C_INT`.

Specifies whether the full computations are performed at once or using the two-stage algorithm. See Two-stage Algorithm for Inspector-executor Sparse BLAS Routines.

SPARSE_STAGE_NNZ_COUNT	Only `rowIndex` (BSR/CSR format) or `colIndex` (CSC format) array of the matrix is computed internally. The computation can be extracted to measure the memory required for full operation.
SPARSE_STAGE_FINALIZE_MULT_NO_VAL	Finalize computations of the matrix structure (values will not be computed). Use only after the call with SPARSE_STAGE_NNZ_COUNT parameter.
SPARSE_STAGE_FINALIZE_MULT	Finalize computation. Can also be used when the matrix structure remains unchanged and only values of the resulting matrix *C* need to be recomputed.
SPARSE_STAGE_FULL_MULT_NO_VAL	Perform computations of the matrix structure.
SPARSE_STAGE_FULL_MULT	Perform the entire computation in a single step.

Output Parameters

C

`SPARSE_MATRIX_T`.

Handle which contains the resulting sparse matrix.

stat

`INTEGER`.

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_?_sp2md

Computes the product of two sparse matrices (support operations on both matrices) and stores the result as a dense matrix.

Syntax

```
stat = mkl_sparse_s_sp2md (transA, descrA, A, transB, descrB, B, alpha, beta, C, layout, ldc )
stat = mkl_sparse_d_sp2md (transA, descrA, A, transB, descrB, B, alpha, beta, C, layout, ldc )
stat = mkl_sparse_c_sp2md (transA, descrA, A, transB, descrB, B, alpha, beta, C, layout, ldc )
stat = mkl_sparse_z_sp2md (transA, descrA, A, transB, descrB, B, alpha, beta, C, layout, ldc )
```

Include Files

- mkl_spblas.f90

Description

The mkl_sparse_?_sp2md routine performs a matrix-matrix operation:

```
C = alpha * opA(A) *opB(B) + beta*C
```

where *A* and *B* are sparse matrices, *opA* is a matrix modifier for matrix *A*, *opB* is a matrix modifier for matrix *B*, and *C* is a dense matrix, *alpha* and *beta* are scalars.

NOTE
This routine is not supported for sparse matrices in the COO format. For sparse matrices in BSR format, these combinations of (indexing, block_layout) are supported:

- (SPARSE_INDEX_BASE_ZERO, SPARSE_LAYOUT_ROW_MAJOR)
- (SPARSE_INDEX_BASE_ONE, SPARSE_LAYOUT_COLUMN_MAJOR)

Input Parameters

transA

C_INT.

Specifies operation op() on the input matrix.

SPARSE_OPERATION_NON_TRANSPOSE	Non-transpose, op(A)=A
SPARSE_OPERATION_TRANSPOSE	Transpose, op(A)=A^T
SPARSE_OPERATION_CONJUGATE_TRANSPOSE	Conjugate transpose, op(A)=A^H

descrA

MATRIX_DESCR.

Structure that specifies the sparse matrix properties.

NOTE Currently, only SPARSE_MATRIX_TYPE_GENERAL is supported.

sparse_matrix_type_t*type* specifies the type of sparse matrix.

SPARSE_MATRIX_TYPE_GENERAL	The matrix is processed as is.
SPARSE_MATRIX_TYPE_SYMMETRIC	The matrix is symmetric (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_HERMITIAN	The matrix is Hermitian (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_TRIANGULAR	The matrix is triangular (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_DIAGONAL	The matrix is diagonal (only diagonal elements are processed).
SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR	The matrix is block-triangular (only the requested triangle is processed). This applies to BSR format only.
SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL	The matrix is block-diagonal (only the requested triangle is processed). This applies to BSR format only.

sparse_fill_mode_t*mode* specifies the triangular matrix portion for symmetric, Hermitian, triangular, and block-triangular matrices.

SPARSE_FILL_MODE_LOWER	The lower triangular matrix is processed.
SPARSE_FILL_MODE_UPPER	The upper triangular matrix is processed.

sparse_diag_type_t*diag* specifies the type of diagonal for non-general matrices.

SPARSE_DIAG_NON_UNIT	Diagonal elements must not be equal to 1.
SPARSE_DIAG_UNIT	Diagonal elements are equal to 1.

A

SPARSE_MATRIX_T.

Handle which contains the sparse matrix *A*.

transB

C_INT.

Specifies operation opB() on the input matrix.

SPARSE_OPERATION_NON_TRANSPOSE	Non-transpose, opB(*B*)=*B*.
SPARSE_OPERATION_TRANSPOSE	Transpose, opB(*B*)=B^T .
SPARSE_OPERATION_CONJUGATE_TRANSPOSE	Conjugate transpose, opB(*B*)=B^H .

descrB

MATRIX_DESCR.

Structure that specifies the sparse matrix properties.

NOTE
Currently, only SPARSE_MATRIX_TYPE_GENERAL is supported.

sparse_matrix_type_t*type* specifies the type of sparse matrix.

SPARSE_MATRIX_TYPE_GENERAL	The matrix is processed as is.
SPARSE_MATRIX_TYPE_SYMMETRIC	The matrix is symmetric (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_HERMITIAN	The matrix is Hermitian (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_TRIANGULAR	The matrix is triangular (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_DIAGONAL	The matrix is diagonal (only diagonal elements are processed).
SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR	The matrix is block-triangular (only the requested triangle is processed). This applies to BSR format only.
SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL	The matrix is block-diagonal (only the requested triangle is processed). This applies to BSR format only.

sparse_fill_mode_t*mode* specifies the triangular matrix portion for symmetric, Hermitian, triangular, and block-triangular matrices.

SPARSE_FILL_MODE_LOWER	The lower triangular matrix is processed.
SPARSE_FILL_MODE_UPPER	The upper triangular matrix is processed.

sparse_diag_type_t*diag* specifies the type of diagonal for non-general matrices.

SPARSE_DIAG_NON_UNIT	Diagonal elements must not be equal to 1.
SPARSE_DIAG_UNIT	Diagonal elements are equal to 1.

B

SPARSE_MATRIX_T.

Handle which contains the sparse matrix *B*.

alpha

C_FLOAT for mkl_sparse_s_sp2md.

C_DOUBLE for mkl_sparse_d_sp2md.

C_FLOAT_COMPLEX for mkl_sparse_c_sp2md.

C_DOUBLE_COMPLEX for mkl_sparse_z_sp2md.

Specifies the scalar alpha.

beta

C_FLOAT for mkl_sparse_s_sp2md.

C_DOUBLE for mkl_sparse_d_sp2md.

C_FLOAT_COMPLEX for mkl_sparse_c_sp2md.

C_DOUBLE_COMPLEX for mkl_sparse_z_sp2md.

Specifies the scalar beta.

layout

C_INT.

Describes the storage scheme for the dense matrix:

SPARSE_LAYOUT_COLUMN_MAJOR	Storage of elements uses column major layout.
SPARSE_LAYOUT_ROW_MAJOR	Storage of elements uses row major layout.

ldc

C_INT.

Leading dimension of matrix *C*.

Output Parameters

C

C_FLOAT for mkl_sparse_s_sp2md.

C_DOUBLE for mkl_sparse_d_sp2md.

C_FLOAT_COMPLEX for mkl_sparse_c_sp2md.

C_DOUBLE_COMPLEX for mkl_sparse_z_sp2md.

The resulting dense matrix.

stat INTEGER

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_sypr

Computes the symmetric product of three sparse matrices and stores the result in a newly allocated sparse matrix.

Syntax

`stat = mkl_sparse_sypr (operation, A, B, descrB, C, request)`

Include Files

- `mkl_spblas.f90`

Description

The `mkl_sparse_sypr` routine performs a multiplication of three sparse matrices that results in a symmetric or Hermitian matrix, *C*.

```
C:=A*B*opA(A)
```

or

```
C:=opA(A)*B*A
```

depending on the matrix modifier *operation*.

Here, *A*, *B*, and *C* are sparse matrices, where *A* has a general structure while *B* and *C* are symmetric (for real data types) or Hermitian (for complex data types) matrices. `op`*A* is the transpose (real data types) or conjugate transpose (complex data types) operator.

NOTE
This routine is not supported for sparse matrices in COO or CSC formats. This routine supports only CSR and BSR formats. In addition, it supports only the sorted CSR and sorted BSR formats for the input matrix. If the data is unsorted, call the mkl_sparse_order routine before either mkl_sparse_sypr or mkl_sparse_?_syprd.

Input Parameters

operation

`C_INT`.

Specifies operation on the input sparse matrices.

`SPARSE_OPERATION_NON_TRANSPOSE`	Non-transpose case. $C:=A*B*(A^T)$ for real precision $C:=A*B*(A^H)$ for complex precision.
`SPARSE_OPERATION_TRANSPOSE`	Transpose case. This is not supported for complex matrices. $C:=(A^T)*B*A$
`SPARSE_OPERATION_CONJUGATE_TRANSPOSE`	Conjugate transpose case. This is not supported for real matrices. $C:=(A^H)*B*A$

A

`SPARSE_MATRIX_T`.

Handle which contains the sparse matrix *A*.

B

`SPARSE_MATRIX_T`.

Handle which contains the sparse matrix *B*.

descrB

`MATRIX_DESCR`.

Structure specifying properties of the sparse matrix.

`sparse_matrix_type_t` *type* specifies the type of a sparse matrix

SPARSE_MATRIX_TYPE_SYMMETRIC	The matrix is symmetric (only the specified triangle is processed).
SPARSE_MATRIX_TYPE_HERMITIAN	The matrix is Hermitian (only the specified triangle is processed).

`sparse_fill_mode_t` *mode* specifies the triangular matrix part.

SPARSE_FILL_MODE_LOWER	The lower triangular matrix part is processed.
SPARSE_FILL_MODE_UPPER	The upper triangular matrix part is processed.

`sparse_diag_type_t` *diag* specifies the type of diagonal.

SPARSE_DIAG_NON_UNIT	Diagonal elements cannot be equal to one.

NOTE
This routine also supports $C=AA^{T,H}$ with these parameters:

`descrB.type`=SPARSE_MATRIX_TYPE_DIAGONAL

`descrB.diag`=SPARSE_DIAG_UNIT

In this case, you do not need to allocate structure B. Use the routine as a 2-stage version of mkl_sparse_syrk.

request

`INTEGER`.

Use this routine to specify if the computations should be performed in a single step or using the two-stage algorithm. See Two-stage Algorithm for Inspector-executor Sparse BLAS Routines for more information.

SPARSE_STAGE_NNZ_COUNT	Only `rowIndex` (BSR/CSR format) or `colIndex` (CSC format) array of the matrix is computed internally. The computation can be extracted to measure the memory required for full operation.
SPARSE_STAGE_FINALIZE_MULT_NO_VAL	Finalize computations of the matrix structure (values will not be computed). Use only after the call with SPARSE_STAGE_NNZ_COUNT parameter.
SPARSE_STAGE_FINALIZE_MULT	Finalize computation. Can be used after the call with the SPARSE_STAGE_NNZ_COUNT or SPARSE_STAGE_FINALIZE_MULT_NO_VAL. Can also be used when the matrix structure remains unchanged and only values of the resulting matrix *C* need to be recomputed.
SPARSE_STAGE_FULL_MULT_NO_VAL	Perform computations of the matrix structure.
SPARSE_STAGE_FULL_MULT	Perform the entire computation in a single step.

Output Parameters

C

`SPARSE_MATRIX_T`.

Handle which contains the resulting sparse matrix. Only the upper-triangular part of the matrix is computed.

stat

INTEGER

Value indicating whether the operation was successful, or the reason why it failed.

SPARSE_STATUS_SUCCESS	The operation was successful.

SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_?_syprd

Computes the symmetric triple product of a sparse matrix and a dense matrix and stores the result as a dense matrix.

Syntax

```
stat = mkl_sparse_s_syprd (operation, A, B, denselayoutB, ldb, alpha, beta, C, denselayoutC, ldc)
stat = mkl_sparse_d_syprd (operation, A, B, denselayoutB, ldb, alpha, beta, C, denselayoutC, ldc)
stat = mkl_sparse_c_syprd (operation, A, B, denselayoutB, ldb, alpha, beta, C, denselayoutC, ldc)
stat = mkl_sparse_z_syprd (operation, A, B, denselayoutB, ldb, alpha, beta, C, denselayoutC, ldc)
```

Include Files

- mkl_spblas.f90

Description

The mkl_sparse_?_syprd routine performs a multiplication of three sparse matrices that results in a symmetric or Hermitian matrix, *C*.

```
C:=alpha*A*B*op(A) + beta*C
```

or

```
C:=alpha*op(A)*B*A + beta*C
```

depending on the matrix modifier operation. Here *A* is a sparse matrix, *B* and *C* are dense and symmetric (or Hermitian) matrices.

op is the transpose (real precision) or conjugate transpose (complex precision) operator.

NOTE
This routine is not supported for sparse matrices in COO or CSC formats. It supports only CSR and BSR formats. In addition, this routine supports only the sorted CSR and sorted BSR formats for the input matrix. If the data is unsorted, call the mkl_sparse_order routine before either mkl_sparse_sypr or mkl_sparse_?_syprd.

Input Parameters

operation

C_INT.

Specifies operation on the input sparse matrix.

SPARSE_OPERATION_NON_TRANSPOSE	Non-transpose case. $C := alpha*A*B*(A^T) + beta*C$ for real precision. $C := alpha*A*B*(A^H) + beta*C$ for complex precision.
SPARSE_OPERATION_TRANSPOSE	Transpose case. This is not supported for complex matrices. $C := alpha*(A^T)*B*A + beta*C$
SPARSE_OPERATION_CONJUGATE_TRANSPOSE	Conjugate transpose case. This is not supported for real matrices. $C := alpha*(A^H)*B*A + beta*C$

A

SPARSE_MATRIX_T.

Handle which contains the sparse matrix *A*.

B

SPARSE_MATRIX_T.

Input dense matrix. Only the upper triangular part of the matrix is used for computation.

denselayoutB

C_INT.

Structure that describes the storage scheme for the dense matrix.

SPARSE_LAYOUT_COLUMN_MAJOR	Store elements in a column-major layout.
SPARSE_LAYOUT_ROW_MAJOR	Store elements in a row-major layout.

ldb

SPARSE_MATRIX_T.

Leading dimension of matrix B.

alpha

Scalar parameter.

mkl_sparse_s_syprd	C_FLOAT
mkl_sparse_d_syprd	C_DOUBLE
mkl_sparse_c_syprd	C_FLOAT_COMPLEX
mkl_sparse_z_syprd	C_DOUBLE_COMPLEX

beta

Scalar parameter.

mkl_sparse_s_syprd	C_FLOAT
mkl_sparse_d_syprd	C_DOUBLE
mkl_sparse_c_syprd	C_FLOAT_COMPLEX
mkl_sparse_z_syprd	C_DOUBLE_COMPLEX

NOTE
Since the upper triangular part of matrix *C* is the only portion that is processed, set real values of `alpha` and `beta` in the complex case to obtain the Hermitian matrix.

denselayoutC

`C_INT`.

Structure that describes the storage scheme for the dense matrix.

SPARSE_LAYOUT_COLUMN_MAJOR	Store elements in a column-major layout.
SPARSE_LAYOUT_ROW_MAJOR	Store elements in a row-major layout.

ldc

`C_INT`.

Leading dimension of matrix C.

Output Parameters

C

`SPARSE_MATRIX_T`.

Handle which contains the resulting dense matrix. Only the upper-triangular part of the matrix is computed.

stat

INTEGER

Value indicating whether the operation was successful, or the reason why it failed.

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.

SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_?_symgs

Computes a symmetric Gauss-Seidel preconditioner.

Syntax

```
stat = mkl_sparse_s_symgs (operation, A, descr, alpha, b, x)
stat = mkl_sparse_d_symgs (operation, A, descr, alpha, b, x)
stat = mkl_sparse_c_symgs (operation, A, descr, alpha, b, x)
stat = mkl_sparse_z_symgs (operation, A, descr, alpha, b, x)
```

Include Files

- mkl_spblas.f90

Description

The mkl_sparse_?_symgs routine performs this operation:

```
x0 := x*alpha;
(L + D)*x1 = b - U*x0;
(U + D)*x = b - L*x1;
```

where $A = L + D + U$.

NOTE
This routine is not supported for sparse matrices in BSR, COO, or CSC formats. It supports only the CSR format. Additionally, only symmetric matrices are supported, so the *desc.type* must be SPARSE_MATRIX_TYPE_SYMMETRIC.

Input Parameters

operation

C_INT.

Specifies the operation performed on matrix *A*.

SPARSE_OPERATION_NON_TRANSPOSE, op(*A*) := *A*.

NOTE
Transpose (SPARSE_OPERATION_TRANSPOSE) and conjugate transpose (SPARSE_OPERATION_CONJUGATE_TRANSPOSE) are not supported.

A

SPARSE_MATRIX_T.

Handle which contains the sparse matrix *A*.

alpha

`C_FLOAT` for `mkl_sparse_s_symgs`

`C_DOUBLE` for `mkl_sparse_d_symgs`

`C_FLOAT_COMPLEX` for `mkl_sparse_c_symgs`

`C_DOUBLE_COMPLEX` for `mkl_sparse_z_symgs`

Specifies the scalar *alpha*.

descr

`MATRIX_DESCR`.

Descriptor specifying sparse matrix properties.

type - Specifies the type of a sparse matrix:

`SPARSE_MATRIX_TYPE_GENERAL`	The matrix is processed as is.
`SPARSE_MATRIX_TYPE_SYMMETRIC`	The matrix is symmetric (only the requested triangle is processed).
`SPARSE_MATRIX_TYPE_HERMITIAN`	The matrix is Hermitian (only the requested triangle is processed).
`SPARSE_MATRIX_TYPE_TRIANGULAR`	The matrix is triangular (only the requested triangle is processed).
`SPARSE_MATRIX_TYPE_DIAGONAL`	The matrix is diagonal (only diagonal elements are processed).
`SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR`	The matrix is block-triangular (only requested triangle is processed). Applies to BSR format only.
`SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL`	The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only.

mode - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:

`SPARSE_FILL_MODE_LOWER`	The lower triangular matrix part is processed.
`SPARSE_FILL_MODE_UPPER`	The upper triangular matrix part is processed.

diag - Specifies diagonal type for non-general matrices:

`SPARSE_DIAG_NON_UNIT`	Diagonal elements might not be equal to one.
`SPARSE_DIAG_UNIT`	Diagonal elements are equal to one.

x

`C_FLOAT` for `mkl_sparse_s_symgs`

`C_DOUBLE` for `mkl_sparse_d_symgs`

`C_FLOAT_COMPLEX` for `mkl_sparse_c_symgs`

`C_DOUBLE_COMPLEX` for `mkl_sparse_z_symgs`

Array of size at least *m*, where *m* is the number of rows of matrix *A*.

On entry, the array *x* must contain the vector *x*.

b

C_FLOAT for mkl_sparse_s_symgs

C_DOUBLE for mkl_sparse_d_symgs

C_FLOAT_COMPLEX for mkl_sparse_c_symgs

C_DOUBLE_COMPLEX for mkl_sparse_z_symgs

Array of size at least *m*, where *m* is the number of rows of matrix *A*.

On entry, the array *b* must contain the vector *b*.

Output Parameters

x Overwritten by the computed vector *x*.

stat INTEGER

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_?_symgs_mv

Computes a symmetric Gauss-Seidel preconditioner followed by a matrix-vector multiplication.

Syntax

```
stat = mkl_sparse_s_symgs_mv (operation, A, descr, alpha, b, x, y)
stat = mkl_sparse_d_symgs_mv (operation, A, descr, alpha, b, x, y)
stat = mkl_sparse_c_symgs_mv (operation, A, descr, alpha, b, x, y)
stat = mkl_sparse_z_symgs_mv (operation, A, descr, alpha, b, x, y)
```

Include Files

- mkl_spblas.f90

Description

The `mkl_sparse_?_symgs_mv` routine performs this operation:

```
x0 := x*alpha;
(L + D)*x1 = b - U*x0;
(U + D)*x = b - L*x1;
y := A*x
```

where `A = L + D + U`

NOTE
This routine is not supported for sparse matrices in BSR, COO, or CSC formats. It supports only the CSR format. Additionally, only symmetric matrices are supported, so the *desc.type* must be `SPARSE_MATRIX_TYPE_SYMMETRIC`.

Input Parameters

operation

`C_INT`.

Specifies the operation performed on input matrix.

`SPARSE_OPERATION_NON_TRANSPOSE`, `op(A) = A`.

NOTE
Transpose (`SPARSE_OPERATION_TRANSPOSE`) and conjugate transpose (`SPARSE_OPERATION_CONJUGATE_TRANSPOSE`) are not supported.

A

`SPARSE_MATRIX_T`.

Handle which contains the sparse matrix *A*.

alpha

`C_FLOAT` for `mkl_sparse_s_symgs_mv`

`C_DOUBLE` for `mkl_sparse_d_symgs_mv`

`C_FLOAT_COMPLEX` for `mkl_sparse_c_symgs_mv`

`C_DOUBLE_COMPLEX` for `mkl_sparse_z_symgs_mv`

Specifies the scalar *alpha*.

descr

`MATRIX_DESCR`.

Descriptor specifying sparse matrix properties.

type - Specifies the type of a sparse matrix:

`SPARSE_MATRIX_TYPE_GENERAL`	The matrix is processed as is.
`SPARSE_MATRIX_TYPE_SYMMETRIC`	The matrix is symmetric (only the requested triangle is processed).
`SPARSE_MATRIX_TYPE_HERMITIAN`	The matrix is Hermitian (only the requested triangle is processed).

SPARSE_MATRIX_TYPE_TRIANGULAR	The matrix is triangular (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_DIAGONAL	The matrix is diagonal (only diagonal elements are processed).
SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR	The matrix is block-triangular (only requested triangle is processed). Applies to BSR format only.
SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL	The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only.

mode - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:

SPARSE_FILL_MODE_LOWER	The lower triangular matrix part is processed.
SPARSE_FILL_MODE_UPPER	The upper triangular matrix part is processed.

diag - Specifies diagonal type for non-general matrices:

SPARSE_DIAG_NON_UNIT	Diagonal elements might not be equal to one.
SPARSE_DIAG_UNIT	Diagonal elements are equal to one.

x

C_FLOAT for mkl_sparse_s_symgs_mv

C_DOUBLE for mkl_sparse_d_symgs_mv

C_FLOAT_COMPLEX for mkl_sparse_c_symgs_mv

C_DOUBLE_COMPLEX for mkl_sparse_z_symgs_mv

Array of size at least *m*, where *m* is the number of rows of matrix *A*.

On entry, the array *x* must contain the vector *x*.

b

C_FLOAT for mkl_sparse_s_symgs_mv

C_DOUBLE for mkl_sparse_d_symgs_mv

C_FLOAT_COMPLEX for mkl_sparse_c_symgs_mv

C_DOUBLE_COMPLEX for mkl_sparse_z_symgs_mv

Array of size at least *m*, where *m* is the number of rows of matrix *A*.

On entry, the array *b* must contain the vector *b*.

Output Parameters

x

Overwritten by the computed vector *x*.

y

C_FLOAT for mkl_sparse_s_symgs_mv

C_DOUBLE for mkl_sparse_d_symgs_mv

C_FLOAT_COMPLEX for mkl_sparse_c_symgs_mv

C_DOUBLE_COMPLEX for mkl_sparse_z_symgs_mv

Array of size at least *m*, where *m* is the number of rows of matrix *A*.

Overwritten by the computed vector *y*.

stat INTEGER

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_syrk

Computes the product of sparse matrix with its transpose (or conjugate transpose) and stores the result in a newly allocated sparse matrix.

Syntax

```
stat = mkl_sparse_syrk (operation, A, C)
```

Include Files

- mkl_spblas.f90

Description

The mkl_sparse_syrk routine performs a sparse matrix-matrix operation which results in a sparse matrix C that is either Symmetric (real) or Hermitian (complex):

```
C := A*op(A)
```

where op(*) is the transpose for real matrices and conjugate transpose for complex matrices OR

```
C := op(A)*A
```

depending on the matrix modifier op which can be the transpose for real matrices or conjugate transpose for complex matrices.

Here, *A* and *C* are sparse matrices.

NOTE This routine is not supported for sparse matrices in COO or CSC formats. It supports only CSR and BSR formats. Additionally, this routine supports only the sorted CSR and sorted BSR formats for the input matrix. If data is unsorted, call the mkl_sparse_order routine before either mkl_sparse_syrk or mkl_sparse_?_syrkd.

Input Parameters

operation

Specifies the operation `op()` on input matrix .

`SPARSE_OPERATION_NON_TRANSPOSE`, Non-transpose, $C := A*op(A)$ where op(*) is the transpose for real matrices and conjugate transpose for complex matrices

`SPARSE_OPERATION_TRANSPOSE`, Transpose, $C := (A^T)*A$ for real matrix A

`SPARSE_OPERATION_CONJUGATE_TRANSPOSE`, Conjugate transpose, $C := (A^H)*A$ for complex matrix A.

A

`SPARSE_MATRIX_T`.

Handle which contains the sparse matrix *A*.

Output Parameters

C

`SPARSE_MATRIX_T`.

Handle which contains the resulting sparse matrix. Only the upper-triangular part of the matrix is computed.

stat

`INTEGER`

Value indicating whether the operation was successful or not, and why:

`SPARSE_STATUS_SUCCESS`	The operation was successful.
`SPARSE_STATUS_NOT_INITIALIZED`	The routine encountered an empty handle or matrix array.
`SPARSE_STATUS_ALLOC_FAILED`	Internal memory allocation failed.
`SPARSE_STATUS_INVALID_VALUE`	The input parameters contain an invalid value.
`SPARSE_STATUS_EXECUTION_FAILED`	Execution failed.
`SPARSE_STATUS_INTERNAL_ERROR`	An error in algorithm implementation occurred.
`SPARSE_STATUS_NOT_SUPPORTED`	The requested operation is not supported.

mkl_sparse_?_syrkd

Computes the product of sparse matrix with its transpose (or conjugate transpose) and stores the result as a dense matrix.

Syntax

```
stat = mkl_sparse_s_syrkd (operation, A, alpha, beta, C, layout, ldc)
stat = mkl_sparse_d_syrkd (operation, A, alpha, beta, C, layout, ldc)
stat = mkl_sparse_c_syrkd (operation, A, alpha, beta, C, layout, ldc)
stat = mkl_sparse_z_syrkd (operation, A, alpha, beta, C, layout, ldc)
```

Include Files

- mkl_spblas.f90

Description

The mkl_sparse_?_syrkd routine performs a sparse matrix-matrix operation which results in a dense matrix C that is either symmetric (real case) or Hermitian (complex case):

```
C := beta*C + alpha*A*op(A)
```

or

```
C := beta*C + alpha*op(A)*A
```

depending on the matrix modifier op which can be the transpose for real matrices or conjugate transpose for complex matrices. Here, *A* is a sparse matrix and *C* is a dense matrix.

NOTE This routine is not supported for sparse matrices in COO or CSC formats. It supports only CSR and BSR formats. Additionally, this routine supports only the sorted CSR and sorted BSR formats for the input matrix. If data is unsorted, call the mkl_sparse_order routine before either mkl_sparse_syrk or mkl_sparse_?_syrkd.

Input Parameters

operation

C_INT.

Specifies the operation op() performed on the input matrix.

SPARSE_OPERATION_NON_TRANSPOSE, Non-transpose, $C := beta*C + alpha*A*op(A)$ where op(*) is the transpose (real matrices) or conjugate transpose (complex matrices).

SPARSE_OPERATION_TRANSPOSE, Transpose, $C := beta*C + alpha*A^{T}*A$ for real matrix A.

SPARSE_OPERATION_CONJUGATE_TRANSPOSE Conjugate transpose, $C := beta*C + alpha*A^{H}*A$ for complex matrix A.

A

SPARSE_MATRIX_T.

Handle which contains the sparse matrix *A*.

alpha

C_FLOAT for mkl_sparse_s_syrkd

C_DOUBLE for mkl_sparse_d_syrkd

C_FLOAT_COMPLEX for mkl_sparse_c_syrkd

C_DOUBLE_COMPLEX for mkl_sparse_z_syrkd

Scalar parameter *alpha*.

beta

C_FLOAT for mkl_sparse_s_syrkd

C_DOUBLE for mkl_sparse_d_syrkd

C_FLOAT_COMPLEX for mkl_sparse_c_syrkd

C_DOUBLE_COMPLEX for mkl_sparse_z_syrkd

Scalar parameter *beta*.

layout Describes the storage scheme for the dense matrix.

layout = SPARSE_LAYOUT_COLUMN_MAJOR	Storage of elements uses column-major layout.
layout = SPARSE_LAYOUT_ROW_MAJOR	Storage of elements uses row-major layout.

ldc C_INT.

Leading dimension of matrix *C*.

NOTE
Only the upper triangular part of matrix C is processed. Therefore, you must set real values of *alpha* and *beta* for complex matrices in order to obtain a Hermitian matrix.

Output Parameters

C SPARSE_MATRIX_T.

Resulting dense matrix. Only the upper triangular part of the matrix is computed.

stat INTEGER

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_?_dotmv

Computes a sparse matrix-vector product followed by a dot product.

Syntax

```
stat = mkl_sparse_s_dotmv (operation, alpha, A, descr, x, beta, y, d)
stat = mkl_sparse_d_dotmv (operation, alpha, A, descr, x, beta, y, d)
stat = mkl_sparse_c_dotmv (operation, alpha, A, descr, x, beta, y, d)
stat = mkl_sparse_z_dotmv (operation, alpha, A, descr, x, beta, y, d)
```

Include Files

- mkl_spblas.f90

Description

The mkl_sparse_?_dotmv routine computes a sparse matrix-vector product and dot product:

```
y := alpha*op(A)*x + beta*yd := ∑ᵢxᵢ*yᵢ (real case)
d := ∑ᵢconj(xᵢ)*yᵢ (complex case)
```

where

- *alpha* and *beta* are scalars.
- *x* and *y* are vectors.
- *A* is an *m*-by-*k* matrix.
- *conj* represents complex conjugation.
- op(*A*) is a matrix modifier.

Available options for op(*A*) are *A*, A^T, or A^H.

> **NOTE**
> For sparse matrices in the BSR format, the supported combinations of (*indexing*,*block_layout*) are:
>
> - (SPARSE_INDEX_BASE_ZERO, SPARSE_LAYOUT_ROW_MAJOR)
> - (SPARSE_INDEX_BASE_ONE, SPARSE_LAYOUT_COLUMN_MAJOR)

Input Parameters

operation

C_INT.

Specifies the operation performed on matrix *A*.

If *operation* = SPARSE_OPERATION_NON_TRANSPOSE, op(*A*) = *A*.

If *operation* = SPARSE_OPERATION_TRANSPOSE, op(*A*) = A^T.

If *operation* = SPARSE_OPERATION_CONJUGATE_TRANSPOSE, op(*A*) = A^H.

alpha

C_FLOAT for mkl_sparse_s_dotmv

C_DOUBLE for mkl_sparse_d_dotmv

C_FLOAT_COMPLEX for mkl_sparse_c_dotmv

C_DOUBLE_COMPLEX for mkl_sparse_z_dotmv

Specifies the scalar *alpha*.

A

SPARSE_MATRIX_T.

Handle which contains the sparse matrix *A*.

descr

MATRIX_DESCR.

Descriptor specifying sparse matrix properties.

type - Specifies the type of a sparse matrix:

SPARSE_MATRIX_TYPE_GENERAL The matrix is processed as is.

SPARSE_MATRIX_TYPE_SYMMETRIC	The matrix is symmetric (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_HERMITIAN	The matrix is Hermitian (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_TRIANGULAR	The matrix is triangular (only the requested triangle is processed).
SPARSE_MATRIX_TYPE_DIAGONAL	The matrix is diagonal (only diagonal elements are processed).
SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR	The matrix is block-triangular (only requested triangle is processed). Applies to BSR format only.
SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL	The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only.

mode - Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices:

SPARSE_FILL_MODE_LOWER	The lower triangular matrix part is processed.
SPARSE_FILL_MODE_UPPER	The upper triangular matrix part is processed.

diag - Specifies diagonal type for non-general matrices:

SPARSE_DIAG_NON_UNIT	Diagonal elements might not be equal to one.
SPARSE_DIAG_UNIT	Diagonal elements are equal to one.

x

C_FLOAT for mkl_sparse_s_dotmv

C_DOUBLE for mkl_sparse_d_dotmv

C_FLOAT_COMPLEX for mkl_sparse_c_dotmv

C_DOUBLE_COMPLEX for mkl_sparse_z_dotmv

If *operation* = SPARSE_OPERATION_NON_TRANSPOSE, array of size at least *k*, where *k* is the number of columns of matrix *A*.

Otherwise, array of size at least *m*, where *m* is the number of rows of matrix *A*.

On entry, the array *x* must contain the vector *x*.

beta

C_FLOAT for mkl_sparse_s_dotmv

C_DOUBLE for mkl_sparse_d_dotmv

C_FLOAT_COMPLEX for mkl_sparse_c_dotmv

C_DOUBLE_COMPLEX for mkl_sparse_z_dotmv

Specifies the scalar *beta*.

y

C_FLOAT for mkl_sparse_s_dotmv

C_DOUBLE for mkl_sparse_d_dotmv

C_FLOAT_COMPLEX for mkl_sparse_c_dotmv

C_DOUBLE_COMPLEX for mkl_sparse_z_dotmv

If *operation* = SPARSE_OPERATION_NON_TRANSPOSE, array of size at least *m*, where *k* is the number of rows of matrix *A*.

Otherwise, array of size at least *k*, where *k* is the number of columns of matrix *A*.

On entry, the array *y* must contain the vector *y*.

Output Parameters

y

Overwritten by the updated vector *y*.

d

C_FLOAT for mkl_sparse_s_dotmv

C_DOUBLE for mkl_sparse_d_dotmv

C_FLOAT_COMPLEX for mkl_sparse_c_dotmv

C_DOUBLE_COMPLEX for mkl_sparse_z_dotmv

Overwritten by the dot product of *x* and *y*.

stat

INTEGER

Value indicating whether the operation was successful or not, and why:

SPARSE_STATUS_SUCCESS	The operation was successful.
SPARSE_STATUS_NOT_INITIALIZED	The routine encountered an empty handle or matrix array.
SPARSE_STATUS_ALLOC_FAILED	Internal memory allocation failed.
SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

mkl_sparse_?_sorv

Computes forward, backward sweeps or a symmetric successive over-relaxation preconditioner operation.

Syntax

```
stat = sparse_status_t mkl_sparse_s_sorv(type, descrA, A, omega, alpha, x, b)
```

```
stat = sparse_status_t mkl_sparse_d_sorv(type, descrA, A, omega, alpha, x, b)
```

Include Files

- `mkl_spblas.f90`

Description

The mkl_sparse_?_sorv routine performs one of the following operations:

SPARSE_SOR_FORWARD:

$$(\omega*L+D)*x\text{^}1 = (D-\omega*D-\omega*U)*x\text{^}0 + \omega*b$$

SPARSE_SOR_BACKWARD:

$$(\omega*U+D)*x\text{^}1 = (D-\omega*D-\omega*L)*x\text{^}0 + \omega*b$$

SPARSE_SOR_SYMMETRIC: Performs application of a

$$\frac{\omega}{2-\omega}\left(\frac{1}{\omega}D+L\right)D^{-1}\left(\frac{1}{\omega}D+L\right)^{T}$$

preconditioner.

where A = L + D + U and x^0 is an input vector x scaled by input parameter alpha vector and x^1 is an output stored in vector x.

NOTE
Currently this routine only supports the following configuration:

- CSR format of the input matrix
- `SPARSE_SOR_FORWARD` operation
- General matrix (`descr.type` is `SPARSE_MATRIX_TYPE_GENERAL`) or symmetric matrix with full portrait and unit diagonal (`descr.type` is `SPARSE_MATRIX_TYPE_SYMMETRIC`, `descr.mode` is `SPARSE_FILL_MODE_FULL`, and `descr.diag` is `SPARSE_DIAG_UNIT`)

NOTE
Currently, this routine is optimized only for sequential threading execution mode.

Warning It is currently not allowed to place a `sorv` call in a parallel section (e.g., under `#pragma omp parallel`), because it is not thread-safe in this scenario. This limitation will be addressed in one of the upcoming releases.

Product and Performance Information
Notice revision #20201201

Input Parameters

type SPARSE_MATRIX_T.

Specifies the operation performed by the SORV preconditioner.

SPARSE_SOR_FORWARD Performs forward sweep as defined by:

$$(\omega*L+D)*x\text{^}1 = (D-\omega*D-\omega*U)*x\text{^}0 + \omega*b$$

SPARSE_SOR_BACKWARD Performs backward sweep as defined by:

$$(\omega*U+D)*x\text{^}1 = (D-\omega*D-\omega*L)*x\text{^}0 + \omega*b$$

SPARSE_SOR_SYMMETRIC Preconditioner matrix could be expressed as:

$$\frac{\omega}{2-\omega}\left(\frac{1}{\omega}D+L\right)D^{-1}\left(\frac{1}{\omega}D+L\right)^{T}$$

descr MATRIX_DESCR.

Structure specifying sparse matrix properties.

SPARSE_MATRIX_T type Specifies the type of a sparse matrix:

- SPARSE_MATRIX_TYPE_GENERAL

  The matrix is processed as-is.
- SPARSE_MATRIX_TYPE_SYMMETRIC

  The matrix is symmetric (only the requested triangle is processed).
- SPARSE_MATRIX_TYPE_HERMITIAN

  The matrix is Hermitian (only the requested triangle is processed).
- SPARSE_MATRIX_TYPE_TRIANGULAR

  The matrix is triangular (only the requested triangle is processed).
- SPARSE_MATRIX_TYPE_DIAGONAL

  The matrix is diagonal (only diagonal elements are processed).
- SPARSE_MATRIX_TYPE_BLOCK_TRIANGULAR

  The matrix is block-triangular (only requested triangle is processed). Applies to BSR format only.
- SPARSE_MATRIX_TYPE_BLOCK_DIAGONAL

  The matrix is block-diagonal (only diagonal blocks are processed). Applies to BSR format only.

`C_INT mode`	Specifies the triangular matrix part for symmetric, Hermitian, triangular, and block-triangular matrices: • `SPARSE_FILL_MODE_LOWER` The lower triangular matrix part is processed. • `SPARSE_FILL_MODE_UPPER` The upper triangular matrix part is processed.
`SPARSE_MATRIX_TYPE_DIAGONAL diag`	Specifies diagonal type for non-general matrices: • `SPARSE_DIAG_NON_UNIT` Diagonal elements might not be equal to one. • `SPARSE_DIAG_UNIT` Diagonal elements are equal to one.

A

`SPARSE_MATRIX_T`.

Handle containing internal data.

omega

`C_FLOAT`.

Relaxation factor.

alpha

`C_FLOAT`.

Parameter that could be used to normalize or set to zero the vector x that holds the initial guess.

x

`C_FLOAT`.

Initial guess on input.

b

`C_FLOAT`.

Right-hand side.

Output Parameters

x

`C_FLOAT`.

Solution vector on output.

stat

`INTEGER`

Value indicating whether the operation was successful or not, and why:

`SPARSE_STATUS_SUCCESS`	The operation was successful.
`SPARSE_STATUS_NOT_INITIALIZED`	The routine encountered an empty handle or matrix array.
`SPARSE_STATUS_ALLOC_FAILED`	Internal memory allocation failed.

SPARSE_STATUS_INVALID_VALUE	The input parameters contain an invalid value.
SPARSE_STATUS_EXECUTION_FAILED	Execution failed.
SPARSE_STATUS_INTERNAL_ERROR	An error in algorithm implementation occurred.
SPARSE_STATUS_NOT_SUPPORTED	The requested operation is not supported.

BLAS-like Extensions

Intel® oneAPI Math Kernel Library provides C and Fortran routines to extend the functionality of the BLAS routines. These include routines to compute vector products, matrix-vector products, and matrix-matrix products.

Intel® oneAPI Math Kernel Library also provides routines to perform certain data manipulation, including matrix in-place and out-of-place transposition operations combined with simple matrix arithmetic operations. Transposition operations are Copy As Is, Conjugate transpose, Transpose, and Conjugate. Each routine adds the possibility of scaling during the transposition operation by giving some *alpha* and/or *beta* parameters. Each routine supports both row-major orderings and column-major orderings.

Table "BLAS-like Extensions" lists these routines.

The <?> symbol in the routine short names is a precision prefix that indicates the data type:

s	REAL
d	DOUBLE PRECISION
c	COMPLEX
z	DOUBLE COMPLEX

BLAS-like Extensions

Routine	Data Types	Description
?axpby	s, d, c, z	Scales two vectors, adds them to one another and stores result in the vector (routines).
?axpy_batch ?axpy_batch_strided	s, d, c, z	Computes groups of vector-scalar products added to a vector.
?dgmm_batch_strided ?dgmm_batch	s, d, c, z	Computes groups of diagonal matrix-general matrix product
?gem2vc	c, z	Two matrix-vector products using a general matrix, complex data.
?gem2vu	s, d	Two matrix-vector products using a general matrix, real data.
?gemm_batch ?gemm_batch_strided	s, d, c, z	Computes scalar-matrix-matrix products and adds the results to scalar matrix products for groups of general matrices.
gemm_*	Integer	Computes a matrix-matrix product with general integer matrices.

Routine	Data Types	Description
?gemm_compute	h, s, d	Computes a matrix-matrix product with general matrices where one or both input matrices are stored in a packed data structure and adds the result to a scalar-matrix product.
gemm_*_compute	Integer	Computes a matrix-matrix product with general integer matrices where one or both input matrices are stored in a packed data structure and adds the result to a scalar-matrix product.
?gemm_pack	h, s, d	Performs scaling and packing of the matrix into the previously allocated buffer.
gemm_*_pack	Integer,	Pack the matrix into the buffer allocated previously.
?gemm_pack_get_size	h, s, d	Returns the number of bytes required to store the packed matrix.
gemm_*_pack_get_size	Integer,	Returns the number of bytes required to store the packed matrix.
?gemm3m	c, z	Computes a scalar-matrix-matrix product using matrix multiplications and adds the result to a scalar-matrix product.
?gemm3m_batch ?gemm3m_batch_strided	c, z	Computes a scalar-matrix-matrix product using matrix multiplications and adds the result to a scalar-matrix product.
?gemmt	s, d, c, z	Computes a matrix-matrix product with general matrices but updates only the upper or lower triangular part of the result matrix.
?gemv_batch_strided ?gemv_batch	s, d, c, z	Computes groups of matrix-vector product using general matrices.
?trsm_batch ?trsm_batch_strided	s, d, c, z	Solves a triangular matrix equation for a group of matrices.
mkl_?imatcopy	s, d, c, z	Performs scaling and in-place transposition/copying of matrices.
mkl_?imatcopy_batch_strided mkl_?imatcopy_batch	s, d, c, z	Computes groups of in-place matrix copy/transposition with scaling using general matrices.
mkl_?omatadd	s, d, c, z	Performs scaling and sum of two matrices including their out-of-place transposition/copying.
mkl_?omatcopy	s, d, c, z	Performs scaling and out-of-place transposition/copying of matrices.
mkl_?omatcopy_batch_strided mkl_?omatcopy_batch	s, d, c, z	Computes groups of out of place matrix copy/transposition with scaling using general matrices.
mkl_?omatcopy2	s, d, c, z	Performs two-strided scaling and out-of-place transposition/copying of matrices.

Routine	Data Types	Description
mkl_jit_create_?gemm	s, d, c, z	Creates a handle on a jitter and generates a GEMM kernel that computes a scalar-matrix-matrix product and adds the result to a scalar-matrix product, with general matrices.
mkl_jit_destroy		Deletes the previously created jitter and the generated GEMM kernel.
mkl_jit_get_?gemm_ptr	s, d, c, z	Returns the GEMM kernel previously generated.

?axpy_batch

Computes a group of vector-scalar products added to a vector.

Syntax

```
call saxpy_batch(n_array, alpha_array, x_array, incx_array, y_array, incy_array, group_count, group_size_array)
call daxpy_batch(n_array, alpha_array, x_array, incx_array, y_array, incy_array, group_count, group_size_array)
call caxpy_batch(n_array, alpha_array, x_array, incx_array, y_array, incy_array, group_count, group_size_array)
call zaxpy_batch(n_array, alpha_array, x_array, incx_array, y_array, incy_array, group_count, group_size_array)
```

Description

The ?axpy_batch routines perform a series of scalar-vector product added to a vector. They are similar to the ?axpy routine counterparts, but the ?axpy_batch routines perform vector operations with a group of vectors. The groups contain vectors with the same parameters.

The operation is defined as

```
idx = 0
for i = 0 … group_count – 1
    n, alpha, incx, incy and group_size at position i in n_array, alpha_array, incx_array,
incy_array and group_size_array
    for j = 0 … group_size – 1
        x and y are vectors of size n at position idx in x_array and y_array
        y := alpha * x + y
        idx := idx + 1
    end for
end for
```

The number of entries in *x_array*, and *y_array* is *total_batch_count* = the sum of all of the *group_size* entries.

Input Parameters

n_array

INTEGER. Array of size *group_count*. For the group i, n_i = n_array[i] is the number of elements in vectors *x* and *y*.

alpha_array

REAL for saxpy_batch

DOUBLE PRECISION for daxpy_batch

	COMPLEX for `caxpy_batch` DOUBLE COMPLEX for `zaxpy_batch` Array of size *group_count*. For the group `i`, $alpha_i$ = `alpha_array[i]` is the scalar *alpha*.
x_array	INTEGER*8 for Intel® 64 architecture INTEGER*4 for IA-32 architecture Array of size *total_batch_count* of pointers used to store *x* vectors. The array allocated for the *x* vectors of the group `i` must be of size at least (1 + (n_i – 1)*abs($incx_i$)).
incx_array	INTEGER. Array of size *group_count*. For the group `i`, $incx_i$ = `incx_array[i]` is the stride of vector *x*.
y_array	INTEGER*8 for Intel® 64 architecture INTEGER*4 for IA-32 architecture Array of size *total_batch_count* of pointers used to store *y* vectors. The array allocated for the *y* vectors of the group `i` must be of size at least (1 + (n_i – 1)*abs($incy_i$)).
incy_array	INTEGER. Array of size *group_count*. For the group `i`, $incy_i$ = `incy_array[i]` is the stride of vector *y*.
group_count	INTEGER. Number of groups. Must be at least 0.
group_size_array	INTEGER. Array of size *group_count*. The element `group_size_array[i]` is the number of vector in the group `i`. Each element in *group_size_array* must be at least 0.

Output Parameters

y_array	Array of pointers holding the *total_batch_count* updated vector *y*.

?axpy_batch_strided

Computes a group of vector-scalar products added to a vector.

Syntax

```
call saxpy_batch_strided(n, alpha, x, incx, stridex, y, incy, stridey, batch_size)
call daxpy_batch_strided(n, alpha, x, incx, stridex, y, incy, stridey, batch_size)
call caxpy_batch_strided(n, alpha, x, incx, stridex, y, incy, stridey, batch_size)
call zaxpy_batch_strided(n, alpha, x, incx, stridex, y, incy, stridey, batch_size)
```

Include Files

- `mkl.fi`

Description

The `?axpy_batch_strided` routines perform a series of scalar-vector product added to a vector. They are similar to the `?axpy` routine counterparts, but the `?axpy_batch_strided` routines perform vector operations with a group of vectors.

All vector *x* (respectively, *y*) have the same parameters (size, increments) and are stored at constant *stridex* (respectively, *stridey*) from each other. The operation is defined as

```
For i = 0 … batch_size – 1
    X and Y are vectors at offset i * stridex and i * stridey in x and y
    Y = alpha * X + Y
end for
```

Input Parameters

n	INTEGER. Number of elements in vectors *x* and *y*.
alpha	REAL for `saxpy_batch_strided` DOUBLE PRECISION for `daxpy_batch_strided` COMPLEX for `caxpy_batch_strided` DOUBLE COMPLEX for `zaxpy_batch_strided` Specifies the scalar *alpha*.
x	REAL for `saxpy_batch_strided` DOUBLE PRECISION for `daxpy_batch_strided` COMPLEX for `caxpy_batch_strided` DOUBLE COMPLEX for `zaxpy_batch_strided` Array of size at least *stridex***batch_size* holding the *x* vectors.
incx	INTEGER. Specifies the increment for the elements of *x*.
stridex	INTEGER. Stride between two consecutive *x* vectors; must be at least zero.
y	REAL for `saxpy_batch_strided` DOUBLE PRECISION for `daxpy_batch_strided` COMPLEX for `caxpy_batch_strided` DOUBLE COMPLEX for `zaxpy_batch_strided` Array of size at least *stridey***batch_size* holding the *y* vectors.
incy	INTEGER. Specifies the increment for the elements of *y*.
stridey	INTEGER. Stride between two consecutive *y* vectors; must be at least (1 + (n-1)*abs(*incy*)).
batch_size	INTEGER. Number of `axpy` computations to perform and *x* and *y* vectors. Must be at least 0.

Output Parameters

y	Array holding the *batch_size* updated vector *y*.

?axpby

Scales two vectors, adds them to one another and stores result in the vector.

Syntax

```
call saxpby(n, a, x, incx, b, y, incy)
call daxpby(n, a, x, incx, b, y, incy)
call caxpby(n, a, x, incx, b, y, incy)
call zaxpby(n, a, x, incx, b, y, incy)
call axpby(x, y [,a] [,b])
```

Include Files

- mkl.fi, blas.f90

Description

The ?axpby routines perform a vector-vector operation defined as

```
y := a*x + b*y
```

where:

a and *b* are scalars

x and *y* are vectors each with *n* elements.

Input Parameters

n	INTEGER. Specifies the number of elements in vectors *x* and *y*.
a	REAL for saxpby DOUBLE PRECISION for daxpby COMPLEX for caxpby DOUBLE COMPLEX for zaxpby Specifies the scalar *a*.
x	REAL for saxpby DOUBLE PRECISION for daxpby COMPLEX for caxpby DOUBLE COMPLEX for zaxpby Array, size at least (1 + (*n*-1)*abs(*incx*)).
incx	INTEGER. Specifies the increment for the elements of *x*.
b	REAL for saxpby DOUBLE PRECISION for daxpby COMPLEX for caxpby DOUBLE COMPLEX for zaxpby Specifies the scalar *b*.
y	REAL for saxpby DOUBLE PRECISION for daxpby

	`COMPLEX` for `caxpby`
	`DOUBLE COMPLEX` for `zaxpby`
	Array, size at least `(1 + (n-1)*abs(incy))`.

incy	`INTEGER`. Specifies the increment for the elements of *y*.

Output Parameters

y	Contains the updated vector *y*.

Example

For examples of routine usage, see these code examples in the Intel® oneAPI Math Kernel Library (oneMKL) installation directory:

- `saxpby`: `examples\blas\source\saxpbyx.f`
- `daxpby`: `examples\blas\source\daxpbyx.f`
- `caxpby`: `examples\blas\source\caxpbyx.f`
- `zaxpby`: `examples\blas\source\zaxpbyx.f`

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine `axpby` interface are the following:

x	Holds the array of size *n*.
y	Holds the array of size *n*.
a	The default value is 1.
b	The default value is 1.

?gem2vu

Computes two matrix-vector products using a general matrix (real data)

Syntax

```
call sgem2vu(m, n, alpha, a, lda, x1, incx1, x2, incx2, beta, y1, incy1, y2, incy2)
call dgem2vu(m, n, alpha, a, lda, x1, incx1, x2, incx2, beta, y1, incy1, y2, incy2)
call gem2vu(a, x1, x2, y1, y2 [,alpha][,beta] )
```

Include Files

- `mkl.fi, blas.f90`

Description

The `?gem2vu` routines perform two matrix-vector operations defined as

*y1 := alpha*A*x1 + beta*y1*,

and

y2 := *alpha*A'*x2* + *beta*y2*,

where:

alpha and *beta* are scalars,

x1, *x2*, *y1*, and *y2* are vectors,

A is an *m*-by-*n* matrix.

Input Parameters

m	INTEGER. Specifies the number of rows of the matrix *A*. The value of *m* must be at least zero.
n	INTEGER. Specifies the number of columns of the matrix *A*. The value of *n* must be at least zero.
alpha	REAL for sgem2vu DOUBLE PRECISION for dgem2vu Specifies the scalar *alpha*.
a	REAL for sgem2vu DOUBLE PRECISION for dgem2vu Array, size (*lda*, *n*). Before entry, the leading *m*-by-*n* part of the array *a* must contain the matrix of coefficients.
lda	INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least max(1, *m*).
x1	REAL for sgem2vu DOUBLE PRECISION for dgem2vu Array, size at least (1+(*n*–1)*abs(*incx1*)). Before entry, the incremented array *x1* must contain the vector *x1*.
incx1	INTEGER. Specifies the increment for the elements of *x1*. The value of *incx1* must not be zero.
x2	REAL for sgem2vu DOUBLE PRECISION for dgem2vu Array, size at least (1+(*m*–1)*abs(*incx2*)). Before entry, the incremented array *x2* must contain the vector *x2*.
incx2	INTEGER. Specifies the increment for the elements of *x2*. The value of *incx2* must not be zero.
beta	REAL for sgem2vu DOUBLE PRECISION for dgem2vu Specifies the scalar *beta*. When *beta* is set to zero, then *y1* and *y2* need not be set on input.
y1	REAL for sgem2vu DOUBLE PRECISION for dgem2vu

	Array, size at least `(1+(m-1)*abs(incy1))`. Before entry with non-zero *beta*, the incremented array *y1* must contain the vector *y1*.
incy1	`INTEGER`. Specifies the increment for the elements of *y1*. The value of *incy1* must not be zero.

y	`REAL` for `sgem2vu`
	`DOUBLE PRECISION` for `dgem2vu`
	Array, size at least `(1+(n-1)*abs(incy2))`. Before entry with non-zero *beta*, the incremented array *y2* must contain the vector *y2*.

incy2	`INTEGER`. Specifies the increment for the elements of *y2*. The value of *incy2* must not be zero.

Output Parameters

y1	Updated vector *y1*.
y2	Updated vector *y2*.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine `gem2vu` interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
x1	Holds the vector with the number of elements *rx1* where *rx1* = *n*.
x2	Holds the vector with the number of elements *rx2* where *rx2* = *m*.
y1	Holds the vector with the number of elements *ry1* where *ry1* = *m*.
y2	Holds the vector with the number of elements *ry2* where *ry2* = *n*.
alpha	The default value is 1.
beta	The default value is 0.

?gem2vc

Computes two matrix-vector products using a general matrix (complex data)

Syntax

```
call cgem2vc(m, n, alpha, a, lda, x1, incx1, x2, incx2, beta, y1, incy1, y2, incy2)
call zgem2vc(m, n, alpha, a, lda, x1, incx1, x2, incx2, beta, y1, incy1, y2, incy2)
call gem2vc(a, x1, x2, y1, y2 [,alpha][,beta] )
```

Include Files

- `mkl.fi, blas.f90`

Description

The ?gem2vc routines perform two matrix-vector operations defined as

y1 := *alpha***A***x1* + *beta***y1*,

and

y2 := *alpha**conjg(*A*')**x2* + *beta***y2*,

where:

alpha and *beta* are scalars,

x1, *x2*, *y1*, and *y2* are vectors,

A is an *m*-by-*n* matrix.

Input Parameters

m	INTEGER. Specifies the number of rows of the matrix *A*. The value of *m* must be at least zero.
n	INTEGER. Specifies the number of columns of the matrix *A*. The value of *n* must be at least zero.
alpha	COMPLEX for cgem2vc DOUBLE COMPLEX for zgem2vc Specifies the scalar *alpha*.
a	COMPLEX for cgem2vc DOUBLE COMPLEX for zgem2vc Array, size (*lda*, *n*). Before entry, the leading *m*-by-*n* part of the array *a* must contain the matrix of coefficients.
lda	INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least max(1, *m*).
x1	COMPLEX for cgem2vc DOUBLE COMPLEX for zgem2vc Array, size at least (1+(*n*–1)*abs(*incx1*)). Before entry, the incremented array *x1* must contain the vector *x1*.
incx1	INTEGER. Specifies the increment for the elements of *x1*. The value of *incx1* must not be zero.
x2	COMPLEX for cgem2vc DOUBLE COMPLEX for zgem2vc Array, size at least (1+(*m*–1)*abs(*incx2*)). Before entry, the incremented array *x2* must contain the vector *x2*.
incx2	INTEGER. Specifies the increment for the elements of *x2*. The value of *incx2* must not be zero.

beta	COMPLEX for cgem2vc DOUBLE COMPLEX for zgem2vc Specifies the scalar *beta*. When *beta* is set to zero, then *y1* and *y2* need not be set on input.
y1	COMPLEX for cgem2vc DOUBLE COMPLEX for zgem2vc Array, size at least (1+(*m*-1)*abs(*incy1*)). Before entry with non-zero *beta*, the incremented array *y1* must contain the vector *y1*.
incy1	INTEGER. Specifies the increment for the elements of *y1*. The value of *incy1* must not be zero.
y2	COMPLEX for cgem2vc DOUBLE COMPLEX for zgem2vc Array, size at least (1+(*n*-1)*abs(*incy2*)). Before entry with non-zero *beta*, the incremented array *y2* must contain the vector *y2*.
incy2	INTEGER. Specifies the increment for the elements of *y2*. The value of *incy* must not be zero. INTEGER. Specifies the increment for the elements of *y*.

Output Parameters

y1	Updated vector *y1*.
y2	Updated vector *y2*.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine gem2vc interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
x1	Holds the vector with the number of elements *rx1* where *rx1* = *n*.
x2	Holds the vector with the number of elements *rx2* where *rx2* = *m*.
y1	Holds the vector with the number of elements *ry1* where *ry1* = *m*.
y2	Holds the vector with the number of elements *ry2* where *ry2* = *n*.
alpha	The default value is 1.
beta	The default value is 0.

?gemmt

Computes a matrix-matrix product with general matrices but updates only the upper or lower triangular part of the result matrix.

Syntax

```
call sgemmt (uplo, transa, transb, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call dgemmt (uplo, transa, transb, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call cgemmt (uplo, transa, transb, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call zgemmt (uplo, transa, transb, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call gemmt (a, b, c[, uplo] [, transa] [, transb] [, alpha] [, beta])
```

Include Files

- mkl.fi, blas.f90

Description

The ?gemmt routines compute a scalar-matrix-matrix product with general matrices and add the result to the upper or lower part of a scalar-matrix product. These routines are similar to the ?gemm routines, but they only access and update a triangular part of the square result matrix (see Application Notes below).

The operation is defined as

C := *alpha**op(*A*)*op(*B*) + *beta***C*,

where:

op(*X*) is one of op(*X*) = *X*, or op(*X*) = X^T, or op(*X*) = X^H,

alpha and *beta* are scalars,

A, *B* and *C* are matrices:

op(*A*) is an *n*-by-*k* matrix,

op(*B*) is a *k*-by-*n* matrix,

C is an *n*-by-*n* upper or lower triangular matrix.

Input Parameters

uplo

CHARACTER*1. Specifies whether the upper or lower triangular part of the array *c* is used. If *uplo* = 'U' or 'u', then the upper triangular part of the array *c* is used. If *uplo* = 'L' or 'l', then the lower triangular part of the array *c* is used.

transa

CHARACTER*1. Specifies the form of op(*A*) used in the matrix multiplication:

if *transa* = 'N' or 'n', then op(*A*) = *A*;

if *transa* = 'T' or 't', then op(*A*) = A^T;

if *transa* = 'C' or 'c', then op(*A*) = A^H.

transb

CHARACTER*1. Specifies the form of op(*B*) used in the matrix multiplication:

if *transb* = 'N' or 'n', then op(*B*) = *B*;

if *transb* = 'T' or 't', then op(*B*) = B^T;

if *transb* = 'C' or 'c', then op(*B*) = B^H.

n — INTEGER. Specifies the order of the matrix *C*. The value of *n* must be at least zero.

k — INTEGER. Specifies the number of columns of the matrix op(*A*) and the number of rows of the matrix op(*B*). The value of *k* must be at least zero.

alpha — REAL for sgemmt

DOUBLE PRECISION for dgemmt

COMPLEX for cgemmt

DOUBLE COMPLEX for zgemmt

Specifies the scalar *alpha*.

a — REAL for sgemmt

DOUBLE PRECISION for dgemmt

COMPLEX for cgemmt

DOUBLE COMPLEX for zgemmt

Array, size *lda* by *ka*, where *ka* is *k* when *transa* = 'N' or 'n', and is *n* otherwise. Before entry with *transa* = 'N' or 'n', the leading *n*-by-*k* part of the array *a* must contain the matrix *A*, otherwise the leading *k*-by-*n* part of the array *a* must contain the matrix *A*.

lda — INTEGER.

Specifies the leading dimension of *a* as declared in the calling (sub)program.

When *transa* = 'N' or 'n', then *lda* must be at least max(1, *n*), otherwise *lda* must be at least max(1, *k*).

b — REAL for sgemmt

DOUBLE PRECISION for dgemmt

COMPLEX for cgemmt

DOUBLE COMPLEX for zgemmt

Array, size *ldb* by *kb*, where *kb* is *n* when *transb* = 'N' or 'n', and is *k* otherwise. Before entry with *transb* = 'N' or 'n', the leading *k*-by-*n* part of the array *b* must contain the matrix *B*, otherwise the leading *n*-by-*k* part of the array *b* must contain the matrix *B*.

ldb — INTEGER. Specifies the leading dimension of *b* as declared in the calling (sub)program.

When *transb* = 'N' or 'n', then *ldb* must be at least max(1, *k*), otherwise *ldb* must be at least max(1, *n*).

beta — REAL for sgemmt

DOUBLE PRECISION for dgemmt

`COMPLEX` for `cgemmt`

`DOUBLE COMPLEX` for `zgemmt`

Specifies the scalar *beta*. When `beta` is equal to zero, then `c` need not be set on input.

`c`

`REAL` for `sgemmt`

`DOUBLE PRECISION` for `dgemmt`

`COMPLEX` for `cgemmt`

`DOUBLE COMPLEX` for `zgemmt`

Array, size `ldc` by `n`.

Before entry with `uplo` = `'U'` or `'u'`, the leading `n`-by-`n` upper triangular part of the array `c` must contain the upper triangular part of the matrix *C* and the strictly lower triangular part of `c` is not referenced.

Before entry with `uplo` = `'L'` or `'l'`, the leading `n`-by-`n` lower triangular part of the array `c` must contain the lower triangular part of the matrix *C* and the strictly upper triangular part of `c` is not referenced.

When `beta` is equal to zero, `c` need not be set on input.

`ldc`

`INTEGER`. Specifies the leading dimension of `c` as declared in the calling (sub)program. The value of `ldc` must be at least max(1, `n`).

Output Parameters

`c`

When `uplo` = `'U'` or `'u'`, the upper triangular part of the array `c` is overwritten by the upper triangular part of the updated matrix.

When `uplo` = `'L'` or `'l'`, the lower triangular part of the array `c` is overwritten by the lower triangular part of the updated matrix.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `gemmt` interface are the following:

`a`

Holds the matrix *A* of size (*ma*,*ka*) where

`ka` = `k` if `transa`=`'N'`,

`ka` = `n` otherwise,

`ma` = `n` if `transa`=`'N'`,

`ma` = `k` otherwise.

`b`

Holds the matrix *B* of size (*mb*,*kb*) where

`kb` = `n` if `transb` = `'N'`,

`kb` = `k` otherwise,

`mb` = `k` if `transb` = `'N'`,

	mb = *n* otherwise.
c	Holds the matrix *C* of size (*n*,*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
transa	Must be 'N', 'C', or 'T'. The default value is 'N'.
transb	Must be 'N', 'C', or 'T'. The default value is 'N'.
alpha	The default value is 1.
beta	The default value is 0.

Application Notes

These routines only access and update the upper or lower triangular part of the result matrix. This can be useful when the result is known to be symmetric; for example, when computing a product of the form *C* := *alpha**B**S**B*^{T} + *beta**C* , where *S* and *C* are symmetric matrices and *B* is a general matrix. In this case, first compute *A* := *B***S* (which can be done using the corresponding ?symm routine), then compute *C* := *alpha**A**B*^{T} + *beta**C* using the ?gemmt routine.

?gemm3m

Computes a scalar-matrix-matrix product using matrix multiplications and adds the result to a scalar-matrix product.

Syntax

```
call cgemm3m(transa, transb, m, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call zgemm3m(transa, transb, m, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call gemm3m(a, b, c [,transa][,transb] [,alpha][,beta])
```

Include Files

- mkl.fi, blas.f90

Description

The ?gemm3m routines perform a matrix-matrix operation with general complex matrices. These routines are similar to the ?gemm routines, but they use fewer matrix multiplication operations (see *Application Notes* below).

The operation is defined as

```
C := alpha*op(A)*op(B) + beta*C,
```

where:

op(*x*) is one of op(*x*) = *x*, or op(*x*) = *x*', or op(*x*) = conjg(*x*'),

alpha and *beta* are scalars,

A, *B* and *C* are matrices:

op(*A*) is an *m*-by-*k* matrix,

op(*B*) is a *k*-by-*n* matrix,

C is an *m*-by-*n* matrix.

Input Parameters

transa

CHARACTER*1. Specifies the form of op(*A*) used in the matrix multiplication:

if *transa* = 'N' or 'n', then op(*A*) = *A*;

if *transa* = 'T' or 't', then op(*A*) = *A*';

if *transa* = 'C' or 'c', then op(*A*) = conjg(*A*').

transb

CHARACTER*1. Specifies the form of op(*B*) used in the matrix multiplication:

if *transb* = 'N' or 'n', then op(*B*) = *B*;

if *transb* = 'T' or 't', then op(*B*) = *B*';

if *transb* = 'C' or 'c', then op(*B*) = conjg(*B*').

m

INTEGER. Specifies the number of rows of the matrix op(*A*) and of the matrix *C*. The value of m must be at least zero.

n

INTEGER. Specifies the number of columns of the matrix op(*B*) and the number of columns of the matrix *C*.

The value of *n* must be at least zero.

k

INTEGER. Specifies the number of columns of the matrix op(*A*) and the number of rows of the matrix op(*B*).

The value of *k* must be at least zero.

alpha

COMPLEX for cgemm3m

DOUBLE COMPLEX for zgemm3m

Specifies the scalar *alpha*.

a

COMPLEX for cgemm3m

DOUBLE COMPLEX for zgemm3m

Array, size *lda* by *ka*, where *ka* is *k* when *transa* = 'N' or 'n', and is *m* otherwise. Before entry with *transa* = 'N' or 'n', the leading *m*-by-*k* part of the array *a* must contain the matrix *A*, otherwise the leading *k*-by-*m* part of the array *a* must contain the matrix *A*.

lda

INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program.

When *transa* = 'N' or 'n', then *lda* must be at least max(1, *m*), otherwise *lda* must be at least max(1, *k*).

b

COMPLEX for cgemm3m

DOUBLE COMPLEX for zgemm3m

Array, size *ldb* by *kb*, where *kb* is *n* when *transa* = 'N' or 'n', and is *k* otherwise. Before entry with *transa* = 'N' or 'n', the leading *k*-by-*n* part of the array *b* must contain the matrix *B*, otherwise the leading *n*-by-*k* part of the array *b* must contain the matrix *B*.

ldb

INTEGER. Specifies the leading dimension of *b* as declared in the calling (sub)program.

When *transa* = 'N' or 'n', then *ldb* must be at least max(1, *k*), otherwise *ldb* must be at least max(1, *n*).

beta

COMPLEX for cgemm3m

DOUBLE COMPLEX for zgemm3m

Specifies the scalar *beta*.

When *beta* is equal to zero, then *c* need not be set on input.

c

COMPLEX for cgemm3m

DOUBLE COMPLEX for zgemm3m

Array, size *ldc* by *n*. Before entry, the leading *m*-by-*n* part of the array *c* must contain the matrix *C*, except when *beta* is equal to zero, in which case *c* need not be set on entry.

ldc

INTEGER. Specifies the leading dimension of *c* as declared in the calling (sub)program.

The value of *ldc* must be at least max(1, *m*).

Output Parameters

c

Overwritten by the *m*-by-*n* matrix (*alpha**op(*A*)*op(*B*) + *beta***C*).

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine gemm3m interface are the following:

a

Holds the matrix *A* of size (*ma*,*ka*) where

ka = *k* if *transa*='N',

ka = *m* otherwise,

ma = *m* if *transa*='N',

ma = *k* otherwise.

b

Holds the matrix *B* of size (*mb*,*kb*) where

kb = *n* if *transb* = 'N',

kb = *k* otherwise,

mb = *k* if *transb* = 'N',

mb = *n* otherwise.

c	Holds the matrix *C* of size (*m*,*n*).
transa	Must be 'N', 'C', or 'T'. The default value is 'N'.
transb	Must be 'N', 'C', or 'T'. The default value is 'N'.
alpha	The default value is 1.
beta	The default value is 1.

Application Notes

These routines perform a complex matrix multiplication by forming the real and imaginary parts of the input matrices. This uses three real matrix multiplications and five real matrix additions instead of the conventional four real matrix multiplications and two real matrix additions. The use of three real matrix multiplications reduces the time spent in matrix operations by 25%, resulting in significant savings in compute time for large matrices.

If the errors in the floating point calculations satisfy the following conditions:

$fl(x \text{ op } y)=(x \text{ op } y)(1+\delta), |\delta|\le u, \text{ op}=\times,/, \quad fl(x\pm y)=x(1+\alpha)\pm y(1+\beta), \quad |\alpha|,|\beta|\le u$

then for an *n*-by-*n* matrix $\hat{C}=fl(C_1+iC_2)= fl((A_1+iA_2)(B_1+iB_2))=\hat{C}_1+i\hat{C}_2$, the following bounds are satisfied:

$\|\hat{C}_1-C_1\|\le 2(n+1)u\|A\|_\infty\|B\|_\infty+O(u^2)$,

$\|\hat{C}_2-C_2\|\le 4(n+4)u\|A\|_\infty\|B\|_\infty+O(u^2)$,

where $\|A\|_\infty=\max(\|A_1\|_\infty,\|A_2\|_\infty)$, and $\|B\|_\infty=\max(\|B_1\|_\infty,\|B_2\|_\infty)$.

Thus the corresponding matrix multiplications are stable.

?gemm_batch

Computes scalar-matrix-matrix products and adds the results to scalar matrix products for groups of general matrices.

Syntax

call sgemm_batch(*transa_array*, *transb_array*, *m_array*, *n_array*, *k_array*, *alpha_array*, *a_array*, *lda_array*, *b_array*, *ldb_array*, *beta_array*, *c_array*, *ldc_array*, *group_count*, *group_size*)

call dgemm_batch(*transa_array*, *transb_array*, *m_array*, *n_array*, *k_array*, *alpha_array*, *a_array*, *lda_array*, *b_array*, *ldb_array*, *beta_array*, *c_array*, *ldc_array*, *group_count*, *group_size*)

call cgemm_batch(*transa_array*, *transb_array*, *m_array*, *n_array*, *k_array*, *alpha_array*, *a_array*, *lda_array*, *b_array*, *ldb_array*, *beta_array*, *c_array*, *ldc_array*, *group_count*, *group_size*)

call zgemm_batch(*transa_array*, *transb_array*, *m_array*, *n_array*, *k_array*, *alpha_array*, *a_array*, *lda_array*, *b_array*, *ldb_array*, *beta_array*, *c_array*, *ldc_array*, *group_count*, *group_size*)

call sgemm_batch(*a_array*, *b_array*, *c_array*, *m_array*, *n_array*, *k_array*, *group_size* [,*transa_array*][,*transb_array*] [,*alpha_array*][,*beta_array*])

```
call dgemm_batch(a_array, b_array, c_array, m_array, n_array, k_array, group_size
[,transa_array][,transb_array] [,alpha_array][,beta_array])
```

```
call cgemm_batch(a_array, b_array, c_array, m_array, n_array, k_array, group_size
[,transa_array][,transb_array] [,alpha_array][,beta_array])
```

```
call zgemm_batch(a_array, b_array, c_array, m_array, n_array, k_array, group_size
[,transa_array][,transb_array] [,alpha_array][,beta_array])
```

Include Files

- mkl.fi, blas.f90

Description

The ?gemm_batch routines perform a series of matrix-matrix operations with general matrices. They are similar to the ?gemm routine counterparts, but the ?gemm_batch routines perform matrix-matrix operations with groups of matrices, processing a number of groups at once. The groups contain matrices with the same parameters.

The operation is defined as

```
idx = 1
for i = 1..group_count
     alpha and beta in alpha_array(i) and beta_array(i)
     for j = 1..group_size(i)
          A, B, and C matrix in a_array(idx), b_array(idx), and c_array(idx)
          C := alpha*op(A)*op(B) + beta*C,
          idx = idx + 1
     end for
 end for
```

where:

op(*X*) is one of op(*X*) = *X*, or op(*X*) = X^T, or op(*X*) = X^H,

alpha and *beta* are scalar elements of *a_array* and *beta_array*,

A, *B* and *C* are matrices such that for *m*, *n*, and *k* which are elements of *m_array*, *n_array*, and *k_array*:

op(*A*) is an *m*-by-*k* matrix,

op(*B*) is a *k*-by-*n* matrix,

C is an *m*-by-*n* matrix.

A, *B*, and *C* represent matrices stored at addresses pointed to by *a_array*, *b_array*, and *c_array*, respectively. The number of entries in *a_array*, *b_array*, and *c_array* is *total_batch_count* = the sum of all of the *group_size* entries.

See also gemm for a detailed description of multiplication for general matrices and ?gemm3m_batch, BLAS-like extension routines for similar matrix-matrix operations.

NOTE
Error checking is not performed for oneMKL Windows* single dynamic libraries for the?gemm_batch routines.

Input Parameters

transa_array

CHARACTER*1. Array of size *group_count*. For the group *i*, $transa_i$ = *transa_array*(*i*) specifies the form of op(*A*) used in the matrix multiplication:

if $transa_i$ = 'N' or 'n', then op(*A*) = *A*;

if $transa_i$ = 'T' or 't', then op(*A*) = A^T;

if $transa_i$ = 'C' or 'c', then op(*A*) = A^H.

transb_array

CHARACTER*1. Array of size *group_count*. For the group *i*, $transb_i$ = *transb_array*(*i*) specifies the form of op(B_i) used in the matrix multiplication:

if $transb_i$ = 'N' or 'n', then op(*B*) = *B*;

if $transb_i$ = 'T' or 't', then op(*B*) = B^T;

if $transb_i$ = 'C' or 'c', then op(*B*) = B^H.

m_array

INTEGER. Array of size *group_count*. For the group *i*, m_i = *m_array*(*i*) specifies the number of rows of the matrix op(*A*) and of the matrix *C*.

The value of each element of *m_array* must be at least zero.

n_array

INTEGER. Array of size *group_count*. For the group *i*, n_i = *n_array*(*i*) specifies the number of columns of the matrix op(*B*) and the number of columns of the matrix *C*.

The value of each element of *n_array* must be at least zero.

k_array

INTEGER. Array of size *group_count*. For the group *i*, k_i = *k_array*(*i*) specifies the number of columns of the matrix op(*A*) and the number of rows of the matrix op(*B*).

The value of each element of *k_array* must be at least zero.

alpha_array

REAL for sgemm_batch

DOUBLE PRECISION for dgemm_batch

COMPLEX for cgemm_batch

DOUBLE COMPLEX for zgemm_batch

Array of size *group_count*. For the group *i*, *alpha_array*(*i*) specifies the scalar $alpha_i$.

a_array

INTEGER*8 for Intel® 64 architecture

INTEGER*4 for IA-32 architecture

Array, size *total_batch_count*, of pointers to arrays used to store *A* matrices.

lda_array

INTEGER. Array of size *group_count*. For the group *i*, lda_i = *lda_array*(*i*) specifies the leading dimension of the array storing matrix *A* as declared in the calling (sub)program.

When $transa_i$ = 'N' or 'n', then lda_i must be at least max(1, m_i), otherwise lda_i must be at least max(1, k_i).

b_array

`INTEGER*8` for Intel® 64 architecture

`INTEGER*4` for IA-32 architecture

Array, size *total_batch_count*, of pointers to arrays used to store *B* matrices.

ldb_array

`INTEGER`.

Array of size *group_count*. For the group *i*, ldb_i = *ldb_array*(*i*) specifies the leading dimension of the array storing matrix *B* as declared in the calling (sub)program.

When $transb_i$ = 'N' or 'n', then ldb_i must be at least max(1, k_i), otherwise ldb_i must be at least max(1, n_i).

beta_array

`REAL` for `sgemm_batch`

`DOUBLE PRECISION` for `dgemm_batch`

`COMPLEX` for `cgemm_batch`

`DOUBLE COMPLEX` for `zgemm_batch`

Array of size *group_count*. For the group *i*, *beta_array*(*i*) specifies the scalar $beta_i$.

When $beta_i$ is equal to zero, then *C* matrices in group *i* need not be set on input.

c_array

`INTEGER*8` for Intel® 64 architecture

`INTEGER*4` for IA-32 architecture

Array, size *total_batch_count*, of pointers to arrays used to store *C* matrices.

ldc_array

`INTEGER`.

Array of size *group_count*. For the group *i*, ldc_i = *ldc_array*(*i*) specifies the leading dimension of all arrays storing matrix *C* in group *i* as declared in the calling (sub)program.

ldc_i must be at least max(1, m_i).

group_count

`INTEGER`.

Specifies the number of groups. Must be at least 0.

group_size

`INTEGER`.

Array of size *group_count*. The element *group_size*(*i*) specifies the number of matrices in group *i*. Each element in *group_size* must be at least 0.

Output Parameters

c_array

Output buffer, overwritten by *total_batch_count* matrix multiply operations of the form alpha*op(A)*op(B) + beta*C.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine `gemm_batch` interface are the following:

a_array	Holds pointers to arrays containing matrices *A* of size (*ma*,*ka*) where *ka* = *k* if *transa*='N', *ka* = *m* otherwise, *ma* = *m* if *transa*='N', *ma* = *k* otherwise.
b_array	Holds pointers to arrays containing matrices *B* of size (*mb*,*kb*) where *kb* = *n* if *transb_array* = 'N', *kb* = *k* otherwise, *mb* = *k* if *transb_array* = 'N', *mb* = *n* otherwise.
c_array	Holds pointers to arrays containing matrices *C* of size (*m*,*n*).
m_array	Array indicating number of rows of matrices op(*A*) and *C* for each group.
n_array	Array indicating number of columns of matrices op(*B*) and *C* for each group.
k_array	Array indicating number of columns of matrices op(*A*) and number of rows of matrices op(*B*) for each group.
group_size	Array indicating number of matrices for each group. Each element in *group_size* must be at least 0.
transa_array	Array with each element set to one of 'N', 'C', or 'T'. The default values are 'N'.
transb_array	Array with each element set to one of 'N', 'C', or 'T'. The default values are 'N'.
alpha_array	Array of *alpha* values; the default value is 1.
beta_array	Array of *beta* values; the default value is 0.

?gemm_batch_strided

Computes groups of matrix-matrix product with general matrices.

Syntax

```
call sgemm_batch_strided(transa, transb, m, n, k, alpha, a, lda, stridea, b, ldb,
strideb, beta, c, ldc, stridec, batch_size)
```

```
call dgemm_batch_strided(transa, transb, m, n, k, alpha, a, lda, stridea, b, ldb,
strideb, beta, c, ldc, stridec, batch_size)
```

```
call cgemm_batch_strided(transa, transb, m, n, k, alpha, a, lda, stridea, b, ldb,
strideb, beta, c, ldc, stridec, batch_size)
```

```
call zgemm_batch_strided(transa, transb, m, n, k, alpha, a, lda, stridea, b, ldb,
strideb, beta, c, ldc, stridec, batch_size)
```

Include Files

- mkl.fi

Description

The ?gemm_batch_strided routines perform a series of matrix-matrix operations with general matrices. They are similar to the ?gemm routine counterparts, but the ?gemm_batch_strided routines perform matrix-matrix operations with groups of matrices. The groups contain matrices with the same parameters.

All matrix *a* (respectively, *b* or *c*) have the same parameters (size, leading dimension, transpose operation, alpha, beta scaling) and are stored at constant *stridea* (respectively, *strideb* or *stridec*) from each other. The operation is defined as

```
For i = 0 … batch_size – 1
    Ai, Bi and Ci are matrices at offset i * stridea, i * strideb and i * stridec in a, b and c
    Ci = alpha * Ai * Bi +  beta * Ci
end for
```

Input Parameters

transa

CHARACTER*1.

Specifies op(A) the transposition operation applied to the matrices *A*.

if *transa* = 'N' or 'n' , then op(A) = A;

if *transa* = 'T' or 't' , then op(A) = A^T;

if *transa* = 'C' or 'c' , then op(A) = A^H.

transb

CHARACTER*1.

Specifies op(B) the transposition operation applied to the matrices *B*.

if *transb* = 'N' or 'n' , then op(B) = B;

if *transb* = 'T' or 't' , then op(B) = B^T;

if *transb* = 'C' or 'c' , then op(B) = B^H.

m

INTEGER. Number of rows of the op(A) and *C* matrices. Must be at least 0.

n

INTEGER. Number of columns of the op(B) and *C* matrices. Must be at least 0.

k

INTEGER. Number of columns of the op(A) matrix and number of rows of the op(B) matrix. Must be at least 0.

alpha

REAL for sgemm_batch_strided

DOUBLE PRECISION for dgemm_batch_strided

COMPLEX for cgemm_batch_strided

DOUBLE COMPLEX for zgemm_batch_strided

Specifies the scalar *alpha*.

a

REAL for sgemm_batch_strided

DOUBLE PRECISION for dgemm_batch_strided

COMPLEX for cgemm_batch_strided

DOUBLE COMPLEX for zgemm_batch_strided

Array of size at least *stridea***batch_size* holding the *a* matrices.

transa='N' or 'n'	*transa*='T' or 't' or 'C' or 'c'

lda

INTEGER. Specifies the leading dimension of the *a* matrices.

transa='N' or 'n'	*transa*='T' or 't' or 'C' or 'c'

stridea

INTEGER. Stride between two consecutive *a* matrices.

transa='N' or 'n'	*transa*='T' or 't' or 'C' or 'c'

b

REAL for sgemm_batch_strided

DOUBLE PRECISION for dgemm_batch_strided

COMPLEX for cgemm_batch_strided

DOUBLE COMPLEX for zgemm_batch_strided

Array of size at least *strideb***batch_size* holding the *b* matrices.

transb='N' or 'n'	*transb*='T' or 't' or 'C' or 'c'

ldb

INTEGER. Specifies the leading dimension of the *b* matrices.

transab='N' or 'n'	*transb*='T' or 't' or 'C' or 'c'

strideb

INTEGER. Stride between two consecutive *b* matrices.

transa='N' or 'n'	*transa*='T' or 't' or 'C' or 'c'

beta

REAL for sgemm_batch_strided

DOUBLE PRECISION for dgemm_batch_strided

COMPLEX for cgemm_batch_strided

DOUBLE COMPLEX for zgemm_batch_strided

Specifies the scalar *beta*.

c

REAL for sgemm_batch_strided

DOUBLE PRECISION for dgemm_batch_strided

COMPLEX for cgemm_batch_strided

DOUBLE COMPLEX for zgemm_batch_strided

Array of size at least *stridec***batch_size* holding the *c* matrices.

ldc INTEGER.

Specifies the leading dimension of the *c* matrices.

Must be at least max(1,*m*) .

stridec INTEGER.

Specifies the stride between two consecutive *c* matrices.

Must be at least ldc**n* .

batch_size INTEGER.

Number of gemm computations to perform and *a*, *b* and *c* matrices. Must be at least 0.

Output Parameters

c Array holding the *batch_size* updated *c* matrices.

?gemm3m_batch_strided

Computes groups of matrix-matrix product with general matrices.

Syntax

```
call cgemm3m_batch_strided(transa, transb, m, n, k, alpha, a, lda, stridea, b, ldb, strideb, beta, c, ldc, stridec, batch_size)
```

```
call zgemm3m_batch_strided(transa, transb, m, n, k, alpha, a, lda, stridea, b, ldb, strideb, beta, c, ldc, stridec, batch_size)
```

Include Files

- mkl.fi

The groups contain matrices with the same parameters.

All matrix *a* (respectively, *b* or *c*) have the same parameters (size, leading dimension, transpose operation, alpha, beta scaling) and are stored at constant *stridea* (respectively, *strideb* or *stridec*) from each other. The operation is defined as

```
For i = 0 … batch_size – 1
    Ai, Bi and Ci are matrices at offset i * stridea, i * strideb and i * stridec in a, b and c
    Ci = alpha * Ai * Bi +  beta * Ci
end for
```

The ?gemm3m_batch_strided routines use fewer matrix multiplications than the ?gemm routines, as described in the *Application Notes* below.

Input Parameters

transa CHARACTER*1.

Specifies op(A) the transposition operation applied to the matrices *A*.

if *transa* = 'N' or 'n' , then op(A) = A;

if *transa* = 'T' or 't' , then op(A) = A^T;

if *transa* = 'C' or 'c' , then op(A) = A^H.

transb

CHARACTER*1.

Specifies op(B) the transposition operation applied to the matrices *B*.

if *transb* = 'N' or 'n' , then op(B) = B;

if *transb* = 'T' or 't' , then op(B) = B^T;

if *transb* = 'C' or 'c' , then op(B) = B^H.

m

INTEGER. Number of rows of the op(A) and *C* matrices. Must be at least 0.

n

INTEGER. Number of columns of the op(B) and *C* matrices. Must be at least 0.

k

INTEGER. Number of columns of the op(A) matrix and number of rows of the op(B) matrix. Must be at least 0.

alpha

COMPLEX for cgemm3m_batch_strided

DOUBLE COMPLEX for zgemm3m_batch_strided

Specifies the scalar *alpha*.

a

COMPLEX for cgemm3m_batch_strided

DOUBLE COMPLEX for zgemm3m_batch_strided

Array of size at least *stridea***batch_size* holding the *a* matrices.

transa='N' or 'n'	*transa*='T' or 't' or 'C' or 'c'

lda

INTEGER. Specifies the leading dimension of the *a* matrices.

transa='N' or 'n'	*transa*='T' or 't' or 'C' or 'c'

stridea

INTEGER. Stride between two consecutive *a* matrices.

transa='N' or 'n'	*transa*='T' or 't' or 'C' or 'c'

b

COMPLEX for cgemm3m_batch_strided

DOUBLE COMPLEX for zgemm3m_batch_strided

Array of size at least *strideb***batch_size* holding the *b* matrices.

transb='N' or 'n'	*transb*='T' or 't' or 'C' or 'c'

ldb

INTEGER. Specifies the leading dimension of the *b* matrices.

transab='N' or 'n'	*transb*='T' or 't' or 'C' or 'c'

strideb INTEGER. Stride between two consecutive *b* matrices.

transa='N' or 'n'	*transa*='T' or 't' or 'C' or 'c'

beta COMPLEX for cgemm3m_batch_strided

DOUBLE COMPLEX for zgemm3m_batch_strided

Specifies the scalar *beta*.

c COMPLEX for cgemm3m_batch_strided

DOUBLE COMPLEX for zgemm3m_batch_strided

Array of size at least *stridec***batch_size* holding the *c* matrices.

ldc INTEGER.

Specifies the leading dimension of the *c* matrices.

Must be at least max(1,*m*) .

stridec INTEGER.

Specifies the stride between two consecutive *c* matrices.

Must be at least ldc**n* .

batch_size INTEGER.

Number of gemm computations to perform and *a*, *b* and *c* matrices. Must be at least 0.

Output Parameters

c Array holding the *batch_size* updated *c* matrices.

Application Notes

These routines perform a complex matrix multiplication by forming the real and imaginary parts of the input matrices. This uses three real matrix multiplications and five real matrix additions instead of the conventional four real matrix multiplications and two real matrix additions. The use of three real matrix multiplications reduces the time spent in matrix operations by 25%, resulting in significant savings in compute time for large matrices.

If the errors in the floating point calculations satisfy the following conditions:

$fl(x\ op\ y)=(x\ op\ y)(1+\delta),|\delta|\leq u,\ op=\times,/,\ fl(x\pm y)=x(1+\alpha)\pm y(1+\beta),\ |\alpha|,|\beta|\leq u$

then for an n-by-n matrix $\hat{C}=fl(C1+iC2)=fl((A1+iA2)(B1+iB2))=\hat{C}1+i\hat{C}2$, the following bounds are satisfied:

$$\|\hat{C}1-C1\|\leq 2(n+1)u\|A\|_\infty\|B\|_\infty+O(u2),$$
$$\|\hat{C}2-C2\|\leq 4(n+4)u\|A\|_\infty\|B\|_\infty+O(u2),$$

where $\|A\|_\infty=max(\|A1\|_\infty,\|A2\|_\infty),\ and\ \|B\|_\infty=max(\|B1\|_\infty,\|B2\|_\infty)$.

Thus the corresponding matrix multiplications are stable.

?gemm3m_batch

Computes scalar-matrix-matrix products and adds the results to scalar matrix products for groups of general matrices.

Syntax

`call cgemm3m_batch(transa_array, transb_array, m_array, n_array, k_array, alpha_array, a_array, lda_array, b_array, ldb_array, beta_array, c_array, ldc_array, group_count, group_size)`

`call zgemm3m_batch(transa_array, transb_array, m_array, n_array, k_array, alpha_array, a_array, lda_array, b_array, ldb_array, beta_array, c_array, ldc_array, group_count, group_size)`

`call cgemm3m_batch(a_array, b_array, c_array, m_array, n_array, k_array, group_size [,transa_array][,transb_array] [,alpha_array][,beta_array])`

`call zgemm3m_batch(a_array, b_array, c_array, m_array, n_array, k_array, group_size [,transa_array][,transb_array] [,alpha_array][,beta_array])`

Include Files

Description

The `?gemm3m_batch` routines perform a series of matrix-matrix operations with general matrices. They are similar to the `?gemm3m` routine counterparts, but the `?gemm3m_batch` routines perform matrix-matrix operations with groups of matrices, processing a number of groups at once. The groups contain matrices with the same parameters. The `?gemm3m_batch` routines use fewer matrix multiplications than the `?gemm_batch` routines, as described in the *Application Notes*.

The operation is defined as

```
idx = 1
for i = 1..group_count
     alpha and beta in alpha_array(i) and beta_array(i)
     for j = 1..group_size(i)
          A, B, and C matrix in a_array(idx), b_array(idx), and c_array(idx)
          C := alpha*op(A)*op(B) + beta*C,
          idx = idx + 1
     end for
 end for
```

where:

`op(X)` is one of `op(X) = X`, or `op(X) =` X^T, or `op(X) =` X^H,

alpha and *beta* are scalar elements of *alpha_array* and *beta_array*,

A, *B* and *C* are matrices such that for *m*, *n*, and *k* which are elements of *m_array*, *n_array*, and *k_array*:

`op(A)` is an *m*-by-*k* matrix,

`op(B)` is a *k*-by-*n* matrix,

C is an *m*-by-*n* matrix.

A, *B*, and *C* represent matrices stored at addresses pointed to by `a_array`, `b_array`, and `c_array`, respectively. The number of entries in `a_array`, `b_array`, and `c_array` is *total_batch_count* = the sum of all the `group_size` entries.

See also gemm for a detailed description of multiplication for general matrices and gemm_batch, BLAS-like extension routines for similar matrix-matrix operations.

NOTE
Error checking is not performed for Intel® oneAPI Math Kernel Library (oneMKL) Windows* single dynamic libraries for the `?gemm3m_batch` routines.

Input Parameters

`transa_array`

`CHARACTER*1`. Array of size `group_count`. For the group *i*, $transa_i$ = `transa_array(i)` specifies the form of `op(A)` used in the matrix multiplication:

if $transa_i$ = `'N'` or `'n'`, then `op(A)` = A;

if $transa_i$ = `'T'` or `'t'`, then `op(A)` = A^T;

if $transa_i$ = `'C'` or `'c'`, then `op(A)` = A^H.

`transb_array`

`CHARACTER*1`. Array of size `group_count`. For the group *i*, $transb_i$ = `transb_array(i)` specifies the form of `op(`B_i`)` used in the matrix multiplication:

if $transb_i$ = `'N'` or `'n'`, then `op(B)` = B;

if $transb_i$ = `'T'` or `'t'`, then `op(B)` = B^T;

if $transb_i$ = `'C'` or `'c'`, then `op(B)` = B^H.

`m_array`

`INTEGER`. Array of size `group_count`. For the group *i*, m_i = `m_array(i)` specifies the number of rows of the matrix `op(A)` and of the matrix *C*.

The value of each element of `m_array` must be at least zero.

`n_array`

`INTEGER`. Array of size `group_count`. For the group *i*, n_i = `n_array(i)` specifies the number of columns of the matrix `op(B)` and the number of columns of the matrix *C*.

The value of each element of `n_array` must be at least zero.

`k_array`

`INTEGER`. Array of size `group_count`. For the group *i*, k_i = `k_array(i)` specifies the number of columns of the matrix `op(A)` and the number of rows of the matrix `op(B)`.

The value of each element of `k_array` must be at least zero.

`alpha_array`

`COMPLEX` for `cgemm3m_batch`

`DOUBLE COMPLEX` for `zgemm3m_batch`

Array of size `group_count`. For the group *i*, `alpha_array(i)` specifies the scalar $alpha_i$.

`a_array`

`INTEGER*8` for Intel® 64 architecture

`INTEGER*4` for IA-32 architecture

Array, size *total_batch_count*, of pointers to arrays used to store *A* matrices.

lda_array

INTEGER. Array of size *group_count*. For the group *i*, lda_i = *lda_array*(*i*) specifies the leading dimension of the array storing matrix *A* as declared in the calling (sub)program.

When $transa_i$ = 'N' or 'n', then lda_i must be at least max(1, m_i), otherwise lda_i must be at least max(1, k_i).

b_array

INTEGER*8 for Intel® 64 architecture

INTEGER*4 for IA-32 architecture

Array, size *total_batch_count*, of pointers to arrays used to store *B* matrices.

ldb_array

INTEGER.

Array of size *group_count*. For the group *i*, ldb_i = *ldb_array*(*i*) specifies the leading dimension of the array storing matrix *B* as declared in the calling (sub)program.

When $transb_i$ = 'N' or 'n', then ldb_i must be at least max(1, k_i), otherwise ldb_i must be at least max(1, n_i).

beta_array

COMPLEX for cgemm3m_batch

DOUBLE COMPLEX for zgemm3m_batch

For the group *i*, *beta_array*(*i*) specifies the scalar $beta_i$.

When $beta_i$ is equal to zero, then *C* matrices in group *i* need not be set on input.

c_array

INTEGER*8 for Intel® 64 architecture

INTEGER*4 for IA-32 architecture

Array, size *total_batch_count*, of pointers to arrays used to store *C* matrices.

ldc_array

INTEGER.

Array of size *group_count*. For the group *i*, ldc_i = *ldc_array*(*i*) specifies the leading dimension of all arrays storing matrix *C* in group *i* as declared in the calling (sub)program.

ldc_i must be at least max(1, m_i).

group_count

INTEGER.

Specifies the number of groups. Must be at least 0.

group_size

INTEGER.

Array of size *group_count*. The element *group_size*(*i*) specifies the number of matrices in group *i*. Each element in *group_size* must be at least 0.

Output Parameters

c_array — Overwritten by the m_i-by-n_i matrix `(alpha_i*op(A)*op(B) + beta_i*C)` for group *i*.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine `gemm3m_batch` interface are the following:

a_array — Holds pointers to arrays containing matrices *A* of size (*ma*,*ka*) where

ka = *k* if *transa*='N',

ka = *m* otherwise,

ma = *m* if *transa*='N',

ma = *k* otherwise.

b_array — Holds pointers to arrays containing matrices *B* of size (*mb*,*kb*) where

kb = *n* if *transb_array* = 'N',

kb = *k* otherwise,

mb = *k* if *transb_array* = 'N',

mb = *n* otherwise.

c_array — Holds pointers to arrays containing matrices *C* of size (*m*,*n*).

m_array — Array indicating number of rows of matrices `op(A)` and *C* for each group.

n_array — Array indicating number of columns of matrices `op(B)` and *C* for each group.

k_array — Array indicating number of columns of matrices `op(A)` and number of rows of matrices `op(B)` for each group.

group_size — Array indicating number of matrices for each group. Each element in *group_size* must be at least 0.

transa_array — Array with each element set to one of 'N', 'C', or 'T'.

The default values are 'N'.

transb_array — Array with each element set to one of 'N', 'C', or 'T'.

The default values are 'N'.

alpha_array — Array of *alpha* values; the default value is 1.

beta_array — Array of *beta* values; the default value is 0.

Application Notes

These routines perform a complex matrix multiplication by forming the real and imaginary parts of the input matrices. This uses three real matrix multiplications and five real matrix additions instead of the conventional four real matrix multiplications and two real matrix additions. The use of three real matrix multiplications reduces the time spent in matrix operations by 25%, resulting in significant savings in compute time for large matrices.

If the errors in the floating point calculations satisfy the following conditions:

$fl(x \text{ op } y)=(x \text{ op } y)(1+\delta), |\delta| \le u, \text{ op}=\times,/, \quad fl(x \pm y)=x(1+\alpha) \pm y(1+\beta), \quad |\alpha|, |\beta| \le u$

then for an *n*-by-*n* matrix $\hat{C}=fl(C_1+iC_2)= fl((A_1+iA_2)(B_1+iB_2))=\hat{C}_1+i\hat{C}_2$, the following bounds are satisfied:

$\|\hat{C}_1-C_1\| \le 2(n+1)u\|A\|_\infty\|B\|_\infty+O(u^2)$,

$\|\hat{C}_2-C_2\| \le 4(n+4)u\|A\|_\infty\|B\|_\infty+O(u^2)$,

where $\|A\|_\infty=\max(\|A_1\|_\infty, \|A_2\|_\infty)$, and $\|B\|_\infty=\max(\|B_1\|_\infty, \|B_2\|_\infty)$.

Thus the corresponding matrix multiplications are stable.

?trsm_batch

Solves a triangular matrix equation for a group of matrices.

Syntax

```
call strsm_batch(side_array, uplo_array, transa_array, diag_array, m_array, n_array,
alpha_array, a_array, lda_array, b_array, ldb_array, group_count, group_size)
```

```
call dtrsm_batch(side_array, uplo_array, transa_array, diag_array, m_array, n_array,
alpha_array, a_array, lda_array, b_array, ldb_array, group_count, group_size)
```

```
call ctrsm_batch(side_array, uplo_array, transa_array, diag_array, m_array, n_array,
alpha_array, a_array, lda_array, b_array, ldb_array, group_count, group_size)
```

```
call ztrsm_batch(side_array, uplo_array, transa_array, diag_array, m_array, n_array,
alpha_array, a_array, lda_array, b_array, ldb_array, group_count, group_size)
```

Include Files

- mkl.fi, blas.f90

Description

The ?trsm_batch routines solve a series of matrix equations. They are similar to the ?trsm routines except that they operate on groups of matrices which have the same parameters. The ?trsm_batch routines process a number of groups at once.

```
idx = 1
for i = 1..group_count
    alpha in alpha_array(i)
    for j = 1..group_size(i)
        A and B matrix in a_array(idx) and b_array(idx)
        Solve op(A)*X = alpha*B
          or
        Solve X*op(A) = alpha*B
```

```
        idx = idx + 1
    end for
end for
```

where:

alpha is a scalar element of `alpha_array`,

X and *B* are *m*-by-*n* matrices for *m* and *n* which are elements of `m_array` and `n_array`, respectively,

A is a unit, or non-unit, upper or lower triangular matrix,

and `op(A)` is one of `op(A) = A`, or `op(A) = A`^{T}, or `op(A) = conjg(A`^{T}`)`.

A and *B* represent matrices stored at addresses pointed to by `a_array` and `b_array`, respectively. There are *total_batch_count* entries in each of `a_array` and `b_array`, where *total_batch_count* is the sum of all the `group_size` entries.

Input Parameters

`side_array`

`CHARACTER*1`. Array of size *group_count*. For group *i*, 1 ≤*i*≤*group_count*, $side_i$ = `side_array(i)` specifies whether `op(A)` appears on the left or right of *X* in the equation:

if $side_i$ = `'L'` or `'l'`, then `op(A)*X = alpha*B`;

if $side_i$ = `'R'` or `'r'`, then `X*op(A) = alpha*B`.

`uplo_array`

`CHARACTER*1`. Array of size *group_count*. For group *i*, 1 ≤*i*≤*group_count*, $uplo_i$ = `uplo_array(i)` specifies whether the matrix *A* is upper or lower triangular:

$uplo_i$ = `'U'` or `'u'`

if $uplo_i$ = `'L'` or `'l'`, then the matrix is low triangular.

`transa_array`

`CHARACTER*1`. Array of size *group_count*. For group *i*, 1 ≤*i*≤*group_count*, $transa_i$ = `transa_array(i)` specifies the form of `op(A)` used in the matrix multiplication:

if $transa_i$= `'N'` or `'n'`, then `op(A) = A`;

if $transa_i$= `'T'` or `'t'`;

if $transa_i$= `'C'` or `'c'`, then `op(A) = conjg(A')`.

`diag_array`

`CHARACTER*1`. Array of size *group_count*. For group *i*, 1 ≤*i*≤*group_count*, $diag_i$ = `diag_array(i)` specifies whether the matrix *A* is unit triangular:

if $diag_i$ = `'U'` or `'u'` then the matrix is unit triangular;

if $diag_i$ = `'N'` or `'n'`, then the matrix is not unit triangular.

`m_array`

`INTEGER`. Array of size *group_count*. For group *i*, 1 ≤*i*≤*group_count*, m_i = `m_array(i)` specifies the number of rows of *B*. The value of m_i must be at least zero.

`n_array`

`INTEGER`. Array of size *group_count*. For group *i*, 1 ≤*i*≤*group_count*, n_i = `n_array(i)` specifies the number of columns of *B*. The value of n_i must be at least zero.

`alpha_array`

`REAL` for `strsm_batch`

`DOUBLE PRECISION` for `dtrsm_batch`

	`COMPLEX` for `ctrsm_batch`
	`DOUBLE COMPLEX` for `ztrsm_batch`
	Array of size *group_count*. For group *i*, 1 ≤*i*≤*group_count*, `alpha_array(i)` specifies the scalar $alpha_i$.

a_array	`INTEGER*8` for Intel® 64 architecture `INTEGER*4` for IA-32 architecture Array, size *total_batch_count*, of pointers to arrays used to store *A* matrices. For group *i*, 1 ≤*i*≤*group_count*, *k* is m_i when $side_i$ `= 'L'` or `'l'` and is n_i when *side* `= 'R'` or `'r'` and *a* is any of the `group_size(i)` arrays starting with `a_array(group_size(1) + group_size(2) + ... + group_size(i - 1) + 1)`: Before entry with $uplo_i$ `= 'U'` or `'u'`, the leading *k* by *k* upper triangular part of the array *a* must contain the upper triangular matrix and the strictly lower triangular part of *a* is not referenced. Before entry with $uplo_i$ `= 'L'` or `'l'` lower triangular part of the array *a* must contain the lower triangular matrix and the strictly upper triangular part of *a* is not referenced. When $diag_i$ `= 'U'` or `'u'`, the diagonal elements of *a* are not referenced either, but are assumed to be unity.
lda_array	`INTEGER`. Array of size *group_count*. For group *i*, 1 ≤*i*≤*group_count*, lda_i = `lda_array(i)` specifies the leading dimension of *a* as declared in the calling (sub)program. When $side_i$ `= 'L'` or `'l'`, then lda_i must be at least `max(1, `m_i`)`, when $side_i$ `= 'R'` or `'r'`, then lda_i must be at least `max(1, `n_i`)`.

b_array	`REAL` for `strsm_batch`
	`DOUBLE PRECISION` for `dtrsm_batch`
	`COMPLEX` for `ctrsm_batch`
	`DOUBLE COMPLEX` for `ztrsm_batch`
	Array, size *total_batch_count*, of pointers to arrays used to store *B* matrices.
	For group *i*, 1 ≤*i*≤*group_count*, *b* is any of the `group_size(i)` arrays starting with `b_array(group_size(1) + group_size(2) + ... + group_size(i - 1) + 1)`:
	Before entry, the leading m_i-by-n_i part of array *b* must contain the matrix *B*.

ldb_array	`INTEGER`. Array of size *group_count*. Specifies the leading dimension of *b* as declared in the calling (sub)program. *ldb* must be at least `max(1, `m`)`. `INTEGER`. Array of size *group_count*. For group *i*, 1 ≤*i*≤*group_count*, ldb_i = `ldb_array(i)` specifies the leading dimension of *b* as declared in the calling (sub)program. ldb_i must be at least `max(1, `m_i`)`.
group_count	`INTEGER`.

Specifies the number of groups. Must be at least 0.

group_size — INTEGER.

Array of size *group_count*. The element *group_size*(*i*) specifies the number of matrices in group *i*. Each element in *group_size* must be at least 0.

Output Parameters

b_array — Overwritten by the solution matrix *X*.

BLAS 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see BLAS 95 Interface Conventions.

Specific details for the routine `trsm_batch` interface are the following:

a_array — Holds pointers to matrices *A* of size (*ma*,*ma*) where *ma* = m_i if *side* = 'L', *ma* = n_i otherwise.

b_array — Holds pointers to matrices *B* of size (m_i,n_i).

m_array — Array indicating the number of rows of matrix *C* for each group.

n_array — Array indicating the number of columns of matrix *B* for each group.

group_size — Array indicating the number of matrices for each group. Each element in *group_size* must be at least zero.

side_array — Array with each element set to either 'L' or 'R'. The default value is 'L'.

uplo_array — Array with each element set to either 'U' or 'L'. The default value is 'U'.

transa_array — Array with each element set to one of 'N', 'C', or 'T'.

The default value is 'N'.

diag_array — Array with each element set to either 'N' or 'U'. The default value is 'N'.

alpha_array — Array of *alpha*values. The default value is 1.

?trsm_batch_strided

Solves groups of triangular matrix equations.

Syntax

```
call strsm_batch_strided(side, uplo, transa, diag, m, n, alpha, a, lda, stridea, b, ldb, strideb, batch_size)
call dtrsm_batch_strided(side, uplo, transa, diag, m, n, alpha, a, lda, stridea, b, ldb, strideb, batch_size)
call ctrsm_batch_strided(side, uplo, transa, diag, m, n, alpha, a, lda, stridea, b, ldb, strideb, batch_size)
call ztrsm_batch_strided(side, uplo, transa, diag, m, n, alpha, a, lda, stridea, b, ldb, strideb, batch_size)
```

Include Files

- mkl.fi, blas.f90

Description

The ?trsm_batch_strided routines solve a series of triangular matrix equations. They are similar to the ?trsm routine counterparts, but the ?trsm_batch_strided routines solve triangular matrix equations with groups of matrices. All matrix *a* have the same parameters (*size*, *leading dimension*, *side*, *uplo*, *diag*, *transpose operation*) and are stored at constant *stridea* from each other. Similarly, all matrix *b* have the same parameters (*size*, *leading dimension*, *alpha scaling*) and are stored at constant *strideb* from each other.

The operation is defined as

```
For i = 0 … batch_size – 1
    Ai, and Bi are matrices at offset i * stridea and i * strideb in a and b
    Solve op(Ai)*Xi = alpha * Bi
        Or
    Solve Xi*op(Ai) = alpha * Bi
end for
```

Input Parameters

side

CHARACTER*1.

Specifies whether op(*A*) appears on the left or right of *X* in the equation.

if *side* = '*L*' or '*l*', then op(*A*)***X* = *alpha***B*;

if *side* = '*R*' or '*r*', then *X**op(*A*) = *alpha***B*.

uplo

CHARACTER*1.

Specifies whether the matrices *A* are upper or lower triangular.

if *uplo* = '*U*' or '*u*', then *A* are upper triangular;

if *uplo* = '*L*' or '*l*', then *A* are lower triangular.

transa

CHARACTER*1.

Specifies op(*A*) the transposition operation applied to the matrices *A*.

if *transa* = '*N*' or '*n*', then op(*A*) = *A*;

if *transa* = '*T*' or '*t*', then op(*A*) = A^T;

if *transa* = '*C*' or '*c*', then op(*A*) = A^H;

diag

CHARACTER*1.

Specifies whether the matrices *A* are unit triangular.

if *diag* = '*U*' or '*u*', then *A* are unit triangular;

if *diag* = '*N*' or '*n*', then *A* are non-unit triangular.

m

INTEGER.

Number of rows of *B* matrices. Must be at least 0

n

INTEGER.

Number of columns of *B* matrices. Must be at least 0

alpha

REAL for strsm_batch_strided

DOUBLE PRECISION for dtrsm_batch_strided

COMPLEX for ctrsm_batch_strided

DOUBLE COMPLEX for ztrsm_batch_strided

Specifies the scalar *alpha*.

a

REAL for strsm_batch_strided

DOUBLE PRECISION for dtrsm_batch_strided

COMPLEX for ctrsm_batch_strided

DOUBLE COMPLEX for ztrsm_batch_strided

Array of size at least *stridea***batch_size* holding the *A* matrices. Each *A* matrix is stored at constant *stridea* from each other.

Each *A* matrix has size *lda* k*, where *k* is *m* when *side* = '*L*' or '*l*' and is *n* when *side* = '*R*' or '*r*' .

Before entry with *uplo* = '*U*' or '*u*', the leading *k*-by-*k* upper triangular part of the array *A* must contain the upper triangular matrix and the strictly lower triangular part of *A* is not referenced.

Before entry with *uplo* = '*L*' or '*l*' lower triangular part of the array *A* must contain the lower triangular matrix and the strictly upper triangular part of *A* is not referenced.

When diag = '*U*' or '*u*' , the diagonal elements of *A* are not referenced either, but are assumed to be unity.

lda

INTEGER.

Specifies the leading dimension of the *A* matrices. When *side* = '*L*' or '*l*', then *lda* must be at least max(1, m), when side = *side* = '*R*' or '*r*', then *lda* must be at least max(1, n).

stridea

INTEGER.

Stride between two consecutive *A* matrices.

When *side* = '*L*' or '*l*', then *stridea* must be at least *lda*m*.

When side = *side* = '*R*' or '*r*', then *stridea* must be at least *lda*n*.

b

REAL for strsm_batch_strided

DOUBLE PRECISION for dtrsm_batch_strided

COMPLEX for ctrsm_batch_strided

DOUBLE COMPLEX for ztrsm_batch_strided

Array of size at least *strideb***batch_size* holding the *B* matrices. Each *B* matrix is stored at constant *strideb* from each other.

Each *B* matrix has size *ldb* n*. Before entry, the leading *m*-by-*n* part of the array *B* must contain the matrix *B*.

ldb

INTEGER.

Specifies the leading dimension of the *B* matrices.

ldb must be at least max(1,*m*).

strideb INTEGER.

Stride between two consecutive *B* matrices.

strideb must be at least `(ldb*n)`.

batch_size INTEGER.

Number of `trsm` computations to perform. Must be at least 0.

Output Parameters

b Overwritten by the solution batch_size *X* matrices.

mkl_?imatcopy

Performs scaling and in-place transposition/copying of matrices.

Syntax

```
call mkl_simatcopy(ordering, trans, rows, cols, alpha, ab, lda, ldb)
call mkl_dimatcopy(ordering, trans, rows, cols, alpha, ab, lda, ldb)
call mkl_cimatcopy(ordering, trans, rows, cols, alpha, ab, lda, ldb)
call mkl_zimatcopy(ordering, trans, rows, cols, alpha, ab, lda, ldb)
```

Include Files

- `mkl.fi`

Description

The `mkl_?imatcopy` routine performs scaling and in-place transposition/copying of matrices. A transposition operation can be a normal matrix copy, a transposition, a conjugate transposition, or just a conjugation. The operation is defined as follows:

AB := *alpha*op(*AB*).

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

NOTE
Different arrays must not overlap.

Input Parameters

ordering CHARACTER*1. Ordering of the matrix storage.

If *ordering* = `'R'` or `'r'`, the ordering is row-major.

If *ordering* = `'C'` or `'c'`, the ordering is column-major.

trans CHARACTER*1. Parameter that specifies the operation type.

If *trans* = 'N' or 'n', op(*AB*)=*AB* and the matrix *AB* is assumed unchanged on input.

If *trans* = 'T' or 't', it is assumed that *AB* should be transposed.

If *trans* = 'C' or 'c', it is assumed that *AB* should be conjugate transposed.

If *trans* = 'R' or 'r', it is assumed that *AB* should be only conjugated.

If the data is real, then *trans* = 'R' is the same as *trans* = 'N', and *trans* = 'C' is the same as *trans* = 'T'.

rows INTEGER. The number of rows in matrix *AB* before the transpose operation.

cols INTEGER. The number of columns in matrix *AB* before the transpose operation.

ab REAL for mkl_simatcopy.

DOUBLE PRECISION for mkl_dimatcopy.

COMPLEX for mkl_cimatcopy.

DOUBLE COMPLEX for mkl_zimatcopy.

Array, size *ab*(*lda*,*).

alpha REAL for mkl_simatcopy.

DOUBLE PRECISION for mkl_dimatcopy.

COMPLEX for mkl_cimatcopy.

DOUBLE COMPLEX for mkl_zimatcopy.

This parameter scales the input matrix by *alpha*.

lda INTEGER. Distance between the first elements in adjacent columns (in the case of the column-major order) or rows (in the case of the row-major order) in the source matrix; measured in the number of elements.

This parameter must be at least *rows* if *ordering* = 'C' or 'c', and max(1,*cols*) otherwise.

ldb INTEGER. Distance between the first elements in adjacent columns (in the case of the column-major order) or rows (in the case of the row-major order) in the destination matrix; measured in the number of elements.

To determine the minimum value of *ldb* on output, consider the following guideline:

If *ordering* = 'C' or 'c', then

- If *trans* = 'T' or 't' or 'C' or 'c', this parameter must be at least max(1,*cols*)
- If *trans* = 'N' or 'n' or 'R' or 'r', this parameter must be at least max(1,*rows*)

If *ordering* = 'R' or 'r', then

- If *trans* = 'T' or 't' or 'C' or 'c', this parameter must be at least max(1,*rows*)

- If *trans* = 'N' or 'n' or 'R' or 'r', this parameter must be at least max(1,*cols*)

Output Parameters

ab

REAL for mkl_simatcopy.

DOUBLE PRECISION for mkl_dimatcopy.

COMPLEX for mkl_cimatcopy.

DOUBLE COMPLEX for mkl_zimatcopy.

Array, size *ab*(*ldb*,*).

Contains the matrix *AB*.

Application Notes

For threading to be active in mkl_?imatcopy, the pointer *AB* must be aligned on the 64-byte boundary. This requirement can be met by allocating *AB* with mkl_malloc.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_simatcopy ( ordering, trans, rows, cols, alpha, ab, lda, ldb )
   CHARACTER*1 ordering, trans
   INTEGER rows, cols, src_ld, dst_ld
   REAL ab(*), alpha*
```

```
SUBROUTINE mkl_dimatcopy ( ordering, trans, rows, cols, alpha, ab, lda, ldb )
   CHARACTER*1 ordering, trans
   INTEGER rows, cols, src_ld, dst_ld
   DOUBLE PRECISION ab(*), alpha*
```

```
SUBROUTINE mkl_cimatcopy ( ordering, trans, rows, cols, alpha, ab, lda, ldb )
   CHARACTER*1 ordering, trans
   INTEGER rows, cols, src_ld, dst_ld
   COMPLEX ab(*), alpha*
```

```
SUBROUTINE mkl_zimatcopy ( ordering, trans, rows, cols, alpha, ab, lda, ldb )
   CHARACTER*1 ordering, trans
   INTEGER rows, cols, src_ld, dst_ld
   DOUBLE COMPLEX ab(*), alpha*
```

mkl_?imatcopy_batch

Computes a group of in-place scaled matrix copy or transposition operations on general matrices.

Syntax

call mkl_simatcopy_batch(*layout*, *trans_arrau*, *rows_arrau*, *cols_array*, *alpha_array*, *AB_array*, *lda_array*, *ldb_array*, *group_size*, *group_count*)

call mkl_dimatcopy_batch(*layout*, *trans_arrau*, *rows_arrau*, *cols_array*, *alpha_array*, *AB_array*, *lda_array*, *ldb_array*, *group_size*, *group_count*)

```
call mkl_cimatcopy_batch(layout, trans_arrau, rows_arrau, cols_array, alpha_array,
AB_array, lda_array, ldb_array, group_size, group_count)
```

```
call mkl_zimatcopy_batch(layout, trans_arrau, rows_arrau, cols_array, alpha_array,
AB_array, lda_array, ldb_array, group_size, group_count)
```

Description

The `mkl_?imatcopy_batch` routine performs a series of in-place scaled matrix copies or transpositions. They are similar to the `mkl_?imatcopy` routine counterparts, but the `mkl_?imatcopy_batch` routine performs matrix operations with groups of matrices. Each group has the same parameters (matrix size, leading dimension, and scaling parameter), but a single call to `mkl_?imatcopy_batch` operates on multiple groups, and each group can have different parameters, unlike the related `mkl_?imatcopy_batch_strided` routines.

The operation is defined as

```
idx = 0
for i = 0..group_count - 1
     m in rows_array[i], n in cols_array[i], and alpha in alpha_array[i]
     for j = 0..group_size[i] - 1
          AB matrices in AB_array[idx]
          AB := alpha*op(AB)
          idx = idx + 1
     end for
end for
```

Where `op(X)` is one of `op(X)=X`, `op(X)=X'`, `op(X)=conjg(X')`, or `op(X)=conjg(X)`. On entry, *AB* is a *m*-by-*n* matrix such that *m* and *n* are elements of *rows_array* and *cols_array*.

AB represents a matrix stored at addresses pointed to by *AB_array*. The number of entries in *AB_array* is *total_batch_count* = the sum of all of the *group_size* entries.

Input Parameters

layout

`CHARACTER*1`.

Specifies whether two-dimensional array storage is row-major (R) or column-major (C).

trans_array

`CHARACTER*1`.

Array of size *group_count*. For the group *i*, *trans* = *trans_array*[*i*] specifies the form of `op(AB)`, the transposition operation applied to the *AB* matrix:

If *trans* = `'N'` or `'n'`, `op(AB)=AB`.

If *trans* = `'T'` or `'t'`, `op(AB)=AB'`

If *trans* = `'C'` or `'c'`, `op(AB)=conjg(AB')`

If *trans* = `'R'` or `'r'`, `op(AB)=conjg(AB)`

rows_array

`INTEGER`. Array of size *group_count*. Specifies the number of rows of the input matrix *AB*. The value of each element must be at least zero.

cols_array

`INTEGER`. Array of size *group_count*. Specifies the number of columns of the input matrix *AB*. The value of each element must be at least zero.

alpha_array

`REAL` for `mkl_simatcopy_batch`.

`DOUBLE PRECISION` for `mkl_dimatcopy_batch`.

	`COMPLEX` for `mkl_cimatcopy_batch`. `DOUBLE COMPLEX` for `mkl_zimatcopy_batch`. Array of size *group_count*. Specifies the scalar *alpha*.
AB_array	`INTEGER*8` for Intel® 64 architecture. `INTEGER*4` for IA-32 architecture. Array of size *total_batch_count*, holding pointers to arrays used to store *AB* matrices.
lda_array	`INTEGER`. Array of size *group_count*. The leading dimension of the matrix input `AB`. It must be positive and at least *m* if column major layout is used or at least *n* if row major layout is used.
ldb_array	`INTEGER`. Array of size *group_count*. The leading dimension of the matrix input `AB`. It must be positive and at least *m* if column major layout is used and `op(AB) = AB` or `conjg(AB)` *n* if row major layout is used and `op(AB) = AB'` or `conjg(AB')` *n* otherwise
group_count	`INTEGER`. Specifies the number of groups. Must be at least 0
group_size	`INTEGER`. Array of size *group_count*. The element *group_size*[*i*] specifies the number of matrices in group *i*. Each element in *group_size* must be at least 0.

Output Parameters

AB_array	`INTEGER*8` for Intel® 64 architecture. `INTEGER*4` for IA-32 architecture. Output array of size *total_batch_count*, holding pointers to arrays used to store the updated *AB* matrices.

mkl_?imatcopy_batch_strided

Computes a group of in-place scaled matrix copy or transposition using general matrices.

Syntax

```
call mkl_simatcopy_batch_strided(layout, trans, row, col, alpha, ab, lda, ldb, stride, batch_size)
call mkl_dimatcopy_batch_strided(layout, trans, row, col, alpha, ab, lda, ldb, stride, batch_size)
call mkl_cimatcopy_batch_strided(layout, trans, row, col, alpha, ab, lda, ldb, stride, batch_size)
call mkl_zimatcopy_batch_strided(layout, trans, row, col, alpha, ab, lda, ldb, stride, batch_size)
```

Description

The mkl_?imatcopy_batch_strided routine performs a series of scaled matrix copy or transposition. They are similar to the mkl_?imatcopy routine counterparts, but the mkl_?imatcopy_batch_strided routine performs matrix operations with a group of matrices.

All matrices ab have the same parameters (size, transposition operation…) and are stored at constant stride from each other. The operation is defined as

```
for i = 0 … batch_size – 1
    AB is a matrix at offset i * stride in ab
    AB = alpha * op(AB)
end for
```

Input Parameters

layout

CHARACTER*1.

Specifies whether two-dimensional array storage is row-major or column-major

trans

CHARACTER*1. Specifies op(AB), the transposition operation applied to the AB matrices.

If *trans* = 'N' or 'n', op(*AB*)=*AB*.

If *trans* = 'T' or 't', op(*AB*)=*AB'*

If *trans* = 'C' or 'c', op(*AB*)=*conjg(AB')*

If *trans* = 'R' or 'r', op(*AB*)=*conjg(AB)*

row

INTEGER. Specifies the number of rows of the matrices AB. The value of *row* must be at least zero.

col

INTEGER. Specifies the number of columns of the matrices AB. The value of *col* must be at least zero.

alpha

REAL for mkl_simatcopy_batch_strided.

DOUBLE PRECISION for mkl_dimatcopy_batch_strided.

COMPLEX for mkl_cimatcopy_batch_strided.

DOUBLE COMPLEX for mkl_zimatcopy_batch_strided.

Specifies the scalar *alpha*.

ab

REAL for mkl_simatcopy_batch_strided.

DOUBLE PRECISION for mkl_dimatcopy_batch_strided.

COMPLEX for mkl_cimatcopy_batch_strided.

DOUBLE COMPLEX for mkl_zimatcopy_batch_strided.

Array holding all the input matrix AB. Must be of size at least batch_size * stride.

lda

INTEGER. The leading dimension of the matrix input AB. It must be positive and at least *row* if column major layout is used or at least *col* if row major layout is used.

ldb — INTEGER. The leading dimension of the matrix input AB. It must be positive and at least

row if column major layout is used and op(AB) = AB or conjg(AB)

row if row major layout is used and op(AB) = AB' or conjg(AB')

col otherwise

stride — INTEGER. Stride between two consecutive AB matrices, must be at least max(ldb,lda)*max(ka, kb) where

- ka is *row* if column major layout is used or *col* if row major layout is used
- kb is *col* if column major layout is used and op(AB) = AB or conjg(AB) or row major layout is used and op(AB) = AB' or conjg(AB'); kb is *row* otherwise.

batch_size — INTEGER. Number of imatcopy computations to perform and AB matrices. Must be at least 0.

Output Parameters

ab — Array holding the *batch_size* updated matrices AB.

mkl_?omatadd_batch_strided

Computes a group of out-of-place scaled matrix additions using general matrices.

Syntax

```
call mkl_somatadd_batch_strided(ordering, transa, transb, rows, cols, alpha, A, lda,
stridea, beta, B, ldb, strideb, C, ldc, stridec, batch_size);

call mkl_domatadd_batch_strided(ordering, transa, transb, rows, cols, alpha, A, lda,
stridea, beta, B, ldb, strideb, C, ldc, stridec, batch_size);

call mkl_comatadd_batch_strided(ordering, transa, transb, rows, cols, alpha, A, lda,
stridea, beta, B, ldb, strideb, C, ldc, stridec, batch_size);

call mkl_zomatadd_batch_strided(ordering, transa, transb, rows, cols, alpha, A, lda,
stridea, beta, B, ldb, strideb, C, ldc, stridec, batch_size);
```

Description

The mkl_omatadd_batch_strided routines perform a series of scaled matrix additions. They are similar to the mkl_omatadd routines, but the mkl_omatadd_batch_strided routines perform matrix operations with a group of matrices.

The matrices A, B, and C are stored at a constant stride from each other in memory, given by the parameters stridea, strideb, and stridec. The operation is defined as:

```
for i = 0 … batch_size – 1
    A is a matrix at offset i * stridea in the array a
    B is a matrix at offset i * strideb in the array b
    C is a matrix at offset i * stridec in the array c
    C = alpha * op(A) + beta * op(B)
end for
```

where:

- op(X) is one of op(X) = X, op(X) = X', op(X) = conjg(X) or op(X) = conjg(X').
- alpha and beta are scalars.
- A, B, and C are matrices.

The input arrays a and b contain all the input matrices, and the single output array c contains all the output matrices. The locations of the individual matrices within the array are given by stride lengths, while the number of matrices is given by the batch_size parameter.

Input Parameters

layout	**CHARACTER*** Specifies whether two-dimensional array storage is row-major or column-major.
transa	**CHARACTER*** Specifies op(A), the transposition operation applied to the matrices A. 'N' or 'n' indicates no operation, 'T' or 't' is transposition, 'R' or 'r' is complex conjugation wtihout tranpsosition, and 'C' or 'c' is conjugate transposition.
transb	**CHARACTER*** Specifies op(B), the transposition operation applied to the matrices B.
rows	**INTEGER** Number of rows for the result matrix C. Must be at least zero.
cols	**INTEGER** Number of columns for the result matrix C. Must be at least zero.
alpha	**REAL** for mkl_somatadd_batch_strided, *DOUBLE PRECISION* for mkl_domatadd_batch_strided, **COMPLEX** for mkl_comatadd_batch_strided, *DOUBLE COMPLEX* for mkl_zomatadd_batch_strided. Scaling factor for the matrices A.
a	**REAL** for mkl_somatadd_batch_strided, *DOUBLE PRECISION* for mkl_domatadd_batch_strided, **COMPLEX** for mkl_comatadd_batch_strided, *DOUBLE COMPLEX* for mkl_zomatadd_batch_strided. Array holding the input matrices A. Must have size at least stride_a*batch_size.
lda	**INTEGER** Leading dimension of the A matrices. If matrices are stored using column major layout, lda must be at least rows if A is not transposed or cols if A is transposed. If matrices are stored using row major layout, lda must be at least cols if A is not transposed or at least rows if A is transposed. Must be positive.
stride_a	**INTEGER** Stride between the different A matrices. If matrices are stored using column major layout, stride_a must be at least lda*rows if A is not transposed or at least lda*cols if A is transposed. If matrices are stored using row major layout, stride_a must be at least lda*rows if B is not transposed or at least lda*cols if A is transposed.
beta	**REAL** for mkl_somatadd_batch_strided, *DOUBLE PRECISION* for mkl_domatadd_batch_strided, **COMPLEX** for mkl_comatadd_batch_strided, *DOUBLE COMPLEX* for mkl_zomatadd_batch_strided. Scaling factor for the matrices B.
b	**REAL** for mkl_somatadd_batch_strided, *DOUBLE PRECISION* for mkl_domatadd_batch_strided, **COMPLEX** for mkl_comatadd_batch_strided, *DOUBLE COMPLEX* for mkl_zomatadd_batch_strided. Array holding the input matrices B. Must have size at least stride_b*batch_size.

ldb	**INTEGER** Leading dimension of the B matrices. If matrices are stored using column major layout, `ldb` must be at least `rows` if B is not transposed or `cols` if B is transposed. If matrices are stored using row major layout, `ldb` must be at least `cols` if B is not transposed or at least `rows` if B is transposed. Must be positive.
stride_b	**INTEGER** Stride between the different B matrices. If matrices are stored using column major layout, `stride_b` must be at least `ldb*cols` if B is not transposed or at least `ldb*rows` if B is transposed. If matrices are stored using row major layout, `stride_b` must be at least `ldb*rows` if B is not transposed or at least `ldb*cols` if B is transposed.
c	**REAL** for `mkl_somatadd_batch_strided`, *DOUBLE PRECISION* for `mkl_domatadd_batch_strided`, **COMPLEX** for `mkl_comatadd_batch_strided`, *DOUBLE COMPLEX* for `mkl_zomatadd_batch_strided`. Output array, overwritten by `batch_size` matrix addition operations of the form `alpha*op(A) + beta*op(B)`. Must have size at least `stride_c*batch_size`.
ldc	**INTEGER** Leading dimension of the A matrices. If matrices are stored using column major layout, `lda` must be at least `rows`. If matrices are stored using row major layout, `lda` must be at least `cols`. Must be positive.
stride_c	**INTEGER** Stride between the different C matrices. If matrices are stored using column major layout, `stride_c` must be at least `ldc*cols`. If matrices are stored using row major layout, `stride_c` must be at least `ldc*rows`.
batch_size	**INTEGER** Specifies the number of input and output matrices to add.

Output Parameters

c	Array holding the updated matrices `C`.

mkl_?omatcopy

Performs scaling and out-place transposition/copying of matrices.

Syntax

```
call mkl_somatcopy(ordering, trans, rows, cols, alpha, a, lda, b, ldb)
call mkl_domatcopy(ordering, trans, rows, cols, alpha, a, lda, b, ldb)
call mkl_comatcopy(ordering, trans, rows, cols, alpha, a, lda, b, ldb)
call mkl_zomatcopy(ordering, trans, rows, cols, alpha, a, lda, b, ldb)
```

Include Files

- `mkl.fi`

Description

The `mkl_?omatcopy` routine performs scaling and out-of-place transposition/copying of matrices. A transposition operation can be a normal matrix copy, a transposition, a conjugate transposition, or just a conjugation. The operation is defined as follows:

B := *alpha**op(*A*)

The routine parameter descriptions are common for all implemented interfaces with the exception of data types that mostly refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

NOTE
Different arrays must not overlap.

Input Parameters

ordering — CHARACTER*1. Ordering of the matrix storage.

If *ordering* = 'R' or 'r', the ordering is row-major.

If *ordering* = 'C' or 'c', the ordering is column-major.

trans — CHARACTER*1. Parameter that specifies the operation type.

If *trans* = 'N' or 'n', op(*A*)=*A* and the matrix *A* is assumed unchanged on input.

If *trans* = 'T' or 't', it is assumed that *A* should be transposed.

If *trans* = 'C' or 'c', it is assumed that *A* should be conjugate transposed.

If *trans* = 'R' or 'r', it is assumed that *A* should be only conjugated.

If the data is real, then *trans* = 'R' is the same as *trans* = 'N', and *trans* = 'C' is the same as *trans* = 'T'.

rows — INTEGER. The number of rows in matrix *A* (the input matrix).

cols — INTEGER. The number of columns in matrix *A* (the input matrix).

alpha — REAL for mkl_somatcopy.

DOUBLE PRECISION for mkl_domatcopy.

COMPLEX for mkl_comatcopy.

DOUBLE COMPLEX for mkl_zomatcopy.

This parameter scales the input matrix by *alpha*.

a — REAL for mkl_somatcopy.

DOUBLE PRECISION for mkl_domatcopy.

COMPLEX for mkl_comatcopy.

DOUBLE COMPLEX for mkl_zomatcopy.

Input array.

If *ordering* = 'R' or 'r', the size of *a* is *lda***rows*.

If *ordering* = 'C' or 'c', the size of *a* is *lda***cols*.

lda — INTEGER. (Fortran interface).

If *ordering* = 'R' or 'r', *lda* represents the number of elements in array *a* between adjacent rows of matrix *A*; *lda* must be at least equal to the number of columns of matrix *A*.

If *ordering* = 'C' or 'c', *lda* represents the number of elements in array *a* between adjacent columns of matrix *A*; *lda* must be at least equal to the number of row in matrix *A*.

b

REAL for mkl_somatcopy.

DOUBLE PRECISION for mkl_domatcopy.

COMPLEX for mkl_comatcopy.

DOUBLE COMPLEX for mkl_zomatcopy.

Output array.

If *ordering* = 'R' or 'r';

- If *trans* = 'T' or 't' or 'C' or 'c', the size of *b* is *ldb* * *cols*.
- If *trans* = 'N' or 'n' or 'R' or 'r', the size of *b* is *ldb* * *rows*.

If *ordering* = 'C' or 'c';

- If *trans* = 'T' or 't' or 'C' or 'c', the size of *b* is *ldb* * *rows*.
- If *trans* = 'N' or 'n' or 'R' or 'r', the size of *b* is *ldb* * *cols*.

ldb

INTEGER. (Fortran interface).

If *ordering* = 'R' or 'r', *ldb* represents the number of elements in array *b* between adjacent rows of matrix *B*.

- If *trans* = 'T' or 't' or 'C' or 'c', *ldb* must be at least equal to *rows*.
- If *trans* = 'N' or 'n' or 'R' or 'r', *ldb* must be at least equal to *cols*.

If *ordering* = 'C' or 'c', *ldb* represents the number of elements in array *b* between adjacent columns of matrix *B*.

- If *trans* = 'T' or 't' or 'C' or 'c', *ldb* must be at least equal to *cols*.
- If *trans* = 'N' or 'n' or 'R' or 'r', *ldb* must be at least equal to *rows*.

Output Parameters

b

REAL for mkl_somatcopy.

DOUBLE PRECISION for mkl_domatcopy.

COMPLEX for mkl_comatcopy.

DOUBLE COMPLEX for mkl_zomatcopy.

Output array.

Contains the destination matrix.

Interfaces

FORTRAN 77:

```

```

```
SUBROUTINE mkl_zomatcopy ( ordering, trans, rows, cols, alpha, a, lda, b, ldb )
   CHARACTER*1 ordering, trans
   INTEGER rows, cols, lda, ldb
   DOUBLE COMPLEX alpha, b(ldb,*), a(lda,*)
```

mkl_?omatcopy_batch

Computes a group of out of place scaled matrix copy or transposition operations on general matrices.

Syntax

`call mkl_somatcopy_batch(`*layout*`, `*trans_array*`, `*rows_array*`, `*cols_array*`, `*alpha_array*`, `*A_array*`, `*lda_array*`, `*B_array*`, `*ldb_array*`, `*group_count*`, `*group_size*`)`

`call mkl_domatcopy_batch(`*layout*`, `*trans_array*`, `*rows_array*`, `*cols_array*`, `*alpha_array*`, `*A_array*`, `*lda_array*`, `*B_array*`, `*ldb_array*`, `*group_count*`, `*group_size*`)`

`call mkl_comatcopy_batch(`*layout*`, `*trans_array*`, `*rows_array*`, `*cols_array*`, `*alpha_array*`, `*A_array*`, `*lda_array*`, `*B_array*`, `*ldb_array*`, `*group_count*`, `*group_size*`)`

`call mkl_zomatcopy_batch(`*layout*`, `*trans_array*`, `*rows_array*`, `*cols_array*`, `*alpha_array*`, `*A_array*`, `*lda_array*`, `*B_array*`, `*ldb_array*`, `*group_count*`, `*group_size*`)`

Description

The `mkl_?omatcopy_batch` routine performs a series of out-of-place scaled matrix copies or transpositions. They are similar to the `mkl_?omatcopy` routine counterparts, but the `mkl_?omatcopy_batch` routine performs matrix operations with groups of matrices. Each group has the same parameters (matrix size, leading dimension, and scaling parameter), but a single call to `mkl_?omatcopy_batch` operates on multiple groups, and each group can have different parameters, unlike the related `mkl_?omatcopy_batch_strided` routines.

The operation is defined as

```
idx = 0
for i = 0..group_count - 1
     m in rows_array[i], n in cols_array[i], and alpha in alpha_array[i]
     for j = 0..group_size[i] - 1
          A and B matrices in a_array[idx] and b_array[idx], respectively
          B := alpha*op(A)
```

```
          idx = idx + 1
      end for
end for
```

Where op(*X*) is one of op(*X*)=*X*, op(*X*)=*X*', op(*X*)=conjg(*X*'), or op(*X*)=conjg(*X*). *A* is a *m*-by-*n* matrix such that *m* and *n* are elements of *rows_array* and *cols_array*.

A and *B* represent matrices stored at addresses pointed to by *A_array* and *B_array*. The number of entries in *A_array* and *B_array* is *total_batch_count* = the sum of all of the *group_size* entries.

Input Parameters

layout

CHARACTER*1.

Specifies whether two-dimensional array storage is row-major (R) or column-major (C).

trans_array

CHARACTER*1.

Array of size *group_count*. For the group *i*, *trans* = *trans_array*[*i*] specifies the form of op(*A*), the transposition operation applied to the *A* matrix:

If *trans* = 'N' or 'n', op(*A*)=*A*.

If *trans* = 'T' or 't', op(*A*)=*A*'

If *trans* = 'C' or 'c', op(*A*)=*conjg(A')*

If *trans* = 'R' or 'r', op(*A*)=*conjg(A)*

rows_array

INTEGER. Array of size *group_count*. Specifies the number of rows of the matrix *A*. The value of each element must be at least zero.

cols_array

INTEGER. Array of size *group_count*. Specifies the number of columns of the matrix *A*. The value of each element must be at least zero.

alpha_array

REAL for mkl_somatcopy_batch.

DOUBLE PRECISION for mkl_domatcopy_batch.

COMPLEX for mkl_comatcopy_batch.

DOUBLE COMPLEX for mkl_zomatcopy_batch.

Array of size *group_count*. Specifies the scalar *alpha*.

A_array

INTEGER*8 for Intel® 64 architecture.

INTEGER*4 for IA-32 architecture.

Array of size *total_batch_count*, holding pointers to arrays used to store *A* input matrices.

lda_array

INTEGER. Array of size *group_count*. The leading dimension of the input matrix A. It must be positive and at least *m* if column major layout is used or at least *n* if row major layout is used.

ldb_array

INTEGER. Array of size *group_count*. The leading dimension of the output matrix B. It must be positive and at least

m if column major layout is used and op(A) = A or conjg(A)

n if row major layout is used and op(A) = A' or conjg(A')

	n otherwise
group_count	INTEGER. Specifies the number of groups. Must be at least 0
group_size	INTEGER. Array of size *group_count*. The element *group_size*[*i*] specifies the number of matrices in group *i*. Each element in *group_size* must be at least 0.

Output Parameters

B_array	INTEGER*8 for Intel® 64 architecture. INTEGER*4 for IA-32 architecture. Output array of size *total_batch_count*, holding pointers to arrays used to store the *B* output matrices, the contents of which are overwritten by the operation of the form alpha*op(*A*).

mkl_?omatcopy_batch_strided

Computes a group of out of place scaled matrix copy or transposition using general matrices.

Syntax

```
call mkl_somatcopy_batch_strided(layout, trans, row, col, alpha, a, lda, stridea, b, ldb, strideb, batch_size)
call mkl_domatcopy_batch_strided(layout, trans, row, col, alpha, a, lda, stridea, b, ldb, strideb, batch_size)
call mkl_comatcopy_batch_strided(layout, trans, row, col, alpha, a, lda, stridea, b, ldb, strideb, batch_size)
call mkl_zomatcopy_batch_strided(layout, trans, row, col, alpha, a, lda, stridea, b, ldb, strideb, batch_size)
```

Description

The mkl_?omatcopy_batch_strided routine performs a series of out-of-place scaled matrix copy or transposition. They are similar to the mkl_?omatcopy routine counterparts, but the mkl_?omatcopy_batch_strided routine performs matrix operations with group of matrices.

All matrices a and b have the same parameters (size, transposition operation…) and are stored at constant stride from each other respectively given by *stridea* and *strideb*. The operation is defined as

```
for i = 0 … batch_size – 1
    A and B are matrices at offset i * stridea in a and I * strideb in b
    B = alpha * op(A)
end for
```

Input Parameters

layout	CHARACTER*1. Specifies whether two-dimensional array storage is row-major or column-major .
trans	CHARACTER*1. Specifies op(A), the transposition operation applied to the AB matrices. If *trans* = 'N' or 'n', op(*A*)=*A*.

If *trans* = 'T' or 't', op(*A*)=*A'*

If *trans* = 'C' or 'c', op(*A*)=*conig(A')*

If *trans* = 'R' or 'r', op(*A*)=*conig(A)*

row — INTEGER. Specifies the number of rows of the matrices A and B. The value of *row* must be at least zero.

col — INTEGER. Specifies the number of columns of the matrices A and B. The value of *col* must be at least zero.

alpha — REAL for mkl_somatcopy_batch_strided.

DOUBLE PRECISION for mkl_domatcopy_batch_strided.

COMPLEX for mkl_comatcopy_batch_strided.

DOUBLE COMPLEX for mkl_zomatcopy_batch_strided.

Specifies the scalar *alpha*.

a — REAL for mkl_somatcopy_batch_strided.

DOUBLE PRECISION for mkl_domatcopy_batch_strided.

COMPLEX for mkl_comatcopy_batch_strided.

DOUBLE COMPLEX for mkl_zomatcopy_batch_strided.

Array holding all the input matrices A. Must be of size at least lda * k + stridea * (batch_size - 1) * stridea where k is *col* if column major is used and *row* otherwise.

lda — INTEGER.

The leading dimension of the matrix input A. It must be positive and at least *row* if column major layout is used or at least *col* if row major layout is used.

stridea — INTEGER. Stride between two consecutive A matrices, must be at least 0.

b — REAL for mkl_somatcopy_batch_strided.

DOUBLE PRECISION for mkl_domatcopy_batch_strided.

COMPLEX for mkl_comatcopy_batch_strided.

DOUBLE COMPLEX for mkl_zomatcopy_batch_strided.

Array holding all the output matrices B. Must be of size at least batch_size * strideb. The b array must be independent from the a array.

ldb — INTEGER.

The leading dimension of the output matrix B. It must be positive and at least:

- *row* if column major layout is used and op(A) = A or conjg(A)
- *row* if row major layout is used and op(A) = A' or conjg(A')
- *col* otherwise

strideb — INTEGER.

Stride between two consecutive B matrices. It must be positive and at least:

- *ldb** *col* if column major layout is used and op(A) = A or conjg(A)
- *ldb** *col* if row major layout is used and op(A) = A' or conjg(A')
- *ldb***row* otherwise

batch_size

Output Parameters

b Array holding the batch_size updated matrices B.

mkl_?omatcopy2

Performs two-strided scaling and out-of-place transposition/copying of matrices.

Syntax

call mkl_somatcopy2(*ordering*, *trans*, *rows*, *cols*, *alpha*, *a*, *lda*, *stridea*, *b*, *ldb*, *strideb*)

call mkl_domatcopy2(*ordering*, *trans*, *rows*, *cols*, *alpha*, *a*, *lda*, *stridea*, *b*, *ldb*, *strideb*)

call mkl_comatcopy2(*ordering*, *trans*, *rows*, *cols*, *alpha*, *a*, *lda*, *stridea*, *b*, *ldb*, *strideb*)

call mkl_zomatcopy2(*ordering*, *trans*, *rows*, *cols*, *alpha*, *a*, *lda*, *stridea*, *b*, *ldb*, *strideb*)

Include Files

- mkl.fi

Description

The mkl_?omatcopy2 routine performs two-strided scaling and out-of-place transposition/copying of matrices. A transposition operation can be a normal matrix copy, a transposition, a conjugate transposition, or just a conjugation. The operation is defined as follows:

B := *alpha**op(*A*)

Normally, matrices in the BLAS or LAPACK are specified by a single stride index. For instance, in the column-major order, *A*(2,1) is stored in memory one element away from *A*(1,1), but *A*(1,2) is a leading dimension away. The leading dimension in this case is at least the number of rows of the source matrix. If a matrix has two strides, then both *A*(2,1) and *A*(1,2) may be an arbitrary distance from *A*(1,1).

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

NOTE
Different arrays must not overlap.

Input Parameters

ordering

CHARACTER*1. Ordering of the matrix storage.

If *ordering* = 'R' or 'r', the ordering is row-major.

If *ordering* = 'C' or 'c', the ordering is column-major.

trans

CHARACTER*1. Parameter that specifies the operation type.

If *trans* = 'N' or 'n', op(*A*)=*A* and the matrix *A* is assumed unchanged on input.

If *trans* = 'T' or 't', it is assumed that *A* should be transposed.

If *trans* = 'C' or 'c', it is assumed that *A* should be conjugate transposed.

If *trans* = 'R' or 'r', it is assumed that *A* should be only conjugated.

If the data is real, then *trans* = 'R' is the same as *trans* = 'N', and *trans* = 'C' is the same as *trans* = 'T'.

rows

INTEGER. number of rows for the input matrix *A*. Must be at least zero.

cols

INTEGER. Number of columns for the input matrix *A*. Must be at least zero.

alpha

REAL for mkl_somatcopy2.

DOUBLE PRECISION for mkl_domatcopy2.

COMPLEX for mkl_comatcopy2.

DOUBLE COMPLEX for mkl_zomatcopy2.

Scaling factor for the matrix transposition or copy.

a

REAL for mkl_somatcopy2.

DOUBLE PRECISION for mkl_domatcopy2.

COMPLEX for mkl_comatcopy2.

DOUBLE COMPLEX for mkl_zomatcopy2.

Array holding the input matrix *A*. Must have size at least *lda* * *n* for column major ordering and at least *lda* * *m* for row major ordering.

lda

INTEGER.

Leading dimension of the matrix *A*. If matrices are stored using column major layout, *lda* is the number of elements in the array between adjacent columns of the matrix and must be at least *stridea* * (*m*-1) + 1. If using row major layout, *lda* is the number of elements between adjacent rows of the matrix and must be at least *stridea* * (*n*-1) + 1.

stridea

INTEGER.

The second stride of the matrix *A*. For column major layout, *stridea* is the number of elements in the array between adjacent rows of the matrix. For row major layout *stridea* is the number of elements between adjacent columns of the matrix. In both cases *stridea* must be at least 1.

b

REAL for mkl_somatcopy2.

`DOUBLE PRECISION` for `mkl_domatcopy2`.

`COMPLEX` for `mkl_comatcopy2`.

`DOUBLE COMPLEX` for `mkl_zomatcopy2`.

Array holding the output matrix *B*.

	trans* = *transpose::nontrans	***trans* = *transpose::trans*, or *trans* = *transpose::conjtrans***
Column major	*B* is *m* x *n* matrix. Size of array *b* must be at least *ldb* * *n*.	*B* is *n* x *m* matrix. Size of array *b* must be at least *ldb* * *m*.
Row major	*B* is *m* x *n* matrix. Size of array *b* must be at least *ldb* * *m*.	*B* is *n* x *m* matrix. Size of array *b* must be at least *ldb* * *n*.

ldb

`INTEGER`.

The leading dimension of the matrix *B*. Must be positive.

	trans* = *transpose::nontrans	***trans* = *transpose::trans*, or *trans* = *transpose::conjtrans***
Column major	*ldb* must be at least *strideb* * (*m*-1) + 1.	*ldb* must be at least *strideb* * (*n*-1) + 1.
Row major	*ldb* must be at least *strideb* * (*n*-1) + 1.	*ldb* must be at least *strideb* * (*m*-1) + 1.

strideb

`INTEGER`.

The second stride of the matrix *B*. For column major layout, *strideb* is the number of elements in the array between adjacent rows of the matrix. For row major layout, *strideb* is the number of elements between adjacent columns of the matrix. In both cases *strideb* must be at least 1.

Output Parameters

b

`REAL` for `mkl_somatcopy2`.

`DOUBLE PRECISION` for `mkl_domatcopy2`.

`COMPLEX` for `mkl_comatcopy2`.

`DOUBLE COMPLEX` for `mkl_zomatcopy2`.

Array, size at least *m*.

Contains the destination matrix.

Interfaces

mkl_?omatadd

Scales and sums two matrices including in addition to performing out-of-place transposition operations.

Syntax

`call mkl_somatadd(`*`ordering, transa, transb, m, n, alpha, a, lda, beta, b, ldb, c, ldc`*`)`

`call mkl_domatadd(`*`ordering, transa, transb, m, n, alpha, a, lda, beta, b, ldb, c, ldc`*`)`

`call mkl_comatadd(`*`ordering, transa, transb, m, n, alpha, a, lda, beta, b, ldb, c, ldc`*`)`

`call mkl_zomatadd(`*`ordering, transa, transb, m, n, alpha, a, lda, beta, b, ldb, c, ldc`*`)`

Include Files

- `mkl.fi`

Description

The `mkl_?omatadd` routine scales and adds two matrices, as well as performing out-of-place transposition operations. A transposition operation can be no operation, a transposition, a conjugate transposition, or a conjugation (without transposition). The following out-of-place memory movement is done:

```
C := alpha*op(A) + beta*op(B)
```

where the `op(A)` and `op(B)` operations are transpose, conjugate-transpose, conjugate (no transpose), or no transpose, depending on the values of *`transa`* and *`transb`*. If no transposition of the source matrices is required, *`m`* is the number of rows and *`n`* is the number of columns in the source matrices *A* and *B*. In this case, the output matrix *C* is *m*-by-*n*.

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

NOTE
Note that different arrays must not overlap.

Input Parameters

ordering
CHARACTER*1. Ordering of the matrix storage.
If *ordering* = 'R' or 'r', the ordering is row-major.
If *ordering* = 'C' or 'c', the ordering is column-major.

transa
CHARACTER*1. Parameter that specifies the operation type on matrix *A*.
If *transa* = 'N' or 'n', op(*A*)=*A* and the matrix *A* is assumed unchanged on input.
If *transa* = 'T' or 't', it is assumed that *A* should be transposed.
If *transa* = 'C' or 'c', it is assumed that *A* should be conjugate transposed.
If *transa* = 'R' or 'r', it is assumed that *A* should be conjugated (and not transposed).
If the data is real, then *transa* = 'R' is the same as *transa* = 'N', and *transa* = 'C' is the same as *transa* = 'T'.

transb
CHARACTER*1. Parameter that specifies the operation type on matrix *B*.
If *transb* = 'N' or 'n', op(*B*)=*B* and the matrix *B* is assumed unchanged on input.
If *transb* = 'T' or 't', it is assumed that *B* should be transposed.
If *transb* = 'C' or 'c', it is assumed that *B* should be conjugate transposed.
If *transb* = 'R' or 'r', it is assumed that *B* should be conjugated (and not transposed).
If the data is real, then *transb* = 'R' is the same as *transb* = 'N', and *transb* = 'C' is the same as *transb* = 'T'.

m
INTEGER. The number of matrix rows in op(*A*), op(*B*), and *C*.

n
INTEGER. The number of matrix columns in op(*A*), op(*B*), and *C*.

alpha
REAL for mkl_somatadd.
DOUBLE PRECISION for mkl_domatadd.
COMPLEX for mkl_comatadd.
DOUBLE COMPLEX for mkl_zomatadd.
This parameter scales the input matrix by *alpha*.

a
REAL for mkl_somatadd.

DOUBLE PRECISION for mkl_domatadd.

COMPLEX for mkl_comatadd.

DOUBLE COMPLEX for mkl_zomatadd.

Array, size *a*(*lda*,*).

lda

INTEGER. Distance between the first elements in adjacent columns (in the case of the column-major order) or rows (in the case of the row-major order) in the source matrix *A*; measured in the number of elements.

For *ordering* = 'C' or 'c': when *transa* = 'N', 'n', 'R', or 'r', *lda* must be at least max(1,*m*); otherwise *lda* must be max(1,*n*).

For *ordering* = 'R' or 'r': when *transa* = 'N', 'n', 'R', or 'r', *lda* must be at least max(1,*n*); otherwise *lda* must be max(1,*m*).

beta

REAL for mkl_somatadd.

DOUBLE PRECISION for mkl_domatadd.

COMPLEX for mkl_comatadd.

DOUBLE COMPLEX for mkl_zomatadd.

This parameter scales the input matrix by *beta*.

b

REAL for mkl_somatadd.

DOUBLE PRECISION for mkl_domatadd.

COMPLEX for mkl_comatadd.

DOUBLE COMPLEX for mkl_zomatadd.

Array, size *b*(*ldb*,*).

ldb

INTEGER. Distance between the first elements in adjacent columns (in the case of the column-major order) or rows (in the case of the row-major order) in the source matrix *B*; measured in the number of elements.

For *ordering* = 'C' or 'c': when *transa* = 'N', 'n', 'R', or 'r', *ldb* must be at least max(1,*m*); otherwise *ldb* must be max(1,*n*).

For *ordering* = 'R' or 'r': when *transa* = 'N', 'n', 'R', or 'r', *ldb* must be at least max(1,*n*); otherwise *ldb* must be max(1,*m*).

ldc

INTEGER. Distance between the first elements in adjacent columns (in the case of the column-major order) or rows (in the case of the row-major order) in the destination matrix *C*; measured in the number of elements.

If *ordering* = 'C' or 'c', then *ldc* must be at least max(1, *m*), otherwise *ldc* must be at least max(1, *n*).

Output Parameters

c

REAL for mkl_somatadd.

DOUBLE PRECISION for mkl_domatadd.

COMPLEX for mkl_comatadd.

DOUBLE COMPLEX for mkl_zomatadd.

Array, size *c*(*ldc*,*).

Interfaces

FORTRAN 77:

```

?gemm_pack_get_size, gemm_*_pack_get_size

Returns the number of bytes required to store the packed matrix.

Syntax

`dest = sgemm_pack_get_size (identifier, m, n, k)`

`dest = dgemm_pack_get_size (identifier, m, n, k)`

`dest = gemm_s8u8s32_pack_get_size (identifier, m, n, k)`

`dest = gemm_s16s16s32_pack_get_size (identifier, m, n, k)`

Include Files

- `mkl.fi`

Description

The `?gemm_pack_get_size` and `gemm_*_pack_get_size` routines belong to a set of related routines that enable the use of an internal packed storage. Call the `?gemm_pack_get_size` and `gemm_*_pack_get_size` routines first to query the size of storage required for a packed matrix structure to be used in subsequent calls. Ultimately, the packed matrix structure is used to compute

C := *alpha**op(*A*)*op(*B*) + *beta***C* for bfloat16, half, single and double precision or

C := *alpha**(op(*A*)+ *A_offset*)*(op(*B*)+ *B_offset*) + *beta***C* + *C_offset* for integer type.

where:

op(*X*) is one of the operations op(*X*) = *X* or op(*X*) = X^T
alpha and *beta* are scalars,
A , *A_offset*,*B*, *B_offset*,*C*, and *C_offset* are matrices
op(*A*) is an *m*-by-*k* matrix,
op(*B*) is a *k*-by-*n* matrix,
C is an *m*-by-*n* matrix.
A_offset is an *m*-by-*k* matrix.
B_offset is an *k*-by-*n* matrix.
C_offset is an *m*-by-*n* matrix.

Input Parameters

Parameter	Type	Description
identifier	CHARACTER*1.	Specifies which matrix is to be packed: If *identifier* = 'A' or 'a', the size returned is the size required to store matrix *A* in an internal format. If *identifier* = 'B' or 'b', the size returned is the size required to store matrix *B* in an internal format.
m	INTEGER.	Specifies the number of rows of matrix op(*A*) and of the matrix *C*. The value of *m* must be at least zero.
n	INTEGER.	Specifies the number of columns of matrix op(*B*) and the number of columns of matrix *C*. The value of *n* must be at least zero.
k	INTEGER.	Specifies the number of columns of matrix op(*A*) and the number of rows of matrix op(*B*). The value of *k* must be at least zero.

Return Values

Parameter	Type	Description
size	INTEGER.	Returns the size (in bytes) required to store the matrix when packed into the internal format of Intel® oneAPI Math Kernel Library (oneMKL).

Example

See the following examples in the MKL installation directory to understand the use of these routines:

sgemm_pack_get_size: examples\blas\source\sgemm_computex.f

dgemm_pack_get_size: examples\blas\source\dgemm_computex.f

gemm_s8u8s32_pack_get_size: examples\blas\source\gemm_s8u8s32_computex.f

gemm_s16s16s32_pack_get_size: examples\blas\source\gemm_s16s16s32_computex.f

See Also

?gemm_pack and gemm_*_pack

to pack the matrix into a buffer allocated previously.

`?gemm_compute` and `?gemm_*_compute`
to compute a matrix-matrix product with general matrices (where one or both input matrices are stored in a packed data structure) and add the result to a scalar-matrix product.

?gemm_pack

Performs scaling and packing of the matrix into the previously allocated buffer.

Syntax

```
call sgemm_pack (identifier, trans, m, n, k, alpha, src, ld, dest)
call dgemm_pack (identifier, trans, m, n, k, alpha, src, ld, dest)
```

Include Files

- mkl.fi

Description

The `?gemm_pack` routine is one of a set of related routines that enable use of an internal packed storage. Call `?gemm_pack` after you allocate a buffer whose size is given by `?gemm_pack_get_size`. The `?gemm_pack` routine scales the identified matrix by alpha and packs it into the buffer allocated previously.

> **NOTE**
> Do not copy the packed matrix to a different address because the internal implementation depends on the alignment of internally-stored metadata.

The `?gemm_pack` routine performs this operation:

dest := *alpha**op(*src*) as part of the computation *C* := *alpha**op(*A*)*op(*B*) + *beta***C*

where:

op(*X*) is one of the operations op(*X*) = *X*, op(*X*) = X^T, or op(*X*) = X^H,
alpha and *beta* are scalars,
src is a matrix,
A , *B*, and *C* are matrices
op(*src*) is an *m*-by-*k* matrix if *identifier* = 'A' or 'a',
op(*src*) is a *k*-by-*n* matrix if *identifier* = 'B' or 'b',
dest is an internal packed storage buffer.

> **NOTE**
> For best performance, use the same number of threads for packing and for computing.
>
> If packing for both *A* and *B* matrices, you must use the same number of threads for packing *A* as for packing *B*.

Input Parameters

identifier — CHARACTER*1. Specifies which matrix is to be packed:

If *identifier* = 'A' or 'a', the routine allocates storage to pack matrix *A*.

If *identifier* = 'B' or 'b', the routine allocates storage to pack matrix *B*.

trans

CHARACTER*1. Specifies the form of op(*src*) used in the packing:

If *trans* = 'N' or 'n' op(*src*) = *src*.

If *trans* = 'T' or 't' op(*src*) = src^T.

If *trans* = 'C' or 'c' op(*src*) = src^H.

m

INTEGER. Specifies the number of rows of the matrix op(*A*) and of the matrix *C*. The value of *m* must be at least zero.

n

INTEGER. Specifies the number of columns of the matrix op(*B*) and the number of columns of the matrix *C*. The value of *n* must be at least zero.

k

INTEGER. Specifies the number of columns of the matrix op(*A*) and the number of rows of the matrix op(*B*). The value of *k* must be at least zero.

alpha

REAL for sgemm_pack

DOUBLE PRECISION for dgemm_pack

Specifies the scalar *alpha*.

src

REAL for sgemm_pack

DOUBLE PRECISION for dgemm_pack

Array:

	trans = 'N' or 'n'	*trans* = 'T', 't', 'C', or 'c'
identifier = 'A' or 'a'	Size *ld***k*. Before entry, the leading *m*-by-*k* part of the array *src* must contain the matrix *A*.	Size *ld***m*. Before entry, the leading *k*-by-*m* part of the array *src* must contain the matrix *A*.
identifier = 'B' or 'b'	Size *ld***n*. Before entry, the leading *k*-by-*n* part of the array *src* must contain the matrix *B*.	Size *ld***k*. Before entry, the leading *n*-by-*k* part of the array *src* must contain the matrix *B*.

ld

INTEGER. Specifies the leading dimension of *src* as declared in the calling (sub)program.

	trans = 'N' or 'n'	*trans* = 'T', 't', 'C', or 'c'
identifier = 'A' or 'a'	*ld* must be at least max(1, *m*).	*ld* must be at least max(1, *k*).

identifier = 'B' or 'b'	*ld* must be at least max(1, *k*).	*ld* must be at least max(1, *n*).

dest POINTER.

Scaled and packed internal storage buffer.

Output Parameters

dest Overwritten by the matrix *alpha**op(*src*).

See Also

?gemm_pack_get_size Returns the number of bytes required to store the packed matrix.

?gemm_compute Computes a matrix-matrix product with general matrices where one or both input matrices are stored in a packed data structure and adds the result to a scalar-matrix product.

?gemm
for a detailed description of general matrix multiplication.

gemm_*_pack

Pack the matrix into the buffer allocated previously.

Syntax

```
call gemm_s8u8s32_pack (identifier, trans, m, n, k, src, ld, dest)
call gemm_s16s16s32_pack (identifier, trans, m, n, k, src, ld, dest)
```

Include Files

- mkl.fi

Description

The gemm_*_pack routine is one of a set of related routines that enable the use of an internal packed storage. Call gemm_*_pack after you allocate a buffer whose size is given by gemm_*_pack_get_size. The gemm_*_pack routine packs the identified matrix into the buffer allocated previously.

The gemm_*_pack routine performs this operation:

dest := op(*src*) as part of the computation *C* := *alpha**(op(*A*) + *A_offset*)*(op(*B*) + *B_offset*) + *beta***C* + *C_offset* for integer types.

C := *alpha**op(*A*) * op(*B*) + *beta***C* for bfloat16 type.

where:

op(*X*) is one of the operations op(*X*) = *X* or op(*X*) = X^T
alpha and *beta* are scalars,
src is a matrix,
A , *A_offset*,*B*, *B_offset*,*c*,and *C_offset* are matrices
op(*src*) is an *m*-by-*k* matrix if *identifier* = 'A' or 'a',
op(*src*) is a *k*-by-*n* matrix if *identifier* = 'B' or 'b',
dest is the buffer previously allocated to store the matrix packed into an internal format
A_offset is an *m*-by-*k* matrix.
B_offset is an *k*-by-*n* matrix.

C_offset is an *m*-by-*n* matrix.

NOTE
For best performance, use the same number of threads for packing and for computing.

If packing for both *A* and *B* matrices, you must use the same number of threads for packing *A* as for packing *B*.

Input Parameters

identifier

CHARACTER*1.

Specifies which matrix is to be packed:

If *identifier* = 'A' or 'a', the *A* matrix is packed.

If *identifier* = 'B' or 'b', the *B* matrix is packed.

trans

CHARACTER*1.

Specifies the form of op(*src*) used in the packing:

If *trans* = 'N' or 'n' op(*src*) = *src*.

If *trans* = 'T' or 't' op(*src*) = src^T.

m

INTEGER.

Specifies the number of rows of matrix op(*A*) and of the matrix *C*. The value of *m* must be at least zero.

n

INTEGER.

Specifies the number of columns of matrix op(*B*) and the number of columns of matrix *C*. The value of *n* must be at least zero.

k

INTEGER.

Specifies the number of columns of matrix op(*A*) and the number of rows of matrix op(*B*). The value of *k* must be at least zero.

src

INTEGER*1 for gemm_s8u8s32_pack and INTEGER*2 for gemm_s16s16s32_pack

	trans = 'N' or 'n'	*trans* = 'T' or 't'
identifier = 'A' or 'a'	Size *ld*k*. Before entry, the leading *m*-by-*k* part of the array *src* must contain the matrix *A*.	Size *ld*m*. Before entry, the leading *k*-by-*m* part of the array *src* must contain the matrix *A*.
identifier = 'B' or 'b'	Size *ld*n*. Before entry, the leading *k*-by-*n* part of the array *src* must contain the matrix *B*.	Size *ld*k*. Before entry, the leading *n*-by-*k* part of the array *src* must contain the matrix *B*.

ld

INTEGER. Specifies the leading dimension of *src* as declared in the calling (sub)program.

	trans = 'N' or 'n'	*trans* = 'T' or 't'
identifier = 'A' or 'a'	*ld* must be at least max(1, *m*).	*ld* must be at least max(1, *k*).
identifier = 'B' or 'b'	*ld* must be at least max(1, *k*).	*ld* must be at least max(1, *n*).

dest INTEGER*1 for gemm_s8u8s32_pack or INTEGER*2 for gemm_s16s16s32_pack
Buffer for the packed matrix.

Output Parameters

dest INTEGER*1 for gemm_s8u8s32_pack or INTEGER*2 for gemm_s16s16s32_pack
Overwritten by the matrix op(*src*) stored in a format internal to Intel® oneAPI Math Kernel Library (oneMKL).

Example

See the following examples in the MKL installation directory to understand the use of these routines:

gemm_s8u8s32_pack: examples\blas\source\gemm_s8u8s32_computex.f

gemm_s16s16s32_pack: examples\blas\source\gemm_s16s16s32_computex.f

Application Notes

See Also

gemm_*_pack_get_size
to return the number of bytes needed to store the packed matrix.

gemm_*_compute
to compute a matrix-matrix product with general integer matrices (where one or both input matrices are stored in a packed data structure) and add the result to a scalar-matrix product.

?gemm_compute

Computes a matrix-matrix product with general matrices where one or both input matrices are stored in a packed data structure and adds the result to a scalar-matrix product.

Syntax

```
call sgemm_compute (transa, transb, m, n, k, a, lda, b, ldb, beta, C, ldc)
call dgemm_compute (transa, transb, m, n, k, a, lda, b, ldb, beta, C, ldc)
```

Include Files

- mkl.fi

Description

The ?gemm_compute routine is one of a set of related routines that enable use of an internal packed storage. After calling ?gemm_pack call ?gemm_compute to compute

C := op(*A*)*op(*B*) + *beta**C*,

where:

op(*X*) is one of the operations op(*X*) = *X*, op(*X*) = X^T, or op(*X*) = X^H,
beta is a scalar,
A , *B*, and *C* are matrices:
op(*A*) is an *m*-by-*k* matrix,
op(*B*) is a *k*-by-*n* matrix,
C is an *m*-by-*n* matrix.

NOTE
For best performance, use the same number of threads for packing and for computing.

If packing for both *A* and *B* matrices, you must use the same number of threads for packing *A* as for packing *B*.

Input Parameters

transa

CHARACTER*1. Specifies the form of op(*A*) used in the matrix multiplication:

If *transa* = 'N' or 'n' op(*A*) = *A*.

If *transa* = 'T' or 't' op(*A*) = A^T.

If *transa* = 'C' or 'c' op(*A*) = A^H.

If *transa* = 'P' or 'p' the matrix in array *a* is packed and *lda* is ignored.

transb

CHARACTER*1. Specifies the form of op(*B*) used in the matrix multiplication:

If *transb* = 'N' or 'n' op(*B*) = *B*.

If *transb* = 'T' or 't' op(*B*) = B^T.

If *transb* = 'C' or 'c' op(*B*) = B^H.

If *transb* = 'P' or 'p' the matrix in array *b* is packed and *ldb* is ignored.

m

INTEGER. Specifies the number of rows of the matrix op(*A*) and of the matrix *C*. The value of *m* must be at least zero.

n

INTEGER. Specifies the number of columns of the matrix op(*B*) and the number of columns of the matrix *C*. The value of *n* must be at least zero.

k

INTEGER. Specifies the number of columns of the matrix op(*A*) and the number of rows of the matrix op(*B*). The value of *k* must be at least zero.

a

REAL for sgemm_compute

DOUBLE PRECISION for dgemm_compute

Array:

transa = 'N' or 'n'	*transa* = 'T', 't', 'C', or 'c'	*transa* = 'P' or 'p'

Size *lda*k*. Before entry, the leading *m*-by-*k* part of the array *a* must contain the matrix *A*.	Size *lda*m*. Before entry, the leading *k*-by-*m* part of the array *a* must contain the matrix *A*.	Stored in internal packed format.

lda INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program.

If *transa* = 'N' or 'n', *lda* must be at least max (1, *m*).

If *transa* = 'T', 't', 'C', or 'c', *lda* must be at least max (1, *k*).

If *transa* = 'P' or 'p', *lda* is ignored.

b REAL for sgemm_compute

DOUBLE PRECISION for dgemm_compute

Array:

transb = 'N' or 'n'	*transb* = 'T', 't', 'C', or 'c'	*transb* = 'P' or 'p'
Size *ldb*n*. Before entry, the leading *k*-by-*n* part of the array *b* must contain the matrix *B*.	Size *ldb*k*. Before entry, the leading *n*-by-*k* part of the array *b* must contain the matrix *B*.	Stored in internal packed format.

ldb INTEGER. Specifies the leading dimension of *b* as declared in the calling (sub)program.

If *transb* = 'N' or 'n', *ldb* must be at least max (1, *k*).

If *transb* = 'T', 't', 'C', or 'c', *ldb* must be at least max (1, *n*).

If *transb* = 'P' or 'p', *ldb* is ignored.

beta REAL for sgemm_compute

DOUBLE PRECISION for dgemm_compute

Specifies the scalar *beta*. When *beta* is equal to zero, then *c* need not be set on input.

c REAL for sgemm_compute

DOUBLE PRECISION for dgemm_compute

Array, size *ldc* by *n*. Before entry, the leading *m*-by-*n* part of the array *c* must contain the matrix *C*, except when *beta* is equal to zero, in which case *c* need not be set on entry.

ldc INTEGER. Specifies the leading dimension of *c* as declared in the calling (sub)program.

The value of *ldc* must be at least max (1, *m*).

Output Parameters

c	Overwritten by the *m*-by-*n* matrix op(*A*)*op(*B*) + *beta**C*.

See Also

?gemm_pack_get_size Returns the number of bytes required to store the packed matrix.

?gemm_pack Performs scaling and packing of the matrix into the previously allocated buffer.

?gemm
for a detailed description of general matrix multiplication.

gemm_*_compute

Computes a matrix-matrix product with general integer matrices (where one or both input matrices are stored in a packed data structure) and adds the result to a scalar-matrix product.

Syntax

```
call gemm_s8u8s32_compute (transa, transb, offsetc, m, n, k, alpha, a, lda, oa, b, ldb, ob, beta, c, ldc, oc)
```

```
call gemm_s16s16s32_compute (transa, transb, offsetc, m, n, k, alpha, a, lda, oa, b, ldb, ob, beta, c, ldc, oc)
```

Include Files

- mkl.fi

Description

The gemm_*_compute routine is one of a set of related routines that enable use of an internal packed storage. After calling gemm_*_pack call gemm_*_compute to compute

C := *alpha**(op(*A*) + *A_offset*)*(op(*B*) + *B_offset*) + *beta**C* + *C_offset*,

where:

op(*X*) is either op(*X*) = *X* or op(*X*) = X^T

alpha and *beta*are scalars

A , *B*, and *C* are matrices:

op(*A*) is an *m*-by-*k* matrix,

op(*B*) is a *k*-by-*n* matrix,

C is an *m*-by-*n* matrix.

A_offset is an *m*-by-*k* matrix with every element equal to the value oa.

B_offset is an *k*-by-*n* matrix with every element equal to the value ob.

C_offset is an *m*-by-*n* matrix defined by the oc array as described in the description of the *offsetc* parameter.

NOTE

For best performance, use the same number of threads for packing and for computing.

If you are packing for both *A* and *B* matrices, you must use the same number of threads for packing *A* as for packing *B*.

Input Parameters

transa CHARACTER*1. Specifies the form of op(*A*) used in the packing:

If *transa* = 'N' or 'n' op(*A*) = *A*.

If *transa* = 'T' or 't' op(*A*) = A^T.

If *transa* = 'P' or 'p' the matrix in array *a* is packed into a format internal to Intel® oneAPI Math Kernel Library (oneMKL) and *lda* is ignored.

transb CHARACTER*1. Specifies the form of op(*B*) used in the packing:

If *transb* = 'N' or 'n' op(*B*) = *B*.

If *transb* = 'T' or 't' op(*B*) = B^T.

If *transb* = 'P' or 'p' the matrix in array *b* is packed into a format internal to Intel® oneAPI Math Kernel Library (oneMKL) and *ldb* is ignored.

offsetc CHARACTER*1. Specifies the form of *C_offset* used in the matrix multiplication.

If *offsetc*='F' or 'f' :oc has a single element and every element of *C_offset* is equal to this element.

If *offsetc*='C' or 'c' :oc has a size of *m* and every element of *C_offset* is equal to oc.

If *offsetc*='R' or 'r' :oc has a size of *n* and every element of *C_offset* is equal to oc.

m INTEGER. Specifies the number of rows of the matrix op(*A*) and of the matrix *C*. The value of *m* must be at least zero.

n INTEGER. Specifies the number of columns of the matrix op(*B*) and the number of columns of the matrix *C*. The value of *n* must be at least zero.

k INTEGER. Specifies the number of columns of the matrix op(*A*) and the number of rows of the matrix op(*B*). The value of *k* must be at least zero.

alpha REAL. Specifies the scalar *alpha*.

a INTEGER*1 for gemm_s8u8s32_compute

INTEGER*2 for gemm_s16s16s32_compute

transa = 'N' or 'n'	*transa* = 'T', 't'	*transa* = 'P' or 'p'
Array, size *lda***k*. Before entry, the leading *m*-by-*k* part of the array *a* must contain the matrix *A*.	Array, size *lda***m*. Before entry, the leading *k*-by-*m* part of the array *a* must contain the matrix *A*.	Array of size returned by gemm_*_pack_get_size and initialized using gemm_*_pack

lda INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program.

If *transa* = 'N' or 'n', *lda* must be at least max (1, *m*).

If *transa* = 'T', 't', *lda* must be at least max (1, *k*).

oa

INTEGER*1 for gemm_s8u8s32_compute

INTEGER*2 for gemm_s16s16s32_compute

Specifies the scalar offset value for the matrix *A*.

b INTEGER*1 for `gemm_s8u8s32_compute`

INTEGER*2 for `gemm_s16s16s32_compute`

transb = 'N' or 'n'	*transb* = 'T', 't'	*transb* = 'P' or 'p'
Array, size *ldb***n*. Before entry, the leading *k*-by-*n* part of the array *b* must contain the matrix *B*.	Array, size *ldb***k*. Before entry, the leading *n*-by-*k* part of the array *b* must contain the matrix *B*.	Array of size returned by `gemm_*_pack_get_size` and initialized using `gemm_*_pack`

ldb INTEGER. Specifies the leading dimension of *b* as declared in the calling (sub)program.

If *transb* = 'N' or 'n', *ldb* must be at least `max (1, k)`.

If *transb* = 'T', 't', 'C', or 'c', *ldb* must be at least `max (1, n)`.

ob

INTEGER*1 for `gemm_s8u8s32_compute`

INTEGER*2 for `gemm_s16s16s32_compute`

Specifies the scalar offset value for the matrix *B*.

beta REAL

Specifies the scalar *beta*.

c INTEGER*4

Array, size *ldc* by *n*. Before entry, the leading *m*-by-*n* part of the array *c* must contain the matrix *C*, except when *beta* is equal to zero, in which case *c* need not be set on entry.

ldc INTEGER. Specifies the leading dimension of *c* as declared in the calling (sub)program.

The value of *ldc* must be at least `max (1, m)`.

oc INTEGER*4

Array, size `len`. Specifies the scalar offset value for the matrix *C*.

If `offsetc = 'F' or 'f'`, `len` must be at least 1.

If `offsetc = 'C' or 'c'`, `len` must be at least `max(1, m)`.

If `offsetc = 'R' or 'r'`, `len` must be at least `max(1, n)`.

Output Parameters

c INTEGER*4

Overwritten by the matrix *alpha**(`op(A) + A_offset)*(op(B) + B_offset) + beta*C + C_offset`.

Example

See the following examples in the MKL installation directory to understand the use of these routines:

gemm_s8u8s32_compute: examples\blas\source\gemm_s8u8s32_computex.f

gemm_s16s16s32_compute: examples\blas\source\gemm_s16s16s32_computex.f

Application Notes

You can expand the matrix-matrix product in this manner:

`(op(A) + A_offset)*(op(B) + B_offset) = op(A)*op(B) + op(A)*B_offset + A_offset*op(B) + A_offset*B_offset`

After computing these four multiplication terms separately, they are summed from left to right. The results from the matrix-matrix product and the *C* matrix are scaled with *alpha* and *beta* floating-point values respectively using double-precision arithmetic. Before storing the results to the output *c* array, the floating-point values are rounded to the nearest integers.

In the event of overflow or underflow, the results depend on the architecture. The results are either unsaturated (wrapped) or saturated to maximum or minimum representable integer values for the data type of the output matrix.

See Also

`gemm_*_pack_get_size`
to return the number of bytes needed to store the packed matrix.

`gemm_*_pack`
to pack the matrix into the buffer allocated previously.

?gemm_free

Frees the storage previously allocated for the packed matrix (deprecated).

Syntax

```
call sgemm_free (dest)
call dgemm_free (dest)
```

Include Files

- `mkl.fi`

Description

The `?gemm_free` routine is one of a set of related routines that enable use of an internal packed storage. Call the `?gemm_free` routine last to release storage for the packed matrix structure allocated with `?gemm_alloc` (deprecated).

Input Parameters

dest	POINTER. Previously allocated storage.

Output Parameters

dest	The freed buffer.

See Also

`?gemm_pack` Performs scaling and packing of the matrix into the previously allocated buffer.

`?gemm_compute` Computes a matrix-matrix product with general matrices where one or both input matrices are stored in a packed data structure and adds the result to a scalar-matrix product.

`?gemm`
for a detailed description of general matrix multiplication.

gemm_*

Computes a matrix-matrix product with general integer matrices.

Syntax

`call gemm_s8u8s32(transa, transb, offsetc, m, n, k, alpha, a, lda, oa, b, ldb, ob, beta, c, ldc, oc)`

`call gemm_s16s16s32(transa, transb, offsetc, m, n, k, alpha, a, lda, oa, b, ldb, ob, beta, c, ldc, oc)`

Include Files

- `mkl.fi`

Description

The `gemm_*` routines compute a scalar-matrix-matrix product and adds the result to a scalar-matrix product. To get the final result, a vector is added to each row or column of the output matrix. The operation is defined as:

```
C := alpha*(op(A) + A_offset)*(op(B) + B_offset) + beta*C + C_offset
```

where :

`op(X)` is either `op(X) = X` or `op(X) = X^T`,

A_offset is an *m*-by-*k* matrix with every element equal to the value *oa*,

B_offset is a *k*-by-*n* matrix with every element equal to the value *ob*,

C_offset is an *m*-by-*n* matrix defined by the *oc* array as described in the description of the *offsetc* parameter,

alpha and *beta* are scalars,

A is a matrix such that `op(A)` is *m*-by-*k*,

B is a matrix such that `op(B)` is *k*-by-*n*,

and *C* is an *m*-by-*n* matrix.

Input Parameters

transa

CHARACTER*1. Specifies the form of op(*A*) used in the matrix multiplication:

if *transa* = `'N'` or `'n'`, then `op(A) = A`;

if *transa* = `'T'` or `'t'`, then `op(A) = A^T`.

transb

CHARACTER*1. Specifies the form of op(*B*) used in the matrix multiplication:

if *transb* = `'N'` or `'n'`, then `op(B) = B`;

if *transb* = `'T'` or `'t'`, then `op(B) = B^T`.

offsetc

CHARACTER*1. Specifies the form of *C_offset* used in the matrix multiplication.

offsetc = `'F'` or `'f'`: *oc* has a single element and every element of *C_offset* is equal to this element.

offsetc = 'C' or 'c': *oc* has a size of *m* and every column of *C_offset* is equal to *oc*.
offsetc = 'R' or 'r': *oc* has a size of *n* and every row of *C_offset* is equal to *oc*.

m — INTEGER. Specifies the number of rows of the matrix op(*A*) and of the matrix *C*. The value of *m* must be at least zero.

n — INTEGER. Specifies the number of columns of the matrix op(*B*) and the number of columns of the matrix *C*. The value of *n* must be at least zero.

k — INTEGER. Specifies the number of columns of the matrix op(*A*) and the number of rows of the matrix op(*B*). The value of *k* must be at least zero.

alpha — SINGLE PRECISION. Specifies the scalar *alpha*.

a — INTEGER*1 for gemm_s8u8s32.

INTEGER*2 for gemm_s16s16s32.

Array, size *lda* by *ka*, where *ka* is *k* when *transa* = 'N' or 'n', and is *m* otherwise. Before entry with *transa* = 'N' or 'n', the leading *m*-by-*k* part of the array *a* must contain the matrix *A*, otherwise the leading *k*-by-*m* part of the array *a* must contain the matrix *A*.

lda — INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program.

When *transa* = 'N' or 'n', then *lda* must be at least max(1, *m*), otherwise *lda* must be at least max(1, *k*).

oa — INTEGER*1 for gemm_s8u8s32.

INTEGER*2 for gemm_s16s16s32.

Specifies the scalar offset value for matrix *A*.

b — INTEGER*1 for gemm_s8u8s32. INTEGER*2 for gemm_s16s16s32. Array, size *ldb* by *kb*, where *kb* is *n* when *transa* = 'N' or 'n', and is *k* otherwise. Before entry with *transa* = 'N' or 'n', the leading *k*-by-*n* part of the array *b* must contain the matrix *B*, otherwise the leading *n*-by-*k* part of the array *b* must contain the matrix *B*.

ldb — INTEGER. Specifies the leading dimension of *b* as declared in the calling (sub)program.

When *transb* = 'N' or 'n', then *ldb* must be at least max(1, *k*), otherwise *ldb* must be at least max(1, *n*).

ob — INTEGER*1 for gemm_s8u8s32. INTEGER*2 for gemm_s16s16s32. Specifies the scalar offset value for matrix *B*.

beta — SINGLE PRECISION. Specifies the scalar *beta*. When *beta* is equal to zero, then *c* need not be set on input.

c — INTEGER*4

Array, size *ldc* by *n*. Before entry, the leading *m*-by-*n* part of the array *c* must contain the matrix *C*, except when *beta* is equal to zero, in which case *c* need not be set on entry.

ldc — INTEGER. Specifies the leading dimension of *c* as declared in the calling (sub)program.

The value of *ldc* must be at least max(1, *m*).

oc — Array, size *len*. Specifies the offset values for matrix *C*.

If *offsetc* = 'F' or 'f': *len* must be at least 1.
If *offsetc* = 'C' or 'c': *len* must be at least max(1, *m*).
If *offsetc* = 'R' or 'r': *oc* must be at least max(1, *n*).

Output Parameters

c — Overwritten by *alpha**(op(*A*) + *A_offset*)*(op(*B*) + *B_offset*) + *beta***C*+ *C_offset*.

Application Notes

The matrix-matrix product can be expanded:

(op(*A*) + *A_offset*)*(op(*B*) + *B_offset*)

= op(*A*)*op(*B*) + op(*A*)**B_offset* + *A_offset**op(*B*) + *A_offset***B_offset*

After computing these four multiplication terms separately, they are summed from left to right. The results from the matrix-matrix product and the *C* matrix are scaled with *alpha* and *beta* floating-point values respectively using double-precision arithmetic. Before storing the results to the output *c* array, the floating-point values are rounded to the nearest integers. In the event of overflow or underflow, the results depend on the architecture . The results are either unsaturated (wrapped) or saturated to maximum or minimum representable integer values for the data type of the output matrix.

When using cblas_gemm_s8u8s32 with row-major layout, the data types of *A* and *B* must be swapped. That is, you must provide an 8-bit unsigned integer array for matrix *A* and an 8-bit signed integer array for matrix *B*.

Intermediate integer computations in gemm_s8u8s32 on 64-bit Intel® Advanced Vector Extensions 2 (Intel® AVX2) and Intel® Advanced Vector Extensions 512 (Intel® AVX-512) architectures without Vector Neural Network Instructions (VNNI) extensions can saturate. This is because only 16-bits are available for the accumulation of intermediate results. You can avoid integer saturation by maintaining all integer elements of A or B matrices under 8 bits.

?gemv_batch_strided

Computes groups of matrix-vector product with general matrices.

Syntax

```
call sgemv_batch_strided(trans, m, n, alpha, a, lda, stridea, x, incx, stridex, beta, y, incy, stridey, batch_size)
```

```
call dgemv_batch_strided(trans, m, n, alpha, a, lda, stridea, x, incx, stridex, beta, y, incy, stridey, batch_size)
```

```
call cgemv_batch_strided(trans, m, n, alpha, a, lda, stridea, x, incx, stridex, beta, y, incy, stridey, batch_size)
```

call zgemv_batch_strided(*trans*, *m*, *n*, *alpha*, *a*, *lda*, *stridea*, *x*, *incx*, *stridex*, *beta*, *y*, *incy*, *stridey*, *batch_size*)

Include Files

- mkl.fi

Description

The ?gemv_batch_strided routines perform a series of matrix-vector product added to a scaled vector. They are similar to the ?gemv routine counterparts, but the ?gemv_batch_strided routines perform matrix-vector operations with groups of matrices and vectors.

All matrices *a* and vectors *x* and *y* have the same parameters (size, increments) and are stored at constant *stridea*, *stridex*, and *stridey* from each other. The operation is defined as

```
for i = 0 … batch_size – 1
    A is a matrix at offset i * stridea in a
    X and Y are vectors at offset i * stridex and i * stridey in x and y
    Y = alpha * op(A) * X + beta * Y
end for
```

Input Parameters

trans

CHARACTER*1.

Specifies op(A) the transposition operation applied to the *A* matrices.

if *trans* = 'N' or 'n' , then op(A) = A;

if *trans* = 'T' or 't' , then op(A) = A';

if *trans* = 'C' or 'c' , then op(A) = conjg(A').

m

INTEGER. Number of rows of the matrices *A*. The value of *m* must be at least 0.

n

INTEGER. Number of columns of the matrices *A*. The value of *n* must be at least 0.

alpha

REAL for sgemv_batch_strided

DOUBLE PRECISION for dgemv_batch_strided

COMPLEX for cgemv_batch_strided

DOUBLE COMPLEX for zgemv_batch_strided

Specifies the scalar *alpha*.

a

REAL for sgemv_batch_strided

DOUBLE PRECISION for dgemv_batch_strided

COMPLEX for cgemv_batch_strided

DOUBLE COMPLEX for zgemv_batch_strided

Array holding all the input matrix *A*. Must be of size at least *lda***k* + *stridea* * (*batch_size* -1) where *k* is *n* if column major layout is used or *m* if row major layout is used.

lda

INTEGER. Specifies the leading dimension of the matrix*A*. It must be positive and at least *m* .

stridea	INTEGER. Stride between two consecutive *A* matrices. Must be at least 0.
x	REAL for sgemv_batch_strided DOUBLE PRECISION for dgemv_batch_strided COMPLEX for cgemv_batch_strided DOUBLE COMPLEX for zgemv_batch_strided Array holding all the input vector *x*. Must be of size at least (1 + (*len*-1)*abs(*incx*)) + *stridex* * (*batch_size* - 1) where *len* is *n* if the *A* matrix is not transposed or *m* otherwise.
incx	INTEGER. Stride between two consecutive elements of the *x* vectors. Must not be zero.
stridex	INTEGER. Stride between two consecutive *x* vectors, must be at least 0.
beta	REAL for sgemv_batch_strided DOUBLE PRECISION for dgemv_batch_strided COMPLEX for cgemv_batch_strided DOUBLE COMPLEX for zgemv_batch_strided Specifies the scalar *beta*.
y	REAL for sgemv_batch_strided DOUBLE PRECISION for dgemv_batch_strided COMPLEX for cgemv_batch_strided DOUBLE COMPLEX for zgemv_batch_strided Array holding all the input vectors *y*. Must be of size at least *batch_size* * *stridey*.
incy	INTEGER. Stride between two consecutive elements of the *y* vectors. Must not be zero.
stridey	INTEGER. Stride between two consecutive *y* vectors, must be at least (1 + (len-1)*abs(*incy*)) where len is *m* if the matrix *A* is non transpose or *n* otherwise.
batch_size	INTEGER. Number of gemv computations to perform and *a* matrices, *x* and *y* vectors. Must be at least 0.

Output Parameters

y	Array holding the *batch_size* updated vector *y*.

?gemv_batch

Computes groups of matrix-vector product with general matrices.

Syntax

call sgemv_batch(*trans_array*, *m_array*, *n_array*, *alpha_array*, *a_array*, *lda_array*, *x_array*, *incx_array*, *beta_array*, *y_array*, *incy_array*, *group_count*, *group_size*)

call dgemv_batch(*trans_array*, *m_array*, *n_array*, *alpha_array*, *a_array*, *lda_array*, *x_array*, *incx_array*, *beta_array*, *y_array*, *incy_array*, *group_count*, *group_size*)

call cgemv_batch(*trans_array*, *m_array*, *n_array*, *alpha_array*, *a_array*, *lda_array*, *x_array*, *incx_array*, *beta_array*, *y_array*, *incy_array*, *group_count*, *group_size*)

call zgemv_batch(*trans_array*, *m_array*, *n_array*, *alpha_array*, *a_array*, *lda_array*, *x_array*, *incx_array*, *beta_array*, *y_array*, *incy_array*, *group_count*, *group_size*)

Include Files

- mkl.fi

Description

The ?gemv_batch routines perform a series of matrix-vector product added to a scaled vector. They are similar to the ?gemv routine counterparts, but the ?gemv_batch routines perform matrix-vector operations with groups of matrices and vectors.

Each group contains matrices and vectors with the same parameters (size, increments). The operation is defined as:

```
idx = 0
For i = 0 … group_count – 1
    trans, m, n, alpha, lda, incx, beta, incy and group_size at position i in trans_array,
m_array, n_array, alpha_array, lda_array, incx_array, beta_array, incy_array and group_size_array
    for j = 0 … group_size – 1
        a is a matrix of size mxn at position idx in a_array
        x and y are vectors of size m or n depending on trans, at position idx in x_array and
y_array
        y := alpha * op(a) * x + beta * y
        idx := idx + 1
    end for
end for
```

The number of entries in *a_array*, *x_array*, and *y_array* is *total_batch_count* = the sum of all of the *group_size* entries.

Input Parameters

trans_array

CHARACTER*1.

Array of size *group_count*. For the group *i*, $trans_i$ = *trans_array*[i] specifies the transposition operation applied to *A*.

if *trans* = 'N' or 'n' , then op(A) = A;

if *trans* = 'T' or 't' , then op(A) = A';

if *trans* = 'C' or 'c' , then op(A) = conjg(A').

m_array

INTEGER. Array of size *group_count*. For the group *i*, m_i = *m_array*[i] is the number of rows of the matrix *A*.

n_array

INTEGER. Array of size *group_count*. For the group *i*, n_i = *n_array*[i] is the number of columns in the matrix *A*.

alpha_array

REAL for sgemv_batch

	DOUBLE PRECISION for dgemv_batch COMPLEX for cgemv_batch DOUBLE COMPLEX for zgemv_batch Array of size *group_count*. For the group *i*, $alpha_i$ = *alpha_array*[i] is the scalar *alpha*.
a_array	INTEGER*8 for Intel® 64 architecture INTEGER*4 for IA32 architecture Array of size *total_batch_count* of pointers used to store *A* matrices. The array allocated for the *A* matrices of the group *i* must be of size at least $lda_i * n_i$ if column major layout is used or at least $lda_i * m_i$ is row major layout is used.
lda_array	INTEGER. Array of size *group_count*. For the group *i*, lda_i = *lda_array*[i] is the leading dimension of the matrix *A*. It must be positive and at least m_i .
x_array	INTEGER*8 for Intel® 64 architecture INTEGER*4 for IA32 architecture Array of size *total_batch_count* of pointers used to store *x* vectors. The array allocated for the *x* vectors of the group *i* must be of size at least (1 + len_i – 1)*abs($incx_i$)) where len_i is n_i if the *A* matrix is not transposed or m_i otherwise.
incx_array	INTEGER. Array of size *group_count*. For the group *i*, $incx_i$ = *incx_array*[i] is the stride of vector *x*. Must not be zero.
beta_array	REAL for sgemv_batch DOUBLE PRECISION for dgemv_batch COMPLEX for cgemv_batch DOUBLE COMPLEX for zgemv_batch Array of size *group_count*. For the group *i*, $beta_i$ = *beta_array*[i] is the scalar *beta*.
y_array	INTEGER*8 for Intel® 64 architecture INTEGER*4 for IA32 architecture Array of size *total_batch_count* of pointers used to store *y* vectors. The array allocated for the *y* vectors of the group *i* must be of size at least (1 + len_i – 1)*abs($incy_i$)) where len_i is m_i if the *A* matrix is not transposed or n_i otherwise.
incy_array	INTEGER. Array of size *group_count*. For the group *i*, $incy_i$ = *incy_array*[i] is the stride of vector *y*. Must not be zero.
group_count	INTEGER. Number of groups. Must be at least 0.
group_size	INTEGER.

Array of size *group_count*. The element *group_count*[i] is the number of operations in the group *i*. Each element in *group_count* must be at least 0.

Output Parameters

y_array — Array of pointers holding the *total_batch_count* updated vector *y*.

?dgmm_batch_strided

Computes groups of matrix-vector product using general matrices.

Syntax

```
call sdgmm_batch_strided(left_right, m, n, a, lda, stridea, x, incx, stridex, c, ldc, stridec, batch_size)
call ddgmm_batch_strided(left_right, m, n, a, lda, stridea, x, incx, stridex, c, ldc, stridec, batch_size)
call cdgmm_batch_strided(left_right, m, n, a, lda, stridea, x, incx, stridex, c, ldc, stridec, batch_size)
call zdgmm_batch_strided(left_right, m, n, a, lda, stridea, x, incx, stridex, c, ldc, stridec, batch_size)
```

Include Files

- mkl.fi

Description

The ?dgmm_batch_strided routines perform a series of diagonal matrix-matrix product. The diagonal matrices are stored as dense vectors and the operations are performed with group of matrices and vectors.

All matrices *a* and *c* and vector *x* have the same parameters (size, increments) and are stored at constant stride, respectively, given by *stridea*, *stridec*, and *stridex* from each other. The operation is defined as

```
for i = 0 … batch_size – 1
    A and C are matrices at offset i * stridea in a and i * stridec in c
    X is a vector at offset i * stridex in x
    C = diag(X) * A or C = A * diag(X)
end for
```

Input Parameters

left_right — CHARACTER*1.

Specifies the position of the diagonal matrix in the matrix product

if *left_right* = 'L' or 'l' , then C = diag(X) * A;

if *left_right* = 'R' or 'r' , then C = A * diag(X).

m — INTEGER. Number of rows of the matrices A and C. The value of *m* must be at least 0.

n — INTEGER. Number of columns of the matrices A and C. The value of *n* must be at least 0.

a — REAL for sdgmm_batch_strided

	DOUBLE PRECISION for ddgmm_batch_strided COMPLEX for cdgmm_batch_strided DOUBLE COMPLEX for zdgmm_batch_strided Array holding all the input matrix *A*. Must be of size at least *lda***k* + *stridea* * (*batch_size* -1) where *k* is *n* if column major layout is used or *m* if row major layout is used.
lda	INTEGER. Specifies the leading dimension of the matrix*A*. It must be positive and at least *m* .
stridea	INTEGER. Stride between two consecutive *A* matrices, must be at least 0.
x	REAL for sdgmm_batch_strided DOUBLE PRECISION for ddgmm_batch_strided COMPLEX for cdgmm_batch_strided DOUBLE COMPLEX for zdgmm_batch_strided Array holding all the input vector *x*. Must be of size at least (1 + (*len* -1)*abs(*incx*)) + *stridex* * (*batch_size* - 1) where *len* is *n* if the diagonal matrix is on the right of the product or *m* otherwise.
incx	INTEGER. Stride between two consecutive elements of the *x* vectors.
stridex	INTEGER. Stride between two consecutive *x* vectors, must be at least 0.
c	REAL for sdgmm_batch_strided DOUBLE PRECISION for ddgmm_batch_strided COMPLEX for cdgmm_batch_strided DOUBLE COMPLEX for zdgmm_batch_strided Array holding all the input matrix *C*. Must be of size at least *batch_size* * *stridec*.
ldc	INTEGER. Specifies the leading dimension of the matrix *C*. It must be positive and at least *m* .
stridec	INTEGER. Stride between two consecutive *A* matrices, must be at least *ldc* * *n* .
batch_size	INTEGER. Number of dgmm computations to perform and a *c* matrices and *x* vectors. Must be at least 0.

Output Parameters

c	Array holding the *batch_size* updated matrices *c*.

?dgmm_batch

Computes groups of matrix-vector product using general matrices.

Syntax

`call sdgmm_batch(left_right_array, m_array, n_array, a_array, lda_array, x_array, incx_array, c_array, ldc_array, group_count, group_size)`

`call ddgmm_batch(left_right_array, m_array, n_array, a_array, lda_array, x_array, incx_array, c_array, ldc_array, group_count, group_size)`

`call cdgmm_batch(left_right_array, m_array, n_array, a_array, lda_array, x_array, incx_array, c_array, ldc_array, group_count, group_size)`

`call zdgmm_batch(left_right_array, m_array, n_array, a_array, lda_array, x_array, incx_array, c_array, ldc_array, group_count, group_size)`

Include Files

- `mkl.fi`

Description

The `?dgmm_batch` routines perform a series of diagonal matrix-matrix product. The diagonal matrices are stored as dense vectors and the operations are performed with group of matrices and vectors. .

Each group contains matrices and vectors with the same parameters (size, increments). The operation is defined as:

```
idx = 0
For i = 0 … group_count – 1
    left_right, m, n, lda, incx, ldc and group_size at position i in left_right_array, m_array,
n_array, lda_array, incx_array, ldc_array and group_size_array
    for j = 0 … group_size – 1
        a and c are matrices of size mxn at position idx in a_array and c_array
        x is a vector of size m or n depending on left_right, at position idx in x_array
        if (left_right == oneapi::mkl::side::left) c := diag(x) * a
        else c := a * diag(x)
        idx := idx + 1
    end for
end for
```

The number of entries in *a_array*, *x_array*, and *c_array* is *total_batch_count* = the sum of all of the *group_size* entries.

Input Parameters

left_right_array

`CHARACTER*1`.

Array of size *group_count*. For the group *i*, $left\_right_i$ = *left_right_array*[i] specifies the position of the diagonal matrix in the matrix product.

if $left\_right_i$ = 'L' or 'l' , then *C* = diag(X) * *A*.

if $left\_right_i$ = 'R' or 'r' , then *C* = *A* * diag(X).

m_array

`INTEGER`. Array of size *group_count*. For the group *i*, m_i = *m_array*[i] is the number of rows of the matrix *A* and *C*.

n_array — INTEGER. Array of size *group_count*. For the group *i*, n_i = *n_array*[i] is the number of columns in the matrix *A* and *C*.

a_array — INTEGER*8 for Intel® 64 architecture

INTEGER*4 for IA32 architecture

Array of size *total_batch_count* of pointers used to store *A* matrices. The array allocated for the *A* matrices of the group *i* must be of size at least $lda_i * n_i$.

lda_array — INTEGER. Array of size *group_count*. For the group *i*, lda_i = *lda_array*[i] is the leading dimension of the matrix *A*. It must be positive and at least m_i .

x_array — INTEGER*8 for Intel® 64 architecture

INTEGER*4 for IA32 architecture

Array of size *total_batch_count* of pointers used to store *x* vectors. The array allocated for the *x* vectors of the group *i* must be of size at least (1 + len_i – 1)*abs($incx_i$)) where len_i is n_i if the diagonal matrix is on the right of the product or m_i otherwise.

incx_array — INTEGER. Array of size *group_count*. For the group *i*, $incx_i$ = *incx_array*[i] is the stride of vector *x*.

c_array — INTEGER*8 for Intel® 64 architecture

INTEGER*4 for IA32 architecture

Array of size *total_batch_count* of pointers used to store *C* matrices. The array allocated for the *C* matrices of the group *i* must be of size at least $ldc_i * n_i$,

ldc_array — INTEGER.

Array of size *group_count*. For the group *i*, ldc_i = *ldc_array*[i] is the leading dimension of the matrix *C*. It must be positive and at least m_i .

group_count — INTEGER.

Number of groups. Must be at least 0.

group_size — INTEGER.

Array of size *group_count*. The element *group_count*[i] is the number of operations in the group *i*. Each element in *group_size* must be at least 0.

Output Parameters

c_array — Array of pointers holding the *total_batch_count* updated matrix *C*.

mkl_jit_create_?gemm

Create a GEMM kernel that computes a scalar-matrix-matrix product and adds the result to a scalar-matrix product.

Syntax

```
status = mkl_jit_create_sgemm(jitter, transa, transb, m, n, k, alpha, lda, ldb, beta, ldc)
```

```
status = mkl_jit_create_dgemm(jitter, transa, transb, m, n, k, alpha, lda, ldb, beta, ldc)
status = mkl_jit_create_cgemm(jitter, transa, transb, m, n, k, alpha, lda, ldb, beta, ldc)
status = mkl_jit_create_zgemm(jitter, transa, transb, m, n, k, alpha, lda, ldb, beta, ldc)
```

Include Files

- mkl_blas.f90

Description

The mkl_jit_create_?gemm functions belong to a set of related routines that enable use of just-in-time code generation.

The mkl_jit_create_?gemm functions create a handle to a just-in-time code generator (a jitter) and generate a GEMM kernel that computes a scalar-matrix-matrix product and adds the result to a scalar-matrix product, with general matrices. The operation of the generated GEMM kernel is defined as follows:

```
C := alpha*op(A)*op(B) + beta*C
```

Where:

- op(X) is either op(X) = X or op(X) = X^T or op(X) = X^H
- alpha and beta are scalars
- A, B, and C are matrices
- op(A) is an m-by-k matrix
- op(B) is a k-by-n matrix
- C is an m-by-n matrix

NOTE
Generating a new kernel with mkl_jit_create_?gemm involves moderate runtime overhead. To benefit from JIT code generation, use this feature when you need to call the generated kernel many times (for example, several hundred calls).

NOTE
The JIT API requires Fortran 90 and the ISO_C_BINDING module.

Input Parameters

transa

CHARACTER*1.

Specifies the form of op(A) used in the generated matrix multiplication:

- if *transa* = 'N', then op(A) = A
- if *transa* = 'T', then op(A) = A^T
- if *transa* = 'C', then op(A) = A^H

transb

CHARACTER*1.

Specifies the form of op(B) used in the generated matrix multiplication:

- if *transb* = 'N', then op(B) = B

- if *transb* = 'T', then op(B) = B^T
- if *transb* = 'C', then op(B) = B^H

m

INTEGER.

Specifies the number of rows of the matrix op(A) and of the matrix C. The value of *m* must be at least zero.

n

INTEGER.

Specifies the number of columns of the matrix op(B) and of the matrix C. The value of *n* must be at least zero.

k

INTEGER.

Specifies the number of columns of the matrix op(A) and the number of rows of the matrix op(B). The value of *k* must be at least zero.

alpha

REAL for mkl_jit_create_sgemm

DOUBLE PRECISION for mkl_jit_create_dgemm.

COMPLEX for mkl_jit_create_cgemm

DOUBLE COMPLEX for mkl_jit_create_zgemm

Specifies the scalar *alpha*.

lda

INTEGER.

Specifies the leading dimension of *a*.

- If *transa* = 'N' *lda* must be at least max(1,m).
- If *transa* = 'T' or *transa* = 'C', *lda* must be at least max(1,k).

ldb

INTEGER.

Specifies the leading dimension of *b*:

- If *transb* = 'N' *ldb* must be at least max(1,k).
- If *transb* = 'T' or *transb* = 'C', *ldb* must be at least max(1,n).

beta

REAL for mkl_jit_create_sgemm

DOUBLE PRECISION for mkl_jit_create_dgemm.

COMPLEX for mkl_jit_create_cgemm

DOUBLE COMPLEX for mkl_jit_create_zgemm

Specifies the scalar *beta*.

ldc

INTEGER.

Specifies the leading dimension of *c* which must be at least max(1,m).

Output Parameters

jitter

TYPE(C_PTR). C pointer to a handle to the newly created code generator.

Return Values

`status`	`INTEGER` Returns one of the following: • `MKL_JIT_ERROR` if the handle cannot be created (no memory) *—or—* • `MKL_JIT_SUCCESS` if the jitter has been created and the GEMM kernel was successfully created *—or—* • `MKL_NO_JIT` if the jitter has been created, but a JIT GEMM kernel was not created because JIT is not beneficial for the given input parameters. The function pointer returned by `mkl_jit_get_?gemm_ptr` will call standard (non-JIT) GEMM.

mkl_jit_get_?gemm_ptr

Return the GEMM kernel associated with a jitter previously created with `mkl_jit_create_?gemm`*.*

Syntax

c_func = mkl_jit_get_sgemm_ptr(*jitter*)

c_func = mkl_jit_get_dgemm_ptr(*jitter*)

c_func = mkl_jit_get_cgemm_ptr(*jitter*)

c_func = mkl_jit_get_zgemm_ptr(*jitter*)

Include Files

- `mkl_blas.f90`

Description

The `mkl_jit_get_?gemm_ptr` functions belong to a set of related routines that enable use of just-in-time code generation.

The `mkl_jit_get_?gemm_ptr` functions take as input a jitter previously created with `mkl_jit_create_?gemm`, and return the GEMM kernel associated with that jitter. The returned GEMM kernel computes a scalar-matrix-matrix product and adds the result to a scalar-matrix product, with general matrices. The operation is defined as follows:

```
C := alpha*op(A)*op(B) + beta*C
```

Where:

- `op(X)` is one of `op(X) = X` or `op(X) = X`^{T} or `op(X) = X`^{H}
- `alpha` and `beta` are scalars
- `A`, `B`, and `C` are matrices
- `op(A)` is an `m`-by-`k` matrix
- `op(B)` is a `k`-by-`n` matrix
- C is an `m`-by-`n` matrix

NOTE
Generating a new kernel with `mkl_jit_create_?gemm` involves moderate runtime overhead. To benefit from JIT code generation, use this feature when you need to call the generated kernel many times (for example, several hundred calls).

NOTE
The JIT API requires Fortran 90 and the ISO_C_BINDING module.

Input Parameter

jitter

`TYPE(C_PTR), VALUE`

Handle to the code generator.

Return Values

c_func

`TYPE(C_FUNPTR)`

If the jitter input is not a C NULL pointer, returns a C function pointer to a GEMM kernel. The returned C function pointer must be converted to a Fortran procedure pointer (of abstract interface `?gemm_jit_kernel_t`) using `C_F_PROCPOINTER`. The GEMM kernel can then be called with four parameters: the jitter and the three matrices *a*, b, and *c*. Otherwise, returns a C NULL pointer.

If *transa*, *transb*, *m*, *n*, *k*, *lda*, *ldb*, and *ldc* are the parameters used during the creation of the input jitter, then:

a

transa = 'N'	*transa* = 'T' or *transa* = 'C'
Array of size *lda***k* Before calling the returned function pointer, the leading *m*-by-*k* part of the array *a* must contain the matrix A.	Array of size *lda***m* Before calling the returned function pointer, the leading *k*-by-*m* part of the array *a* must contain the matrix A.

b

transb = 'N'	*transb* = 'T' or *transb* = 'C'
Array of size *ldb***n* Before calling the returned function pointer, the leading *k*-by-*n* part of the array *b* must contain the matrix B.	Array of size *ldb***k* Before calling the returned function pointer, the leading *n*-by-*k* part of the array *b* must contain the matrix B.

c

Array of size *ldc***n*

Before calling the returned function pointer, the leading *m*-by-*n* part of the array *c* must contain the matrix C.

mkl_jit_destroy

Delete the jitter previously created with `mkl_jit_create_?gemm` *as well as the GEMM kernel that it contains.*

Syntax

`status = mkl_jit_destroy (jitter)`

Include Files

- `mkl_blas.f90`

Description

The `mkl_jit_destroy` function belongs to a set of related routines that enable use of just-in-time code generation.

The `mkl_jit_destroy` function takes as input a jitter previously created with `mkl_jit_create_?gemm` and deletes the jitter as well as the GEMM kernel that it contains.

NOTE
Generating a new kernel with `mkl_jit_create_?gemm` involves moderate runtime overhead. To benefit from JIT code generation, use this feature when you need to call the generated kernel many times (for example, several hundred calls).

NOTE
The JIT API requires Fortran 90 and the ISO_C_BINDING module.

Input Parameter

`jitter`	`TYPE(C_PTR), VALUE` Jitter handle

Return Values

`status`	`INTEGER` Returns one of the following: • `MKL_JIT_ERROR` if the pointer is not NULL and is not a handle on a jitter—that is, if it was not created with `mkl_jit_create_?gemm` *—or—* • `MKL_JIT_SUCCESS` if the jitter has been successfully destroyed

LAPACK Routines

Intel® oneAPI Math Kernel Library (oneMKL)implements routines from the LAPACK package that are used for solving systems of linear equations, linear least squares problems, eigenvalue and singular value problems, and performing a number of related computational tasks. The library includes LAPACK routines for both real and complex data. Routines are supported for systems of equations with the following types of matrices:

- General
- Banded
- Symmetric or Hermitian positive-definite (full, packed, and rectangular full packed (RFP) storage)
- Symmetric or Hermitian positive-definite banded
- Symmetric or Hermitian indefinite (both full and packed storage)
- Symmetric or Hermitian indefinite banded
- Triangular (full, packed, and RFP storage)
- Triangular banded
- Tridiagonal
- Diagonally dominant tridiagonal.

NOTE
Different arrays used as parameters to Intel® MKL LAPACK routines must not overlap.

Warning
LAPACK routines assume that input matrices do not contain IEEE 754 special values such as `INF` or `NaN` values. Using these special values may cause LAPACK to return unexpected results or become unstable.

Intel MKL supports the Fortran 95 interface, which uses simplified routine calls with shorter argument lists, in addition to the FORTRAN 77 interface to LAPACK computational and driver routines. The syntax section of the routine description gives the calling sequence for the Fortran 95 interface, where available, immediately after the FORTRAN 77 calls.

Naming Conventions for LAPACK Routines

To call one of the routines from a FORTRAN 77 program, you can use the LAPACK name.

LAPACK names have the structure `?yyzzz` or `?yyzz`, where the initial symbol `?` indicates the data type:

`s`	real, single precision
`c`	complex, single precision
`d`	real, double precision
`z`	complex, double precision

Some routines can have combined character codes, such as `ds` or `zc`.

The Fortran 95 interfaces to the LAPACK computational and driver routines are the same as the FORTRAN 77 names but without the first letter that indicates the data type. For example, the name of the routine that performs a triangular factorization of general real matrices in Fortran 95 is `getrf`. Different data types are handled through the definition of a specific internal parameter that refers to a module block with named constants for single and double precision.

Fortran 95 Interface Conventions for LAPACK Routines

Intel® oneAPI Math Kernel Library (oneMKL) implements the Fortran 95 interface to LAPACK through wrappers that call respective FORTRAN 77 routines. This interface uses such Fortran 95 features as assumed-shape arrays and optional arguments to provide simplified calls to LAPACK routines with fewer arguments.

NOTE
For LAPACK, Intel® oneAPI Math Kernel Library (oneMKL) offers two types of the Fortran 95 interfaces:

- using `mkl_lapack.fi` only through the `include 'mkl_lapack.fi'` statement. Such interfaces allow you to make use of the original LAPACK routines with all their arguments
- using `lapack.f90` that includes improved interfaces. This file is used to generate the module files `lapack95.mod` and `f95_precision.mod`. See also the section "Fortran 95 interfaces and wrappers to LAPACK and BLAS" of the *Intel® oneAPI Math Kernel Library (oneMKL) Developer Guide* for details. The module files are used to process the FORTRAN use clauses referencing the LAPACK interface: `use lapack95` and `use f95_precision`.

The main conventions for the Fortran 95 interface are as follows:

- The names of arguments used in Fortran 95 call are typically the same as for the respective generic (FORTRAN 77) interface. In rare cases, formal argument names may be different. For instance, *select* instead of *selctg*.
- Input arguments such as array dimensions are not required in Fortran 95 and are skipped from the calling sequence. Array dimensions are reconstructed from the user data that must exactly follow the required array shape.

  Another type of generic arguments that are skipped in the Fortran 95 interface are arguments that represent workspace arrays (such as *work*, *rwork*, and so on). The only exception are cases when workspace arrays return significant information on output.

  NOTE
  Internally, workspace arrays are allocated by the Fortran 95 interface wrapper, and are of optimal size for the best performance of the routine.

  An argument can also be skipped if its value is completely defined by the presence or absence of another argument in the calling sequence, and the restored value is the only meaningful value for the skipped argument.
- Some generic arguments are declared as optional in the Fortran 95 interface and may or may not be present in the calling sequence. An argument can be declared optional if it meets one of the following conditions:
  - If an argument value is completely defined by the presence or absence of another argument in the calling sequence, it can be declared optional. The difference from the skipped argument in this case is that the optional argument can have some meaningful values that are distinct from the value reconstructed by default. For example, if some argument (like *jobz*) can take only two values and one of these values directly implies the use of another argument, then the value of *jobz* can be uniquely reconstructed from the actual presence or absence of this second argument, and *jobz* can be omitted.
  - If an input argument can take only a few possible values, it can be declared as optional. The default value of such argument is typically set as the first value in the list and all exceptions to this rule are explicitly stated in the routine description.
  - If an input argument has a natural default value, it can be declared as optional. The default value of such optional argument is set to its natural default value.
- Argument *info* is declared as optional in the Fortran 95 interface. If it is present in the calling sequence, the value assigned to *info* is interpreted as follows:
  - If this value is more than -1000, its meaning is the same as in the FORTRAN 77 routine.
  - If this value is equal to -1000, it means that there is not enough work memory.
  - If this value is equal to -1001, incompatible arguments are present in the calling sequence.
  - If this value is equal to *-i*, the *i*th parameter (counting parameters in the FORTRAN 77 interface, not the Fortran 95 interface) had an illegal value.
- Optional arguments are given in square brackets in the Fortran 95 call syntax.

The "Fortran 95 Notes" subsection at the end of the topic describing each routine details concrete rules for reconstructing the values of the omitted optional parameters.

Intel® MKL Fortran 95 Interfaces for LAPACK Routines vs. Netlib Implementation

The following list presents general digressions of the Intel® oneAPI Math Kernel Library (oneMKL) LAPACK95 implementation from the Netlib analog:

- The Intel® oneAPI Math Kernel Library (oneMKL) Fortran 95 interfaces are provided for pure procedures.
- Names of interfaces do not contain the `LA_` prefix.
- An optional array argument always has the `target` attribute.
- Functionality of the Intel® oneAPI Math Kernel Library (oneMKL) LAPACK95 wrapper is close to the FORTRAN 77 original implementation in the`getrf`, `gbtrf`, and `potrf` interfaces.
- If *jobz* argument value specifies presence or absence of *z* argument, then *z* is always declared as optional and *jobz* is restored depending on whether *z* is present or not.
- To avoid double error checking, processing of the *info* argument is limited to checking of the allocated memory and disarranging of optional arguments.
- If an argument that is present in the list of arguments completely defines another argument, the latter is always declared as optional.

You can transform an application that uses the Netlib LAPACK interfaces to ensure its work with the Intel® oneAPI Math Kernel Library (oneMKL) interfaces providing that:

a. The application is correct, that is, unambiguous, compiler-independent, and contains no errors.
b. Each routine name denotes only one specific routine. If any routine name in the application coincides with a name of the original Netlib routine (for example, after removing the `LA_` prefix) but denotes a routine different from the Netlib original routine, this name should be modified through context name replacement.

You should transform your application in the following cases:

- When using the Netlib routines that differ from the Intel® oneAPI Math Kernel Library (oneMKL) routines only by the`LA_` prefix or in the array attribute `target`. The only transformation required in this case is context name replacement.
- When using Netlib routines that differ from the Intel® oneAPI Math Kernel Library (oneMKL) routines by the`LA_` prefix, the `target` array attribute, and the names of formal arguments. In the case of positional passing of arguments, no additional transformation except context name replacement is required. In the case of the keywords passing of arguments, in addition to the context name replacement the names of mismatching keywords should also be modified.
- When using the Netlib routines that differ from the respective Intel® oneAPI Math Kernel Library (oneMKL) routines by the`LA_` prefix, the `target`array attribute, sequence of the arguments, arguments missing in Intel® oneAPI Math Kernel Library (oneMKL) but present in Netlib and, vice versa, present in Intel® oneAPI Math Kernel Library (oneMKL) but missing in Netlib. Remove the differences in the sequence and range of the arguments in process of all the transformations when you use the Netlib routines specified by this bullet and the preceding bullet.
- When using the `getrf`, `gbtrf`, and `potrf`interfaces, that is, new functionality implemented in Intel® oneAPI Math Kernel Library (oneMKL) but unavailable in the Netlib source. To override the differences, build the desired functionality explicitly with the Intel® oneAPI Math Kernel Library (oneMKL) means or create a new subroutine with the new functionality, using specific MKL interfaces corresponding to LAPACK 77 routines. You can call the LAPACK 77 routines directly but using the new Intel® oneAPI Math Kernel Library (oneMKL) interfaces is preferable. Note that if the transformed application calls`getrf`, `gbtrf` or `potrf` without controlling arguments *rcond* and *norm*, just context name replacement is enough in modifying the calls into the Intel® oneAPI Math Kernel Library (oneMKL) interfaces, as described in the first bullet above. The Netlib functionality is preserved in such cases.
- When using the Netlib auxiliary routines. In this case, call a corresponding subroutine directly, using the Intel® oneAPI Math Kernel Library (oneMKL) LAPACK 77 interfaces.

Transform your application as follows:

1. Make sure conditions a. and b. are met.
2. Select Netlib LAPACK 95 calls. For each call, do the following:
   - Select the type of digression and do the required transformations.
   - Revise results to eliminate unneeded code or data, which may appear after several identical calls.
3. Make sure the transformations are correct and complete.

Matrix Storage Schemes for LAPACK Routines

LAPACK routines use the following matrix storage schemes:

- *Full storage*: an *m*-by-*n* matrix *A* is stored in a two-dimensional array `a`, with the matrix element a_{ij} (i = 1..*mj* = 1..*n*), and stored in the array element `a(i,j)`.
- *Packed storage* scheme allows you to store symmetric, Hermitian, or triangular matrices more compactly: the upper or lower triangle of the matrix is packed by columns in a one-dimensional array.
- *Band storage*: an *m*-by-*n* band matrix with *kl* sub-diagonals and *ku* superdiagonals is stored compactly in a two-dimensional array *ab* with `kl+ku+1` rows and *n* columns. Columns of the matrix are stored in the corresponding columns of the array, and *diagonals* of the matrix are stored in rows of the array.
- *Rectangular Full Packed (RFP) storage*: the upper or lower triangle of the matrix is packed combining the full and packed storage schemes. This combination enables using half of the full storage as packed storage while maintaining efficiency by using Level 3 BLAS/LAPACK kernels as the full storage.

Generally in LAPACK routines, arrays that hold matrices in packed storage have names ending in *p*; arrays with matrices in band storage have names ending in *b*; arrays with matrices in the RFP storage have names ending in *fp*.

For more information on matrix storage schemes, see "Matrix Arguments" in "Routine and Function Arguments".

Mathematical Notation for LAPACK Routines

Descriptions of LAPACK routines use the following notation:

A^H	For an *M*-by-*N* matrix A, denotes the conjugate transposed *N*-by-*M* matrix with elements: $a^H_{ij} = \overline{a_{ji}}$ For a real-valued matrix, $A^H = A^T$.
$x \cdot y$	The *dot product* of two vectors, defined as: $x \cdot y = \sum_i x_i \overline{y_i}$
$Ax = b$	A system of linear equations with an *n*-by-*n* matrix $A = \{a_{ij}\}$, a right-hand side vector $b = \{b_i\}$, and an unknown vector $x = \{x_i\}$.
$AX = B$	A set of systems with a common matrix *A* and multiple right-hand sides. The columns of *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.
$\|x\|$	the vector with elements $\|x_i\|$ (absolute values of x_i).
$\|A\|$	the matrix with elements $\|a_{ij}\|$ (absolute values of a_{ij}).
$\|\|x\|\|_\infty = \max_i \|x_i\|$	The *infinity-norm* of the vector *x*.
$\|\|A\|\|_\infty = \max_i \Sigma_j \|a_{ij}\|$	The *infinity-norm* of the matrix *A*.
$\|\|A\|\|_1 = \max_j \Sigma_i \|a_{ij}\|$	The *one-norm* of the matrix *A*. $\|\|A\|\|_1 = \|\|A^T\|\|_\infty = \|\|A^H\|\|_\infty$
$\|\|x\|\|_2$	The *2-norm* of the vector *x*: $\|\|x\|\|_2 = (\Sigma_i \|x_i\|^2)^{1/2} = \|\|x\|\|_E$ (see the definition for *Euclidean norm* in this topic).
$\|\|A\|\|_2$	The *2-norm* (or *spectral norm*) of the matrix *A*.

$$\|A\|_2 = \max_i \sigma_i, \|A\|_2^2 = \max_{\|x\|_2=1} (Ax \cdot Ax)$$

$\|\|A\|\|_E$	The *Euclidean norm* of the matrix *A*: $\|\|A\|\|_E^2 = \Sigma_i \Sigma_j \|a_{ij}\|^2$.
$\kappa(A) = \|\|A\|\| \cdot \|\|A^{-1}\|\|$	The *condition number* of the matrix *A*.
λ_i	*Eigenvalues* of the matrix *A* (for the definition of eigenvalues, see Eigenvalue Problems).
σ_i	*Singular values* of the matrix *A*. They are equal to square roots of the eigenvalues of $A^H A$. (For more information, see Singular Value Decomposition).

Error Analysis

In practice, most computations are performed with rounding errors. Besides, you often need to solve a system $Ax = b$, where the data (the elements of *A* and *b*) are not known exactly. Therefore, it is important to understand how the data errors and rounding errors can affect the solution *x*.

Data perturbations. If *x* is the exact solution of $Ax = b$, and $x + \delta x$ is the exact solution of a perturbed problem $(A + \delta A)(x + \delta x) = (b + \delta b)$, then this estimate, given up to linear terms of perturbations, holds:

$$\frac{\|\delta x\|}{\|x\|} \le \kappa(A) \left(\frac{\|\delta A\|}{\|A\|} + \frac{\|\delta b\|}{\|b\|} \right)$$

where $A + \delta A$ is nonsingular and

$$\kappa(A) = \|A\| \|A^{-1}\|.$$

In other words, relative errors in *A* or *b* may be amplified in the solution vector *x* by a factor $\kappa(A) = \|\|A\|\| \|\|A^{-1}\|\|$ called the *condition number* of *A*.

Rounding errors have the same effect as relative perturbations $c(n)\varepsilon$ in the original data. Here ε is the *machine precision*, defined as the smallest positive number *x* such that $1 + x > 1$; and $c(n)$ is a modest function of the matrix order *n*. The corresponding solution error is

$\|\|\delta x\|\| / \|\|x\|\| \le c(n)\kappa(A)\varepsilon$. (The value of $c(n)$ is seldom greater than $10n$.)

NOTE
Machine precision depends on the data type used.

Thus, if your matrix *A* is *ill-conditioned* (that is, its condition number $\kappa(A)$ is very large), then the error in the solution *x* can also be large; you might even encounter a complete loss of precision. LAPACK provides routines that allow you to estimate $\kappa(A)$ (see Routines for Estimating the Condition Number) and also give you a more precise estimate for the actual solution error (see Refining the Solution and Estimating Its Error).

LAPACK Linear Equation Routines

This section describes routines for performing the following computations:

- factoring the matrix (except for triangular matrices)
- equilibrating the matrix (except for RFP matrices)
- solving a system of linear equations
- estimating the condition number of a matrix (except for RFP matrices)
- refining the solution of linear equations and computing its error bounds (except for RFP matrices)
- inverting the matrix.

To solve a particular problem, you can call two or more computational routines or call a corresponding driver routine that combines several tasks in one call. For example, to solve a system of linear equations with a general matrix, call `?getrf` (*LU* factorization) and then `?getrs` (computing the solution). Then, call `?gerfs` to refine the solution and get the error bounds. Alternatively, use the driver routine `?gesvx` that performs all these tasks in one call.

LAPACK Linear Equation Computational Routines

Table "Computational Routines for Systems of Equations with Real Matrices" lists the LAPACK computational routines (FORTRAN 77 and Fortran 95 interfaces) for factorizing, equilibrating, and inverting *real* matrices, estimating their condition numbers, solving systems of equations with real matrices, refining the solution, and estimating its error. Table "Computational Routines for Systems of Equations with Complex Matrices" lists similar routines for *complex* matrices. Respective routine names in the Fortran 95 interface are without the first symbol (see Routine Naming Conventions).

Computational Routines for Systems of Equations with Real Matrices

Matrix type, storage scheme	Factorize matrix	Equilibrate matrix	Solve system	Condition number	Estimate error	Invert matrix

In the table above, ? stands for c (single precision complex) or z (double precision complex) for FORTRAN 77 interface.

Matrix Factorization: LAPACK Computational Routines

This section describes the LAPACK routines for matrix factorization. The following factorizations are supported:

- *LU* factorization
- Cholesky factorization of real symmetric positive-definite matrices
- Cholesky factorization of real symmetric positive-definite matrices with pivoting
- Cholesky factorization of Hermitian positive-definite matrices
- Cholesky factorization of Hermitian positive-definite matrices with pivoting
- Bunch-Kaufman factorization of real and complex symmetric matrices
- Bunch-Kaufman factorization of Hermitian matrices.

You can compute:

- the *LU* factorization using full and band storage of matrices
- the Cholesky factorization using full, packed, RFP, and band storage
- the Bunch-Kaufman factorization using full and packed storage.

?getrf
Computes the LU factorization of a general m-by-n matrix.

Syntax

```
call sgetrf( m, n, a, lda, ipiv, info )
call dgetrf( m, n, a, lda, ipiv, info )
call cgetrf( m, n, a, lda, ipiv, info )
call zgetrf( m, n, a, lda, ipiv, info )
call getrf( a [,ipiv] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes the *LU* factorization of a general *m*-by-*n* matrix *A* as

```
A = P*L*U,
```

where *P* is a permutation matrix, *L* is lower triangular with unit diagonal elements (lower trapezoidal if $m > n$) and *U* is upper triangular (upper trapezoidal if $m < n$). The routine uses partial pivoting, with row interchanges.

NOTE
This routine supports the Progress Routine feature. See Progress Function for details.

Input Parameters

m — INTEGER. The number of rows in the matrix *A* ($m \geq 0$).

n — INTEGER. The number of columns in *A*; $n \geq 0$.

a — REAL for sgetrf
DOUBLE PRECISION for dgetrf
COMPLEX for cgetrf
DOUBLE COMPLEX for zgetrf.
Array, size *lda* by * . Contains the matrix *A*. The second dimension of *a* must be at least max(1, *n*).

lda — INTEGER. The leading dimension of array *a*.

Output Parameters

a — Overwritten by *L* and *U*. The unit diagonal elements of *L* are not stored.

ipiv — INTEGER.

	Array, size at least `max(1,min(m, n))`. Contains the pivot indices; for `1 ≤i≤ min(m, n)`, row *i* was interchanged with row `ipiv(i)`.
info	`INTEGER`. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, u_{ii} is 0. The factorization has been completed, but *U* is exactly singular. Division by 0 will occur if you use the factor *U* for solving a system of linear equations.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `getrf` interface are as follows:

a	Holds the matrix *A* of size (*m*, *n*).
ipiv	Holds the vector of length min(*m*, *n*).

Application Notes

The computed *L* and *U* are the exact factors of a perturbed matrix *A* + *E*, where

$$|E| \le c(\min(m,n))\varepsilon P|L||U|$$

$c(n)$ is a modest linear function of *n*, and ε is the machine precision.

The approximate number of floating-point operations for real flavors is

$(2/3)n^3$	If $m = n$,
$(1/3)n^2(3m-n)$	If $m>n$,
$(1/3)m^2(3n-m)$	If $m<n$.

The number of operations for complex flavors is four times greater.

After calling this routine with $m = n$, you can call the following:

`?getrs`	to solve $A*X = B$ or $A^TX = B$ or $A^HX = B$
`?gecon`	to estimate the condition number of *A*
`?getri`	to compute the inverse of *A*.

Matrix Storage Schemes

?getrf_batch
Computes the LU factorization for 1 or more groups of general m-by-n matrices.

Syntax

```
call sgetrf_batch(m_array, n_array, A_array, lda_array, ipiv_array, group_size, group_count, info_array)
call dgetrf_batch(m_array, n_array, A_array, lda_array, ipiv_array, group_size, group_count, info_array)
call cgetrf_batch(m_array, n_array, A_array, lda_array, ipiv_array, group_size, group_count, info_array)
call zgetrf_batch(m_array, n_array, A_array, lda_array, ipiv_array, group_size, group_count, info_array)
```

Include Files

```
mkl.fi
```

Description

The `?getrf_batch` routines are similar to the `?getrf` counterparts, but instead compute the LU factorization for a group of general *m*-by-*n* matrices, processing one or more groups at once. Each group contains matrices with the same parameters.

The operation is defined as

```
i = 1
for g = 1 … group_count
    m_g n_g and lda_g in m_array(g), n_array(g) and lda_array(g)
    for j = 1 … group_size(g)
            A_i, ipiv_i in A_array(i), ipiv_array(i)
            A_i := P_i * L_i * U_i
            i = i + 1
    end for
end for
```

where P_i is a permutation matrix, L_i is lower triangular with unit diagonal elements (lower trapezoidal if $m_g > n_g$) and U_i is upper triangular (upper trapezoidal if $m_g < n_g$). These routines use partial pivoting, with row interchanges.

A_i represents matrices stored at the addresses pointed to by *A_array*. The dimensions of each matrix is m_g-by-n_g, where m_g and n_g are the g-th elements of *m_array* and *n_array*, respectively. Similarly, $ipiv_i$ represents the pivot arrays stored at addresses pointed to by *ipiv_array*, where the size of the pivoting arrays is min(m_g, n_g).

The number of entries in *A_array* and *ipiv_array* is *total_batch_count*, which is equal to the sum of all the entries in the array *group_size*.

Refer to ?getrf for a detailed description of the LU factorization of general matrices.

Input Parameters

m_array

INTEGER. Array of size *group_count*. For the group g, m_g = *m_array*(*g*) specifies the number of rows of the matrices A_i in group g.

The value of each element of *m_array* must be at least zero.

n_array

INTEGER. Array of size *group_count*. For the group g, n_g = *n_array*(*g*) specifies the number of columns of the matrices A_i in group g.

The value of each element of *n_array* must be at least zero.

A_array
`INTEGER*8` for Intel® 64 architecture

`INTEGER*4` for IA-32 architecture

Array, size *total_batch_count*, of pointers to arrays used to store A_i matrices.

lda_array
`INTEGER`. Array of size `group_count`. For group *g*, lda_g = `lda_array(g)` specifies the leading dimension of the matricies A_i in group *g*, as declared in the calling (sub)program.

The value of lda_g must be at least max(1, m_g).

group_count
`INTEGER`.

Specifies the number of groups. Must be at least 0.

group_size
`INTEGER`.

Array of size `group_count`. The element `group_size(g)` specifies the number of matrices in group *g*. Each element in `group_size` must be at least 0.

Output Parameters

A_array
Output array, overwritten by the *total_batch_count* LU-factored matrices. Each matrix A_i is overwritten by L_i and U_i. The unit diagonal elements of L_i are not stored.

ipiv_array
`INTEGER*8` for Intel® 64 architecture

`INTEGER*4` for IA-32 architecture

Array, size *total_batch_count*, of pointers to the pivot arrays associated with the LU-factored A_i matrices.

info_array
`INTEGER`.

Array of size *total_batch_count*, which reports the factorization status for each matrix.

If *info(i)* = 0, the execution is successful for A_i.

If *info(i)* = -*j*, the *j*-th parameter had an illegal value for A_i.

If *info(i)* = *j*, the *j*-th diagonal element of U_i is 0. The factorization has been completed, but U_i is exactly singular. Division by 0 will occur if you use the factor U_i for solving a system of linear equations.

Related Information

Refer to `?getrf_batch_strided` , which computes the LU factorization for a group of general *m*-by-*n* matrices that are allocated at a constant stride from each other in the same contiguous block of memory.

?getrf_batch_strided
Computes the LU factorization of a group of general m-by-n matrices that are stored at a constant stride from each other in a contiguous block of memory.

Syntax

```
call sgetrf_batch_strided(m, n, A, lda, stride_a, ipiv, stride_ipiv, batch_size, info)
```

```
call dgetrf_batch_strided(m, n, A, lda, stride_a, ipiv, stride_ipiv, batch_size, info)
call cgetrf_batch_strided(m, n, A, lda, stride_a, ipiv, stride_ipiv, batch_size, info)
call zgetrf_batch_strided(m, n, A, lda, stride_a, ipiv, stride_ipiv, batch_size, info)
```

Include Files

mkl.fi

Description

The ?getrf_batch_strided routines are similar to the ?getrf counterparts, but instead compute the LU factorization for a group of general *m*-by-*n* matrices.

All matrices have the same parameters (matrix size, leading dimension) and are stored at constant *stride_a* from each other in a contiguous block of memory. Their respective pivot arrays associated with each of the LU-factored A_i matrices are stored at constant *stride_ipiv* from each other. The operation is defined as

```
for i = 0 … batch_size-1
    A_i is a matrix at offset i * stride_a from A
    ipiv_i is an array at offset i * stride_ipiv from ipiv
    A_i :=  P_i * L_i* U_i
end for
```

where P_i is a permutation matrix, L_i is lower triangular with unit diagonal elements (lower trapezoidal if $m > n$) and U_i is upper triangular (upper trapezoidal if $m < n$). The routine uses partial pivoting, with row interchanges.

Input Parameters

m

INTEGER. The number of rows in the *A* matrices: $m \geq 0$.

n

INTEGER. The number of columns in the *A* matrices: $n \geq 0$.

A

REAL for sgetrf_batch_strided

DOUBLE PRECISION for dgetrf_batch_strided

COMPLEX for cgetrf_batch_strided

DOUBLE COMPLEX for zgetrf_batch_strided

The *A* array of size at least *stride_a* * *batch_size* holding the A_i matrices.

lda

INTEGER. Specifies the leading dimension of the A_i matrices; *lda* ≥ max(1,*m*).

stride_a

INTEGER.

Stride between two consecutive A_i matrices; *stride_a* ≥ *lda* * *n*.

stride_ipiv

INTEGER.

Stride between two consecutive pivot arrays; *stride_ipiv* ≥ min(*m*, *n*).

batch_size

INTEGER.

Number of A_i matrices to be factorized. Must be at least 0.

Output Parameters

A	Array holding the LU-factored A_i matrices. Each matrix is overwritten by their respective L_i and U_i factors. The unit diagonal elements of *L* are not stored.
ipiv	INTEGER Array of size at least *stride_ipiv* * *batch_size* holding the pivot array associated with each of the LU-factored A_i matrices. The pivot array $ipiv_i$ contains the pivot indices associated with matrix A_i; for $1 \le j \le \min(m,n)$, row j was interchanged with row $ipiv_i(j)$.
info	INTEGER. Array of size at least *batch_size*, which reports the factorization status for each matrix. If *info(i)* = 0, the execution is successful for A_i. If *info(i)* = -*j*, the *j*-th parameter had an illegal value for A_i. If *info(i)* = *j*, the *j*-th diagonal element of U_i is 0. The factorization has been completed, but U_i is exactly singular. Division by 0 will occur if you use the factor U_i for solving a system of linear equations.

After calling this routine with m=n, you can call the following:

?getrs_batch_strided

to solve systems of linear equations of the form $A_i * X_i = B_i$ *or* $A_i^T * X_i = B_i$ *or* $A_i^H * X_i = B_i$ with the group of LU-factored matrices.

Related Information

See ?getrf_batch, which computes the LU factorization for a group of general m-by-n matrices that are allocated at a constant stride from each other in the same contiguous block of memory.

mkl_?getrfnp

Computes the LU factorization of a general m-by-n matrix without pivoting.

Syntax

```
call mkl_sgetrfnp( m, n, a, lda, info )
call mkl_dgetrfnp( m, n, a, lda, info )
call mkl_cgetrfnp( m, n, a, lda, info )
call mkl_zgetrfnp( m, n, a, lda, info )
```

Include Files

- mkl.fi

Description

The routine computes the *LU* factorization of a general *m*-by-*n* matrix *A* as

```
A = L*U,
```

where *L* is lower triangular with unit-diagonal elements (lower trapezoidal if $m > n$) and *U* is upper triangular (upper trapezoidal if $m < n$). The routine does not use pivoting.

Input Parameters

m	INTEGER. The number of rows in the matrix *A* ($m \geq 0$).
n	INTEGER. The number of columns in *A*; $n \geq 0$.
a	REAL for mkl_sgetrfnp DOUBLE PRECISION for mkl_dgetrfnp COMPLEX for mkl_cgetrfnp DOUBLE COMPLEX for mkl_zgetrfnp. Array, size *lda* by *. Contains the matrix *A*. The second dimension of *a* must be at least max(1, *n*).
lda	INTEGER. The leading dimension of array *a*.

Output Parameters

a	Overwritten by *L* and *U*. The unit diagonal elements of *L* are not stored.
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, u_{ii} is 0. The factorization has been completed, but *U* is exactly singular. Division by 0 will occur if you use the factor *U* for solving a system of linear equations.

Application Notes

The approximate number of floating-point operations for real flavors is

$(2/3)n^3$	If $m = n$,
$(1/3)n^2(3m-n)$	If $m>n$,
$(1/3)m^2(3n-m)$	If $m<n$.

The number of operations for complex flavors is four times greater.

After calling this routine with $m = n$, you can call the following:

mkl_?getrinp	to compute the inverse of *A*

mkl_progress

Matrix Storage Schemes

?getrfnp_batch_strided

Computes the LU factorization, without pivoting, of a group of general m-by-n matrices that are stored at a constant stride from each other in a contiguous block of memory.

Syntax

```
call sgetrfnp_batch_strided(m, n, A, lda, stride_a, batch_size, info)
call dgetrfnp_batch_strided(m, n, A, lda, stride_a, batch_size, info)
call cgetrfnp_batch_strided(m, n, A, lda, stride_a, batch_size, info)
call zgetrfnp_batch_strided(m, n, A, lda, stride_a, batch_size, info)
```

Include Files

```
mkl.fi
```

Description

The `?getrfnp_batch_strided` routines are similar to the `?getrfnp` counterparts, but instead compute the LU factorization for a group of general *m*-by-*n* matrices.

All matrices `A` have the same parameters (matrix size, leading dimension) and are stored at constant `stride_a` from each other in a single block of memory. The operation is defined as

```
for i = 0 … batch_size-1
    A_i is a matrix at offset i * stride_a from A
    A_i :=  L_i* U_i
end for
```

where L_i is lower triangular with unit diagonal elements (lower trapezoidal if $m > n$) and U_i is upper triangular (upper trapezoidal if $m < n$). The routine does not perform any pivoting.

Input Parameters

`m`	`INTEGER`. The number of rows in the `A` matrices: $m \geq 0$.
`n`	`INTEGER`. The number of columns in the A_i matrices: $n \geq 0$.

`A`	`REAL` for `sgetrfnp_batch_strided`
	`DOUBLE PRECISION` for `dgetrfnp_batch_strided`
	`COMPLEX` for `cgetrfnp_batch_strided`
	`DOUBLE COMPLEX` for `zgetrfnp_batch_strided`
	The `A` array of size at least `stride_a` * `batch_size` holding the A_i matrices.

`lda`	`INTEGER`. Specifies the leading dimension of the A_i matrices; `lda` ≥ max(1,`m`).
`stride_a`	`INTEGER`. Stride between two consecutive A_i matrices; `stride_a` ≥ `lda` * `n`.
`batch_size`	`INTEGER`. Number of A_i matrices to be factorized. Must be at least 0.

Output Parameters

A	Array holding the LU-factored A_i matrices. Each matrix is overwritten by their respective L_i and U_i factors. The unit diagonal elements of *L* are not stored.
info	INTEGER. Array of size at least *batch_size*, which reports the factorization status for each matrix. If *info(i)* = 0, the execution is successful for A_i. If *info(i)* = -*j*, the *j*-th parameter had an illegal value for A_i. If *info(i)* = *j*, the *j*-th diagonal element of U_i is 0. The factorization has been completed, but U_i is exactly singular. Division by 0 will occur if you use the factor U_i for solving a system of linear equations.

After calling this routine with *m*=*n*, you can call the following:

?getrsnp_batch_strided

to solve systems of linear equations of the form $A_i * X_i = B_i$ *or* $A_i^T * X_i = B_i$ *or* $A_i^H * X_i = B_i$ with the group of LU-factored matrices.

mkl_?getrfnpi
Performs LU factorization (complete or incomplete) of a general matrix without pivoting.

Syntax

```
call mkl_sgetrfnpi (m, n, nfact, a, lda, info)
call mkl_dgetrfnpi (m, n, nfact, a, lda, info )
call mkl_cgetrfnpi (m, n, nfact, a, lda, info )
call mkl_zgetrfnpi (m, n, nfact, a, lda, info )
call mkl_getrfnpi ( a [, nfact] [, info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes the LU factorization of a general *m*-by-*n* matrix *A* without using pivoting. It supports incomplete factorization. The factorization has the form:

*A = L*U*,

where *L* is lower triangular with unit diagonal elements (lower trapezoidal if *m* > *n*) and *U* is upper triangular (upper trapezoidal if *m* < *n*).

Incomplete factorization has the form:

$$A = L * U + \tilde{A}$$

where *L* is lower trapezoidal with unit diagonal elements, *U* is upper trapezoidal, and

$$\tilde{A}$$

is the unfactored part of matrix *A*. See the application notes section for further details.

NOTE
Use `?getrf` if it is possible that the matrix is not diagonal dominant.

Input Parameters

The data types are given for the Fortran interface.

m — INTEGER. The number of rows in matrix *A*; *m*≥ 0.

n — INTEGER. The number of columns in matrix *A*; *n*≥ 0.

nfact — INTEGER. The number of rows and columns to factor; 0 ≤*nfact*≤ min(*m*, *n*). Note that if *nfact* < min(*m*, *n*), incomplete factorization is performed.

a — `REAL` for `mkl_sgetrfnpi`

`DOUBLE PRECISION` for `mkl_dgetrfnpi`

`COMPLEX` for `mkl_cgetrfnpi`

`DOUBLE COMPLEX` for `mkl_zgetrfnpi`

Array of size `(lda,*)`. Contains the matrix *A*. The second dimension of *a* must be at least max(1, *n*).

lda — INTEGER. The leading dimension of array *a*. *lda*≥ max(1, *m*).

Output Parameters

a — Overwritten by *L* and *U*. The unit diagonal elements of *L* are not stored.

When incomplete factorization is specified by setting *nfact* < min(*m*, *n*), *a* also contains the unfactored submatrix

$$\tilde{A}_{22}$$

. See the application notes section for further details.

info — INTEGER. If *info*=0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, u_{ii} is 0. The requested factorization has been completed, but *U* is exactly singular. Division by 0 will occur if factorization is completed and factor *U* is used for solving a system of linear equations.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `getrf` interface are as follows:

a — Holds the matrix *A* of size (*m*, *n*).

Application Notes

The computed *L* and *U* are the exact factors of a perturbed matrix *A* + *E*, with

$$|E| \leq c(\min(m, n))\varepsilon|L||U|$$

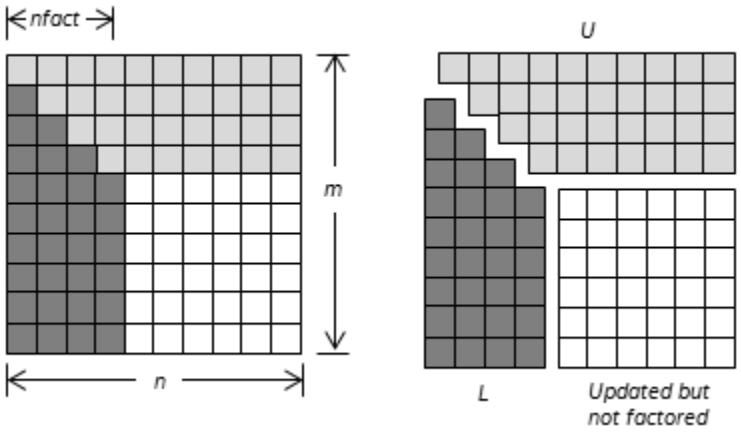
where `c(n)` is a modest linear function of *n*, and ε is the machine precision.

The approximate number of floating-point operations for real flavors is

$(2/3)n^3$	If `m = n` = `nfact`
$(1/3)n^2(3m-n)$	If `m>n = nfact`
$(1/3)m^2(3n-m)$	If `m = nfact<n`
$(2/3)n^3 - (n-nfact)^3$	If `m = n`, `nfact< min(m, n)`
$(1/3)(n^2(3m-n) - (n-nfact)^2(3m - 2nfact - n))$	If `m>n > nfact`
$(1/3)(m^2(3n-m) - (m-nfact)^2(3n - 2nfact - m))$	If `nfact < m < n`

The number of operations for complex flavors is four times greater.

When incomplete factorization is specified, the first `nfact` rows and columns are factored, with the update of the remaining rows and columns of *A* as follows:



If matrix *A* is represented as a block 2-by-2 matrix:

$$A = \begin{bmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{bmatrix}$$

where

- A_{11} is a square matrix of order `nfact`,
- A_{21} is an (`m` - `nfact`)-by-`nfact` matrix,
- A_{12} is an `nfact`-by-(`n` - `nfact`) matrix, and
- A_{22} is an (`m` - `nfact`)-by-(`n` - `nfact`) matrix.

The result is

$$A = \begin{bmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{bmatrix} = \begin{bmatrix} L_1 \\ L_2 \end{bmatrix} \cdot \begin{bmatrix} U_1 & U_2 \end{bmatrix} + \begin{bmatrix} 0 & 0 \\ 0 & \tilde{A}_{22} \end{bmatrix}$$

L_1 is a lower triangular square matrix of order `nfact` with unit diagonal and U_1 is an upper triangular square matrix of order `nfact`. L_1 and U_1 result from LU factorization of matrix A_{11}: $A_{11} = L_1U_1$.

L_2 is an (m - $nfact$)-by-$nfact$ matrix and $L_2 = A_{21}U_1^{-1}$. U_2 is an $nfact$-by-(n - $nfact$) matrix and $U_2 = L_1^{-1}A_{12}$.

$$\tilde{A}_{22}$$

is an (m - $nfact$)-by-(n - $nfact$) matrix and

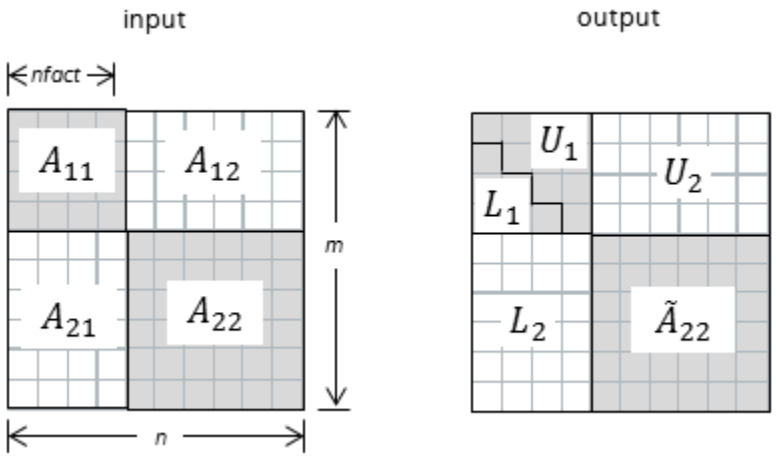
$$\tilde{A}_{22}$$

$= A_{22} - L_2U_2$.

On exit, elements of the upper triangle U_1 are stored in place of the upper triangle of block A_{11} in array a; elements of the lower triangle L_1 are stored in the lower triangle of block A_{11} in array a (unit diagonal elements are not stored). Elements of L_2 replace elements of A_{21}; U_2 replaces elements of A_{12} and

$$\tilde{A}_{22}$$

replaces elements of A_{22}.



?getrf2
Computes LU factorization using partial pivoting with row interchanges.

Syntax

```
call sgetrf2 (m, n, a, lda, ipiv, info )
call dgetrf2 (m, n, a, lda, ipiv, info )
call cgetrf2 (m, n, a, lda, ipiv, info )
call zgetrf2 (m, n, a, lda, ipiv, info )
```

Include Files

- `mkl.fi`

Description

`?getrf2` computes an LU factorization of a general m-by-n matrix A using partial pivoting with row interchanges.

The factorization has the form

$A = P * L * U$

where *P* is a permutation matrix, *L* is lower triangular with unit diagonal elements (lower trapezoidal if $m > n$), and *U* is upper triangular (upper trapezoidal if $m < n$).

This is the recursive version of the algorithm. It divides the matrix into four submatrices:

$$A = \begin{pmatrix} A11 & A12 \\ A21 & A22 \end{pmatrix}$$

where *A11* is *n1* by *n1* and *A22* is *n2* by *n2* with *n1* = min(m, n), and *n2* = n - *n1*.

The subroutine calls itself to factor $\begin{pmatrix} A11 \\ A12 \end{pmatrix}$,

do the swaps on $\begin{pmatrix} A12 \\ A22 \end{pmatrix}$, solve *A12*, update *A22*, then it calls itself to factor *A22* and do the swaps on *A21*.

Input Parameters

m	INTEGER. The number of rows of the matrix A. $m >= 0$.
n	INTEGER. The number of columns of the matrix A. $n >= 0$.

a	`REAL` for `sgetrf2`
	`DOUBLE PRECISION` for `dgetrf2`
	`COMPLEX` for `cgetrf2`
	`DOUBLE COMPLEX` for `zgetrf2`
	Array, size (*lda*,*n*).
	On entry, the *m*-by-*n* matrix to be factored.

lda	INTEGER. The leading dimension of the array *a*. *lda* >= max(1,*m*).

Output Parameters

a	On exit, the factors *L* and *U* from the factorization *A* = *P* * *L* * *U*; the unit diagonal elements of *L* are not stored.
ipiv	INTEGER. Array, size (min(*m*,*n*)). The pivot indices; for 1 <= *i* <= min(*m*,*n*), row *i* of the matrix was interchanged with row *ipiv(i)*.
info	INTEGER. = 0: successful exit. < 0: if info = -*i*, the *i*-th argument had an illegal value. > 0: if info = *i*, $U_{i,i}$ is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, and division by zero will occur if it is used to solve a system of equations.

?getri_oop_batch
Computes the inverses for 1 or more groups of LU factored, n-by-n matrices.

Syntax

```
call sgetri_oop_batch(n_array, A_array, lda_array, ipiv_array, Ainv_array, ldainv_array, group_count, group_size, info_array)
```

```
call dgetri_oop_batch(n_array, A_array, lda_array, ipiv_array, Ainv_array, ldainv_array,
group_count, group_size, info_array)
```

```
call cgetri_oop_batch(n_array, A_array, lda_array, ipiv_array, Ainv_array, ldainv_array,
group_count, group_size, info_array)
```

```
call zgetri_oop_batch(n_array, A_array, lda_array, ipiv_array, Ainv_array, ldainv_array,
group_count, group_size, info_array)
```

Include Files

mkl.fi

Description

The ?getri_oop_batch routines are similar to the ?getri counterparts, but instead compute the inverses for groups of n-by-n LU factored matrices, processing one or more groups at once. Each group contains matrices with the same parameters.

The operation is defined as

```
i = 1
for g = 1 … group_count
    n_g and lda_g in n_array(g) and lda_array(g)
    for j = 1 … group_size(g)
    A_i, Ainv_i, ipiv_i in A_array(i), Ainv_array(i), ipiv_array(i)
    Ainv_i :=  inv(P_i * L_i* U_i)
    i = i + 1
    end for
end for
```

where P_i is a permutation matrix, L_i is lower triangular with unit diagonal elements and U_i is upper triangular. These routines use partial pivoting, with row interchanges.

A_i and $Ainv_i$ represents matrices stored at the addresses pointed to by *A_array* and *Ainv_array*. The dimensions of each matrix is n_g-by-n_g, where n_g is the g-th elements of *n_array*. Similarly, $ipiv_i$ represents the pivot arrays stored at addresses pointed to by *ipiv_array*, where the size of the pivoting arrays is n_g.

The number of entries in *A_array*, *Ainv_array* and *ipiv_array* is *total_batch_count*, which is equal to the sum of all the entries in the array *group_size*.

Refer to ?getri for a detailed description of the inversion of LU factorized matrices.

Input Parameters

n_array

INTEGER. Array of size *group_count*. For the group g, n_g = *n_array*(*g*) specifies the order of the matrices A_i in group g.

The value of each element of *n_array* must be at least zero.

A_array

INTEGER*8 for Intel® 64 architecture

INTEGER*4 for IA-32 architecture

Array, size *total_batch_count*, of pointers to the A_i matrices.

lda_array

INTEGER. Array of size *group_count*. For group g, lda_g = *lda_array*(*g*) specifies the leading dimension of the matricies A_i in group g, as declared in the calling (sub)program.

The value of lda_g must be at least max(1, n_g).

ipiv_array

INTEGER*8 for Intel® 64 architecture

INTEGER*4 for IA-32 architecture

Array, size *total_batch_count*, of pointers to the pivot arrays associated with the LU-factored A_i matrices, as returned by ?getrf_batch.

group_count INTEGER.

Specifies the number of groups. Must be at least 0.

group_size INTEGER.

Array of size *group_count*. The element *group_size*(*g*) specifies the number of matrices in group *g*. Each element in *group_size* must be at least 0.

Output Parameters

Ainv_array INTEGER*8 for Intel® 64 architecture

INTEGER*4 for IA-32 architecture

Array, size *total_batch_count*, of pointers to the $Ainv_i$ matrices.

Each matrix is overwritten by the n_g-by-n_g matrix $inv(A_i)$.

ldainv_array INTEGER.

Array of size *group_count*. For group *g*, $ldainv_g$ = *ldainv_array*(*g*) specifies the leading dimension of the matrices $Ainv_i$ in group *g*.

The value of $ldainv_g$ must be at least max(1, n_g).

info_array INTEGER.

Array of size *total_batch_count*, which reports the inversion status for each matrix.

If *info(i)* = 0, the execution is successful for A_i.

If *info(i)* = -*j*, the *j*-th parameter had an illegal value for A_i.

If *info(i)* = *j*, the *j*-th diagonal element of the factor U_i is 0, U_i is singular, and the inversion could not be completed.

Related Information

Refer to ?getri_oop_batch_strided , which computes inverses for a group of *n*-by-*n* matrices that are allocated at a constant stride from each other in the same contiguous block of memory.

?getri_oop_batch_strided
Computes the inverses of a group of LU factored matrices that are stored at a constant stride from each other in a contiguous block of memory.

Syntax

```
call sgetri_oop_batch_strided(n, A, lda, stride_a, ipiv, stride_ipiv, Ainv, ldainv, stride_ainv, batch_size, info)
```

```
call dgetri_oop_batch_strided(n, A, lda, stride_a, ipiv, stride_ipiv, Ainv, ldainv, stride_ainv, batch_size, info)
```

```
call cgetri_oop_batch_strided(n, A, lda, stride_a, ipiv, stride_ipiv, Ainv, ldainv, stride_ainv, batch_size, info)
```

```
call zgetri_oop_batch_strided(n, A, lda, stride_a, ipiv, stride_ipiv, Ainv, ldainv,
stride_ainv, batch_size, info)
```

Include Files

```
mkl.fi
```

Description

The `?getri_oop_batch_strided` routines are similar to the `?getri` counterparts, but instead compute the inverses for a group of LU factored matrices.

All matrices have the same parameters (matrix size, leading dimension) and are stored at constant *stride_a* from each other in a contiguous block of memory. The output arrays are stored at constant *stride_ainv* from each other in a contiguous block of memory. Their respective pivot arrays associated with each of the LU-factored A_i matrices are stored at constant *stride_ipiv* from each other.

The operation is defined as

```
for i = 0 … batch_size-1
    A_i is a matrix at offset i * stride_a from A
    ipiv_i is an array at offset i * stride_ipiv from ipiv
    Ainv_i is a matrix at offset i * stride_ainv from Ainv
    Ainv_i :=  inv(P_i * L_i* U_i)
end for
```

where P_i is a permutation matrix, L_i is lower triangular with unit diagonal elements (lower trapezoidal if $m>n$), and U_i is upper triangular (upper trapezoidal if $m<n$). The routine uses partial pivoting, with row interchanges.

Input Parameters

n
: `INTEGER`. The number of columns in the A_i matrices; $n \geq 0$.

A
: REAL for `sgetri_oop_batch_strided`
: DOUBLE PRECISION for `dgetri_oop_batch_strided`
: COMPLEX for `cgetri_oop_batch_strided`
: DOUBLE COMPLEX for `zgetri_oop_batch_strided`
: The *A* array of size at least *stride_a* * *batch_size* holding the A_i matrices.

lda
: `INTEGER`. Specifies the leading dimension of the A_i matrices; *lda* ≥ *n*.

stride_a
: `INTEGER`. Stride between two consecutive A_i matrices; ; *stride_a* ≥ *lda* * *n*.

ipiv
: `INTEGER`.
: Array of size at least *stride_ipiv* * *batch_size*, holding the pivot array associated with each of the LU-factored A_i matrices, as returned by `?getrf_batch_strided`.

stride_ipiv
: `INTEGER`.
: Stride between two consecutive pivot arrays; *stride_ipiv* ≥ *n*.

ldainv
: `INTEGER`. Specifies the leading dimension of the $Ainv_i$ matrices; *ldainv* ≥ *n*.

stride_ainv
: `INTEGER`. Stride between two consecutive $Ainv_i$ matrices; ; *stride_ainv* ≥ *ldainv* * *n*.

batch_size
: `INTEGER`.

Number of A_i matrices to be factorized. Must be at least 0.

Output Parameters

Ainv — Array holding the inverses $Ainv_i$ matrices. Each matrix is overwritten by their respective L_i and $U_i$factors. The unit diagonal elements of L are not stored.

info — INTEGER.

Array of size *batch_size*, which reports the factorization status for each matrix.

If *info(i)* = 0, the execution is successful for A_i.

If *info(i)* = -*j*, the *j*-th parameter had an illegal value for A_i.

If *info(i)* = *j*, the *j*-th diagonal element of the factor U_i is 0, U_i is exactly singular. Division by - will occur if you use the factor U_i to solve a system of linear equations.

?gbtrf

Computes the LU factorization of a general m-by-n band matrix.

Syntax

```
call sgbtrf( m, n, kl, ku, ab, ldab, ipiv, info )
call dgbtrf( m, n, kl, ku, ab, ldab, ipiv, info )
call cgbtrf( m, n, kl, ku, ab, ldab, ipiv, info )
call zgbtrf( m, n, kl, ku, ab, ldab, ipiv, info )
call gbtrf( ab [,kl] [,m] [,ipiv] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine forms the *LU* factorization of a general *m*-by-*n* band matrix *A* with *kl* non-zero subdiagonals and *ku* non-zero superdiagonals, that is,

```
A = P*L*U,
```

where *P* is a permutation matrix; *L* is lower triangular with unit diagonal elements and at most *kl* non-zero elements in each column; *U* is an upper triangular band matrix with *kl* + *ku* superdiagonals. The routine uses partial pivoting, with row interchanges (which creates the additional *kl* superdiagonals in *U*).

NOTE
This routine supports the Progress Routine feature. See Progress Function for details.

Input Parameters

m — INTEGER. The number of rows in matrix *A*; $m \geq 0$.

n — INTEGER. The number of columns in matrix *A*; $n \geq 0$.

kl — INTEGER. The number of subdiagonals within the band of *A*; $kl \geq 0$.

ku — INTEGER. The number of superdiagonals within the band of *A*; $ku \geq 0$.

ab — REAL for sgbtrf

DOUBLE PRECISION for dgbtrf

COMPLEX for cgbtrf

DOUBLE COMPLEX for zgbtrf.

Array, size *ldab* by *.

The array *ab* contains the matrix *A* in band storage, in rows *kl* + 1 to 2**kl* + *ku* + 1; rows 1 to *kl* of the array need not be set. The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows:

ab(*kl* + *ku* + 1 + *i* – *j*, *j*) = *a*(*i*,*j*) for max(1,*j*–*ku*) ≤*i*≤ min(*m*,*j*+*kl*).

ldab — INTEGER. The leading dimension of the array *ab*. (*ldab*≥ 2**kl* + *ku* + 1)

Output Parameters

ab — Overwritten by *L* and *U*. *U* is stored as an upper triangular band matrix with *kl* + *ku* superdiagonals in rows 1 to *kl* + *ku* + 1, and the multipliers used during the factorization are stored in rows *kl* + *ku* + 2 to 2**kl* + *ku* + 1.

See Application Notes below for further details.

ipiv — INTEGER.

Array, size at least max(1,min(*m*, *n*)). The pivot indices; for 1 ≤*i*≤ min(*m*, *n*) , row *i* was interchanged with row *ipiv*(*i*).

info — If *info* = 0, the execution is successful.

If *info* = –*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, u_{ii} is 0. The factorization has been completed, but *U* is exactly singular. Division by 0 will occur if you use the factor *U* for solving a system of linear equations.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine gbtrf interface are as follows:

ab — Holds the array *A* of size (2**kl*+*ku*+1,*n*).

ipiv — Holds the vector of length min(*m*,*n*).

kl — If omitted, assumed *kl* = *ku*.

ku	Restored as *ku* = *lda*-2**kl*-1.
m	If omitted, assumed *m* = *n*.

Application Notes

The computed *L* and *U* are the exact factors of a perturbed matrix *A* + *E*, where

$$|E| \le c(kl+ku+1)\ \varepsilon P|L||U|$$

$c(k)$ is a modest linear function of *k*, and ε is the machine precision.

The total number of floating-point operations for real flavors varies between approximately $2n(ku+1)kl$ and $2n(kl+ku+1)kl$. The number of operations for complex flavors is four times greater. All these estimates assume that *kl* and *ku* are much less than $\min(m,n)$.

The band storage scheme is illustrated by the following example, when *m* = *n* = 6, *kl* = 2, *ku* = 1:

on entry

$$\begin{bmatrix} * & * & * & + & + & + \\ * & * & + & + & + & + \\ * & a_{12} & a_{23} & a_{34} & a_{45} & a_{56} \\ a_{11} & a_{22} & a_{33} & a_{44} & a_{55} & a_{66} \\ a_{21} & a_{32} & a_{43} & a_{54} & a_{65} & * \\ a_{31} & a_{42} & a_{53} & a_{64} & * & * \end{bmatrix}$$

on exit

$$\begin{bmatrix} * & * & * & u_{14} & u_{25} & u_{36} \\ * & * & u_{13} & u_{24} & u_{35} & u_{46} \\ * & u_{12} & u_{23} & u_{34} & u_{45} & u_{56} \\ u_{11} & u_{22} & u_{33} & u_{44} & u_{55} & u_{66} \\ m_{21} & m_{32} & m_{43} & m_{54} & m_{65} & * \\ m_{31} & m_{42} & m_{53} & m_{64} & * & * \end{bmatrix}$$

Elements marked * are not used; elements marked + need not be set on entry, but are required by the routine to store elements of *U* because of fill-in resulting from the row interchanges.

After calling this routine with *m* = *n*, you can call the following routines:

gbtrs	to solve *A*X* = *B* or A^T*X* = *B* or A^H*X* = *B*
gbcon	to estimate the condition number of *A*.

mkl_progress

Matrix Storage Schemes

?gttrf
Computes the LU factorization of a tridiagonal matrix.

Syntax

```
call sgttrf( n, dl, d, du, du2, ipiv, info )
call dgttrf( n, dl, d, du, du2, ipiv, info )
call cgttrf( n, dl, d, du, du2, ipiv, info )
call zgttrf( n, dl, d, du, du2, ipiv, info )
call gttrf( dl, d, du, du2 [, ipiv] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes the *LU* factorization of a real or complex tridiagonal matrix *A* using elimination with partial pivoting and row interchanges.

The factorization has the form

```
A = L*U,
```

where *L* is a product of permutation and unit lower bidiagonal matrices and *U* is upper triangular with nonzeroes in only the main diagonal and first two superdiagonals.

Input Parameters

n

INTEGER. The order of the matrix *A*; $n \geq 0$.

dl, *d*, *du*

REAL for sgttrf

DOUBLE PRECISION for dgttrf

COMPLEX for cgttrf

DOUBLE COMPLEX for zgttrf.

Arrays containing elements of *A*.

The array *dl* of dimension (*n* – 1) contains the subdiagonal elements of *A*.

The array *d* of dimension *n* contains the diagonal elements of *A*.

The array *du* of dimension (*n* – 1) contains the superdiagonal elements of *A*.

Output Parameters

dl

Overwritten by the (*n*–1) multipliers that define the matrix *L* from the *LU* factorization of *A*. The matrix *L* has unit diagonal elements, and the (*n*–1) elements of *dl* form the subdiagonal. All other elements of *L* are zero.

d

Overwritten by the *n* diagonal elements of the upper triangular matrix *U* from the *LU* factorization of *A*.

du

Overwritten by the (*n*–1) elements of the first superdiagonal of *U*.

du2

REAL for sgttrf

DOUBLE PRECISION for dgttrf

COMPLEX for cgttrf

DOUBLE COMPLEX for zgttrf.

Array, dimension (*n* –2). On exit, *du2* contains (*n*–2) elements of the second superdiagonal of *U*.

ipiv

INTEGER.

	Array, dimension (*n*). The pivot indices: for $1 \le i \le n$, row *i* was interchanged with row *ipiv*(*i*). *ipiv*(*i*) is always *i* or *i*+1; *ipiv*(*i*) = *i* indicates a row interchange was not required.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, u_{ii} is 0. The factorization has been completed, but *U* is exactly singular. Division by zero will occur if you use the factor *U* for solving a system of linear equations.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine gttrf interface are as follows:

dl	Holds the vector of length (*n*-1).
d	Holds the vector of length *n*.
du	Holds the vector of length (*n*-1).
du2	Holds the vector of length (*n*-2).
ipiv	Holds the vector of length *n*.

Application Notes

?gbtrs	to solve *A*X = B* or $A^T*X = B$ or $A^H*X = B$
?gbcon	to estimate the condition number of *A*.

?dttrfb

Computes the factorization of a diagonally dominant tridiagonal matrix.

Syntax

```
call sdttrfb( n, dl, d, du, info )
call ddttrfb( n, dl, d, du, info )
call cdttrfb( n, dl, d, du, info )
call zdttrfb( n, dl, d, du, info )
call dttrfb( dl, d, du [, info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The ?dttrfb routine computes the factorization of a real or complex tridiagonal matrix *A* with the BABE (Burning At Both Ends) algorithm without pivoting. The factorization has the form

$A = L_1 * U * L_2$

where

- L_1 and L_2 are unit lower bidiagonal with *k* and *n* - *k* - 1 subdiagonal elements, respectively, where *k* = *n*/2, and
- *U* is an upper bidiagonal matrix with nonzeroes in only the main diagonal and first superdiagonal.

Input Parameters

n	INTEGER. The order of the matrix *A*; $n \geq 0$.
dl, *d*, *du*	REAL for sdttrfb DOUBLE PRECISION for ddttrfb COMPLEX for cdttrfb DOUBLE COMPLEX for zdttrfb. Arrays containing elements of *A*. The array *dl* of dimension (*n* – 1) contains the subdiagonal elements of *A*. The array *d* of dimension *n* contains the diagonal elements of *A*. The array *du* of dimension (*n* – 1) contains the superdiagonal elements of *A*.

Output Parameters

dl	Overwritten by the (*n* –1) multipliers that define the matrix *L* from the *LU* factorization of *A*.
d	Overwritten by the *n* diagonal element reciprocals of the upper triangular matrix *U* from the factorization of *A*.
du	Overwritten by the (*n*–1) elements of the superdiagonal of *U*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = –*i*, the *i*-th parameter had an illegal value. If *info* = *i*, u_{ii} is 0. The factorization has been completed, but *U* is exactly singular. Division by zero will occur if you use the factor *U* for solving a system of linear equations.

Application Notes

A diagonally dominant tridiagonal system is defined such that $|d_i| > |dl_{i-1}| + |du_i|$ for any *i*:

$1 < i < n$, and $|d_1| > |du_1|$, $|d_n| > |dl_{n-1}|$

The underlying BABE algorithm is designed for diagonally dominant systems. Such systems are free from the numerical stability issue unlike the canonical systems that use elimination with partial pivoting (see ?gttrf). The diagonally dominant systems are much faster than the canonical systems.

NOTE

- The current implementation of BABE has a potential accuracy issue on very small or large data close to the underflow or overflow threshold respectively. Scale the matrix before applying the solver in the case of such input data.
- Applying the `?dttrfb` factorization to non-diagonally dominant systems may lead to an accuracy loss, or false singularity detected due to no pivoting.

?potrf
Computes the Cholesky factorization of a symmetric (Hermitian) positive-definite matrix.

Syntax

```
call spotrf( uplo, n, a, lda, info )
call dpotrf( uplo, n, a, lda, info )
call cpotrf( uplo, n, a, lda, info )
call zpotrf( uplo, n, a, lda, info )
call potrf( a [, uplo] [,info] )
```

Include Files

- `mkl.fi, lapack.f90`

Description

The routine forms the Cholesky factorization of a symmetric positive-definite or, for complex data, Hermitian positive-definite matrix *A*:

$A = U^T * U$ for real data, $A = U^H * U$ for complex data	if *uplo*='U'
$A = L * L^T$ for real data, $A = L * L^H$ for complex data	if *uplo*='L'

where *L* is a lower triangular matrix and *U* is upper triangular.

NOTE
This routine supports the Progress Routine feature. See Progress Function for details.

Input Parameters

uplo

`CHARACTER*1`. Must be `'U'` or `'L'`.

Indicates whether the upper or lower triangular part of *A* is stored and how *A* is factored:

If *uplo* = `'U'`, the array *a* stores the upper triangular part of the matrix *A*, and the strictly lower triangular part of the matrix is not referenced.

If *uplo* = `'L'`, the array *a* stores the lower triangular part of the matrix *A*, and the strictly upper triangular part of the matrix is not referenced.

n	INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.
a	REAL for spotrf DOUBLE PRECISION for dpotrf COMPLEX for cpotrf DOUBLE COMPLEX for zpotrf. Array, size (*lda*,*). The array *a* contains either the upper or the lower triangular part of the matrix *A* (see *uplo*). The second dimension of *a* must be at least max(1, *n*).
lda	INTEGER. The leading dimension of *a*.

Output Parameters

a	The upper or lower triangular part of *a* is overwritten by the Cholesky factor *U* or *L*, as specified by *uplo*.
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite, and the factorization could not be completed. This may indicate an error in forming the matrix *A*.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine potrf interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

If *uplo* = 'U', the computed factor *U* is the exact factor of a perturbed matrix *A* + *E*, where

$$|E| \le c(n)\varepsilon |U^H| |U|, |e_{ij}| \le c(n)\varepsilon \sqrt{a_{ii}a_{jj}}$$

$c(n)$ is a modest linear function of *n*, and ε is the machine precision.

A similar estimate holds for *uplo* = 'L'.

The total number of floating-point operations is approximately $(1/3)n^3$ for real flavors or $(4/3)n^3$ for complex flavors.

After calling this routine, you can call the following routines:

?potrs	to solve *A***X* = *B*

?pocon	to estimate the condition number of *A*
?potri	to compute the inverse of *A*.

Matrix Storage Schemes

?potrf2
Computes Cholesky factorization using a recursive algorithm.

Syntax

```
call spotrf2(uplo, n, a, lda, info)
call dpotrf2(uplo, n, a, lda, info)
call cpotrf2(uplo, n, a, lda, info)
call zpotrf2(uplo, n, a, lda, info)
```

Include Files

- mkl.fi

Description

?potrf2 computes the Cholesky factorization of a real or complex symmetric positive definite matrix *A* using the recursive algorithm.

The factorization has the form

for real flavors:

A = U^T * *U*, if *uplo* = 'U', or

A = *L* * L^T, if *uplo* = 'L',

for complex flavors:

A = U^H * *U*, if *uplo* = 'U',

or *A* = *L* * L^H, if *uplo* = 'L',

where *U* is an upper triangular matrix and *L* is lower triangular.

This is the recursive version of the algorithm. It divides the matrix into four submatrices:

$$A = \begin{pmatrix} A11 & A12 \\ A21 & A22 \end{pmatrix}$$

where *A11* is *n1* by *n1* and *A22* is *n2* by *n2*, with *n1* = *n*/2 and *n2* = *n*-*n1*.

The subroutine calls itself to factor *A11*. Update and scale *A21* or *A12*, update *A22* then call itself to factor *A22*.

Input Parameters

uplo	CHARACTER*1. = 'U': Upper triangle of *A* is stored; = 'L': Lower triangle of *A* is stored.
n	INTEGER. The order of the matrix *A*.

n ≥ 0.

a

REAL for spotrf2

DOUBLE PRECISION for dpotrf2

COMPLEX for cpotrf2

DOUBLE COMPLEX for zpotrf2

Array, size (*lda*, *n*).

On entry, the symmetric matrix *A*.

If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *a* is not referenced.

If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *a* is not referenced.

lda

INTEGER. The leading dimension of the array *a*.

lda ≥ max(1,*n*).

Output Parameters

a

On exit, if *info* = 0, the factor *U* or *L* from the Cholesky factorization.

For real flavors:

$A = U^T*U$ or $A = L*L^T$;

For complex flavors:

$A = U^H*U$ or $A = L*L^H$.

info

INTEGER. = 0: successful exit

< 0: if *info* = -*i*, the *i*-th argument had an illegal value

> 0: if *info* = *i*, the leading minor of order *i* is not positive definite, and the factorization could not be completed.

?pstrf

Computes the Cholesky factorization with complete pivoting of a real symmetric (complex Hermitian) positive semidefinite matrix.

Syntax

```
call spstrf( uplo, n, a, lda, piv, rank, tol, work, info )
call dpstrf( uplo, n, a, lda, piv, rank, tol, work, info )
call cpstrf( uplo, n, a, lda, piv, rank, tol, work, info )
call zpstrf( uplo, n, a, lda, piv, rank, tol, work, info )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes the Cholesky factorization with complete pivoting of a real symmetric (complex Hermitian) positive semidefinite matrix. The form of the factorization is:

$P^T * A * P = U^T * U$, if *uplo* = 'U' for real flavors,
$P^T * A * P = U^H * U$, if *uplo* = 'U' for complex flavors,
$P^T * A * P = L * L^T$, if *uplo* = 'L' for real flavors,
$P^T * A * P = L * L^H$, if *uplo* = 'L' for complex flavors,

where *P* is a permutation matrix stored as vector *piv*, and *U* and *L* are upper and lower triangular matrices, respectively.

This algorithm does not attempt to check that *A* is positive semidefinite. This version of the algorithm calls level 3 BLAS.

Input Parameters

uplo

CHARACTER*1. Must be 'U' or 'L'.

Indicates whether the upper or lower triangular part of *A* is stored:

If *uplo* = 'U', the array *a* stores the upper triangular part of the matrix *A*, and the strictly lower triangular part of the matrix is not referenced.

If *uplo* = 'L', the array *a* stores the lower triangular part of the matrix *A*, and the strictly upper triangular part of the matrix is not referenced.

n

INTEGER. The order of matrix *A*; $n \geq 0$.

a

REAL for spstrf

DOUBLE PRECISION for dpstrf

COMPLEX for cpstrf

DOUBLE COMPLEX for zpstrf.

Array *a*, size (*lda*,*). The array *a* contains either the upper or the lower triangular part of the matrix *A* (see *uplo*). The second dimension of *a* must be at least max(1, *n*).

work

REAL for spstrf and cpstrf

DOUBLE PRECISION for dpstrf and zpstrf.

work(*) is a workspace array. The dimension of *work* is at least max(1,2**n*).

tol

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

User defined tolerance. If *tol* < 0, then $n*\varepsilon*\max(A_{k,k})$, where ε is the machine precision, will be used (see Error Analysis for the definition of machine precision). The algorithm terminates at the (*k*-1)-st step, if the pivot $\leq tol$.

lda

INTEGER. The leading dimension of *a*; at least max(1, *n*).

Output Parameters

a	If *info* = 0, the factor U or L from the Cholesky factorization is as described in *Description*.
piv	INTEGER. Array, size at least max(1, *n*). The array *piv* is such that the nonzero entries are $P_{piv(k),k}$ ($1 \le k \le n$).
rank	INTEGER. The rank of *a* given by the number of steps the algorithm completed.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*k*, the *k*-th argument had an illegal value. If *info* > 0, the matrix *A* is either rank deficient with a computed rank as returned in *rank*, or is not positive semidefinite.

Description

The routine forms the Cholesky factorization of a symmetric positive-definite or, for complex data, a Hermitian positive-definite matrix *A*:

$A = U^T*U$ for real data, $A = U^H*U$ for complex data	if *uplo*='U'
$A = L*L^T$ for real data, $A = L*L^H$ for complex data	if *uplo*='L'

where *L* is a lower triangular matrix and *U* is upper triangular.

The matrix *A* is in the Rectangular Full Packed (RFP) format. For the description of the RFP format, see Matrix Storage Schemes.

This is the block version of the algorithm, calling Level 3 BLAS.

Input Parameters

transr	CHARACTER*1. Must be 'N', 'T' (for real data) or 'C' (for complex data). If *transr* = 'N', the Normal *transr* of RFP *A* is stored. If *transr* = 'T', the Transpose *transr* of RFP *A* is stored. If *transr* = 'C', the Conjugate-Transpose *transr* of RFP *A* is stored.
uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of *A* is stored: If *uplo* = 'U', the array *a* stores the upper triangular part of the matrix *A*. If *uplo* = 'L', the array *a* stores the lower triangular part of the matrix *A*.
n	INTEGER. The order of the matrix *A*; $n \geq 0$.
a	REAL for spftrf DOUBLE PRECISION for dpftrf COMPLEX for cpftrf DOUBLE COMPLEX for zpftrf. Array, size (*n**(*n*+1)/2). The array *a* contains the matrix *A* in the RFP format.

Output Parameters

a	*a* is overwritten by the Cholesky factor *U* or *L*, as specified by *uplo* and *trans*.
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite, and the factorization could not be completed. This may indicate an error in forming the matrix *A*.

Description

The routine forms the Cholesky factorization of a symmetric positive-definite or, for complex data, Hermitian positive-definite packed matrix *A*:

$A = U^T*U$ for real data, $A = U^H*U$ for complex data	if *uplo*='U'
$A = L*L^T$ for real data, $A = L*L^H$ for complex data	if *uplo*='L'

where *L* is a lower triangular matrix and *U* is upper triangular.

NOTE
This routine supports the Progress Routine feature. See Progress Function for details.

Input Parameters

uplo

CHARACTER*1. Must be 'U' or 'L'.

Indicates whether the upper or lower triangular part of *A* is packed in the array *ap*, and how *A* is factored:

If *uplo* = 'U', the array *ap* stores the upper triangular part of the matrix *A*, and *A* is factored as U^H*U.

If *uplo* = 'L', the array *ap* stores the lower triangular part of the matrix *A*; *A* is factored as $L*L^H$.

n

INTEGER. The order of matrix *A*; $n \geq 0$.

ap

REAL for spptrf

DOUBLE PRECISION for dpptrf

COMPLEX for cpptrf

DOUBLE COMPLEX for zpptrf.

Array, size at least max(1, $n(n+1)/2$). The array *ap* contains either the upper or the lower triangular part of the matrix *A* (as specified by *uplo*) in packed storage (see Matrix Storage Schemes).

Output Parameters

ap

Overwritten by the Cholesky factor *U* or *L*, as specified by *uplo*.

info

INTEGER. If *info*=0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite, and the factorization could not be completed. This may indicate an error in forming the matrix *A*.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `pptrf` interface are as follows:

ap	Holds the array *A* of size `(n*(n+1)/2)`.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

If *uplo* = `'U'`, the computed factor *U* is the exact factor of a perturbed matrix $A + E$, where

$$|E| \leq c(n)\varepsilon |U^H||U|, |e_{ij}| \leq c(n)\varepsilon \sqrt{a_{ii}a_{jj}}$$

$c(n)$ is a modest linear function of *n*, and ε is the machine precision.

A similar estimate holds for *uplo* = `'L'`.

The total number of floating-point operations is approximately $(1/3)n^3$ for real flavors and $(4/3)n^3$ for complex flavors.

After calling this routine, you can call the following routines:

`?pptrs`	to solve *A*X = B*
`?ppcon`	to estimate the condition number of *A*
`?pptri`	to compute the inverse of *A*.

Description

The routine forms the Cholesky factorization of a symmetric positive-definite or, for complex data, Hermitian positive-definite band matrix *A*:

$A = U^T*U$ for real data, $A = U^H*U$ for complex data if *uplo*='U'

$A = L*L^T$ for real data, $A = L*L^H$ for complex data if *uplo*='L'

where *L* is a lower triangular matrix and *U* is upper triangular.

NOTE
This routine supports the Progress Routine feature. See Progress Function for details.

Input Parameters

uplo — CHARACTER*1. Must be 'U' or 'L'.

Indicates whether the upper or lower triangular part of *A* is stored in the array *ab*, and how *A* is factored:

If *uplo* = 'U', the upper triangle of *A* is stored.

If *uplo* = 'L', the lower triangle of *A* is stored.

n — INTEGER. The order of matrix *A*; $n \geq 0$.

kd — INTEGER. The number of superdiagonals or subdiagonals in the matrix *A*; $kd \geq 0$.

ab — REAL for spbtrf

DOUBLE PRECISION for dpbtrf

COMPLEX for cpbtrf

DOUBLE COMPLEX for zpbtrf.

Array, size (*ldab*,*). The array *ab* contains either the upper or the lower triangular part of the matrix *A* (as specified by *uplo*) in band storage (see Matrix Storage Schemes). The second dimension of *ab* must be at least max(1, *n*).

ldab — INTEGER. The leading dimension of the array *ab*. ($ldab \geq kd + 1$)

Output Parameters

ab — The upper or lower triangular part of *A* (in band storage) is overwritten by the Cholesky factor *U* or *L*, as specified by *uplo*.

info — INTEGER. If *info*=0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite, and the factorization could not be completed. This may indicate an error in forming the matrix *A*.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `pbtrf` interface are as follows:

ab	Holds the array *A* of size `(kd+1,n)`.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

If *uplo* = `'U'`, the computed factor *U* is the exact factor of a perturbed matrix *A* + *E*, where

$$|E| \le c(kd+1)\varepsilon |U^H||U|, |e_{ij}| \le c(kd+1)\varepsilon\sqrt{a_{ii}a_{jj}}$$

$c(n)$ is a modest linear function of *n*, and ε is the machine precision.

A similar estimate holds for *uplo* = `'L'`.

The total number of floating-point operations for real flavors is approximately $n(kd+1)^2$. The number of operations for complex flavors is 4 times greater. All these estimates assume that *kd* is much less than *n*.

After calling this routine, you can call the following routines:

`?pbtrs`	to solve *A*X* = *B*
`?pbcon`	to estimate the condition number of *A*.

Syntax

```
call spttrf( n, d, e, info )
call dpttrf( n, d, e, info )
call cpttrf( n, d, e, info )
call zpttrf( n, d, e, info )
call pttrf( d, e [,info] )
```

Include Files

- `mkl.fi, lapack.f90`

Description

The routine forms the factorization of a symmetric positive-definite or, for complex data, Hermitian positive-definite tridiagonal matrix *A*:

$A = L*D*L^T$ for real flavors, or

$A = L*D*L^H$ for complex flavors,

where D is diagonal and L is unit lower bidiagonal. The factorization may also be regarded as having the form $A = U^T*D*U$ for real flavors, or $A = U^H*D*U$ for complex flavors, where U is unit upper bidiagonal.

Input Parameters

n	INTEGER. The order of the matrix A; $n \geq 0$.
d	REAL for sptrf, cpttrf DOUBLE PRECISION for dpttrf, zpttrf. Array, dimension (n). Contains the diagonal elements of A.
e	REAL for spttrf DOUBLE PRECISION for dpttrf COMPLEX for cpttrf DOUBLE COMPLEX for zpttrf. Array, dimension (n -1). Contains the subdiagonal elements of A.

Output Parameters

d	Overwritten by the n diagonal elements of the diagonal matrix D from the $L*D*L^T$ (for real flavors) or $L*D*L^H$ (for complex flavors) factorization of A.
e	Overwritten by the $(n - 1)$ sub-diagonal elements of the unit bidiagonal factor L or U from the factorization of A.
info	INTEGER. If $info = 0$, the execution is successful. If $info = -i$, the i-th parameter had an illegal value. If $info = i$, the leading minor of order i (and therefore the matrix A itself) is not positive-definite; if $i < n$, the factorization could not be completed, while if $i = n$, the factorization was completed, but $d(n) \leq 0$.

LAPACK 95 Interface Notes

```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes the factorization of a real/complex symmetric matrix *A* using the Bunch-Kaufman diagonal pivoting method. The form of the factorization is:

if *uplo*='U', $A = U*D*U^T$
if *uplo*='L', $A = L*D*L^T$

where *A* is the input matrix, *U* and *L* are products of permutation and triangular matrices with unit diagonal (upper triangular for *U* and lower triangular for *L*), and *D* is a symmetric block-diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks. *U* and *L* have 2-by-2 unit diagonal blocks corresponding to the 2-by-2 blocks of *D*.

NOTE This routine supports the Progress Routine feature. See Progress Routine for details.

Input Parameters

uplo

CHARACTER*1. Must be 'U' or 'L'.

Indicates whether the upper or lower triangular part of *A* is stored and how *A* is factored:

If *uplo* = 'U', the array *a* stores the upper triangular part of the matrix *A*, and *A* is factored as $U*D*U^T$.

If *uplo* = 'L', the array *a* stores the lower triangular part of the matrix *A*, and *A* is factored as $L*D*L^T$.

n

INTEGER. The order of matrix *A*; $n \geq 0$.

a

REAL for ssytrf

DOUBLE PRECISION for dsytrf

COMPLEX for csytrf

DOUBLE COMPLEX for zsytrf.

Array, size (*lda*,*) . The array *a* contains either the upper or the lower triangular part of the matrix *A* (see *uplo*). The second dimension of *a* must be at least max(1, *n*).

lda

INTEGER. The leading dimension of a; at least max(1, *n*).

work — Same type as *a*. A workspace array, dimension at least `max(1,lwork)`.

lwork — `INTEGER`. The size of the *work* array `(lwork≥n)`.

If `lwork = -1`, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by `xerbla`.

See Application Notes for the suggested value of *lwork*.

Output Parameters

a — The upper or lower triangular part of `a` is overwritten by details of the block-diagonal matrix *D* and the multipliers used to obtain the factor *U* (or *L*).

work(1) — If `info=0`, on exit `work(1)` contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

ipiv — `INTEGER`.

Array, size at least `max(1, n)`. Contains details of the interchanges and the block structure of *D*. If `ipiv(i) = k >0`, then d_{ii} is a 1-by-1 block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column.

If *uplo* = `'U'` and *ipiv*(*i*) =*ipiv*(*i*-1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and `i–1`, and (`i–1`)-th row and column of *A* was interchanged with the *m*-th row and column.

If *uplo* = `'L'` and *ipiv*(*i*) =*ipiv*(*i*+1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and `i+1`, and (`i+1`)-th row and column of *A* was interchanged with the *m*-th row and column.

info — `INTEGER`. If `info = 0`, the execution is successful.

If `info = -i`, the *i*-th parameter had an illegal value.

If `info = i`, D_{ii} is 0. The factorization has been completed, but *D* is exactly singular. Division by 0 will occur if you use *D* for solving a system of linear equations.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `sytrf` interface are as follows:

a — holds the matrix *A* of size (*n*, *n*)

ipiv — holds the vector of length *n*

uplo — must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

For better performance, try using *lwork* = *n***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The 2-by-2 unit diagonal blocks and the unit diagonal elements of *U* and *L* are not stored. The remaining elements of *U* and *L* are stored in the corresponding columns of the array *a*, but additional row interchanges are required to recover *U* or *L* explicitly (which is seldom necessary).

If *ipiv*(*i*) = *i* for all *i* =1...*n* , then all off-diagonal elements of *U* (*L*) are stored explicitly in the corresponding elements of the array *a*.

If *uplo* = 'U', the computed factors *U* and *D* are the exact factors of a perturbed matrix *A* + *E*, where

$$|E| \leq c(n)\varepsilon P|U||D||U^T|P^T$$

c(*n*) is a modest linear function of *n*, and ε is the machine precision. A similar estimate holds for the computed *L* and *D* when *uplo* = 'L'.

The total number of floating-point operations is approximately $(1/3)n^3$ for real flavors or $(4/3)n^3$ for complex flavors.

After calling this routine, you can call the following routines:

?sytrs	to solve *A***X* = *B*
?sycon	to estimate the condition number of *A*
?sytri	to compute the inverse of *A*.

If *uplo* = 'U', then *A* = U*D*U', where

```
U = P(n)*U(n)* ... *P(k)*U(k)*...,
```

that is, U is a product of terms P(*k*)*U(*k*), where

- *k* decreases from *n* to 1 in steps of 1 and 2.
- D is a block diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks D(*k*).
- P(*k*) is a permutation matrix as defined by *ipiv*(*k*) .
- U(*k*) is a unit upper triangular matrix, such that if the diagonal block D(*k*) is of order *s* (*s* = 1 or 2), then

$$U(k) = \begin{pmatrix} I & v & 0 \\ 0 & I & 0 \\ 0 & 0 & I \end{pmatrix} \begin{matrix} k-s \\ s \\ n-k \end{matrix}$$
$$\begin{matrix} k-s & s & n-k \end{matrix}$$

If *s* = 1, D(*k*) overwrites *A*(*k*,*k*), and *v* overwrites *A*(1:*k*-1,*k*).

If *s* = 2, the upper triangle of D(*k*) overwrites *A*(*k*-1,*k*-1), *A*(*k*-1,*k*) and *A*(*k*,*k*), and *v* overwrites *A*(1:*k*-2,*k* -1:*k*).

If *uplo* = 'L', then *A* = L*D*L', where

```
L = P(1)*L(1)* ... *P(k)*L(k)*...,
```

that is, L is a product of terms P(*k*)*L(*k*), where

- *k* increases from 1 to *n* in steps of 1 and 2.
- D is a block diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks D(*k*).
- P(*k*) is a permutation matrix as defined by *ipiv*(*k*).
- L(*k*) is a unit lower triangular matrix, such that if the diagonal block D(*k*) is of order *s* (*s* = 1 or 2), then

$$L(k) = \begin{pmatrix} I & 0 & 0 \\ 0 & I & 0 \\ 0 & v & I \end{pmatrix} \begin{matrix} k-1 \\ s \\ n-k-s+1 \end{matrix}$$
$$\begin{matrix} k-1 & s & n-k-s+1 \end{matrix}$$

If *s* = 1, D(*k*) overwrites *A*(*k*,*k*), and *v* overwrites *A*(*k*+1:*n*,*k*).

If *s* = 2, the lower triangle of D(*k*) overwrites *A*(*k*,*k*), *A*(*k*+1,*k*), and *A*(*k*+1,*k*+1), and *v* overwrites *A*(*k* +2:*n*,*k*:*k*+1).

?sytrf_aa
Computes the factorization of a symmetric matrix using Aasen's algorithm.

```
call ssytrf_aa(uplo, n, A, lda, ipiv, work, lwork, info)
call dsytrf_aa(uplo, n, A, lda, ipiv, work, lwork, info)
call csytrf_aa(uplo, n, A, lda, ipiv, work, lwork, info)
```

```
call zsytrf_aa(uplo, n, A, lda, ipiv, work, lwork, info)
```

Description

?sytrf_aa computes the factorization of a symmetric matrix A using Aasen's algorithm. The form of the factorization is A = U*T*U^T or A = L*T*L^T where U (or L) is a product of permutation and unit upper (lower) triangular matrices, and T is a complex symmetric tridiagonal matrix.

This is the blocked version of the algorithm, calling Level 3 BLAS.

Input Parameters

uplo CHARACTER*1

- = 'U': The upper triangle of A is stored.
- = 'L': The lower triangle of A is stored.

n INTEGER

The order of the matrix A. *n* ≥ 0.

A REAL for ssytrf_aa

DOUBLE PRECISION for dsytrf_aa

COMPLEX for csytrf_aa

COMPLEX*16 for zsytrf_aa

Array, dimension (*lda*,*n*). On entry, the symmetric matrix A. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of A contains the upper triangular part of the matrix A, and the strictly lower triangular part of A is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of A contains the lower triangular part of the matrix A, and the strictly upper triangular part of A is not referenced.

lda INTEGER

The leading dimension of the array *A*. *lda* ≥ max(1, *n*).

lwork INTEGER

The length of the array *work*.

If *lwork* = -1, a workspace query is assumed; the routine calculates only the optimal size of the *work* array and returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by XERBLA.

Output Parameters

A REAL for ssytrf_aa

DOUBLE PRECISION for dsytrf_aa

COMPLEX for csytrf_aa

COMPLEX*16 for zsytrf_aa

On exit, the tridiagonal matrix is stored in the diagonals and the subdiagonals of A just below (or above) the diagonals, and L is stored below (or above) the subdiagonals, when *uplo* is 'L' (or 'U').

ipiv INTEGER

Array, dimension (*n*). On exit, it contains the details of the interchanges; that is, the row and column *k* of A were interchanged with the row and column *ipiv*(*k*).

work REAL for ssytrf_aa

DOUBLE PRECISION for dsytrf_aa

COMPLEX for csytrf_aa

COMPLEX*16 for zsytrf_aa

Array, dimension (max(1, *lwork*)). On exit, if *info* = 0, *work*(1) returns the optimal *lwork*.

info INTEGER

- = 0: successful exit.
- < 0: If *info* = -*i*, the i^{th} argument had an illegal value.
- > 0: If *info* = *i*, D(*i*,*i*) is exactly zero. The factorization has been completed, but the block diagonal matrix D is exactly singular, and division by zero will occur if it is used to solve a system of equations.

?sytrf_rook

Computes the bounded Bunch-Kaufman factorization of a symmetric matrix.

Syntax

```
call ssytrf_rook( uplo, n, a, lda, ipiv, work, lwork, info )
call dsytrf_rook( uplo, n, a, lda, ipiv, work, lwork, info )
call csytrf_rook( uplo, n, a, lda, ipiv, work, lwork, info )
call zsytrf_rook( uplo, n, a, lda, ipiv, work, lwork, info )
call sytrf_rook( a [, uplo] [,ipiv] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes the factorization of a real/complex symmetric matrix *A* using the bounded Bunch-Kaufman ("rook") diagonal pivoting method. The form of the factorization is:

if *uplo*='U', $A = U*D*U^T$
if *uplo*='L', $A = L*D*L^T$,

where *A* is the input matrix, *U* and *L* are products of permutation and triangular matrices with unit diagonal (upper triangular for *U* and lower triangular for *L*), and *D* is a symmetric block-diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks. *U* and *L* have 2-by-2 unit diagonal blocks corresponding to the 2-by-2 blocks of *D*.

Input Parameters

uplo

CHARACTER*1. Must be 'U' or 'L'.

Indicates whether the upper or lower triangular part of *A* is stored and how *A* is factored:

If *uplo* = 'U', the array *a* stores the upper triangular part of the matrix *A*, and *A* is factored as $U*D*U^T$.

If *uplo* = 'L', the array *a* stores the lower triangular part of the matrix *A*, and *A* is factored as $L*D*L^T$.

n

INTEGER. The order of matrix *A*; $n \geq 0$.

a

REAL for ssytrf_rook

DOUBLE PRECISION for dsytrf_rook

COMPLEX for csytrf_rook

DOUBLE COMPLEX for zsytrf_rook.

Array, size (*lda*, *n*). The array *a* contains either the upper or the lower triangular part of the matrix *A* (see *uplo*).

lda

INTEGER. The leading dimension of *a*; at least max(1, *n*).

work

Same type as *a*. A workspace array, dimension at least max(1, *lwork*).

lwork

INTEGER. The size of the *work* array (*lwork*≥*n*).

If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See ?sytrf Application Notes for the suggested value of *lwork*.

Output Parameters

a

The upper or lower triangular part of *a* is overwritten by details of the block-diagonal matrix *D* and the multipliers used to obtain the factor *U* (or *L*).

work(1)

If *info*=0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

ipiv

INTEGER.

Array, size at least max(1, *n*). Contains details of the interchanges and the block structure of *D*.

If *ipiv*(*k*) > 0, then rows and columns *k* and *ipiv*(*k*) were interchanged and $D_{k,k}$ is a 1-by-1 diagonal block.

If *uplo* = 'U' and *ipiv*(*k*) < 0 and *ipiv*(*k* − 1) < 0, then rows and columns *k* and -*ipiv*(*k*) were interchanged, rows and columns *k* - 1 and -*ipiv*(*k* - 1) were interchanged, and $D_{k-1:k,\ k-1:k}$ is a 2-by-2 diagonal block.

If *uplo* = 'L' and *ipiv*(*k*) < 0 and *ipiv*(*k* + 1) < 0, then rows and columns *k* and -*ipiv*(*k*) were interchanged, rows and columns *k* + 1 and -*ipiv*(*k* + 1) were interchanged, and $D_{k:k+1,\ k:k+1}$ is a 2-by-2 diagonal block.

info — INTEGER. If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, D_{ii} is 0. The factorization has been completed, but *D* is exactly singular. Division by 0 will occur if you use *D* for solving a system of linear equations.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine sytrf_rook interface are as follows:

a — holds the matrix *A* of size (*n*, *n*)

ipiv — holds the vector of length *n*

uplo — must be 'U' or 'L'. The default value is 'U'.

Application Notes

The total number of floating-point operations is approximately $(1/3)n^3$ for real flavors or $(4/3)n^3$ for complex flavors.

After calling this routine, you can call the following routines:

?sytrs_rook — to solve *A*X* = *B*

?sycon_rook — to estimate the condition number of *A*

?sytri_rook — to compute the inverse of *A*.

If *uplo* = 'U', then *A* = U*D*U', where

```
U = P(n)*U(n)* ... *P(k)*U(k)*...,
```

that is, U is a product of terms P(*k*)*U(*k*), where

- *k* decreases from *n* to 1 in steps of 1 and 2.
- D is a block diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks D(*k*).
- P(*k*) is a permutation matrix as defined by *ipiv*(*k*).
- U(*k*) is a unit upper triangular matrix, such that if the diagonal block D(*k*) is of order *s* (*s* = 1 or 2), then

$$U(k) = \begin{pmatrix} I & v & 0 \\ 0 & I & 0 \\ 0 & 0 & I \end{pmatrix} \begin{matrix} k-s \\ s \\ n-k \end{matrix}$$
$$\begin{matrix} k-s & s & n-k \end{matrix}$$

If *s* = 1, D(*k*) overwrites *A*(*k*,*k*), and *v* overwrites *A*(1:*k*-1,*k*).

If *s* = 2, the upper triangle of D(*k*) overwrites *A*(*k*-1,*k*-1), *A*(*k*-1,*k*) and *A*(*k*,*k*), and *v* overwrites *A*(1:*k*-2,*k* -1:*k*).

If *uplo* = 'L', then *A* = L*D*L', where

```
L = P(1)*L(1)* ... *P(k)*L(k)*...,
```

that is, L is a product of terms P(*k*)*L(*k*), where

- *k* increases from 1 to *n* in steps of 1 and 2.
- D is a block diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks D(*k*).
- P(*k*) is a permutation matrix as defined by *ipiv*(*k*).
- L(*k*) is a unit lower triangular matrix, such that if the diagonal block D(*k*) is of order *s* (*s* = 1 or 2), then

$$L(k) = \begin{pmatrix} I & 0 & 0 \\ 0 & I & 0 \\ 0 & v & I \end{pmatrix} \begin{matrix} k-1 \\ s \\ n-k-s+1 \end{matrix}$$
$$\begin{matrix} k-1 & s & n-k-s+1 \end{matrix}$$

If *s* = 1, D(*k*) overwrites *A*(*k*,*k*), and *v* overwrites *A*(*k*+1:*n*,*k*).

If *s* = 2, the lower triangle of D(*k*) overwrites *A*(*k*,*k*), *A*(*k*+1,*k*), and *A*(*k*+1,*k*+1), and *v* overwrites *A*(*k* +2:*n*,*k*:*k*+1).

Matrix Storage Schemes

?sytrf_rk
Computes the factorization of a real or complex symmetric indefinite matrix using the bounded Bunch-Kaufman (rook) diagonal pivoting method (BLAS3 blocked algorithm).

```
call ssytrf_rk(uplo, n, A, lda, e, ipiv, work, lwork, info)
call dsytrf_rk(uplo, n, A, lda, e, ipiv, work, lwork, info)
call csytrf_rk(uplo, n, A, lda, e, ipiv, work, lwork, info)
```

```
call zsytrf_rk(uplo, n, A, lda, e, ipiv, work, lwork, info)
```

Description

?sytrf_rk computes the factorization of a real or complex symmetric matrix A using the bounded Bunch-Kaufman (rook) diagonal pivoting method: A= P*U*D*(U^T)*(P^T) or A = P*L*D*(L^T)*(P^T), where U (or L) is unit upper (or lower) triangular matrix, U^T (or L^T) is the transpose of U (or L), P is a permutation matrix, P^T is the transpose of P, and D is symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

This is the blocked version of the algorithm, calling Level-3 BLAS.

Input Parameters

uplo

CHARACTER*1

Specifies whether the upper or lower triangular part of the symmetric matrix A is stored:

- = 'U': Upper triangular
- = 'L': Lower triangular

n

INTEGER

The order of the matrix A. *n* ≥ 0.

A

REAL for ssytrf_rk

DOUBLE PRECISION for dsytrf_rk

COMPLEX for csytrf_rk

COMPLEX*16 for zsytrf_rk

Array, dimension (*lda*,*n*). On entry, the symmetric matrix A. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of A contains the upper triangular part of the matrix A, and the strictly lower triangular part of A is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of A contains the lower triangular part of the matrix A, and the strictly upper triangular part of A is not referenced.

lda

INTEGER

The leading dimension of the array *A*.*lda* ≥ max(1, *n*).

lwork

INTEGER

The length of the array *work*.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by XERBLA.

Output Parameters

A

REAL for ssytrf_rk

DOUBLE PRECISION for dsytrf_rk

COMPLEX for csytrf_rk

COMPLEX*16 for zsytrf_rk

On exit, contains:

- *Only* diagonal elements of the symmetric block diagonal matrix D on the diagonal of A; that is, D(*k*,*k*) = A(*k*,*k*); (superdiagonal (or subdiagonal) elements of D are stored on exit in array *e*).
- If *uplo* = 'U', factor U in the superdiagonal part of A. If *uplo* = 'L', factor L in the subdiagonal part of A.

e

REAL for ssytrf_rk

DOUBLE PRECISION for dsytrf_rk

COMPLEX for csytrf_rk

COMPLEX*16 for zsytrf_rk

Array, dimension (*n*). On exit, contains the superdiagonal (or subdiagonal) elements of the symmetric block diagonal matrix D with 1-by-1 or 2-by-2 diagonal blocks. If *uplo* = 'U', e(*i*) = D(*i*–1,*i*), *i*=2:N, and e(1) is set to 0. If *uplo* = 'L', e(*i*) = D(*i*+1,*i*), *i*=1:N–1, and e(*n*) is set to 0.

NOTE For 1-by-1 diagonal block D(*k*), where 1 ≤ *k* ≤ *n*, the element *e*(*k*) is set to 0 in both the *uplo* = 'U' and *uplo* = 'L' cases.

ipiv

INTEGER

Array, dimension (*n*).*ipiv* describes the permutation matrix P in the factorization of matrix A as follows: The absolute value of ipiv(*k*) represents the index of the row and column that were interchanged with the k^{th} row and column. The value of *uplo* describes the order in which the interchanges were applied. Also, the sign of *ipiv* represents the block structure of the symmetric block diagonal matrix D with 1-by-1 or 2-by-2 diagonal blocks, which correspond to 1 or 2 interchanges at each factorization step. If *uplo* = 'U' (in factorization order, *k* decreases from *n* to 1):

1. A single positive entry ipiv(*k*) > 0 means that D(*k*,*k*) is a 1-by-1 diagonal block. If ipiv(*k*) != *k*, rows and columns *k* and ipiv(*k*) were interchanged in the matrix A(1:N,1:N). If ipiv(*k*) = *k*, no interchange occurred.
2. A pair of consecutive negative entries ipiv(*k*) < 0 and ipiv(*k*–1). < 0 means that D(*k*–1:*k*,*k*–1:*k*) is a 2-by-2 diagonal block. (Note that negative entries in *ipiv* appear *only* in pairs.)
   - If –ipiv(*k*) != *k*, rows and columns *k* and –ipiv(*k*) were interchanged in the matrix A(1:N,1:N). If –ipiv(*k*) = *k*, no interchange occurred.
   - If –ipiv(*k*–1) != *k*–1, rows and columns *k*–1 and –ipiv(*k*–1) were interchanged in the matrix A(1:N,1:N). If –ipiv(*k*–1) = *k*–1, no interchange occurred.
3. In both cases 1 and 2, always ABS(ipiv(*k*)) ≤ *k*.

NOTE Any entry ipiv(*k*) is always nonzero on output.

If *uplo* = 'L' (in factorization order, *k* increases from 1 to *n*):

1. A single positive entry ipiv(*k*) > 0 means that D(*k*,*k*) is a 1-by-1 diagonal block. If ipiv(*k*) != *k*, rows and columns *k* and ipiv(*k*) were interchanged in the matrix A(1:N,1:N). If ipiv(*k*) = *k*, no interchange occurred.
2. A pair of consecutive negative entries ipiv(*k*) < 0 and ipiv(*k*+1) < 0 means that D(*k*:*k*+1,*k*:*k*+1) is a 2-by-2 diagonal block. (Note that negative entries in *ipiv* appear *only* in pairs.)
   - If –ipiv(*k*) != *k*, rows and columns *k* and –ipiv(*k*) were interchanged in the matrix A(1:N,1:N). If –ipiv(*k*) = *k*, no interchange occurred.
   - If –ipiv(*k*+1) != *k*+1, rows and columns *k*–1 and –ipiv(*k*–1) were interchanged in the matrix A(1:N,1:N). If –ipiv(*k*+1) = *k*+1, no interchange occurred.
3. In both cases 1 and 2, always ABS(ipiv(*k*)) ≥ *k*.

NOTE Any entry ipiv(*k*) is always nonzero on output.

work

`REAL` for `ssytrf_rk`

`DOUBLE PRECISION` for `dsytrf_rk`

`COMPLEX` for `csytrf_rk`

`COMPLEX*16` for `zsytrf_rk`

Array, dimension (MAX(1,*lwork*)). On exit, if *info* = 0, *work*(1) returns the optimal *lwork*.

info

`INTEGER`

- = 0: Successful exit.
- < 0: If *info* = –*k*, the k^{th} argument had an illegal value.
- > 0: If *info* = *k*, the matrix A is singular. If *uplo* = `'U'`, column *k* in the upper triangular part of A contains all zeros. If *uplo* = `'L'`, column *k* in the lower triangular part of A contains all zeros. Therefore, D(*k*,*k*) is exactly zero, and superdiagonal elements of column *k* of U (or subdiagonal elements of column *k* of L) are all zeros. The factorization has been completed, but the block diagonal matrix D is exactly singular, and division by zero will occur if it is used to solve a system of equations.

NOTE *info* stores only the first occurrence of a singularity; any subsequent occurrence of singularity is not stored in *info* even though the factorization always completes.

?hetrf

Computes the Bunch-Kaufman factorization of a complex Hermitian matrix.

Syntax

```
call chetrf( uplo, n, a, lda, ipiv, work, lwork, info )
call zhetrf( uplo, n, a, lda, ipiv, work, lwork, info )
```

```
call hetrf( a [, uplo] [,ipiv] [,info] )
```

Description

The routine computes the factorization of a complex Hermitian matrix *A* using the Bunch-Kaufman diagonal pivoting method:

if *uplo*='U', $A = U*D*U^H$
if *uplo*='L', $A = L*D*L^H$,

where *A* is the input matrix, *U* and *L* are products of permutation and triangular matrices with unit diagonal (upper triangular for *U* and lower triangular for *L*), and *D* is a Hermitian block-diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks. *U* and *L* have 2-by-2 unit diagonal blocks corresponding to the 2-by-2 blocks of *D*.

> **NOTE**
> This routine supports the Progress Routine feature. See Progress Routine for details.

Input Parameters

uplo

CHARACTER*1. Must be 'U' or 'L'.

Indicates whether the upper or lower triangular part of *A* is stored and how *A* is factored:

If *uplo* = 'U', the array *a* stores the upper triangular part of the matrix *A*, and *A* is factored as $U*D*U^H$.

If *uplo* = 'L', the array *a* stores the lower triangular part of the matrix *A*, and *A* is factored as $L*D*L^H$.

n

INTEGER. The order of matrix *A*; $n \geq 0$.

a, *work*

COMPLEX for chetrf

DOUBLE COMPLEX for zhetrf.

Arrays, size (*lda*,*), *work*(*).

The array *a* contains the upper or the lower triangular part of the matrix *A* (see *uplo*). The second dimension of *a* must be at least max(1, *n*).

work(*) is a workspace array of dimension at least max(1, *lwork*).

lda

INTEGER. The leading dimension of *a*; at least max(1, *n*).

lwork

INTEGER. The size of the *work* array ($lwork \geq n$).

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See Application Notes for the suggested value of *lwork*.

Output Parameters

a	The upper or lower triangular part of *a* is overwritten by details of the block-diagonal matrix *D* and the multipliers used to obtain the factor *U* (or *L*).
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
ipiv	INTEGER. Array, size at least max(1, *n*). Contains details of the interchanges and the block structure of *D*. If *ipiv*(*i*) = *k* >0, then d_{ii} is a 1-by-1 block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column. If *uplo* = 'U' and *ipiv*(*i*) =*ipiv*(*i*-1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*–1, and (*i*–1)-th row and column of *A* was interchanged with the *m*-th row and column. If *uplo* = 'L' and *ipiv*(*i*) =*ipiv*(*i*+1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*+1, and (*i*+1)-th row and column of *A* was interchanged with the *m*-th row and column.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = –*i*, the *i*-th parameter had an illegal value. If *info* = *i*, d_{ii} is 0. The factorization has been completed, but *D* is exactly singular. Division by 0 will occur if you use *D* for solving a system of linear equations.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine hetrf interface are as follows:

a	holds the matrix *A* of size (*n*, *n*)
ipiv	holds the vector of length *n*
uplo	must be 'U' or 'L'. The default value is 'U'.

Application Notes

This routine is suitable for Hermitian matrices that are not known to be positive-definite. If *A* is in fact positive-definite, the routine does not perform interchanges, and no 2-by-2 diagonal blocks occur in *D*.

For better performance, try using *lwork* = *n***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = –1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (`work(1)`) for subsequent runs.

If you set `lwork = -1`, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The 2-by-2 unit diagonal blocks and the unit diagonal elements of *U* and *L* are not stored. The remaining elements of *U* and *L* are stored in the corresponding columns of the array *a*, but additional row interchanges are required to recover *U* or *L* explicitly (which is seldom necessary).

If*ipiv*(*i*) = *i* for all $i = 1 \ldots n$, then all off-diagonal elements of *U* (*L*) are stored explicitly in the corresponding elements of the array *a*.

If `uplo = 'U'`, the computed factors *U* and *D* are the exact factors of a perturbed matrix $A + E$, where

$$|E| \leq c(n)\varepsilon P|U||D||U^T|P^T$$

$c(n)$ is a modest linear function of *n*, and ε is the machine precision.

A similar estimate holds for the computed *L* and *D* when `uplo = 'L'`.

The total number of floating-point operations is approximately $(4/3)n^3$.

After calling this routine, you can call the following routines:

`?hetrs`	to solve $A*X = B$
`?hecon`	to estimate the condition number of *A*
`?hetri`	to compute the inverse of *A*.

Matrix Storage Schemes

?hetrf_aa
Computes the factorization of a complex hermitian matrix using Aasen's algorithm.

```
call chetrf_aa(uplo, n, a, lda, ipiv, work, lwork, info)
call zhetrf_aa(uplo, n, a, lda, ipiv, work, lwork, info)
```

Description

`?hetrf_aa` computes the factorization of a complex Hermitian matrix *A* using Aasen's algorithm. The form of the factorization is $A = U * T * U^H$ or $a = L*T*L^H$ where U (or L) is a product of permutation and unit upper (lower) triangular matrices, and T is a Hermitian tridiagonal matrix. This is the blocked version of the algorithm, calling Level 3 BLAS.

Input Parameters

uplo	`CHARACTER*1`. = 'U': Upper triangle of *A* is stored; = 'L': Lower triangle of *a* is stored.
n	`INTEGER`. The order of the matrix *A*. $n \geq 0$.

a — COMPLEX for chetrf_aa

COMPLEX*16 for zhetrf_aa

Array of size (*lda*, *n*). On entry, the Hermitian matrix *A*.

If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *a* is not referenced.

If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *a* is not referenced.

lda — INTEGER. The leading dimension of the array *a*. *lda*≥ max(1,*n*).

lwork — INTEGER. The length of *work*. *lwork*≥ 2**n*. For optimum performance *lwork*≥*n**(1 + *nb*), where *nb* is the optimal block size. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

Output Parameters

a — On exit, the tridiagonal matrix is stored in the diagonals and the subdiagonals of *a* just below (or above) the diagonals, and *L* is stored below (or above) the subdiagonals, when *uplo* is 'L' (or 'U').

ipiv — INTEGER . array, dimension (*n*) On exit, it contains the details of the interchanges: the row and column *k* of *a* were interchanged with the row and column *ipiv*(*k*).

work — COMPLEX for chetrf_aa

COMPLEX*16 for zhetrf_aa

Array of size (max(1, *lwork*)). On exit, if *info* = 0, *work*(1) returns the optimal *lwork*.

info — INTEGER.

If *info* = 0: successful exit < 0: if *info* = -*i*, the *i*-th argument had an illegal value,

If *info* > 0: if *info* = *i*, $D_{i,i}$ is exactly zero. The factorization has been completed, but the block diagonal matrix *D* is exactly singular, and division by zero will occur if it is used to solve a system of equations.

?hetrf_rook
Computes the bounded Bunch-Kaufman factorization of a complex Hermitian matrix.

Syntax

```
call chetrf_rook( uplo, n, a, lda, ipiv, work, lwork, info )
call zhetrf_rook( uplo, n, a, lda, ipiv, work, lwork, info )
call hetrf_rook( a [, uplo] [,ipiv] [,info] )
```

Include Files

Description

The routine computes the factorization of a complex Hermitian matrix *A* using the bounded Bunch-Kaufman diagonal pivoting method:

if *uplo*='U', *A* = *U***D***U*^{H}
if *uplo*='L', *A* = *L***D***L*^{H},

where *A* is the input matrix, *U* (or *L*) is a product of permutation and unit upper (or lower) triangular matrices, and *D* is a Hermitian block-diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks.

This is the blocked version of the algorithm, calling Level 3 BLAS.

Input Parameters

uplo

CHARACTER*1. Must be 'U' or 'L'.

Indicates whether the upper or lower triangular part of *A* is stored:

If *uplo* = 'U', the array *a* stores the upper triangular part of the matrix *A*.

If *uplo* = 'L', the array *a* stores the lower triangular part of the matrix *A*.

n

INTEGER. The order of matrix *A*; *n*≥ 0.

a

COMPLEX for chetrf_rook

COMPLEX*16 for zhetrf_rook.

Array *a*, size (*lda*,n).

The array *a* contains the upper or the lower triangular part of the matrix *A* (see *uplo*).

If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *a* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *a* is not referenced.

lda

INTEGER. The leading dimension of *a*; at least max(1, *n*).

work

COMPLEX for chetrf_rook

COMPLEX*16 for zhetrf_rook.

Array *work*(*).

work(*) is a workspace array of dimension at least max(1, *lwork*).

lwork

INTEGER. The size of the *work* array (*lwork*≥*n*).

The length of *work*. *lwork*≥ 1. For best performance *lwork*≥*n***nb*, where *nb* is the block size returned by ilaenv.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

Output Parameters

a

The block diagonal matrix *D* and the multipliers used to obtain the factor *U* or *L* (see Application Notes for further details).

work(1)

If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

ipiv

INTEGER.

Array, size at least max(1, *n*). Contains details of the interchanges and the block structure of *D*.

- If *uplo* = 'U':

  If *ipiv*(*k*) > 0, then rows and columns *k* and *ipiv*(*k*) were interchanged and $D_{k,k}$ is a 1-by-1 diagonal block.

  If *ipiv*(*k*) < 0 and *ipiv*(*k* - 1) < 0, then rows and columns *k* and -*ipiv*(*k*) were interchanged and rows and columns *k* - 1 and -*ipiv*(*k* - 1) were interchanged, $D_{k-1:k,k-1:k}$ is a 2-by-2 diagonal block.
- If *uplo* = 'L':

  If *ipiv*(*k*) > 0, then rows and columns *k* and *ipiv*(*k*) were interchanged and $D_{k,k}$ is a 1-by-1 diagonal block.

  If *ipiv*(*k*) < 0 and *ipiv*(*k* + 1) < 0, then rows and columns *k* and -*ipiv*(*k*) were interchanged and rows and columns *k* + 1 and -*ipiv*(*k* + 1) were interchanged, $D_{k:k+1,k:k+1}$ is a 2-by-2 diagonal block.

info

INTEGER. If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, D_{ii} is exactly 0. The factorization has been completed, but the block diagonal matrix *D* is exactly singular, and division by 0 will occur if you use *D* for solving a system of linear equations.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine hetrf_rook interface are as follows:

a

holds the matrix *A* of size (*n*, *n*)

ipiv

holds the vector of length *n*

uplo

must be 'U' or 'L'. The default value is 'U'.

Application Notes

If *uplo* = 'U', then$A = U*D*U^H$, where

U = *P*(*n*)**U*(*n*)* ... **P*(*k*)*U*(*k*)* ...,

i.e., *U* is a product of terms *P*(*k*)**U*(*k*), where *k* decreases from *n* to 1 in steps of 1 or 2, and *D* is a block diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks *D*(*k*). *P*(*k*) is a permutation matrix as defined by *ipiv*(*k*), and *U*(*k*) is a unit upper triangular matrix, such that if the diagonal block *D*(*k*) is of order *s* (*s* = 1 or 2), then

$$U(k) = \begin{array}{c} \\ k-s \\ s \\ n-k \end{array} \begin{array}{c} \begin{array}{ccc} k-s & s & n-k \end{array} \\ \begin{pmatrix} I & v & 0 \\ 0 & I & 0 \\ 0 & 0 & I \end{pmatrix} \end{array}$$

If *s* = 1, *D*(*k*) overwrites *A*(*k*,*k*), and *v* overwrites *A*(1:*k*-1,*k*).

If *s* = 2, the upper triangle of *D*(*k*) overwrites *A*(*k*-1,*k*-1), *A*(*k*-1,*k*), and *A*(*k*,*k*), and *v* overwrites *A*(1:*k*-2,*k*-1:*k*).

If *uplo* = 'L', then $A = L*D*L^H$, where

L = *P*(1)**L*(1)* ... **P*(*k*)**L*(*k*)* ...,

i.e., *L* is a product of terms *P*(*k*)**L*(*k*), where *k* increases from 1 to *n* in steps of 1 or 2, and *D* is a block diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks *D*(*k*). *P*(*k*) is a permutation matrix as defined by *ipiv*(*k*), and *L*(*k*) is a unit lower triangular matrix, such that if the diagonal block *D*(*k*) is of order *s* (*s* = 1 or 2), then

$$L(k) = \begin{array}{c} \\ k-1 \\ s \\ n-k-s+1 \end{array} \begin{array}{c} \begin{array}{ccc} k-1 & s & n-k-s+1 \end{array} \\ \begin{pmatrix} I & 0 & 0 \\ 0 & I & 0 \\ 0 & v & I \end{pmatrix} \end{array}$$

If *s* = 1, *D*(*k*) overwrites *A*(*k*,*k*), and *v* overwrites *A*(*k*+1:*n*,*k*).

If *s* = 2, the lower triangle of *D*(*k*) overwrites *A*(*k*,*k*), *A*(*k*+1,*k*), and *A*(*k*+1,*k*+1), and *v* overwrites *A*(*k*+2:*n*,*k*:*k*+1).

Matrix Storage Schemes

?hetrf_rk
Computes the factorization of a complex Hermitian indefinite matrix using the bounded Bunch-Kaufman (rook) diagonal pivoting method (BLAS3 blocked algorithm).

```
call chetrf_rk(uplo, n, A, lda, e, ipiv, work, lwork, info)
call zhetrf_rk(uplo, n, A, lda, e, ipiv, work, lwork, info)
```

Description

?hetrf_rk computes the factorization of a complex Hermitian matrix A using the bounded Bunch-Kaufman (rook) diagonal pivoting method: A = P*U*D*(U^H)*(P^T) or A = P*L*D*(L^H)*(P^T), where U (or L) is unit upper (or lower) triangular matrix, U^H (or L^H) is the conjugate of U (or L), P is a permutation matrix, P^T is the transpose of P, and D is Hermitian and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

This is the blocked version of the algorithm, calling Level 3 BLAS.

Input Parameters

uplo CHARACTER*1

Specifies whether the upper or lower triangular part of the Hermitian matrix A is stored:

- = 'U': Upper triangular.
- = 'L': Lower triangular.

n INTEGER

The order of the matrix A. *n* ≥ 0.

A COMPLEX for chetrf_rk

COMPLEX*16 for zhetrf_rk

Array, dimension (*lda*,*n*). On entry, the Hermitian matrix A. If *uplo* = 'U': The leading *n*-by-*n* upper triangular part of A contains the upper triangular part of the matrix A, and the strictly lower triangular part of A is not referenced. If *uplo* = 'L': The leading *n*-by-*n* lower triangular part of A contains the lower triangular part of the matrix A, and the strictly upper triangular part of A is not referenced.

lda INTEGER

The leading dimension of the array *A*. *lda* ≥ max(1, *n*).

lwork INTEGER

The length of the array *work*.

If *lwork* = –1, a workspace query is assumed; the routine calculates only the optimal size of the *work* array and returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by XERBLA.

Output Parameters

A COMPLEX for chetrf_rk

COMPLEX*16 for zhetrf_rk

On exit, contains:

- *Only* diagonal elements of the Hermitian block diagonal matrix D on the diagonal of A; that is, D(*k*,*k*) = A(*k*,*k*). Superdiagonal (or subdiagonal) elements of D are stored on exit in array *e*.

  —and—
- If *uplo* = 'U', factor U in the superdiagonal part of A. If *uplo* = 'L', factor L in the subdiagonal part of A.

e COMPLEX for chetrf_rk

COMPLEX*16 for zhetrf_rk

Array, dimension (*n*). On exit, contains the superdiagonal (or subdiagonal) elements of the Hermitian block diagonal matrix D with 1-by-1 or 2-by-2 diagonal blocks. If *uplo* = 'U', e(*i*) = D(*i*–1,*i*), *i*=2:N, and e(1) is set to 0. If *uplo* = 'L', e(*i*) = D(*i*+1,*i*), *i*=1:N–1, and e(*n*) is set to 0.

NOTE For 1-by-1 diagonal block D(*k*), where 1 ≤ k ≤ *n*, the element *e*(*k*) is set to 0 in both the *uplo* = 'U' and *uplo* = 'L' cases.

ipiv INTEGER

Array, dimension (*n*). *ipiv* describes the permutation matrix P in the factorization of matrix A as follows. The absolute value of *ipiv*(*k*) represents the index of row and column that were interchanged with the k^{th} row and column. The value of *uplo* describes the order in which the interchanges were applied. Also, the sign of *ipiv* represents the block structure of the Hermitian block diagonal matrix D with 1-by-1 or 2-by-2 diagonal blocks that correspond to 1 or 2 interchanges at each factorization step. If *uplo* = 'U' (in factorization order, *k* decreases from *n* to 1):

1. A single positive entry ipiv(*k*) > 0 means that D(*k*,*k*) is a 1-by-1 diagonal block. If ipiv(*k*) != *k*, rows and columns *k* and ipiv(*k*) were interchanged in the matrix A(1:N,1:N). If ipiv(*k*) = *k*, no interchange occurred.
2. A pair of consecutive negative entries ipiv(*k*) < 0 and ipiv(*k*–1) < 0 means that D(*k*–1:*k*,*k*–1:*k*) is a 2-by-2 diagonal block. (Note that negative entries in *ipiv* appear *only* in pairs.)
   - If –ipiv(*k*) != *k*, rows and columns *k* and –ipiv(*k*) were interchanged in the matrix A(1:N,1:N). If –ipiv(*k*) = *k*, no interchange occurred.
   - If –ipiv(*k*–1) != *k*–1, rows and columns *k*–1 and –ipiv(*k*–1) were interchanged in the matrix A(1:N,1:N). If –ipiv(*k*–1) = *k*–1, no interchange occurred.
3. In both cases 1 and 2, always ABS(ipiv(*k*)) ≤ *k*.

NOTE Any entry ipiv(*k*) is always nonzero on output.

If *uplo* = 'L' (in factorization order, *k* increases from 1 to *n*):

1. A single positive entry ipiv(*k*) > 0 means that D(*k*,*k*) is a 1-by-1 diagonal block. If ipiv(*k*) != *k*, rows and columns *k* and ipiv(*k*) were interchanged in the matrix A(1:N,1:N). If ipiv(*k*) = *k*, no interchange occurred.
2. A pair of consecutive negative entries ipiv(*k*) < 0 and ipiv(*k*+1) < 0 means that D(*k*:*k*+1,*k*:*k*+1) is a 2-by-2 diagonal block. (Note that negative entries in *ipiv* appear *only* in pairs.)
   - If –ipiv(*k*) != *k*, rows and columns *k* and –ipiv(*k*) were interchanged in the matrix A(1:N,1:N). If –ipiv(*k*) = *k*, no interchange occurred.
   - If –ipiv(*k*+1) != *k*+1, rows and columns *k*–1 and –ipiv(*k*–1) were interchanged in the matrix A(1:N,1:N). If –ipiv(*k*+1) = *k*+1, no interchange occurred.
3. In both cases 1 and 2, always ABS(ipiv(*k*)) ≥ *k*.

NOTE Any entry ipiv(*k*) is always nonzero on output.

work

COMPLEX for chetrf_rk

COMPLEX*16 for zhetrf_rk

Array, dimension (MAX(1,*lwork*)). On exit, if *info* = 0, *work*(1) returns the optimal *lwork*.

info

INTEGER

- = 0: Successful exit.
- < 0: If *info* = -*k*, the k^{th} argument had an illegal value.
- > 0: If *info* = *k*, the matrix A is singular. If *uplo* = 'U', the column *k* in the upper triangular part of A contains all zeros. If *uplo* = 'L', the column *k* in the lower triangular part of A contains all zeros. Therefore D(*k*,*k*) is exactly zero, and superdiagonal elements of column *k* of U (or subdiagonal elements of column *k* of L) are all zeros. The factorization has been completed, but the block diagonal matrix D is exactly singular, and division by zero will occur if it is used to solve a system of equations.

NOTE *info* stores only the first occurrence of a singularity; any subsequent occurrence of a singularity is not stored in *info* even though the factorization always completes.

?sptrf

Computes the Bunch-Kaufman factorization of a symmetric matrix using packed storage.

Syntax

```
call ssptrf( uplo, n, ap, ipiv, info )
call dsptrf( uplo, n, ap, ipiv, info )
call csptrf( uplo, n, ap, ipiv, info )
call zsptrf( uplo, n, ap, ipiv, info )
call sptrf( ap [,uplo] [,ipiv] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes the factorization of a real/complex symmetric matrix *A* stored in the packed format using the Bunch-Kaufman diagonal pivoting method. The form of the factorization is:

if *uplo*='U', $A = U*D*U^T$
if *uplo*='L', $A = L*D*L^T$,

where *U* and *L* are products of permutation and triangular matrices with unit diagonal (upper triangular for *U* and lower triangular for *L*), and *D* is a symmetric block-diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks. *U* and *L* have 2-by-2 unit diagonal blocks corresponding to the 2-by-2 blocks of *D*.

NOTE
This routine supports the Progress Routine feature. See Progress Function for details.

Input Parameters

uplo

`CHARACTER*1`. Must be `'U'` or `'L'`.

Indicates whether the upper or lower triangular part of *A* is packed in the array *ap* and how *A* is factored:

If *uplo* = `'U'`, the array *ap* stores the upper triangular part of the matrix *A*, and *A* is factored as $U*D*U^T$.

If *uplo* = `'L'`, the array *ap* stores the lower triangular part of the matrix *A*, and *A* is factored as $L*D*L^T$.

n

`INTEGER`. The order of matrix *A*; $n \geq 0$.

ap

`REAL` for `ssptrf`

`DOUBLE PRECISION` for `dsptrf`

`COMPLEX` for `csptrf`

`DOUBLE COMPLEX` for `zsptrf`.

Array, size at least max(1, *n*(*n*+1)/2). The array *ap* contains the upper or the lower triangular part of the matrix *A* (as specified by *uplo*) in *packed storage* (see Matrix Storage Schemes).

Output Parameters

ap

The upper or lower triangle of *A* (as specified by *uplo*) is overwritten by details of the block-diagonal matrix *D* and the multipliers used to obtain the factor *U* (or *L*).

ipiv

`INTEGER`.

Array, size at least `max(1, n)`. Contains details of the interchanges and the block structure of *D*. If *ipiv*(*i*) = *k* >0, then d_{ii} is a 1-by-1 block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column.

If *uplo* = `'U'` and *ipiv*(*i*) =*ipiv*(*i*-1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*–1, and (*i*–1)-th row and column of *A* was interchanged with the *m*-th row and column.

If *uplo* = `'L'` and *ipiv*(*i*) =*ipiv*(*i*+1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*+1, and (*i*+1)-th row and column of *A* was interchanged with the *m*-th row and column.

info

`INTEGER`. If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, d_{ii} is 0. The factorization has been completed, but *D* is exactly singular. Division by 0 will occur if you use *D* for solving a system of linear equations.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `sptrf` interface are as follows:

ap	Holds the array *A* of size `(n*(n+1)/2)`.
ipiv	Holds the vector of length *n*.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

The 2-by-2 unit diagonal blocks and the unit diagonal elements of *U* and *L* are not stored. The remaining elements of *U* and *L* overwrite elements of the corresponding columns of the array *ap*, but additional row interchanges are required to recover *U* or *L* explicitly (which is seldom necessary).

If *ipiv*(*i*) = *i* for all *i* = 1...*n*, then all off-diagonal elements of *U* (*L*) are stored explicitly in packed form.

If *uplo* = `'U'`, the computed factors *U* and *D* are the exact factors of a perturbed matrix *A* + *E*, where

$$|E| \leq c(n)\varepsilon P|U||D||U^T|P^T$$

$c(n)$ is a modest linear function of *n*, and ε is the machine precision. A similar estimate holds for the computed *L* and *D* when *uplo* = `'L'`.

The total number of floating-point operations is approximately $(1/3)n^3$ for real flavors or $(4/3)n^3$ for complex flavors.

After calling this routine, you can call the following routines:

`?sptrs`	to solve *A*X* = *B*
`?spcon`	to estimate the condition number of *A*
`?sptri`	to compute the inverse of *A*.

See Also

`mkl_progress`

Matrix Storage Schemes

?hptrf
Computes the Bunch-Kaufman factorization of a complex Hermitian matrix using packed storage.

Syntax

```
call chptrf( uplo, n, ap, ipiv, info )
call zhptrf( uplo, n, ap, ipiv, info )
call hptrf( ap [,uplo] [,ipiv] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes the factorization of a complex Hermitian packed matrix *A* using the Bunch-Kaufman diagonal pivoting method:

if *uplo*='U', *A* = *U***D***U*^{H}
if *uplo*='L', *A* = *L***D***L*^{H},

where *A* is the input matrix, *U* and *L* are products of permutation and triangular matrices with unit diagonal (upper triangular for *U* and lower triangular for *L*), and *D* is a Hermitian block-diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks. *U* and *L* have 2-by-2 unit diagonal blocks corresponding to the 2-by-2 blocks of *D*.

NOTE
This routine supports the Progress Routine feature. See Progress Function for details.

Input Parameters

uplo

CHARACTER*1. Must be 'U' or 'L'.

Indicates whether the upper or lower triangular part of *A* is packed and how *A* is factored:

If *uplo* = 'U', the array *ap* stores the upper triangular part of the matrix *A*, and *A* is factored as *U***D***U*^{H}.

If *uplo* = 'L', the array *ap* stores the lower triangular part of the matrix *A*, and *A* is factored as *L***D***L*^{H}.

n

INTEGER. The order of matrix *A*; $n \geq 0$.

ap

COMPLEX for chptrf

DOUBLE COMPLEX for zhptrf.

Array, size at least max(1, *n*(*n*+1)/2). The array *ap* contains the upper or the lower triangular part of the matrix *A* (as specified by *uplo*) in *packed storage* (see Matrix Storage Schemes).

Output Parameters

ap

The upper or lower triangle of *A* (as specified by *uplo*) is overwritten by details of the block-diagonal matrix *D* and the multipliers used to obtain the factor *U* (or *L*).

ipiv

INTEGER.

Array, size at least max(1, *n*). Contains details of the interchanges and the block structure of *D*. If *ipiv*(*i*) = *k* >0, then d_{ii} is a 1-by-1 block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column.

If *uplo* = 'U' and *ipiv*(*i*) =*ipiv*(*i*-1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*–1, and (*i*–1)-th row and column of *A* was interchanged with the *m*-th row and column.

If *uplo* = 'L' and *ipiv*(*i*) =*ipiv*(*i*+1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*+1, and (*i*+1)-th row and column of *A* was interchanged with the *m*-th row and column.

info — INTEGER. If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, d_{ii} is 0. The factorization has been completed, but *D* is exactly singular. Division by 0 will occur if you use *D* for solving a system of linear equations.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine hptrf interface are as follows:

ap — Holds the array *A* of size (*n**(*n*+1)/2).

ipiv — Holds the vector of length *n*.

uplo — Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The 2-by-2 unit diagonal blocks and the unit diagonal elements of *U* and *L* are not stored. The remaining elements of *U* and *L* are stored in the array *ap*, but additional row interchanges are required to recover *U* or *L* explicitly (which is seldom necessary).

If *ipiv*(*i*) = *i* for all *i* = 1...*n*, then all off-diagonal elements of *U* (*L*) are stored explicitly in the corresponding elements of the array *a*.

If *uplo* = 'U', the computed factors *U* and *D* are the exact factors of a perturbed matrix *A* + *E*, where

$$|E| \leq c(n)\varepsilon P|U||D||U^T|P^T$$

c(*n*) is a modest linear function of *n*, and ε is the machine precision.

A similar estimate holds for the computed *L* and *D* when *uplo* = 'L'.

The total number of floating-point operations is approximately $(4/3)n^3$.

After calling this routine, you can call the following routines:

?hptrs — to solve *A***X* = *B*

?hpcon — to estimate the condition number of *A*

?hptri — to compute the inverse of *A*.

call mkl_dspffrtx( ap, n, ncolm, work, work2 )
call mkl_cspffrtx( ap, n, ncolm, work, work2 )
call mkl_zspffrtx( ap, n, ncolm, work, work2 )
```

Include Files

- `mkl.fi`

Description

The routine computes the partial factorization $A = LDL^T$, where L is a lower triangular matrix and D is a diagonal matrix.

> **Caution**
> The routine assumes that the matrix A is factorizable. The routine does not perform pivoting and does not handle diagonal elements which are zero, which cause the routine to produce incorrect results without any indication.

Consider the matrix $A = \begin{pmatrix} a & b^{\mathrm{T}} \\ b & C \end{pmatrix}$, where a is the element in the first row and first column of A, b is a column vector of size n - 1 containing the elements from the second through n-th column of A, C is the lower-right square submatrix of A, and I is the identity matrix.

The `mkl_?spffrt2` routine performs `ncolm` successive factorizations of the form

$$A = \begin{pmatrix} a & b^{\mathrm{T}} \\ b & C \end{pmatrix} = \begin{pmatrix} a & 0 \\ b & I \end{pmatrix} \begin{pmatrix} a^{-1} & 0 \\ 0 & C - ba^{-1}b^{\mathrm{T}} \end{pmatrix} \begin{pmatrix} a & b^{\mathrm{T}} \\ 0 & I \end{pmatrix}.$$

The `mkl_?spffrtx` routine performs `ncolm` successive factorizations of the form

$$A = \begin{pmatrix} a & b^{\mathrm{T}} \\ b & C \end{pmatrix} = \begin{pmatrix} 1 & 0 \\ ba^{-1} & I \end{pmatrix} \begin{pmatrix} a & 0 \\ 0 & C - ba^{-1}b^{\mathrm{T}} \end{pmatrix} \begin{pmatrix} 1 & \left(ba^{-1}\right)^{\mathrm{T}} \\ 0 & I \end{pmatrix}.$$

The approximate number of floating point operations performed by real flavors of these routines is (1/6)*`ncolm`*(2*`ncolm`^{2} - 6*`ncolm`*`n` + 3*`ncolm` + 6*`n`^{2} - 6*`n` + 7).

The approximate number of floating point operations performed by complex flavors of these routines is (1/3)*`ncolm`*(4*`ncolm`^{2} - 12*`ncolm`*`n` + 9*`ncolm` + 12*`n`^{2} - 18*`n` + 8).

Input Parameters

ap	`REAL` for `mkl_sspffrt2` and `mkl_sspffrtx`
	`DOUBLE PRECISION` for `mkl_dspffrt2` and `mkl_dspffrtx`
	`COMPLEX` for `mkl_cspffrt2` and `mkl_cspffrtx`
	`DOUBLE COMPLEX` for `mkl_zspffrt2` and `mkl_zspffrtx`.
	Array, size at least max(1, $n(n+1)/2$). The array *ap* contains the lower triangular part of the matrix *A* in packed storage (see Matrix Storage Schemes for *uplo* = `'L'`).

n	`INTEGER`. The order of matrix *A*; $n \geq 0$.
ncolm	`INTEGER`. The number of columns to factor, $ncolm \leq n$.

work, *work2*	`REAL` for `mkl_sspffrt2` and `mkl_sspffrtx`
	`DOUBLE PRECISION` for `mkl_dspffrt2` and `mkl_dspffrtx`
	`COMPLEX` for `mkl_cspffrt2` and `mkl_cspffrtx`
	`DOUBLE COMPLEX` for `mkl_zspffrt2` and `mkl_zspffrtx`.
	Workspace arrays, size of each at least *n*.

Output Parameters

ap	Overwritten by the factor *L*. The first *ncolm* diagonal elements of the input matrix *A* are replaced with the diagonal elements of *D*. The subdiagonal elements of the first *ncolm* columns are replaced with the corresponding elements of *L*. The rest of the input array is updated as indicated in the Description section.

NOTE
Specifying *ncolm* = *n* results in complete factorization $A = LDL^T$.

Solving Systems of Linear Equations: LAPACK Computational Routines

This section describes the LAPACK routines for solving systems of linear equations. Before calling most of these routines, you need to factorize the matrix of your system of equations (see Routines for Matrix Factorization). However, the factorization is not necessary if your system of equations has a triangular matrix.

?getrs
Solves a system of linear equations with an LU-factored square coefficient matrix, with multiple right-hand sides.

Syntax

```
call sgetrs( trans, n, nrhs, a, lda, ipiv, b, ldb, info )
call dgetrs( trans, n, nrhs, a, lda, ipiv, b, ldb, info )
call cgetrs( trans, n, nrhs, a, lda, ipiv, b, ldb, info )
call zgetrs( trans, n, nrhs, a, lda, ipiv, b, ldb, info )
call getrs( a, ipiv, b [, trans] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine solves for *X* the following systems of linear equations:

$A*X = B$	if *trans*='N',
$A^T*X = B$	if *trans*='T',
$A^H*X = B$	if *trans*='C' (for complex matrices only).

Before calling this routine, you must call ?getrf to compute the *LU* factorization of *A*.

Input Parameters

trans	CHARACTER*1. Must be 'N' or 'T' or 'C'. Indicates the form of the equations: If *trans* = 'N', then $A*X = B$ is solved for *X*. If *trans* = 'T', then $A^T*X = B$ is solved for *X*. If *trans* = 'C', then $A^H*X = B$ is solved for *X*.
n	INTEGER. The order of *A*; the number of rows in $B(n \geq 0)$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
a, *b*	REAL for sgetrs DOUBLE PRECISION for dgetrs COMPLEX for cgetrs DOUBLE COMPLEX for zgetrs. Arrays: *a* (size *lda* by *), *b* (size *ldb* by *). The array *a* contains *LU* factorization of matrix *A* resulting from the call of ?getrf. The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *a* must be at least max(1,*n*) and the second dimension of *b* at least max(1,*nrhs*).
lda	INTEGER. The leading dimension of *a*; $lda \geq \max(1, n)$.

ldb	INTEGER. The leading dimension of *b*; *ldb*≥ max(1, *n*).
ipiv	INTEGER. Array, size at least max(1, *n*). The *ipiv* array, as returned by ?getrf.

Output Parameters

b	Overwritten by the solution matrix *X*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine getrs interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *nrhs*).
ipiv	Holds the vector of length *n*.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.

Application Notes

For each right-hand side *b*, the computed solution is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$$|E| \leq c(n)\varepsilon P|L||U|$$

$c(n)$ is a modest linear function of *n*, and ε is the machine precision.

If x_0 is the true solution, the computed solution *x* satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \leq c(n)\, cond\,(A, x)\varepsilon$$

where $cond(A,x) = \| |A^{-1}||A| |x| \|_\infty / \|x\|_\infty \leq \| |A^{-1}| \|_\infty \| |A| \|_\infty = \kappa_\infty(A)$.

Note that $cond(A,x)$ can be much smaller than $\kappa_\infty(A)$; the condition number of A^T and A^H might or might not be equal to $\kappa_\infty(A)$.

The approximate number of floating-point operations for one right-hand side vector *b* is $2n^2$ for real flavors and $8n^2$ for complex flavors.

To estimate the condition number $\kappa_\infty(A)$, call ?gecon.

To refine the solution and estimate the error, call ?gerfs.

Matrix Storage Schemes

?getrs_batch_strided

Solves a group of systems of linear equations, each with an LU-factored square coefficient matrix and multiple right hand sides.

Syntax

```
call sgetrs_batch_strided(trans, n, nrhs, A, lda, stride_a, ipiv, stride_ipiv, b, ldb, stride_b, batch_size, info)
call dgetrs_batch_strided(trans, n, nrhs, A, lda, stride_a, ipiv, stride_ipiv, b, ldb, stride_b, batch_size, info)
call cgetrs_batch_strided(trans, n, nrhs, A, lda, stride_a, ipiv, stride_ipiv, b, ldb, stride_b, batch_size, info)
call zgetrs_batch_strided(trans, n, nrhs, A, lda, stride_a, ipiv, stride_ipiv, b, ldb, stride_b, batch_size, info)
```

Include Files

```
mkl.fi
```

Description

The `?getrs_batch_strided` routines are similar to the `?getrs` counterparts, but instead solve a group of systems of linear equations. Before calling this routine, you must call `?getrf_batch_strided` to compute the LU factorization of the square coefficient matrix of each linear system.

All coefficient matrices, A_i have the same parameters (matrix size, leading dimension) and are stored at constant *stride_a* from each other. Similarly, all right-hand-side matrices, B_i, have the same parameters and are stored at constant *stride_b* from each other. The respective pivot array associated with each of the LU-factored A_i matrices are stored at constant *stride_ipiv* from each other. The operation is defined as

```
for i = 0 … batch_size-1
    Ai, Bi are matrices at offset i * stride_a, i * stride_b from A and B
    ipivi is an array at offset i * stride_ipiv from ipiv
    Solve the system
    Ai * Xi = Bi   , if trans='N'
    Ai^T * Xi = Bi   , if trans='T'
    Ai^C * Xi = Bi , if trans='C' (for complex matrices)
end for
```

Input Parameters

trans

`CHARACTER*1`. Must be 'N', 'T', or 'C'.

Indicates the form of the systems of linear equations:

If trans = 'N', $A_i * X_i = B_i$ is solved for X_i.

If trans = 'T', $A_i^T * X_i = B_i$ is solved for X_i.

If trans = 'C', $A_i^C * X_i = B_i$ is solved for X_i.

n — INTEGER. The order fo the A_i matrices; $n \geq 0$.

nrhs — INTEGER. The number of right hand sides in each linear system of equations (*nrhs* ≥ 0).

A, B — REAL for sgetrs_batch_strided

DOUBLE PRECISION for dgetrs_batch_strided

COMPLEX for cgetrs_batch_strided

DOUBLE COMPLEX for zgetrs_batch_strided

The *A* array of size at least *stride_a* * *batch_size* holding the LU-factorized A_i matrices resulting from the call to ?getrf_batch_strided.

The *B* array of size at least *stride_b* * *batch_size* holding the B_i matrices, whose columns are the right -hand sides for each linear system of equations.

lda — INTEGER. Specifies the leading dimension of the A_i matrices; *lda* ≥ max(1,*n*).

ldb — INTEGER. Specifies the leading dimension of the B_i matrices; *ldb* ≥ max(1,*n*).

stride_a — INTEGER.

Stride between two consecutive A_i matrices; *stride_a* ≥ *lda* * *n*.

stride_b — INTEGER.

Stride between two consecutive B_i matrices; *stride_b* ≥ *ldb* * *nrhs*.

ipiv — INTEGER.

Array of size at least *stride_ipiv* * *batch_size* holding the pivoting indices for each LU-factorized matrix A_i.

stride_ipiv — INTEGER.

Stride between two consecutive pivot arrays; *stride_ipiv* ≥ *n*).

batch_size — INTEGER.

Number of linear systems to be solved; *batch_size* ≥ 0.

Output Parameters

B — Array is overwritten by the solution matrices X_i.

info — INTEGER.

Array of size at least *batch_size*, which reports the status for each linear system solve.

If *info(i)* = 0, the execution is successful for A_i.

If *info(i)* = -*j*, the *j*-th parameter had an illegal value for A_i.

?getrsnp_batch_strided
Solves a group of systems of linear equations, each with an LU-factored square coefficient matrix and multiple right hand sides.

Syntax

```
call sgetrsnp_batch_strided(trans, n, nrhs, A, lda, stride_a, b, ldb, stride_b, batch_size, info)
call dgetrsnp_batch_strided(trans, n, nrhs, A, lda, stride_a, b, ldb, stride_b, batch_size, info)
call cgetrsnp_batch_strided(trans, n, nrhs, A, lda, stride_a, b, ldb, stride_b, batch_size, info)
call zgetrsnp_batch_strided(trans, n, nrhs, A, lda, stride_a, b, ldb, stride_b, batch_size, info)
```

Include Files

```
mkl.fi
```

Description

The `?getrsnp_batch_strided` routines solve a group of systems of linear equations. Before calling this routine, you must call `?getrfnp_batch_strided` to compute the LU factorization (without pivoting) of the square coefficient matrix of each linear system.

All coefficient matrices, A_i have the same parameters (matrix size, leading dimension) and are stored at constant *stride_a* from each other. Similarly, all right-hand-side matrices, B_i, have the same parameters and are stored at constant *stride_b* from each other. The operation is defined as

```
for i = 0 … batch_size-1
    A_i, B_i are matrices at offset i * stride_a, i * stride_b from A and B
    Solve the system
    A_i * X_i = B_i  , if trans='N'
    A_i^T * X_i = B_i  , if trans='T'
    A_i^C * X_i = B_i , if trans='C' (for complex matrices)
end for
```

Input Parameters

trans
`CHARACTER*1`. Must be 'N', 'T', or 'C'.
Indicates the form of the systems of linear equations:
If trans = 'N', $A_i * X_i = B_i$ is solved for X_i.
If trans = 'T', $A_i^T * X_i = B_i$ is solved for X_i.
If trans = 'C', $A_i^C * X_i = B_i$ is solved for X_i.

n
`INTEGER`. The order fo the A_i matrices; $n \geq 0$.

nrhs
`INTEGER`. The number of right hand sides in each linear system of equations (*nrhs* ≥ 0).

A, B	REAL for sgetrsnp_batch_strided DOUBLE PRECISION for dgetrsnp_batch_strided COMPLEX for cgetrsnp_batch_strided DOUBLE COMPLEX for zgetrsnp_batch_strided The *A* array of size at least *stride_a* * *batch_size* holding the LU-factorized A_i matrices resulting from the call to ?getrfnp_batch_strided. The *B* array of size at least *stride_b* * *batch_size* holding the B_i matrices, whose columns are the right -hand sides for each linear system of equations.
lda	INTEGER. Specifies the leading dimension of the A_i matrices; *lda* ≥ max(1,*n*).
ldb	INTEGER. Specifies the leading dimension of the B_i matrices; *ldb* ≥ max(1,*n*).
stride_a	INTEGER. Stride between two consecutive A_i matrices; *stride_a* ≥ *lda* * *n*.
stride_b	INTEGER. Stride between two consecutive B_i matrices; *stride_b* ≥ *ldb* * *nrhs*.
ipiv	INTEGER. Array of size at least *stride_ipiv* * *batch_size* holding the pivoting indices for each LU-factorized matrix A_i.
batch_size	INTEGER. Number of linear systems to be solved; *batch_size* ≥ 0.

Output Parameters

B	Array is overwritten by the solution matrices X_i.
info	INTEGER. Array of size at least *batch_size*, which reports the status for each linear system solve. If *info(i)* = 0, the execution is successful for A_i. If *info(i)* = -*j*, the *j*-th parameter had an illegal value for A_i.

?gbtrs

Solves a system of linear equations with an LU-factored band coefficient matrix, with multiple right-hand sides.

Syntax

```
call sgbtrs( trans, n, kl, ku, nrhs, ab, ldab, ipiv, b, ldb, info )
call dgbtrs( trans, n, kl, ku, nrhs, ab, ldab, ipiv, b, ldb, info )
call cgbtrs( trans, n, kl, ku, nrhs, ab, ldab, ipiv, b, ldb, info )
```

```
call zgbtrs( trans, n, kl, ku, nrhs, ab, ldab, ipiv, b, ldb, info )
call gbtrs( ab, b, ipiv, [, kl] [, trans] [, info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine solves for *X* the following systems of linear equations:

$A*X = B$	if *trans*='N',
$A^T*X = B$	if *trans*='T',
$A^H*X = B$	if *trans*='C' (for complex matrices only).

Here *A* is an *LU*-factored general band matrix of order *n* with *kl* non-zero subdiagonals and *ku* nonzero superdiagonals. Before calling this routine, call ?gbtrf to compute the *LU* factorization of *A*.

Input Parameters

trans	CHARACTER*1. Must be 'N' or 'T' or 'C'.
n	INTEGER. The order of *A*; the number of rows in *B*; $n \geq 0$.
kl	INTEGER. The number of subdiagonals within the band of *A*; $kl \geq 0$.
ku	INTEGER. The number of superdiagonals within the band of *A*; $ku \geq 0$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
ab, *b*	REAL for sgbtrs DOUBLE PRECISION for dgbtrs COMPLEX for cgbtrs DOUBLE COMPLEX for zgbtrs. Arrays: *ab*(*ldab*,*), *b*(*ldb*,*). The array *ab* contains elements of the LU factors of the matrix *A* as returned by gbtrf. The second dimension of *ab* must be at least max(1, *n*). The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* at least max(1,*nrhs*).
ldab	INTEGER. The leading dimension of the array *ab*; $ldab \geq 2*kl + ku + 1$.
ldb	INTEGER. The leading dimension of *b*; $ldb \geq$ max(1, *n*).
ipiv	INTEGER. Array, size at least max(1, *n*). The *ipiv* array, as returned by ?gbtrf.

Output Parameters

b	Overwritten by the solution matrix *X*.

info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine gbtrs interface are as follows:

ab	Holds the array *A* of size (2**kl*+*ku*+1, *n*).
b	Holds the matrix *B* of size (*n*, *nrhs*).
ipiv	Holds the vector of length min(*m*, *n*).
kl	If omitted, assumed *kl* = *ku*.
ku	Restored as *lda*-2**kl*-1.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.

Application Notes

For each right-hand side *b*, the computed solution is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$$|E| \leq c(kl + ku + 1)\varepsilon P|L||U|$$

$c(k)$ is a modest linear function of *k*, and ε is the machine precision.

If x_0 is the true solution, the computed solution *x* satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \leq c(kl + ku + 1)\, cond\,(A, x)\varepsilon$$

where $cond(A, x) = \| |A^{-1}||A|\,|x|\,\|_\infty / \|x\|_\infty \leq \||A^{-1}|\|_\infty \||A|\|_\infty = \kappa_\infty(A)$.

Note that $cond(A, x)$ can be much smaller than $\kappa_\infty(A)$; the condition number of A^T and A^H might or might not be equal to $\kappa_\infty(A)$.

The approximate number of floating-point operations for one right-hand side vector is $2n(ku + 2kl)$ for real flavors. The number of operations for complex flavors is 4 times greater. All these estimates assume that *kl* and *ku* are much less than min(*m*,*n*).

To estimate the condition number $\kappa_\infty(A)$, call ?gbcon.

To refine the solution and estimate the error, call ?gbrfs.

call gttrs( dl, d, du, du2, b, ipiv [, trans] [,info] )
```

Include Files

- `mkl.fi, lapack.f90`

Description

The routine solves for *X* the following systems of linear equations with multiple right hand sides:

$A*X = B$	if *trans*=`'N'`,
$A^T*X = B$	if *trans*=`'T'`,
$A^H*X = B$	if *trans*=`'C'` (for complex matrices only).

Before calling this routine, you must call `?gttrf` to compute the *LU* factorization of *A*.

Input Parameters

trans	`CHARACTER*1`. Must be `'N'` or `'T'` or `'C'`. Indicates the form of the equations: If *trans* = `'N'`, then $A*X = B$ is solved for *X*. If *trans* = `'T'`, then $A^T*X = B$ is solved for *X*. If *trans* = `'C'`, then $A^H*X = B$ is solved for *X*.
n	`INTEGER`. The order of *A*; $n \geq 0$.
nrhs	`INTEGER`. The number of right-hand sides, that is, the number of columns in *B*; $nrhs \geq 0$.

dl,*d*,*du*,*du2*,*b*	`REAL` for `sgttrs`
	`DOUBLE PRECISION` for `dgttrs`
	`COMPLEX` for `cgttrs`
	`DOUBLE COMPLEX` for `zgttrs`.
	Arrays: *dl*(*n* -1), *d*(*n*), *du*(*n* -1), *du2*(*n* -2), *b*(*ldb*,*nrhs*).
	The array *dl* contains the (*n* – 1) multipliers that define the matrix *L* from the *LU* factorization of *A*.

	The array *d* contains the *n* diagonal elements of the upper triangular matrix *U* from the *LU* factorization of *A*. The array *du* contains the (*n* - 1) elements of the first superdiagonal of *U*. The array *du2* contains the (*n* - 2) elements of the second superdiagonal of *U*. The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations.
ldb	INTEGER. The leading dimension of *b*; *ldb*≥ max(1, *n*).
ipiv	INTEGER. Array, size (*n*). The *ipiv* array, as returned by ?gttrf.

Output Parameters

b	Overwritten by the solution matrix *X*.
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine gttrs interface are as follows:

dl	Holds the vector of length (*n*-1).
d	Holds the vector of length *n*.
du	Holds the vector of length (*n*-1).
du2	Holds the vector of length (*n*-2).
b	Holds the matrix *B* of size (*n*, *nrhs*).
ipiv	Holds the vector of length *n*.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.

Application Notes

For each right-hand side *b*, the computed solution is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$$|E| \leq c(n)\varepsilon P|L||U|$$

$c(n)$ is a modest linear function of *n*, and ε is the machine precision.

If x_0 is the true solution, the computed solution *x* satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \leq c(kl + ku + 1)\, cond\,(A, x)\varepsilon$$

where cond(*A*, *x*) = || $|A^{-1}||A|$ $|x|$ $||_\infty$ / $||x||_\infty \leq ||A^{-1}||_\infty ||A||_\infty = \kappa_\infty(A)$.

Note that cond(*A*, *x*) can be much smaller than $\kappa_\infty(A)$; the condition number of A^T and A^H might or might not be equal to $\kappa_\infty(A)$.

The approximate number of floating-point operations for one right-hand side vector *b* is 7*n* (including *n* divisions) for real flavors and 34*n* (including 2*n* divisions) for complex flavors.

To estimate the condition number $\kappa_\infty(A)$, call ?gtcon.

To refine the solution and estimate the error, call ?gtrfs.

?dttrsb

Solves a system of linear equations with a diagonally dominant tridiagonal coefficient matrix using the LU factorization computed by ?dttrfb.

Syntax

```
call sdttrsb( trans, n, nrhs, dl, d, du, b, ldb, info )
call ddttrsb( trans, n, nrhs, dl, d, du, b, ldb, info )
call cdttrsb( trans, n, nrhs, dl, d, du, b, ldb, info )
call zdttrsb( trans, n, nrhs, dl, d, du, b, ldb, info )
call dttrsb( dl, d, du, b [, trans] [, info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The ?dttrsb routine solves the following systems of linear equations with multiple right hand sides for *X*:

*A*X = B*	if *trans*='N',
$A^T*X = B$	if *trans*='T',
$A^H*X = B$	if *trans*='C' (for complex matrices only).

Before calling this routine, call ?dttrfb to compute the factorization of *A*.

Input Parameters

trans	CHARACTER*1. Must be 'N' or 'T' or 'C'. Indicates the form of the equations solved for *X*:

If *trans* = 'N', then $A*X = B$.

If *trans* = 'T', then $A^T*X = B$.

If *trans* = 'C', then $A^H*X = B$.

n — INTEGER. The order of *A*; $n \geq 0$.

nrhs — INTEGER. The number of right-hand sides, that is, the number of columns in *B*; $nrhs \geq 0$.

dl, *d*, *du*, *b* — REAL for sdttrsb

DOUBLE PRECISION for ddttrsb

COMPLEX for cdttrsb

DOUBLE COMPLEX for zdttrsb.

Arrays: *dl*(*n* -1), *d*(*n*), *du*(*n* -1), *b*(*ldb*,*nrhs*).

The array *dl* contains the (*n* - 1) multipliers that define the matrices L_1, L_2 from the factorization of *A*.

The array *d* contains the *n* diagonal elements of the upper triangular matrix *U* from the factorization of *A*.

The array *du* contains the (*n* - 1) elements of the superdiagonal of *U*.

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations.

ldb — INTEGER. The leading dimension of *b*; $ldb \geq \max(1, n)$.

Output Parameters

b — Overwritten by the solution matrix *X*.

info — INTEGER. If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

?potrs

Solves a system of linear equations with a Cholesky-factored symmetric (Hermitian) positive-definite coefficient matrix.

Syntax

```
call spotrs( uplo, n, nrhs, a, lda, b, ldb, info )
call dpotrs( uplo, n, nrhs, a, lda, b, ldb, info )
call cpotrs( uplo, n, nrhs, a, lda, b, ldb, info )
call zpotrs( uplo, n, nrhs, a, lda, b, ldb, info )
call potrs( a, b [,uplo] [, info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine solves for *X* the system of linear equations *A*X = B* with a symmetric positive-definite or, for complex data, Hermitian positive-definite matrix *A*, given the Cholesky factorization of *A*:

A = U^T**U* for real data, *A = U*^{H}**U* for complex data if *uplo*='U'

*A = L*L*^{T} for real data, *A = L*L*^{H} for complex data if *uplo*='L'

where *L* is a lower triangular matrix and *U* is upper triangular. The system is solved with multiple right-hand sides stored in the columns of the matrix *B*.

Before calling this routine, you must call ?potrf to compute the Cholesky factorization of *A*.

Input Parameters

uplo CHARACTER*1. Must be 'U' or 'L'.

Indicates how the input matrix *A* has been factored:

If *uplo = 'U'*, *U* is stored, where*A* = U^T**U* for real data, *A* = U^H**U* for complex data.

If *uplo = 'L'*, *L* is stored, where*A* = *L**L^T for real data, *A* = *L**L^H for complex data.

n INTEGER. The order of matrix *A*; *n*≥ 0.

nrhs INTEGER. The number of right-hand sides (*nrhs*≥ 0).

a, *b* REAL for spotrs

DOUBLE PRECISION for dpotrs

COMPLEX for cpotrs

DOUBLE COMPLEX for zpotrs.

Arrays: *a*(*lda*,*), *b*(*ldb*,*).

The array *a* contains the factor *U* or *L* (see *uplo*) as returned by potrf. The second dimension of *a* must be at least max(1,*n*).

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).

lda INTEGER. The leading dimension of a. *lda*≥ max(1, *n*).

ldb INTEGER. The leading dimension of b. *ldb*≥ max(1, *n*).

Output Parameters

b Overwritten by the solution matrix *X*.

info INTEGER. If *info = 0*, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `potrs` interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *nrhs*).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

If *uplo* = `'U'`, the computed solution for each right-hand side *b* is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$$|E| \leq c(n)\varepsilon \ |U^H||U|$$

$c(n)$ is a modest linear function of *n*, and ε is the machine precision.

A similar estimate holds for *uplo* = `'L'`. If x_0 is the true solution, the computed solution *x* satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \leq c(n)\, cond\,(A, x)\varepsilon$$

where $cond(A, x) = \| \ |A^{-1}||A| \ |x| \ \|_\infty / \ \|x\|_\infty \leq \ \||A^{-1}|\|_\infty \ \||A|\|_\infty = \kappa_\infty(A)$.

Note that $cond(A, x)$ can be much smaller than $\kappa_\infty(A)$. The approximate number of floating-point operations for one right-hand side vector *b* is $2n^2$ for real flavors and $8n^2$ for complex flavors.

To estimate the condition number $\kappa_\infty(A)$, call `?pocon`.

To refine the solution and estimate the error, call `?porfs`.

?pftrs
Solves a system of linear equations with a Cholesky-factored symmetric (Hermitian) positive-definite coefficient matrix using the Rectangular Full Packed (RFP) format.

Syntax

```
call spftrs( transr, uplo, n, nrhs, a, b, ldb, info )
call dpftrs( transr, uplo, n, nrhs, a, b, ldb, info )
call cpftrs( transr, uplo, n, nrhs, a, b, ldb, info )
call zpftrs( transr, uplo, n, nrhs, a, b, ldb, info )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine solves a system of linear equations *A*X = B* with a symmetric positive-definite or, for complex data, Hermitian positive-definite matrix *A* using the Cholesky factorization of *A*:

*A = U^T*U* for real data, *A = U^H*U* for complex data if *uplo*='U'

*A = L*L^T* for real data, *A = L*L^H* for complex data if *uplo*='L'

Before calling ?pftrs, you must call ?pftrf to compute the Cholesky factorization of *A*. *L* stands for a lower triangular matrix and *U* for an upper triangular matrix.

The matrix *A* is in the Rectangular Full Packed (RFP) format. For the description of the RFP format, see Matrix Storage Schemes.

Input Parameters

transr

CHARACTER*1. Must be 'N', 'T' (for real data) or 'C' (for complex data).

If *transr* = 'N', the untransposed factor of *A*is stored in RFP format.

If *transr* = 'T', the transposed factor of *A*is stored in RFP format.

If *transr* = 'C', the conjugate-transposed factor of *A*is stored in RFP format.

uplo

CHARACTER*1. Must be 'U' or 'L'.

Indicates how the input matrix *A* has been factored:

If *uplo* = 'U', *U* is stored, where $A = U^{T}*U$ for real data, $A = U^{H}*U$ for complex data.

If *uplo* = 'L', *L* is stored, where $A = L*L^{T}$ for real data, $A = L*L^{H}$ for complex data

n

INTEGER. The order of the matrix *A*; *n*≥ 0.

nrhs

INTEGER. The number of right-hand sides, that is, the number of columns of the matrix *B*; *nrhs*≥ 0.

a, *b*

REAL for spftrs

DOUBLE PRECISION for dpftrs

COMPLEX for cpftrs

DOUBLE COMPLEX for zpftrs.

Arrays: *a*(*n**(*n* + 1)/2), *b*(*ldb*,*nrhs*).

The array *a* contains, in the RFP format, the factor *U* or *L* obtained by factorization of matrix *A*.

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations.

ldb

INTEGER. The leading dimension of *b*; *ldb*≥ max(1, *n*).

Output Parameters

b	The solution matrix *X*.
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Description

The routine solves for real data a system of linear equations *A*X = B* with a symmetric positive-definite or, for complex data, Hermitian positive-definite *band* matrix *A*, given the Cholesky factorization of *A*:

$A = U^T*U$ for real data, $A = U^H*U$ for complex data	if *uplo*='U'
$A = L*L^T$ for real data, $A = L*L^H$ for complex data	if *uplo*='L'

where *L* is a lower triangular matrix and *U* is upper triangular. The system is solved with multiple right-hand sides stored in the columns of the matrix *B*.

Before calling this routine, you must call ?pbtrf to compute the Cholesky factorization of *A* in the band storage form.

Input Parameters

uplo

CHARACTER*1. Must be 'U' or 'L'.

Indicates how the input matrix *A* has been factored:

If *uplo* = 'U', *U* is stored in *ab*, where $A = U^T*U$ for real matrices and $A = U^H*U$ for complex matrices.

If *uplo* = 'L', *L* is stored in *ab*, where $A = L*L^T$ for real matrices and $A = L*L^H$ for complex matrices.

n	INTEGER. The order of matrix *A*; *n*≥ 0.
kd	INTEGER. The number of superdiagonals or subdiagonals in the matrix *A*; *kd*≥ 0.
nrhs	INTEGER. The number of right-hand sides; *nrhs*≥ 0.
ab, *b*	REAL for spbtrs DOUBLE PRECISION for dpbtrs COMPLEX for cpbtrs DOUBLE COMPLEX for zpbtrs. Arrays: *ab*(*ldab*,*), *b*(*ldb*,*). The array *ab* contains the Cholesky factor, as returned by the factorization routine, in *band storage* form. The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *ab* must be at least max(1, *n*), and the second dimension of *b* at least max(1,*nrhs*).
ldab	INTEGER. The leading dimension of the array *ab*; *ldab*≥*kd* +1.
ldb	INTEGER. The leading dimension of *b*; *ldb*≥ max(1, *n*).

Output Parameters

b	Overwritten by the solution matrix *X*.
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine pbtrs interface are as follows:

ab	Holds the array *A* of size (*kd*+1,*n*).
b	Holds the matrix *B* of size (*n*, *nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For each right-hand side *b*, the computed solution is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$$|E| \leq c(kd + 1)\varepsilon P|U^H||U| \text{ or } |E| \leq c(kd + 1)\varepsilon P|L^H||L|$$

$c(k)$ is a modest linear function of k, and ε is the machine precision.

If x_0 is the true solution, the computed solution x satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \leq c(kd + 1)\, cond\,(A, x)\varepsilon$$

where cond(*A*, *x*) = || $|A^{-1}||A|\,|x|$ $||_\infty$ / $||x||_\infty \leq ||A^{-1}||_\infty\, ||A||_\infty = \kappa_\infty(A)$.

Note that cond(*A*, *x*) can be much smaller than $\kappa_\infty(A)$.

The approximate number of floating-point operations for one right-hand side vector is 4*n***kd* for real flavors and 16*n***kd* for complex flavors.

To estimate the condition number $\kappa_\infty(A)$, call ?pbcon.

To refine the solution and estimate the error, call ?pbrfs.

Include Files

- mkl.fi, lapack.f90

Description

The routine solves for *X* a system of linear equations *A***X* = *B* with a symmetric (Hermitian) positive-definite tridiagonal matrix *A*. Before calling this routine, call ?pttrf to compute the $L*D*L^T$ or U^T*D*U for real data and the $L*D*L^H$ or U^H*D*U factorization of *A* for complex data.

Input Parameters

uplo

CHARACTER*1. Used for cpttrs/zpttrs only. Must be 'U' or 'L'.

Specifies whether the superdiagonal or the subdiagonal of the tridiagonal matrix *A* is stored and how *A* is factored:

If *uplo* = 'U', the array *e* stores the conjugated values of the superdiagonal of *U*, and *A* is factored as U^H*D*U.

If *uplo* = 'L', the array *e* stores the subdiagonal of *L*, and *A* is factored as $L*D*L^H$.

n — INTEGER. The order of *A*; $n \geq 0$.

nrhs — INTEGER. The number of right-hand sides, that is, the number of columns of the matrix *B*; $nrhs \geq 0$.

d — REAL for spttrs, cpttrs

DOUBLE PRECISION for dpttrs, zpttrs.

Array, dimension (*n*). Contains the diagonal elements of the diagonal matrix *D* from the factorization computed by ?pttrf.

e, *b* — REAL for spttrs

DOUBLE PRECISION for dpttrs

COMPLEX for cpttrs

DOUBLE COMPLEX for zpttrs.

Arrays: *e*(*n* -1), *b*(*ldb*, *nrhs*).

The array *e* contains the (*n* - 1) sub-diagonal elements of the unit bidiagonal factor *L* or the conjugated values of the superdiagonal of *U* from the factorization computed by ?pttrf (see *uplo*).

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations.

ldb — INTEGER. The leading dimension of *b*; $ldb \geq \max(1, n)$.

Output Parameters

b — Overwritten by the solution matrix *X*.

info — INTEGER. If *info*=0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine pttrs interface are as follows:

d — Holds the vector of length *n*.

e — Holds the vector of length (*n*-1).

b — Holds the matrix *B* of size (*n*, *nrhs*).

uplo — Used in complex flavors only. Must be 'U' or 'L'. The default value is 'U'.

Description

The routine solves for *X* the system of linear equations *A*X = B* with a symmetric matrix *A*, given the Bunch-Kaufman factorization of *A*:

if *uplo*='U', $A = U*D*U^T$

if *uplo*='L', $A = L*D*L^T$,

where *U* and *L* are upper and lower triangular matrices with unit diagonal and *D* is a symmetric block-diagonal matrix. The system is solved with multiple right-hand sides stored in the columns of the matrix *B*. You must supply to this routine the factor *U* (or *L*) and the array *ipiv* returned by the factorization routine ?sytrf.

Input Parameters

uplo
CHARACTER*1. Must be 'U' or 'L'.
Indicates how the input matrix *A* has been factored:
If *uplo* = 'U', the array *a* stores the upper triangular factor *U* of the factorization *A* = *U*D*U*^{T}.
If *uplo* = 'L', the array *a* stores the lower triangular factor *L* of the factorization *A* = *L*D*L*^{T}.

n
INTEGER. The order of matrix *A*; *n*≥ 0.

nrhs
INTEGER. The number of right-hand sides; *nrhs*≥ 0.

ipiv
INTEGER. Array, size at least max(1, *n*). The *ipiv* array, as returned by ?sytrf.

a, *b*
REAL for ssytrs
DOUBLE PRECISION for dsytrs
COMPLEX for csytrs
DOUBLE COMPLEX for zsytrs.
Arrays: *a*(*lda*,*), *b*(*ldb*,*).

	The array *a* contains the factor *U* or *L* (see *uplo*). The second dimension of *a* must be at least `max(1,n)`. The array *b* contains the matrix *B* whose columns are the right-hand sides for the system of equations. The second dimension of *b* must be at least `max(1,nrhs)`.
lda	`INTEGER`. The leading dimension of *a*; *lda*≥ `max(1, n)`.
ldb	`INTEGER`. The leading dimension of *b*; *ldb*≥ `max(1, n)`.

Output Parameters

b	Overwritten by the solution matrix *X*.
info	`INTEGER`. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `sytrs` interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *nrhs*).
ipiv	Holds the vector of length *n*.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

For each right-hand side *b*, the computed solution is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$$|E| \le c(n)\varepsilon P|U||D||U^T|P^T \text{ or } |E| \le c(n)\varepsilon P|L||D||U^T|P^T$$

$c(n)$ is a modest linear function of *n*, and ε is the machine precision.

If x_0 is the true solution, the computed solution *x* satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \le c(n)\, cond\,(A, x)\varepsilon$$

where $cond(A, x) = \| |A^{-1}||A|\,|x|\,\|_\infty / \|x\|_\infty \le \||A^{-1}|\|_\infty \||A|\|_\infty = \kappa_\infty(A)$.

Note that $cond(A, x)$ can be much smaller than $\kappa_\infty(A)$.

The total number of floating-point operations for one right-hand side vector is approximately $2n^2$ for real flavors or $8n^2$ for complex flavors.

To estimate the condition number $\kappa_\infty(A)$, call ?sycon.

To refine the solution and estimate the error, call ?syrfs.

call zsytrs_aa(uplo, n, nrhs, A, lda, ipiv, B, ldb, work, lwork, info)
```

Description

?sytrs_aa solves a system of linear equations A * X = B with a symmetric matrix A using the factorization A = U*T*U^T or A = L*T*L^T computed by ?sytrf_aa.

Input Parameters

uplo

CHARACTER*1

Specifies whether the details of the factorization are stored as an upper or lower triangular matrix.

- = 'U': Upper triangular; the form is A = U*T*U^T.
- = 'L': Lower triangular; the form is A = L*T*L^T.

n

INTEGER

The order of the matrix A. $n \geq 0$.

nrhs

INTEGER

The number of right-hand sides; that is, the number of columns of the matrix B. $nrhs \geq 0$.

A

REAL for ssytrs_aa

DOUBLE COMPLEX for dsytrs_aa

COMPLEX for csytrs_aa

COMPLEX*16 for zsytrs_aa

Array, dimension (*lda*,*n*). Details of factors computed by ?sytrf_aa.

lda

INTEGER

The leading dimension of the array *A*.$lda \geq \max(1, n)$.

ipiv

INTEGER

Array, dimension (*n*). Details of the interchanges as computed by ?sytrf_aa.

B

REAL for ssytrs_aa

DOUBLE COMPLEX for dsytrs_aa

COMPLEX for csytrs_aa

COMPLEX*16 for zsytrs_aa

Array, dimension (*ldb*,*nrhs*). On entry, the right-hand side matrix B.

ldb INTEGER

The leading dimension of the array *B*. *ldb* ≥ max(1, *n*).

work Array, dimension (MAX(1,*lwork*)).

REAL for ssytrs_aa

DOUBLE COMPLEX for dsytrs_aa

COMPLEX for csytrs_aa

COMPLEX*16 for zsytrs_aa

lwork INTEGER

The length of the array *work*.

Output Parameters

B REAL for ssytrs_aa

DOUBLE COMPLEX for dsytrs_aa

COMPLEX for csytrs_aa

COMPLEX*16 for zsytrs_aa

On exit, the solution matrix X.

info INTEGER

- If *info* = 0: Successful exit.
- < 0: If *info* = –*i*, the *i*th argument had an illegal value.

?sytrs_rook

Solves a system of linear equations with a UDU- or LDL-factored symmetric coefficient matrix.

Syntax

Description

The routine solves for *X* the system of linear equations *A*X = B* with a Hermitian matrix *A*, given the Bunch-Kaufman factorization of *A*:

if *uplo*='U', $A = U*D*U^H$

if *uplo*='L', $A = L*D*L^H$,

where *U* and *L* are upper and lower triangular matrices with unit diagonal and *D* is a symmetric block-diagonal matrix. The system is solved with multiple right-hand sides stored in the columns of the matrix *B*. You must supply to this routine the factor *U* (or *L*) and the array *ipiv* returned by the factorization routine ?hetrf.

Input Parameters

uplo
CHARACTER*1. Must be 'U' or 'L'.
Indicates how the input matrix *A* has been factored:
If *uplo* = 'U', the array *a* stores the upper triangular factor *U* of the factorization *A* = $U*D*U^H$.
If *uplo* = 'L', the array *a* stores the lower triangular factor *L* of the factorization *A* = $L*D*L^H$.

n
INTEGER. The order of matrix *A*; $n \geq 0$.

nrhs
INTEGER. The number of right-hand sides; $nrhs \geq 0$.

ipiv
INTEGER.
Array, size at least max(1, *n*).
The *ipiv* array, as returned by ?hetrf.

a, *b*	`COMPLEX` for `chetrs` `DOUBLE COMPLEX` for `zhetrs`. Arrays: `a(lda,*)`, `b(ldb,*)`. The array *a* contains the factor *U* or *L* (see *uplo*). The array *b* contains the matrix *B* whose columns are the right-hand sides for the system of equations. The second dimension of *a* must be at least `max(1,n)`, the second dimension of *b* at least `max(1,nrhs)`.
lda	`INTEGER`. The leading dimension of *a*; *lda*≥ `max(1, n)`.
ldb	`INTEGER`. The leading dimension of *b*; *ldb*≥ `max(1, n)`.

Output Parameters

b	Overwritten by the solution matrix *X*.
info	`INTEGER`. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

?sytrs_3
*Solves a system of linear equations A * X = B with a real or complex symmetric matrix.*

```
call ssytrs_3(uplo, n, nrhs, A, lda, e, ipiv, B, ldb, info)
call dsytrs_3(uplo, n, nrhs, A, lda, e, ipiv, B, ldb, info)
call csytrs_3(uplo, n, nrhs, A, lda, e, ipiv, B, ldb, info)
call zsytrs_3(uplo, n, nrhs, A, lda, e, ipiv, B, ldb, info)
```

Description

`?sytrs_3` solves a system of linear equations A * X = B with a real or complex symmetric matrix A using the factorization computed by `?sytrf_rk`: A = P*U*D*(U^T)*(P^T) or A = P*L*D*(L^T)*(P^T), where U (or L) is unit upper (or lower) triangular matrix, U^T (or L^T) is the transpose of U (or L), P is a permutation matrix, P^T is the transpose of P, and D is a symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

This algorithm uses Level 3 BLAS.

Input Parameters

uplo

`CHARACTER*1`

Specifies whether the details of the factorization are stored as an upper or lower triangular matrix:

- = `'U'`: Upper triangular; the form is A= P*U*D*(U^T)*(P^T).
- = `'L'`: Lower triangular; the form is A = P*L*D*(L^T)*(P^T).

n

`INTEGER`

The order of the matrix A. *n* ≥ 0.

nrhs

`INTEGER`

The number of right-hand sides; that is, the number of columns of the matrix B. *nrhs* ≥ 0.

A

`REAL` for `ssytrs_3`

`DOUBLE PRECISION` for `dsytrs_3`

`COMPLEX` for `csytrs_3`

`COMPLEX*16` for `zsytrs_3`

Array, dimension (*lda*,*n*). Diagonal of the block diagonal matrix D and factors U or L as computed by `?sytrf_rk`:

- *Only* diagonal elements of the symmetric block diagonal matrix D on the diagonal of A; that is, D(*k*,*k*) = A(*k*,*k*). Superdiagonal (or subdiagonal) elements of D should be provided on entry in array *e*.

  —and—
- If *uplo* = `'U'`, factor U in the superdiagonal part of A. If *uplo* = `'L'`, factor L in the subdiagonal part of A.

lda

`INTEGER`

The leading dimension of the array *A*.*lda* ≥ max(1, *n*).

e

`REAL` for `ssytrs_3`

DOUBLE PRECISION for dsytrs_3

COMPLEX for csytrs_3

COMPLEX*16 for zsytrs_3

Array, dimension (*n*). On entry, contains the superdiagonal (or subdiagonal) elements of the symmetric block diagonal matrix D with 1-by-1 or 2-by-2 diagonal blocks. If *uplo* = 'U', e(*i*) = D(*i*–1,*i*),*i*=2:N, and e(1) is not referenced. If *uplo* = 'L', e(*i*) = D(*i*+1,*i*), *i*=1:N–1, and e(*n*) is not referenced.

NOTE For 1-by-1 diagonal block D(*k*), where 1 ≤ k ≤ *n*, the element *e*(*k*) is not referenced in both the *uplo* = 'U' and *uplo* = 'L' cases.

ipiv

INTEGER

Array, dimension (*n*). Details of the interchanges and the block structure of D as determined by ?sytrf_rk.

B

REAL for ssytrs_3

DOUBLE PRECISION for dsytrs_3

COMPLEX for csytrs_3

COMPLEX*16 for zsytrs_3

On entry, the right-hand side matrix B.

The second dimension of *B* must be at least max(1, *nrhs*).

ldb

INTEGER

The leading dimension of the array *B*. *ldb* ≥ max(1, *n*).

Output Parameters

B

REAL for ssytrs_3

DOUBLE PRECISION for dsytrs_3

COMPLEX for csytrs_3

COMPLEX*16 for zsytrs_3

On exit, the solution matrix X.

info

INTEGER

- = 0: successful exit.
- < 0: If *info* = –*i*, the *i*th argument had an illegal value.

?hetrs_3

*Solves a system of linear equations A * X = B with a complex Hermitian matrix using the factorization computed by* ?hetrf_rk.

```
call chetrs_3(uplo, n, nrhs, A, lda, e, ipiv, B, ldb, info)

Description

?hetrs_3 solves a system of linear equations A * X = B with a complex Hermitian matrix A using the factorization computed by ?hetrf_rk: A = P*U*D*(U^H)*(P^T) or A = P*L*D*(L^H)*(P^T), where U (or L) is unit upper (or lower) triangular matrix, U^H (or L^H) is the conjugate of U (or L), P is a permutation matrix, P^T is the transpose of P, and D is a Hermitian and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

This algorithm uses Level 3 BLAS.

Input Parameters

uplo CHARACTER*1

Specifies whether the details of the factorization are stored as an upper or lower triangular matrix:

- = 'U': Upper triangular; form is A = P*U*D*(U^H)*(P^T).
- = 'L': Lower triangular; form is A = P*L*D*(L^H)*(P^T).

n INTEGER

The order of the matrix A. *n* ≥ 0.

nrhs INTEGER

The number of right-hand sides; that is, the number of columns in the matrix B. *nrhs* ≥ 0.

A COMPLEX for chetrs_3

COMPLEX*16 for zhetrs_3

Array, dimension (*lda*,*n*). Diagonal of the block diagonal matrix D and factor U or L as computed by ?hetrf_rk:

- *Only* diagonal elements of the Hermitian block diagonal matrix D on the diagonal of A; that is, D(*k*,*k*) = A(*k*,*k*). Superdiagonal (or subdiagonal) elements of D should be provided on entry in array *e*.
- If *uplo* = 'U', factor U in the superdiagonal part of A. If *uplo* = 'L', factor L in the subdiagonal part of A.

lda INTEGER

The leading dimension of the array *A*.*lda* ≥ max(1, *n*).

e COMPLEX for chetrs_3

COMPLEX*16 for zhetrs_3

Array, dimension (*n*). On entry, contains the superdiagonal (or subdiagonal) elements of the Hermitian block diagonal matrix D with 1-by-1 or 2-by-2 diagonal blocks. If *uplo* = 'U', e(*i*) = D(*i*–1,*i*),*i*=2:N, and e(1) is not referenced. If *uplo* = 'L', e(*i*) = D(*i*+1,*i*),*i*=1:N–1, and e(*n*) is not referenced.

> **NOTE** For 1-by-1 diagonal block D(*k*), where 1 ≤ *k* ≤ *n*, the element *e*(*k*) is not referenced in both the *uplo* = 'U' and *uplo* = 'L' cases.

ipiv INTEGER

Array, dimension (*n*). Details of the interchanges and the block structure of D as determined by ?hetrf_rk.

B — COMPLEX for chetrs_3

COMPLEX*16 for zhetrs_3

On entry, the right-hand side matrix B.

The second dimension of *B* must be at least max(1, *nrhs*).

ldb — INTEGER

The leading dimension of the array *B*. *ldb* ≥ max(1, *n*).

Output Parameters

B — COMPLEX for chetrs_3

COMPLEX*16 for zhetrs_3

On exit, the solution matrix X.

info — INTEGER

- = 0: Successful exit.
- < 0: If *info* = *-i*, the *i*th argument had an illegal value.

?sptrs

Solves a system of linear equations with a UDU- or LDL-factored symmetric coefficient matrix using packed storage.

Syntax

```
call ssptrs( uplo, n, nrhs, ap, ipiv, b, ldb, info )
call dsptrs( uplo, n, nrhs, ap, ipiv, b, ldb, info )
call csptrs( uplo, n, nrhs, ap, ipiv, b, ldb, info )
call zsptrs( uplo, n, nrhs, ap, ipiv, b, ldb, info )
call sptrs( ap, b, ipiv [, uplo] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine solves for *X* the system of linear equations *A*X = B* with a symmetric matrix *A*, given the Bunch-Kaufman factorization of *A*:

if *uplo*='U', $A = U*D*U^T$

if *uplo*='L', $A = L*D*L^T$,

where *U* and *L* are upper and lower *packed* triangular matrices with unit diagonal and *D* is a symmetric block-diagonal matrix. The system is solved with multiple right-hand sides stored in the columns of the matrix *B*. You must supply the factor *U* (or *L*) and the array *ipiv* returned by the factorization routine ?sptrf.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates how the input matrix *A* has been factored: If *uplo* = 'U', the array *ap* stores the packed factor *U* of the factorization $A = U*D*U^T$. If *uplo* = 'L', the array *ap* stores the packed factor *L* of the factorization $A = L*D*L^T$.
n	INTEGER. The order of matrix *A*; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
ipiv	INTEGER. Array, size at least max(1, *n*). The *ipiv* array, as returned by ?sptrf.
ap	REAL for ssptrs DOUBLE PRECISION for dsptrs COMPLEX for csptrs DOUBLE COMPLEX for zsptrs. The dimension of array *ap* must be at least max(1, *n*(*n*+1)/2). The array *ap* contains the factor *U* or *L*, as specified by *uplo*, in *packed storage* (see Matrix Storage Schemes).
b	REAL for ssptrs DOUBLE PRECISION for dsptrs COMPLEX for csptrs DOUBLE COMPLEX for zsptrs. The array *b*(*ldb*,*) contains the matrix *B* whose columns are the right-hand sides for the system of equations. The second dimension of *b* must be at least max(1, *nrhs*).
ldb	INTEGER. The leading dimension of *b*; *ldb* ≥ max(1, *n*).

Output Parameters

b	Overwritten by the solution matrix *X*.
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine sptrs interface are as follows:

ap	Holds the array *A* of size (*n**(*n*+1)/2).
b	Holds the matrix *B* of size (*n*, *nrhs*).

ipiv	Holds the vector of length *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For each right-hand side *b*, the computed solution is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$$|E| \le c(n)\varepsilon P|U||D||U^T|P^T \text{ or } |E| \le c(n)\varepsilon P|L||D||L^T|P^T$$

$c(n)$ is a modest linear function of *n*, and ε is the machine precision.

If x_0 is the true solution, the computed solution *x* satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \le c(n)\, cond\,(A, x)\varepsilon$$

where $cond(A,x) = \| |A^{-1}||A|\,|x|\,\|_\infty / \||x|\|_\infty \le \||A^{-1}|\|_\infty \||A|\|_\infty = \kappa_\infty(A)$.

Note that $cond(A,x)$ can be much smaller than $\kappa_\infty(A)$.

The total number of floating-point operations for one right-hand side vector is approximately $2n^2$ for real flavors or $8n^2$ for complex flavors.

To estimate the condition number $\kappa_\infty(A)$, call ?spcon.

To refine the solution and estimate the error, call ?sprfs.

Description

The routine solves for *X* the system of linear equations $A*X = B$ with a Hermitian matrix *A*, given the Bunch-Kaufman factorization of *A*:

if *uplo*='U', $A = U*D*U^H$

if *uplo*='L', $A = L*D*L^H$,

where *U* and *L* are upper and lower *packed* triangular matrices with unit diagonal and *D* is a symmetric block-diagonal matrix. The system is solved with multiple right-hand sides stored in the columns of the matrix *B*.

You must supply to this routine the arrays *ap* (containing *U* or *L*)and *ipiv* in the form returned by the factorization routine ?hptrf.

Input Parameters

uplo
CHARACTER*1. Must be 'U' or 'L'.
Indicates how the input matrix *A* has been factored:
If *uplo* = 'U', the array *ap* stores the packed factor *U* of the factorization $A = U*D*U^H$. If *uplo* = 'L', the array *ap* stores the packed factor *L* of the factorization $A = L*D*L^H$.

n
INTEGER. The order of matrix *A*; $n \geq 0$.

nrhs
INTEGER. The number of right-hand sides; $nrhs \geq 0$.

ipiv
INTEGER. Array, size at least max(1, *n*). The *ipiv* array, as returned by ?hptrf.

ap
COMPLEX for chptrs
DOUBLE COMPLEX for zhptrs.
The dimension of array *ap*(*) must be at least max(1,*n*(*n*+1)/2). The array *ap* contains the factor *U* or *L*, as specified by *uplo*, in *packed storage* (see Matrix Storage Schemes).

b
COMPLEX for chptrs
DOUBLE COMPLEX for zhptrs.
The array *b*(*ldb*,*) contains the matrix *B* whose columns are the right-hand sides for the system of equations. The second dimension of *b* must be at least max(1, *nrhs*).

ldb
INTEGER. The leading dimension of *b*; $ldb \geq$ max(1, *n*).

Output Parameters

b
Overwritten by the solution matrix *X*.

info
INTEGER. If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine hptrs interface are as follows:

ap	Holds the array *A* of size `(n*(n+1)/2)`.
b	Holds the matrix *B* of size (*n*, *nrhs*).
ipiv	Holds the vector of length *n*.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

For each right-hand side *b*, the computed solution is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$$|E| \leq c(n)\varepsilon P|U||D||U^H|P^T \text{ or } |E| \leq c(n)\varepsilon P|L||D||L^H|P^T$$

$c(n)$ is a modest linear function of *n*, and ε is the machine precision.

If x_0 is the true solution, the computed solution *x* satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \leq c(n)\, cond\,(A, x)\varepsilon$$

where $cond(A,x) = \| |A^{-1}||A|\,|x| \|_\infty / \||x|\|_\infty \leq \||A^{-1}|\|_\infty \||A|\|_\infty = \kappa_\infty(A)$.

Note that $cond(A,x)$ can be much smaller than $\kappa_\infty(A)$.

The total number of floating-point operations for one right-hand side vector is approximately $8n^2$ for complex flavors.

To estimate the condition number $\kappa_\infty(A)$, call `?hpcon`.

To refine the solution and estimate the error, call `?hprfs`.

Matrix Storage Schemes

Estimating the Condition Number: LAPACK Computational Routines

This section describes the LAPACK routines for estimating the *condition number* of a matrix. The condition number is used for analyzing the errors in the solution of a system of linear equations (see Error Analysis). Since the condition number may be arbitrarily large when the matrix is nearly singular, the routines actually compute the *reciprocal* condition number.

?gecon
Estimates the reciprocal of the condition number of a general matrix in the 1-norm or the infinity-norm.

Syntax

```
call sgecon( norm, n, a, lda, anorm, rcond, work, iwork, info )
call dgecon( norm, n, a, lda, anorm, rcond, work, iwork, info )
call cgecon( norm, n, a, lda, anorm, rcond, work, rwork, info )
call zgecon( norm, n, a, lda, anorm, rcond, work, rwork, info )
```

```
call gecon( a, anorm, rcond [,norm] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine estimates the reciprocal of the condition number of a general matrix *A* in the 1-norm or infinity-norm:

$\kappa_1(A) = ||A||_1||A^{-1}||_1 = \kappa_\infty(A^T) = \kappa_\infty(A^H)$

$\kappa_\infty(A) = ||A||_\infty||A^{-1}||_\infty = \kappa_1(A^T) = \kappa_1(A^H)$.

An estimate is obtained for $||A^{-1}||$, and the reciprocal of the condition number is computed as *rcond* = 1 / (||*A*|| ||A^{-1}||).

Before calling this routine:

- compute *anorm* (either $||A||_1 = \max_j \Sigma_i |a_{ij}|$ or $||A||_\infty = \max_i \Sigma_j |a_{ij}|$)
- call ?getrf to compute the *LU* factorization of *A*.

Input Parameters

norm	CHARACTER*1. Must be '1' or 'O' or 'I'. If *norm* = '1' or 'O', then the routine estimates the condition number of matrix *A* in 1-norm. If *norm* = 'I', then the routine estimates the condition number of matrix *A* in infinity-norm.
n	INTEGER. The order of the matrix *A*; $n \geq 0$.
a, *work*	REAL for sgecon DOUBLE PRECISION for dgecon COMPLEX for cgecon DOUBLE COMPLEX for zgecon. Arrays: *a*(*lda*,*), *work*(*). The array *a* contains the *LU*-factored matrix *A*, as returned by ?getrf. The second dimension of *a* must be at least max(1,*n*). The array *work* is a workspace for the routine. The dimension of *work* must be at least max(1, 4*n) for real flavors and max(1, 2*n) for complex flavors.
anorm	REAL for single precision flavors. DOUBLE PRECISION for double precision flavors. The norm of the *original* matrix *A* (see Description).
lda	INTEGER. The leading dimension of *a*; *lda* ≥ max(1, *n*).
iwork	INTEGER. Workspace array, size at least max(1, *n*).
rwork	REAL for cgecon DOUBLE PRECISION for zgecon. Workspace array, size at least max(1, 2*n).

Output Parameters

rcond	`REAL` for single precision flavors. `DOUBLE PRECISION` for double precision flavors. An estimate of the reciprocal of the condition number. The routine sets *rcond* = 0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.
info	`INTEGER`. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `gecon` interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
norm	Must be `'1'`, `'O'`, or `'I'`. The default value is `'1'`.

Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than 10*r*. A call to this routine involves solving a number of systems of linear equations *A*x = b* or A^Hx = b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately 2*n^2 floating-point operations for real flavors and 8*n^2 for complex flavors.

Description

The routine estimates the reciprocal of the condition number of a general band matrix *A* in the 1-norm or infinity-norm:

$\kappa_1(A) = ||A||_1||A^{-1}||_1 = \kappa_\infty(A^T) = \kappa_\infty(A^H)$

$\kappa_\infty(A) = ||A||_\infty||A^{-1}||_\infty = \kappa_1(A^T) = \kappa_1(A^H)$.

An estimate is obtained for $||A^{-1}||$, and the reciprocal of the condition number is computed as `rcond = 1 / (||A|| ||A^-1||)`.

Before calling this routine:

- compute *anorm* (either $||A||_1 = \max_j \Sigma_i |a_{ij}|$ or $||A||_\infty = \max_i \Sigma_j |a_{ij}|$)
- call `?gbtrf` to compute the *LU* factorization of *A*.

Input Parameters

norm	`CHARACTER*1`. Must be `'1'` or `'O'` or `'I'`. If *norm* = `'1'` or `'O'`, then the routine estimates the condition number of matrix *A* in 1-norm. If *norm* = `'I'`, then the routine estimates the condition number of matrix *A* in infinity-norm.
n	`INTEGER`. The order of the matrix *A*; $n \geq 0$.
kl	`INTEGER`. The number of subdiagonals within the band of *A*; $kl \geq 0$.
ku	`INTEGER`. The number of superdiagonals within the band of *A*; $ku \geq 0$.
ldab	`INTEGER`. The leading dimension of the array *ab*. ($ldab \geq 2*kl + ku + 1$).
ipiv	`INTEGER`. Array, size at least `max(1, n)`. The *ipiv* array, as returned by `?gbtrf`.

ab, *work*	`REAL` for `sgbcon`
	`DOUBLE PRECISION` for `dgbcon`
	`COMPLEX` for `cgbcon`
	`DOUBLE COMPLEX` for `zgbcon`.
	Arrays: `ab(ldab,*)`, `work(*)`.
	The array *ab* contains the factored band matrix *A*, as returned by `?gbtrf`.
	The second dimension of *ab* must be at least `max(1,n)`. The array *work* is a workspace for the routine.
	The dimension of *work* must be at least `max(1, 3*n)` for real flavors and `max(1, 2*n)` for complex flavors.

anorm	`REAL` for single precision flavors. `DOUBLE PRECISION` for double precision flavors. The norm of the *original* matrix *A*(see Description).
iwork	`INTEGER`. Workspace array, size at least `max(1, n)`.
rwork	`REAL` for `cgbcon` `DOUBLE PRECISION` for `zgbcon`.

Workspace array, size at least `max(1, 2*n)`.

Output Parameters

rcond

`REAL` for single precision flavors.

`DOUBLE PRECISION` for double precision flavors.

An estimate of the reciprocal of the condition number. The routine sets *rcond* =0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.

info

`INTEGER`. If *info*=0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `gbcon` interface are as follows:

ab

Holds the array *A* of size (`2*kl+ku+1,n`).

ipiv

Holds the vector of length *n*.

norm

Must be `'1'`, `'O'`, or `'I'`. The default value is `'1'`.

kl

If omitted, assumed *kl* = *ku*.

ku

Restored as *ku* = *lda*-2*kl*-1.

Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than `10r`. A call to this routine involves solving a number of systems of linear equations *A*x* = *b* or A^H*x* = *b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately `2n(ku + 2kl)` floating-point operations for real flavors and `8n(ku + 2kl)` for complex flavors.

Input Parameters

norm

CHARACTER*1. Must be '1' or 'O' or 'I'.

If *norm* = '1' or 'O', then the routine estimates the condition number of matrix *A* in 1-norm.

If *norm* = 'I', then the routine estimates the condition number of matrix *A* in infinity-norm.

n

INTEGER. The order of the matrix *A*; $n \geq 0$.

dl,*d*,*du*,*du2*

REAL for sgtcon

DOUBLE PRECISION for dgtcon

COMPLEX for cgtcon

DOUBLE COMPLEX for zgtcon.

Arrays: *dl*(*n* -1), *d*(*n*), *du*(*n* -1), *du2*(*n* -2).

The array *dl* contains the (*n* - 1) multipliers that define the matrix *L* from the *LU* factorization of *A* as computed by ?gttrf.

The array *d* contains the *n* diagonal elements of the upper triangular matrix *U* from the *LU* factorization of *A*.

The array *du* contains the (*n* - 1) elements of the first superdiagonal of *U*.

The array *du2* contains the (*n* - 2) elements of the second superdiagonal of *U*.

ipiv

INTEGER.

Array, size (*n*). The array of pivot indices, as returned by ?gttrf.

anorm

REAL for single precision flavors.

DOUBLE PRECISION for double precision flavors.

The norm of the *original* matrix *A*(see *Description*).

work	REAL for sgtcon DOUBLE PRECISION for dgtcon COMPLEX for cgtcon DOUBLE COMPLEX for zgtcon. Workspace array, size (2*n).
iwork	INTEGER. Workspace array, size (*n*). Used for real flavors only.

Output Parameters

rcond	REAL for single precision flavors. DOUBLE PRECISION for double precision flavors. An estimate of the reciprocal of the condition number. The routine sets *rcond*=0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Description

The routine computes the reciprocal of the condition number (in the 1-norm) of a real symmetric or complex Hermitian positive-definite tridiagonal matrix using the factorization $A = L*D*L^T$ for real flavors and $A = L*D*L^H$ for complex flavors or $A = U^T*D*U$ for real flavors and $A = U^H*D*U$ for complex flavors computed by ?pttrf :

$\kappa_1(A) = ||A||_1 \ ||A^{-1}||_1$ (since *A* is symmetric or Hermitian, $\kappa_\infty(A) = \kappa_1(A)$).

The norm $||A^{-1}||$ is computed by a direct method, and the reciprocal of the condition number is computed as *rcond* = 1 / (||*A*|| $||A^{-1}||$).

Before calling this routine:

- compute *anorm* as $||A||_1 = \max_j \Sigma_i |a_{ij}|$
- call ?pttrf to compute the factorization of *A*.

Input Parameters

n	INTEGER. The order of the matrix *A*; $n \geq 0$.
d, *work*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors.

Arrays, dimension (*n*).

The array *d* contains the *n* diagonal elements of the diagonal matrix *D* from the factorization of *A*, as computed by ?pttrf ;

work is a workspace array.

e

REAL for sptcon

DOUBLE PRECISION for dptcon

COMPLEX for cptcon

DOUBLE COMPLEX for zptcon.

Array, size (*n* -1).

Contains off-diagonal elements of the unit bidiagonal factor *U* or *L* from the factorization computed by ?pttrf .

anorm

REAL for single precision flavors.

DOUBLE PRECISION for double precision flavors.

The 1- norm of the *original* matrix *A* (see *Description*).

Output Parameters

rcond

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

An estimate of the reciprocal of the condition number. The routine sets *rcond* =0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.

info

INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine gtcon interface are as follows:

d

Holds the vector of length *n*.

e

Holds the vector of length (*n*-1).

Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than 10*r*. A call to this routine involves solving a number of systems of linear equations *A***x* = *b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately 4**n*(*kd* + 1) floating-point operations for real flavors and 16**n*(*kd* + 1) for complex flavors.

?sycon
Estimates the reciprocal of the condition number of a symmetric matrix.

Syntax

```
call ssycon( uplo, n, a, lda, ipiv, anorm, rcond, work, iwork, info )
call dsycon( uplo, n, a, lda, ipiv, anorm, rcond, work, iwork, info )

call sycon( a, ipiv, anorm, rcond [,uplo] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine estimates the reciprocal of the condition number of a symmetric matrix *A*:

$\kappa_1(A) = ||A||_1 \ ||A^{-1}||_1$ (since *A* is symmetric, $\kappa_\infty(A) = \kappa_1(A)$).

An estimate is obtained for $||A^{-1}||$, and the reciprocal of the condition number is computed as *rcond* = 1 / (||*A*|| $||A^{-1}||$).

Before calling this routine:

- compute *anorm* (either $||A||_1 = \max_j \Sigma_i |a_{ij}|$ or $||A||_\infty = \max_i \Sigma_j |a_{ij}|$)
- call ?sytrf to compute the factorization of *A*.

Input Parameters

uplo

CHARACTER*1. Must be 'U' or 'L'.

Indicates how the input matrix *A* has been factored:

If *uplo* = 'U', the array *a* stores the upper triangular factor *U* of the factorization *A* = $U*D*U^T$.

If *uplo* = 'L', the array *a* stores the lower triangular factor *L* of the factorization *A* = $L*D*L^T$.

n

INTEGER. The order of matrix *A*; $n \geq 0$.

a, *work*

REAL for ssycon

DOUBLE PRECISION for dsycon

COMPLEX for csycon

DOUBLE COMPLEX for zsycon.

Arrays: *a*(*lda*,*), *work*(*).

The array *a* contains the factored matrix *A*, as returned by ?sytrf. The second dimension of *a* must be at least max(1,*n*).

The array *work* is a workspace for the routine.

	The dimension of *work* must be at least `max(1, 2*n)`.
lda	`INTEGER`. The leading dimension of *a*; *lda*≥ `max(1, n)`.
ipiv	`INTEGER`. Array, size at least `max(1, n)`. The array *ipiv*, as returned by `?sytrf`.
anorm	`REAL` for single precision flavors. `DOUBLE PRECISION` for double precision flavors. The norm of the *original* matrix *A* (see *Description*).
iwork	`INTEGER`. Workspace array, size at least `max(1, n)`.

Output Parameters

rcond	`REAL` for single precision flavors `DOUBLE PRECISION` for double precision flavors. An estimate of the reciprocal of the condition number. The routine sets *rcond* =0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.
info	`INTEGER`. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `sycon` interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
ipiv	Holds the vector of length *n*.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than 10*r*. A call to this routine involves solving a number of systems of linear equations *A***x* = *b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors and $8n^2$ for complex flavors.

call sycon_rook( a, ipiv, anorm, rcond [,uplo] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine estimates the reciprocal of the condition number of a symmetric matrix *A*:

$\kappa_1(A) = ||A||_1 \ ||A^{-1}||_1$ (since *A* is symmetric, $\kappa_\infty(A) = \kappa_1(A)$).

Before calling this routine:

- compute *anorm* (either $||A||_1 = \max_j \Sigma_i |a_{ij}|$ or $||A||_\infty = \max_i \Sigma_j |a_{ij}|$)
- call ?sytrf_rook to compute the factorization of *A*.

Input Parameters

uplo

CHARACTER*1. Must be 'U' or 'L'.

Indicates how the input matrix *A* has been factored:

If *uplo* = 'U', the array *a* stores the upper triangular factor *U* of the factorization $A = U*D*U^T$.

If *uplo* = 'L', the array *a* stores the lower triangular factor *L* of the factorization $A = L*D*L^T$.

n

INTEGER. The order of matrix *A*; $n \geq 0$.

a, *work*

REAL for ssycon_rook

DOUBLE PRECISION for dsycon_rook

COMPLEX for csycon_rook

DOUBLE COMPLEX for zsycon_rook.

Arrays: *a*(*lda*,*), *work*(*).

The array *a* contains the factored matrix *A*, as returned by ?sytrf_rook. The second dimension of *a* must be at least max(1,*n*).

The array *work* is a workspace for the routine.

The dimension of *work* must be at least max(1, 2*n).

lda

INTEGER. The leading dimension of *a*; *lda* ≥ max(1, *n*).

ipiv

INTEGER. Array, size at least max(1, *n*).

The array *ipiv*, as returned by ?sytrf_rook.

anorm	`REAL` for single precision flavors. `DOUBLE PRECISION` for double precision flavors. The norm of the *original* matrix *A* (see *Description*).
iwork	`INTEGER`. Workspace array, size at least `max(1, n)`.

Output Parameters

rcond	`REAL` for single precision flavors `DOUBLE PRECISION` for double precision flavors. An estimate of the reciprocal of the condition number. The routine sets *rcond* =0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.
info	`INTEGER`. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `sycon_rook` interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
ipiv	Holds the vector of length *n*.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than 10*r*. A call to this routine involves solving a number of systems of linear equations *A*x = b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors and $8n^2$ for complex flavors.

Matrix Storage Schemes

?sycon_3

Estimates the reciprocal of the condition number (in the 1-norm) of a real or complex symmetric matrix A using the factorization computed by `?sytrf_rk`.

```
call ssycon_3(uplo, n, A, lda, e, ipiv, anorm, rcond, work, iwork, info)
call dsycon_3(uplo, n, A, lda, e, ipiv, anorm, rcond, work, iwork, info)
call csycon_3(uplo, n, A, lda, e, ipiv, anorm, rcond, work, info)
call zsycon_3(uplo, n, A, lda, e, ipiv, anorm, rcond, work, info)
```

Description

`?sycon_3` estimates the reciprocal of the condition number (in the 1-norm) of a real or complex symmetric matrix A using the factorization computed by `?sytrf_rk`. A = P*U*D*(U^T)*(P^T) or A = P*L*D*(L^T)*(P^T), where U (or L) is unit upper (or lower) triangular matrix, U^T (or L^T) is the transpose of U (or L), P is a permutation matrix, P^T is the transpose of P, and D is symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

An estimate is obtained for norm(inv(A)), and the reciprocal of the condition number is computed as *rcond* = 1 / (*anorm* * norm(inv(A))).

This routine uses BLAS3 solver `?sytrs_3`.

Input Parameters

uplo

`CHARACTER*1`

Specifies whether the details of the factorization are stored as an upper or lower triangular matrix:

- = `'U'`: Upper triangular. The form is A = P*U*D*(U^T)*(P^T).
- = `'L'`: Lower triangular. The form is A = P*L*D*(L^T)*(P^T).

n

`INTEGER`

The order of the matrix A. *n* ≥ 0.

A

`REAL` for `ssycon_3`

`DOUBLE PRECISION` for `dsycon_3`

`COMPLEX` for `csycon_3`

`COMPLEX*16` for `zsycon_3`

Array, dimension (*lda*,*n*). Diagonal of the block diagonal matrix D and factors U or L as computed by `?sytrf_rk`:

- *Only* diagonal elements of the symmetric block diagonal matrix D on the diagonal of A; that is, D(*k*,*k*) = A(*k*,*k*). Superdiagonal (or subdiagonal) elements of D should be provided on entry in array *e*).

  —and—
- If *uplo* = `'U'`, factor U in the superdiagonal part of A. If *uplo* = `'L'`, factor L in the subdiagonal part of A.

lda

`INTEGER`

The leading dimension of the array *A*.*lda* ≥ max(1, *n*).

e

`REAL` for `ssycon_3`

`DOUBLE PRECISION` for `dsycon_3`

`COMPLEX` for `csycon_3`

`COMPLEX*16` for `zsycon_3`

Array, dimension (*n*). On entry, contains the superdiagonal (or subdiagonal) elements of the symmetric block diagonal matrix D with 1-by-1 or 2-by-2 diagonal blocks. If *uplo* = `'U'`, e(*i*) = D(*i*–1,*i*), *i*=2:N, and e(1) is not referenced. If *uplo* = `'L'`, e(*i*) = D(*i*+1,*i*), *i*=1:N–1, and e(*n*) is not referenced.

NOTE For 1-by-1 diagonal block D(k), where $1 \le k \le n$, the element $e(k)$ is not referenced in both the *uplo* = 'U' and *uplo* = 'L' cases.

ipiv INTEGER

Array, dimension (n). Details of the interchanges and the block structure of D as determined by ?sytrf_rk.

anorm REAL for ssycon_3

DOUBLE PRECISION for dsycon_3

REAL for csycon_3

DOUBLE PRECISION for zsycon_3

The 1-norm of the original matrix A.

Output Parameters

rcond REAL for ssycon_3

DOUBLE PRECISION for dsycon_3

REAL for csycon_3

DOUBLE PRECISION for zsycon_3

The reciprocal of the condition number of the matrix A, computed as *rcond* = 1/(*anorm* * *AINVNM*), where *AINVNM* is an estimate of the 1-norm of inv(A) computed in this routine.

work REAL for ssycon_3

DOUBLE PRECISION for dsycon_3

COMPLEX for csycon_3

COMPLEX*16 for zsycon_3

Array, dimension (2*n)

iwork INTEGER

Array, dimension (n).

info INTEGER

- = 0: Successful exit.
- < 0: If *info* = -*i*, the i^{th} argument had an illegal value.

?hecon

Estimates the reciprocal of a Hermitian matrix.

Syntax

```
call checon( uplo, n, a, lda, ipiv, anorm, rcond, work, info )
call zhecon( uplo, n, a, lda, ipiv, anorm, rcond, work, info )
```

```
call hecon( a, ipiv, anorm, rcond [,uplo] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine estimates the reciprocal of the condition number of a Hermitian matrix *A*:

$\kappa_1(A) = ||A||_1 \ ||A^{-1}||_1$ (since *A* is Hermitian, $\kappa_\infty(A) = \kappa_1(A)$).

Before calling this routine:

- compute *anorm* (either $||A||_1 = \max_j \Sigma_i |a_{ij}|$ or $||A||_\infty = \max_i \Sigma_j |a_{ij}|$)
- call ?hetrf to compute the factorization of *A*.

Input Parameters

uplo

CHARACTER*1. Must be 'U' or 'L'.

Indicates how the input matrix *A* has been factored:

If *uplo* = 'U', the array *a* stores the upper triangular factor *U* of the factorization $A = U*D*U^H$.

If *uplo* = 'L', the array *a* stores the lower triangular factor *L* of the factorization $A = L*D*L^H$.

n

INTEGER. The order of matrix *A*; $n \geq 0$.

a, *work*

COMPLEX for checon

DOUBLE COMPLEX for zhecon.

Arrays: *a*(*lda*,*), *work*(*).

The array *a* contains the factored matrix *A*, as returned by ?hetrf. The second dimension of *a* must be at least max(1,*n*).

The array *work* is a workspace for the routine. The dimension of *work* must be at least max(1, 2*n).

lda

INTEGER. The leading dimension of *a*; *lda*≥ max(1, *n*).

ipiv

INTEGER. Array, size at least max(1, *n*).

The array *ipiv*, as returned by ?hetrf.

anorm

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

The norm of the *original* matrix *A* (see *Description*).

Output Parameters

rcond

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

	An estimate of the reciprocal of the condition number. The routine sets *rcond* =0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine hecon interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
ipiv	Holds the vector of length *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than 10*r*. A call to this routine involves solving a number of systems of linear equations *A*x = b*; the number is usually 5 and never more than 11. Each solution requires approximately $8n^2$ floating-point operations.

Description

The routine estimates the reciprocal of the condition number of a triangular matrix *A* in either the 1-norm or infinity-norm:

$\kappa_1(A) = ||A||_1 \, ||A^{-1}||_1 = \kappa_\infty(A^T) = \kappa_\infty(A^H)$

$\kappa_\infty(A) = ||A||_\infty \, ||A^{-1}||_\infty = \kappa_1(A^T) = \kappa_1(A^H)$.

Input Parameters

norm	`CHARACTER*1`. Must be `'1'` or `'O'` or `'I'`. If *norm* = `'1'` or `'O'`, then the routine estimates the condition number of matrix *A* in 1-norm. If `norm = 'I'`, then the routine estimates the condition number of matrix *A* in infinity-norm.
uplo	`CHARACTER*1`. Must be `'U'` or `'L'`. Indicates whether *A* is upper or lower triangular: If `uplo = 'U'`, the array *a* stores the upper triangle of *A*, other array elements are not referenced.

If *uplo* = 'L', the array *a* stores the lower triangle of *A*, other array elements are not referenced.

diag — CHARACTER*1. Must be 'N' or 'U'.

If *diag* = 'N', then *A* is not a unit triangular matrix.

If *diag* = 'U', then *A* is unit triangular: diagonal elements are assumed to be 1 and not referenced in the array *a*.

n — INTEGER. The order of the matrix *A*; $n \geq 0$.

a, *work* — REAL for strcon

DOUBLE PRECISION for dtrcon

COMPLEX for ctrcon

DOUBLE COMPLEX for ztrcon.

The array *a*(*lda*,*) contains the matrix *A*. The second dimension of *a* must be at least max(1,*n*).

The array *work*(*) is a workspace for the routine. The dimension of *work* must be at least max(1, 3**n*) for real flavors and max(1, 2**n*) for complex flavors.

lda — INTEGER. The leading dimension of *a*; *lda*≥ max(1, *n*).

iwork — INTEGER. Workspace array, size at least max(1, *n*).

rwork — REAL for ctrcon

DOUBLE PRECISION for ztrcon.

Workspace array, size at least max(1, *n*).

Output Parameters

rcond — REAL for single precision flavors.

DOUBLE PRECISION for double precision flavors.

An estimate of the reciprocal of the condition number. The routine sets *rcond* =0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.

info — INTEGER. If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine trcon interface are as follows:

a — Holds the matrix *A* of size (*n*, *n*).

norm	Must be '1', 'O', or 'I'. The default value is '1'.
uplo	Must be 'U' or 'L'. The default value is 'U'.
diag	Must be 'N' or 'U'. The default value is 'N'.

Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than 10*r*. A call to this routine involves solving a number of systems of linear equations *A*x = b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately n^2 floating-point operations for real flavors and $4n^2$ operations for complex flavors.

Description

The routine estimates the reciprocal of the condition number of a triangular band matrix *A* in either the 1-norm or infinity-norm:

$\kappa_1(A) = ||A||_1 \, ||A^{-1}||_1 = \kappa_\infty(A^T) = \kappa_\infty(A^H)$

$\kappa_\infty(A) = ||A||_\infty \, ||A^{-1}||_\infty = \kappa_1(A^T) = \kappa_1(A^H)$.

Input Parameters

norm	CHARACTER*1. Must be '1' or 'O' or 'I'. If *norm* = '1' or 'O', then the routine estimates the condition number of matrix *A* in 1-norm. If *norm* = 'I', then the routine estimates the condition number of matrix *A* in infinity-norm.
uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether *A* is upper or lower triangular: If *uplo* = 'U', the array *ap* stores the upper triangle of *A* in packed form.

If *uplo* = 'L', the array *ap* stores the lower triangle of *A* in packed form.

diag

CHARACTER*1. Must be 'N' or 'U'.

If *diag* = 'N', then *A* is not a unit triangular matrix.

If *diag* = 'U', then *A* is unit triangular: diagonal elements are assumed to be 1 and not referenced in the array *ab*.

n

INTEGER. The order of the matrix *A*; $n \geq 0$.

kd

INTEGER. The number of superdiagonals or subdiagonals in the matrix *A*; $kd \geq 0$.

ab, *work*

REAL for stbcon

DOUBLE PRECISION for dtbcon

COMPLEX for ctbcon

DOUBLE COMPLEX for ztbcon.

The array *ab*(*ldab*,*) contains the band matrix *A*. The second dimension of *ab* must be at least max(1,*n*).

The array *work* is a workspace for the routine. The dimension of *work*(*) must be at least max(1, 3**n*) for real flavors and max(1, 2**n*) for complex flavors.

ldab

INTEGER. The leading dimension of the array *ab*. ($ldab \geq kd + 1$).

iwork

INTEGER. Workspace array, size at least max(1, *n*).

rwork

REAL for ctbcon

DOUBLE PRECISION for ztbcon.

Workspace array, size at least max(1, *n*).

Output Parameters

rcond

REAL for single precision flavors.

DOUBLE PRECISION for double precision flavors.

An estimate of the reciprocal of the condition number. The routine sets *rcond* =0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.

info

INTEGER. If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine tbcon interface are as follows:

ab	Holds the array *A* of size `(kd+1,n)`.
norm	Must be `'1'`, `'O'`, or `'I'`. The default value is `'1'`.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
diag	Must be `'N'` or `'U'`. The default value is `'N'`.

Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than 10*r*. A call to this routine involves solving a number of systems of linear equations `A*x = b`; the number is usually 4 or 5 and never more than 11. Each solution requires approximately `2*n(kd + 1)` floating-point operations for real flavors and `8*n(kd + 1)` operations for complex flavors.

Refining the Solution and Estimating Its Error: LAPACK Computational Routines

This section describes the LAPACK routines for refining the computed solution of a system of linear equations and estimating the solution error. You can call these routines after factorizing the matrix of the system of equations and computing the solution (see Routines for Matrix Factorization and Routines for Solving Systems of Linear Equations).

?gerfs
Refines the solution of a system of linear equations with a general coefficient matrix and estimates its error.

Syntax

```
call sgerfs( trans, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, ferr, berr, work, iwork, info )
call dgerfs( trans, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, ferr, berr, work, iwork, info )
call cgerfs( trans, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, ferr, berr, work, rwork, info )
call zgerfs( trans, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, ferr, berr, work, rwork, info )
call gerfs( a, af, ipiv, b, x [,trans] [,ferr] [,berr] [,info] )
```

Include Files

- `mkl.fi, lapack.f90`

Description

The routine performs an iterative refinement of the solution to a system of linear equations `A*X = B` or A^T`*X = B` or A^H`*X = B` with a general matrix *A*, with multiple right-hand sides. For each computed solution vector *x*, the routine computes the *component-wise backward error*β. This error is the smallest relative perturbation in elements of *A* and *b* such that *x* is the exact solution of the perturbed system:

$|\delta a_{ij}| \le \beta |a_{ij}|$, $|\delta b_i| \le \beta |b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

Finally, the routine estimates the *component-wise forward error* in the computed solution $||x - x_e||_\infty / ||x||_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine ?getrf
- call the solver routine ?getrs.

Input Parameters

trans

CHARACTER*1. Must be 'N' or 'T' or 'C'.

Indicates the form of the equations:

If *trans* = 'N', the system has the form *A*X = B*.

If *trans* = 'T', the system has the form $A^T*X = B$.

If *trans* = 'C', the system has the form $A^H*X = B$.

n

INTEGER. The order of the matrix *A*; $n \geq 0$.

nrhs

INTEGER. The number of right-hand sides; $nrhs \geq 0$.

a,*af*,*b*,*x*,*work*

REAL for sgerfs

DOUBLE PRECISION for dgerfs

COMPLEX for cgerfs

DOUBLE COMPLEX for zgerfs.

Arrays:

a(size *lda* by *) contains the original matrix *A*, as supplied to ?getrf.

af(size *ldaf* by *) contains the factored matrix *A*, as returned by ?getrf.

b(size *ldb* by *) contains the right-hand side matrix *B*.

x(size *ldx* by *) contains the solution matrix *X*.

work(size *) is a workspace array.

The second dimension of *a* and *af* must be at least max(1, *n*); the second dimension of *b* and *x* must be at least max(1, *nrhs*); the dimension of *work* must be at least max(1, 3**n*) for real flavors and max(1, 2**n*) for complex flavors.

lda

INTEGER. The leading dimension of *a*; $lda \geq \max(1, n)$.

ldaf

INTEGER. The leading dimension of *af*; $ldaf \geq \max(1, n)$.

ldb

INTEGER. The leading dimension of *b*; $ldb \geq \max(1, n)$.

ldx

INTEGER. The leading dimension of *x*; $ldx \geq \max(1, n)$.

ipiv

INTEGER.

Array, size at least max(1, *n*).

The *ipiv* array, as returned by ?getrf.

iwork

INTEGER.

	Workspace array, size at least `max(1, n)`.
rwork	`REAL` for `cgerfs`
	`DOUBLE PRECISION` for `zgerfs`.
	Workspace array, size at least `max(1, n)`.

Output Parameters

x	The refined solution matrix *X*.
ferr, *berr*	`REAL` for single precision flavors
	`DOUBLE PRECISION` for double precision flavors.
	Arrays, size at least `max(1, nrhs)`. Contain the component-wise forward and backward errors, respectively, for each solution vector.
info	`INTEGER`. If *info* = 0, the execution is successful.
	If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `gerfs` interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
af	Holds the matrix *AF* of size (*n*, *n*).
ipiv	Holds the vector of length *n*.
b	Holds the matrix *B* of size (*n*, *nrhs*).
x	Holds the matrix *X* of size (*n*, *nrhs*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
trans	Must be `'N'`, `'C'`, or `'T'`. The default value is `'N'`.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of $4n^2$ floating-point operations (for real flavors) or $16n^2$ operations (for complex flavors). In addition, each step of iterative refinement involves $6n^2$ operations (for real flavors) or $24n^2$ operations (for complex flavors); the number of iterations may range from 1 to 5. Estimating the forward error involves solving a number of systems of linear equations $A^*x = b$ with the same coefficient matrix *A* and different right hand sides *b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors or $8n^2$ for complex flavors.

?gerfsx
Uses extra precise iterative refinement to improve the solution to the system of linear equations with a general coefficient matrix A and provides error bounds and backward error estimates.

Syntax

```
call sgerfsx( trans, equed, n, nrhs, a, lda, af, ldaf, ipiv, r, c, b, ldb, x, ldx, rcond, berr, n_err_bnds, err_bnds_norm, err_bnds_comp, nparams, params, work, iwork, info )
call dgerfsx( trans, equed, n, nrhs, a, lda, af, ldaf, ipiv, r, c, b, ldb, x, ldx, rcond, berr, n_err_bnds, err_bnds_norm, err_bnds_comp, nparams, params, work, iwork, info )
call cgerfsx( trans, equed, n, nrhs, a, lda, af, ldaf, ipiv, r, c, b, ldb, x, ldx, rcond, berr, n_err_bnds, err_bnds_norm, err_bnds_comp, nparams, params, work, rwork, info )
call zgerfsx( trans, equed, n, nrhs, a, lda, af, ldaf, ipiv, r, c, b, ldb, x, ldx, rcond, berr, n_err_bnds, err_bnds_norm, err_bnds_comp, nparams, params, work, rwork, info )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine improves the computed solution to a system of linear equations and provides error bounds and backward error estimates for the solution. In addition to a normwise error bound, the code provides a maximum componentwise error bound, if possible. See comments for *err_bnds_norm* and *err_bnds_comp* for details of the error bounds.

The original system of linear equations may have been equilibrated before calling this routine, as described by the parameters *equed*, *r*, and *c* below. In this case, the solution and error bounds returned are for the original unequilibrated system.

Input Parameters

trans

CHARACTER*1. Must be 'N', 'T', or 'C'.

Specifies the form of the system of equations:

If *trans* = 'N', the system has the form $A*X = B$ (No transpose).

If *trans* = 'T', the system has the form $A^T*X = B$ (Transpose).

If *trans* = 'C', the system has the form $A^H*X = B$ (Conjugate transpose for complex flavors, Transpose for real flavors).

equed

CHARACTER*1. Must be 'N', 'R', 'C', or 'B'.

Specifies the form of equilibration that was done to *A* before calling this routine.

If *equed* = 'N', no equilibration was done.

If *equed* = 'R', row equilibration was done, that is, *A* has been premultiplied by *diag*(*r*).

If *equed* = 'C', column equilibration was done, that is, *A* has been postmultiplied by *diag*(*c*).

If *equed* = 'B', both row and column equilibration was done, that is, *A* has been replaced by *diag(r)*A*diag(c)*. The right-hand side *B* has been changed accordingly.

n — INTEGER. The number of linear equations; the order of the matrix *A*; *n*≥ 0.

nrhs — INTEGER. The number of right-hand sides; the number of columns of the matrices *B* and *X*; *nrhs*≥ 0.

a, *af*, *b*, *work* — REAL for sgerfsx

DOUBLE PRECISION for dgerfsx

COMPLEX for cgerfsx

DOUBLE COMPLEX for zgerfsx.

Arrays: *a* (size *lda* by *), *af* (size *ldaf* by *), *b*(size *ldb* by *), *work*(*).

The array *a* contains the original *n*-by-*n* matrix *A*.

The array *af* contains the factored form of the matrix *A*, that is, the factors *L* and *U* from the factorization *A = P*L*U* as computed by ?getrf.

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).

work (size *) is a workspace array. The dimension of *work* must be at least max(1,4**n*) for real flavors, and at least max(1,2**n*) for complex flavors.

lda — INTEGER. The leading dimension of *a*; *lda*≥ max(1, *n*).

ldaf — INTEGER. The leading dimension of *af*; *ldaf*≥ max(1, *n*).

ipiv — INTEGER.

Array, size at least max(1, *n*). Contains the pivot indices as computed by ?getrf; for row 1 ≤*i*≤*n*, row *i* of the matrix was interchanged with row *ipiv*(*i*).

r, *c* — REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Arrays: *r* (size *n*), *c* (size *n*). The array *r* contains the row scale factors for *A*, and the array *c* contains the column scale factors for *A*.

equed = 'R' or 'B', *A* is multiplied on the left by *diag*(*r*); if *equed* = 'N' or 'C', *r* is not accessed.

If *equed* = 'R' or 'B', each element of *r* must be positive.

If *equed* = 'C' or 'B', *A* is multiplied on the right by *diag*(*c*); if *equed* = 'N' or 'R', *c* is not accessed.

If *equed* = 'C' or 'B', each element of *c* must be positive.

Each element of *r* or *c* should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

ldb

INTEGER. The leading dimension of the array *b*; *ldb*≥ max(1, *n*).

x

REAL for sgerfsx

DOUBLE PRECISION for dgerfsx

COMPLEX for cgerfsx

DOUBLE COMPLEX for zgerfsx.

Array, size *ldx* by *.

The solution matrix *X* as computed by ?getrs

ldx

INTEGER. The leading dimension of the output array *x*; *ldx*≥ max(1, *n*).

n_err_bnds

INTEGER. Number of error bounds to return for each right hand side and each type (normwise or componentwise). See *err_bnds_norm* and *err_bnds_comp* descriptions in *Output Arguments* section below.

nparams

INTEGER. Specifies the number of parameters set in *params*. If ≤ 0, the *params* array is never referenced and default values are used.

params

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size *nparams*. Specifies algorithm parameters. If an entry is less than 0.0, that entry is filled with the default value used for that parameter. Only positions up to *nparams* are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass *nparams* = 0, which prevents the source code from accessing the *params* argument.

params(1) : Whether to perform iterative refinement or not. Default: 1.0

=0.0	No refinement is performed and no error bounds are computed.
=1.0	Use the double-precision refinement algorithm, possibly with doubled-single computations if the compilation environment does not support double precision.

(Other values are reserved for future use.)

params(2) : Maximum number of residual computations allowed for refinement.

Default	10.0

Aggressive	Set to 100.0 to permit convergence using approximate factorizations or factorizations other than *LU*. If the factorization uses a technique other than Gaussian elimination, the guarantees in *err_bnds_norm* and *err_bnds_comp* may no longer be trustworthy.

params(3) : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

iwork — INTEGER. Workspace array, size at least max(1, *n*); used in real flavors only.

rwork — REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Workspace array, size at least max(1, 3**n*); used in complex flavors only.

Output Parameters

x — REAL for sgerfsx

DOUBLE PRECISION for dgerfsx

COMPLEX for cgerfsx

DOUBLE COMPLEX for zgerfsx.

The improved solution matrix *X*.

rcond — REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision, in particular, if *rcond* = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.

berr — REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size at least max(1, *nrhs*). Contains the componentwise relative backward error for each solution vector *x*(*j*), that is, the smallest relative change in any element of *A* or *B* that makes *x*(*j*) an exact solution.

err_bnds_norm — REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array of size *nrhs* by *n_err_bnds*. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:

Normwise relative error in the *i*-th solution vector

$$\frac{\max_j \left|Xtrue_{ji} - X_{ji}\right|}{\max_j \left|X_{ji}\right|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.

The first index in `err_bnds_norm(i,:)` corresponds to the *i*-th right-hand side.

The second index in `err_bnds_norm(:,err)` contains the following three fields:

err=1	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold `sqrt(n)*slamch(ε)` for single precision flavors and `sqrt(n)*dlamch(ε)` for double precision flavors.
err=2	"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold `sqrt(n)*slamch(ε)` for single precision flavors and `sqrt(n)*dlamch(ε)` for double precision flavors. This error bound should only be trusted if the previous boolean is true.
err=3	Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold `sqrt(n)*slamch(ε)` for single precision flavors and `sqrt(n)*dlamch(ε)` for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix *Z* are: $\|Z\|_\infty \cdot \|Z^{-1}\|_\infty$ Let *z=s*a*, where *s* scales each row by a power of the radix so all absolute row sums of *z* are approximately 1.

err_bnds_comp — `REAL` for single precision flavors

`DOUBLE PRECISION` for double precision flavors.

Array of size *nrhs* by *n_err_bnds*. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:

Componentwise relative error in the *i*-th solution vector:

$$\max_j \frac{\left|Xtrue_{ji} - X_{ji}\right|}{\left|X_{ji}\right|}$$

The array is indexed by the right-hand side *i*, on which the componentwise relative error depends, and by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is not requested (*params(3)* = 0.0), then *err_bnds_comp* is not accessed. If *n_err_bnds* < 3, then at most the first *(:,n_err_bnds)* entries are returned.

The first index in *err_bnds_comp(i,:)* corresponds to the *i*-th right-hand side.

The second index in *err_bnds_comp(:,err)* contains the following three fields:

err=1	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors.
err=2	"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors. This error bound should only be trusted if the previous boolean is true.
err=3	Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix *Z* are: $\|Z\|_\infty \cdot \|Z^{-1}\|_\infty$

Let *z*=*s**(*a**diag(*x*)), where *x* is the solution for the current right-hand side and *s* scales each row of *a**diag(*x*) by a power of the radix so all absolute row sums of *z* are approximately 1.

params

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Output parameter only if the input contains erroneous values, namely, in *params(1)*, *params(2)*, *params(3)*. In such a case, the corresponding elements of *params* are filled with default values on output.

info

INTEGER. If *info* = 0, the execution is successful. The solution to every right-hand side is guaranteed.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If 0 < *info*≤*n*: $U_{info,info}$ is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned.

If *info* = *n*+*j*: The solution corresponding to the *j*-th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides *k* with *k* > *j* may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested *params(3)* = 0.0, then the *j*-th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest *j* such that *err_bnds_norm*(*j*,1) = 0.0 or *err_bnds_comp*(*j*,1) = 0.0). See the definition of *err_bnds_norm* and *err_bnds_comp* for *err* = 1. To get information about all of the right-hand sides, check *err_bnds_norm* or *err_bnds_comp*.

Description

The routine performs an iterative refinement of the solution to a system of linear equations $A*X = B$ or $A^T*X = B$ or $A^H*X = B$ with a band matrix A, with multiple right-hand sides. For each computed solution vector x, the routine computes the *component-wise backward error* β. This error is the smallest relative perturbation in elements of A and b such that x is the exact solution of the perturbed system:

$|\delta a_{ij}| \leq \beta |a_{ij}|$, $|\delta b_i| \leq \beta |b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

Finally, the routine estimates the *component-wise forward error* in the computed solution $||x - x_e||_\infty / ||x||_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine ?gbtrf
- call the solver routine ?gbtrs.

Input Parameters

trans

CHARACTER*1. Must be 'N' or 'T' or 'C'.

Indicates the form of the equations:

If *trans* = 'N', the system has the form $A*X = B$.

If *trans* = 'T', the system has the form $A^T*X = B$.

If *trans* = 'C', the system has the form $A^H*X = B$.

n

INTEGER. The order of the matrix A; $n \geq 0$.

kl

INTEGER. The number of sub-diagonals within the band of A; $kl \geq 0$.

ku

INTEGER. The number of super-diagonals within the band of A; $ku \geq 0$.

nrhs

INTEGER. The number of right-hand sides; $nrhs \geq 0$.

ab,*afb*,*b*,*x*,*work*

REAL for sgbrfs

DOUBLE PRECISION for dgbrfs

COMPLEX for cgbrfs

DOUBLE COMPLEX for zgbrfs.

Arrays:

ab(size *ldab* by *) contains the original band matrix A, as supplied to ?gbtrf, but stored in rows from 1 to $kl + ku + 1$.

afb(size *ldafb* by *) contains the factored band matrix A, as returned by ?gbtrf.

b(size *ldb* by *) contains the right-hand side matrix B.

x(size *ldx* by *) contains the solution matrix X.

work(*) is a workspace array.

The second dimension of *ab* and *afb* must be at least `max(1, n)`; the second dimension of *b* and *x* must be at least `max(1, nrhs)`; the dimension of *work* must be at least `max(1, 3*n)` for real flavors and `max(1, 2*n)` for complex flavors.

ldab — `INTEGER`. The leading dimension of *ab*.

ldafb — `INTEGER`. The leading dimension of *afb*.

ldb — `INTEGER`. The leading dimension of *b*; *ldb*≥ `max(1, n)`.

ldx — `INTEGER`. The leading dimension of *x*; *ldx*≥ `max(1, n)`.

ipiv — `INTEGER`.

Array, size at least `max(1, n)`. The *ipiv* array, as returned by `?gbtrf`.

iwork — `INTEGER`. Workspace array, size at least `max(1, n)`.

rwork — `REAL` for `cgbrfs`

`DOUBLE PRECISION` for `zgbrfs`.

Workspace array, size at least `max(1, n)`.

Output Parameters

x — The refined solution matrix *X*.

ferr, *berr* — `REAL` for single precision flavors

`DOUBLE PRECISION` for double precision flavors.

Arrays, size at least `max(1, nrhs)`. Contain the component-wise forward and backward errors, respectively, for each solution vector.

info — `INTEGER`. If *info* =0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `gbrfs` interface are as follows:

ab — Holds the array *A* of size (*kl*+*ku*+1,*n*).

afb — Holds the array *AF* of size (2**kl**ku*+1,*n*).

ipiv — Holds the vector of length *n*.

b — Holds the matrix *B* of size (*n*, *nrhs*).

x — Holds the matrix *X* of size (*n*, *nrhs*).

ferr — Holds the vector of length (*nrhs*).

berr — Holds the vector of length (*nrhs*).

trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
kl	If omitted, assumed *kl* = *ku*.
ku	Restored as *ku* = *lda*-*kl*-1.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of 4*n*(*kl* + *ku*) floating-point operations (for real flavors) or 16*n*(*kl* + *ku*) operations (for complex flavors). In addition, each step of iterative refinement involves 2*n*(4*kl* + 3*ku*) operations (for real flavors) or 8*n*(4*kl* + 3*ku*) operations (for complex flavors); the number of iterations may range from 1 to 5. Estimating the forward error involves solving a number of systems of linear equations *A***x* = *b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors or $8n^2$ for complex flavors.

Include Files

- mkl.fi, lapack.f90

Description

The routine improves the computed solution to a system of linear equations and provides error bounds and backward error estimates for the solution. In addition to a normwise error bound, the code provides a maximum componentwise error bound, if possible. See comments for *err_bnds_norm* and *err_bnds_comp* for details of the error bounds.

The original system of linear equations may have been equilibrated before calling this routine, as described by the parameters *equed*, *r*, and *c* below. In this case, the solution and error bounds returned are for the original unequilibrated system.

Input Parameters

trans

CHARACTER*1. Must be 'N', 'T', or 'C'.

Specifies the form of the system of equations:

If *trans* = 'N', the system has the form *A***X* = *B* (No transpose).

If *trans* = 'T', the system has the form A^T**X* = *B* (Transpose).

If *trans* = 'C', the system has the form A^H**X* = *B* (Conjugate transpose for complex flavors, Transpose for real flavors).

equed

CHARACTER*1. Must be 'N', 'R', 'C', or 'B'.

Specifies the form of equilibration that was done to *A* before calling this routine.

If *equed* = 'N', no equilibration was done.

If *equed* = 'R', row equilibration was done, that is, *A* has been premultiplied by *diag*(*r*).

If *equed* = 'C', column equilibration was done, that is, *A* has been postmultiplied by *diag*(*c*).

If *equed* = 'B', both row and column equilibration was done, that is, *A* has been replaced by *diag*(*r*)**A***diag*(*c*). The right-hand side *B* has been changed accordingly.

n

INTEGER. The number of linear equations; the order of the matrix *A*; $n \geq 0$.

kl

INTEGER. The number of subdiagonals within the band of *A*; $kl \geq 0$.

ku

INTEGER. The number of superdiagonals within the band of *A*; $ku \geq 0$.

nrhs

INTEGER. The number of right-hand sides; the number of columns of the matrices *B* and *X*; $nrhs \geq 0$.

ab, *afb*, *b*, *work*

REAL for sgbrfsx

DOUBLE PRECISION for dgbrfsx

COMPLEX for cgbrfsx

DOUBLE COMPLEX for zgbrfsx.

Arrays: *ab*(*ldab*,*), *afb*(*ldafb*,*), *b*(*ldb*,*), *work*(*).

The array *ab* contains the original matrix *A* in band storage, in rows 1 to *kl* +*ku*+1. The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows:

ab(*ku*+1+*i*-*j*,*j*) = *A*(*i*,*j*) for max(1,*j*-*ku*) $\leq i \leq$ min(*n*,*j*+*kl*).

The array *afb* contains details of the LU factorization of the banded matrix *A* as computed by ?gbtrf. *U* is stored as an upper triangular banded matrix with *kl* + *ku* superdiagonals in rows 1 to *kl* + *ku* + 1. The multipliers used during the factorization are stored in rows *kl* + *ku* + 2 to 2**kl* + *ku* + 1.

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).

work(*) is a workspace array. The dimension of *work* must be at least max(1,4**n*) for real flavors, and at least max(1,2**n*) for complex flavors.

ldab — INTEGER. The leading dimension of the array *ab*; *ldab*≥*kl*+*ku*+1.

ldafb — INTEGER. The leading dimension of the array *afb*; *ldafb*≥ 2**kl*+*ku*+1.

ipiv — INTEGER.

Array, size at least max(1, *n*). Contains the pivot indices as computed by ?gbtrf; for row 1 ≤*i*≤*n*, row *i* of the matrix was interchanged with row *ipiv*(*i*).

r, *c* — REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Arrays: *r*(*n*), *c*(*n*). The array *r* contains the row scale factors for *A*, and the array *c* contains the column scale factors for *A*.

If *equed* = 'R' or 'B', *A* is multiplied on the left by *diag*(*r*); if *equed* = 'N' or 'C', *r* is not accessed.

If *equed* = 'R' or 'B', each element of *r* must be positive.

If *equed* = 'C' or 'B', *A* is multiplied on the right by *diag*(*c*); if *equed* = 'N' or 'R', *c* is not accessed.

If *equed* = 'C' or 'B', each element of *c* must be positive.

Each element of *r* or *c* should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

ldb — INTEGER. The leading dimension of the array *b*; *ldb*≥ max(1, *n*).

x — REAL for sgbrfsx

DOUBLE PRECISION for dgbrfsx

COMPLEX for cgbrfsx

DOUBLE COMPLEX for zgbrfsx.

Array, size (*ldx*,*).

The solution matrix *X* as computed by sgbtrs/dgbtrs for real flavors or cgbtrs/zgbtrs for complex flavors.

ldx — INTEGER. The leading dimension of the output array *x*; *ldx*≥ max(1, *n*).

n_err_bnds — INTEGER. Number of error bounds to return for each right-hand side and each type (normwise or componentwise). See *err_bnds_norm* and *err_bnds_comp* descriptions in *Output Arguments* section below.

nparams — INTEGER. Specifies the number of parameters set in *params*. If ≤ 0, the *params* array is never referenced and default values are used.

params — REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size *nparams*. Specifies algorithm parameters. If an entry is less than 0.0, that entry will be filled with the default value used for that parameter. Only positions up to *nparams* are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass *nparams* = 0, which prevents the source code from accessing the *params* argument.

params(1) : Whether to perform iterative refinement or not. Default: 1.0 (for single precision flavors), 1.0D+0 (for double precision flavors).

=0.0	No refinement is performed and no error bounds are computed.
=1.0	Use the double-precision refinement algorithm, possibly with doubled-single computations if the compilation environment does not support double precision.

(Other values are reserved for future use.)

params(2) : Maximum number of residual computations allowed for refinement.

Default	10.0
Aggressive	Set to 100.0 to permit convergence using approximate factorizations or factorizations other than *LU*. If the factorization uses a technique other than Gaussian elimination, the guarantees in *err_bnds_norm* and *err_bnds_comp* may no longer be trustworthy.

params(3) : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

iwork INTEGER. Workspace array, size at least max(1, *n*); used in real flavors only.

rwork REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Workspace array, size at least max(1, 3*n); used in complex flavors only.

Output Parameters

x REAL for sgbrfsx

DOUBLE PRECISION for dgbrfsx

COMPLEX for cgbrfsx

DOUBLE COMPLEX for zgbrfsx.

The improved solution matrix *X*.

rcond REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision, in particular, if *rcond* = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.

berr

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size at least max(1, *nrhs*). Contains the componentwise relative backward error for each solution vector *x*(*j*), that is, the smallest relative change in any element of *A* or *B* that makes *x*(*j*) an exact solution.

err_bnds_norm

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array of size *nrhs* by *n_err_bnds*. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:

Normwise relative error in the *i*-th solution vector

$$\frac{\max_j \left| Xtrue_{ji} - X_{ji} \right|}{\max_j \left| X_{ji} \right|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.

The first index in *err_bnds_norm*(*i*,:) corresponds to the *i*-th right-hand side.

The second index in *err_bnds_norm*(:,*err*) contains the following three fields:

err=1

"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors.

err=2

"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors. This error bound should only be trusted if the previous boolean is true.

err=3

Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision

flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix *Z* are

$$\|Z\|_\infty \cdot \|Z^{-1}\|_\infty$$

Let *z=s*a*, where *s* scales each row by a power of the radix so all absolute row sums of *z* are approximately 1.

err_bnds_comp

`REAL` for single precision flavors

`DOUBLE PRECISION` for double precision flavors.

Array of size *nrhs* by *n_err_bnds*. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:

Componentwise relative error in the *i*-th solution vector:

$$\max_j \frac{|Xtrue_{ji} - X_{ji}|}{|X_{ji}|}$$

The array is indexed by the right-hand side *i*, on which the componentwise relative error depends, and by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is not requested (*params(3)* = 0.0), then *err_bnds_comp* is not accessed. If *n_err_bnds* < 3, then at most the first *(:,n_err_bnds)* entries are returned.

The first index in *err_bnds_comp(i,:)* corresponds to the *i*-th right-hand side.

The second index in *err_bnds_comp(:,err)* contains the following three fields:

err=1

"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors.

err=2

"Guaranteed" error bpound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors. This error bound should only be trusted if the previous boolean is true.

err=3

Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold

`sqrt(n)*slamch(ε)` for single precision flavors and `sqrt(n)*dlamch(ε)` for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix *Z* are

$$\|Z\|_\infty \cdot \|Z^{-1}\|_\infty$$

Let `z=s*(a*diag(x))`, where *x* is the solution for the current right-hand side and *s* scales each row of `a*diag(x)` by a power of the radix so all absolute row sums of *z* are approximately 1.

params

`REAL` for single precision flavors

`DOUBLE PRECISION` for double precision flavors.

Output parameter only if the input contains erroneous values, namely, in `params(1)`, `params(2)`, and `params(3)`. In such a case, the corresponding elements of `params` are filled with default values on output.

info

`INTEGER`. If `info = 0`, the execution is successful. The solution to every right-hand side is guaranteed.

If `info = -i`, the *i*-th parameter had an illegal value.

If 0 < `info`≤*n*: $U_{info,info}$ is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution and error bounds could not be computed; `rcond` = 0 is returned.

If `info = n+j`: The solution corresponding to the *j*-th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides *k* with *k* > *j* may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested `params(3) = 0.0`, then the *j*-th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest *j* such that `err_bnds_norm(j,1) = 0.0` or `err_bnds_comp(j,1) = 0.0`. See the definition of `err_bnds_norm` and `err_bnds_comp` for *err* = 1. To get information about all of the right-hand sides, check `err_bnds_norm` or `err_bnds_comp`.

Arrays: *dl*, dimension (*n* -1), contains the subdiagonal elements of A. *d*, dimension (*n*), contains the diagonal elements of A. *du*, dimension (*n* -1), contains the superdiagonal elements of A. *dlf*, dimension (*n* - 1), contains the (*n* - 1) multipliers that define the matrix L from the LU factorization of A as computed by ?gttrf.

df, dimension (*n*), contains the *n* diagonal elements of the upper triangular matrix *U* from the *LU* factorization of *A*.

duf, dimension (*n* -1), contains the (*n* - 1) elements of the first superdiagonal of *U*.

du2, dimension (*n* -2), contains the (*n* - 2) elements of the second superdiagonal of *U*.

`b(ldb,nrhs)` contains the right-hand side matrix *B*.

`x(ldx,nrhs)` contains the solution matrix *X*, as computed by `?gttrs`.

`work(*)` is a workspace array; the dimension of *work* must be at least `max(1, 3*n)` for real flavors and `max(1, 2*n)` for complex flavors.

ldb — `INTEGER`. The leading dimension of *b*; *ldb*≥ `max(1, n)`.

ldx — `INTEGER`. The leading dimension of *x*; *ldx*≥ `max(1, n)`.

ipiv — `INTEGER`.

Array, size at least `max(1, n)`. The *ipiv* array, as returned by `?gttrf`.

iwork — `INTEGER`. Workspace array, size (*n*). Used for real flavors only.

rwork — `REAL` for `cgtrfs`

`DOUBLE PRECISION` for `zgtrfs`.

Workspace array, size (*n*). Used for complex flavors only.

Output Parameters

x — The refined solution matrix *X*.

ferr, *berr* — `REAL` for single precision flavors

`DOUBLE PRECISION` for double precision flavors.

Arrays, size at least `max(1,nrhs)`. Contain the component-wise forward and backward errors, respectively, for each solution vector.

info — `INTEGER`. If *info* = `0`, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `gtrfs` interface are as follows:

dl — Holds the vector of length (*n*-1).

d — Holds the vector of length *n*.

du — Holds the vector of length (*n*-1).

dlf — Holds the vector of length (*n*-1).

df — Holds the vector of length *n*.

duf	Holds the vector of length (*n*-1).
du2	Holds the vector of length (*n*-2).
ipiv	Holds the vector of length *n*.
b	Holds the matrix *B* of size (*n*,*nrhs*).
x	Holds the matrix *X* of size (*n*,*nrhs*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.

```

Include Files

- mkl.fi, lapack.f90

Description

The routine performs an iterative refinement of the solution to a system of linear equations *A*X = B* with a symmetric (Hermitian) positive definite matrix *A*, with multiple right-hand sides. For each computed solution vector *x*, the routine computes the *component-wise backward error*β. This error is the smallest relative perturbation in elements of *A* and *b* such that *x* is the exact solution of the perturbed system:

$|\delta a_{ij}| \leq \beta |a_{ij}|$, $|\delta b_i| \leq \beta |b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

Finally, the routine estimates the *component-wise forward error* in the computed solution $||x - x_e||_\infty / ||x||_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine ?potrf
- call the solver routine ?potrs.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', the upper triangle of *A* is stored. If *uplo* = 'L', the lower triangle of *A* is stored.
n	INTEGER. The order of the matrix *A*; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
a,*af*,*b*,*x*,*work*	REAL for sporfs DOUBLE PRECISION for dporfs COMPLEX for cporfs DOUBLE COMPLEX for zporfs. Arrays: *a*(*lda*,*) contains the original matrix *A*, as supplied to ?potrf. *af*(*ldaf*,*) contains the factored matrix *A*, as returned by ?potrf. *b*(*ldb*,*) contains the right-hand side matrix *B*. *x*(*ldx*,*) contains the solution matrix *X*. *work*(*) is a workspace array. The second dimension of *a* and *af* must be at least max(1, *n*); the second dimension of *b* and *x* must be at least max(1, *nrhs*); the dimension of *work* must be at least max(1, 3*n) for real flavors and max(1, 2*n) for complex flavors.
lda	INTEGER. The leading dimension of *a*; $lda \geq$ max(1, *n*).
ldaf	INTEGER. The leading dimension of *af*; $ldaf \geq$ max(1, *n*).
ldb	INTEGER. The leading dimension of *b*; $ldb \geq$ max(1, *n*).
ldx	INTEGER. The leading dimension of *x*; $ldx \geq$ max(1, *n*).
iwork	INTEGER. Workspace array, size at least max(1, *n*).
rwork	REAL for cporfs DOUBLE PRECISION for zporfs. Workspace array, size at least max(1, *n*).

Output Parameters

x	The refined solution matrix *X*.
ferr, *berr*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays, size at least max(1, *nrhs*). Contain the component-wise forward and backward errors, respectively, for each solution vector.

info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine porfs interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
af	Holds the matrix *AF* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *nrhs*).
x	Holds the matrix *X* of size (*n*, *nrhs*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of $4n^2$ floating-point operations (for real flavors) or $16n^2$ operations (for complex flavors). In addition, each step of iterative refinement involves $6n^2$ operations (for real flavors) or $24n^2$ operations (for complex flavors); the number of iterations may range from 1 to 5. Estimating the forward error involves solving a number of systems of linear equations *A*x = b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors or $8n^2$ for complex flavors.

Include Files

- mkl.fi, lapack.f90

Description

The routine improves the computed solution to a system of linear equations and provides error bounds and backward error estimates for the solution. In addition to a normwise error bound, the code provides a maximum componentwise error bound, if possible. See comments for *err_bnds_norm* and *err_bnds_comp* for details of the error bounds.

The original system of linear equations may have been equilibrated before calling this routine, as described by the parameters *equed* and *s* below. In this case, the solution and error bounds returned are for the original unequilibrated system.

Input Parameters

uplo

CHARACTER*1. Must be 'U' or 'L'.

Indicates whether the upper or lower triangular part of *A* is stored:

If *uplo* = 'U', the upper triangle of *A* is stored.

If *uplo* = 'L', the lower triangle of *A* is stored.

equed

CHARACTER*1. Must be 'N' or 'Y'.

Specifies the form of equilibration that was done to *A* before calling this routine.

If *equed* = 'N', no equilibration was done.

If *equed* = 'Y', both row and column equilibration was done, that is, *A* has been replaced by *diag(s)*A*diag(s)*. The right-hand side *B* has been changed accordingly.

n

INTEGER. The number of linear equations; the order of the matrix *A*; $n \geq 0$.

nrhs

INTEGER. The number of right-hand sides; the number of columns of the matrices *B* and *X*; $nrhs \geq 0$.

a, *af*, *b*, *work*

REAL for sporfsx

DOUBLE PRECISION for dporfsx

COMPLEX for cporfsx

DOUBLE COMPLEX for zporfsx.

Arrays: *a(lda,*)*, *af(ldaf,*)*, *b(ldb,*)*, *work(*)*.

The array *a* contains the symmetric/Hermitian matrix *A* as specified by *uplo*. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A* and the strictly lower triangular part of *a* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A* and the strictly upper triangular part of *a* is not referenced. The second dimension of *a* must be at least max(1,*n*).

The array *af* contains the triangular factor *L* or *U* from the Cholesky factorization *A = U**T*U* or *A = L*L**T* as computed by spotrf for real flavors or dpotrf for complex flavors.

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least `max(1,nrhs)`.

work(*) is a workspace array. The dimension of *work* must be at least `max(1,4*n)` for real flavors, and at least `max(1,2*n)` for complex flavors.

lda — `INTEGER`. The leading dimension of *a*; *lda* ≥ `max(1, n)`.

ldaf — `INTEGER`. The leading dimension of *af*; *ldaf* ≥ `max(1, n)`.

s — `REAL` for single precision flavors

`DOUBLE PRECISION` for double precision flavors.

Array of size *n*. The array *s* contains the scale factors for *A*.

If *equed* = `'N'`, *s* is not accessed.

If *equed* = `'Y'`, each element of *s* must be positive.

Each element of *s* should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

ldb — `INTEGER`. The leading dimension of the array *b*; *ldb* ≥ `max(1, n)`.

x — `REAL` for `sporfsx`

`DOUBLE PRECISION` for `dporfsx`

`COMPLEX` for `cporfsx`

`DOUBLE COMPLEX` for `zporfsx`.

Array, size *ldx* by *.

The solution matrix *X* as computed by `?potrs`

ldx — `INTEGER`. The leading dimension of the output array *x*; *ldx* ≥ `max(1, n)`.

n_err_bnds — `INTEGER`. Number of error bounds to return for each right hand side and each type (normwise or componentwise). See *err_bnds_norm* and *err_bnds_comp* descriptions in *Output Arguments* section below.

nparams — `INTEGER`. Specifies the number of parameters set in *params*. If ≤ 0, the *params* array is never referenced and default values are used.

params — `REAL` for single precision flavors

`DOUBLE PRECISION` for double precision flavors.

Array, size *nparams*. Specifies algorithm parameters. If an entry is less than 0.0, that entry will be filled with the default value used for that parameter. Only positions up to *nparams* are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass *nparams* = 0, which prevents the source code from accessing the *params* argument.

params`(1)` : Whether to perform iterative refinement or not. Default: 1.0 (for single precision flavors), 1.0D+0 (for double precision flavors).

=0.0	No refinement is performed and no error bounds are computed.
=1.0	Use the double-precision refinement algorithm, possibly with doubled-single computations if the compilation environment does not support double precision.

(Other values are reserved for future use.)

params(2) : Maximum number of residual computations allowed for refinement.

Default	10.0
Aggressive	Set to 100.0 to permit convergence using approximate factorizations or factorizations other than *LU*. If the factorization uses a technique other than Gaussian elimination, the guarantees in *err_bnds_norm* and *err_bnds_comp* may no longer be trustworthy.

params(3) : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

iwork INTEGER. Workspace array, size at least max(1, *n*); used in real flavors only.

rwork REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Workspace array, size at least max(1, 3**n*); used in complex flavors only.

Output Parameters

x REAL for sporfsx

DOUBLE PRECISION for dporfsx

COMPLEX for cporfsx

DOUBLE COMPLEX for zporfsx.

The improved solution matrix *X*.

rcond REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision, in particular, if *rcond* = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.

berr REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size at least `max(1, nrhs)`. Contains the componentwise relative backward error for each solution vector `x(j)`, that is, the smallest relative change in any element of *A* or *B* that makes `x(j)` an exact solution.

err_bnds_norm

`REAL` for single precision flavors

`DOUBLE PRECISION` for double precision flavors.

Array of size *nrhs* by *n_err_bnds*. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:

Normwise relative error in the *i*-th solution vector

$$\frac{\max_j \left| Xtrue_{ji} - X_{ji} \right|}{\max_j \left| X_{ji} \right|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.

The first index in `err_bnds_norm(i,:)` corresponds to the *i*-th right-hand side.

The second index in `err_bnds_norm(:,err)` contains the following three fields:

err=1

"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold `sqrt(n)*slamch(ε)` for single precision flavors and `sqrt(n)*dlamch(ε)` for double precision flavors.

err=2

"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold `sqrt(n)*slamch(ε)` for single precision flavors and `sqrt(n)*dlamch(ε)` for double precision flavors. This error bound should only be trusted if the previous boolean is true.

err=3

Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold `sqrt(n)*slamch(ε)` for single precision flavors and `sqrt(n)*dlamch(ε)` for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix *Z* are

$$\|Z\|_\infty \cdot \|Z^{-1}\|_\infty$$

Let *z*=*s***a*, where *s* scales each row by a power of the radix so all absolute row sums of *z* are approximately 1.

err_bnds_comp

`REAL` for single precision flavors

`DOUBLE PRECISION` for double precision flavors.

Array of size *nrhs* by *n_err_bnds*. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:

Componentwise relative error in the *i*-th solution vector:

$$\max_j \frac{\left|Xtrue_{ji} - X_{ji}\right|}{\left|X_{ji}\right|}$$

The array is indexed by the right-hand side *i*, on which the componentwise relative error depends, and by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is not requested (*params(3)* = 0.0), then *err_bnds_comp* is not accessed. If *n_err_bnds* < 3, then at most the first *(:,n_err_bnds)* entries are returned.

The first index in *err_bnds_comp(i,:)* corresponds to the *i*-th right-hand side.

The second index in *err_bnds_comp(:,err)* contains the following three fields:

err=1

"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors.

err=2

"Guaranteed" error bpound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors. This error bound should only be trusted if the previous boolean is true.

err=3

Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix *Z* are

$\|Z\|_\infty \cdot \|Z^{-1}\|_\infty$

Let `z=s*(a*diag(x))`, where *x* is the solution for the current right-hand side and *s* scales each row of `a*diag(x)` by a power of the radix so all absolute row sums of *z* are approximately 1.

params

`REAL` for single precision flavors

`DOUBLE PRECISION` for double precision flavors.

Output parameter only if the input contains erroneous values, namely in `params(1)`, `params(2)`, or `params(3)`. In such a case, the corresponding elements of `params` are filled with default values on output.

info

`INTEGER`. If `info = 0`, the execution is successful. The solution to every right-hand side is guaranteed.

If `info = -i`, the *i*-th parameter had an illegal value.

If 0 < `info`≤*n*: $U_{info,info}$ is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution and error bounds could not be computed; `rcond` = 0 is returned.

If `info = n+j`: The solution corresponding to the *j*-th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides *k* with *k* > *j* may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested `params(3) = 0.0`, then the *j*-th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest *j* such that `err_bnds_norm(j,1) = 0.0` or `err_bnds_comp(j,1) = 0.0`. See the definition of `err_bnds_norm` and `err_bnds_comp` for *err* = 1. To get information about all of the right-hand sides, check `err_bnds_norm` or `err_bnds_comp`.

Description

The routine performs an iterative refinement of the solution to a system of linear equations `A*X = B` with a symmetric (Hermitian) positive definite matrix *A*, with multiple right-hand sides. For each computed solution vector *x*, the routine computes the *component-wise backward error*β. This error is the smallest relative perturbation in elements of *A* and *b* such that *x* is the exact solution of the perturbed system:

$|\delta a_{ij}| \leq \beta |a_{ij}|$, $|\delta b_i| \leq \beta |b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

Finally, the routine estimates the *component-wise forward error* in the computed solution

$||x - x_e||_\infty / ||x||_\infty$

where x_e is the exact solution.

Before calling this routine:

- call the factorization routine `?pptrf`
- call the solver routine `?pptrs`.

Input Parameters

uplo

`CHARACTER*1`. Must be `'U'` or `'L'`.

Indicates how the input matrix *A* has been factored:

If `uplo = 'U'`, the upper triangle of *A* is stored.

If `uplo = 'L'`, the lower triangle of *A* is stored.

n

`INTEGER`. The order of the matrix *A*; $n \geq 0$.

nrhs

`INTEGER`. The number of right-hand sides; $nrhs \geq 0$.

ap, *afp*, *b*, *x*, *work*

`REAL` for `spprfs`

`DOUBLE PRECISION` for `dpprfs`

`COMPLEX` for `cpprfs`

`DOUBLE COMPLEX` for `zpprfs`.

Arrays:

`ap(*)` contains the original matrix *A* in a packed format, as supplied to `?pptrf`.

`afp(*)` contains the factored matrix *A* in a packed format, as returned by `?pptrf`.

`b(ldb,*)` contains the right-hand side matrix *B*.

`x(ldx,*)` contains the solution matrix *X*.

`work(*)` is a workspace array.

The dimension of arrays *ap* and *afp* must be at least `max(1,n(n+1)/2)`; the second dimension of *b* and *x* must be at least `max(1, nrhs)`; the dimension of *work* must be at least `max(1, 3*n)` for real flavors and `max(1, 2*n)` for complex flavors.

ldb

`INTEGER`. The leading dimension of *b*; $ldb \geq \max(1, n)$.

ldx

`INTEGER`. The leading dimension of *x*; $ldx \geq \max(1, n)$.

iwork	INTEGER. Workspace array, size at least max(1, *n*).
rwork	REAL for cpprfs DOUBLE PRECISION for zpprfs. Workspace array, size at least max(1, *n*).

Output Parameters

x	The refined solution matrix *X*.
ferr, *berr*	REAL for single precision flavors. DOUBLE PRECISION for double precision flavors. Arrays, size at least max(1, *nrhs*). Contain the component-wise forward and backward errors, respectively, for each solution vector.
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine pprfs interface are as follows:

ap	Holds the array *A* of size (*n**(*n*+1)/2).
afp	Holds the array *AF* of size (*n**(*n*+1)/2).
b	Holds the matrix *B* of size (*n*, *nrhs*).
x	Holds the matrix *X* of size (*n*, *nrhs*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of $4n^2$ floating-point operations (for real flavors) or $16n^2$ operations (for complex flavors). In addition, each step of iterative refinement involves $6n^2$ operations (for real flavors) or $24n^2$ operations (for complex flavors); the number of iterations may range from 1 to 5.

Estimating the forward error involves solving a number of systems of linear equations *A***x* = *b*; the number of systems is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors or $8n^2$ for complex flavors.

Description

The routine performs an iterative refinement of the solution to a system of linear equations $A*X = B$ with a symmetric (Hermitian) positive definite band matrix A, with multiple right-hand sides. For each computed solution vector x, the routine computes the *component-wise backward error*β. This error is the smallest relative perturbation in elements of A and b such that x is the exact solution of the perturbed system:

$|\delta a_{ij}| \leq \beta |a_{ij}|$, $|\delta b_i| \leq \beta |b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

Finally, the routine estimates the *component-wise forward error* in the computed solution $||x - x_e||_\infty / ||x||_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine ?pbtrf
- call the solver routine ?pbtrs.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates how the input matrix A has been factored: If *uplo* = 'U', the upper triangle of A is stored. If *uplo* = 'L', the lower triangle of A is stored.
n	INTEGER. The order of the matrix A; $n \geq 0$.
kd	INTEGER. The number of superdiagonals or subdiagonals in the matrix A; $kd \geq 0$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
ab,*afb*,*b*,*x*,*work*	REAL for spbrfs DOUBLE PRECISION for dpbrfs

COMPLEX for cpbrfs

DOUBLE COMPLEX for zpbrfs.

Arrays:

ab(*ldab*,*) contains the original band matrix *A*, as supplied to ?pbtrf.

afb(*ldafb*,*) contains the factored band matrix *A*, as returned by ?pbtrf.

b(*ldb*,*) contains the right-hand side matrix *B*.

x(*ldx*,*) contains the solution matrix *X*.

work(*) is a workspace array.

The second dimension of *ab* and *afb* must be at least max(1, *n*); the second dimension of *b* and *x* must be at least max(1, *nrhs*); the dimension of *work* must be at least max(1, 3**n*) for real flavors and max(1, 2**n*) for complex flavors.

ldab — INTEGER. The leading dimension of *ab*; *ldab*≥*kd* + 1.

ldafb — INTEGER. The leading dimension of *afb*; *ldafb*≥*kd* + 1.

ldb — INTEGER. The leading dimension of *b*; *ldb*≥ max(1, *n*).

ldx — INTEGER. The leading dimension of *x*; *ldx*≥ max(1, *n*).

iwork — INTEGER. Workspace array, size at least max(1, *n*).

rwork — REAL for cpbrfs

DOUBLE PRECISION for zpbrfs.

Workspace array, size at least max(1, *n*).

Output Parameters

x — The refined solution matrix *X*.

ferr, *berr* — REAL for single precision flavors.

DOUBLE PRECISION for double precision flavors.

Arrays, size at least max(1, *nrhs*). Contain the component-wise forward and backward errors, respectively, for each solution vector.

info — INTEGER. If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine pbrfs interface are as follows:

ab — Holds the array *A* of size (*kd*+1, *n*).

afb	Holds the array *AF* of size (*kd*+1, *n*).
b	Holds the matrix *B* of size (*n*, *nrhs*).
x	Holds the matrix *X* of size (*n*, *nrhs*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of $8n*kd$ floating-point operations (for real flavors) or $32n*kd$ operations (for complex flavors). In addition, each step of iterative refinement involves $12n*kd$ operations (for real flavors) or $48n*kd$ operations (for complex flavors); the number of iterations may range from 1 to 5.

Estimating the forward error involves solving a number of systems of linear equations $A*x = b$; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $4n*kd$ floating-point operations for real flavors or $16n*kd$ for complex flavors.

Description

The routine performs an iterative refinement of the solution to a system of linear equations $A*X = B$ with a symmetric (Hermitian) positive definite tridiagonal matrix *A*, with multiple right-hand sides. For each computed solution vector *x*, the routine computes the *component-wise backward error*β. This error is the smallest relative perturbation in elements of *A* and *b* such that *x* is the exact solution of the perturbed system:

$|\delta a_{ij}| \leq \beta |a_{ij}|$, $|\delta b_i| \leq \beta |b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

Finally, the routine estimates the *component-wise forward error* in the computed solution $||x - x_e||_\infty / ||x||_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine ?pttrf
- call the solver routine ?pttrs.

Input Parameters

uplo

CHARACTER*1. Used for complex flavors only. Must be 'U' or 'L'.

Specifies whether the superdiagonal or the subdiagonal of the tridiagonal matrix *A* is stored and how *A* is factored:

If *uplo* = 'U', the array *e* stores the superdiagonal of *A*, and *A* is factored as U^H*D*U.

If *uplo* = 'L', the array *e* stores the subdiagonal of *A*, and *A* is factored as $L*D*L^H$.

n

INTEGER. The order of the matrix *A*; $n \geq 0$.

nrhs

INTEGER. The number of right-hand sides; $nrhs \geq 0$.

d, *df*, *rwork*

REAL for single precision flavors DOUBLE PRECISION for double precision flavors

Arrays: *d*(*n*), *df*(*n*), *rwork*(*n*).

The array *d* contains the *n* diagonal elements of the tridiagonal matrix *A*.

The array *df* contains the *n* diagonal elements of the diagonal matrix *D* from the factorization of *A* as computed by ?pttrf.

The array *rwork* is a workspace array used for complex flavors only.

e,*ef*,*b*,*x*,*work*

REAL for sptrfs

DOUBLE PRECISION for dptrfs

COMPLEX for cptrfs

DOUBLE COMPLEX for zptrfs.

Arrays: *e*(*n* -1), *ef*(*n* -1), *b*(*ldb*,*nrhs*), *x*(*ldx*,*nrhs*), *work*(*).

The array *e* contains the (*n* - 1) off-diagonal elements of the tridiagonal matrix *A* (see *uplo*).

The array *ef* contains the (*n* - 1) off-diagonal elements of the unit bidiagonal factor *U* or *L* from the factorization computed by ?pttrf (see *uplo*).

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations.

The array *x* contains the solution matrix *X* as computed by ?pttrs.

The array *work* is a workspace array. The dimension of *work* must be at least 2*n for real flavors, and at least *n* for complex flavors.

ldb

INTEGER. The leading dimension of *b*; $ldb \geq \max(1, n)$.

ldx	INTEGER. The leading dimension of *x*; *ldx*≥ max(1, *n*).

Output Parameters

x	The refined solution matrix *X*.
ferr, *berr*	REAL for single precision flavors. DOUBLE PRECISION for double precision flavors. Arrays, size at least max(1, *nrhs*). Contain the component-wise forward and backward errors, respectively, for each solution vector.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine ptrfs interface are as follows:

d	Holds the vector of length *n*.
df	Holds the vector of length *n*.
e	Holds the vector of length (*n*-1).
ef	Holds the vector of length (*n*-1).
b	Holds the matrix *B* of size (*n*,*nrhs*).
x	Holds the matrix *X* of size (*n*,*nrhs*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Used in complex flavors only. Must be 'U' or 'L'. The default value is 'U'.

Description

The routine performs an iterative refinement of the solution to a system of linear equations $A*X = B$ with a symmetric full-storage matrix A, with multiple right-hand sides. For each computed solution vector x, the routine computes the *component-wise backward error*β. This error is the smallest relative perturbation in elements of A and b such that x is the exact solution of the perturbed system:

$|\delta a_{ij}| \leq \beta |a_{ij}|$, $|\delta b_i| \leq \beta |b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

Finally, the routine estimates the *component-wise forward error* in the computed solution $||x - x_e||_\infty / ||x||_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine ?sytrf
- call the solver routine ?sytrs.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', the upper triangle of *A* is stored. If *uplo* = 'L', the lower triangle of *A* is stored.
n	INTEGER. The order of the matrix *A*; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
a,*af*,*b*,*x*,*work*	REAL for ssyrfs DOUBLE PRECISION for dsyrfs COMPLEX for csyrfs DOUBLE COMPLEX for zsyrfs. Arrays: *a*(*lda*,*) contains the original matrix *A*, as supplied to ?sytrf. *af*(*ldaf*,*) contains the factored matrix *A*, as returned by ?sytrf. *b*(*ldb*,*) contains the right-hand side matrix *B*. *x*(*ldx*,*) contains the solution matrix *X*. *work*(*) is a workspace array.

The second dimension of *a* and *af* must be at least `max(1, n)`; the second dimension of *b* and *x* must be at least `max(1, nrhs)`; the dimension of *work* must be at least `max(1, 3*n)` for real flavors and `max(1, 2*n)` for complex flavors.

lda — `INTEGER`. The leading dimension of *a*; *lda* ≥ `max(1, n)`.

ldaf — `INTEGER`. The leading dimension of *af*; *ldaf* ≥ `max(1, n)`.

ldb — `INTEGER`. The leading dimension of *b*; *ldb* ≥ `max(1, n)`.

ldx — `INTEGER`. The leading dimension of *x*; *ldx* ≥ `max(1, n)`.

ipiv — `INTEGER`.

Array, size at least `max(1, n)`. The *ipiv* array, as returned by `?sytrf`.

iwork — `INTEGER`. Workspace array, size at least `max(1, n)`.

rwork — `REAL` for `csyrfs`

`DOUBLE PRECISION` for `zsyrfs`.

Workspace array, size at least `max(1, n)`.

Output Parameters

x — The refined solution matrix *X*.

ferr, *berr* — `REAL` for single precision flavors

`DOUBLE PRECISION` for double precision flavors.

Arrays, size at least `max(1, nrhs)`. Contain the component-wise forward and backward errors, respectively, for each solution vector.

info — `INTEGER`. If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `syrfs` interface are as follows:

a — Holds the matrix *A* of size (*n*, *n*).

af — Holds the matrix *AF* of size (*n*, *n*).

ipiv — Holds the vector of length *n*.

b — Holds the matrix *B* of size (*n*, *nrhs*).

x — Holds the matrix *X* of size (*n*, *nrhs*).

ferr — Holds the vector of length (*nrhs*).

berr — Holds the vector of length (*nrhs*).

uplo Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of $4n^2$ floating-point operations (for real flavors) or $16n^2$ operations (for complex flavors). In addition, each step of iterative refinement involves $6n^2$ operations (for real flavors) or $24n^2$ operations (for complex flavors); the number of iterations may range from 1 to 5. Estimating the forward error involves solving a number of systems of linear equations $A*x = b$; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors or $8n^2$ for complex flavors.

Description

The routine improves the computed solution to a system of linear equations when the coefficient matrix is symmetric indefinite, and provides error bounds and backward error estimates for the solution. In addition to a normwise error bound, the code provides a maximum componentwise error bound, if possible. See comments for *err_bnds_norm* and *err_bnds_comp* for details of the error bounds.

The original system of linear equations may have been equilibrated before calling this routine, as described by the parameters *equed* and *s* below. In this case, the solution and error bounds returned are for the original unequilibrated system.

Input Parameters

uplo CHARACTER*1. Must be 'U' or 'L'.

Indicates whether the upper or lower triangular part of *A* is stored:

If *uplo* = 'U', the upper triangle of *A* is stored.

If *uplo* = 'L', the lower triangle of *A* is stored.

equed — CHARACTER*1. Must be 'N' or 'Y'.

Specifies the form of equilibration that was done to *A* before calling this routine.

If *equed* = 'N', no equilibration was done.

If *equed* = 'Y', both row and column equilibration was done, that is, *A* has been replaced by *diag(s)*A*diag(s)*. The right-hand side *B* has been changed accordingly.

n — INTEGER. The number of linear equations; the order of the matrix *A*; $n \geq 0$.

nrhs — INTEGER. The number of right-hand sides; the number of columns of the matrices *B* and *X*; $nrhs \geq 0$.

a, *af*, *b*, *work* — REAL for ssyrfsx

DOUBLE PRECISION for dsyrfsx

COMPLEX for csyrfsx

DOUBLE COMPLEX for zsyrfsx.

Arrays: *a(lda,*)*, *af(ldaf,*)*, *b(ldb,*)*, *work(*)*.

The array *a* contains the symmetric/Hermitian matrix *A* as specified by *uplo*. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A* and the strictly lower triangular part of *a* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A* and the strictly upper triangular part of *a* is not referenced. The second dimension of *a* must be at least max(1,*n*).

The array *af* contains the triangular factor *L* or *U* from the Cholesky factorization $A = U^T*U$ or $A = L*L^T$ as computed by ssytrf for real flavors or dsytrf for complex flavors.

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).

work(*) is a workspace array. The dimension of *work* must be at least max(1,4**n*) for real flavors, and at least max(1,2**n*) for complex flavors.

lda — INTEGER. The leading dimension of *a*; *lda* ≥ max(1, *n*).

ldaf — INTEGER. The leading dimension of *af*; *ldaf* ≥ max(1, *n*).

ipiv — INTEGER.

Array, size at least max(1, *n*). Contains details of the interchanges and the block structure of *D* as determined by ssytrf for real flavors or dsytrf for complex flavors.

s — REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size (*n*). The array *s* contains the scale factors for *A*.

If *equed* = 'N', *s* is not accessed.

If *equed* = 'Y', each element of *s* must be positive.

Each element of *s* should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

ldb

INTEGER. The leading dimension of the array *b*; *ldb* ≥ max(1, *n*).

x

REAL for ssyrfsx

DOUBLE PRECISION for dsyrfsx

COMPLEX for csyrfsx

DOUBLE COMPLEX for zsyrfsx.

Array, size *ldx* by *.

The solution matrix *X* as computed by ?sytrs

ldx

INTEGER. The leading dimension of the output array *x*; *ldx* ≥ max(1, *n*).

n_err_bnds

INTEGER. Number of error bounds to return for each right hand side and each type (normwise or componentwise). See *err_bnds_norm* and *err_bnds_comp* descriptions in *Output Arguments* section below.

nparams

INTEGER. Specifies the number of parameters set in *params*. If ≤ 0, the *params* array is never referenced and default values are used.

params

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size *nparams*. Specifies algorithm parameters. If an entry is less than 0.0, that entry will be filled with the default value used for that parameter. Only positions up to *nparams* are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass *nparams* = 0, which prevents the source code from accessing the *params* argument.

params(1) : Whether to perform iterative refinement or not. Default: 1.0 (for single precision flavors), 1.0D+0 (for double precision flavors).

=0.0	No refinement is performed and no error bounds are computed.
=1.0	Use the double-precision refinement algorithm, possibly with doubled-single computations if the compilation environment does not support double precision.

(Other values are reserved for future use.)

params(2) : Maximum number of residual computations allowed for refinement.

Default	10.0

Aggressive	Set to 100.0 to permit convergence using approximate factorizations or factorizations other than *LU*. If the factorization uses a technique other than Gaussian elimination, the guarantees in *err_bnds_norm* and *err_bnds_comp* may no longer be trustworthy.

params(3) : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

iwork — INTEGER. Workspace array, size at least max(1, *n*); used in real flavors only.

rwork — REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Workspace array, size at least max(1, 3**n*); used in complex flavors only.

Output Parameters

x — REAL for ssyrfsx

DOUBLE PRECISION for dsyrfsx

COMPLEX for csyrfsx

DOUBLE COMPLEX for zsyrfsx.

The improved solution matrix *X*.

rcond — REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision, in particular, if *rcond* = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.

berr — REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size at least max(1, *nrhs*). Contains the componentwise relative backward error for each solution vector *x*(*j*), that is, the smallest relative change in any element of *A* or *B* that makes *x*(*j*) an exact solution.

err_bnds_norm — REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array of size *nrhs* by *n_err_bnds*. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:

Normwise relative error in the *i*-th solution vector

$$\frac{\max_j \left|Xtrue_{ji} - X_{ji}\right|}{\max_j \left|X_{ji}\right|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.

The first index in *err_bnds_norm(i,:)* corresponds to the *i*-th right-hand side.

The second index in *err_bnds_norm(:,err)* contains the follwoing three fields:

err=1	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors.
err=2	"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors. This error bound should only be trusted if the previous boolean is true.
err=3	Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix *Z* are: $\|Z\|_\infty \cdot \|Z^{-1}\|_\infty$

err_bnds_comp

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array of size *nrhs* by *n_err_bnds*. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:

Componentwise relative error in the *i*-th solution vector:

$$\max_j \frac{\left|Xtrue_{ji} - X_{ji}\right|}{\left|X_{ji}\right|}$$

The array is indexed by the right-hand side *i*, on which the componentwise relative error depends, and by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is not requested (*params(3)* = 0.0), then *err_bnds_comp* is not accessed. If *n_err_bnds* < 3, then at most the first *(:,n_err_bnds)* entries are returned.

The first index in *err_bnds_comp(i,:)* corresponds to the *i*-th right-hand side.

The second index in *err_bnds_comp(:,err)* contains the following three fields:

err=1	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors.
err=2	"Guaranteed" error bpound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors. This error bound should only be trusted if the previous boolean is true.
err=3	Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix *Z* are: $\|Z\|_\infty \cdot \|Z^{-1}\|_\infty$ Let *z=s**(*a**diag(*x*)), where *x* is the solution for the current right-hand side and *s* scales each row of *a**diag(*x*) by a power of the radix so all absolute row sums of *z* are approximately 1.

params

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Output parameter only if the input contains erroneous values, namely, in *params(1)*, *params(2)*, *params(3)*. In such a case, the corresponding elements of *params* are filled with default values on output.

info

INTEGER. If *info* = 0, the execution is successful. The solution to every right-hand side is guaranteed.

If *info* = –*i*, the *i*-th parameter had an illegal value.

If 0 < *info*≤*n*: $U_{info,info}$ is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned.

If *info* = *n*+*j*: The solution corresponding to the *j*-th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides *k* with *k* > *j* may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested *params(3)* = 0.0, then the *j*-th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest *j* such that *err_bnds_norm*(*j*,1) = 0.0 or *err_bnds_comp*(*j*,1) = 0.0. See the definition of *err_bnds_norm* and *err_bnds_comp* for *err* = 1. To get information about all of the right-hand sides, check *err_bnds_norm* or *err_bnds_comp*.

Description

The routine performs an iterative refinement of the solution to a system of linear equations *A*X* = *B* with a complex Hermitian full-storage matrix *A*, with multiple right-hand sides. For each computed solution vector *x*, the routine computes the *component-wise backward error*β. This error is the smallest relative perturbation in elements of *A* and *b* such that *x* is the exact solution of the perturbed system:

$|\delta a_{ij}| \le \beta |a_{ij}|$, $|\delta b_i| \le \beta |b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

Finally, the routine estimates the *component-wise forward error* in the computed solution $||x - x_e||_\infty / ||x||_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine ?hetrf
- call the solver routine ?hetrs.

Input Parameters

uplo — CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', the upper triangle of *A* is stored.

If *uplo* = 'L', the lower triangle of *A* is stored.

n — INTEGER. The order of the matrix *A*; *n*≥ 0.

nrhs — INTEGER. The number of right-hand sides; *nrhs*≥ 0.

a,*af*,*b*,*x*,*work* — COMPLEX for cherfs

DOUBLE COMPLEX for zherfs.

Arrays:

a(size *lda* by *) contains the original matrix *A*, as supplied to ?hetrf.

af(size *ldaf* by *) contains the factored matrix *A*, as returned by ?hetrf.

b(size *ldb* by *) contains the right-hand side matrix *B*.

x(size *ldx* by *) contains the solution matrix *X*.

work(*) is a workspace array.

The second dimension of *a* and *af* must be at least max(1, *n*); the second dimension of *b* and *x* must be at least max(1, *nrhs*); the dimension of *work* must be at least max(1, 2**n*).

lda — INTEGER. The leading dimension of *a*; *lda*≥ max(1, *n*).

ldaf — INTEGER. The leading dimension of *af*; *ldaf*≥ max(1, *n*).

ldb — INTEGER. The leading dimension of *b*; *ldb*≥ max(1, *n*).

ldx — INTEGER. The leading dimension of *x*; *ldx*≥ max(1, *n*).

ipiv — INTEGER.

Array, size at least max(1, *n*). The *ipiv* array, as returned by ?hetrf.

rwork — REAL for cherfs

DOUBLE PRECISION for zherfs.

Workspace array, size at least max(1, *n*).

Output Parameters

x — The refined solution matrix *X*.

ferr, *berr* — REAL for cherfs

DOUBLE PRECISION for zherfs.

Arrays, size at least max(1, *nrhs*). Contain the component-wise forward and backward errors, respectively, for each solution vector.

info — INTEGER. If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `herfs` interface are as follows:

a	Holds the matrix *A* of size (*n*,*n*).
af	Holds the matrix *AF* of size (*n*,*n*).
ipiv	Holds the vector of length *n*.
b	Holds the matrix *B* of size (*n*,*nrhs*).
x	Holds the matrix *X* of size (*n*,*nrhs*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of $16n^2$ operations. In addition, each step of iterative refinement involves $24n^2$ operations; the number of iterations may range from 1 to 5.

Estimating the forward error involves solving a number of systems of linear equations $A*x = b$; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $8n^2$ floating-point operations.

The real counterpart of this routine is `?ssyrfs`/`?dsyrfs`

Description

The routine improves the computed solution to a system of linear equations when the coefficient matrix is Hermitian indefinite, and provides error bounds and backward error estimates for the solution. In addition to a normwise error bound, the code provides a maximum componentwise error bound, if possible. See comments for *err_bnds_norm* and *err_bnds_comp* for details of the error bounds.

The original system of linear equations may have been equilibrated before calling this routine, as described by the parameters *equed* and *s* below. In this case, the solution and error bounds returned are for the original unequilibrated system.

Input Parameters

uplo

CHARACTER*1. Must be 'U' or 'L'.

Indicates whether the upper or lower triangular part of *A* is stored:

If *uplo* = 'U', the upper triangle of *A* is stored.

If *uplo* = 'L', the lower triangle of *A* is stored.

equed

CHARACTER*1. Must be 'N' or 'Y'.

Specifies the form of equilibration that was done to *A* before calling this routine.

If *equed* = 'N', no equilibration was done.

If *equed* = 'Y', both row and column equilibration was done, that is, *A* has been replaced by *diag(s)*A*diag(s)*. The right-hand side *B* has been changed accordingly.

n

INTEGER. The number of linear equations; the order of the matrix *A*; $n \geq 0$.

nrhs

INTEGER. The number of right-hand sides; the number of columns of the matrices *B* and *X*; $nrhs \geq 0$.

a, *af*, *b*, *work*

COMPLEX for cherfsx

DOUBLE COMPLEX for zherfsx.

Arrays: *a(lda,*)*, *af(ldaf,*)*, *b(ldb,*)*, *work(*)*.

The array *a* contains the Hermitian matrix *A* as specified by *uplo*. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A* and the strictly lower triangular part of *a* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A* and the strictly upper triangular part of *a* is not referenced. The second dimension of *a* must be at least max(1,*n*).

The array *af* contains the block diagonal matrix *D* and the multipliers used to obtain the factor *U* or *L* from the factorization $A = U*D*U^T$ or $A = L*D*L^T$ as computed by ssytrf for cherfsx or dsytrf for zherfsx.

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).

work(*) is a workspace array. The dimension of *work* must be at least max(1,2**n*).

lda

INTEGER. The leading dimension of *a*; *lda* ≥ max(1, *n*).

ldaf INTEGER. The leading dimension of *af*; *ldaf* ≥ max(1, *n*).

ipiv INTEGER.

Array, size at least max(1, *n*). Contains details of the interchanges and the block structure of *D* as determined by ssytrf for real flavors or dsytrf for complex flavors.

s REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size (*n*). The array *s* contains the scale factors for *A*.

If *equed* = 'N', *s* is not accessed.

If *equed* = 'Y', each element of *s* must be positive.

Each element of *s* should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

ldb INTEGER. The leading dimension of the array *b*; *ldb* ≥ max(1, *n*).

x COMPLEX for cherfsx

DOUBLE COMPLEX for zherfsx.

Array, size (*ldx*,*).

The solution matrix *X* as computed by ?hetrs

ldx INTEGER. The leading dimension of the output array *x*; *ldx* ≥ max(1, *n*).

n_err_bnds INTEGER. Number of error bounds to return for each right hand side and each type (normwise or componentwise). See *err_bnds_norm* and *err_bnds_comp* descriptions in *Output Arguments* section below.

nparams INTEGER. Specifies the number of parameters set in *params*. If ≤ 0, the *params* array is never referenced and default values are used.

params REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size *nparams*. Specifies algorithm parameters. If an entry is less than 0.0, that entry will be filled with the default value used for that parameter. Only positions up to *nparams* are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass *nparams* = 0, which prevents the source code from accessing the *params* argument.

params(1) : Whether to perform iterative refinement or not. Default: 1.0 (for cherfsx), 1.0D+0 (for zherfsx).

=0.0	No refinement is performed and no error bounds are computed.

=1.0	Use the double-precision refinement algorithm, possibly with doubled-single computations if the compilation environment does not support double precision.

(Other values are reserved for future use.)

params(2) : Maximum number of residual computations allowed for refinement.

Default	10
Aggressive	Set to 100 to permit convergence using approximate factorizations or factorizations other than *LU*. If the factorization uses a technique other than Gaussian elimination, the guarantees in *err_bnds_norm* and *err_bnds_comp* may no longer be trustworthy.

params(3) : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

rwork

REAL for cherfsx

DOUBLE PRECISION for zherfsx.

Workspace array, size at least max(1, 3*n).

Output Parameters

x

COMPLEX for cherfsx

DOUBLE COMPLEX for zherfsx.

The improved solution matrix *X*.

rcond

REAL for cherfsx

DOUBLE PRECISION for zherfsx.

Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision, in particular, if *rcond* = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.

berr

REAL for cherfsx

DOUBLE PRECISION for zherfsx.

Array, size at least max(1, *nrhs*). Contains the componentwise relative backward error for each solution vector *x*(*j*), that is, the smallest relative change in any element of *A* or *B* that makes *x*(*j*) an exact solution.

err_bnds_norm

REAL for cherfsx

DOUBLE PRECISION for zherfsx.

Array of size *nrhs* by *n_err_bnds*. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:

Normwise relative error in the *i*-th solution vector

$$\frac{\max_j \left|Xtrue_{ji} - X_{ji}\right|}{\max_j \left|X_{ji}\right|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.

The first index in *err_bnds_norm(i,:)* corresponds to the *i*-th right-hand side.

The second index in *err_bnds_norm(:,err)* contains the following three fields:

err=1 — "Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for `cherfsx` and *sqrt*(*n*)**dlamch*(ε) for `zherfsx`.

err=2 — "Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for `cherfsx` and *sqrt*(*n*)**dlamch*(ε) for `zherfsx`. This error bound should only be trusted if the previous boolean is true.

err=3 — Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix *Z* are:

$$\|Z\|_\infty \cdot \|Z^{-1}\|_\infty$$

Let *z*=*s***a*, where *s* scales each row by a power of the radix so all absolute row sums of *z* are approximately 1.

err_bnds_comp

`REAL` for `cherfsx`

`DOUBLE PRECISION` for `zherfsx`.

Array of size *nrhs* by *n_err_bnds*. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:

Componentwise relative error in the *i*-th solution vector:

$$\max_j \frac{|Xtrue_{ji} - X_{ji}|}{|X_{ji}|}$$

The array is indexed by the right-hand side *i*, on which the componentwise relative error depends, and by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is not requested (*params(3)* = 0.0), then *err_bnds_comp* is not accessed. If *n_err_bnds* < 3, then at most the first *(:,n_err_bnds)* entries are returned.

The first index in *err_bnds_comp(i,:)* corresponds to the *i*-th right-hand side.

The second index in *err_bnds_comp(:,err)* contains the following three fields:

err=1 — "Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for `cherfsx` and *sqrt*(*n*)**dlamch*(ε) for `zherfsx`.

err=2 — "Guaranteed" error bpound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for `cherfsx` and *sqrt*(*n*)**dlamch*(ε) for `zherfsx`. This error bound should only be trusted if the previous boolean is true.

err=3 — Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix *Z* are:

$$\|Z\|_\infty \cdot \|Z^{-1}\|_\infty$$

Let *z=s**(*a**diag(*x*)), where *x* is the solution for the current right-hand side and *s* scales each row of *a**diag(*x*) by a power of the radix so all absolute row sums of *z* are approximately 1.

params — `REAL` for single precision flavors

`DOUBLE PRECISION` for double precision flavors.

Output parameter only if the input contains erroneous values, namely, in *params(1)*, *params(2)*, *params(3)*. In such a case, the corresponding elements of *params* are filled with default values on output.

info

INTEGER. If *info* = 0, the execution is successful. The solution to every right-hand side is guaranteed.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If 0 < *info*≤*n*: $U_{info,info}$ is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned.

If *info* = *n*+*j*: The solution corresponding to the *j*-th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides *k* with *k* > *j* may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested *params(3)* = 0.0, then the *j*-th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest *j* such that *err_bnds_norm*(*j*,1) = 0.0 or *err_bnds_comp*(*j*,1) = 0.0. See the definition of *err_bnds_norm* and *err_bnds_comp* for *err* = 1. To get information about all of the right-hand sides, check *err_bnds_norm* or *err_bnds_comp*.

Description

The routine performs an iterative refinement of the solution to a system of linear equations *A*X* = *B* with a packed symmetric matrix *A*, with multiple right-hand sides. For each computed solution vector *x*, the routine computes the *component-wise backward error*β. This error is the smallest relative perturbation in elements of *A* and *b* such that *x* is the exact solution of the perturbed system:

$|\delta a_{ij}| \leq \beta |a_{ij}|$, $|\delta b_i| \leq \beta |b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

Finally, the routine estimates the *component-wise forward error* in the computed solution $||x - x_e||_\infty / ||x||_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine ?sptrf
- call the solver routine ?sptrs.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', the upper triangle of *A* is stored. If *uplo* = 'L', the lower triangle of *A* is stored.
n	INTEGER. The order of the matrix *A*; *n*≥ 0.
nrhs	INTEGER. The number of right-hand sides; *nrhs*≥ 0.
ap,*afp*,*b*,*x*,*work*	REAL for ssprfs DOUBLE PRECISION for dsprfs COMPLEX for csprfs DOUBLE COMPLEX for zsprfs. Arrays: *ap* (size *) contains the original packed matrix *A*, as supplied to ?sptrf. *afp* (size *) contains the factored packed matrix *A*, as returned by ?sptrf. *b*(size *ldb* by *) contains the right-hand side matrix *B*. *x*(size *ldx* by *) contains the solution matrix *X*. *work*(*) is a workspace array. The dimension of arrays *ap* and *afp* must be at least max(1, *n*(*n*+1)/2); the second dimension of *b* and *x* must be at least max(1, *nrhs*); the dimension of *work* must be at least max(1, 3**n*) for real flavors and max(1, 2**n*) for complex flavors.
ldb	INTEGER. The leading dimension of *b*; *ldb*≥ max(1, *n*).
ldx	INTEGER. The leading dimension of *x*; *ldx*≥ max(1, *n*).
ipiv	INTEGER. Array, size at least max(1, *n*). The *ipiv* array, as returned by ?sptrf.
iwork	INTEGER. Workspace array, size at least max(1, *n*).
rwork	REAL for csprfs DOUBLE PRECISION for zsprfs. Workspace array, size at least max(1, *n*).

Output Parameters

x	The refined solution matrix *X*.

ferr, *berr*	REAL for single precision flavors. DOUBLE PRECISION for double precision flavors. Arrays, size at least max(1, *nrhs*). Contain the component-wise forward and backward errors, respectively, for each solution vector.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine sprfs interface are as follows:

ap	Holds the array *A* of size (*n**(*n*+1)/2).
afp	Holds the array *AF* of size (*n**(*n*+1)/2).
ipiv	Holds the vector of length *n*.
b	Holds the matrix *B* of size (*n*,*nrhs*).
x	Holds the matrix *X* of size (*n*,*nrhs*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of $4n^2$ floating-point operations (for real flavors) or $16n^2$ operations (for complex flavors). In addition, each step of iterative refinement involves $6n^2$ operations (for real flavors) or $24n^2$ operations (for complex flavors); the number of iterations may range from 1 to 5.

Estimating the forward error involves solving a number of systems of linear equations *A***x* = *b*; the number of systems is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors or $8n^2$ for complex flavors.

Description

The routine estimates the errors in the solution to a system of linear equations $A*X = B$ or $A^T*X = B$ or $A^H*X = B$ with a triangular matrix A, with multiple right-hand sides. For each computed solution vector x, the routine computes the *component-wise backward error* β. This error is the smallest relative perturbation in elements of A and b such that x is the exact solution of the perturbed system:

$|\delta a_{ij}| \leq \beta |a_{ij}|$, $|\delta b_i| \leq \beta |b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

The routine also estimates the *component-wise forward error* in the computed solution $||x - x_e||_\infty / ||x||_\infty$ (here x_e is the exact solution).

Before calling this routine, call the solver routine ?trtrs.

Input Parameters

uplo

CHARACTER*1. Must be 'U' or 'L'.

Indicates whether A is upper or lower triangular:

If *uplo* = 'U', then A is upper triangular.

If *uplo* = 'L', then A is lower triangular.

trans

CHARACTER*1. Must be 'N' or 'T' or 'C'.

Indicates the form of the equations:

If *trans* = 'N', the system has the form $A*X = B$.

If *trans* = 'T', the system has the form $A^T*X = B$.

If *trans* = 'C', the system has the form $A^H*X = B$.

diag — CHARACTER*1. Must be 'N' or 'U'.

If *diag* = 'N', then *A* is not a unit triangular matrix.

If *diag* = 'U', then *A* is unit triangular: diagonal elements of *A* are assumed to be 1 and not referenced in the array *a*.

n — INTEGER. The order of the matrix *A*; $n \geq 0$.

nrhs — INTEGER. The number of right-hand sides; $nrhs \geq 0$.

a, *b*, *x*, *work* — REAL for strrfs

DOUBLE PRECISION for dtrrfs

COMPLEX for ctrrfs

DOUBLE COMPLEX for ztrrfs.

Arrays:

a(size *lda* by *) contains the upper or lower triangular matrix *A*, as specified by *uplo*.

b(size *ldb* by *) contains the right-hand side matrix *B*.

x(size *ldx* by *) contains the solution matrix *X*.

work(*) is a workspace array.

The second dimension of *a* must be at least max(1,*n*); the second dimension of *b* and *x* must be at least max(1,*nrhs*); the dimension of *work* must be at least max(1,3*n) for real flavors and max(1,2*n) for complex flavors.

lda — INTEGER. The leading dimension of *a*; *lda* ≥ max(1, *n*).

ldb — INTEGER. The leading dimension of *b*; *ldb* ≥ max(1, *n*).

ldx — INTEGER. The leading dimension of *x*; *ldx* ≥ max(1, *n*).

iwork — INTEGER. Workspace array, size at least max(1, *n*).

rwork — REAL for ctrrfs

DOUBLE PRECISION for ztrrfs.

Workspace array, size at least max(1, *n*).

Output Parameters

ferr, *berr* — REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Arrays, size at least max(1, *nrhs*). Contain the component-wise forward and backward errors, respectively, for each solution vector.

info — INTEGER. If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `trrfs` interface are as follows:

a	Holds the matrix *A* of size (*n*,*n*).
b	Holds the matrix *B* of size (*n*,*nrhs*).
x	Holds the matrix *X* of size (*n*,*nrhs*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
trans	Must be `'N'`, `'C'`, or `'T'`. The default value is `'N'`.
diag	Must be `'N'` or `'U'`. The default value is `'N'`.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

A call to this routine involves, for each right-hand side, solving a number of systems of linear equations *A*x = b*; the number of systems is usually 4 or 5 and never more than 11. Each solution requires approximately n^2 floating-point operations for real flavors or $4n^2$ for complex flavors.

Description

The routine estimates the errors in the solution to a system of linear equations `A*X = B` or A^T`*X = B` or A^H*X = *B* with a packed triangular matrix *A*, with multiple right-hand sides. For each computed solution vector *x*, the routine computes the *component-wise backward error*β. This error is the smallest relative perturbation in elements of *A* and *b* such that *x* is the exact solution of the perturbed system:

$|\delta a_{ij}| \leq \beta |a_{ij}|$, $|\delta b_i| \leq \beta |b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

The routine also estimates the *component-wise forward error* in the computed solution $||x - x_e||_\infty / ||x||_\infty$ (here x_e is the exact solution).

Before calling this routine, call the solver routine `?tptrs`.

Input Parameters

uplo

`CHARACTER*1`. Must be `'U'` or `'L'`.

Indicates whether *A* is upper or lower triangular:

If `uplo = 'U'`, then *A* is upper triangular.

If `uplo = 'L'`, then *A* is lower triangular.

trans

`CHARACTER*1`. Must be `'N'` or `'T'` or `'C'`.

Indicates the form of the equations:

If `trans = 'N'`, the system has the form `A*X = B`.

If `trans = 'T'`, the system has the form A^T*X = *B*.

If `trans = 'C'`, the system has the form A^H*X = *B*.

diag

`CHARACTER*1`. Must be `'N'` or `'U'`.

If `diag = 'N'`, *A* is not a unit triangular matrix.

If `diag = 'U'`, *A* is unit triangular: diagonal elements of *A* are assumed to be 1 and not referenced in the array *ap*.

n

`INTEGER`. The order of the matrix *A*; $n \geq 0$.

nrhs

`INTEGER`. The number of right-hand sides; $nrhs \geq 0$.

ap, *b*, *x*, *work*

`REAL` for `stprfs`

`DOUBLE PRECISION` for `dtprfs`

`COMPLEX` for `ctprfs`

`DOUBLE COMPLEX` for `ztprfs`.

Arrays:

ap (size *) contains the upper or lower triangular matrix *A*, as specified by *uplo*.

b(size *ldb* by *) contains the right-hand side matrix *B*.

x(size *ldx* by *) contains the solution matrix *X*.

`work(*)` is a workspace array.

	The dimension of *ap* must be at least `max(1,n(n+1)/2)`; the second dimension of *b* and *x* must be at least `max(1,nrhs)`; the dimension of *work* must be at least `max(1,3*n)` for real flavors and `max(1,2*n)` for complex flavors.
ldb	`INTEGER`. The leading dimension of *b*; *ldb*≥ `max(1, n)`.
ldx	`INTEGER`. The leading dimension of *x*; *ldx*≥ `max(1, n)`.
iwork	`INTEGER`. Workspace array, size at least `max(1, n)`.
rwork	`REAL` for `ctprfs` `DOUBLE PRECISION` for `ztprfs`. Workspace array, size at least `max(1, n)`.

Output Parameters

ferr, *berr*	`REAL` for single precision flavors `DOUBLE PRECISION` for double precision flavors. Arrays, size at least `max(1, nrhs)`. Contain the component-wise forward and backward errors, respectively, for each solution vector.
info	`INTEGER`. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `tprfs` interface are as follows:

ap	Holds the array *A* of size (*n**(*n*+1)/2).
b	Holds the matrix *B* of size (*n*,*nrhs*).
x	Holds the matrix *X* of size (*n*,*nrhs*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
trans	Must be `'N'`, `'C'`, or `'T'`. The default value is `'N'`.
diag	Must be `'N'` or `'U'`. The default value is `'N'`.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

A call to this routine involves, for each right-hand side, solving a number of systems of linear equations $A*x = b$; the number of systems is usually 4 or 5 and never more than 11. Each solution requires approximately n^2 floating-point operations for real flavors or $4n^2$ for complex flavors.

Description

The routine estimates the errors in the solution to a system of linear equations $A*X = B$ or $A^T*X = B$ or $A^H*X = B$ with a triangular band matrix A, with multiple right-hand sides. For each computed solution vector x, the routine computes the *component-wise backward error* β. This error is the smallest relative perturbation in elements of A and b such that x is the exact solution of the perturbed system:

$|\delta a_{ij}| \leq \beta |a_{ij}|$, $|\delta b_i| \leq \beta |b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

The routine also estimates the *component-wise forward error* in the computed solution $||x - x_e||_\infty / ||x||_\infty$ (here x_e is the exact solution).

Before calling this routine, call the solver routine ?tbtrs.

Input Parameters

uplo
CHARACTER*1. Must be 'U' or 'L'.
Indicates whether A is upper or lower triangular:
If *uplo* = 'U', then A is upper triangular.
If *uplo* = 'L', then A is lower triangular.

trans
CHARACTER*1. Must be 'N' or 'T' or 'C'.
Indicates the form of the equations:
If *trans* = 'N', the system has the form $A*X = B$.

If *trans* = 'T', the system has the form $A^T*X = B$.

If *trans* = 'C', the system has the form $A^H*X = B$.

diag CHARACTER*1. Must be 'N' or 'U'.

If *diag* = 'N', *A* is not a unit triangular matrix.

If *diag* = 'U', *A* is unit triangular: diagonal elements of *A* are assumed to be 1 and not referenced in the array *ab*.

n INTEGER. The order of the matrix *A*; $n \geq 0$.

kd INTEGER. The number of super-diagonals or sub-diagonals in the matrix *A*; $kd \geq 0$.

nrhs INTEGER. The number of right-hand sides; $nrhs \geq 0$.

ab, *b*, *x*, *work* REAL for stbrfs

DOUBLE PRECISION for dtbrfs

COMPLEX for ctbrfs

DOUBLE COMPLEX for ztbrfs.

Arrays:

ab(size *ldab* by *) contains the upper or lower triangular matrix *A*, as specified by *uplo*, in band storage format.

b(size *ldb* by *) contains the right-hand side matrix *B*.

x(size *ldx* by *) contains the solution matrix *X*.

work(*) is a workspace array.

The second dimension of *a* must be at least max(1,*n*); the second dimension of *b* and *x* must be at least max(1,*nrhs*). The dimension of *work* must be at least max(1,3*n) for real flavors and max(1,2*n) for complex flavors.

ldab INTEGER. The leading dimension of the array *ab*; $ldab \geq kd + 1$.

ldb INTEGER. The leading dimension of *b*; $ldb \geq$ max(1, *n*).

ldx INTEGER. The leading dimension of *x*; $ldx \geq$ max(1, *n*).

iwork INTEGER. Workspace array, size at least max(1, *n*).

rwork REAL for ctbrfs

DOUBLE PRECISION for ztbrfs.

Workspace array, size at least max(1, *n*).

Output Parameters

ferr, *berr* REAL for single precision flavors.

DOUBLE PRECISION for double precision flavors.

Arrays, size at least max(1, *nrhs*). Contain the component-wise forward and backward errors, respectively, for each solution vector.

info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine tbrfs interface are as follows:

ab	Holds the array *A* of size (*kd*+1, *n*).
b	Holds the matrix *B* of size (*n*, *nrhs*).
x	Holds the matrix *X* of size (*n*, *nrhs*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
diag	Must be 'N' or 'U'. The default value is 'N'.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

A call to this routine involves, for each right-hand side, solving a number of systems of linear equations $A*x = b$; the number of systems is usually 4 or 5 and never more than 11. Each solution requires approximately $2n*kd$ floating-point operations for real flavors or $8n*kd$ operations for complex flavors.

Matrix Inversion: LAPACK Computational Routines

It is seldom necessary to compute an explicit inverse of a matrix. In particular, do not attempt to solve a system of equations $Ax = b$ by first computing A^{-1} and then forming the matrix-vector product $x = A^{-1}b$. Call a solver routine instead (see Routines for Solving Systems of Linear Equations); this is more efficient and more accurate.

However, matrix inversion routines are provided for the rare occasions when an explicit inverse matrix is needed.

?getri
Computes the inverse of an LU-factored general matrix.

Syntax

```
call sgetri( n, a, lda, ipiv, work, lwork, info )
call dgetri( n, a, lda, ipiv, work, lwork, info )
call cgetri( n, a, lda, ipiv, work, lwork, info )
call zgetri( n, a, lda, ipiv, work, lwork, info )
```

```
call getri( a, ipiv [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes the inverse inv(*A*) of a general matrix *A*. Before calling this routine, call ?getrf to factorize *A*.

Input Parameters

n	INTEGER. The order of the matrix *A*; $n \geq 0$.
a, *work*	REAL for sgetri DOUBLE PRECISION for dgetri COMPLEX for cgetri DOUBLE COMPLEX for zgetri. Arrays: *a*(*lda*,*), *work*(*). *a*(*lda*,*) contains the factorization of the matrix *A*, as returned by ?getrf: *A = P*L*U*. The second dimension of *a* must be at least max(1,*n*). *work*(*) is a workspace array of dimension at least max(1,*lwork*).
lda	INTEGER. The leading dimension of *a*; *lda* ≥ max(1, *n*).
ipiv	INTEGER. Array, size at least max(1, *n*). The *ipiv* array, as returned by ?getrf.
lwork	INTEGER. The size of the *work* array; *lwork* ≥ *n*. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* below for the suggested value of *lwork*.

Output Parameters

a	Overwritten by the *n*-by-*n* matrix inv(*A*).
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, the *i*-th diagonal element of the factor *U* is zero, *U* is singular, and the inversion could not be completed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `getri` interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
ipiv	Holds the vector of length *n*.

Application Notes

For better performance, try using *lwork* = *n*blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed inverse *X* satisfies the following error bound:

$$|XA - I| \leq c(n)\varepsilon|X|P|L||U|,$$

where $c(n)$ is a modest linear function of *n*; ε is the machine precision; *I* denotes the identity matrix; *P*, *L*, and *U* are the factors of the matrix factorization *A* = *P*L*U*.

The total number of floating-point operations is approximately $(4/3)n^3$ for real flavors and $(16/3)n^3$ for complex flavors.

?potri
Computes the inverse of a symmetric (Hermitian) positive-definite matrix using the Cholesky factorization.

Syntax

```
call spotri( uplo, n, a, lda, info )
call dpotri( uplo, n, a, lda, info )
call cpotri( uplo, n, a, lda, info )
call zpotri( uplo, n, a, lda, info )
call potri( a [,uplo] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes the inverse inv(*A*) of a symmetric positive definite or, for complex flavors, Hermitian positive-definite matrix *A*. Before calling this routine, call ?potrf to factorize *A*.

Input Parameters

uplo
CHARACTER*1. Must be 'U' or 'L'.
Indicates how the input matrix *A* has been factored:
If *uplo* = 'U', the upper triangle of *A* is stored.
If *uplo* = 'L', the lower triangle of *A* is stored.

n
INTEGER. The order of the matrix *A*; *n* ≥ 0.

a
REAL for spotri
DOUBLE PRECISION for dpotri
COMPLEX for cpotri
DOUBLE COMPLEX for zpotri.
Array *a*(size *lda* by *) Contains the factorization of the matrix *A*, as returned by ?potrf.
The second dimension of *a* must be at least max(1, *n*).

lda
INTEGER. The leading dimension of a. *lda* ≥ max(1, *n*).

Output Parameters

a
Overwritten by the upper or lower triangle of the inverse of *A*.

info
INTEGER.
If *info* = 0, the execution is successful.

If *info* = *-i*, the *i*-th parameter had an illegal value.

If *info* = *i*, the *i*-th diagonal element of the Cholesky factor (and therefore the factor itself) is zero, and the inversion could not be completed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine potri interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed inverse *X* satisfies the following error bounds:

$$||XA - I||_2 \le c(n)\varepsilon\kappa_2(A), \quad ||AX - I||_2 \le c(n)\varepsilon\kappa_2(A),$$

where $c(n)$ is a modest linear function of *n*, and ε is the machine precision; *I* denotes the identity matrix.

The 2-norm $||A||_2$ of a matrix *A* is defined by $||A||_2 = max_{x \cdot x=1}(Ax \cdot Ax)^{1/2}$, and the condition number $\kappa_2(A)$ is defined by $\kappa_2(A) = ||A||_2 \, ||A^{-1}||_2$.

The total number of floating-point operations is approximately $(2/3)n^3$ for real flavors and $(8/3)n^3$ for complex flavors.

Matrix Storage Schemes

?pftri
Computes the inverse of a symmetric (Hermitian) positive-definite matrix in RFP format using the Cholesky factorization.

Syntax

```
call spftri( transr, uplo, n, a, info )
call dpftri( transr, uplo, n, a, info )
call cpftri( transr, uplo, n, a, info )
call zpftri( transr, uplo, n, a, info )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes the inverse inv(*A*) of a symmetric positive definite or, for complex data, Hermitian positive-definite matrix *A* using the Cholesky factorization:

$A = U^T*U$ for real data, $A = U^H*U$ for complex data if *uplo*='U'

$A = L*L^T$ for real data, $A = L*L^H$ for complex data if *uplo*='L'

Before calling this routine, call ?pftrf to factorize *A*.

The matrix *A* is in the Rectangular Full Packed (RFP) format. For the description of the RFP format, see Matrix Storage Schemes.

Input Parameters

transr

CHARACTER*1. Must be 'N', 'T' (for real data) or 'C' (for complex data).

If *transr* = 'N', the Normal *transr* of RFP *U* (if *uplo* = 'U') or *L* (if *uplo* = 'L') is stored.

If *transr* = 'T', the Transpose *transr* of RFP *U* (if *uplo* = 'U') or *L* (if *uplo* = 'L' is stored.

If *transr* = 'C', the Conjugate-Transpose *transr* of RFP *U* (if *uplo* = 'U') or *L* (if *uplo* = 'L' is stored.

uplo

CHARACTER*1. Must be 'U' or 'L'.

Indicates how the input matrix *A* has been factored:

If *uplo* = 'U', $A = U^T*U$ for real data or $A = U^H*U$ for complex data, and *U* is stored.

If *uplo* = 'L', $A = L*L^T$ for real data or $A = L*L^H$ for complex data, and *L* is stored.

n

INTEGER. The order of the matrix *A*; $n \geq 0$.

a

REAL for spftri

DOUBLE PRECISION for dpftri

COMPLEX for cpftri

DOUBLE COMPLEX for zpftri.

Array, size (*n**(*n*+1)/2). The array *a* contains the factor *U* or *L* matrix *A* in the RFP format.

Output Parameters

a

The symmetric/Hermitian inverse of the original matrix in the same storage format.

info

INTEGER. If *info*=0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, the (*i*, *i*) element of the factor U or L is zero, and the inverse could not be computed.

- mkl.fi, lapack.f90

Description

The routine computes the inverse inv(*A*) of a symmetric positive definite or, for complex flavors, Hermitian positive-definite matrix *A* in *packed* form. Before calling this routine, call ?pptrf to factorize *A*.

Input Parameters

uplo

CHARACTER*1. Must be 'U' or 'L'.

Indicates whether the upper or lower triangular factor is stored in *ap*:

If *uplo* = 'U', then the upper triangular factor is stored.

If *uplo* = 'L', then the lower triangular factor is stored.

n

INTEGER. The order of the matrix *A*; $n \geq 0$.

ap

REAL for spptri

DOUBLE PRECISION for dpptri

COMPLEX for cpptri

DOUBLE COMPLEX for zpptri.

Array, size at least max(1, $n(n+1)/2$).

Contains the factorization of the packed matrix *A*, as returned by ?pptrf.

The dimension *ap* must be at least max(1,$n(n+1)/2$).

Output Parameters

ap

Overwritten by the packed *n*-by-*n* matrix inv(*A*).

info

INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, the *i*-th diagonal element of the Cholesky factor (and therefore the factor itself) is zero, and the inversion could not be completed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `pptri` interface are as follows:

ap	Holds the array *A* of size `(n*(n+1)/2)`.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

The computed inverse *X* satisfies the following error bounds:

$$||XA - I||_2 \le c(n)\varepsilon\kappa_2(A), \quad ||AX - I||_2 \le c(n)\varepsilon\kappa_2(A),$$

where $c(n)$ is a modest linear function of *n*, and ε is the machine precision; *I* denotes the identity matrix.

The 2-norm $||A||_2$ of a matrix *A* is defined by $||A||_2 = max_{x \cdot x=1}(Ax \cdot Ax)^{1/2}$, and the condition number $\kappa_2(A)$ is defined by $\kappa_2(A) = ||A||_2 \, ||A^{-1}||_2$.

The total number of floating-point operations is approximately $(2/3)n^3$ for real flavors and $(8/3)n^3$ for complex flavors.

Description

The routine computes the inverse `inv(A)` of a symmetric matrix *A*. Before calling this routine, call `?sytrf` to factorize *A*.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates how the input matrix *A* has been factored: If *uplo* = 'U', the array *a* stores the Bunch-Kaufman factorization $A = U*D*U^T$. If *uplo* = 'L', the array *a* stores the Bunch-Kaufman factorization $A = L*D*L^T$.
n	INTEGER. The order of the matrix *A*; $n \geq 0$.
a, *work*	REAL for ssytri DOUBLE PRECISION for dsytri COMPLEX for csytri DOUBLE COMPLEX for zsytri. Arrays: *a*(size *lda* by *) contains the factorization of the matrix *A*, as returned by ?sytrf. The second dimension of *a* must be at least max(1,*n*). *work*(*) is a workspace array. The dimension of *work* must be at least max(1,2*n).
lda	INTEGER. The leading dimension of *a*; $lda \geq \max(1, n)$.
ipiv	INTEGER. Array, size at least max(1, *n*). The *ipiv* array, as returned by ?sytrf.

Output Parameters

a	Overwritten by the *n*-by-*n* matrix inv(*A*).
info	INTEGER. If *info* = 0, the execution is successful. If *info* =-*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the *i*-th diagonal element of *D* is zero, *D* is singular, and the inversion could not be completed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine sytri interface are as follows:

a	Holds the matrix *A* of size (*n*,*n*).
ipiv	Holds the vector of length *n*.

uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed inverse *X* satisfies the following error bounds:

$$|D*U^T*P^T*X*P*U - I| \le c(n)\varepsilon(|D||U^T|P^T|X|P|U| + |D||D^{-1}|)$$

for *uplo* = 'U', and

$$|D*L^T*P^T*X*P*L - I| \le c(n)\varepsilon(|D||L^T|P^T|X|P|L| + |D||D^{-1}|)$$

for *uplo* = 'L'. Here $c(n)$ is a modest linear function of *n*, and ε is the machine precision; *I* denotes the identity matrix.

The total number of floating-point operations is approximately $(2/3)n^3$ for real flavors and $(8/3)n^3$ for complex flavors.

The routine computes the inverse `inv(A)` of a symmetric indefinite matrix *A* using the factorization $A = U*D*U^T$ or $A = L*D*L^T$ computed by `?sytrf`.

The `?sytri2x` actually computes the inverse after the `?sytri2` routine sets the leading dimension of the workspace before calling `?sytri2x`.

Input Parameters

uplo

`CHARACTER*1`. Must be `'U'` or `'L'`.

Indicates how the input matrix *A* has been factored:

If *uplo* = `'U'`, the array *a* stores the factorization $A = U*D*U^T$.

If *uplo* = `'L'`, the array *a* stores the factorization $A = L*D*L^T$.

n

`INTEGER`. The order of the matrix *A*; $n \geq 0$.

a, *work*

`REAL` for `ssytri2x`

`DOUBLE PRECISION` for `dsytri2x`

`COMPLEX` for `csytri2x`

`DOUBLE COMPLEX` for `zsytri2x`

Arrays:

a(*lda*,*) contains the *nb* (block size) diagonal matrix *D* and the multipliers used to obtain the factor `U` or `L` as returned by `?sytrf`.

The second dimension of *a* must be at least `max(1,n)`.

work is a workspace array of dimension `(n+nb+1)*(nb+3)`

where

nb is the block size as set by `?sytrf`.

lda

`INTEGER`. The leading dimension of *a*; $lda \geq \max(1, n)$.

ipiv

`INTEGER`.

Array, size at least `max(1, n)`.

Details of the interchanges and the *nb* structure of *D* as returned by `?sytrf`.

nb

`INTEGER`. Block size.

Output Parameters

a

If *info* = 0, the symmetric inverse of the original matrix.

If *info* = `'U'`, the upper triangular part of the inverse is formed and the part of *A* below the diagonal is not referenced.

If *info* = `'L'`, the lower triangular part of the inverse is formed and the part of *A* above the diagonal is not referenced.

info

`INTEGER`.

If *info* = 0, the execution is successful.

If *info* =-*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, D_{ii}= 0; *D* is singular and its inversion could not be computed.

```

Description

`?sytri_3` computes the inverse of a real or complex symmetric matrix A using the factorization computed by `?sytrf_rk`: A = P*U*D*(U^T)*(P^T) or A = P*L*D*(L^T)*(P^T), where U (or L) is a unit upper (or lower) triangular matrix, U^T (or L^T) is the transpose of U (or L), P is a permutation matrix, P^T is the transpose of P, and D is symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

`?sytri_3` sets the leading dimension of the workspace before calling `?sytri_3x`, which actually computes the inverse. This is the blocked version of the algorithm, calling Level-3 BLAS.

Input Parameters

uplo `CHARACTER*1`

Specifies whether the details of the factorization are stored as an upper or lower triangular matrix.

- = `'U'`: The upper triangle of A is stored.
- = `'L'`: The lower triangle of A is stored.

n `INTEGER`

The order of the matrix A. $n \geq 0$.

A `REAL` for `ssytri_3`

`DOUBLE PRECISION` for `dsytri_3`

`COMPLEX` for `csytri_3`

`COMPLEX*16` for `zsytri_3`

Array, dimension (*lda*,*n*). On entry, diagonal of the block diagonal matrix D and factors U or L as computed by `?sytrf_rk`:

- *Only* diagonal elements of the symmetric block diagonal matrix D on the diagonal of A; that is, D(*k*,*k*) = A(*k*,*k*). Superdiagonal (or subdiagonal) elements of D should be provided on entry in array *e*.

  —and—

- If *uplo* = 'U', factor U in the superdiagonal part of A. If *uplo* = 'L', factor L in the subdiagonal part of A.

lda INTEGER

The leading dimension of the array *A*.*lda* ≥ max(1, *n*).

e REAL for ssytri_3

DOUBLE PRECISION for dsytri_3

COMPLEX for csytri_3

COMPLEX*16 for zsytri_3

Array, dimension (*n*). On entry, contains the superdiagonal (or subdiagonal) elements of the symmetric block diagonal matrix D with 1-by-1 or 2-by-2 diagonal blocks. If *uplo* = 'U', e(*i*) = D(*i*–1,*i*), *i*=2:N, and e(1) is not referenced. If *uplo* = 'L', e(*i*) = D(*i*+1,*i*), *i*=1:N–1, and e(*n*) is not referenced.

NOTE For 1-by-1 diagonal block D(*k*), where 1 ≤ k ≤ *n*, the element *e*(*k*) is not referenced in both the *uplo* = 'U' and *uplo* = 'L' cases.

ipiv INTEGER

Array, dimension (*n*). Details of the interchanges and the block structure of D as determined by ?sytrf_rk.

lwork INTEGER

The length of the array *work*.

If *LDWORK* = *-1*, a workspace query is assumed; the routine calculates only the optimal size of the optimal size of the *work* array and returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by XERBLA.

Output Parameters

A REAL for ssytri_3

DOUBLE PRECISION for dsytri_3

COMPLEX for csytri_3

COMPLEX*16 for zsytri_3

On exit, if *info* = 0, the symmetric inverse of the original matrix. If *uplo* = 'U', the upper triangular part of the inverse is formed and the part of A below the diagonal is not referenced. If *uplo* = 'L', the lower triangular part of the inverse is formed and the part of A above the diagonal is not referenced.

work REAL for ssytri_3

DOUBLE PRECISION for dsytri_3

COMPLEX for csytri_3

COMPLEX*16 for zsytri_3

Array, dimension (*n*+*NB*+1)*(*NB*+3). On exit, if *info* = 0, *work*(1) returns the optimal *lwork*.

info INTEGER

- = 0: successful exit.
- < 0: If *info* = –*i*, the *i*th argument had an illegal value.
- > 0: If *info* = *i*, D(*i*,*i*) = 0; the matrix is singular and its inverse could not be computed.

?hetri_3

Computes the inverse of a complex Hermitian matrix using the factorization computed by ?hetrf_rk*.*

```
call chetri_3(uplo, n, A, lda, e, ipiv, work, lwork, info)
call zhetri_3(uplo, n, A, lda, e, ipiv, work, lwork, info)
```

Description

?hetri_3 computes the inverse of a complex Hermitian matrix A using the factorization computed by ?hetrf_rk: A = P*U*D*(U^H)*(P^T) or A = P*L*D*(L^H)*(P^T), where U (or L) is a unit upper (or lower) triangular matrix, U^H (or L^H) is the conjugate of U (or L), P is a permutation matrix, P^T is the transpose of P, and D is a Hermitian and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

?hetri_3 sets the leading dimension of the workspace before calling ?hetri_3x, which actually computes the inverse.

This is the blocked version of the algorithm, calling Level-3 BLAS.

Input Parameters

uplo CHARACTER*1

Specifies whether the details of the factorization are stored as an upper or lower triangular matrix.

- = 'U': The upper triangle of A is stored.
- = 'L': The lower triangle of A is stored.

n INTEGER

The order of the matrix A. *n* ≥ 0.

A COMPLEX for chetri_3

COMPLEX*16 for zhetri_3

Array, dimension (*lda*,*n*). On entry, diagonal of the block diagonal matrix D and factor U or L as computed by ?hetrf_rk:

- *Only* diagonal elements of the Hermitian block diagonal matrix D on the diagonal of A; that is, D(*k*,*k*) = A(*k*,*k*). Superdiagonal (or subdiagonal) elements of D should be provided on entry in array *e*.
- If *uplo* = 'U', factor U in the superdiagonal part of A. If *uplo* = 'L', factor L is the subdiagonal part of A.

lda INTEGER

The leading dimension of the array *A*. *lda* ≥ max(1, *n*).

e

COMPLEX for chetri_3

COMPLEX*16 for zhetri_3

Array, dimension (*n*). On entry, contains the superdiagonal (or subdiagonal) elements of the Hermitian block diagonal matrix D with 1-by-1 or 2-by-2 diagonal blocks. If *uplo* = 'U', e(*i*) = D(*i*–1,*i*), *i*=2:N, and e(1) is not referenced. If *uplo* = 'L', e(*i*) = D(*i*+1,*i*), *i*=1:N–1, and e(*n*) is not referenced.

NOTE For 1-by-1 diagonal block D(*k*), where 1 ≤ *k* ≤ *n*, the element *e*(*k*) is not referenced in both the *uplo* = 'U' and *uplo* = 'L' cases.

ipiv

INTEGER

Array, dimension (*n*). Details of the interchanges and the block structure of D as determined by ?hetrf_rk.

lwork

INTEGER

The length of the array *work*.

If *LDWORK* = –1, a workspace query is assumed; the routine calculates only the optimal size of the *work* array and returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by XERBLA.

Output Parameters

A

COMPLEX for chetri_3

COMPLEX*16 for zhetri_3

On exit, if *info* = 0, the Hermitian inverse of the original matrix. If *uplo* = 'U', the upper triangular part of the inverse is formed and the part of A below the diagonal is not referenced. If *uplo* = 'L', the lower triangular part of the inverse is formed and the part of A above the diagonal is not referenced.

work

COMPLEX for chetri_3

COMPLEX*16 for zhetri_3

Array, dimension (*n*+*NB*+1)*(*NB*+3). On exit, if *info* = 0, *work*(1) returns the optimal *lwork*.

info

INTEGER

- = 0: Successful exit.
- < 0: If *info* = *-i*, the i^{th} argument had an illegal value.
- > 0: If *info* = *i*, D(*i*,*i*) = 0; the matrix is singular and its inverse could not be computed.

?sptri

Computes the inverse of a symmetric matrix using $U*D*U^T$ or $L*D*L^T$ Bunch-Kaufman factorization of matrix in packed storage.

Syntax

```
call ssptri( uplo, n, ap, ipiv, work, info )
call dsptri( uplo, n, ap, ipiv, work, info )
call csptri( uplo, n, ap, ipiv, work, info )
call zsptri( uplo, n, ap, ipiv, work, info )
call sptri( ap, ipiv [,uplo] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes the inverse inv(*A*) of a packed symmetric matrix *A*. Before calling this routine, call ?sptrf to factorize *A*.

Input Parameters

uplo

CHARACTER*1. Must be 'U' or 'L'.

Indicates how the input matrix *A* has been factored:

If *uplo* = 'U', the array *ap* stores the Bunch-Kaufman factorization $A = U*D*U^T$.

If *uplo* = 'L', the array *ap* stores the Bunch-Kaufman factorization $A = L*D*L^T$.

n

INTEGER. The order of the matrix *A*; $n \geq 0$.

ap, *work*

REAL for ssptri

DOUBLE PRECISION for dsptri

COMPLEX for csptri

DOUBLE COMPLEX for zsptri.

Arrays:

ap(*) contains the factorization of the matrix *A*, as returned by ?sptrf.

The dimension of *ap* must be at least max(1,*n*(*n*+1)/2).

work(*) is a workspace array.

The dimension of *work* must be at least max(1,*n*).

ipiv

INTEGER.

Array, size at least max(1, *n*). The *ipiv* array, as returned by ?sptrf.

Output Parameters

ap	Overwritten by the matrix `inv(A)` in packed form.
info	`INTEGER`. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the *i*-th diagonal element of *D* is zero, *D* is singular, and the inversion could not be completed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `sptri` interface are as follows:

ap	Holds the array *A* of size (*n**(*n*+1)/2).
ipiv	Holds the vector of length *n*.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

The computed inverse *X* satisfies the following error bounds:

$$|D*U^T*P^T*X*P*U - I| \le c(n)\varepsilon(|D||U^T|P^T|X|P|U| + |D||D^{-1}|)$$

for *uplo* = `'U'`, and

$$|D*L^T*P^T*X*P*L - I| \le c(n)\varepsilon(|D||L^T|P^T|X|P|L| + |D||D^{-1}|)$$

for *uplo* = `'L'`. Here $c(n)$ is a modest linear function of *n*, and ε is the machine precision; *I* denotes the identity matrix.

The total number of floating-point operations is approximately $(2/3)n^3$ for real flavors and $(8/3)n^3$ for complex flavors.

Description

The routine computes the inverse `inv(A)` of a complex Hermitian matrix *A* using packed storage. Before calling this routine, call `?hptrf` to factorize *A*.

Input Parameters

uplo

`CHARACTER*1`. Must be `'U'` or `'L'`.

Indicates how the input matrix *A* has been factored:

If *uplo* = `'U'`, the array *ap* stores the packed Bunch-Kaufman factorization $A = U*D*U^H$.

If *uplo* = `'L'`, the array *ap* stores the packed Bunch-Kaufman factorization $A = L*D*L^H$.

n

`INTEGER`. The order of the matrix *A*; $n \geq 0$.

ap, *work*

`COMPLEX` for `chptri`

`DOUBLE COMPLEX` for `zhptri`.

Arrays:

ap`(*)` contains the factorization of the matrix *A*, as returned by `?hptrf`.

The dimension of *ap* must be at least `max(1,`*n*`(`*n*`+1)/2)`.

work`(*)` is a workspace array.

The dimension of *work* must be at least `max(1,`*n*`)`.

ipiv

`INTEGER`.

Array, size at least `max(1,` *n*`)`.

The *ipiv* array, as returned by `?hptrf`.

Output Parameters

ap

Overwritten by the matrix `inv(`*A*`)`.

info

`INTEGER`.

If *info* = `0`, the execution is successful.

If *info* = `-`*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, the *i*-th diagonal element of *D* is zero, *D* is singular, and the inversion could not be completed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `hptri` interface are as follows:

ap

Holds the array *A* of size (*n*`*(`*n*`+1)/2`).

ipiv	Holds the vector of length *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed inverse *X* satisfies the following error bounds:

$$|D*U^H*P^T*X*P*U - I| \le c(n)\varepsilon(|D||U^H|P^T|X|P|U| + |D||D^{-1}|)$$

for *uplo* = 'U', and

$$|D*L^H*P^T*X*PL - I| \le c(n)\varepsilon(|D||L^H|P^T|X|P|L| + |D||D^{-1}|)$$

for *uplo* = 'L'. Here $c(n)$ is a modest linear function of *n*, and ε is the machine precision; *I* denotes the identity matrix.

The total number of floating-point operations is approximately $(8/3)n^3$.

The real counterpart of this routine is ?sptri.

Matrix Equilibration: LAPACK Computational Routines

Routines described in this section are used to compute scaling factors needed to equilibrate a matrix. Note that these routines do not actually scale the matrices.

?geequ
Computes row and column scaling factors intended to equilibrate a general matrix and reduce its condition number.

Syntax

```
call sgeequ( m, n, a, lda, r, c, rowcnd, colcnd, amax, info )
call dgeequ( m, n, a, lda, r, c, rowcnd, colcnd, amax, info )
call cgeequ( m, n, a, lda, r, c, rowcnd, colcnd, amax, info )
call zgeequ( m, n, a, lda, r, c, rowcnd, colcnd, amax, info )
call geequ( a, r, c [,rowcnd] [,colcnd] [,amax] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes row and column scalings intended to equilibrate an *m*-by-*n* matrix *A* and reduce its condition number. The output array *r* returns the row scale factors and the array *c* the column scale factors. These factors are chosen to try to make the largest element in each row and column of the matrix *B* with elements b_{ij}=r(i)*a_{ij}*c(j) have absolute value 1.

See ?laqge auxiliary function that uses scaling factors computed by ?geequ.

Input Parameters

m

INTEGER. The number of rows of the matrix *A*; *m*≥ 0.

n

INTEGER. The number of columns of the matrix *A*; *n*≥ 0.

a

REAL for sgeequ

DOUBLE PRECISION for dgeequ

COMPLEX for cgeequ

DOUBLE COMPLEX for zgeequ.

Array: size *lda* by *.

Contains the *m*-by-*n* matrix *A* whose equilibration factors are to be computed.

The second dimension of *a* must be at least max(1,*n*).

lda

INTEGER. The leading dimension of *a*; *lda*≥ max(1, *m*).

Output Parameters

r, *c*

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Arrays: *r* (size *m*), *c* (size *n*).

If *info* = 0, or *info*>*m*, the array *r* contains the row scale factors of the matrix *A*.

If *info* = 0, the array *c* contains the column scale factors of the matrix *A*.

rowcnd

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

If *info* = 0 or *info*>*m*, *rowcnd* contains the ratio of the smallest *r*(i) to the largest *r*(i).

colcnd — REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

If *info* = 0, *colcnd* contains the ratio of the smallest *c*(i) to the largest *c*(i).

amax — REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Absolute value of the largest element of the matrix *A*.

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, *i* > 0, and

i≤*m*, the *i*-th row of *A* is exactly zero;

i>*m*, the (*i*-*m*)th column of *A* is exactly zero.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine geequ interface are as follows:

a — Holds the matrix *A* of size (*m*, *n*).

r — Holds the vector of length (*m*).

c — Holds the vector of length *n*.

Application Notes

All the components of *r* and *c* are restricted to be between SMLNUM = smallest safe number and BIGNUM= largest safe number. Use of these scaling factors is not guaranteed to reduce the condition number of *A* but works well in practice.

SMLNUM and *BIGNUM* are parameters representing machine precision. You can use the ?lamch routines to compute them. For example, compute single precision values of *SMLNUM* and *BIGNUM* as follows:

```
SMLNUM = slamch ('s')
BIGNUM = 1 / SMLNUM
```

If *rowcnd*≥ 0.1 and *amax* is neither too large nor too small, it is not worth scaling by *r*.

If *colcnd*≥ 0.1, it is not worth scaling by *c*.

If *amax* is very close to SMLNUM or very close to BIGNUM, the matrix *A* should be scaled.

See Also

Error Analysis

Matrix Storage Schemes

?geequb
Computes row and column scaling factors restricted to a power of radix to equilibrate a general matrix and reduce its condition number.

Syntax

```
call sgeequb( m, n, a, lda, r, c, rowcnd, colcnd, amax, info )
call dgeequb( m, n, a, lda, r, c, rowcnd, colcnd, amax, info )
call cgeequb( m, n, a, lda, r, c, rowcnd, colcnd, amax, info )
call zgeequb( m, n, a, lda, r, c, rowcnd, colcnd, amax, info )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes row and column scalings intended to equilibrate an *m*-by-*n* general matrix *A* and reduce its condition number. The output array *r* returns the row scale factors and the array *c* - the column scale factors. These factors are chosen to try to make the largest element in each row and column of the matrix *B* with elements $b_{i,j}$ =r(i)*$a_{i,j}$*c(j) have an absolute value of at most the radix.

r(i) and *c*(j) are restricted to be a power of the radix between SMLNUM = smallest safe number and BIGNUM = largest safe number. Use of these scaling factors is not guaranteed to reduce the condition number of *a* but works well in practice.

SMLNUM and *BIGNUM* are parameters representing machine precision. You can use the ?lamch routines to compute them. For example, compute single precision values of *SMLNUM* and *BIGNUM* as follows:

```
SMLNUM = slamch ('s')
BIGNUM = 1 / SMLNUM
```

This routine differs from ?geequ by restricting the scaling factors to a power of the radix. Except for over- and underflow, scaling by these factors introduces no additional rounding errors. However, the scaled entries' magnitudes are no longer equal to approximately 1 but lie between sqrt(radix) and 1/sqrt(radix).

Input Parameters

m
INTEGER. The number of rows of the matrix *A*; *m*≥ 0.

n
INTEGER. The number of columns of the matrix *A*; *n*≥ 0.

a
REAL for sgeequb

DOUBLE PRECISION for dgeequb

COMPLEX for cgeequb

DOUBLE COMPLEX for zgeequb.

Array: size (*lda*,*).

Contains the *m*-by-*n* matrix *A* whose equilibration factors are to be computed.

The second dimension of *a* must be at least max(1,*n*).

lda	INTEGER. The leading dimension of *a*; *lda*≥ max(1, *m*).

Output Parameters

r, *c*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays: *r*(*m*), *c*(*n*). If *info* = 0, or *info*>*m*, the array *r* contains the row scale factors for the matrix *A*. If *info* = 0, the array *c* contains the column scale factors for the matrix *A*.
rowcnd	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. If *info* = 0 or *info*>*m*, *rowcnd* contains the ratio of the smallest *r*(i) to the largest *r*(i). If *rowcnd*≥ 0.1, and *amax* is neither too large nor too small, it is not worth scaling by *r*.
colcnd	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. If *info* = 0, *colcnd* contains the ratio of the smallest *c*(i) to the largest *c*(i). If *colcnd*≥ 0.1, it is not worth scaling by *c*.
amax	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Absolute value of the largest element of the matrix *A*. If *amax* is very close to SMLNUM or very close to BIGNUM, the matrix should be scaled.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, *i* > 0, and *i*≤*m*, the *i*-th row of *A* is exactly zero; *i*>*m*, the (*i*-*m*)-th column of *A* is exactly zero.

?gbequ

Computes row and column scaling factors intended to equilibrate a banded matrix and reduce its condition number.

Syntax

```
call sgbequ( m, n, kl, ku, ab, ldab, r, c, rowcnd, colcnd, amax, info )
```

```
call dgbequ( m, n, kl, ku, ab, ldab, r, c, rowcnd, colcnd, amax, info )
call cgbequ( m, n, kl, ku, ab, ldab, r, c, rowcnd, colcnd, amax, info )
call zgbequ( m, n, kl, ku, ab, ldab, r, c, rowcnd, colcnd, amax, info )
call gbequ( ab, r, c [,kl] [,rowcnd] [,colcnd] [,amax] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes row and column scalings intended to equilibrate an *m*-by-*n* band matrix *A* and reduce its condition number. The output array *r* returns the row scale factors and the array *c* the column scale factors. These factors are chosen to try to make the largest element in each row and column of the matrix *B* with elements b_{ij}=r(i)*a_{ij}*c(j) have absolute value 1.

See ?laqgb auxiliary function that uses scaling factors computed by ?gbequ.

Input Parameters

m
: INTEGER. The number of rows of the matrix *A*; *m*≥ 0.

n
: INTEGER. The number of columns of the matrix *A*; *n*≥ 0.

kl
: INTEGER. The number of subdiagonals within the band of *A*; *kl*≥ 0.

ku
: INTEGER. The number of superdiagonals within the band of *A*; *ku*≥ 0.

ab
: REAL for sgbequ

DOUBLE PRECISION for dgbequ

COMPLEX for cgbequ

DOUBLE COMPLEX for zgbequ.

Array, size *ldab* by *. Contains the original band matrix *A* stored in rows from 1 to *kl* + *ku* + 1. The second dimension of *ab* must be at least max(1,*n*).

ldab
: INTEGER. The leading dimension of *ab*; *ldab*≥*kl*+*ku*+1.

Output Parameters

r, *c*
: REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Arrays: *r* (size *m*), *c* (size *n*).

If *info* = 0, or *info*>*m*, the array *r* contains the row scale factors of the matrix *A*.

If *info* = 0, the array *c* contains the column scale factors of the matrix *A*.

rowcnd
: REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

	If *info* = 0 or *info*>*m*, *rowcnd* contains the ratio of the smallest *r*(i) to the largest *r*(i).
colcnd	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. If *info* = 0, *colcnd* contains the ratio of the smallest *c*(i) to the largest *c*(i).
amax	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Absolute value of the largest element of the matrix *A*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i* and *i*≤*m*, the *i*-th row of *A* is exactly zero; *i*>*m*, the (*i*-*m*)th column of *A* is exactly zero.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine gbequ interface are as follows:

ab	Holds the array *A* of size (*kl*+*ku*+1, *n*).
r	Holds the vector of length (*m*).
c	Holds the vector of length *n*.
kl	If omitted, assumed *kl* = *ku*.
ku	Restored as *ku* = *lda*-*kl*-1.

Application Notes

All the components of *r* and *c* are restricted to be between *SMLNUM* = smallest safe number and *BIGNUM*= largest safe number. Use of these scaling factors is not guaranteed to reduce the condition number of *A* but works well in practice.

SMLNUM and *BIGNUM* are parameters representing machine precision. You can use the ?lamch routines to compute them. For example, compute single precision values of *SMLNUM* and *BIGNUM* as follows:

```
SMLNUM = slamch ('s')
BIGNUM = 1 / SMLNUM
```

If *rowcnd*≥ 0.1 and *amax* is neither too large nor too small, it is not worth scaling by *r*.

If *colcnd*≥ 0.1, it is not worth scaling by *c*.

If *amax* is very close to SMLNUM or very close to BIGNUM, the matrix *A* should be scaled.

?gbequb
Computes row and column scaling factors restricted to a power of radix to equilibrate a banded matrix and reduce its condition number.

Syntax

```
call sgbequb( m, n, kl, ku, ab, ldab, r, c, rowcnd, colcnd, amax, info )
call dgbequb( m, n, kl, ku, ab, ldab, r, c, rowcnd, colcnd, amax, info )
call cgbequb( m, n, kl, ku, ab, ldab, r, c, rowcnd, colcnd, amax, info )
call zgbequb( m, n, kl, ku, ab, ldab, r, c, rowcnd, colcnd, amax, info )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes row and column scalings intended to equilibrate an *m*-by-*n* banded matrix *A* and reduce its condition number. The output array *r* returns the row scale factors and the array *c* - the column scale factors. These factors are chosen to try to make the largest element in each row and column of the matrix *B* with elements *b(ij)=r(i)*a(ij)*c(j)* have an absolute value of at most the radix.

r(i) and *c(j)* are restricted to be a power of the radix between *SMLNUM* = smallest safe number and *BIGNUM* = largest safe number. Use of these scaling factors is not guaranteed to reduce the condition number of *a* but works well in practice.

SMLNUM and *BIGNUM* are parameters representing machine precision. You can use the ?lamch routines to compute them. For example, compute single precision values of *SMLNUM* and *BIGNUM* as follows:

```
SMLNUM = slamch ('s')
BIGNUM = 1 / SMLNUM
```

This routine differs from ?gbequ by restricting the scaling factors to a power of the radix. Except for over- and underflow, scaling by these factors introduces no additional rounding errors. However, the scaled entries' magnitudes are no longer equal to approximately 1 but lie between sqrt(radix) and 1/sqrt(radix).

Input Parameters

m	INTEGER. The number of rows of the matrix *A*; *m*≥ 0.
n	INTEGER. The number of columns of the matrix *A*; *n*≥ 0.
kl	INTEGER. The number of subdiagonals within the band of *A*; *kl*≥ 0.
ku	INTEGER. The number of superdiagonals within the band of *A*; *ku*≥ 0.
ab	REAL for sgbequb DOUBLE PRECISION for dgbequb COMPLEX for cgbequb DOUBLE COMPLEX for zgbequb.

Array: size *ldab* by *

Contains the original banded matrix *A* stored in rows from 1 to *kl* + *ku* + 1. The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows:

ab(*ku*+1+*i*-*j*,*j*) = *a*(*i*,*j*) for max(1,*j*-*ku*) ≤*i*≤ min(*n*,*j*+*kl*).

The second dimension of *ab* must be at least max(1,*n*).

ldab INTEGER. The leading dimension of *a*; *ldab*≥ max(1, *m*).

Output Parameters

r, *c* REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Arrays: *r* (size *m*), *c* (size *n*).

If *info* = 0, or *info*>*m*, the array *r* contains the row scale factors for the matrix *A*.

If *info* = 0, the array *c* contains the column scale factors for the matrix *A*.

rowcnd REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

If *info* = 0 or *info*>*m*, *rowcnd* contains the ratio of the smallest *r*(i) to the largest *r*(i). If *rowcnd*≥ 0.1, and *amax* is neither too large nor too small, it is not worth scaling by *r*.

colcnd REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

If *info* = 0, *colcnd* contains the ratio of the smallest *c*(i) to the largest *c*(i). If *colcnd*≥ 0.1, it is not worth scaling by *c*.

amax REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Absolute value of the largest element of the matrix *A*. If *amax* is very close to SMLNUM or BIGNUM, the matrix should be scaled.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, the *i*-th diagonal element of *A* is nonpositive.

i≤*m*, the *i*-th row of *A* is exactly zero;

i>*m*, the (*i*-*m*)-th column of *A* is exactly zero.

?poequ
Computes row and column scaling factors intended to equilibrate a symmetric (Hermitian) positive definite matrix and reduce its condition number.

Syntax

```
call spoequ( n, a, lda, s, scond, amax, info )
call dpoequ( n, a, lda, s, scond, amax, info )
call cpoequ( n, a, lda, s, scond, amax, info )
call zpoequ( n, a, lda, s, scond, amax, info )
call poequ( a, s [,scond] [,amax] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes row and column scalings intended to equilibrate a symmetric (Hermitian) positive-definite matrix *A* and reduce its condition number (with respect to the two-norm). The output array *s* returns scale factors such that `s(i)s[i + 1]` contains

$$1/\sqrt{a_{i,i}}$$

These factors are chosen so that the scaled matrix *B* with elements $B_{i,j}=s(i)*A_{i,j}*s(j)$ has diagonal elements equal to 1.

This choice of *s* puts the condition number of *B* within a factor *n* of the smallest possible condition number over all possible diagonal scalings.

See `?laqsy` auxiliary function that uses scaling factors computed by `?poequ`.

Input Parameters

n	`INTEGER`. The order of the matrix *A*; $n \geq 0$.

a	`REAL` for `spoequ`
	`DOUBLE PRECISION` for `dpoequ`
	`COMPLEX` for `cpoequ`
	`DOUBLE COMPLEX` for `zpoequ`.
	Array: size *lda* by *.
	Contains the *n*-by-*n* symmetric or Hermitian positive definite matrix *A* whose scaling factors are to be computed. Only the diagonal elements of *A* are referenced.
	The second dimension of *a* must be at least `max(1,n)`.

lda	`INTEGER`. The leading dimension of *a*; $lda \geq$ `max(1,n)`.

Output Parameters

s	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Array, size *n*. If *info* = 0, the array *s* contains the scale factors for *A*.
scond	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. If *info* = 0, *scond* contains the ratio of the smallest *s*(i) to the largest *s*(i).
amax	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Absolute value of the largest element of the matrix *A*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the *i*-th diagonal element of *A* is nonpositive.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine poequ interface are as follows:

a	Holds the matrix *A* of size (*n*,*n*).
s	Holds the vector of length *n*.

Application Notes

If *scond*≥ 0.1 and *amax* is neither too large nor too small, it is not worth scaling by *s*.

If *amax* is very close to SMLNUM or very close to BIGNUM, the matrix *A* should be scaled.

If *uplo* = 'U', the array *a* stores the upper triangular part of the matrix *A*.

If *uplo* = 'L', the array *a* stores the lower triangular part of the matrix *A*.

n	INTEGER. The order of the matrix *A*; *n* ≥ 0.
a, *work*	COMPLEX for cheequb DOUBLE COMPLEX for zheequb. Array *a*: size *lda* by *. Contains the *n*-by-*n* symmetric indefinite matrix *A* whose scaling factors are to be computed. Only the diagonal elements of *A* are referenced. The second dimension of *a* must be at least max(1,*n*). *work*(*) is a workspace array. The dimension of *work* is at least max(1,3*n).
lda	INTEGER. The leading dimension of *a*; *lda* ≥ max(1, *m*).

Output Parameters

s	REAL for cheequb DOUBLE PRECISION for zheequb. Array, size (*n*). If *info* = 0, the array *s* contains the scale factors for *A*.
scond	REAL for cheequb DOUBLE PRECISION for zheequb. If *info* = 0, *scond* contains the ratio of the smallest *s*(i) to the largest *s*(i). If *scond* ≥ 0.1, and *amax* is neither too large nor too small, it is not worth scaling by *s*.
amax	REAL for cheequb DOUBLE PRECISION for zheequb. Absolute value of the largest element of the matrix *A*. If *amax* is very close to SMLNUM or BIGNUM, the matrix should be scaled.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the *i*-th diagonal element of *A* is nonpositive.

Description

The routine solves for *X* the system of linear equations `A*X = B`, where *A* is an *n*-by-*n* matrix, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

The *LU* decomposition with partial pivoting and row interchanges is used to factor *A* as `A = P*L*U`, where *P* is a permutation matrix, *L* is unit lower triangular, and *U* is upper triangular. The factored form of *A* is then used to solve the system of equations `A*X = B`.

The `dsgesv` and `zcgesv` are mixed precision iterative refinement subroutines for exploiting fast single precision hardware. They first attempt to factorize the matrix in single precision (`dsgesv`) or single complex precision (`zcgesv`) and use this factorization within an iterative refinement procedure to produce a solution with double precision (`dsgesv`) / double complex precision (`zcgesv`) normwise backward error quality (see below). If the approach fails, the method switches to a double precision or double complex precision factorization respectively and computes the solution.

The iterative refinement is not going to be a winning strategy if the ratio single precision performance over double precision performance is too small. A reasonable strategy should take the number of right-hand sides and the size of the matrix into account. This might be done with a call to `ilaenv` in the future. At present, iterative refinement is implemented.

The iterative refinement process is stopped if

```
iter > itermax
```

or for all the right-hand sides:

```
rnmr < sqrt(n)*xnrm*anrm*eps*bwdmax
```

where

- `iter` is the number of the current iteration in the iterativerefinement process
- `rnmr` is the infinity-norm of the residual
- `xnrm` is the infinity-norm of the solution
- `anrm` is the infinity-operator-norm of the matrix *A*
- `eps` is the machine epsilon returned by `dlamch` ('Epsilon').

The values `itermax` and `bwdmax` are fixed to 30 and 1.0d+00 respectively.

Input Parameters

n	`INTEGER`. The number of linear equations, that is, the order of the matrix *A*; $n \geq 0$.
nrhs	`INTEGER`. The number of right-hand sides, that is, the number of columns of the matrix *B*; $nrhs \geq 0$.
a	`REAL` for `sgesv` `DOUBLE PRECISION` for `dgesv` and `dsgesv`

COMPLEX for cgesv

DOUBLE COMPLEX for zgesv and zcgesv.

The array *a*(size *lda* by *) contains the *n*-by-*n* coefficient matrix *A*.

The second dimension of *a* must be at least max(1, *n*), the second dimension of *b* at least max(1,*nrhs*).

b

REAL for sgesv

DOUBLE PRECISION for dgesv and dsgesv

COMPLEX for cgesv

DOUBLE COMPLEX for zgesv and zcgesv.

The array *b*(size *ldb* by *) contains the *n*-by-*nrhs* matrix of right hand side matrix *B*.

lda

INTEGER. The leading dimension of the array *a*; *lda*≥ max(1, *n*).

ldb

INTEGER. The leading dimension of the array *b*; *ldb*≥ max(1, *n*).

ldx

INTEGER. The leading dimension of the array *x*; *ldx*≥ max(1, *n*).

work

DOUBLE PRECISION for dsgesv

DOUBLE COMPLEX for zcgesv.

Workspace array, size at least max(1,*n***nrhs*). This array is used to hold the residual vectors.

swork

REAL for dsgesv

COMPLEX for zcgesv.

Workspace array, size at least max(1,*n**(*n*+*nrhs*)). This array is used to use the single precision matrix and the right-hand sides or solutions in single precision.

rwork

DOUBLE PRECISION. Workspace array, size at least max(1,*n*).

Output Parameters

a

Overwritten by the factors *L* and *U* from the factorization of *A* = *P***L***U*; the unit diagonal elements of *L* are not stored.

If iterative refinement has been successfully used (*info*= 0 and *iter*≥ 0), then *A* is unchanged.

If double precision factorization has been used (*info*= 0 and *iter* < 0), then the array *A* contains the factors *L* and *U* from the factorization *A* = *P***L***U*; the unit diagonal elements of *L* are not stored.

b

Overwritten by the solution matrix *X* for dgesv, sgesv,zgesv,zgesv. Unchanged for dsgesv and zcgesv.

ipiv

INTEGER.

Array, size at least `max(1, n)`. The pivot indices that define the permutation matrix *P*; row *i* of the matrix was interchanged with row `ipiv(i)`. Corresponds to the single precision factorization (if `info`= 0 and `iter`≥ 0) or the double precision factorization (if `info`= 0 and `iter` < 0).

x

`DOUBLE PRECISION` for `dsgesv`

`DOUBLE COMPLEX` for `zcgesv`.

Array, size *ldx* by *nrhs*. If `info` = 0, contains the *n*-by-*nrhs* solution matrix *X*.

iter

`INTEGER`.

If `iter < 0`: iterative refinement has failed, double precision factorization has been performed

- If `iter = -1`: the routine fell back to full precision for implementation- or machine-specific reason
- If `iter = -2`: narrowing the precision induced an overflow, the routine fell back to full precision
- If `iter = -3`: failure of `sgetrf` for `dsgesv`, or `cgetrf` for `zcgesv`
- If `iter = -31`: stop the iterative refinement after the 30th iteration.

If `iter > 0`: iterative refinement has been successfully used. Returns the number of iterations.

info

`INTEGER`. If `info`=0, the execution is successful.

If `info = -i`, the *i*-th parameter had an illegal value.

If `info = i`, $U_{i,i}$ (computed in double precision for mixed precision subroutines) is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution could not be computed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `gesv` interface are as follows:

a

Holds the matrix *A* of size (`n`, `n`).

b

Holds the matrix *B* of size (`n`, `nrhs`).

ipiv

Holds the vector of length *n*.

NOTE
Fortran 95 Interface is so far not available for the mixed precision subroutines `dsgesv`/`zcgesv`.

rcond, ferr, berr, work, rwork, info )
```

```
call gesvx( a, b, x [,af] [,ipiv] [,fact] [,trans] [,equed] [,r] [,c] [,ferr] [,berr]
[,rcond] [,rpvgrw] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine uses the *LU* factorization to compute the solution to a real or complex system of linear equations $A*X = B$, where A is an n-by-n matrix, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?gesvx performs the following steps:

1. If $fact = 'E'$, real scaling factors r and c are computed to equilibrate the system:

   $trans = 'N'$: $diag(r)*A*diag(c)*\mathrm{inv}(diag(c))*X = diag(r)*B$

   $trans = 'T'$: $(diag(r)*A*diag(c))^{T}*\mathrm{inv}(diag(r))*X = diag(c)*B$

   $trans = 'C'$: $(diag(r)*A*diag(c))^{H}*\mathrm{inv}(diag(r))*X = diag(c)*B$

   Whether or not the system will be equilibrated depends on the scaling of the matrix A, but if equilibration is used, A is overwritten by $diag(r)*A*diag(c)$ and B by $diag(r)*B$ (if $trans='N'$) or $diag(c)*B$ (if $trans = 'T'$ or $'C'$).
2. If $fact = 'N'$ or $'E'$, the *LU* decomposition is used to factor the matrix A (after equilibration if $fact = 'E'$) as $A = P*L*U$, where P is a permutation matrix, L is a unit lower triangular matrix, and U is upper triangular.
3. If some $U_{i,i} = 0$, so that U is exactly singular, then the routine returns with $info = i$. Otherwise, the factored form of A is used to estimate the condition number of the matrix A. If the reciprocal of the condition number is less than machine precision, $info = n + 1$ is returned as a warning, but the routine still goes on to solve for X and compute error bounds as described below.
4. The system of equations is solved for X using the factored form of A.

5. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.
6. If equilibration was used, the matrix *X* is premultiplied by `diag(c)` (if `trans = 'N'`) or `diag(r)` (if `trans = 'T'` or `'C'`) so that it solves the original system before equilibration.

Input Parameters

fact

`CHARACTER*1`. Must be `'F'`, `'N'`, or `'E'`.

Specifies whether or not the factored form of the matrix *A* is supplied on entry, and if not, whether the matrix *A* should be equilibrated before it is factored.

If `fact = 'F'`: on entry, *af* and *ipiv* contain the factored form of *A*. If *equed* is not `'N'`, the matrix *A* has been equilibrated with scaling factors given by *r* and *c*.
a, *af*, and *ipiv* are not modified.

If `fact = 'N'`, the matrix *A* will be copied to *af* and factored.

If `fact = 'E'`, the matrix *A* will be equilibrated if necessary, then copied to *af* and factored.

trans

`CHARACTER*1`. Must be `'N'`, `'T'`, or `'C'`.

Specifies the form of the system of equations:

If `trans = 'N'`, the system has the form `A*X = B` (No transpose).

If `trans = 'T'`, the system has the form $A^T*X = B$ (Transpose).

If `trans = 'C'`, the system has the form $A^H*X = B$ (Transpose for real flavors, conjugate transpose for complex flavors).

n

`INTEGER`. The number of linear equations; the order of the matrix *A*; $n \geq 0$.

nrhs

`INTEGER`. The number of right hand sides; the number of columns of the matrices *B* and *X*; $nrhs \geq 0$.

a

`REAL` for `sgesvx`

`DOUBLE PRECISION` for `dgesvx`

`COMPLEX` for `cgesvx`

`DOUBLE COMPLEX` for `zgesvx`.

The array *a*(size *lda* by *) contains the matrix *A*. If `fact = 'F'` and *equed* is not `'N'`, then *A* must have been equilibrated by the scaling factors in *r* and/or *c*. The second dimension of *a* must be at least `max(1,n)`.

af

`REAL` for `sgesvx`

`DOUBLE PRECISION` for `dgesvx`

`COMPLEX` for `cgesvx`

`DOUBLE COMPLEX` for `zgesvx`.

The array *af* `af(size ldaf by *)` is an input argument if `fact = 'F'`. It contains the factored form of the matrix *A*, that is, the factors *L* and *U* from the factorization `A = P*L*U` as computed by `?getrf`. If *equed* is not `'N'`, then *af* is the factored form of the equilibrated matrix *A*. The second dimension of *af* must be at least `max(1,n)`.

b

`REAL` for `sgesvx`

`DOUBLE PRECISION` for `dgesvx`

`COMPLEX` for `cgesvx`

`DOUBLE COMPLEX` for `zgesvx`.

The array *b* `b(size ldb by *)` contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least `max(1, nrhs)`.

, *work*

`REAL` for `sgesvx`

`DOUBLE PRECISION` for `dgesvx`

`COMPLEX` for `cgesvx`

`DOUBLE COMPLEX` for `zgesvx`.

work(*) is a workspace array. The dimension of *work* must be at least `max(1,4*n)` for real flavors, and at least `max(1,2*n)` for complex flavors.

lda

`INTEGER`. The leading dimension of *a*; `lda` ≥ `max(1, n)`.

ldaf

`INTEGER`. The leading dimension of *af*; `ldaf` ≥ `max(1, n)`.

ldb

`INTEGER`. The leading dimension of *b*; `ldb` ≥ `max(1, n)`.

ipiv

`INTEGER`.

Array, size at least `max(1, n)`. The array *ipiv* is an input argument if `fact = 'F'`. It contains the pivot indices from the factorization `A = P*L*U` as computed by `?getrf`; row *i* of the matrix was interchanged with row `ipiv(i)`.

equed

`CHARACTER*1`. Must be `'N'`, `'R'`, `'C'`, or `'B'`.

equed is an input argument if `fact = 'F'`. It specifies the form of equilibration that was done:

If `equed = 'N'`, no equilibration was done (always true if `fact = 'N'`).

If `equed = 'R'`, row equilibration was done, that is, *A* has been premultiplied by *diag*(*r*).

If `equed = 'C'`, column equilibration was done, that is, *A* has been postmultiplied by *diag*(*c*).

If `equed = 'B'`, both row and column equilibration was done, that is, *A* has been replaced by `diag(r)*A*diag(c)`.

r, *c*

`REAL` for single precision flavors

`DOUBLE PRECISION` for double precision flavors.

Arrays: *r* (size *n*), *c* (size *n*). The array *r* contains the row scale factors for *A*, and the array *c* contains the column scale factors for *A*. These arrays are input arguments if *fact* = 'F' only; otherwise they are output arguments.

If *equed* = 'R' or 'B', *A* is multiplied on the left by *diag*(*r*); if *equed* = 'N' or 'C', *r* is not accessed.

If *fact* = 'F' and *equed* = 'R' or 'B', each element of *r* must be positive.

If *equed* = 'C' or 'B', *A* is multiplied on the right by *diag*(*c*); if *equed* = 'N' or 'R', *c* is not accessed.

If *fact* = 'F' and *equed* = 'C' or 'B', each element of *c* must be positive.

ldx — INTEGER. The leading dimension of the output array *x*; *ldx* ≥ max(1, *n*).

iwork — INTEGER. Workspace array, size at least max(1, *n*); used in real flavors only.

rwork — REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Workspace array, size at least max(1, 2*n); used in complex flavors only.

Output Parameters

x — REAL for sgesvx

DOUBLE PRECISION for dgesvx

COMPLEX for cgesvx

DOUBLE COMPLEX for zgesvx.

Array, size *ldx* by *.

If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X* to the *original* system of equations. Note that *A* and *B* are modified on exit if *equed* ≠ 'N', and the solution to the *equilibrated* system is:

$diag(C)^{-1}*X$, if *trans* = 'N' and *equed* = 'C' or 'B';
$diag(R)^{-1}*X$, if *trans* = 'T' or 'C' and *equed* = 'R' or 'B'. The second dimension of *x* must be at least max(1,*nrhs*).

a — Array *a* is not modified on exit if *fact* = 'F' or 'N', or if *fact* = 'E' and *equed* = 'N'. If *equed* ≠ 'N', *A* is scaled on exit as follows:

equed = 'R': *A* = *diag*(*R*)*A*

equed = 'C': *A* = *A***diag*(*c*)

equed = 'B': *A* = *diag*(*R*)**A***diag*(*c*).

af

If *fact* = 'N' or 'E', then *af* is an output argument and on exit returns the factors *L* and *U* from the factorization *A* = *PLU* of the original matrix *A* (if *fact* = 'N') or of the equilibrated matrix *A* (if *fact* = 'E'). See the description of *a* for the form of the equilibrated matrix.

b

Overwritten by *diag(r)*B* if *trans* = 'N' and *equed* = 'R'or 'B';

overwritten by *diag(c)*B* if *trans* = 'T' or 'C' and *equed* = 'C' or 'B';

not changed if *equed* = 'N'.

r, *c*

These arrays are output arguments if *fact*≠'F'. See the description of *r*, *c* in *Input Arguments* section.

rcond

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

An estimate of the reciprocal condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision, in particular, if *rcond* = 0, the matrix is singular to working precision. This condition is indicated by a return code of *info* > 0.

ferr

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size at least max(1, *nrhs*). Contains the estimated forward error bound for each solution vector *x(j)* (the *j*-th column of the solution matrix *X*). If *xtrue* is the true solution corresponding to *x(j)*, *ferr(j)* is an estimated upper bound for the magnitude of the largest element in *(x(j) - xtrue)* divided by the magnitude of the largest element in *x(j)*. The estimate is as reliable as the estimate for *rcond*, and is almost always a slight overestimate of the true error.

berr

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size at least max(1, *nrhs*). Contains the component-wise relative backward error for each solution vector *x(j)*, that is, the smallest relative change in any element of *A* or *B* that makes *x(j)* an exact solution.

ipiv

If *fact* = 'N'or 'E', then *ipiv* is an output argument and on exit contains the pivot indices from the factorization *A* = *P*L*U* of the original matrix *A* (if *fact* = 'N') or of the equilibrated matrix *A* (if *fact* = 'E').

equed

If *fact*≠'F', then *equed* is an output argument. It specifies the form of equilibration that was done (see the description of *equed* in *Input Arguments* section).

work, *rwork*

On exit, *work(1)* for real flavors, or *rwork(1)* for complex flavors (the Fortran interface) contains the reciprocal pivot growth factor norm(*A*)/norm(*U*). The "max absolute element" norm is used. If

	work(1) for real flavors, or *rwork*(1) for complex flavors is much less than 1, then the stability of the *LU* factorization of the (equilibrated) matrix *A* could be poor. This also means that the solution *x*, condition estimator *rcond*, and forward error bound *ferr* could be unreliable. If factorization fails with $0 < info \le n$, then *work*(1) for real flavors, or *rwork*(1) for complex flavors contains the reciprocal pivot growth factor for the leading *info* columns of *A*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, and $i \le n$, then *U*(*i*, *i*) is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned. If *info* = *n* + 1, then *U* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine gesvx interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *nrhs*).
x	Holds the matrix *X* of size (*n*, *nrhs*).
af	Holds the matrix *AF* of size (*n*, *n*).
ipiv	Holds the vector of length *n*.
r	Holds the vector of length *n*. Default value for each element is *r*(*i*) = 1.0_WP.
c	Holds the vector of length *n*. Default value for each element is *c*(*i*) = 1.0_WP.
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
fact	Must be 'N', 'E', or 'F'. The default value is 'N'. If *fact* = 'F', then both arguments *af* and *ipiv* must be present; otherwise, an error is returned.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
equed	Must be 'N', 'B', 'C', or 'R'. The default value is 'N'.

rpvgrw	Real value that contains the reciprocal pivot growth factor norm(*A*)/ norm(*U*).

Description

The routine uses the *LU* factorization to compute the solution to a real or complex system of linear equations *A*X = B*, where *A* is an *n*-by-*n* matrix, the columns of the matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

Both normwise and maximum componentwise error bounds are also provided on request. The routine returns a solution with a small guaranteed error (`O(eps)`, where `eps` is the working machine precision) unless the matrix is very ill-conditioned, in which case a warning is returned. Relevant condition numbers are also calculated and returned.

The routine accepts user-provided factorizations and equilibration factors; see definitions of the *fact* and *equed* options. Solving with refinement and using a factorization from a previous call of the routine also produces a solution with `O(eps)` errors or warnings but that may not be true for general user-provided factorizations and equilibration factors if they differ from what the routine would itself produce.

The routine `?gesvxx` performs the following steps:

1. If *fact* = 'E', scaling factors *r* and *c* are computed to equilibrate the system:

trans = 'N': *diag*(*r*)**A***diag*(*c*)*inv(*diag*(*c*))**X* = *diag*(*r*)**B*

trans = 'T': $(diag(r)*A*diag(c))^{T}$*inv(*diag*(*r*))**X* = *diag*(*c*)**B*

trans = 'C': $(diag(r)*A*diag(c))^{H}$*inv(*diag*(*r*))**X* = *diag*(*c*)**B*

Whether or not the system will be equilibrated depends on the scaling of the matrix *A*, but if equilibration is used, *A* is overwritten by *diag(r)*A*diag(c)* and *B* by *diag(r)*B* (if *trans*='N') or *diag(c)*B* (if *trans* = 'T' or 'C').

2. If *fact* = 'N' or 'E', the *LU* decomposition is used to factor the matrix *A* (after equilibration if *fact* = 'E') as *A* = *P*L*U*, where *P* is a permutation matrix, *L* is a unit lower triangular matrix, and *U* is upper triangular.
3. If some $U_{i,i}$= 0, so that *U* is exactly singular, then the routine returns with *info* = *i*. Otherwise, the factored form of *A* is used to estimate the condition number of the matrix *A* (see the *rcond* parameter). If the reciprocal of the condition number is less than machine precision, the routine still goes on to solve for *X* and compute error bounds.
4. The system of equations is solved for *X* using the factored form of *A*.
5. By default, unless params(la_linrx_itref_i) is set to zero, the routine applies iterative refinement to improve the computed solution matrix and calculate error bounds. Refinement calculates the residual to at least twice the working precision.
6. If equilibration was used, the matrix *X* is premultiplied by *diag(c)* (if *trans* = 'N') or *diag(r)* (if *trans* = 'T' or 'C') so that it solves the original system before equilibration.

Input Parameters

fact

CHARACTER*1. Must be 'F', 'N', or 'E'.

Specifies whether or not the factored form of the matrix *A* is supplied on entry, and if not, whether the matrix *A* should be equilibrated before it is factored.

If *fact* = 'F', on entry, *af* and *ipiv* contain the factored form of *A*. If *equed* is not 'N', the matrix *A* has been equilibrated with scaling factors given by *r* and *c*. Parameters *a*, *af*, and *ipiv* are not modified.

If *fact* = 'N', the matrix *A* will be copied to *af* and factored.

If *fact* = 'E', the matrix *A* will be equilibrated, if necessary, copied to *af* and factored.

trans

CHARACTER*1. Must be 'N', 'T', or 'C'.

Specifies the form of the system of equations:

If *trans* = 'N', the system has the form *A*X* = *B* (No transpose).

If *trans* = 'T', the system has the form $A^T*X = B$ (Transpose).

If *trans* = 'C', the system has the form $A^H*X = B$ (Conjugate Transpose = Transpose for real flavors, Conjugate Transpose for complex flavors).

n

INTEGER. The number of linear equations; the order of the matrix *A*; *n*≥ 0.

nrhs

INTEGER. The number of right hand sides; the number of columns of the matrices *B* and *X*; *nrhs*≥ 0.

a, *af*, *b*, *work*

REAL for sgesvxx

DOUBLE PRECISION for dgesvxx

COMPLEX for cgesvxx

DOUBLE COMPLEX for zgesvxx.

Arrays: *a*(size *lda* by *), *af*(size *ldaf*by *), *b*(size *ldb* by *), *work*(*).

The array *a* contains the matrix *A*. If *fact* = 'F' and *equed* is not 'N', then *A* must have been equilibrated by the scaling factors in *r* and/or *c*. The second dimension of *a* must be at least max(1,*n*).

The array *af* is an input argument if *fact* = 'F'. It contains the factored form of the matrix *A*, that is, the factors *L* and *U* from the factorization *A* = *P*L*U* as computed by ?getrf. If *equed* is not 'N', then *af* is the factored form of the equilibrated matrix *A*. The second dimension of *af* must be at least max(1,*n*).

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).

work(*) is a workspace array. The dimension of *work* must be at least max(1,4**n*) for real flavors, and at least max(1,2**n*) for complex flavors.

lda — INTEGER. The leading dimension of *a*; *lda* ≥ max(1, *n*).

ldaf — INTEGER. The leading dimension of *af*; *ldaf* ≥ max(1, *n*).

ipiv — INTEGER.

Array, size at least max(1, *n*). The array *ipiv* is an input argument if *fact* = 'F'. It contains the pivot indices from the factorization *A* = *P*L*U* as computed by ?getrf; row *i* of the matrix was interchanged with row *ipiv*(*i*).

equed — CHARACTER*1. Must be 'N', 'R', 'C', or 'B'.

equed is an input argument if *fact* = 'F'. It specifies the form of equilibration that was done:

If *equed* = 'N', no equilibration was done (always true if *fact* = 'N').

If *equed* = 'R', row equilibration was done, that is, *A* has been premultiplied by *diag*(*r*).

If *equed* = 'C', column equilibration was done, that is, *A* has been postmultiplied by *diag*(*c*).

If *equed* = 'B', both row and column equilibration was done, that is, *A* has been replaced by *diag*(*r*)**A**diag*(*c*).

r, *c* — REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Arrays: *r* (size *n*), *c* (size *n*). The array *r* contains the row scale factors for *A*, and the array *c* contains the column scale factors for *A*. These arrays are input arguments if *fact* = 'F' only; otherwise they are output arguments.

If *equed* = 'R' or 'B', *A* is multiplied on the left by *diag*(*r*); if *equed* = 'N' or 'C', *r* is not accessed.

If *fact* = 'F' and *equed* = 'R'or 'B', each element of *r* must be positive.

If *equed* = 'C' or 'B', *A* is multiplied on the right by *diag*(*c*); if *equed* = 'N' or 'R', *c* is not accessed.

If *fact* = 'F' and *equed* = 'C' or 'B', each element of *c* must be positive.

Each element of *r* or *c* should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

ldb — INTEGER. The leading dimension of the array *b*; *ldb*≥ max(1, *n*).

ldx — INTEGER. The leading dimension of the output array *x*; *ldx*≥ max(1, *n*).

n_err_bnds — INTEGER. Number of error bounds to return for each right hand side and each type (normwise or componentwise). See *err_bnds_norm* and *err_bnds_comp* descriptions in *Output Arguments* section below.

nparams — INTEGER. Specifies the number of parameters set in *params*. If ≤ 0, the *params* array is never referenced and default values are used.

params — REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size max(1, *nparams*). Specifies algorithm parameters. If an entry is less than 0.0, that entry is filled with the default value used for that parameter. Only positions up to *nparams* are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass *nparams* = 0, which prevents the source code from accessing the *params* argument.

params(1) : Whether to perform iterative refinement or not. Default: 1.0

=0.0	No refinement is performed and no error bounds are computed.
=1.0	Use the double-precision refinement algorithm, possibly with doubled-single computations if the compilation environment does not support double precision.

(Other values are reserved for future use.)

params(2) : Maximum number of residual computations allowed for refinement.

Default	10.0

	Aggressive	Set to 100.0 to permit convergence using approximate factorizations or factorizations other than *LU*. If the factorization uses a technique other than Gaussian elimination, the guarantees in *err_bnds_norm* and *err_bnds_comp* may no longer be trustworthy.

params(3) : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

iwork INTEGER. Workspace array, size at least max(1, *n*); used in real flavors only.

rwork REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Workspace array, size at least max(1, 3*n); used in complex flavors only.

Output Parameters

x REAL for sgesvxx

DOUBLE PRECISION for dgesvxx

COMPLEX for cgesvxx

DOUBLE COMPLEX for zgesvxx.

Array, size (*ldx*,*).

If *info* = 0, the array *x* contains the solution *n*-by-*nrhs* matrix *X* to the *original* system of equations. Note that *A* and *B* are modified on exit if *equed*≠'N', and the solution to the *equilibrated* system is:

inv(*diag*(*c*))*X, if *trans* = 'N' and *equed* = 'C' or 'B'; or inv(*diag*(*r*))*X, if *trans* = 'T' or 'C' and *equed* = 'R' or 'B'. The second dimension of *x* must be at least max(1,*nrhs*).

a Array *a* is not modified on exit if *fact* = 'F' or 'N', or if *fact* = 'E' and *equed* = 'N'.

If *equed*≠'N', *A* is scaled on exit as follows:

equed = 'R': *A* = *diag*(*r*)*A*

equed = 'C': *A* = *A***diag*(*c*)

equed = 'B': *A* = *diag*(*r*)**A***diag*(*c*).

af If *fact* = 'N' or 'E', then *af* is an output argument and on exit returns the factors *L* and *U* from the factorization *A* = *PLU* of the original matrix *A* (if *fact* = 'N') or of the equilibrated matrix *A* (if *fact* = 'E'). See the description of *a* for the form of the equilibrated matrix.

b Overwritten by *diag*(*r*)**B* if *trans* = 'N' and *equed* = 'R' or 'B';

overwritten by *trans* = 'T' or 'C' and *equed* = 'C' or 'B';

not changed if *equed* = 'N'.

r, *c*

These arrays are output arguments if *fact*≠'F'. Each element of these arrays is a power of the radix. See the description of *r*, *c* in *Input Arguments* section.

rcond

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision, in particular, if *rcond* = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.

rpvgrw

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Contains the reciprocal pivot growth factor:

$$\|A\|/\|U\|$$

If this is much less than 1, the stability of the *LU* factorization of the (equlibrated) matrix *A* could be poor. This also means that the solution *X*, estimated condition numbers, and error bounds could be unreliable. If factorization fails with 0 < *info*≤*n*, this parameter contains the reciprocal pivot growth factor for the leading *info* columns of *A*. In ?gesvx, this quantity is returned in *work(1)*.

berr

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size at least max(1, *nrhs*). Contains the componentwise relative backward error for each solution vector *x*(*j*), that is, the smallest relative change in any element of *A* or *B* that makes *x*(*j*) an exact solution.

err_bnds_norm

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array of size *nrhs* by *n_err_bnds*. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:

Normwise relative error in the *i*-th solution vector

$$\frac{\max_j \left| Xtrue_{ji} - X_{ji} \right|}{\max_j \left| X_{ji} \right|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.

The first index in *err_bnds_norm(i,:)* corresponds to the *i*-th right-hand side.

The second index in *err_bnds_norm(:,err)* contains the following three fields:

err=1	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt(n)*slamch(ε)* for single precision flavors and *sqrt(n)*dlamch(ε)* for double precision flavors.
err=2	"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt(n)*slamch(ε)* for single precision flavors and *sqrt(n)*dlamch(ε)* for double precision flavors. This error bound should only be trusted if the previous boolean is true.
err=3	Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold *sqrt(n)*slamch(ε)* for single precision flavors and *sqrt(n)*dlamch(ε)* for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix *Z* are: $\|Z\|_\infty \cdot \|Z^{-1}\|_\infty$ Let *z=s*a*, where *s* scales each row by a power of the radix so all absolute row sums of *z* are approximately 1.

err_bnds_comp

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array of size *nrhs* by *n_err_bnds*. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:

Componentwise relative error in the *i*-th solution vector:

$$\max_j \frac{|Xtrue_{ji} - X_{ji}|}{|X_{ji}|}$$

The array is indexed by the right-hand side *i*, on which the componentwise relative error depends, and by the type of error information as described below. There are currently up to three pieces of information returned for

each right-hand side. If componentwise accuracy is not requested (*params(3)* = 0.0), then *err_bnds_comp* is not accessed. If *n_err_bnds* < 3, then at most the first *(:,n_err_bnds)* entries are returned.

The first index in *err_bnds_comp(i,:)* corresponds to the *i*-th right-hand side.

The second index in *err_bnds_comp(:,err)* contains the following three fields:

err=1	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors.
err=2	"Guaranteed" error bpound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors. This error bound should only be trusted if the previous boolean is true.
err=3	Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix *Z* are: $\|Z\|_\infty \cdot \|Z^{-1}\|_\infty$ Let *z*=*s**(*a**diag(*x*)), where *x* is the solution for the current right-hand side and *s* scales each row of *a**diag(*x*) by a power of the radix so all absolute row sums of *z* are approximately 1.

ipiv If *fact* = 'N' or 'E', then *ipiv* is an output argument and on exit contains the pivot indices from the factorization *A* = *P*L*U* of the original matrix *A* (if *fact* = 'N') or of the equilibrated matrix *A* (if *fact* = 'E').

equed If *fact*≠'F', then *equed* is an output argument. It specifies the form of equilibration that was done (see the description of *equed* in *Input Arguments* section).

params If an entry is less than 0.0, that entry is filled with the default value used for that parameter, otherwise the entry is not modified

info INTEGER. If *info* = 0, the execution is successful. The solution to every right-hand side is guaranteed.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If 0 < *info*≤*n*: *U*(*info*,*info*) is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned.

If *info* = *n*+*j*: The solution corresponding to the *j*-th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides *k* with *k* > *j* may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested *params(3)* = 0.0, then the *j*-th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest *j* such that *err_bnds_norm*(*j*,1) = 0.0 or *err_bnds_comp*(*j*,1) = 0.0. See the definition of *err_bnds_norm* and *err_bnds_comp* for *err* = 1. To get information about all of the right-hand sides, check *err_bnds_norm* or *err_bnds_comp*.

Matrix Storage Schemes

?gbsv

Computes the solution to the system of linear equations with a band coefficient matrix A and multiple right-hand sides.

Syntax

```
call sgbsv( n, kl, ku, nrhs, ab, ldab, ipiv, b, ldb, info )
call dgbsv( n, kl, ku, nrhs, ab, ldab, ipiv, b, ldb, info )
call cgbsv( n, kl, ku, nrhs, ab, ldab, ipiv, b, ldb, info )
call zgbsv( n, kl, ku, nrhs, ab, ldab, ipiv, b, ldb, info )
call gbsv( ab, b [,kl] [,ipiv] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine solves for *X* the real or complex system of linear equations *A***X* = *B*, where *A* is an *n*-by-*n* band matrix with *kl* subdiagonals and *ku* superdiagonals, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

The *LU* decomposition with partial pivoting and row interchanges is used to factor *A* as *A* = *L***U*, where *L* is a product of permutation and unit lower triangular matrices with *kl* subdiagonals, and *U* is upper triangular with *kl*+*ku* superdiagonals. The factored form of *A* is then used to solve the system of equations *A***X* = *B*.

Input Parameters

n	INTEGER. The order of *A*. The number of rows in *B*; *n*≥ 0.
kl	INTEGER. The number of subdiagonals within the band of *A*; *kl*≥ 0.
ku	INTEGER. The number of superdiagonals within the band of *A*; *ku*≥ 0.

nrhs — INTEGER. The number of right-hand sides. The number of columns in *B*; *nrhs*≥ 0.

ab, *b* — REAL for sgbsv

DOUBLE PRECISION for dgbsv

COMPLEX for cgbsv

DOUBLE COMPLEX for zgbsv.

Arrays: *ab*(size *ldab* by *), *b*(size *ldb* by *).

The array *ab* contains the matrix *A* in band storage (see Matrix Storage Schemes). The second dimension of *ab* must be at least max(1, *n*).

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).

ldab — INTEGER. The leading dimension of the array *ab*. (*ldab*≥ 2*kl* + *ku* +1)

ldb — INTEGER. The leading dimension of *b*; *ldb*≥ max(1, *n*).

Output Parameters

ab — Overwritten by *L* and *U*. The diagonal and *kl* + *ku* superdiagonals of *U* are stored in the first 1 + *kl* + *ku* rows of *ab*. The multipliers used to form *L* are stored in the next *kl* rows.

b — Overwritten by the solution matrix *X*.

ipiv — INTEGER.

Array, size at least max(1, *n*). The pivot indices: row *i* was interchanged with row *ipiv*(*i*).

info — INTEGER. If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, *U*(*i*, *i*) is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution could not be computed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine gbsv interface are as follows:

ab — Holds the array *A* of size (2*kl*+*ku*+1,*n*).

b — Holds the matrix *B* of size (*n*,*nrhs*).

ipiv — Holds the vector of length *n*.

kl — If omitted, assumed *kl* = *ku*.

ku	Restored as *ku* = *lda*-2**kl*-1.

ldb, x, ldx, rcond, ferr, berr, work, rwork, info )

call gbsvx( ab, b, x [,kl] [,afb] [,ipiv] [,fact] [,trans] [,equed] [,r] [,c] [,ferr]
[,berr] [,rcond] [,rpvgrw] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine uses the *LU* factorization to compute the solution to a real or complex system of linear equations *A*X = B*, $A^T*X = B$, or $A^H*X = B$, where *A* is a band matrix of order *n* with *kl* subdiagonals and *ku* superdiagonals, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?gbsvx performs the following steps:

1. If *fact* = 'E', real scaling factors *r* and *c* are computed to equilibrate the system:

   trans = 'N': *diag(r)*A*diag(c) *inv(diag(c))*X = diag(r)*B*

   trans = 'T': $(diag(r)*A*diag(c))^T$ *inv(diag(r))*X = diag(c)*B*

   trans = 'C': $(diag(r)*A*diag(c))^H$ *inv(diag(r))*X = diag(c)*B*

   Whether the system will be equilibrated depends on the scaling of the matrix *A*, but if equilibration is used, *A* is overwritten by *diag(r)*A*diag(c)* and *B* by *diag(r)*B* (if *trans*='N') or *diag(c)*B* (if *trans* = 'T'or 'C').
2. If *fact* = 'N'or 'E', the *LU* decomposition is used to factor the matrix *A* (after equilibration if *fact* = 'E') as *A* = *L*U*, where *L* is a product of permutation and unit lower triangular matrices with *kl* subdiagonals, and *U* is upper triangular with *kl*+*ku* superdiagonals.
3. If some $U_{i,i}$ = 0, so that *U* is exactly singular, then the routine returns with *info* = *i*. Otherwise, the factored form of *A* is used to estimate the condition number of the matrix *A*. If the reciprocal of the condition number is less than machine precision, *info* = *n* + 1 is returned as a warning, but the routine still goes on to solve for *X* and compute error bounds as described below.

4. The system of equations is solved for *X* using the factored form of *A*.
5. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.
6. If equilibration was used, the matrix *X* is premultiplied by `diag(c)` (if `trans = 'N'`) or `diag(r)` (if `trans = 'T'` or `'C'`) so that it solves the original system before equilibration.

Input Parameters

fact

`CHARACTER*1`. Must be `'F'`, `'N'`, or `'E'`.

Specifies whether the factored form of the matrix *A* is supplied on entry, and if not, whether the matrix *A* should be equilibrated before it is factored.

If `fact = 'F'`: on entry, *afb* and *ipiv* contain the factored form of *A*. If *equed* is not `'N'`, the matrix *A* is equilibrated with scaling factors given by *r* and *c*.
ab, *afb*, and *ipiv* are not modified.

If `fact = 'N'`, the matrix *A* will be copied to *afb* and factored.

If `fact = 'E'`, the matrix *A* will be equilibrated if necessary, then copied to *afb* and factored.

trans

`CHARACTER*1`. Must be `'N'`, `'T'`, or `'C'`.

Specifies the form of the system of equations:

If `trans = 'N'`, the system has the form `A*X = B` (No transpose).

If `trans = 'T'`, the system has the form $A^T*X = B$ (Transpose).

If `trans = 'C'`, the system has the form $A^H*X = B$ (Transpose for real flavors, conjugate transpose for complex flavors).

n

`INTEGER`. The number of linear equations, the order of the matrix *A*; $n \geq 0$.

kl

`INTEGER`. The number of subdiagonals within the band of *A*; $kl \geq 0$.

ku

`INTEGER`. The number of superdiagonals within the band of *A*; $ku \geq 0$.

nrhs

`INTEGER`. The number of right hand sides, the number of columns of the matrices *B* and *X*; $nrhs \geq 0$.

ab, *afb*, *b*, *work*

`REAL` for `sgbsvx`

`DOUBLE PRECISION` for `dgbsvx`

`COMPLEX` for `cgbsvx`

`DOUBLE COMPLEX` for `zgbsvx`.

Arrays: `ab(ldab,*)`, `afb(ldafb,*)`, `b(size ldb by *)`, `work(*)`.

The array *ab* contains the matrix *A* in band storage (see Matrix Storage Schemes). The second dimension of *ab* must be at least `max(1, n)`. If `fact = 'F'` and *equed* is not `'N'`, then *A* must have been equilibrated by the scaling factors in *r* and/or *c*.

The array *afb* is an input argument if `fact = 'F'`. The second dimension of *afb* must be at least `max(1,n)`. It contains the factored form of the matrix *A*, that is, the factors *L* and *U* from the factorization

*A = P*L*U* as computed by ?gbtrf. *U* is stored as an upper triangular band matrix with *kl* + *ku* superdiagonals in the first 1 + *kl* + *ku* rows of *afb*. The multipliers used during the factorization are stored in the next *kl* rows. If *equed* is not 'N', then *afb* is the factored form of the equilibrated matrix *A*.

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1, *nrhs*).

work(*) is a workspace array. The dimension of *work* must be at least max(1,3**n*) for real flavors, and at least max(1,2**n*) for complex flavors.

ldab — INTEGER. The leading dimension of *ab*; *ldab*≥*kl*+*ku*+1.

ldafb — INTEGER. The leading dimension of *afb*; *ldafb*≥ 2**kl*+*ku*+1.

ldb — INTEGER. The leading dimension of *b*; *ldb*≥ max(1, *n*).

ipiv — INTEGER.

Array, size at least max(1, *n*). The array *ipiv* is an input argument if *fact* = 'F'. It contains the pivot indices from the factorization *A* = *P*L*U* as computed by ?gbtrf; row *i* of the matrix was interchanged with row *ipiv*(*i*).

equed — CHARACTER*1. Must be 'N', 'R', 'C', or 'B'.

equed is an input argument if *fact* = 'F'. It specifies the form of equilibration that was done:

If *equed* = 'N', no equilibration was done (always true if *fact* = 'N').

If *equed* = 'R', row equilibration was done, that is, *A* has been premultiplied by *diag*(*r*).

If *equed* = 'C', column equilibration was done, that is, *A* has been postmultiplied by *diag*(*c*).

if *equed* = 'B', both row and column equilibration was done, that is, *A* has been replaced by *diag*(*r*)**A***diag*(*c*).

r, *c* — REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Arrays: *r* (size *n*), *c* (size *n*).

The array *r* contains the row scale factors for *A*, and the array *c* contains the column scale factors for *A*. These arrays are input arguments if *fact* = 'F' only; otherwise they are output arguments.

If *equed* = 'R'or 'B', *A* is multiplied on the left by *diag*(*r*); if *equed* = 'N' or 'C', *r* is not accessed.

If *fact* = 'F' and *equed* = 'R' or 'B', each element of *r* must be positive.

If *equed* = 'C'or 'B', *A* is multiplied on the right by *diag*(*c*); if *equed* = 'N'or 'R', *c* is not accessed.

If *fact* = 'F' and *equed* = 'C'or 'B', each element of *c* must be positive.

ldx — INTEGER. The leading dimension of the output array *x*; *ldx*≥ max(1, *n*).

iwork — INTEGER. Workspace array, size at least max(1, *n*); used in real flavors only.

rwork — REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Workspace array, size at least max(1, *n*); used in complex flavors only.

Output Parameters

x — REAL for sgbsvx

DOUBLE PRECISION for dgbsvx

COMPLEX for cgbsvx

DOUBLE COMPLEX for zgbsvx.

Array, size *ldx* by *.

If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X* to the *original* system of equations. Note that *A* and *B* are modified on exit if *equed*≠'N', and the solution to the *equilibrated* system is: inv(*diag*(*c*))***X*, if *trans* = 'N' and *equed* = 'C'or 'B'; inv(*diag*(*r*))***X*, if *trans* = 'T' or 'C' and *equed* = 'R' or 'B'.

The second dimension of *x* must be at least max(1,*nrhs*).

ab — Array *ab* is not modified on exit if *fact* = 'F' or 'N', or if *fact* = 'E' and *equed* = 'N'.

If *equed*≠'N', *A* is scaled on exit as follows:

equed = 'R': *A* = *diag*(*r*)***A*

equed = 'C': *A* = *A***diag*(*c*)

equed = 'B': *A* = *diag*(*r*)***A***diag*(*c*).

afb — If *fact* = 'N' or 'E', then *afb* is an output argument and on exit returns details of the *LU* factorization of the original matrix *A* (if *fact* = 'N') or of the equilibrated matrix *A* (if *fact* = 'E'). See the description of *ab* for the form of the equilibrated matrix.

b — Overwritten by *diag*(*r*)***b* if *trans* = 'N' and *equed* = 'R' or 'B';

overwritten by *diag*(*c*)***b* if *trans* = 'T' or 'C' and *equed* = 'C' or 'B';

not changed if *equed* = 'N'.

r, *c* — These arrays are output arguments if *fact*≠'F'. See the description of *r*, *c* in *Input Arguments* section.

rcond

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

An estimate of the reciprocal condition number of the matrix *A* after equilibration (if done).

If *rcond* is less than the machine precision (in particular, if *rcond* =0), the matrix is singular to working precision. This condition is indicated by a return code of *info*>0.

ferr

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size at least max(1, *nrhs*). Contains the estimated forward error bound for each solution vector *x*(*j*) (the *j*-th column of the solution matrix *X*). If *xtrue* is the true solution corresponding to *x*(*j*), *ferr*(*j*) is an estimated upper bound for the magnitude of the largest element in (*x*(*j*) - *xtrue*) divided by the magnitude of the largest element in *x*(*j*). The estimate is as reliable as the estimate for *rcond*, and is almost always a slight overestimate of the true error.

berr

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size at least max(1, *nrhs*). Contains the component-wise relative backward error for each solution vector *x*(*j*), that is, the smallest relative change in any element of *A* or *B* that makes *x*(*j*) an exact solution.

ipiv

If *fact* = 'N' or 'E', then *ipiv* is an output argument and on exit contains the pivot indices from the factorization *A* = *L***U* of the original matrix *A* (if *fact* = 'N') or of the equilibrated matrix *A* (if *fact* = 'E').

info

INTEGER. If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, and *i*≤*n*, then *U*(*i*, *i*) is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned. If *info* = *i*, and *i* = *n*+1, then *U* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

equed

If *fact*≠'F', then *equed* is an output argument. It specifies the form of equilibration that was done (see the description of *equed* in *Input Arguments* section).

work, *rwork*

On exit, *work*(1) for real flavors, or *rwork*(1) for complex flavors, contains the reciprocal pivot growth factor norm(*A*)/norm(*U*). The "max absolute element" norm is used. If *work*(1) for real flavors, or *rwork*(1) for complex flavors is much less than 1, then the stability of

the *LU* factorization of the (equilibrated) matrix *A* could be poor. This also means that the solution *x*, condition estimator *rcond*, and forward error bound *ferr* could be unreliable. If factorization fails with `0 < info≤n`, then `work(1)` for real flavors, or `rwork(1)` for complex flavors contains the reciprocal pivot growth factor for the leading *info* columns of *A*.

info — `INTEGER`. If `info = 0`, the execution is successful.

If `info = -i`, the *i*-th parameter had an illegal value.

If `info = i`, and `i≤n`, then *U*(*i*, *i*) is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned. If `info = i`, and `i = n+1`, then *U* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `gbsvx` interface are as follows:

ab — Holds the array *A* of size (`kl+ku+1`, `n`).

b — Holds the matrix *B* of size (`n`, `nrhs`).

x — Holds the matrix *X* of size (`n`, `nrhs`).

afb — Holds the array *AF* of size (`2*kl+ku+1`, `n`).

ipiv — Holds the vector of length *n*.

r — Holds the vector of length *n*. Default value for each element is `r(i) = 1.0_WP`.

c — Holds the vector of length *n*. Default value for each element is `c(i) = 1.0_WP`.

ferr — Holds the vector of length (*nrhs*).

berr — Holds the vector of length (*nrhs*).

trans — Must be `'N'`, `'C'`, or `'T'`. The default value is `'N'`.

equed — Must be `'N'`, `'B'`, `'C'`, or `'R'`. The default value is `'N'`.

fact — Must be `'N'`, `'E'`, or `'F'`. The default value is `'N'`. If `fact = 'F'`, then both arguments *af* and *ipiv* must be present; otherwise, an error is returned.

rpvgrw — Real value that contains the reciprocal pivot growth factor norm(*A*)/ norm(*U*).

kl	If omitted, assumed *kl = ku*.
ku	Restored as *ku = lda-kl-1*.

Description

The routine uses the *LU* factorization to compute the solution to a real or complex system of linear equations $A*X = B$, $A^T*X = B$, or $A^H*X = B$, where *A* is an *n*-by-*n* banded matrix, the columns of the matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

Both normwise and maximum componentwise error bounds are also provided on request. The routine returns a solution with a small guaranteed error (O(eps), where eps is the working machine precision) unless the matrix is very ill-conditioned, in which case a warning is returned. Relevant condition numbers are also calculated and returned.

The routine accepts user-provided factorizations and equilibration factors; see definitions of the *fact* and *equed* options. Solving with refinement and using a factorization from a previous call of the routine also produces a solution with O(eps) errors or warnings but that may not be true for general user-provided factorizations and equilibration factors if they differ from what the routine would itself produce.

The routine ?gbsvxx performs the following steps:

1. If *fact* = 'E', scaling factors *r* and *c* are computed to equilibrate the system:

trans = 'N': *diag(r)*A*diag(c)*inv(diag(c))*X = diag(r)*B*

trans = 'T': $(diag(r)*A*diag(c))^T*inv(diag(r))*X = diag(c)*B$

trans = 'C': $(diag(r)*A*diag(c))^H*inv(diag(r))*X = diag(c)*B$

Whether or not the system will be equilibrated depends on the scaling of the matrix *A*, but if equilibration is used, *A* is overwritten by *diag(r)*A*diag(c)* and *B* by *diag(r)*B* (if *trans*='N') or *diag(c)*B* (if *trans* = 'T' or 'C').

2. If *fact* = 'N' or 'E', the *LU* decomposition is used to factor the matrix *A* (after equilibration if *fact* = 'E') as *A* = *P*L*U*, where *P* is a permutation matrix, *L* is a unit lower triangular matrix, and *U* is upper triangular.
3. If some $U_{i,i}$= 0, so that *U* is exactly singular, then the routine returns with *info* = *i*. Otherwise, the factored form of *A* is used to estimate the condition number of the matrix *A* (see the *rcond* parameter). If the reciprocal of the condition number is less than machine precision, the routine still goes on to solve for *X* and compute error bounds.
4. The system of equations is solved for *X* using the factored form of *A*.
5. By default, unless params(1) is set to zero, the routine applies iterative refinement to improve the computed solution matrix and calculate error bounds. Refinement calculates the residual to at least twice the working precision.
6. If equilibration was used, the matrix *X* is premultiplied by *diag(c)* (if *trans* = 'N') or *diag(r)* (if *trans* = 'T' or 'C') so that it solves the original system before equilibration.

Input Parameters

fact

CHARACTER*1. Must be 'F', 'N', or 'E'.

Specifies whether or not the factored form of the matrix *A* is supplied on entry, and if not, whether the matrix *A* should be equilibrated before it is factored.

If *fact* = 'F', on entry, *afb* and *ipiv* contain the factored form of *A*. If *equed* is not 'N', the matrix *A* has been equilibrated with scaling factors given by *r* and *c*. Parameters *ab*, *afb*, and *ipiv* are not modified.

If *fact* = 'N', the matrix *A* will be copied to *afb* and factored.

If *fact* = 'E', the matrix *A* will be equilibrated, if necessary, copied to *afb* and factored.

trans

CHARACTER*1. Must be 'N', 'T', or 'C'.

Specifies the form of the system of equations:

If *trans* = 'N', the system has the form *A*X* = *B* (No transpose).

If *trans* = 'T', the system has the form $A^T*X = B$ (Transpose).

If *trans* = 'C', the system has the form $A^H*X = B$ (Conjugate Transpose = Transpose for real flavors, Conjugate Transpose for complex flavors).

n

INTEGER. The number of linear equations; the order of the matrix *A*; *n*≥ 0.

kl

INTEGER. The number of subdiagonals within the band of *A*; *kl*≥ 0.

ku

INTEGER. The number of superdiagonals within the band of *A*; *ku*≥ 0.

nrhs

INTEGER. The number of right-hand sides; the number of columns of the matrices *B* and *X*; *nrhs*≥ 0.

ab, *afb*, *b*, *work*

REAL for sgbsvxx

DOUBLE PRECISION for dgbsvxx

COMPLEX for cgbsvxx

DOUBLE COMPLEX for zgbsvxx.

Arrays: *ab*(*ldab*,*), *afb*(*ldafb*,*), *b*(size *ldb* by *), *work*(*).

The array *ab* contains the matrix *A* in band storage, in rows 1 to *kl* +*ku*+1. The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows:

ab(*ku*+1+*i*-*j*,*j*) = *A*(*i*,*j*) for max(1,*j*-*ku*) ≤*i*≤ min(*n*,*j*+*kl*).

If *fact* = 'F' and *equed* is not 'N', then *AB* must have been equilibrated by the scaling factors in *r* and/or *c*. The second dimension of *a* must be at least max(1,*n*).

The array *afb* is an input argument if *fact* = 'F'. It contains the factored form of the banded matrix *A*, that is, the factors *L* and *U* from the factorization *A* = *P*L*U* as computed by ?gbtrf. *U* is stored as an upper triangular banded matrix with *kl* + *ku* superdiagonals in rows 1 to *kl* + *ku* + 1. The multipliers used during the factorization are stored in rows *kl* + *ku* + 2 to 2**kl* + *ku* + 1. If *equed* is not 'N', then *afb* is the factored form of the equilibrated matrix *A*.

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).

work(*) is a workspace array. The dimension of *work* must be at least max(1,4**n*) for real flavors, and at least max(1,2**n*) for complex flavors.

ldab — INTEGER. The leading dimension of the array *ab*; *ldab*≥*kl*+*ku*+1.

ldafb — INTEGER. The leading dimension of the array *afb*; *ldafb*≥ 2**kl*+*ku* +1.

ipiv — INTEGER.

Array, size at least max(1, *n*). The array *ipiv* is an input argument if *fact* = 'F'. It contains the pivot indices from the factorization *A* = *P*L*U* as computed by ?gbtrf; row *i* of the matrix was interchanged with row *ipiv*(*i*).

equed — CHARACTER*1. Must be 'N', 'R', 'C', or 'B'.

equed is an input argument if *fact* = 'F'. It specifies the form of equilibration that was done:

If *equed* = 'N', no equilibration was done (always true if *fact* = 'N').

If *equed* = 'R', row equilibration was done, that is, *A* has been premultiplied by *diag*(*r*).

If *equed* = 'C', column equilibration was done, that is, *A* has been postmultiplied by *diag*(*c*).

If *equed* = 'B', both row and column equilibration was done, that is, *A* has been replaced by *diag*(*r*)**A**diag*(*c*).

r, *c*

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Arrays: *r* (size *n*), *c* (size *n*). The array *r* contains the row scale factors for *A*, and the array *c* contains the column scale factors for *A*. These arrays are input arguments if *fact* = 'F' only; otherwise they are output arguments.

If *equed* = 'R' or 'B', *A* is multiplied on the left by *diag*(*r*); if *equed* = 'N'or 'C', *r* is not accessed.

If *fact* = 'F' and *equed* = 'R' or 'B', each element of *r* must be positive.

If *equed* = 'C' or 'B', *A* is multiplied on the right by *diag*(*c*); if *equed* = 'N' or 'R', *c* is not accessed.

If *fact* = 'F' and *equed* = 'C' or 'B', each element of *c* must be positive.

Each element of *r* or *c* should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

ldb

INTEGER. The leading dimension of the array *b*; *ldb*≥ max(1, *n*).

ldx

INTEGER. The leading dimension of the output array *x*; *ldx*≥ max(1, *n*).

n_err_bnds

INTEGER. Number of error bounds to return for each right hand side and each type (normwise or componentwise). See *err_bnds_norm* and *err_bnds_comp* descriptions in *Output Arguments* section below.

nparams

INTEGER. Specifies the number of parameters set in *params*. If ≤ 0, the *params* array is never referenced and default values are used.

params

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size *nparams*. Specifies algorithm parameters. If an entry is less than 0.0, that entry is filled with the default value used for that parameter. Only positions up to *nparams* are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass *nparams* = 0, which prevents the source code from accessing the *params* argument.

params(1) : Whether to perform iterative refinement or not. Default: 1.0 (for single precision flavors), 1.0D+0 (for double precision flavors).

=0.0	No refinement is performed and no error bounds are computed.
=1.0	Use the extra-precise refinement algorithm.

(Other values are reserved for future use.)

params(2) : Maximum number of residual computations allowed for refinement.

Default	10.0
Aggressive	Set to 100.0 to permit convergence using approximate factorizations or factorizations other than *LU*. If the factorization uses a technique other than Gaussian elimination, the guarantees in *err_bnds_norm* and *err_bnds_comp* may no longer be trustworthy.

params(3) : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

iwork INTEGER. Workspace array, size at least max(1, *n*); used in real flavors only.

rwork REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Workspace array, size at least max(1, 2**n*); used in complex flavors only.

Output Parameters

x REAL for sgbsvxx

DOUBLE PRECISION for dgbsvxx

COMPLEX for cgbsvxx

DOUBLE COMPLEX for zgbsvxx.

Array, size *ldx* by *.

If *info* = 0, the array *x* contains the solution *n*-by-*nrhs* matrix *X* to the *original* system of equations. Note that *A* and *B* are modified on exit if *equed*≠'N', and the solution to the *equilibrated* system is:

inv(*diag*(*c*))**X*, if *trans* = 'N' and *equed* = 'C' or 'B'; or inv(*diag*(*r*))**X*, if *trans* = 'T' or 'C' and *equed* = 'R' or 'B'. The second dimension of *x* must be at least max(1,*nrhs*).

ab Array *ab* is not modified on exit if *fact* = 'F' or 'N', or if *fact* = 'E' and *equed* = 'N'.

If *equed*≠'N', *A* is scaled on exit as follows:

equed = 'R': *A* = *diag*(*r*)**A*

equed = 'C': *A* = *A***diag*(*c*)

equed = 'B': *A* = *diag*(*r*)**A***diag*(*c*).

afb

If *fact* = 'N' or 'E', then *afb* is an output argument and on exit returns the factors *L* and *U* from the factorization *A* = *PLU* of the original matrix *A* (if *fact* = 'N') or of the equilibrated matrix *A* (if *fact* = 'E').

b

Overwritten by *diag*(*r*)**B* if *trans* = 'N' and *equed* = 'R' or 'B';

overwritten by *trans* = 'T' or 'C' and *equed* = 'C' or 'B';

not changed if *equed* = 'N'.

r, *c*

These arrays are output arguments if *fact*≠'F'. Each element of these arrays is a power of the radix. See the description of *r*, *c* in *Input Arguments* section.

rcond

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision, in particular, if *rcond* = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.

rpvgrw

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Contains the reciprocal pivot growth factor:

$$\|A\|/\|U\|$$

If this is much less than 1, the stability of the *LU* factorization of the (equlibrated) matrix *A* could be poor. This also means that the solution *X*, estimated condition numbers, and error bounds could be unreliable. If factorization fails with 0 < *info*≤*n*, this parameter contains the reciprocal pivot growth factor for the leading *info* columns of *A*. In ?gbsvx, this quantity is returned in *work(1)*.

berr

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size at least max(1, *nrhs*). Contains the componentwise relative backward error for each solution vector *x*(*j*), that is, the smallest relative change in any element of *A* or *B* that makes *x*(*j*) an exact solution.

err_bnds_norm

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array of size *nrhs* by *n_err_bnds*. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:

Normwise relative error in the *i*-th solution vector

$$\frac{\max_j \left| Xtrue_{ji} - X_{ji} \right|}{\max_j \left| X_{ji} \right|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.

The first index in *err_bnds_norm(i,:)* corresponds to the *i*-th right-hand side.

The second index in *err_bnds_norm(:,err)* contains the following three fields:

err=1	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors.
err=2	"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors. This error bound should only be trusted if the previous boolean is true.
err=3	Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix *Z* are: $\|Z\|_\infty \cdot \|Z^{-1}\|_\infty$ Let *z*=*s***a*, where *s* scales each row by a power of the radix so all absolute row sums of *z* are approximately 1.

err_bnds_comp

`REAL` for single precision flavors

`DOUBLE PRECISION` for double precision flavors.

Array of size *nrhs* by *n_err_bnds*. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:

Componentwise relative error in the *i*-th solution vector:

$$\max_j \frac{|Xtrue_{ji} - X_{ji}|}{|X_{ji}|}$$

The array is indexed by the right-hand side *i*, on which the componentwise relative error depends, and by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is not requested (*params(3)* = 0.0), then *err_bnds_comp* is not accessed. If *n_err_bnds* < 3, then at most the first *(:,n_err_bnds)* entries are returned.

The first index in *err_bnds_comp(i,:)* corresponds to the *i*-th right-hand side.

The second index in *err_bnds_comp(:,err)* contains the following three fields:

err=1 — "Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors.

err=2 — "Guaranteed" error bpound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors. This error bound should only be trusted if the previous boolean is true.

err=3 — Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix *Z* are:

$$\|Z\|_\infty \cdot \|Z^{-1}\|_\infty$$

Let *z=s**(*a**diag(*x*)), where *x* is the solution for the current right-hand side and *s* scales each row of *a**diag(*x*) by a power of the radix so all absolute row sums of *z* are approximately 1.

ipiv

If *fact* = 'N' or 'E', then *ipiv* is an output argument and on exit contains the pivot indices from the factorization *A = P*L*U* of the original matrix *A* (if *fact* = 'N') or of the equilibrated matrix *A* (if *fact* = 'E').

equed	If *fact*≠'F', then *equed* is an output argument. It specifies the form of equilibration that was done (see the description of *equed* in *Input Arguments* section).
params	If an entry is less than 0.0, that entry is filled with the default value used for that parameter, otherwise the entry is not modified.
info	INTEGER. If *info* = 0, the execution is successful. The solution to every right-hand side is guaranteed. If *info* = -*i*, the *i*-th parameter had an illegal value. If 0 < *info*≤*n*: $U_{info,info}$ is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned. If *info* = *n*+*j*: The solution corresponding to the *j*-th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides *k* with *k* > *j* may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested *params(3)* = 0.0, then the *j*-th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest *j* such that *err_bnds_norm*(*j*,1) = 0.0 or *err_bnds_comp*(*j*,1) = 0.0. See the definition of *err_bnds_norm* and *err_bnds_comp* for *err* = 1. To get information about all of the right-hand sides, check *err_bnds_norm* or *err_bnds_comp*.

?gtsv

Computes the solution to the system of linear equations with a tridiagonal coefficient matrix A and multiple right-hand sides.

Syntax

```
call sgtsv( n, nrhs, dl, d, du, b, ldb, info )
call dgtsv( n, nrhs, dl, d, du, b, ldb, info )
call cgtsv( n, nrhs, dl, d, du, b, ldb, info )
call zgtsv( n, nrhs, dl, d, du, b, ldb, info )
call gtsv( dl, d, du, b [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine solves for *X* the system of linear equations *A*X* = *B*, where *A* is an *n*-by-*n* tridiagonal matrix, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions. The routine uses Gaussian elimination with partial pivoting.

Note that the equation $A^T*X = B$ may be solved by interchanging the order of the arguments *du* and *dl*.

Input Parameters

n	INTEGER. The order of *A*, the number of rows in *B*; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides, the number of columns in *B*; $nrhs \geq 0$.
dl	REAL for sgtsv DOUBLE PRECISION for dgtsv COMPLEX for cgtsv DOUBLE COMPLEX for zgtsv. The array *dl* (size *n* - 1) contains the $(n - 1)$ subdiagonal elements of *A*.
d	REAL for sgtsv DOUBLE PRECISION for dgtsv COMPLEX for cgtsv DOUBLE COMPLEX for zgtsv. The array *d* (size *n*) contains the diagonal elements of *A*.
du	REAL for sgtsv DOUBLE PRECISION for dgtsv COMPLEX for cgtsv DOUBLE COMPLEX for zgtsv. The array *du* (size *n* - 1) contains the $(n - 1)$ superdiagonal elements of *A*.
b	REAL for sgtsv DOUBLE PRECISION for dgtsv COMPLEX for cgtsv DOUBLE COMPLEX for zgtsv. The array *b* (size *ldb* by *) contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).
ldb	INTEGER. The leading dimension of *b*; $ldb \geq \max(1, n)$.

Output Parameters

dl	Overwritten by the $(n-2)$ elements of the second superdiagonal of the upper triangular matrix *U* from the *LU* factorization of A. These elements are stored in *dl*(1), ..., *dl*($n - 2$).
d	Overwritten by the *n* diagonal elements of *U*.
du	Overwritten by the $(n-1)$ elements of the first superdiagonal of *U*.
b	Overwritten by the solution matrix *X*.

info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, *U*(*i*, *i*) is exactly zero, and the solution has not been computed. The factorization has not been completed unless *i* = *n*.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine gtsv interface are as follows:

dl	Holds the vector of length (*n*-1).
d	Holds the vector of length *n*.
dl	Holds the vector of length (*n*-1).
b	Holds the matrix *B* of size (*n*,*nrhs*).

rcond, ferr, berr, work, rwork, info )
```

```
call gtsvx( dl, d, du, b, x [,dlf] [,df] [,duf] [,du2] [,ipiv] [,fact] [,trans] [,ferr]
[,berr] [,rcond] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine uses the *LU* factorization to compute the solution to a real or complex system of linear equations *A*X = B*, $A^T*X = B$, or $A^H*X = B$, where *A* is a tridiagonal matrix of order *n*, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?gtsvx performs the following steps:

1. If *fact* = 'N', the *LU* decomposition is used to factor the matrix *A* as *A* = *L***U*, where *L* is a product of permutation and unit lower bidiagonal matrices and *U* is an upper triangular matrix with nonzeroes in only the main diagonal and first two superdiagonals.
2. If some $U_{i,i}$= 0, so that *U* is exactly singular, then the routine returns with *info* = *i*. Otherwise, the factored form of *A* is used to estimate the condition number of the matrix *A*. If the reciprocal of the condition number is less than machine precision, *info* = *n* + 1 is returned as a warning, but the routine still goes on to solve for *X* and compute error bounds as described below.
3. The system of equations is solved for *X* using the factored form of *A*.
4. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.

Input Parameters

fact

CHARACTER*1. Must be 'F' or 'N'.

Specifies whether or not the factored form of the matrix *A* has been supplied on entry.

If *fact* = 'F': on entry, *dlf*, *df*, *duf*, *du2*, and *ipiv* contain the factored form of *A*; arrays *dl*, *d*, *du*, *dlf*, *df*, *duf*, *du2*, and *ipiv* will not be modified.

If *fact* = 'N', the matrix *A* will be copied to *dlf*, *df*, and *duf* and factored.

trans

CHARACTER*1. Must be 'N', 'T', or 'C'.

Specifies the form of the system of equations:

If *trans* = 'N', the system has the form *A***X* = *B* (No transpose).

If *trans* = 'T', the system has the form A^T**X* = *B* (Transpose).

If *trans* = 'C', the system has the form A^H**X* = *B* (Conjugate transpose).

n

INTEGER. The number of linear equations, the order of the matrix *A*; *n*≥ 0.

nrhs

INTEGER. The number of right hand sides, the number of columns of the matrices *B* and *X*; *nrhs*≥ 0.

dl,*d*,*du*,*dlf*,*df*, *duf*,*du2*,*b*,*work*

REAL for sgtsvx

DOUBLE PRECISION for dgtsvx

COMPLEX for cgtsvx

DOUBLE COMPLEX for zgtsvx.

Arrays:

dl, size (*n* -1), contains the subdiagonal elements of *A*.

d, size (*n*), contains the diagonal elements of *A*.

du, size (*n* -1), contains the superdiagonal elements of *A*.

dlf, size (*n* -1). If *fact* = 'F', then *dlf* is an input argument and on entry contains the (*n* -1) multipliers that define the matrix *L* from the *LU* factorization of *A* as computed by ?gttrf.

df, size (*n*). If *fact* = 'F', then *df* is an input argument and on entry contains the *n* diagonal elements of the upper triangular matrix *U* from the *LU* factorization of *A*.

duf, size (*n* -1). If *fact* = 'F', then *duf* is an input argument and on entry contains the (*n* -1) elements of the first superdiagonal of *U*.

du2, size (*n* -2). If *fact* = 'F', then *du2* is an input argument and on entry contains the (*n*-2) elements of the second superdiagonal of *U*.

b(*ldb*, *) contains the right-hand side matrix *B*. The second dimension of *b* must be at least max(1, *nrhs*).

work(*) is a workspace array. The size of *work* must be at least max(1, 3**n*) for real flavors and max(1, 2**n*) for complex flavors.

ldb — INTEGER. The leading dimension of *b*; *ldb*≥ max(1, *n*).

ldx — INTEGER. The leading dimension of *x*; *ldx*≥ max(1, *n*).

ipiv — INTEGER.

Array, size at least max(1, *n*). If *fact* = 'F', then *ipiv* is an input argument and on entry contains the pivot indices, as returned by ?gttrf.

iwork — INTEGER. Workspace array, size (*n*). Used for real flavors only.

rwork — REAL for cgtsvx

DOUBLE PRECISION for zgtsvx.

Workspace array, size (*n*). Used for complex flavors only.

Output Parameters

x — REAL for sgtsvx

DOUBLE PRECISION for dgtsvx

COMPLEX for cgtsvx

DOUBLE COMPLEX for zgtsvx.

Array, size *ldx* by *.

If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X*. The second dimension of *x* must be at least max(1, *nrhs*).

dlf — If *fact* = 'N', then *dlf* is an output argument and on exit contains the (*n*–1) multipliers that define the matrix *L* from the *LU* factorization of A.

df — If *fact* = 'N', then *df* is an output argument and on exit contains the *n* diagonal elements of the upper triangular matrix *U* from the *LU* factorization of *A*.

duf — If *fact* = 'N', then *duf* is an output argument and on exit contains the (*n*–1) elements of the first superdiagonal of *U*.

du2

If *fact* = 'N', then *du2* is an output argument and on exit contains the (*n*-2) elements of the second superdiagonal of *U*.

ipiv

The array *ipiv* is an output argument if *fact* = 'N'and, on exit, contains the pivot indices from the factorization *A* = *L***U* ; row *i* of the matrix was interchanged with row *ipiv*(*i*). The value of *ipiv*(*i*) will always be *i* or *i*+1; *ipiv*(*i*)=*i* indicates a row interchange was not required.

rcond

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

An estimate of the reciprocal condition number of the matrix *A*. If *rcond* is less than the machine precision (in particular, if *rcond* =0), the matrix is singular to working precision. This condition is indicated by a return code of *info*>0.

ferr

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size at least max(1, *nrhs*). Contains the estimated forward error bound for each solution vector *x*(*j*) (the *j*-th column of the solution matrix *X*). If *xtrue* is the true solution corresponding to *x*(*j*), *ferr*(*j*) is an estimated upper bound for the magnitude of the largest element in (*x*(*j*) - *xtrue*) divided by the magnitude of the largest element in *x*(*j*). The estimate is as reliable as the estimate for *rcond*, and is almost always a slight overestimate of the true error.

berr

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size at least max(1, *nrhs*). Contains the component-wise relative backward error for each solution vector *x*(*j*), that is, the smallest relative change in any element of *A* or *B* that makes *x*(*j*) an exact solution.

info

INTEGER. If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, and *i*≤*n*, then *U*(*i*, *i*) is exactly zero. The factorization has not been completed unless *i* = *n*, but the factor *U* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned. If *info* = *i*, and *i* = *n* + 1, then *U* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `gtsvx` interface are as follows:

dl	Holds the vector of length (*n*-1).
d	Holds the vector of length *n*.
du	Holds the vector of length (*n*-1).
b	Holds the matrix *B* of size (*n*,*nrhs*).
x	Holds the matrix *X* of size (*n*,*nrhs*).
dlf	Holds the vector of length (*n*-1).
df	Holds the vector of length *n*.
duf	Holds the vector of length (*n*-1).
du2	Holds the vector of length (*n*-2).
ipiv	Holds the vector of length *n*.
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
fact	Must be `'N'` or `'F'`. The default value is `'N'`. If *fact* = `'F'`, then the arguments *dlf*, *df*, *duf*, *du2*, and *ipiv* must be present; otherwise, an error is returned.
trans	Must be `'N'`, `'C'`, or `'T'`. The default value is `'N'`.

?dtsvb

Computes the solution to the system of linear equations with a diagonally dominant tridiagonal coefficient matrix A and multiple right-hand sides.

Syntax

```
call sdtsvb( n, nrhs, dl, d, du, b, ldb, info )
call ddtsvb( n, nrhs, dl, d, du, b, ldb, info )
call cdtsvb( n, nrhs, dl, d, du, b, ldb, info )
call zdtsvb( n, nrhs, dl, d, du, b, ldb, info )
call dtsvb( dl, d, du, b [, info])
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The `?dtsvb` routine solves a system of linear equations *A*X = B* for *X*, where *A* is an *n*-by-*n* diagonally dominant tridiagonal matrix, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions. The routine uses the BABE (Burning At Both Ends) algorithm.

Note that the equation $A^T*X = B$ may be solved by interchanging the order of the arguments `du` and `dl`.

Input Parameters

`n`	`INTEGER`. The order of A, the number of rows in B; $n \geq 0$.
`nrhs`	`INTEGER`. The number of right-hand sides, the number of columns in B; $nrhs \geq 0$.

`dl`, `d`, `du`, `b`	`REAL` for `sdtsvb`
	`DOUBLE PRECISION` for `ddtsvb`
	`COMPLEX` for `cdtsvb`
	`DOUBLE COMPLEX` for `zdtsvb`.
	Arrays: `dl` (size `n` - 1), `d` (size `n`), `du` (size `n` - 1), `b`(size `ldb`,*).
	The array `dl` contains the `(n - 1)` subdiagonal elements of A.
	The array `d` contains the diagonal elements of A.
	The array `du` contains the `(n - 1)` superdiagonal elements of A.
	The array `b` contains the matrix B whose columns are the right-hand sides for the systems of equations. The second dimension of `b` must be at least `max(1,nrhs)`.

`ldb`	`INTEGER`. The leading dimension of `b`; `ldb` $\geq$ `max(1, n)`.

Output Parameters

`dl`	Overwritten by the `(n-1)` elements of the subdiagonal of the lower triangular matrices L_1, L_2 from the factorization of A (see dttrfb).
`d`	Overwritten by the `n` diagonal element reciprocals of U.
`b`	Overwritten by the solution matrix X.
`info`	`INTEGER`. If `info = 0`, the execution is successful. If `info = -i`, the i-th parameter had an illegal value. If `info = i`, u_{ii} is exactly zero, and the solution has not been computed. The factorization has not been completed unless `i = n`.

Application Notes

A diagonally dominant tridiagonal system is defined such that $|d_i| > |dl_{i-1}| + |du_i|$ for any i:

$1 < i < n$, and $|d_1| > |du_1|$, $|d_n| > |dl_{n-1}|$

The underlying BABE algorithm is designed for diagonally dominant systems. Such systems have no numerical stability issue unlike the canonical systems that use elimination with partial pivoting (see `?gtsv`). The diagonally dominant systems are much faster than the canonical systems.

NOTE

- The current implementation of BABE has a potential accuracy issue on very small or large data close to the underflow or overflow threshold respectively. Scale the matrix before applying the solver in the case of such input data.
- Applying the `?dtsvb` factorization to non-diagonally dominant systems may lead to an accuracy loss, or false singularity detected due to no pivoting.

?posv

Computes the solution to the system of linear equations with a symmetric or Hermitian positive-definite coefficient matrix A and multiple right-hand sides.

Syntax

```
call sposv( uplo, n, nrhs, a, lda, b, ldb, info )
call dposv( uplo, n, nrhs, a, lda, b, ldb, info )
call cposv( uplo, n, nrhs, a, lda, b, ldb, info )
call zposv( uplo, n, nrhs, a, lda, b, ldb, info )
call dsposv( uplo, n, nrhs, a, lda, b, ldb, x, ldx, work, swork, iter, info )
call zcposv( uplo, n, nrhs, a, lda, b, ldb, x, ldx, work, swork, rwork, iter, info )
call posv( a, b [,uplo] [,info] )
```

Include Files

- `mkl.fi, lapack.f90`

Description

The routine solves for *X* the real or complex system of linear equations `A*X = B`, where *A* is an *n*-by-*n* symmetric/Hermitian positive-definite matrix, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

The Cholesky decomposition is used to factor *A* as

`A = U`^{T}`*U` (real flavors) and `A = U`^{H}`*U` (complex flavors), if `uplo = 'U'`

or `A = L*L`^{T} (real flavors) and `A = L*L`^{H} (complex flavors), if `uplo = 'L'`,

where *U* is an upper triangular matrix and *L* is a lower triangular matrix. The factored form of *A* is then used to solve the system of equations `A*X = B`.

The `dsposv` and `zcposv` are mixed precision iterative refinement subroutines for exploiting fast single precision hardware. They first attempt to factorize the matrix in single precision (`dsposv`) or single complex precision (`zcposv`) and use this factorization within an iterative refinement procedure to produce a solution with double precision (`dsposv`) / double complex precision (`zcposv`) normwise backward error quality (see below). If the approach fails, the method switches to a double precision or double complex precision factorization respectively and computes the solution.

The iterative refinement is not going to be a winning strategy if the ratio single precision/complex performance over double precision/double complex performance is too small. A reasonable strategy should take the number of right-hand sides and the size of the matrix into account. This might be done with a call to `ilaenv` in the future. At present, iterative refinement is implemented.

The iterative refinement process is stopped if
`iter > itermax`
or for all the right-hand sides:
`rnmr < sqrt(n)*xnrm*anrm*eps*bwdmax`,
where

- `iter` is the number of the current iteration in the iterative refinement process
- `rnmr` is the infinity-norm of the residual
- `xnrm` is the infinity-norm of the solution
- `anrm` is the infinity-operator-norm of the matrix *A*
- `eps` is the machine epsilon returned by `dlamch` ('Epsilon').

The values `itermax` and `bwdmax` are fixed to 30 and 1.0d+00 respectively.

Input Parameters

uplo
`CHARACTER*1`. Must be `'U'` or `'L'`.
Indicates whether the upper or lower triangular part of *A* is stored:
If *uplo* = `'U'`, the upper triangle of *A* is stored.
If *uplo* = `'L'`, the lower triangle of *A* is stored.

n
`INTEGER`. The order of matrix *A*; *n*≥ 0.

nrhs
`INTEGER`. The number of right-hand sides, the number of columns in *B*; *nrhs*≥ 0.

a, *b*
`REAL` for `sposv`
`DOUBLE PRECISION` for `dposv` and `dsposv`.
`COMPLEX` for `cposv`
`DOUBLE COMPLEX` for `zposv` and `zcposv`.
Arrays: *a*(size *lda*,*), *b*(*ldb*, *). The array *a* contains the upper or the lower triangular part of the matrix *A* (see *uplo*). The second dimension of *a* must be at least `max(1, n)`.
Note that in the case of `zcposv` the imaginary parts of the diagonal elements need not be set and are assumed to be zero.
The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least `max(1,nrhs)`.

lda
`INTEGER`. The leading dimension of *a*; *lda*≥ `max(1, n)`.

ldb
`INTEGER`. The leading dimension of *b*; *ldb*≥ `max(1, n)`.

ldx
`INTEGER`. The leading dimension of the array *x*; *ldx*≥ `max(1, n)`.

work
`DOUBLE PRECISION` for `dsposv`
`DOUBLE COMPLEX` for `zcposv`.
Workspace array, size `(n*nrhs)`. This array is used to hold the residual vectors.

swork
`REAL` for `dsgesv`

COMPLEX for zcgesv.

Workspace array, size (n*(n+nrhs)). This array is used to use the single precision matrix and the right-hand sides or solutions in single precision.

rwork DOUBLE PRECISION. Workspace array, size (*n*).

Output Parameters

a If *info* = 0, the upper or lower triangular part of *a* is overwritten by the Cholesky factor *U* or *L*, as specified by *uplo*.

If iterative refinement has been successfully used (*info*= 0 and *iter*≥ 0), then *A* is unchanged.

If double precision factorization has been used (*info*= 0 and *iter* < 0), then the array *A* contains the factors *L* or *U* from the Cholesky factorization.

b Overwritten by the solution matrix *X*.

x DOUBLE PRECISION for dsposv

DOUBLE COMPLEX for zcposv.

Array, size *ldx* by *nrhs*. If *info* = 0, contains the *n*-by-*nrhs* solution matrix *X*.

iter INTEGER.

If *iter* < 0: iterative refinement has failed, double precision factorization has been performed

- If *iter* = -1: the routine fell back to full precision for implementation- or machine-specific reason
- If *iter* = -2: narrowing the precision induced an overflow, the routine fell back to full precision
- If *iter* = -3: failure of spotrf for dsposv, or cpotrf for zcposv
- If *iter* = -31: stop the iterative refinement after the 30th iteration.

If *iter* > 0: iterative refinement has been successfully used. Returns the number of iterations.

info INTEGER. If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive definite, so the factorization could not be completed, and the solution has not been computed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine posv interface are as follows:

a	Holds the matrix *A* of size (*n*,*n*).
b	Holds the matrix *B* of size (*n*,*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Matrix Storage Schemes

?posvx

Uses the Cholesky factorization to compute the solution to the system of linear equations with a symmetric or Hermitian positive-definite coefficient matrix A, and provides error bounds on the solution.

Syntax

```
call sposvx( fact, uplo, n, nrhs, a, lda, af, ldaf, equed, s, b, ldb, x, ldx, rcond, ferr, berr, work, iwork, info )
call dposvx( fact, uplo, n, nrhs, a, lda, af, ldaf, equed, s, b, ldb, x, ldx, rcond, ferr, berr, work, iwork, info )
call cposvx( fact, uplo, n, nrhs, a, lda, af, ldaf, equed, s, b, ldb, x, ldx, rcond, ferr, berr, work, rwork, info )
call zposvx( fact, uplo, n, nrhs, a, lda, af, ldaf, equed, s, b, ldb, x, ldx, rcond, ferr, berr, work, rwork, info )
call posvx( a, b, x [,uplo] [,af] [,fact] [,equed] [,s] [,ferr] [,berr] [,rcond] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine uses the *Cholesky* factorization $A=U^T*U$ (real flavors) / $A=U^H*U$ (complex flavors) or $A=L*L^T$ (real flavors) / $A=L*L^H$ (complex flavors) to compute the solution to a real or complex system of linear equations $A*X = B$, where *A* is a *n*-by-*n* real symmetric/Hermitian positive definite matrix, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?posvx performs the following steps:

1. If *fact* = 'E', real scaling factors *s* are computed to equilibrate the system:

   ```
   diag(s)*A*diag(s)*inv(diag(s))*X = diag(s)*B.
   ```

   Whether or not the system will be equilibrated depends on the scaling of the matrix *A*, but if equilibration is used, *A* is overwritten by *diag(s)*A*diag(s)* and *B* by *diag(s)*B*.
2. If *fact* = 'N' or 'E', the Cholesky decomposition is used to factor the matrix *A* (after equilibration if *fact* = 'E') as

   $A = U^T*U$ (real), $A = U^H*U$ (complex), if *uplo* = 'U',

   or $A = L*L^T$ (real), $A = L*L^H$ (complex), if *uplo* = 'L',

   where *U* is an upper triangular matrix and *L* is a lower triangular matrix.

3. If the leading *i*-by-*i* principal minor is not positive-definite, then the routine returns with *info* = *i*. Otherwise, the factored form of *A* is used to estimate the condition number of the matrix *A*. If the reciprocal of the condition number is less than machine precision, *info* = *n* + 1 is returned as a warning, but the routine still goes on to solve for *X* and compute error bounds as described below.
4. The system of equations is solved for *X* using the factored form of *A*.
5. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.
6. If equilibration was used, the matrix *X* is premultiplied by *diag*(*s*) so that it solves the original system before equilibration.

Input Parameters

fact

CHARACTER*1. Must be 'F', 'N', or 'E'.

Specifies whether or not the factored form of the matrix *A* is supplied on entry, and if not, whether the matrix *A* should be equilibrated before it is factored.

If *fact* = 'F': on entry, *af* contains the factored form of *A*. If *equed* = 'Y', the matrix *A* has been equilibrated with scaling factors given by *s*.
a and *af* will not be modified.

If *fact* = 'N', the matrix *A* will be copied to *af* and factored.

If *fact* = 'E', the matrix *A* will be equilibrated if necessary, then copied to *af* and factored.

uplo

CHARACTER*1. Must be 'U' or 'L'.

Indicates whether the upper or lower triangular part of *A* is stored:

If *uplo* = 'U', the upper triangle of *A* is stored.

If *uplo* = 'L', the lower triangle of *A* is stored.

n

INTEGER. The order of matrix *A*; $n \geq 0$.

nrhs

INTEGER. The number of right-hand sides, the number of columns in *B*; $nrhs \geq 0$.

a, *af*, *b*, *work*

REAL for sposvx

DOUBLE PRECISION for dposvx

COMPLEX for cposvx

DOUBLE COMPLEX for zposvx.

Arrays: *a*(size *lda* by *), *af*(size *ldaf* by *), *b*(size *ldb* by *), *work*(*).

The array *a* contains the matrix *A* as specified by *uplo*. If *fact* = 'F' and *equed* = 'Y', then *A* must have been equilibrated by the scaling factors in *s*, and *a* must contain the equilibrated matrix *diag*(*s*)*A*diag*(*s*). The second dimension of *a* must be at least max(1,*n*).

The array *af* is an input argument if *fact* = 'F'. It contains the triangular factor *U* or *L* from the Cholesky factorization of *A* in the same storage format as *A*. If *equed* is not 'N', then *af* is the factored form of the equilibrated matrix *diag(s)*A*diag(s)*. The second dimension of *af* must be at least max(1,*n*).

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1, *nrhs*).

work(*) is a workspace array. The dimension of *work* must be at least max(1,3**n*) for real flavors, and at least max(1,2**n*) for complex flavors.

lda — INTEGER. The leading dimension of *a*; *lda* ≥ max(1, *n*).

ldaf — INTEGER. The leading dimension of *af*; *ldaf* ≥ max(1, *n*).

ldb — INTEGER. The leading dimension of *b*; *ldb* ≥ max(1, *n*).

equed — CHARACTER*1. Must be 'N' or 'Y'.

equed is an input argument if *fact* = 'F'. It specifies the form of equilibration that was done:

if *equed* = 'N', no equilibration was done (always true if *fact* = 'N');

if *equed* = 'Y', equilibration was done, that is, *A* has been replaced by *diag(s)*A*diag(s)*.

s — REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size (*n*). The array *s* contains the scale factors for *A*. This array is an input argument if *fact* = 'F' only; otherwise it is an output argument.

If *equed* = 'N', *s* is not accessed.

If *fact* = 'F' and *equed* = 'Y', each element of *s* must be positive.

ldx — INTEGER. The leading dimension of the output array *x*; *ldx* ≥ max(1, *n*).

iwork — INTEGER. Workspace array, size at least max(1, *n*); used in real flavors only.

rwork — REAL for cposvx

DOUBLE PRECISION for zposvx.

Workspace array, size at least max(1, *n*); used in complex flavors only.

Output Parameters

x — REAL for sposvx

DOUBLE PRECISION for dposvx

COMPLEX for cposvx

DOUBLE COMPLEX for zposvx.

Array, size *ldx* by *.

If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X* to the *original* system of equations. Note that if *equed* = 'Y', *A* and *B* are modified on exit, and the solution to the equilibrated system is inv(*diag*(*s*))*X. The second dimension of *x* must be at least max(1,*nrhs*).

a

Array *a* is not modified on exit if *fact* = 'F' or 'N', or if *fact* = 'E' and *equed* = 'N'.

If *fact* = 'E' and *equed* = 'Y', *A* is overwritten by *diag*(*s*)*A*diag*(*s*).

af

If *fact* = 'N' or 'E', then *af* is an output argument and on exit returns the triangular factor *U* or *L* from the Cholesky factorization $A=U^{T}*U$ or $A=L*L^{T}$ (real routines), $A=U^{H}*U$ or $A=L*L^{H}$ (complex routines) of the original matrix *A* (if *fact* = 'N'), or of the equilibrated matrix *A* (if *fact* = 'E'). See the description of *a* for the form of the equilibrated matrix.

b

Overwritten by *diag*(*s*)*B, if *equed* = 'Y'; not changed if *equed* = 'N'.

s

This array is an output argument if *fact*≠'F'. See the description of *s* in *Input Arguments* section.

rcond

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

An estimate of the reciprocal condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision (in particular, if *rcond* =0), the matrix is singular to working precision. This condition is indicated by a return code of *info*>0.

ferr

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size at least max(1, *nrhs*). Contains the estimated forward error bound for each solution vector x_j (the *j*-th column of the solution matrix *X*). If *xtrue* is the true solution corresponding to x_j, *ferr*(*j*) is an estimated upper bound for the magnitude of the largest element in (x_j) - *xtrue*) divided by the magnitude of the largest element in x_j. The estimate is as reliable as the estimate for *rcond*, and is almost always a slight overestimate of the true error.

berr

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size at least max(1, *nrhs*). Contains the component-wise relative backward error for each solution vector x_j, that is, the smallest relative change in any element of *A* or *B* that makes x_j an exact solution.

equed	If *fact*≠'F', then *equed* is an output argument. It specifies the form of equilibration that was done (see the description of *equed* in *Input Arguments* section).
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, and *i*≤*n*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite, so the factorization could not be completed, and the solution and error bounds could not be computed; *rcond* =0 is returned. If *info* = *i*, and *i* = *n* + 1, then *U* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine posvx interface are as follows:

a	Holds the matrix *A* of size (*n*,*n*).
b	Holds the matrix *B* of size (*n*,*nrhs*).
x	Holds the matrix *X* of size (*n*,*nrhs*).
af	Holds the matrix *AF* of size (*n*,*n*).
s	Holds the vector of length *n*. Default value for each element is *s*(*i*) = 1.0_WP.
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
fact	Must be 'N', 'E', or 'F'. The default value is 'N'. If *fact* = 'F', then *af* must be present; otherwise, an error is returned.
equed	Must be 'N' or 'Y'. The default value is 'N'.

Include Files

- mkl.fi, lapack.f90

Description

The routine uses the *Cholesky* factorization $A=U^T*U$ (real flavors) / $A=U^H*U$ (complex flavors) or $A=L*L^T$ (real flavors) / $A=L*L^H$ (complex flavors) to compute the solution to a real or complex system of linear equations $A*X = B$, where A is an n-by-n real symmetric/Hermitian positive definite matrix, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

Both normwise and maximum componentwise error bounds are also provided on request. The routine returns a solution with a small guaranteed error (O(eps), where eps is the working machine precision) unless the matrix is very ill-conditioned, in which case a warning is returned. Relevant condition numbers are also calculated and returned.

The routine accepts user-provided factorizations and equilibration factors; see definitions of the *fact* and *equed* options. Solving with refinement and using a factorization from a previous call of the routine also produces a solution with O(eps) errors or warnings but that may not be true for general user-provided factorizations and equilibration factors if they differ from what the routine would itself produce.

The routine ?posvxx performs the following steps:

1. If *fact* = 'E', scaling factors are computed to equilibrate the system:

   diag(*s*)***A***diag*(*s*) *inv(*diag*(*s*))***X* = *diag*(*s*)***B*

   Whether or not the system will be equilibrated depends on the scaling of the matrix A, but if equilibration is used, A is overwritten by *diag*(*s*)***A***diag*(*s*) and B by *diag*(*s*)***B*.
2. If *fact* = 'N' or 'E', the Cholesky decomposition is used to factor the matrix A (after equilibration if *fact* = 'E') as

   $A = U^T*U$ (real), $A = U^H*U$ (complex), if *uplo* = 'U',

   or $A = L*L^T$ (real), $A = L*L^H$ (complex), if *uplo* = 'L',

   where U is an upper triangular matrix and L is a lower triangular matrix.
3. If the leading i-by-i principal minor is not positive-definite, the routine returns with *info* = *i*. Otherwise, the factored form of A is used to estimate the condition number of the matrix A (see the *rcond* parameter). If the reciprocal of the condition number is less than machine precision, the routine still goes on to solve for X and compute error bounds.
4. The system of equations is solved for X using the factored form of A.

5. By default, unless `params(1)` is set to zero, the routine applies iterative refinement to get a small error and error bounds. Refinement calculates the residual to at least twice the working precision.
6. If equilibration was used, the matrix *X* is premultiplied by *diag(s)* so that it solves the original system before equilibration.

Input Parameters

fact

CHARACTER*1. Must be 'F', 'N', or 'E'.

Specifies whether or not the factored form of the matrix *A* is supplied on entry, and if not, whether the matrix *A* should be equilibrated before it is factored.

If *fact* = 'F', on entry, *af* contains the factored form of *A*. If *equed* is not 'N', the matrix *A* has been equilibrated with scaling factors given by *s*. Parameters *a* and *af* are not modified.

If *fact* = 'N', the matrix *A* will be copied to *af* and factored.

If *fact* = 'E', the matrix *A* will be equilibrated, if necessary, copied to *af* and factored.

uplo

CHARACTER*1. Must be 'U' or 'L'.

Indicates whether the upper or lower triangular part of *A* is stored:

If *uplo* = 'U', the upper triangle of *A* is stored.

If *uplo* = 'L', the lower triangle of *A* is stored.

n

INTEGER. The number of linear equations; the order of the matrix *A*; $n \geq 0$.

nrhs

INTEGER. The number of right-hand sides; the number of columns of the matrices *B* and *X*; $nrhs \geq 0$.

a, *af*, *b*, *work*

REAL for sposvxx

DOUBLE PRECISION for dposvxx

COMPLEX for cposvxx

DOUBLE COMPLEX for zposvxx.

Arrays: *a*(size *lda* by *), *af*(size *ldaf*by *), *b*(size *ldb* by *), *work*(*).

The array *a* contains the matrix *A* as specified by *uplo* . If *fact* = 'F' and *equed* = 'Y', then *A* must have been equilibrated by the scaling factors in *s*, and *a* must contain the equilibrated matrix *diag(s)*A*diag(s)*. The second dimension of *a* must be at least max(1,*n*).

The array *af* is an input argument if *fact* = 'F'. It contains the triangular factor *U* or *L* from the Cholesky factorization of *A* in the same storage format as *A*. If *equed* is not 'N', then *af* is the factored form of the equilibrated matrix *diag(s)*A*diag(s)*. The second dimension of *af* must be at least max(1,*n*).

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).

	work(*) is a workspace array. The dimension of *work* must be at least max(1,4**n*) for real flavors, and at least max(1,2**n*) for complex flavors.
lda	INTEGER. The leading dimension of the array *a*; *lda*≥ max(1,*n*).
ldaf	INTEGER. The leading dimension of the array *af*; *ldaf*≥ max(1,*n*).
equed	CHARACTER*1. Must be 'N' or 'Y'. *equed* is an input argument if *fact* = 'F'. It specifies the form of equilibration that was done: If *equed* = 'N', no equilibration was done (always true if *fact* = 'N'). if *equed* = 'Y', both row and column equilibration was done, that is, *A* has been replaced by *diag*(*s*)**A***diag*(*s*).
s	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Array, size (*n*). The array *s* contains the scale factors for *A*. This array is an input argument if *fact* = 'F' only; otherwise it is an output argument. If *equed* = 'N', *s* is not accessed. If *fact* = 'F' and *equed* = 'Y', each element of *s* must be positive. Each element of *s* should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.
ldb	INTEGER. The leading dimension of the array *b*; *ldb*≥ max(1, *n*).
ldx	INTEGER. The leading dimension of the output array *x*; *ldx*≥ max(1, *n*).
n_err_bnds	INTEGER. Number of error bounds to return for each right hand side and each type (normwise or componentwise). See *err_bnds_norm* and *err_bnds_comp* descriptions in the *Output Arguments* section below.
nparams	INTEGER. Specifies the number of parameters set in *params*. If ≤ 0, the *params* array is never referenced and default values are used.
params	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Array, size *nparams*. Specifies algorithm parameters. If an entry is less than 0.0, that entry is filled with the default value used for that parameter. Only positions up to *nparams* are accessed; defaults are

used for higher-numbered parameters. If defaults are acceptable, you can pass *nparams* = 0, which prevents the source code from accessing the *params* argument.

params(1) : Whether to perform iterative refinement or not. Default: 1.0 (for single precision flavors), 1.0D+0 (for double precision flavors).

=0.0	No refinement is performed and no error bounds are computed.
=1.0	Use the extra-precise refinement algorithm.

(Other values are reserved for future use.)

params(2) : Maximum number of residual computations allowed for refinement.

Default	10.0
Aggressive	Set to 100.0 to permit convergence using approximate factorizations or factorizations other than *LU*. If the factorization uses a technique other than Gaussian elimination, the guarantees in *err_bnds_norm* and *err_bnds_comp* may no longer be trustworthy.

params(3) : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

iwork INTEGER. Workspace array, size at least max(1, *n*); used in real flavors only.

rwork REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Workspace array, size at least max(1, 3*n); used in complex flavors only.

Output Parameters

x REAL for sposvxx

DOUBLE PRECISION for dposvxx

COMPLEX for cposvxx

DOUBLE COMPLEX for zposvxx.

Array, size *ldx* by *.

If *info* = 0, the array *x* contains the solution *n*-by-*nrhs* matrix *X* to the original system of equations. Note that *A* and *B* are modified on exit if *equed*≠'N', and the solution to the equilibrated system is:

inv(*diag*(*s*))*X.

a

Array *a* is not modified on exit if *fact* = 'F' or 'N', or if *fact* = 'E' and *equed* = 'N'.

If *fact* = 'E' and *equed* = 'Y', *A* is overwritten by *diag(s)*A*diag(s)*.

af

If *fact* = 'N' or 'E', then *af* is an output argument and on exit returns the triangular factor *U* or *L* from the Cholesky factorization $A=U^{T}*U$ or $A=L*L^{T}$ (real routines), $A=U^{H}*U$ or $A=L*L^{H}$ (complex routines) of the original matrix *A* (if *fact* = 'N'), or of the equilibrated matrix *A* (if *fact* = 'E'). See the description of *a* for the form of the equilibrated matrix.

b

If *equed* = 'N', *B* is not modified.

If *equed* = 'Y', *B* is overwritten by *diag(s)*B*.

s

This array is an output argument if *fact*≠'F'. Each element of this array is a power of the radix. See the description of *s* in *Input Arguments* section.

rcond

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision, in particular, if *rcond* = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.

rpvgrw

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Contains the reciprocal pivot growth factor:

$$\|A\|/\|U\|$$

If this is much less than 1, the stability of the *LU* factorization of the (equlibrated) matrix *A* could be poor. This also means that the solution *X*, estimated condition numbers, and error bounds could be unreliable. If factorization fails with $0 < info \le n$, this parameter contains the reciprocal pivot growth factor for the leading *info* columns of *A*.

berr

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size at least max(1, *nrhs*). Contains the componentwise relative backward error for each solution vector *x(j)*, that is, the smallest relative change in any element of *A* or *B* that makes *x(j)* an exact solution.

err_bnds_norm

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array of size *nrhs* by *n_err_bnds*. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:

Normwise relative error in the *i*-th solution vector

$$\frac{\max_j \left| Xtrue_{ji} - X_{ji} \right|}{\max_j \left| X_{ji} \right|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.

The first index in *err_bnds_norm(i,:)* corresponds to the *i*-th right-hand side.

The second index in *err_bnds_norm(:,err)* contains the following three fields:

err=1	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors.
err=2	"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors. This error bound should only be trusted if the previous boolean is true.
err=3	Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix *Z* are: $\|Z\|_\infty \cdot \|Z^{-1}\|_\infty$ Let *z*=*s***a*, where *s* scales each row by a power of the radix so all absolute row sums of *z* are approximately 1.

err_bnds_comp

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array of size *nrhs* by *n_err_bnds*. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:

Componentwise relative error in the *i*-th solution vector:

$$\max_j \frac{\left|Xtrue_{ji} - X_{ji}\right|}{\left|X_{ji}\right|}$$

The array is indexed by the right-hand side *i*, on which the componentwise relative error depends, and by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is not requested (*params(3)* = 0.0), then *err_bnds_comp* is not accessed. If *n_err_bnds* < 3, then at most the first *(:,n_err_bnds)* entries are returned.

The first index in *err_bnds_comp(i,:)* corresponds to the *i*-th right-hand side.

The second index in *err_bnds_comp(:,err)* contains the following three fields:

err=1 — "Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors.

err=2 — "Guaranteed" error bpound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors. This error bound should only be trusted if the previous boolean is true.

err=3 — Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix *Z* are:

$$\left\|Z\right\|_\infty \cdot \left\|Z^{-1}\right\|_\infty$$

Let *z*=*s**(*a**diag(*x*)), where *x* is the solution for the current right-hand side and *s* scales each row of *a**diag(*x*) by a power of the radix so all absolute row sums of *z* are approximately 1.

equed — If *fact*≠'F', then *equed* is an output argument. It specifies the form of equilibration that was done (see the description of *equed* in *Input Arguments* section).

params — If an entry is less than 0.0, that entry is filled with the default value used for that parameter, otherwise the entry is not modified.

info

INTEGER. If *info* = 0, the execution is successful. The solution to every right-hand side is guaranteed.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If 0 < *info*≤*n*: $U_{info,info}$ is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned.

If *info* = *n*+*j*: The solution corresponding to the *j*-th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides *k* with *k* > *j* may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested *params(3)* = 0.0, then the *j*-th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest *j* such that *err_bnds_norm*(*j*,1) = 0.0 or *err_bnds_comp*(*j*,1) = 0.0. See the definition of *err_bnds_norm* and *err_bnds_comp* for *err* = 1. To get information about all of the right-hand sides, check *err_bnds_norm* or *err_bnds_comp*.

Description

The routine solves for *X* the real or complex system of linear equations *A***X* = *B*, where *A* is an *n*-by-*n* real symmetric/Hermitian positive-definite matrix stored in packed format, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

The Cholesky decomposition is used to factor *A* as

A = U^T**U* (real flavors) and *A* = U^H**U* (complex flavors), if *uplo* = 'U'

or *A* = *L**L^T (real flavors) and *A* = *L**L^H (complex flavors), if *uplo* = 'L',

where *U* is an upper triangular matrix and *L* is a lower triangular matrix. The factored form of *A* is then used to solve the system of equations *A***X* = *B*.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of *A* is stored: If *uplo* = 'U', the upper triangle of *A* is stored. If *uplo* = 'L', the lower triangle of *A* is stored.
n	INTEGER. The order of matrix *A*; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides, the number of columns in *B*; $nrhs \geq 0$.
ap, *b*	REAL for sppsv DOUBLE PRECISION for dppsv COMPLEX for cppsv DOUBLE COMPLEX for zppsv. Arrays: *ap*(size *), *b*(size *ldb*, *). The array *ap* contains the upper or the lower triangular part of the matrix *A* (as specified by *uplo*) in *packed storage* (see Matrix Storage Schemes). The dimension of *ap* must be at least max(1,*n*(*n*+1)/2). The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).
ldb	INTEGER. The leading dimension of *b*; $ldb \geq \max(1, n)$.

Output Parameters

ap	If *info* = 0, the upper or lower triangular part of *A* in packed storage is overwritten by the Cholesky factor *U* or *L*, as specified by *uplo*.
b	Overwritten by the solution matrix *X*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite, so the factorization could not be completed, and the solution has not been computed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine ppsv interface are as follows:

ap	Holds the array *A* of size (*n**(*n*+1)/2).
b	Holds the matrix *B* of size (*n*,*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

```

Include Files

- mkl.fi, lapack.f90

Description

The routine uses the Cholesky factorization $A=U^T*U$ (real flavors) / $A=U^H*U$ (complex flavors) or $A=L*L^T$ (real flavors) / $A=L*L^H$ (complex flavors) to compute the solution to a real or complex system of linear equations $A*X = B$, where A is a n-by-n symmetric or Hermitian positive-definite matrix stored in packed format, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?ppsvx performs the following steps:

1. If *fact* = 'E', real scaling factors s are computed to equilibrate the system:

   ```
   diag(s)*A*diag(s)*inv(diag(s))*X = diag(s)*B.
   ```

   Whether or not the system will be equilibrated depends on the scaling of the matrix A, but if equilibration is used, A is overwritten by *diag(s)*A*diag(s)* and *B* by *diag(s)*B*.
2. If *fact* = 'N' or 'E', the Cholesky decomposition is used to factor the matrix A (after equilibration if *fact* = 'E') as

   $A = U^T*U$ (real), $A = U^H*U$ (complex), if *uplo* = 'U',

   or $A = L*L^T$ (real), $A = L*L^H$ (complex), if *uplo* = 'L',

   where U is an upper triangular matrix and L is a lower triangular matrix.
3. If the leading i-by-i principal minor is not positive-definite, then the routine returns with *info* = i. Otherwise, the factored form of A is used to estimate the condition number of the matrix A. If the reciprocal of the condition number is less than machine precision, *info* = n+1 is returned as a warning, but the routine still goes on to solve for X and compute error bounds as described below.

4. The system of equations is solved for *X* using the factored form of *A*.
5. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.
6. If equilibration was used, the matrix *X* is premultiplied by `diag(s)` so that it solves the original system before equilibration.

Input Parameters

fact

`CHARACTER*1`. Must be `'F'`, `'N'`, or `'E'`.

Specifies whether or not the factored form of the matrix *A* is supplied on entry, and if not, whether the matrix *A* should be equilibrated before it is factored.

If `fact = 'F'`: on entry, *afp* contains the factored form of *A*. If `equed = 'Y'`, the matrix *A* has been equilibrated with scaling factors given by *s*.
ap and *afp* will not be modified.

If `fact = 'N'`, the matrix *A* will be copied to *afp* and factored.

If `fact = 'E'`, the matrix *A* will be equilibrated if necessary, then copied to *afp* and factored.

uplo

`CHARACTER*1`. Must be `'U'` or `'L'`.

Indicates whether the upper or lower triangular part of *A* is stored:

If `uplo = 'U'`, the upper triangle of *A* is stored.

If `uplo = 'L'`, the lower triangle of *A* is stored.

n

`INTEGER`. The order of matrix *A*; $n \geq 0$.

nrhs

`INTEGER`. The number of right-hand sides; the number of columns in *B*; $nrhs \geq 0$.

ap, *afp*, *b*, *work*

`REAL` for `sppsvx`

`DOUBLE PRECISION` for `dppsvx`

`COMPLEX` for `cppsvx`

`DOUBLE COMPLEX` for `zppsvx`.

Arrays: (size *), *afp*(size *), *b*(size *ldb* by *), `work(*)`.

The array *ap* contains the upper or lower triangle of the original symmetric/Hermitian matrix *A* in *packed storage* (see Matrix Storage Schemes). In case when `fact = 'F'` and `equed = 'Y'`, *ap* must contain the equilibrated matrix `diag(s)*A*diag(s)`.

The array *afp* is an input argument if `fact = 'F'` and contains the triangular factor *U* or *L* from the Cholesky factorization of *A* in the same storage format as *A*. If *equed* is not `'N'`, then *afp* is the factored form of the equilibrated matrix *A*.

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations.

`work(*)` is a workspace array.

The dimension of arrays *ap* and *afp* must at least `max(1, n(n+1)/2)`; the second dimension of *b* must be at least `max(1,nrhs)`; the dimension of *work* must be at least `max(1, 3*n)` for real flavors and `max(1, 2*n)` for complex flavors.

ldb — `INTEGER`. The leading dimension of *b*; *ldb*≥ `max(1, n)`.

equed — `CHARACTER*1`. Must be `'N'` or `'Y'`.

equed is an input argument if *fact* = `'F'`. It specifies the form of equilibration that was done:

if *equed* = `'N'`, no equilibration was done (always true if *fact* = `'N'`);

if *equed* = `'Y'`, equilibration was done, that is, *A* has been replaced by *diag(s)A*diag(s)*.

s — `REAL` for single precision flavors

`DOUBLE PRECISION` for double precision flavors.

Array, size (*n*). The array *s* contains the scale factors for *A*. This array is an input argument if *fact* = `'F'` only; otherwise it is an output argument.

If *equed* = `'N'`, *s* is not accessed.

If *fact* = `'F'` and *equed* = `'Y'`, each element of *s* must be positive.

ldx — `INTEGER`. The leading dimension of the output array *x*; *ldx*≥ `max(1, n)`.

iwork — `INTEGER`. Workspace array, size at least `max(1, n)`; used in real flavors only.

rwork — `REAL` for `cppsvx`;

`DOUBLE PRECISION` for `zppsvx`.

Workspace array, size at least `max(1, n)`; used in complex flavors only.

Output Parameters

x — `REAL` for `sppsvx`

`DOUBLE PRECISION` for `dppsvx`

`COMPLEX` for `cppsvx`

`DOUBLE COMPLEX` for `zppsvx`.

Array, size *ldx* by *.

If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X* to the *original* system of equations. Note that if *equed* = `'Y'`, *A* and *B* are modified on exit, and the solution to the equilibrated system is `inv(diag(s))*X`. The second dimension of *x* must be at least `max(1,nrhs)`.

ap

Array *ap* is not modified on exit if *fact* = 'F' or 'N', or if *fact* = 'E'and *equed* = 'N'.

If *fact* = 'E' and *equed* = 'Y', *ap* is overwritten by *diag(s)*A*diag(s)*.

afp

If *fact* = 'N'or 'E', then *afp* is an output argument and on exit returns the triangular factor *U* or *L* from the Cholesky factorization $A=U^T*U$ or $A=L*L^T$ (real routines), $A=U^H*U$ or $A=L*L^H$ (complex routines) of the original matrix *A* (if *fact* = 'N'), or of the equilibrated matrix *A* (if *fact* = 'E'). See the description of *ap* for the form of the equilibrated matrix.

b

Overwritten by *diag(s)*B*, if *equed* = 'Y'; not changed if *equed* = 'N'.

s

This array is an output argument if *fact*≠'F'. See the description of *s* in *Input Arguments* section.

rcond

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

An estimate of the reciprocal condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision (in particular, if *rcond* = 0), the matrix is singular to working precision. This condition is indicated by a return code of *info* > 0.

ferr

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size at least max(1, *nrhs*). Contains the estimated forward error bound for each solution vector *x(j)* (the *j*-th column of the solution matrix *X*). If *xtrue* is the true solution corresponding to *x(j)* , *ferr(j)* is an estimated upper bound for the magnitude of the largest element in *(x(j) - xtrue)* divided by the magnitude of the largest element in *x(j)* . The estimate is as reliable as the estimate for *rcond*, and is almost always a slight overestimate of the true error.

berr

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size at least max(1, *nrhs*). Contains the component-wise relative backward error for each solution vector *x(j)* , that is, the smallest relative change in any element of *A* or *B* that makes *x(j)* an exact solution.

equed

If *fact*≠'F', then *equed* is an output argument. It specifies the form of equilibration that was done (see the description of *equed* in *Input Arguments* section).

info

INTEGER. If *info*=0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, and *i*≤*n*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite, so the factorization could not be completed, and the solution and error bounds could not be computed; *rcond* = 0 is returned.

If *info* = *i*, and *i* = *n* + 1, then *U* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `ppsvx` interface are as follows:

ap	Holds the array *A* of size (*n**(*n*+1)/2).
b	Holds the matrix *B* of size (*n*,*nrhs*).
x	Holds the matrix *X* of size (*n*,*nrhs*).
afp	Holds the matrix *AF* of size (*n**(*n*+1)/2).
s	Holds the vector of length *n*. Default value for each element is *s*(*i*) = 1.0_WP.
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
fact	Must be 'N', 'E', or 'F'. The default value is 'N'. If *fact* = 'F', then *af* must be present; otherwise, an error is returned.
equed	Must be 'N' or 'Y'. The default value is 'N'.

Description

The routine uses the Cholesky factorization $A=U^T*U$ (real flavors) / $A=U^H*U$ (complex flavors) or $A=L*L^T$ (real flavors) / $A=L*L^H$ (complex flavors) to compute the solution to a real or complex system of linear equations $A*X = B$, where A is a n-by-n symmetric or Hermitian positive definite band matrix, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine `?pbsvx` performs the following steps:

1. If `fact = 'E'`, real scaling factors s are computed to equilibrate the system:

   `diag(s)*A*diag(s)*inv(diag(s))*X = diag(s)*B`.

   Whether or not the system will be equilibrated depends on the scaling of the matrix A, but if equilibration is used, A is overwritten by `diag(s)*A*diag(s)` and B by `diag(s)*B`.
2. If `fact = 'N'` or `'E'`, the Cholesky decomposition is used to factor the matrix A (after equilibration if `fact = 'E'`) as

   $A = U^T*U$ (real), $A = U^H*U$ (complex), if `uplo = 'U'`,

   or $A = L*L^T$ (real), $A = L*L^H$ (complex), if `uplo = 'L'`,

   where U is an upper triangular band matrix and L is a lower triangular band matrix.
3. If the leading i-by-i principal minor is not positive definite, then the routine returns with `info = i`. Otherwise, the factored form of A is used to estimate the condition number of the matrix A. If the reciprocal of the condition number is less than machine precision, `info = n+1` is returned as a warning, but the routine still goes on to solve for X and compute error bounds as described below.
4. The system of equations is solved for X using the factored form of A.
5. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.
6. If equilibration was used, the matrix X is premultiplied by `diag(s)` so that it solves the original system before equilibration.

Input Parameters

fact

`CHARACTER*1`. Must be `'F'`, `'N'`, or `'E'`.

Specifies whether or not the factored form of the matrix A is supplied on entry, and if not, whether the matrix A should be equilibrated before it is factored.

If `fact = 'F'`: on entry, *afb* contains the factored form of A. If `equed = 'Y'`, the matrix A has been equilibrated with scaling factors given by s.
ab and *afb* will not be modified.

If `fact = 'N'`, the matrix A will be copied to *afb* and factored.

If `fact = 'E'`, the matrix A will be equilibrated if necessary, then copied to *afb* and factored.

uplo

`CHARACTER*1`. Must be `'U'` or `'L'`.

Indicates whether the upper or lower triangular part of A is stored:

If `uplo = 'U'`, the upper triangle of A is stored.

If `uplo = 'L'`, the lower triangle of A is stored.

n — INTEGER. The order of matrix *A*; *n*≥ 0.

kd — INTEGER. The number of superdiagonals or subdiagonals in the matrix *A*; *kd*≥ 0.

nrhs — INTEGER. The number of right-hand sides, the number of columns in *B*; *nrhs*≥ 0.

ab, *afb*, *b*, *work* — REAL for spbsvx

DOUBLE PRECISION for dpbsvx

COMPLEX for cpbsvx

DOUBLE COMPLEX for zpbsvx.

Arrays: *ab*(size *ldab* by *), *afb*(size *ldafb* by *), *b*(size *ldb* by *), *work*(*).

The array *ab* contains the upper or lower triangle of the matrix *A* in *band storage* (see Matrix Storage Schemes).

If *fact* = 'F' and *equed* = 'Y', then *ab* must contain the equilibrated matrix *diag*(*s*)***A***diag*(*s*). The second dimension of *ab* must be at least max(1, *n*).

The array *afb* is an input argument if *fact* = 'F'. It contains the triangular factor *U* or *L* from the Cholesky factorization of the band matrix *A* in the same storage format as *A*. If *equed* = 'Y', then *afb* is the factored form of the equilibrated matrix *A*. The second dimension of *afb* must be at least max(1, *n*).

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1, *nrhs*).

work(*) is a workspace array.

The dimension of *work* must be at least max(1,3**n*) for real flavors, and at least max(1,2**n*) for complex flavors.

ldab — INTEGER. The leading dimension of *ab*; *ldab*≥*kd*+1.

ldafb — INTEGER. The leading dimension of *afb*; *ldafb*≥*kd*+1.

ldb — INTEGER. The leading dimension of *b*; *ldb*≥ max(1, *n*).

equed — CHARACTER*1. Must be 'N' or 'Y'.

equed is an input argument if *fact* = 'F'. It specifies the form of equilibration that was done:

if *equed* = 'N', no equilibration was done (always true if *fact* = 'N')

if *equed* = 'Y', equilibration was done, that is, *A* has been replaced by *diag*(*s*)***A***diag*(*s*).

s — REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size (*n*). The array *s* contains the scale factors for *A*. This array is an input argument if *fact* = 'F' only; otherwise it is an output argument.

If *equed* = 'N', *s* is not accessed.

If *fact* = 'F' and *equed* = 'Y', each element of *s* must be positive.

ldx INTEGER. The leading dimension of the output array *x*; *ldx*≥ max(1, *n*).

iwork INTEGER. Workspace array, size at least max(1, *n*); used in real flavors only.

rwork REAL for cpbsvx

DOUBLE PRECISION for zpbsvx.

Workspace array, size at least max(1, *n*); used in complex flavors only.

Output Parameters

x REAL for spbsvx

DOUBLE PRECISION for dpbsvx

COMPLEX for cpbsvx

DOUBLE COMPLEX for zpbsvx.

Array, size *ldx* by *.

If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X* to the *original* system of equations. Note that if *equed* = 'Y', *A* and *B* are modified on exit, and the solution to the equilibrated system is inv(*diag*(*s*))***X*. The second dimension of *x* must be at least max(1,*nrhs*).

ab On exit, if *fact* = 'E'and *equed* = 'Y', *A* is overwritten by *diag*(*s*)***A***diag*(*s*).

afb If *fact* = 'N'or 'E', then *afb* is an output argument and on exit returns the triangular factor *U* or *L* from the Cholesky factorization $A=U^{T}*U$ or $A=L*L^{T}$ (real routines), $A=U^{H}*U$ or $A=L*L^{H}$ (complex routines) of the original matrix *A* (if *fact* = 'N'), or of the equilibrated matrix *A* (if *fact* = 'E'). See the description of *ab* for the form of the equilibrated matrix.

b Overwritten by *diag*(*s*)***B*, if *equed* = 'Y'; not changed if *equed* = 'N'.

s This array is an output argument if *fact*≠'F'. See the description of *s* in *Input Arguments* section.

rcond REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

An estimate of the reciprocal condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision (in particular, if *rcond* = 0), the matrix is singular to working precision. This condition is indicated by a return code of *info* > 0.

ferr

`REAL` for single precision flavors

`DOUBLE PRECISION` for double precision flavors.

Array, size at least `max(1, nrhs)`. Contains the estimated forward error bound for each solution vector `x(j)` (the *j*-th column of the solution matrix *X*). If *xtrue* is the true solution corresponding to `x(j)`, `ferr(j)` is an estimated upper bound for the magnitude of the largest element in `(x(j) - xtrue)` divided by the magnitude of the largest element in `x(j)`. The estimate is as reliable as the estimate for *rcond*, and is almost always a slight overestimate of the true error.

berr

`REAL` for single precision flavors

`DOUBLE PRECISION` for double precision flavors.

Array, size at least `max(1, nrhs)`. Contains the component-wise relative backward error for each solution vector `x(j)`, that is, the smallest relative change in any element of *A* or *B* that makes `x(j)` an exact solution.

equed

If `fact`≠`'F'`, then *equed* is an output argument. It specifies the form of equilibration that was done (see the description of *equed* in *Input Arguments* section).

info

`INTEGER`. If `info = 0`, the execution is successful.

If `info = -i`, the *i*-th parameter had an illegal value.

If `info = i`, and `i`≤`n`, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive definite, so the factorization could not be completed, and the solution and error bounds could not be computed; *rcond* =0 is returned. If `info = i`, and *i* = *n* + 1, then *U* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `pbsvx` interface are as follows:

ab

Holds the array *A* of size (`kd`+1,`n`).

b

Holds the matrix *B* of size (`n`,`nrhs`).

x

Holds the matrix *X* of size (`n`,`nrhs`).

afb

Holds the array *AF* of size (`kd`+1,`n`).

s	Holds the vector with the number of elements *n*. Default value for each element is `s(i) = 1.0_WP`.
ferr	Holds the vector with the number of elements *nrhs*.
berr	Holds the vector with the number of elements *nrhs*.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
fact	Must be `'N'`, `'E'`, or `'F'`. The default value is `'N'`. If `fact = 'F'`, then *af* must be present; otherwise, an error is returned.
equed	Must be `'N'` or `'Y'`. The default value is `'N'`.

Description

The routine solves for *X* the real or complex system of linear equations `A*X = B`, where *A* is an *n*-by-*n* symmetric/Hermitian positive-definite tridiagonal matrix, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

A is factored as $A = L*D*L^T$ (real flavors) or $A = L*D*L^H$ (complex flavors), and the factored form of *A* is then used to solve the system of equations `A*X = B`.

Input Parameters

n	`INTEGER`. The order of matrix *A*; $n \geq 0$.
nrhs	`INTEGER`. The number of right-hand sides, the number of columns in *B*; $nrhs \geq 0$.
d	`REAL` for single precision flavors `DOUBLE PRECISION` for double precision flavors.

	Array, dimension at least `max(1, n)`. Contains the diagonal elements of the tridiagonal matrix *A*.

e, *b*	`REAL` for `sptsv`
	`DOUBLE PRECISION` for `dptsv`
	`COMPLEX` for `cptsv`
	`DOUBLE COMPLEX` for `zptsv`.
	Arrays: *e* (size *n* - 1), *b*(size *ldb* by *). The array *e* contains the `(n - 1)` subdiagonal elements of *A*.
	The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least `max(1,nrhs)`.

ldb	`INTEGER`. The leading dimension of *b*; *ldb*≥ `max(1, n)`.

Output Parameters

d	Overwritten by the *n* diagonal elements of the diagonal matrix *D* from the $L*D*L^T$ (real)/ $L*D*L^H$ (complex) factorization of *A*.
e	Overwritten by the `(n - 1)` subdiagonal elements of the unit bidiagonal factor *L* from the factorization of *A*.
b	Overwritten by the solution matrix *X*.
info	`INTEGER`. If *info* `= 0`, the execution is successful. If *info* `= -i`, the *i*-th parameter had an illegal value. If *info* `= i`, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite, and the solution has not been computed. The factorization has not been completed unless *i* `= n`.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `ptsv` interface are as follows:

d	Holds the vector of length *n*.
e	Holds the vector of length (*n*-1).
b	Holds the matrix *B* of size (*n*,*nrhs*).

call zptsvx( fact, n, nrhs, d, e, df, ef, b, ldb, x, ldx, rcond, ferr, berr, work, rwork, info )
call ptsvx( d, e, b, x [,df] [,ef] [,fact] [,ferr] [,berr] [,rcond] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine uses the Cholesky factorization $A = L*D*L^T$ (real)/$A = L*D*L^H$ (complex) to compute the solution to a real or complex system of linear equations $A*X = B$, where A is a n-by-n symmetric or Hermitian positive definite tridiagonal matrix, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?ptsvx performs the following steps:

1. If *fact* = 'N', the matrix A is factored as $A = L*D*L^T$ (real flavors)/$A = L*D*L^H$ (complex flavors), where L is a unit lower bidiagonal matrix and D is diagonal. The factorization can also be regarded as having the form $A = U^T*D*U$ (real flavors)/$A = U^H*D*U$ (complex flavors).
2. If the leading i-by-i principal minor is not positive-definite, then the routine returns with *info* = i. Otherwise, the factored form of A is used to estimate the condition number of the matrix A. If the reciprocal of the condition number is less than machine precision, *info* = n+1 is returned as a warning, but the routine still goes on to solve for X and compute error bounds as described below.
3. The system of equations is solved for X using the factored form of A.
4. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.

Input Parameters

fact

CHARACTER*1. Must be 'F' or 'N'.

Specifies whether or not the factored form of the matrix A is supplied on entry.

If *fact* = 'F': on entry, *df* and *ef* contain the factored form of A. Arrays *d*, *e*, *df*, and *ef* will not be modified.

If *fact* = 'N', the matrix A will be copied to *df* and *ef*, and factored.

n

INTEGER. The order of matrix A; $n \geq 0$.

nrhs

INTEGER. The number of right-hand sides, the number of columns in B; *nrhs* ≥ 0.

d, *df*, *rwork*

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Arrays: *d* (size *n*), *df* (size *n*), *rwork*(*n*).

The array *d* contains the *n* diagonal elements of the tridiagonal matrix *A*.

The array *df* is an input argument if *fact* = 'F' and on entry contains the *n* diagonal elements of the diagonal matrix *D* from the $L*D*L^T$ (real)/ $L*D*L^H$ (complex) factorization of *A*.

The array *rwork* is a workspace array used for complex flavors only.

e,*ef*,*b*,*work*

REAL for sptsvx

DOUBLE PRECISION for dptsvx

COMPLEX for cptsvx

DOUBLE COMPLEX for zptsvx.

Arrays: *e* (size *n* -1), *ef* (size *n* -1), *b*(size *ldb*, *), *work*(*). The array *e* contains the (*n* – 1) subdiagonal elements of the tridiagonal matrix *A*.

The array *ef* is an input argument if *fact* = 'F' and on entry contains the (*n* – 1) subdiagonal elements of the unit bidiagonal factor *L* from the $L*D*L^T$ (real)/ $L*D*L^H$ (complex) factorization of *A*.

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations.

The array *work* is a workspace array. The dimension of *work* must be at least 2*n for real flavors, and at least *n* for complex flavors.

ldb

INTEGER. The leading dimension of *b*; *ldb*≥ max(1, *n*).

ldx

INTEGER. The leading dimension of *x*; *ldx*≥ max(1, *n*).

Output Parameters

x

REAL for sptsvx

DOUBLE PRECISION for dptsvx

COMPLEX for cptsvx

DOUBLE COMPLEX for zptsvx.

Array, size *ldx* by *.

If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X* to the system of equations. The second dimension of *x* must be at least max(1,*nrhs*).

df, *ef*

These arrays are output arguments if *fact* = 'N'. See the description of *df*, *ef* in *Input Arguments* section.

rcond

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

An estimate of the reciprocal condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision (in particular, if *rcond* = 0), the matrix is singular to working precision. This condition is indicated by a return code of *info* > 0.

ferr

`REAL` for single precision flavors

`DOUBLE PRECISION` for double precision flavors.

Array, size at least `max(1, nrhs)`. Contains the estimated forward error bound for each solution vector `x(j)` (the *j*-th column of the solution matrix *X*). If *xtrue* is the true solution corresponding to `x(j)`, `ferr(j)` is an estimated upper bound for the magnitude of the largest element in `(x(j) - xtrue)` divided by the magnitude of the largest element in `x(j)`. The estimate is as reliable as the estimate for `rcond`, and is almost always a slight overestimate of the true error.

berr

`REAL` for single precision flavors

`DOUBLE PRECISION` for double precision flavors.

Array, size at least `max(1, nrhs)`. Contains the component-wise relative backward error for each solution vector `x(j)`, that is, the smallest relative change in any element of *A* or *B* that makes `x(j)` an exact solution.

info

`INTEGER`. If `info = 0`, the execution is successful.

If `info = -i`, the *i*-th parameter had an illegal value.

If `info = i`, and $i \le n$, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite, so the factorization could not be completed, and the solution and error bounds could not be computed; *rcond* =0 is returned.

If `info = i`, and $i = n + 1$, then *U* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `ptsvx` interface are as follows:

d

Holds the vector of length *n*.

e

Holds the vector of length (*n*-1).

b

Holds the matrix *B* of size (*n*,*nrhs*).

x

Holds the matrix *X* of size (*n*,*nrhs*).

df

Holds the vector of length *n*.

ef	Holds the vector of length (*n*-1).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
fact	Must be 'N' or 'F'. The default value is 'N'. If *fact* = 'F', then both arguments *af* and *ipiv* must be present; otherwise, an error is returned.

Description

The routine solves for *X* the real or complex system of linear equations *A*X = B*, where *A* is an *n*-by-*n* symmetric matrix, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

The diagonal pivoting method is used to factor *A* as $A = U*D*U^T$ or $A = L*D*L^T$, where *U* (or *L*) is a product of permutation and unit upper (lower) triangular matrices, and *D* is symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

The factored form of *A* is then used to solve the system of equations *A*X = B*.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of *A* is stored: If *uplo* = 'U', the upper triangle of *A* is stored. If *uplo* = 'L', the lower triangle of *A* is stored.
n	INTEGER. The order of matrix *A*; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides; the number of columns in *B*; $nrhs \geq 0$.

a, *b*, *work*	REAL for ssysv DOUBLE PRECISION for dsysv COMPLEX for csysv DOUBLE COMPLEX for zsysv. Arrays: *a*(size *lda* by *), *b*(size *ldb* by *), *work*(*). The array *a* contains the upper or the lower triangular part of the symmetric matrix *A* (see *uplo*). The second dimension of *a* must be at least max(1, *n*). The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*). *work* is a workspace array, dimension at least max(1,*lwork*).
lda	INTEGER. The leading dimension of *a*; *lda*≥ max(1, *n*).
ldb	INTEGER. The leading dimension of *b*; *ldb*≥ max(1, *n*).
lwork	INTEGER. The size of the *work* array; *lwork*≥ 1. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* below for details and for the suggested value of *lwork*.

Output Parameters

a	If *info* = 0, *a* is overwritten by the block-diagonal matrix *D* and the multipliers used to obtain the factor *U* (or *L*) from the factorization of *A* as computed by ?sytrf.
b	If *info* = 0, *b* is overwritten by the solution matrix *X*.
ipiv	INTEGER. Array, size at least max(1, *n*). Contains details of the interchanges and the block structure of *D*, as determined by ?sytrf. If *ipiv*(*i*) = *k* >0, then d_{ii} is a 1-by-1 diagonal block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column. If *uplo* = 'U' and *ipiv*(*i*) = *ipiv*(*i*-1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*–1, and (*i*–1)-th row and column of *A* was interchanged with the *m*-th row and column. If *uplo* = 'L'and *ipiv*(*i*) = *ipiv*(*i*+1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*+1, and (*i*+1)-th row and column of *A* was interchanged with the *m*-th row and column.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful.

If *info* = *-i*, the *i*-th parameter had an illegal value.

If *info* = *i*, d_{ii} is 0. The factorization has been completed, but *D* is exactly singular, so the solution could not be computed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `sysv` interface are as follows:

a	Holds the matrix *A* of size (*n*,*n*).
b	Holds the matrix *B* of size (*n*,*nrhs*).
ipiv	Holds the vector of length *n*.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

For better performance, try using *lwork* = *n*blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?sysv_aa

*Computes the solution to a system of linear equations A * X = B for symmetric matrices.*

```
call ssysv_aa(uplo, n, nrhs, A, lda, ipiv, B, ldb, work, lwork, info)
call csysv_aa(uplo, n, nrhs, A, lda, ipiv, B, ldb, work, lwork, info)
call dsysv_aa(uplo, n, nrhs, A, lda, ipiv, B, ldb, work, lwork, info)
call zsysv_aa(uplo, n, nrhs, A, lda, ipiv, B, ldb, work, lwork, info)
```

Description

The `?sysv` routine computes the solution to a complex system of linear equations A * X = B, where A is an *n*-by-*n* symmetric matrix and X and B are *n*-by-*nrhs* matrices.

Aasen's algorithm is used to factor A as A = U * T * U^T, if *uplo* = `'U'`, or A = L * T * L^T, if *uplo* = `'L'`, where U (or L) is a product of permutation and unit upper (lower) triangular matrices, and T is symmetric tri-diagonal. The factored form of A is then used to solve the system of equations A * X= B.

Input Parameters

uplo

CHARACTER*1

- = 'U': The upper triangle of A is stored.
- = 'L': The lower triangle of A is stored.

n

INTEGER

The number of linear equations; that is, the order of the matrix A. *n* ≥ 0.

nrhs

INTEGER

The number of right-hand sides; that is, the number of columns of the matrix B. *nrhs* ≥ 0.

A

REAL for ssysv_aa

DOUBLE PRECISION for dsysv_aa

COMPLEX for csysv_aa

COMPLEX*16 for zsysv_aa

Array, dimension (*lda*,*n*). On entry, the symmetric matrix A. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of A contains the upper triangular part of the matrix A, and the strictly lower triangular part of A is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of A contains the lower triangular part of the matrix A, and the strictly upper triangular part of A is not referenced.

lda

INTEGER

The leading dimension of the array *A*.*lda* ≥ max(1, *n*).

B

REAL for ssysv_aa

DOUBLE PRECISION for dsysv_aa

COMPLEX for csysv_aa

COMPLEX*16 for zsysv_aa

Array, dimension (*ldb*,*nrhs*). On entry, the *n*-by-*nrhs* right-hand side matrix B.

ldb

INTEGER

The leading dimension of the array *B*. *ldb* ≥ max(1, *n*).

lwork

INTEGER

The length of the array *work*.

If *lwork* = *-1*, a workspace query is assumed; the routine calculates only the optimal size of the work array and returns this value as the first entry of the work array, and no error message related to *lwork* is issued by XERBLA.

Output Parameters

A

REAL for ssysv_aa

DOUBLE PRECISION for dsysv_aa

COMPLEX for csysv_aa

COMPLEX*16 for zsysv_aa

On exit, if *info* = 0, the tridiagonal matrix T and the multipliers used to obtain the factor U or L from the factorization A = U*T*U^T or A = L*T*L^T as computed by ?sytrf.

ipiv — INTEGER

Array, dimension (*n*). On exit, it contains the details of the interchanges; that is, the row and column *k* of A were interchanged with the row and column ipiv(*k*).

B — REAL for ssysv_aa

DOUBLE PRECISION for dsytrs_aa

COMPLEX for csysv_aa

COMPLEX*16 for zsysv_aa

On exit, if *info* = 0, the *n*-by-*nrhs* solution matrix X.

work — REAL for ssysv_aa

DOUBLE PRECISION for dsytrs_aa

COMPLEX for csysv_aa

COMPLEX*16 for zsysv_aa

Array, dimension (MAX(1,*lwork*)). On exit, if *info* = 0, *work*(1) returns the optimal *lwork*.

info — INTEGER

- = 0: Successful exit.
- < 0: If *info* = -*i*, the i^{th} argument had an illegal value.
- > 0: If *info* = *i*, D(*i*,*i*) is exactly zero. The factorization has been completed, but the block diagonal matrix D is exactly singular, so the solution could not be computed.

?sysv_rook

Computes the solution to the system of linear equations with a real or complex symmetric coefficient matrix A and multiple right-hand sides.

Syntax

```
call ssysv_rook( uplo, n, nrhs, a, lda, ipiv, b, ldb, work, lwork, info )
call dsysv_rook( uplo, n, nrhs, a, lda, ipiv, b, ldb, work, lwork, info )
call csysv_rook( uplo, n, nrhs, a, lda, ipiv, b, ldb, work, lwork, info )
call zsysv_rook( uplo, n, nrhs, a, lda, ipiv, b, ldb, work, lwork, info )
call sysv_rook( a, b [,uplo] [,ipiv] [,info] )
```

Include Files

Description

The routine solves for *X* the real or complex system of linear equations `A*X = B`, where *A* is an *n*-by-*n* symmetric matrix, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

The diagonal pivoting method is used to factor *A* as $A = U*D*U^T$ or $A = L*D*L^T$, where *U* (or *L*) is a product of permutation and unit upper (lower) triangular matrices, and *D* is symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

The `?sysv_rook` routine is called to compute the factorization of a complex symmetric matrix *A* using the bounded Bunch-Kaufman ("rook") diagonal pivoting method.

The factored form of *A* is then used to solve the system of equations `A*X = B`.

Input Parameters

uplo

`CHARACTER*1`. Must be `'U'` or `'L'`.

Indicates whether the upper or lower triangular part of *A* is stored:

If `uplo = 'U'`, the upper triangle of *A* is stored.

If `uplo = 'L'`, the lower triangle of *A* is stored.

n

`INTEGER`. The order of matrix *A*; $n \geq 0$.

nrhs

`INTEGER`. The number of right-hand sides; the number of columns in *B*; $nrhs \geq 0$.

a, *b*, *work*

`REAL` for `ssysv_rook`

`DOUBLE PRECISION` for `dsysv_rook`

`COMPLEX` for `csysv_rook`

`DOUBLE COMPLEX` for `zsysv_rook`.

Arrays: *a*(size *lda* by *), *b*(size *ldb* by *), `work(*)`.

The array *a* contains the upper or the lower triangular part of the symmetric matrix *A* (see *uplo*). The second dimension of *a* must be at least `max(1, n)`.

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least `max(1,nrhs)`.

work is a workspace array, dimension at least `max(1,lwork)`.

lda

`INTEGER`. The leading dimension of *a*; $lda \geq \max(1, n)$.

ldb

`INTEGER`. The leading dimension of *b*; $ldb \geq \max(1, n)$.

lwork

`INTEGER`. The size of the *work* array; $lwork \geq 1$.

If `lwork = -1`, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by `xerbla`. See *Application Notes* below for details and for the suggested value of *lwork*.

Output Parameters

a	If *info* = 0, *a* is overwritten by the block-diagonal matrix *D* and the multipliers used to obtain the factor *U* (or *L*) from the factorization of *A* as computed by sytrf_rook.
b	If *info* = 0, *b* is overwritten by the solution matrix *X*.
ipiv	INTEGER. Array, size at least max(1, *n*). Contains details of the interchanges and the block structure of *D*, as determined by sytrf_rook. If *ipiv*(*k*) > 0, then rows and columns *k* and *ipiv*(*k*) were interchanged and $D_{k,k}$ is a 1-by-1 diagonal block. If *uplo* = 'U' and *ipiv*(*k*) < 0 and *ipiv*(*k* – 1) < 0, then rows and columns *k* and -*ipiv*(*k*) were interchanged, rows and columns *k* - 1 and -*ipiv*(*k* - 1) were interchanged, and $D_{k-1:k,\ k-1:k}$ is a 2-by-2 diagonal block. If *uplo* = 'L' and *ipiv*(*k*) < 0 and *ipiv*(*k* + 1) < 0, then rows and columns *k* and -*ipiv*(*k*) were interchanged, rows and columns *k* + 1 and -*ipiv*(*k* + 1) were interchanged, and $D_{k:k+1,\ k:k+1}$ is a 2-by-2 diagonal block.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, d_{ii} is 0. The factorization has been completed, but *D* is exactly singular, so the solution could not be computed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine sysv_rook interface are as follows:

a	Holds the matrix *A* of size (*n*,*n*).
b	Holds the matrix *B* of size (*n*,*nrhs*).
ipiv	Holds the vector of length *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.

?sysv_rk

*Computes the solution to system of linear equations A * X = B for SY matrices.*

```
call ssysv_rk(uplo, n, nrhs, A, lda, e, ipiv, B, ldb, work, lwork, info)
```

```
call dsysv_rk(uplo, n, nrhs, A, lda, e, ipiv, B, ldb, work, lwork, info)
call csysv_rk(uplo, n, nrhs, A, lda, e, ipiv, B, ldb, work, lwork, info)
call zsysv_rk(uplo, n, nrhs, A, lda, e, ipiv, B, ldb, work, lwork, info)
```

Description

?sysv_rk computes the solution to a real or complex system of linear equations A * X = B, where A is an *n*-by-*n* symmetric matrix and X and B are *n*-by-*nrhs* matrices.

The bounded Bunch-Kaufman (rook) diagonal pivoting method is used to factor A as A= P*U*D*(U^T)*(P^T), if *uplo* = 'U', or A= P*L*D*(L^T)*(P^T), if *uplo* = 'L', where U (or L) is unit upper (or lower) triangular matrix, U^T (or L^T) is the transpose of U (or L), P is a permutation matrix, P^T is the transpose of P, and D is symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

?sytrf_rk is called to compute the factorization of a real or complex symmetric matrix. The factored form of A is then used to solve the system of equations A * X = B by calling BLAS3 routine ?sytrs_3.

Input Parameters

uplo

CHARACTER*1

Specifies whether the upper or lower triangular part of the symmetric matrix A is stored:

- = 'U': The upper triangle of A is stored.
- = 'L': The lower triangle of A is stored.

n

INTEGER

The number of linear equations; that is, the order of the matrix A. *n* ≥ 0.

nrhs

INTEGER

The number of right-hand sides; that is, the number of columns of the matrix B. *nrhs* ≥ 0.

A

REAL for ssysv_rk

DOUBLE PRECISION for dsysv_rk

COMPLEX for csysv_rk

COMPLEX*16 for zsysv_rk

Array, dimension (*lda*,*n*). On entry, the symmetric matrix A. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of A contains the upper triangular part of the matrix A, and the strictly lower triangular part of A is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of A contains the lower triangular part of the matrix A, and the strictly upper triangular part of A is not referenced.

lda

INTEGER

The leading dimension of the array *A*.*lda* ≥ max(1, *n*).

B

REAL for ssysv_rk

DOUBLE PRECISION for dsysv_rk

COMPLEX for csysv_rk

COMPLEX*16 for zsysv_rk

Array, dimension (*ldb*,*nrhs*). On entry, the *n*-by-*nrhs* right-hand side matrix B.

ldb INTEGER

The leading dimension of the array *B*. *ldb* ≥ max(1, *n*).

lwork INTEGER

The length of the array *work*.

If *lwork* = *-1*, a workspace query is assumed; the routine calculates only the optimal size of the *work* array for factorization stage and returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by XERBLA.

Output Parameters

A REAL for ssysv_rk

DOUBLE PRECISION for dsysv_rk

COMPLEX for csysv_rk

COMPLEX*16 for zsysv_rk

On exit, if *info* = 0, the diagonal of the block diagonal matrix D and factors U or L as computed by ?sytrf_rk:

- *Only* diagonal elements of the symmetric block diagonal matrix D on the diagonal of A; that is, D(*k*,*k*) = A(*k*,*k*). Superdiagonal (or subdiagonal) elements of D are stored on exit in array *e*.
- If *uplo* = 'U', factor U in the superdiagonal part of A. If *uplo* = 'L', factor L in the subdiagonal part of A. For more information, see the description of the ?sytrf_rk routine.

e REAL for ssysv_rk

DOUBLE PRECISION for dsysv_rk

COMPLEX for csysv_rk

COMPLEX*16 for zsysv_rk

Array, dimension (*n*). On exit, contains the output computed by the factorization routine ?sytrf_rk; that is, the superdiagonal (or subdiagonal) elements of the symmetric block diagonal matrix D with 1-by-1 or 2-by-2 diagonal blocks. If *uplo* = 'U', e(*i*) = D(*i*–1,*i*), *i*=1:N–1, and e(1) is set to 0. If *uplo* = 'L', e(*i*) = D(*i*+1,*i*), *i*=1:N–1, and e(*n*) is set to 0.

NOTE For 1-by-1 diagonal block D(*k*), where 1 ≤ k ≤ *n*, the element e(*k*) is set to 0 in both the *uplo* = 'U' and *uplo* = 'L' cases. For more information, see the description of the?sytrf_rk routine.

ipiv INTEGER

Array, dimension (*n*). Details of the interchanges and the block structure of D, as determined by `?sytrf_rk`. For more information, see the description of the `?sytrf_rk` routine.

B

`REAL` for `ssysv_rk`

`DOUBLE PRECISION` for `dsysv_rk`

`COMPLEX` for `csysv_rk`

`COMPLEX*16` for `zsysv_rk`

On exit, if *info* = 0, the *n*-by-*nrhs* solution matrix X.

work

`REAL` for `ssysv_rk`

`DOUBLE PRECISION` for `dsysv_rk`

`COMPLEX` for `csysv_rk`

`COMPLEX*16` for `zsysv_rk`

Array, dimension (MAX(1,*lwork*)). Work array used in the factorization stage. On exit, if *info* = 0, *work*(1) returns the optimal *lwork*.

info

`INTEGER`

- = 0: successful exit.
- < 0: If *info* = *-k*, the k^{th} argument had an illegal value.
- > 0: If *info* = *k*, the matrix A is singular. If *uplo* = `'U'`, column *k* in the upper triangular part of A contains all zeros. If *uplo* = `'L'`, column *k* in the lower triangular part of A contains all zeros. Therefore D(*k*,*k*) is exactly zero, and superdiagonal elements of column *k* of U (or subdiagonal elements of column *k* of L) are all zeros. The factorization has been completed, but the block diagonal matrix D is exactly singular, and division by zero will occur if it is used to solve a system of equations.

NOTE *info* stores only the first occurrence of a singularity; any subsequent occurrence of singularity is not stored in *info* even though the factorization always completes.

?sysvx

Uses the diagonal pivoting factorization to compute the solution to the system of linear equations with a real or complex symmetric coefficient matrix A, and provides error bounds on the solution.

Syntax

```
call ssysvx( fact, uplo, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, rcond, ferr, berr, work, lwork, iwork, info )
```

```
call dsysvx( fact, uplo, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, rcond, ferr, berr, work, lwork, iwork, info )
```

```
call csysvx( fact, uplo, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, rcond, ferr, berr, work, lwork, rwork, info )
```

```
call zsysvx( fact, uplo, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, rcond, ferr, berr, work, lwork, rwork, info )
call sysvx( a, b, x [,uplo] [,af] [,ipiv] [,fact] [,ferr] [,berr] [,rcond] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine uses the diagonal pivoting factorization to compute the solution to a real or complex system of linear equations *A*X = B*, where *A* is a *n*-by-*n* symmetric matrix, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?sysvx performs the following steps:

1. If *fact = 'N'*, the diagonal pivoting method is used to factor the matrix *A*. The form of the factorization is $A = U*D*U^T$ or $A = L*D*L^T$, where *U* (or *L*) is a product of permutation and unit upper (lower) triangular matrices, and *D* is symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.
2. If some $d_{i,i}$= 0, so that *D* is exactly singular, then the routine returns with *info = i*. Otherwise, the factored form of *A* is used to estimate the condition number of the matrix *A*. If the reciprocal of the condition number is less than machine precision, *info = n*+1 is returned as a warning, but the routine still goes on to solve for *X* and compute error bounds as described below.
3. The system of equations is solved for *X* using the factored form of *A*.
4. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.

Input Parameters

fact

CHARACTER*1. Must be 'F' or 'N'.

Specifies whether or not the factored form of the matrix *A* has been supplied on entry.

If *fact = 'F'*: on entry, *af* and *ipiv* contain the factored form of *A*. Arrays *a*, *af*, and *ipiv* will not be modified.

If *fact = 'N'*, the matrix *A* will be copied to *af* and factored.

uplo

CHARACTER*1. Must be 'U' or 'L'.

Indicates whether the upper or lower triangular part of *A* is stored:

If *uplo = 'U'*, the upper triangle of *A* is stored.

If *uplo = 'L'*, the lower triangle of *A* is stored.

n

INTEGER. The order of matrix *A*; $n \geq 0$.

nrhs

INTEGER. The number of right-hand sides, the number of columns in *B*; $nrhs \geq 0$.

a, *af*, *b*, *work*

REAL for ssysvx

DOUBLE PRECISION for dsysvx

COMPLEX for csysvx

DOUBLE COMPLEX for zsysvx.

Arrays: *a*(size *lda* by *), *af*(size *ldaf* by *), *b*(size *ldb* by *), *work*(*).

The array *a* contains the upper or the lower triangular part of the symmetric matrix *A* (see *uplo*). The second dimension of *a* must be at least max(1,*n*).

The array *af* is an input argument if *fact* = 'F'. It contains the block diagonal matrix *D* and the multipliers used to obtain the factor *U* or *L* from the factorization $A = U*D*U^T$ or $A = L*D*L^T$ as computed by ?sytrf. The second dimension of *af* must be at least max(1,*n*).

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1, *nrhs*).

work(*) is a workspace array, dimension at least max(1,*lwork*).

lda — INTEGER. The leading dimension of *a*; *lda* ≥ max(1, *n*).

ldaf — INTEGER. The leading dimension of *af*; *ldaf* ≥ max(1, *n*).

ldb — INTEGER. The leading dimension of *b*; *ldb* ≥ max(1, *n*).

ipiv — INTEGER.

Array, size at least max(1, *n*). The array *ipiv* is an input argument if *fact* = 'F'. It contains details of the interchanges and the block structure of *D*, as determined by ?sytrf.

If *ipiv*(*i*) = *k* > 0, then d_{ii} is a 1-by-1 diagonal block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column.

If *uplo* = 'U' and *ipiv*(*i*) = *ipiv*(*i*–1) = –*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*–1, and (*i*–1)-th row and column of *A* was interchanged with the *m*-th row and column.

If *uplo* = 'L' and *ipiv*(*i*) = *ipiv*(*i*+1) = –*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*+1, and (*i*+1)-th row and column of *A* was interchanged with the *m*-th row and column.

ldx — INTEGER. The leading dimension of the output array *x*; *ldx* ≥ max(1, *n*).

lwork — INTEGER. The size of the *work* array.

If *lwork* = –1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* below for details and for the suggested value of *lwork*.

iwork — INTEGER. Workspace array, size at least max(1, *n*); used in real flavors only.

rwork — REAL for csysvx;

DOUBLE PRECISION for zsysvx.

Workspace array, size at least `max(1, n)`; used in complex flavors only.

Output Parameters

x

`REAL` for `ssysvx`

`DOUBLE PRECISION` for `dsysvx`

`COMPLEX` for `csysvx`

`DOUBLE COMPLEX` for `zsysvx`.

Array, size *ldx* by *.

If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X* to the system of equations. The second dimension of *x* must be at least `max(1,nrhs)`.

af, *ipiv*

These arrays are output arguments if *fact* = 'N'.

See the description of *af*, *ipiv* in *Input Arguments* section.

rcond

`REAL` for single precision flavors

`DOUBLE PRECISION` for double precision flavors.

An estimate of the reciprocal condition number of the matrix *A*. If *rcond* is less than the machine precision (in particular, if *rcond* = 0), the matrix is singular to working precision. This condition is indicated by a return code of *info* > 0.

ferr

`REAL` for single precision flavors

`DOUBLE PRECISION` for double precision flavors.

Array, size at least `max(1, nrhs)`. Contains the estimated forward error bound for each solution vector *x*(*j*) (the *j*-th column of the solution matrix *X*). If *xtrue* is the true solution corresponding to *x*(*j*), *ferr*(*j*) is an estimated upper bound for the magnitude of the largest element in (*x*(*j*) - *xtrue*) divided by the magnitude of the largest element in *x*(*j*). The estimate is as reliable as the estimate for *rcond*, and is almost always a slight overestimate of the true error.

berr

`REAL` for single precision flavors

`DOUBLE PRECISION` for double precision flavors.

Array, size at least `max(1, nrhs)`. Contains the component-wise relative backward error for each solution vector *x*(*j*), that is, the smallest relative change in any element of *A* or *B* that makes *x*(*j*) an exact solution.

work(1)

If *info*=0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info

`INTEGER`. If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, and *i*≤*n*, then d_{ii} is exactly zero. The factorization has been completed, but the block diagonal matrix *D* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned.

If *info* = *i*, and *i* = *n* + 1, then *D* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `sysvx` interface are as follows:

a	Holds the matrix *A* of size (*n*,*n*).
b	Holds the matrix *B* of size (*n*,*nrhs*).
x	Holds the matrix *X* of size (*n*,*nrhs*).
af	Holds the matrix *AF* of size (*n*,*n*).
ipiv	Holds the vector of length *n*.
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
fact	Must be `'N'` or `'F'`. The default value is `'N'`. If *fact* = `'F'`, then both arguments *af* and *ipiv* must be present; otherwise, an error is returned.

Application Notes

The value of *lwork* must be at least `max(1,m*n)`, where for real flavors *m* = 3 and for complex flavors *m* = 2. For better performance, try using *lwork* = `max(1, m*n, n*blocksize)`, where *blocksize* is the optimal block size for `?sytrf`.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*`(1)`) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

Description

The routine uses the *diagonal pivoting* factorization to compute the solution to a real or complex system of linear equations *A*X = B*, where *A* is an *n*-by-*n* real symmetric/Hermitian matrix, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

Both normwise and maximum componentwise error bounds are also provided on request. The routine returns a solution with a small guaranteed error (O(eps), where eps is the working machine precision) unless the matrix is very ill-conditioned, in which case a warning is returned. Relevant condition numbers are also calculated and returned.

The routine accepts user-provided factorizations and equilibration factors; see definitions of the *fact* and *equed* options. Solving with refinement and using a factorization from a previous call of the routine also produces a solution with O(eps) errors or warnings but that may not be true for general user-provided factorizations and equilibration factors if they differ from what the routine would itself produce.

The routine ?sysvxx performs the following steps:

1. If *fact* = 'E', scaling factors are computed to equilibrate the system:

   *diag(s)*A*diag(s) *inv(diag(s))*X = diag(s)*B*

   Whether or not the system will be equilibrated depends on the scaling of the matrix *A*, but if equilibration is used, *A* is overwritten by *diag(s)*A*diag(s)* and *B* by *diag(s)*B*.
2. If *fact* = 'N' or 'E', the LU decomposition is used to factor the matrix *A* (after equilibration if *fact* = 'E') as

   *A = U*D*U*^{T}, if *uplo* = 'U',

or $A = L*D*L^T$, if *uplo* = 'L',

where *U* or *L* is a product of permutation and unit upper (lower) triangular matrices, and *D* is a symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

3. If some $D(i,i)=0$, so that *D* is exactly singular, the routine returns with *info* = *i*. Otherwise, the factored form of *A* is used to estimate the condition number of the matrix *A* (see the *rcond* parameter). If the reciprocal of the condition number is less than machine precision, the routine still goes on to solve for *X* and compute error bounds.
4. The system of equations is solved for *X* using the factored form of *A*.
5. By default, unless params(1) is set to zero, the routine applies iterative refinement to get a small error and error bounds. Refinement calculates the residual to at least twice the working precision.
6. If equilibration was used, the matrix *X* is premultiplied by *diag(r)* so that it solves the original system before equilibration.

Input Parameters

fact

CHARACTER*1. Must be 'F', 'N', or 'E'.

Specifies whether or not the factored form of the matrix *A* is supplied on entry, and if not, whether the matrix *A* should be equilibrated before it is factored.

If *fact* = 'F', on entry, *af* and *ipiv* contain the factored form of *A*. If *equed* is not 'N', the matrix *A* has been equilibrated with scaling factors given by *s*. Parameters *a*, *af*, and *ipiv* are not modified.

If *fact* = 'N', the matrix *A* will be copied to *af* and factored.

If *fact* = 'E', the matrix *A* will be equilibrated, if necessary, copied to *af* and factored.

uplo

CHARACTER*1. Must be 'U' or 'L'.

Indicates whether the upper or lower triangular part of *A* is stored:

If *uplo* = 'U', the upper triangle of *A* is stored.

If *uplo* = 'L', the lower triangle of *A* is stored.

n

INTEGER. The number of linear equations; the order of the matrix *A*; $n \geq 0$.

nrhs

INTEGER. The number of right-hand sides; the number of columns of the matrices *B* and *X*; $nrhs \geq 0$.

a, *af*, *b*, *work*

REAL for ssysvxx

DOUBLE PRECISION for dsysvxx

COMPLEX for csysvxx

DOUBLE COMPLEX for zsysvxx.

Arrays: *a*(size *lda* by *), *af*(size *ldaf* by *), *b*(size *ldb*, *), *work*(*).

The array *a* contains the symmetric matrix *A* as specified by *uplo*. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A* and the strictly lower triangular part of *a* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower

triangular part of *a* contains the lower triangular part of the matrix *A* and the strictly upper triangular part of *a* is not referenced. The second dimension of *a* must be at least max(1,*n*).

The array *af* is an input argument if *fact* = 'F'. It contains the block diagonal matrix *D* and the multipliers used to obtain the factor *U* and *L* from the factorization $A = U*D*U^T$ or $A = L*D*L^T$ as computed by ?sytrf. The second dimension of *af* must be at least max(1,*n*).

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).

work(*) is a workspace array. The dimension of *work* must be at least max(1,4**n*) for real flavors, and at least max(1,2**n*) for complex flavors.

lda — INTEGER. The leading dimension of the array *a*; *lda* ≥ max(1,*n*).

ldaf — INTEGER. The leading dimension of the array *af*; *ldaf* ≥ max(1,*n*).

ipiv — INTEGER.

Array, size at least max(1, *n*). The array *ipiv* is an input argument if *fact* = 'F'. It contains details of the interchanges and the block structure of *D* as determined by ?sytrf. If *ipiv(k)* > 0, rows and columns *k* and *ipiv(k)* were interchanged and *D(k,k)* is a 1-by-1 diagonal block.

If *uplo* = 'U' and *ipiv(k)* = *ipiv(k–1)* < 0, rows and columns *k-1* and *–ipiv(k)* were interchanged and *D*(*k*–1:*k*, *k*–1:*k*) is a 2-by-2 diagonal block.

If *uplo* = 'L' and *ipiv(k)* = *ipiv(k+1)* < 0, rows and columns *k +1* and *–ipiv(k)* were interchanged and *D*(*k*:*k*+1, *k*:*k*+1) is a 2-by-2 diagonal block.

equed — CHARACTER*1. Must be 'N' or 'Y'.

equed is an input argument if *fact* = 'F'. It specifies the form of equilibration that was done:

If *equed* = 'N', no equilibration was done (always true if *fact* = 'N').

if *equed* = 'Y', both row and column equilibration was done, that is, *A* has been replaced by *diag*(*s*)**A***diag*(*s*).

s — REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size (*n*). The array *s* contains the scale factors for *A*. If *equed* = 'Y', *A* is multiplied on the left and right by diag(*s*).

This array is an input argument if *fact* = 'F' only; otherwise it is an output argument.

If *fact* = 'F' and *equed* = 'Y', each element of *s* must be positive.

Each element of *s* should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

ldb — INTEGER. The leading dimension of the array *b*; *ldb*≥ max(1, *n*).

ldx — INTEGER. The leading dimension of the output array *x*; *ldx*≥ max(1, *n*).

n_err_bnds — INTEGER. Number of error bounds to return for each right hand side and each type (normwise or componentwise). See *err_bnds_norm* and *err_bnds_comp* descriptions in the *Output Arguments* section below.

nparams — INTEGER. Specifies the number of parameters set in *params*. If ≤ 0, the *params* array is never referenced and default values are used.

params — REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size *nparams*. Specifies algorithm parameters. If an entry is less than 0.0, that entry is filled with the default value used for that parameter. Only positions up to *nparams* are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass *nparams* = 0, which prevents the source code from accessing the *params* argument.

params(1) : Whether to perform iterative refinement or not. Default: 1.0 (for single precision flavors), 1.0D+0 (for double precision flavors).

=0.0	No refinement is performed and no error bounds are computed.
=1.0	Use the extra-precise refinement algorithm.

(Other values are reserved for future use.)

params(2) : Maximum number of residual computations allowed for refinement.

Default	10.0
Aggressive	Set to 100.0 to permit convergence using approximate factorizations or factorizations other than *LU*. If the factorization uses a technique other than Gaussian elimination, the guarantees in *err_bnds_norm* and *err_bnds_comp* may no longer be trustworthy.

params(3) : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

iwork INTEGER. Workspace array, size at least max(1, *n*); used in real flavors only.

rwork REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Workspace array, size at least max(1, 3**n*); used in complex flavors only.

Output Parameters

x REAL for ssysvxx

DOUBLE PRECISION for dsysvxx

COMPLEX for csysvxx

DOUBLE COMPLEX for zsysvxx.

Array, size *ldx* by *nrhs*).

If *info* = 0, the array *x* contains the solution *n*-by-*nrhs* matrix *X* to the original system of equations. Note that *A* and *B* are modified on exit if *equed*≠'N', and the solution to the equilibrated system is:

inv(*diag*(*s*))**X*.

a If *fact* = 'E' and *equed* = 'Y', overwritten by *diag*(*s*)**A***diag*(*s*).

af If *fact* = 'N', *af* is an output argument and on exit returns the block diagonal matrix *D* and the multipliers used to obtain the factor *U* or *L* from the factorization $A = U*D*U^{T}$ or $A = L*D*L^{T}$.

b If *equed* = 'N', *B* is not modified.

If *equed* = 'Y', *B* is overwritten by *diag*(*s*)**B*.

s This array is an output argument if *fact*≠'F'. Each element of this array is a power of the radix. See the description of *s* in *Input Arguments* section.

rcond REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision, in particular, if *rcond* = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.

rpvgrw REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Contains the reciprocal pivot growth factor:

$$\|A\|/\|U\|$$

If this is much less than 1, the stability of the *LU* factorization of the (equlibrated) matrix *A* could be poor. This also means that the solution *X*, estimated condition numbers, and error bounds could be unreliable. If factorization fails with `0 < info≤n`, this parameter contains the reciprocal pivot growth factor for the leading *info* columns of *A*.

berr

`REAL` for single precision flavors

`DOUBLE PRECISION` for double precision flavors.

Array, size at least `max(1, nrhs)`. Contains the componentwise relative backward error for each solution vector `x(j)`, that is, the smallest relative change in any element of *A* or *B* that makes `x(j)` an exact solution.

err_bnds_norm

`REAL` for single precision flavors

`DOUBLE PRECISION` for double precision flavors.

Array of size *nrhs* by *n_err_bnds*. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:

Normwise relative error in the *i*-th solution vector

$$\frac{\max_j \left|Xtrue_{ji} - X_{ji}\right|}{\max_j \left|X_{ji}\right|}$$

The array is indexed by the type of error information as described below. Up to three pieces of information are returned.

The first index in *err_bnds_norm(i,:)* corresponds to the *i*-th right-hand side.

The second index in *err_bnds_norm(:,err)* contains the following three fields:

err=1

"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors.

err=2

"Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors. This error bound should only be trusted if the previous boolean is true.

err=3 Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix *Z* are:

$$\|Z\|_\infty \cdot \|Z^{-1}\|_\infty$$

Let *z*=*s***a*, where *s* scales each row by a power of the radix so all absolute row sums of *z* are approximately 1.

err_bnds_comp REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array of size *nrhs* by *n_err_bnds*. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:

Componentwise relative error in the *i*-th solution vector:

$$\max_j \frac{\left|Xtrue_{ji} - X_{ji}\right|}{\left|X_{ji}\right|}$$

The array is indexed by the right-hand side *i*, on which the componentwise relative error depends, and by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is not requested (*params(3)* = 0.0), then *err_bnds_comp* is not accessed. If *n_err_bnds* < 3, then at most the first *(:,n_err_bnds)* entries are returned.

The first index in *err_bnds_comp(i,:)* corresponds to the *i*-th right-hand side.

The second index in *err_bnds_comp(:,err)* contains the following three fields:

err=1 "Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors.

err=2 "Guaranteed" error bpound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and

`sqrt(n)*dlamch(ε)` for double precision flavors. This error bound should only be trusted if the previous boolean is true.

`err`=3

Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold `sqrt(n)*slamch(ε)` for single precision flavors and `sqrt(n)*dlamch(ε)` for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix *Z* are:

$$\|Z\|_\infty \cdot \|Z^{-1}\|_\infty$$

Let `z=s*(a*diag(x))`, where *x* is the solution for the current right-hand side and `s` scales each row of `a*diag(x)` by a power of the radix so all absolute row sums of *z* are approximately 1.

ipiv

If `fact = 'N'`, *ipiv* is an output argument and on exit contains details of the interchanges and the block structure *D*, as determined by `ssytrf` for single precision flavors and `dsytrf` for double precision flavors.

equed

If `fact≠'F'`, then *equed* is an output argument. It specifies the form of equilibration that was done (see the description of *equed* in *Input Arguments* section).

params

If an entry is less than 0.0, that entry is filled with the default value used for that parameter, otherwise the entry is not modified.

info

`INTEGER`. If `info = 0`, the execution is successful. The solution to every right-hand side is guaranteed.

If `info = -i`, the *i*-th parameter had an illegal value.

If 0 < `info`≤*n*: *U*(`info`,`info`) is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution and error bounds could not be computed; `rcond` = 0 is returned.

If `info = n+j`: The solution corresponding to the *j*-th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides *k* with *k* > *j* may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested `params(3) = 0.0`, then the *j*-th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest *j* such that `err_bnds_norm(j,1) = 0.0` or `err_bnds_comp(j,1) = 0.0`. See the definition of `err_bnds_norm` and `err_bnds_comp` for *err* = 1. To get information about all of the right-hand sides, check `err_bnds_norm` or `err_bnds_comp`.

?hesv

Computes the solution to the system of linear equations with a Hermitian matrix A and multiple right-hand sides.

Syntax

```
call chesv( uplo, n, nrhs, a, lda, ipiv, b, ldb, work, lwork, info )
call zhesv( uplo, n, nrhs, a, lda, ipiv, b, ldb, work, lwork, info )
call hesv( a, b [,uplo] [,ipiv] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine solves for X the complex system of linear equations $A*X = B$, where A is an n-by-n symmetric matrix, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

The diagonal pivoting method is used to factor A as $A = U*D*U^H$ or $A = L*D*L^H$, where U (or L) is a product of permutation and unit upper (lower) triangular matrices, and D is Hermitian and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

The factored form of A is then used to solve the system of equations $A*X = B$.

Input Parameters

uplo

CHARACTER*1. Must be 'U' or 'L'.

Indicates whether the upper or lower triangular part of A is stored and how A is factored:

If *uplo* = 'U', the array *a* stores the upper triangular part of the matrix A, and A is factored as $U*D*U^H$.

If *uplo* = 'L', the array *a* stores the lower triangular part of the matrix A, and A is factored as $L*D*L^H$.

n

INTEGER. The order of matrix A; $n \geq 0$.

nrhs

INTEGER. The number of right-hand sides, the number of columns in B; $nrhs \geq 0$.

a, *b*, *work*

COMPLEX for chesv

DOUBLE COMPLEX for zhesv.

Arrays: *a*(size *lda* by *), *b*b(size *ldb* by *), *work*(*). The array *a* contains the upper or the lower triangular part of the Hermitian matrix A (see *uplo*). The second dimension of *a* must be at least max(1, *n*).

The array *b* contains the matrix B whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).

work is a workspace array, dimension at least max(1,*lwork*).

lda INTEGER. The leading dimension of *a*; *lda* ≥ max(1, *n*).

ldb INTEGER. The leading dimension of *b*; *ldb* ≥ max(1, *n*).

lwork INTEGER. The size of the *work* array (*lwork* ≥ 1).

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* below for details and for the suggested value of *lwork*.

Output Parameters

a If *info* = 0, *a* is overwritten by the block-diagonal matrix *D* and the multipliers used to obtain the factor *U* (or *L*) from the factorization of *A* as computed by ?hetrf.

b If *info* = 0, *b* is overwritten by the solution matrix *X*.

ipiv INTEGER.

Array, size at least max(1, *n*). Contains details of the interchanges and the block structure of *D*, as determined by ?hetrf.

If *ipiv*(*i*) = *k* > 0, then d_{ii} is a 1-by-1 diagonal block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column.

If *uplo* = 'U' and *ipiv*(*i*) = *ipiv*(*i*-1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*–1, and (*i*–1)-th row and column of *A* was interchanged with the *m*-th row and column.

If *uplo* = 'L' and *ipiv*(*i*) = *ipiv*(*i*+1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*+1, and (*i*+1)–th row and column of *A* was interchanged with the *m*-th row and column.

work(1) If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info INTEGER. If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, d_{ii} is 0. The factorization has been completed, but *D* is exactly singular, so the solution could not be computed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine hesv interface are as follows:

a Holds the matrix *A* of size (*n*, *n*).

b Holds the matrix *B* of size (*n*, *nrhs*).

ipiv Holds the vector of length *n*.

uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For better performance, try using *lwork = n*blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

Matrix Storage Schemes

?hesv_aa

Computes the solution to system of linear equations for HE matrices.

```
call chesv_aa(uplo, n, nrhs, a, lda, ipiv, b, ldb, work, lwork, info)
call zhesv_aa(uplo, n, nrhs, a, lda, ipiv, b, ldb, work, lwork, info)
```

Description

?hesv_aa computes the solution to a complex system of linear equations $A * X = B$, where A is an n-by-n Hermitian matrix and X and B are n-by-$nrhs$ matrices. Aasen's algorithm is used to factor A as

$A = U * T * U^H$ if *uplo* = 'U', or

$A = L * T * L^H$ if *uplo* = 'L',

where U (or L) is a product of permutation and unit upper (lower) triangular matrices, and T is Hermitian and tridiagonal. The factored form of A is then used to solve the system of equations $A * X = B$.

Input Parameters

uplo	CHARACTER*1. If *uplo* = 'U': The upper triangle of A is stored. If *uplo* = 'L': the lower triangle of A is stored.
n	INTEGER. The number of linear equations or the order of the matrix A. $n \geq 0$.
nrhs	INTEGER. The number of right hand sides or the number of columns of the matrix B. $nrhs \geq 0$.
a	COMPLEX for chesv_aa COMPLEX*16 for zhesv_aa Array of size (*lda*, *n*). On entry, the Hermitian matrix A.

If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *a* is not referenced.

If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *a* is not referenced.

lda INTEGER. The leading dimension of the array *a*. *lda*≥ max(1,*n*).

b COMPLEX for chesv_aa

COMPLEX*16 for zhesv_aa

Array of size (*ldb*, *nrhs*). On entry, the *n*-by-*nrhs* right hand side matrix *B*.

ldb INTEGER. The leading dimension of the array *b*. *ldb*≥ max(1,*n*).

lwork INTEGER. The length of *work*. *lwork*≥ max(1, 2**n*, 3**n*-2), and for best performance *lwork*≥ max(1,*n***nb*), where *nb* is the optimal blocksize for ?hetrf.

If *lwork* < *n*, TRS is done with Level BLAS 2. If *lwork*≥*n*, TRS is done with Level BLAS 3.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

Output Parameters

a On exit, if *info* = 0, the tridiagonal matrix *T* and the multipliers used to obtain the factor *U* or *L* from the factorization $A = U*T*U^H$ or $A = L*T*L^H$ as computed by ?hetrf_aa.

ipiv INTEGER . Array of size (*n*) On exit, it contains the details of the interchanges: row and column *k* of *A* were interchanged with the row and column *ipiv*(*k*).

b On exit, if *info* = 0, the *n*-by-*nrhs* solution matrix *X*.

work COMPLEX for chesv_aa

COMPLEX*16 for zhesv_aa

Array of size (max(1, *lwork*)). On exit, if *info* = 0, *work*(1) returns the optimal *lwork*.

info INTEGER.

If *info* = 0: successful exit.

If *info* < 0: if *info* = -*i*, the *i*-th argument had an illegal value.

If *info* > 0: if *info* = *i*, $D_{i,i}$ is exactly zero. The factorization has been completed, but the block diagonal matrix *D* is exactly singular, so the solution could not be computed.

?hesv_rk

?hesv_rk *computes the solution to a system of linear equations A * X = B for Hermitian matrices.*

```
call chesv_rk(uplo, n, nrhs, A, lda, e, ipiv, B, ldb, work, lwork, info)
call zhesv_rk(uplo, n, nrhs, A, lda, e, ipiv, B, ldb, work, lwork, info)
```

Description

?hesv_rk computes the solution to a complex system of linear equations A * X = B, where A is an *n*-by-*n* Hermitian matrix and X and B are *n*-by-*nrhs* matrices.

The bounded Bunch-Kaufman (rook) diagonal pivoting method is used to factor A as A = P*U*D*(U^H)*(P^T), if *uplo* = 'U', or A = P*L*D*(L^H)*(P^T), if *uplo* = 'L', where U (or L) is unit upper (or lower) triangular matrix, U^H (or L^H) is the conjugate of U (or L), P is a permutation matrix, P^T is the transpose of P, and D is Hermitian and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

?hetrf_rk is called to compute the factorization of a complex Hermitian matrix. The factored form of A is then used to solve the system of equations A * X = B by calling BLAS3 routine ?hetrs_3.

Input Parameters

uplo

CHARACTER*1

Specifies whether the upper or lower triangular part of the Hermitian matrix A is stored:

- = 'U': The upper triangle of A is stored.
- = 'L': The lower triangle of A is stored.

n

INTEGER

The number of linear equations; that is, the order of the matrix A. *n* ≥ 0.

nrhs

INTEGER

The number of right-hand sides; that is, the number of columns of the matrix B. *nrhs* ≥ 0.

A

COMPLEX for chesv_rk

COMPLEX*16 for zhesv_rk

Array, dimension (*lda*,*n*). On entry, the Hermitian matrix A. If *uplo* = 'U': the leading *n*-by-*n* upper triangular part of A contains the upper triangular part of the matrix A, and the strictly lower triangular part of A is not referenced. If *uplo* = 'L': the leading *n*-by-*n* lower triangular part of A contains the lower triangular part of the matrix A, and the strictly upper triangular part of A is not referenced.

lda

INTEGER

The leading dimension of the array *A*.*lda* ≥ max(1, *n*).

B

COMPLEX for chesv_rk

COMPLEX*16 for zhesv_rk

On entry, the *n*-by-*nrhs* right-hand side matrix B.

The second dimension of *B* must be at least max(1, *nrhs*).

ldb INTEGER

The leading dimension of the array *B*. *ldb* ≥ max(1, *n*).

lwork INTEGER

The length of the array *work*.

If *lwork* = –1, a workspace query is assumed; the routine calculates only the optimal size of the *work* array for the factorization stage and returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by XERBLA.

Output Parameters

A COMPLEX for chesv_rk

COMPLEX*16 for zhesv_rk

On exit, if *info* = 0, diagonal of the block diagonal matrix D and factors U or L as computed by ?hetrf_rk:

- *Only* diagonal elements of the Hermitian block diagonal matrix D on the diagonal of A; that is, D(*k*,*k*) = *A*(*k*,*k*); (superdiagonal (or subdiagonal) elements of D are stored on exit in array *e*).

  —and—
- If *uplo* = 'U', factor U in the superdiagonal part of A. If *uplo* = 'L', factor L in the subdiagonal part of A.

For more information, see the description of the ?hetrf_rk routine.

e COMPLEX for chesv_rk

COMPLEX*16 for zhesv_rk

Array, dimension (*n*). On exit, contains the output computed by the factorization routine ?hetrf_rk; that is, the superdiagonal (or subdiagonal) elements of the Hermitian block diagonal matrix D with 1-by-1 or 2-by-2 diagonal blocks:

- If *uplo* = 'U', e(*i*) = D(*i*-1,*i*), *i*=2:N, e(1) is set to 0.
- If *uplo* = 'L', e(*i*) = D(*i*+1,*i*), *i*=1:N-1, e(*n*) is set to 0.

> **NOTE** For a 1-by-1 diagonal block D(*k*), where 1 ≤ *k* ≤ *n*, the element e(*k*) is set to 0 in both the *uplo* = 'U' and *uplo* = 'L' cases.

For more information, see the description of the ?hetrf_rk routine.

ipiv INTEGER

Array, dimension (*n*). Details of the interchanges and the block structure of D, as determined by ?hetrf_rk.

B COMPLEX for chesv_rk

COMPLEX*16 for zhesv_rk

On exit, if *info* = 0, the *n*-by-*nrhs* solution matrix X.

work COMPLEX for chesv_rk

COMPLEX*16 for zhesv_rk

Array, dimension (MAX(1,*lwork*)). Work array used in the factorization stage. On exit, if *info* = 0, *work*(1) returns the optimal *lwork*.

info INTEGER

- = 0: Successful exit.
- < 0: If *info* = -*k*, the k^{th} argument had an illegal value.
- > 0: If *info* = *k*, the matrix A is singular. If *uplo* = 'U', column *k* in the upper triangular part of A contains all zeros. If *uplo* = 'L', column *k* in the lower triangular part of A contains all zeros. Therefore D(*k*,*k*) is exactly zero, and superdiagonal elements of column *k* of U (or subdiagonal elements of column *k* of L) are all zeros. The factorization has been completed, but the block diagonal matrix D is exactly singular, and division by zero will occur if it is used to solve a system of equations.

NOTE *info* stores only the first occurrence of a singularity; any subsequent occurrence of singularity is not stored in *info* even though the factorization always completes.

?hesv_rook

Computes the solution to the system of linear equations for Hermitian matrices using the bounded Bunch-Kaufman diagonal pivoting method.

Syntax

```
call chesv_rook( uplo, n, nrhs, a, lda, ipiv, b, ldb, work, lwork, info )
call zhesv_rook( uplo, n, nrhs, a, lda, ipiv, b, ldb, work, lwork, info )
call hesv_rook( a, b [,uplo] [,ipiv] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine solves for *X* the complex system of linear equations *A*X = B*, where *A* is an *n*-by-*n* Hermitian matrix, and *X* and *B* are *n*-by-*nrhs* matrices.

The bounded Bunch-Kaufman ("rook") diagonal pivoting method is used to factor *A* as

$A = U*D*U^H$ if *uplo* = 'U', or

$A = L*D*L^H$ if *uplo* = 'L',

where *U* (or *L*) is a product of permutation and unit upper (lower) triangular matrices, and *D* is Hermitian and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

hetrf_rook is called to compute the factorization of a complex Hermition matrix *A* using the bounded Bunch-Kaufman ("rook") diagonal pivoting method.

The factored form of *A* is then used to solve the system of equations *A***X* = *B* by calling ?HETRS_ROOK, which uses BLAS level 2 routines.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of *A* is stored: If *uplo* = 'U', the array *a* stores the upper triangular part of the matrix *A*. If *uplo* = 'L', the array *a* stores the lower triangular part of the matrix *A*.
n	INTEGER. The number of linear equations, which is the order of matrix *A*; *n*≥ 0.
nrhs	INTEGER. The number of right-hand sides, the number of columns in *B*; *nrhs*≥ 0.
a, *b*, *work*	COMPLEX for chesv_rook COMPLEX*16 for zhesv_rook. Arrays: *a*(size *lda* by *), *b*(size *ldb* by *), *work*(*). The array *a* contains the Hermitian matrix *A*. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *a* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *a* is not referenced. The second dimension of *a* must be at least max(1, *n*). The array *b* contains the *n*-by-*nrhs* right hand side matrix *B*. The second dimension of *b* must be at least max(1,*nrhs*). *work* is a workspace array, dimension at least max(1,*lwork*).
lda	INTEGER. The leading dimension of *a*; *lda*≥ max(1, *n*).
ldb	INTEGER. The leading dimension of *b*; *ldb*≥ max(1, *n*).
lwork	INTEGER. The size of the *work* array (*lwork*≥ 1). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* below for details and for the suggested value of *lwork*.

Output Parameters

a	If *info* = 0, *a* is overwritten by the block-diagonal matrix *D* and the multipliers used to obtain the factor *U* (or *L*) from the factorization of *A* as computed by hetrf_rook.
b	If *info* = 0, *b* is overwritten by the *n*-by-*nrhs* solution matrix *X*.

ipiv — INTEGER.

Array, size at least `max(1, n)`. Contains details of the interchanges and the block structure of *D*, as determined by `?hetrf_rook`.

- If *uplo* = 'U':

  If *ipiv*(*k*) > 0, rows and columns *k* and *ipiv*(*k*) were interchanged and $D_{k,k}$ is a 1-by-1 diagonal block.

  If *ipiv*(*k*) < 0 and *ipiv*(*k* – 1) < 0, rows and columns *k* and –*ipiv*(*k*) were interchanged, rows and columns *k* - 1 and –*ipiv*(*k* – 1) were interchanged, and $D_{k-1:k,\,k-1:k}$ is a 2-by-2 diagonal block.
- If *uplo* = 'L':

  If *ipiv*(*k*) > 0, rows and columns *k* and *ipiv*(*k*) were interchanged and $D_{k,k}$ is a 1-by-1 diagonal block.

  If *ipiv*(*k*) < 0 and *ipiv*(*k* + 1) < 0, rows and columns *k* and –*ipiv*(*k*) were interchanged, rows and columns *k* + 1 and –*ipiv*(*k* + 1) were interchanged, and $D_{k:k+1,\,k:k+1}$ is a 2-by-2 diagonal block.

work(1) — If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info — INTEGER. If *info* = 0, the execution is successful.

If *info* = –*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, D_{ii} is 0. The factorization has been completed, but *D* is exactly singular, so the solution could not be computed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `hesv_rook` interface are as follows:

a — Holds the matrix *A* of size (*n*,*n*).

b — Holds the matrix *B* of size (*n*,*nrhs*).

ipiv — Holds the vector of length *n*.

uplo — Must be 'U' or 'L'. The default value is 'U'.

Description

The routine uses the diagonal pivoting factorization to compute the solution to a complex system of linear equations $A*X = B$, where A is an n-by-n Hermitian matrix, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?hesvx performs the following steps:

1. If *fact* = 'N', the diagonal pivoting method is used to factor the matrix A. The form of the factorization is $A = U*D*U^H$ or $A = L*D*L^H$, where U (or L) is a product of permutation and unit upper (lower) triangular matrices, and D is Hermitian and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.
2. If some $d_{i,i} = 0$, so that D is exactly singular, then the routine returns with *info* = i. Otherwise, the factored form of A is used to estimate the condition number of the matrix A. If the reciprocal of the condition number is less than machine precision, *info* = $n+1$ is returned as a warning, but the routine still goes on to solve for X and compute error bounds as described below.
3. The system of equations is solved for X using the factored form of A.
4. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.

Input Parameters

fact

CHARACTER*1. Must be 'F' or 'N'.

Specifies whether or not the factored form of the matrix A has been supplied on entry.

If *fact* = 'F': on entry, *af* and *ipiv* contain the factored form of A. Arrays *a*, *af*, and *ipiv* are not modified.

If *fact* = 'N', the matrix A is copied to *af* and factored.

uplo

CHARACTER*1. Must be 'U' or 'L'.

Indicates whether the upper or lower triangular part of A is stored and how A is factored:

If *uplo* = 'U', the array *a* stores the upper triangular part of the Hermitian matrix A, and A is factored as $U*D*U^H$.

If *uplo* = 'L', the array *a* stores the lower triangular part of the Hermitian matrix A; A is factored as $L*D*L^H$.

n

INTEGER. The order of matrix A; $n \geq 0$.

nrhs — INTEGER. The number of right-hand sides, the number of columns in *B*; *nrhs*≥ 0.

a, *af*, *b*, *work* — COMPLEX for chesvx

DOUBLE COMPLEX for zhesvx.

Arrays: *a*(size *lda* by *), *af*(size *ldaf* by *), *b*(size *ldb* by *), *work*(*).

The array *a* contains the upper or the lower triangular part of the Hermitian matrix *A* (see *uplo*). The second dimension of *a* must be at least max(1,*n*).

The array *af* is an input argument if *fact* = 'F'. It contains he block diagonal matrix *D* and the multipliers used to obtain the factor *U* or *L* from the factorization $A = U*D*U^H$ or $A = L*D*L^H$ as computed by ?hetrf. The second dimension of *af* must be at least max(1,*n*).

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1, *nrhs*).

work(*) is a workspace array of dimension at least max(1, *lwork*).

lda — INTEGER. The leading dimension of *a*; *lda*≥ max(1, *n*).

ldaf — INTEGER. The leading dimension of *af*; *ldaf*≥ max(1, *n*).

ldb — INTEGER. The leading dimension of *b*; *ldb*≥ max(1, *n*).

ipiv — INTEGER.

Array, size at least max(1, *n*). The array *ipiv* is an input argument if *fact* = 'F'. It contains details of the interchanges and the block structure of *D*, as determined by ?hetrf.

If *ipiv*(*i*) = *k* > 0, then d_{ii} is a 1-by-1 diagonal block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column.

If *uplo* = 'U'and *ipiv*(*i*) =*ipiv*(*i*-1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*–1, and (*i*–1)-th row and column of *A* was interchanged with the *m*-th row and column.

If *uplo* = 'L'and *ipiv*(*i*) =*ipiv*(*i*+1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*+1, and (*i*+1)–th row and column of *A* was interchanged with the *m*-th row and column.

ldx — INTEGER. The leading dimension of the output array *x*; *ldx*≥ max(1, *n*).

lwork — INTEGER. The size of the *work* array.

If *lwork* = –1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* below for details and for the suggested value of *lwork*.

rwork — REAL for chesvx

DOUBLE PRECISION for zhesvx.

Workspace array, size at least `max(1, n)`.

Output Parameters

x

`COMPLEX` for `chesvx`

`DOUBLE COMPLEX` for `zhesvx`.

Array, size *ldx* by *.

If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X* to the system of equations. The second dimension of *x* must be at least `max(1,nrhs)`.

af, *ipiv*

These arrays are output arguments if *fact* = 'N'. See the description of *af*, *ipiv* in *Input Arguments* section.

rcond

`REAL` for `chesvx`

`DOUBLE PRECISION` for `zhesvx`.

An estimate of the reciprocal condition number of the matrix *A*. If *rcond* is less than the machine precision (in particular, if *rcond* = 0), the matrix is singular to working precision. This condition is indicated by a return code of *info* > 0.

ferr

`REAL` for `chesvx`

`DOUBLE PRECISION` for `zhesvx`.

Array, size at least `max(1, nrhs)`. Contains the estimated forward error bound for each solution vector *x*(*j*) (the *j*-th column of the solution matrix *X*). If *xtrue* is the true solution corresponding to *x*(*j*), *ferr*(*j*) is an estimated upper bound for the magnitude of the largest element in (*x*(*j*) - *xtrue*) divided by the magnitude of the largest element in *x*(*j*). The estimate is as reliable as the estimate for *rcon*, and is almost always a slight overestimate of the true error.

berr

`REAL` for `chesvx`

`DOUBLE PRECISION` for `zhesvx`.

Array, size at least `max(1, nrhs)`. Contains the component-wise relative backward error for each solution vector *x*(*j*), that is, the smallest relative change in any element of *A* or *B* that makes *x*(*j*) an exact solution.

work(1)

If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info

`INTEGER`. If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, and *i*≤*n*, then d_{ii} is exactly zero. The factorization has been completed, but the block diagonal matrix *D* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned.

If *info* = *i*, and *i* = *n* + 1, then *D* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `hesvx` interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *nrhs*).
x	Holds the matrix *X* of size (*n*, *nrhs*).
af	Holds the matrix *AF* of size (*n*, *n*).
ipiv	Holds the vector of length *n*.
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
fact	Must be `'N'` or `'F'`. The default value is `'N'`. If *fact* = `'F'`, then both arguments *af* and *ipiv* must be present; otherwise, an error is returned.

Application Notes

The value of *lwork* must be at least `2*n`. For better performance, try using *lwork* = *n*blocksize*, where *blocksize* is the optimal block size for `?hetrf`.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = –1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

Description

The routine uses the *diagonal pivoting* factorization to compute the solution to a complex/double complex system of linear equations *A*X = B*, where *A* is an *n*-by-*n* Hermitian matrix, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

Both normwise and maximum componentwise error bounds are also provided on request. The routine returns a solution with a small guaranteed error (O(eps), where eps is the working machine precision) unless the matrix is very ill-conditioned, in which case a warning is returned. Relevant condition numbers are also calculated and returned.

The routine accepts user-provided factorizations and equilibration factors; see definitions of the *fact* and *equed* options. Solving with refinement and using a factorization from a previous call of the routine also produces a solution with O(eps) errors or warnings but that may not be true for general user-provided factorizations and equilibration factors if they differ from what the routine would itself produce.

The routine ?hesvxx performs the following steps:

1. If *fact* = 'E', scaling factors are computed to equilibrate the system:

   *diag(s)*A*diag(s) *inv(diag(s))*X = diag(s)*B*

   Whether or not the system will be equilibrated depends on the scaling of the matrix *A*, but if equilibration is used, *A* is overwritten by *diag(s)*A*diag(s)* and *B* by *diag(s)*B*.
2. If *fact* = 'N' or 'E', the LU decomposition is used to factor the matrix *A* (after equilibration if *fact* = 'E') as

   $A = U*D*U^T$, if *uplo* = 'U',

   or $A = L*D*L^T$, if *uplo* = 'L',

   where *U* or *L* is a product of permutation and unit upper (lower) triangular matrices, and *D* is a symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.
3. If some *D(i,i)=0*, so that *D* is exactly singular, the routine returns with *info = i*. Otherwise, the factored form of *A* is used to estimate the condition number of the matrix *A* (see the *rcond* parameter). If the reciprocal of the condition number is less than machine precision, the routine still goes on to solve for *X* and compute error bounds.
4. The system of equations is solved for *X* using the factored form of *A*.

5. By default, unless `params(1)` is set to zero, the routine applies iterative refinement to get a small error and error bounds. Refinement calculates the residual to at least twice the working precision.
6. If equilibration was used, the matrix *X* is premultiplied by *diag(r)* so that it solves the original system before equilibration.

Input Parameters

fact

CHARACTER*1. Must be 'F', 'N', or 'E'.

Specifies whether or not the factored form of the matrix *A* is supplied on entry, and if not, whether the matrix *A* should be equilibrated before it is factored.

If *fact* = 'F', on entry, *af* and *ipiv* contain the factored form of *A*. If *equed* is not 'N', the matrix *A* has been equilibrated with scaling factors given by *s*. Parameters *a*, *af*, and *ipiv* are not modified.

If *fact* = 'N', the matrix *A* will be copied to *af* and factored.

If *fact* = 'E', the matrix *A* will be equilibrated, if necessary, copied to *af* and factored.

uplo

CHARACTER*1. Must be 'U' or 'L'.

Indicates whether the upper or lower triangular part of *A* is stored:

If *uplo* = 'U', the upper triangle of *A* is stored.

If *uplo* = 'L', the lower triangle of *A* is stored.

n

INTEGER. The number of linear equations; the order of the matrix *A*; $n \geq 0$.

nrhs

INTEGER. The number of right-hand sides; the number of columns of the matrices *B* and *X*; $nrhs \geq 0$.

a, *af*, *b*, *work*

COMPLEX for chesvxx

DOUBLE COMPLEX for zhesvxx.

Arrays: *a*(size *lda* by *), *af*(size *ldaf* by *), *b*(*ldb*, *), *work(*)*.

The array *a* contains the Hermitian matrix *A* as specified by *uplo*. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A* and the strictly lower triangular part of *a* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A* and the strictly upper triangular part of *a* is not referenced. The second dimension of *a* must be at least max(1,*n*).

The array *af* is an input argument if *fact* = 'F'. It contains the block diagonal matrix *D* and the multipliers used to obtain the factor *U* and *L* from the factorization $A = U*D*U^T$ or $A = L*D*L^T$ as computed by ?hetrf. The second dimension of *af* must be at least max(1,*n*).

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).

work(*) is a workspace array. The dimension of *work* must be at least max(1,5*n).

lda INTEGER. The leading dimension of the array *a*; *lda* ≥ max(1,*n*).

ldaf INTEGER. The leading dimension of the array *af*; *ldaf* ≥ max(1,*n*).

ipiv INTEGER.

Array, size at least max(1, *n*). The array *ipiv* is an input argument if *fact* = 'F'. It contains details of the interchanges and the block structure of *D* as determined by ?sytrf.

If *ipiv(k)* > 0, rows and columns *k* and *ipiv(k)* were interchanged and *D(k,k)* is a 1-by-1 diagonal block.

If *uplo* = 'U' and *ipiv(k)* = *ipiv(k-1)* < 0, rows and columns *k-1* and *-ipiv(k)* were interchanged and *D*(*k*-1:*k*, *k*-1:*k*) is a 2-by-2 diagonal block.

If *uplo* = 'L' and *ipiv(k)* = *ipiv(k+1)* < 0, rows and columns *k+1* and *-ipiv(k)* were interchanged and *D*(*k*:*k*+1, *k*:*k*+1) is a 2-by-2 diagonal block.

equed CHARACTER*1. Must be 'N' or 'Y'.

equed is an input argument if *fact* = 'F'. It specifies the form of equilibration that was done:

If *equed* = 'N', no equilibration was done (always true if *fact* = 'N').

if *equed* = 'Y', both row and column equilibration was done, that is, *A* has been replaced by *diag*(*s*)**A***diag*(*s*).

s REAL for chesvxx

DOUBLE PRECISION for zhesvxx.

Array, size (*n*). The array *s* contains the scale factors for *A*. If *equed* = 'Y', *A* is multiplied on the left and right by diag(*s*).

This array is an input argument if *fact* = 'F' only; otherwise it is an output argument.

If *fact* = 'F' and *equed* = 'Y', each element of *s* must be positive.

Each element of *s* should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

ldb INTEGER. The leading dimension of the array *b*; *ldb* ≥ max(1, *n*).

ldx INTEGER. The leading dimension of the output array *x*; *ldx* ≥ max(1, *n*).

n_err_bnds INTEGER. Number of error bounds to return for each right hand side and each type (normwise or componentwise). See *err_bnds_norm* and *err_bnds_comp* descriptions in the *Output Arguments* section below.

nparams

INTEGER. Specifies the number of parameters set in *params*. If ≤ 0, the *params* array is never referenced and default values are used.

params

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size *nparams*. Specifies algorithm parameters. If an entry is less than 0.0, that entry is filled with the default value used for that parameter. Only positions up to *nparams* are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass *nparams* = 0, which prevents the source code from accessing the *params* argument.

params(1) : Whether to perform iterative refinement or not. Default: 1.0 (for single precision flavors), 1.0D+0 (for double precision flavors).

=0.0	No refinement is performed and no error bounds are computed.
=1.0	Use the extra-precise refinement algorithm.

(Other values are reserved for future use.)

params(2) : Maximum number of residual computations allowed for refinement.

Default	10
Aggressive	Set to 100 to permit convergence using approximate factorizations or factorizations other than *LU*. If the factorization uses a technique other than Gaussian elimination, the guarantees in *err_bnds_norm* and *err_bnds_comp* may no longer be trustworthy.

params(3) : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

rwork

REAL for chesvxx

DOUBLE PRECISION for zhesvxx.

Workspace array, size at least max(1, 3*n); used in complex flavors only.

Output Parameters

x

COMPLEX for chesvxx

DOUBLE COMPLEX for zhesvxx.

Array, size *ldx* by *nrhs*.

If *info* = 0, the array *x* contains the solution *n*-by-*nrhs* matrix *X* to the original system of equations. Note that *A* and *B* are modified on exit if *equed*≠'N', and the solution to the equilibrated system is:

inv(*diag*(*s*))***X*.

a

If *fact* = 'E' and *equed* = 'Y', overwritten by *diag*(*s*)***A***diag*(*s*).

af

If *fact* = 'N', *af* is an output argument and on exit returns the block diagonal matrix *D* and the multipliers used to obtain the factor *U* or *L* from the factorization *A* = *U***D***U*^{T} or *A* = *L***D***L*^{T}.

b

If *equed* = 'N', *B* is not modified.

If *equed* = 'Y', *B* is overwritten by *diag*(*s*)***B*.

s

This array is an output argument if *fact*≠'F'. Each element of this array is a power of the radix. See the description of *s* in *Input Arguments* section.

rcond

REAL for chesvxx

DOUBLE PRECISION for zhesvxx.

Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision, in particular, if *rcond* = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.

rpvgrw

REAL for chesvxx

DOUBLE PRECISION for zhesvxx.

Contains the reciprocal pivot growth factor:

$$\|A\|/\|U\|$$

If this is much less than 1, the stability of the *LU* factorization of the (equlibrated) matrix *A* could be poor. This also means that the solution *X*, estimated condition numbers, and error bounds could be unreliable. If factorization fails with 0 < *info*≤*n*, this parameter contains the reciprocal pivot growth factor for the leading *info* columns of *A*.

berr

REAL for chesvxx

DOUBLE PRECISION for zhesvxx.

Array, size at least max(1, *nrhs*). Contains the component-wise relative backward error for each solution vector *x*(*j*), that is, the smallest relative change in any element of *A* or *B* that makes *x*(*j*) an exact solution.

err_bnds_norm

REAL for chesvxx

DOUBLE PRECISION for zhesvxx.

Array of size *nrhs* by *n_err_bnds*. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:

Normwise relative error in the *i*-th solution vector

$$\frac{\max_j \left| Xtrue_{ji} - X_{ji} \right|}{\max_j \left| X_{ji} \right|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.

The first index in *err_bnds_norm(i,:)* corresponds to the *i*-th right-hand side.

The second index in *err_bnds_norm(:,err)* contains the following three fields:

err=1 — "Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for `chesvxx` and *sqrt*(*n*)**dlamch*(ε) for `zhesvxx`.

err=2 — "Guaranteed" error bound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for `chesvxx` and *sqrt*(*n*)**dlamch*(ε) for `zhesvxx`. This error bound should only be trusted if the previous boolean is true.

err=3 — Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for `chesvxx` and *sqrt*(*n*)**dlamch*(ε) for `zhesvxx` to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix *Z* are:

$$\|Z\|_\infty \cdot \|Z^{-1}\|_\infty$$

Let *z*=*s***a*, where *s* scales each row by a power of the radix so all absolute row sums of *z* are approximately 1.

err_bnds_comp

`REAL` for `chesvxx`

`DOUBLE PRECISION` for `zhesvxx`.

Array of size *nrhs* by *n_err_bnds*. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:

Componentwise relative error in the *i*-th solution vector:

$$\max_j \frac{\left| Xtrue_{ji} - X_{ji} \right|}{\left| X_{ji} \right|}$$

The array is indexed by the right-hand side *i*, on which the componentwise relative error depends, and by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is not requested (*params(3)* = 0.0), then *err_bnds_comp* is not accessed. If *n_err_bnds* < 3, then at most the first *(:,n_err_bnds)* entries are returned.

The first index in *err_bnds_comp(i,:)* corresponds to the *i*-th right-hand side.

The second index in *err_bnds_comp(:,err)* contains the following three fields:

err=1	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for chesvxx and *sqrt*(*n*)**dlamch*(ε) for zhesvxx.
err=2	"Guaranteed" error bpound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for chesvxx and *sqrt*(*n*)**dlamch*(ε) for zhesvxx. This error bound should only be trusted if the previous boolean is true.
err=3	Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for chesvxx and *sqrt*(*n*)**dlamch*(ε) for zhesvxx to determine if the error estimate is "guaranteed". These reciprocal condition numbers for some appropriately scaled matrix *Z* are: $\|Z\|_\infty \cdot \|Z^{-1}\|_\infty$ Let *z=s**(*a**diag(*x*)), where *x* is the solution for the current right-hand side and *s* scales each row of *a**diag(*x*) by a power of the radix so all absolute row sums of *z* are approximately 1.

ipiv If *fact* = 'N', *ipiv* is an output argument and on exit contains details of the interchanges and the block structure *D*, as determined by ssytrf for single precision flavors and dsytrf for double precision flavors.

equed If *fact*≠'F', then *equed* is an output argument. It specifies the form of equilibration that was done (see the description of *equed* in *Input Arguments* section).

params If an entry is less than 0.0, that entry is filled with the default value used for that parameter, otherwise the entry is not modified.

info INTEGER. If *info* = 0, the execution is successful. The solution to every right-hand side is guaranteed.

If *info* = *-i*, the *i*-th parameter had an illegal value.

If 0 < *info*≤*n*:*U*(*info*,*info*) is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned.

If *info* = *n*+*j*: The solution corresponding to the *j*-th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides *k* with *k* > *j* may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested *params(3)* = 0.0, then the *j*-th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest *j* such that *err_bnds_norm*(*j*,1) = 0.0 or *err_bnds_comp*(*j*,1) = 0.0. See the definition of *err_bnds_norm* and *err_bnds_comp* for *err* = 1. To get information about all of the right-hand sides, check *err_bnds_norm* or *err_bnds_comp*.

?spsv

Computes the solution to the system of linear equations with a real or complex symmetric coefficient matrix A stored in packed format, and multiple right-hand sides.

Syntax

```
call sspsv( uplo, n, nrhs, ap, ipiv, b, ldb, info )
call dspsv( uplo, n, nrhs, ap, ipiv, b, ldb, info )
call cspsv( uplo, n, nrhs, ap, ipiv, b, ldb, info )
call zspsv( uplo, n, nrhs, ap, ipiv, b, ldb, info )
call spsv( ap, b [,uplo] [,ipiv] [,info] )
```

Include Files

- mkl.fi, lapack.f90

Description

The routine solves for *X* the real or complex system of linear equations *A***X* = *B*, where *A* is an *n*-by-*n* symmetric matrix stored in packed format, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

The diagonal pivoting method is used to factor *A* as $A = U*D*U^T$ or $A = L*D*L^T$, where *U* (or *L*) is a product of permutation and unit upper (lower) triangular matrices, and *D* is symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

The factored form of *A* is then used to solve the system of equations *A***X* = *B*.

Input Parameters

uplo

CHARACTER*1. Must be 'U' or 'L'.

Indicates whether the upper or lower triangular part of *A* is stored:

If *uplo* = 'U', the upper triangle of *A* is stored.

If *uplo* = 'L', the lower triangle of *A* is stored.

n

INTEGER. The order of matrix *A*; $n \geq 0$.

nrhs

INTEGER. The number of right-hand sides, the number of columns in *B*; $nrhs \geq 0$.

ap, *b*

REAL for sspsv

DOUBLE PRECISION for dspsv

COMPLEX for cspsv

DOUBLE COMPLEX for zspsv.

Arrays: *ap*(size *), *b*(size *ldb* by *).

The dimension of *ap* must be at least max(1,*n*(*n*+1)/2). The array *ap* contains the factor *U* or *L*, as specified by *uplo*, in *packed storage* (see Matrix Storage Schemes).

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).

ldb

INTEGER. The leading dimension of *b*; $ldb \geq \max(1, n)$.

Output Parameters

ap

The block-diagonal matrix *D* and the multipliers used to obtain the factor *U* (or *L*) from the factorization of *A* as computed by ?sptrf, stored as a packed triangular matrix in the same storage format as *A*.

b

If *info* = 0, *b* is overwritten by the solution matrix *X*.

ipiv

INTEGER.

Array, size at least max(1, *n*). Contains details of the interchanges and the block structure of *D*, as determined by ?sptrf.

If $ipiv(i) = k > 0$, then d_{ii} is a 1-by-1 block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column.

If *uplo* = 'U'and *ipiv*(*i*) =*ipiv*(*i*-1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*–1, and (*i*–1)-th row and column of *A* was interchanged with the *m*-th row and column.

If *uplo* = 'L'and *ipiv*(*i*) =*ipiv*(*i*+1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*+1, and (*i*+1)-th row and column of *A* was interchanged with the *m*-th row and column.

info

INTEGER. If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, d_{ii} is 0. The factorization has been completed, but *D* is exactly singular, so the solution could not be computed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `spsv` interface are as follows:

ap	Holds the array *A* of size (*n**(*n*+1)/2).
b	Holds the matrix *B* of size (*n*,*nrhs*).
ipiv	Holds the vector with the number of elements *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Description

The routine uses the diagonal pivoting factorization to compute the solution to a real or complex system of linear equations *A*X = B*, where *A* is a *n*-by-*n* symmetric matrix stored in packed format, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine `?spsvx` performs the following steps:

1. If *fact = 'N'*, the diagonal pivoting method is used to factor the matrix A. The form of the factorization is $A = U*D*U^T$ or $A = L*D*L^T$, where *U* (or *L*) is a product of permutation and unit upper (lower) triangular matrices, and *D* is symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

2. If some $d_{i,i}$= 0, so that *D* is exactly singular, then the routine returns with *info* = *i*. Otherwise, the factored form of *A* is used to estimate the condition number of the matrix *A*. If the reciprocal of the condition number is less than machine precision, *info* = *n*+1 is returned as a warning, but the routine still goes on to solve for *X* and compute error bounds as described below.
3. The system of equations is solved for *X* using the factored form of *A*.
4. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.

Input Parameters

fact

CHARACTER*1. Must be 'F' or 'N'.

Specifies whether or not the factored form of the matrix *A* has been supplied on entry.

If *fact* = 'F': on entry, *afp* and *ipiv* contain the factored form of *A*. Arrays *ap*, *afp*, and *ipiv* are not modified.

If *fact* = 'N', the matrix *A* is copied to *afp* and factored.

uplo

CHARACTER*1. Must be 'U' or 'L'.

Indicates whether the upper or lower triangular part of *A* is stored and how *A* is factored:

If *uplo* = 'U', the array *ap* stores the upper triangular part of the symmetric matrix *A*, and *A* is factored as $U*D*U^T$.

If *uplo* = 'L', the array *ap* stores the lower triangular part of the symmetric matrix *A*; *A* is factored as $L*D*L^T$.

n

INTEGER. The order of matrix *A*; $n \geq 0$.

nrhs

INTEGER. The number of right-hand sides, the number of columns in *B*; $nrhs \geq 0$.

ap, *afp*, *b*, *work*

REAL for sspsvx

DOUBLE PRECISION for dspsvx

COMPLEX for cspsvx

DOUBLE COMPLEX for zspsvx.

Arrays: *ap*(size *), *afp*(size *), *b*(size *ldb* by *), *work*(*).

The array *ap* contains the upper or lower triangle of the symmetric matrix *A* in *packed storage* (see Matrix Storage Schemes).

The array *afp* is an input argument if *fact* = 'F'. It contains the block diagonal matrix *D* and the multipliers used to obtain the factor *U* or *L* from the factorization $A = U*D*U^T$ or $A = L*D*L^T$ as computed by ?sptrf, in the same storage format as *A*.

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations.

work(*) is a workspace array.

The dimension of arrays *ap* and *afp* must at least `max(1, n(n+1)/2)`; the second dimension of *b* must be at least `max(1,nrhs)`; the dimension of *work* must be at least `max(1,3*n)` for real flavors and `max(1,2*n)` for complex flavors.

ldb — `INTEGER`. The leading dimension of *b*; *ldb*≥ `max(1, n)`.

ipiv — `INTEGER`.

Array, size at least `max(1, n)`. The array *ipiv* is an input argument if *fact* = `'F'`. It contains details of the interchanges and the block structure of *D*, as determined by `?sptrf`.

If *ipiv*(*i*) = *k* > 0, then d_{ii} is a 1-by-1 block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column.

If *uplo* = `'U'` and *ipiv*(*i*) =*ipiv*(*i*-1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*–1, and (*i*–1)-th row and column of *A* was interchanged with the *m*-th row and column.

If *uplo* = `'L'` and *ipiv*(*i*) =*ipiv*(*i*+1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*+1, and (*i*+1)-th row and column of *A* was interchanged with the *m*-th row and column.

ldx — `INTEGER`. The leading dimension of the output array *x*; *ldx*≥ `max(1, n)`.

iwork — `INTEGER`. Workspace array, size at least `max(1, n)`; used in real flavors only.

rwork — `REAL` for `cspsvx`

`DOUBLE PRECISION` for `zspsvx`.

Workspace array, size at least `max(1, n)`; used in complex flavors only.

Output Parameters

x — `REAL` for `sspsvx`

`DOUBLE PRECISION` for `dspsvx`

`COMPLEX` for `cspsvx`

`DOUBLE COMPLEX` for `zspsvx`.

Array, size *ldx* by *.

If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X* to the system of equations. The second dimension of *x* must be at least `max(1,nrhs)`.

afp, *ipiv* — These arrays are output arguments if *fact* = `'N'`. See the description of *afp*, *ipiv* in *Input Arguments* section.

rcond — `REAL` for single precision flavors.

`DOUBLE PRECISION` for double precision flavors.

	An estimate of the reciprocal condition number of the matrix *A*. If *rcond* is less than the machine precision (in particular, if `rcond = 0`), the matrix is singular to working precision. This condition is indicated by a return code of *info* > 0.
ferr, *berr*	`REAL` for single precision flavors `DOUBLE PRECISION` for double precision flavors. Arrays, size at least `max(1, nrhs)`. Contain the component-wise forward and relative backward errors, respectively, for each solution vector.
info	`INTEGER`. If `info = 0`, the execution is successful. If `info = -i`, the *i*-th parameter had an illegal value. If `info = i`, and $i \le n$, then d_{ii} is exactly zero. The factorization has been completed, but the block diagonal matrix *D* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned. If `info = i`, and *i* = *n* + 1, then *D* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `spsvx` interface are as follows:

ap	Holds the array *A* of size (`n*(n+1)/2`).
b	Holds the matrix *B* of size (`n,nrhs`).
x	Holds the matrix *X* of size (`n,nrhs`).
afp	Holds the array *AF* of size (`n*(n+1)/2`).
ipiv	Holds the vector with the number of elements *n*.
ferr	Holds the vector with the number of elements *nrhs*.
berr	Holds the vector with the number of elements *nrhs*.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
fact	Must be `'N'` or `'F'`. The default value is `'N'`. If `fact = 'F'`, then both arguments *af* and *ipiv* must be present; otherwise, an error is returned.

Description

The routine uses the diagonal pivoting factorization to compute the solution to a complex system of linear equations $A*X = B$, where A is a n-by-n Hermitian matrix stored in packed format, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?hpsvx performs the following steps:

1. If *fact* = 'N', the diagonal pivoting method is used to factor the matrix A. The form of the factorization is $A = U*D*U^H$ or $A = L*D*L^H$, where U (or L) is a product of permutation and unit upper (lower) triangular matrices, and D is a Hermitian and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.
2. If some $d_{i,i} = 0$, so that D is exactly singular, then the routine returns with *info* = *i*. Otherwise, the factored form of A is used to estimate the condition number of the matrix A. If the reciprocal of the condition number is less than machine precision, *info* = *n*+1 is returned as a warning, but the routine still goes on to solve for X and compute error bounds as described below.
3. The system of equations is solved for X using the factored form of A.
4. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.

Input Parameters

fact

CHARACTER*1. Must be 'F' or 'N'.

Specifies whether or not the factored form of the matrix A has been supplied on entry.

If *fact* = 'F': on entry, *afp* and *ipiv* contain the factored form of A. Arrays *ap*, *afp*, and *ipiv* are not modified.

If *fact* = 'N', the matrix A is copied to *afp* and factored.

uplo

CHARACTER*1. Must be 'U' or 'L'.

Indicates whether the upper or lower triangular part of A is stored and how A is factored:

If *uplo* = 'U', the array *ap* stores the upper triangular part of the Hermitian matrix A, and A is factored as $U*D*U^H$.

If *uplo* = 'L', the array *ap* stores the lower triangular part of the Hermitian matrix A, and A is factored as $L*D*L^H$.

n

INTEGER. The order of matrix A; $n \geq 0$.

nrhs

INTEGER. The number of right-hand sides, the number of columns in B; $nrhs \geq 0$.

ap, *afp*, *b*, *work*

COMPLEX for chpsvx

DOUBLE COMPLEX for zhpsvx.

Arrays: *ap*(size *), *afp*(size *), *b*(size *ldb* by *), *work*(*).

The array *ap* contains the upper or lower triangle of the Hermitian matrix *A* in *packed storage* (see Matrix Storage Schemes).

The array *afp* is an input argument if *fact* = 'F'. It contains the block diagonal matrix *D* and the multipliers used to obtain the factor *U* or *L* from the factorization $A = U*D*U^H$ or $A = L*D*L^H$ as computed by ?hptrf, in the same storage format as *A*.

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations.

work(*) is a workspace array.

The dimension of arrays *ap* and *afp* must be at least max(1,*n*(*n*+1)/2); the second dimension of *b* must be at least max(1,*nrhs*); the dimension of *work* must be at least max(1,2**n*).

ldb

INTEGER. The leading dimension of *b*; *ldb*≥ max(1, *n*).

ipiv

INTEGER.

Array, size at least max(1, *n*). The array *ipiv* is an input argument if *fact* = 'F'. It contains details of the interchanges and the block structure of *D*, as determined by ?hptrf.

If *ipiv*(*i*) = *k* > 0, then d_{ii} is a 1-by-1 block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column.

If *uplo* = 'U'and *ipiv*(*i*) =*ipiv*(*i*-1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*–1, and (*i*–1)-th row and column of *A* was interchanged with the *m*-th row and column.

If *uplo* = 'L'and *ipiv*(*i*) =*ipiv*(*i*+1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*+1, and (*i*+1)-th row and column of *A* was interchanged with the *m*-th row and column.

ldx

INTEGER. The leading dimension of the output array *x*; *ldx*≥ max(1, *n*).

rwork

REAL for chpsvx

DOUBLE PRECISION for zhpsvx.

Workspace array, size at least max(1, *n*).

Output Parameters

x

COMPLEX for chpsvx

DOUBLE COMPLEX for zhpsvx.

Array, size *ldx* by *.

If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X* to the system of equations. The second dimension of *x* must be at least max(1,*nrhs*).

afp, *ipiv* — These arrays are output arguments if *fact* = 'N'. See the description of *afp*, *ipiv* in *Input Arguments* section.

rcond — REAL for chpsvx

DOUBLE PRECISION for zhpsvx.

An estimate of the reciprocal condition number of the matrix *A*. If *rcond* is less than the machine precision (in particular, if *rcond* = 0), the matrix is singular to working precision. This condition is indicated by a return code of *info* > 0.

ferr — REAL for chpsvx

DOUBLE PRECISION for zhpsvx.

Array, size at least max(1, *nrhs*). Contains the estimated forward error bound for each solution vector *x*(*j*) (the *j*-th column of the solution matrix *X*). If *xtrue* is the true solution corresponding to *x*(*j*), *ferr*(*j*) is an estimated upper bound for the magnitude of the largest element in (*x*(*j*) - *xtrue*) divided by the magnitude of the largest element in *x*(*j*). The estimate is as reliable as the estimate for *rcond*, and is almost always a slight overestimate of the true error.

berr — REAL for chpsvx

DOUBLE PRECISION for zhpsvx.

Array, size at least max(1, *nrhs*). Contains the component-wise relative backward error for each solution vector *x*(*j*), that is, the smallest relative change in any element of *A* or *B* that makes *x*(*j*) an exact solution.

info — INTEGER. If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, and $i \le n$, then d_{ii} is exactly zero. The factorization has been completed, but the block diagonal matrix *D* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned.

If *info* = *i*, and *i* = *n* + 1, then *D* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine hpsvx interface are as follows:

ap — Holds the array *A* of size (*n**(*n*+1)/2).

b — Holds the matrix *B* of size (*n*, *nrhs*).

x	Holds the matrix *X* of size (*n*, *nrhs*).
afp	Holds the array *AF* of size (*n**(*n*+1)/2).
ipiv	Holds the vector with the number of elements *n*.
ferr	Holds the vector with the number of elements *nrhs*.
berr	Holds the vector with the number of elements *nrhs*.
uplo	Must be 'U' or 'L'. The default value is 'U'.
fact	Must be 'N' or 'F'. The default value is 'N'. If *fact* = 'F', then both arguments *af* and *ipiv* must be present; otherwise, an error is returned.

This section includes descriptions of LAPACK computational routines and driver routines for solving linear least squares problems, eigenvalue and singular value problems, and performing a number of related computational tasks. For a full reference on LAPACK routines and related information see [LUG].

Least Squares Problems. A typical *least squares problem* is as follows: given a matrix *A* and a vector *b*, find the vector *x* that minimizes the sum of squares $\Sigma_i((Ax)_i - b_i)^2$ or, equivalently, find the vector *x* that minimizes the 2-norm $||Ax - b||_2$.

In the most usual case, *A* is an *m*-by-*n* matrix with $m \geq n$ and rank(*A*) = *n*. This problem is also referred to as finding the *least squares solution* to an *overdetermined* system of linear equations (here we have more equations than unknowns). To solve this problem, you can use the *QR* factorization of the matrix A (see QR Factorization).

If $m < n$ and rank(*A*) = *m*, there exist an infinite number of solutions *x* which exactly satisfy $Ax = b$, and thus minimize the norm $||Ax - b||_2$. In this case it is often useful to find the unique solution that minimizes $||x||_2$. This problem is referred to as finding the *minimum-norm solution* to an *underdetermined* system of linear equations (here we have more unknowns than equations). To solve this problem, you can use the *LQ* factorization of the matrix *A* (see LQ Factorization).

In the general case you may have a *rank-deficient least squares problem*, with rank(*A*) < min(*m*, *n*): find the *minimum-norm least squares solution* that minimizes both $||x||_2$ and $||Ax - b||^2$. In this case (or when the rank of A is in doubt) you can use the *QR* factorization with pivoting or *singular value decomposition* (see Singular Value Decomposition).

Eigenvalue Problems. The eigenvalue problems (from German *eigen* "own") are stated as follows: given a matrix *A*, find the *eigenvalues*λ and the corresponding *eigenvectorsz* that satisfy the equation

$Az = \lambda z$ (right eigenvectors *z*)

or the equation

$z^H A = \lambda z^H$ (left eigenvectors *z*).

If *A* is a real symmetric or complex Hermitian matrix, the above two equations are equivalent, and the problem is called a *symmetric* eigenvalue problem. Routines for solving this type of problems are described in the topic Symmetric Eigenvalue Problems.

Routines for solving eigenvalue problems with nonsymmetric or non-Hermitian matrices are described in the topic Nonsymmetric Eigenvalue Problems.

The library also includes routines that handle *generalized symmetric-definite eigenvalue problems*: find the eigenvalues λ and the corresponding eigenvectors *x* that satisfy one of the following equations:

$Az = \lambda Bz$, $ABz = \lambda z$, or $BAz = \lambda z$,

where *A* is symmetric or Hermitian, and *B* is symmetric positive-definite or Hermitian positive-definite. Routines for reducing these problems to standard symmetric eigenvalue problems are described in the topic Generalized Symmetric-Definite Eigenvalue Problems.

To solve a particular problem, you usually call several computational routines. Sometimes you need to combine the routines of this chapter with other LAPACK routines described in "LAPACK Routines: Linear Equations" as well as with BLAS routines described in "BLAS and Sparse BLAS Routines".

For example, to solve a set of least squares problems minimizing $||Ax - b||^2$ for all columns *b* of a given matrix *B* (where *A* and *B* are real matrices), you can call `?geqrf` to form the factorization $A = QR$, then call `?ormqr` to compute $C = Q^H B$ and finally call the BLAS routine `?trsm` to solve for *X* the system of equations $RX = C$.

Another way is to call an appropriate driver routine that performs several tasks in one call. For example, to solve the least squares problem the driver routine `?gels` can be used.

LAPACK Least Squares and Eigenvalue Problem Computational Routines

In the topics that follow, the descriptions of LAPACK computational routines are given. These routines perform distinct computational tasks that can be used for:

Orthogonal Factorizations

Singular Value Decomposition

Symmetric Eigenvalue Problems

Generalized Symmetric-Definite Eigenvalue Problems

Nonsymmetric Eigenvalue Problems

Generalized Nonsymmetric Eigenvalue Problems

Generalized Singular Value Decomposition

See also the respective driver routines.

Orthogonal Factorizations: LAPACK Computational Routines

This topic describes the LAPACK routines for the *QR (RQ)* and *LQ (QL)* factorization of matrices. Routines for the *RZ* factorization as well as for generalized *QR* and *RQ* factorizations are also included.

QR Factorization. Assume that *A* is an *m*-by-*n* matrix to be factored.

If $m \geq n$, the *QR* factorization is given by

$$A = Q \begin{pmatrix} R \\ 0 \end{pmatrix} = (Q_1, Q_2) \begin{pmatrix} R \\ 0 \end{pmatrix}$$

where *R* is an *n*-by-*n* upper triangular matrix with real diagonal elements, and *Q* is an *m*-by-*m* orthogonal (or unitary) matrix.

You can use the *QR* factorization for solving the following least squares problem: minimize $||Ax - b||^2$ where *A* is a full-rank *m*-by-*n* matrix ($m \geq n$). After factoring the matrix, compute the solution *x* by solving $Rx = (Q_1)^T b$.

If $m < n$, the *QR* factorization is given by

$$A = QR = Q(R_1 R_2)$$

where *R* is trapezoidal, R_1 is upper triangular and R_2 is rectangular.

Q is represented as a product of min(m, n) *elementary reflectors*. Routines are provided to work with Q in this representation.

LQ Factorization LQ factorization of an m-by-n matrix A is as follows. If $m \le n$,

$$A = (L, 0)\,Q = (L, 0)\begin{pmatrix} Q_1 \\ Q_2 \end{pmatrix} = (LQ_1)$$

where L is an m-by-m lower triangular matrix with real diagonal elements, and Q is an n-by-n orthogonal (or unitary) matrix.

If $m > n$, the LQ factorization is

$$A = \begin{pmatrix} L_1 \\ L_2 \end{pmatrix} Q$$

where L_1 is an n-by-n lower triangular matrix, L_2 is rectangular, and Q is an n-by-n orthogonal (or unitary) matrix.

You can use the LQ factorization to find the minimum-norm solution of an underdetermined system of linear equations $Ax = b$ where A is an m-by-n matrix of rank m $(m < n)$. After factoring the matrix, compute the solution vector x as follows: solve $Ly = b$ for y, and then compute $x = (Q_1)^H y$.

Table "Computational Routines for Orthogonal Factorization" lists LAPACK routines that perform orthogonal factorization of matrices.

Computational Routines for Orthogonal Factorization

?geqrf
Computes the QR factorization of a general m-by-n matrix.

Syntax

```
call sgeqrf(m, n, a, lda, tau, work, lwork, info)
call dgeqrf(m, n, a, lda, tau, work, lwork, info)
call cgeqrf(m, n, a, lda, tau, work, lwork, info)
call zgeqrf(m, n, a, lda, tau, work, lwork, info)
call geqrf(a [, tau] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine forms the *QR* factorization of a general *m*-by-*n* matrix *A* (see Orthogonal Factorizations). No pivoting is performed.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of min(*m*, *n*) *elementary reflectors*. Routines are provided to work with *Q* in this representation.

NOTE
This routine supports the Progress Routine feature. See Progress Function for details.

Input Parameters

m	INTEGER. The number of rows in the matrix *A* (*m*≥ 0).
n	INTEGER. The number of columns in *A* (*n*≥ 0).
a, *work*	REAL for sgeqrf DOUBLE PRECISION for dgeqrf COMPLEX for cgeqrf DOUBLE COMPLEX for zgeqrf. Arrays: *a*(*lda*,*) contains the matrix *A*. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The leading dimension of *a*; at least max(1, *m*).
lwork	INTEGER. The size of the *work* array (*lwork*≥*n*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

a	Overwritten by the factorization data as follows: The elements on and above the diagonal of the array contain the min(*m*,*n*)-by-*n* upper trapezoidal matrix *R* (*R* is upper triangular if *m*≥*n*); the elements below the diagonal, with the array *tau*, present the orthogonal matrix *Q* as a product of min(*m*,*n*) elementary reflectors (see Orthogonal Factorizations).
tau	REAL for sgeqrf DOUBLE PRECISION for dgeqrf COMPLEX for cgeqrf DOUBLE COMPLEX for zgeqrf. Array, size at least max (1, min(*m*, *n*)). Contains scalars that define elementary reflectors for the matrix Q in its decomposition in a product of elementary reflectors (see Orthogonal Factorizations).
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine *geqrf* interface are the following:

`a`	Holds the matrix *A* of size (*m*,*n*).
`tau`	Holds the vector of length min(*m*,*n*)

Application Notes

For better performance, try using `lwork = n*blocksize`, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set `lwork = -1`.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (`work(1)`) for subsequent runs.

If you set `lwork = -1`, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed factorization is the exact factorization of a matrix $A + E$, where

$||E||_2 = O(\varepsilon)||A||_2$.

The approximate number of floating-point operations for real flavors is

$(4/3)n^3$	if $m = n$,
$(2/3)n^2(3m-n)$	if $m > n$,
$(2/3)m^2(3n-m)$	if $m < n$.

The number of operations for complex flavors is 4 times greater.

To solve a set of least squares problems minimizing $||A*x - b||_2$ for all columns *b* of a given matrix *B*, you can call the following:

`?geqrf` (this routine)	to factorize $A = QR$;
ormqr	to compute $C = Q^T*B$ (for real matrices);
unmqr	to compute $C = Q^H*B$ (for complex matrices);
trsm (a BLAS routine)	to solve $R*X = C$.

(The columns of the computed *X* are the least squares solution vectors *x*.)

To compute the elements of *Q* explicitly, call

orgqr	(for real matrices)
ungqr	(for complex matrices).

Matrix Storage Schemes

?geqr
Computes a QR factorization of a general matrix, with best performance for tall and skinny matrices.

```
call sgeqr(m, n, a, lda, t, tsize, work, lwork, info)
call dgeqr(m, n, a, lda, t, tsize, work, lwork, info)
call cgeqr(m, n, a, lda, t, tsize, work, lwork, info)
call zgeqr(m, n, a, lda, t, tsize, work, lwork, info)
```

Description

The ?geqr routine computes a QR factorization of an *m*-by-*n* matrix *A*. If the matrix is tall and skinny (*m* is substantially larger than *m*), a highly scalable algorithm is used to avoid communication overhead.

NOTE
The internal format of the elementary reflectors generated by ?geqr is only compatible with the ?gemqr routine and not any other QR routines.

Input Parameters

m
INTEGER. The number of rows of the matrix *A*. *m*≥ 0.

n
REAL for sgeqr
INTEGER. The number of columns of the matrix *A*. *n*≥ 0.

a
DOUBLE PRECISION for dgeqr
COMPLEX for cgeqr
COMPLEX*16 for zgeqr
Array of size (*lda*,*n*). On entry, the *m*-by-*n* matrix *A*.

lda
INTEGER. The leading dimension of the array *a*. *lda*≥ max(1,*m*).

tsize
INTEGER. If *tsize*≥ 5, the size of the array *t*. If *tsize* = -1 or *tsize* = -2, then the routine performs a workspace query. The routine calculates the sizes required for the *t* and *work* arrays and returns these values as the first entries of the *t* and *work* arrays, without issuing any error message related to *t* or *work* by xerbla.

If *tsize* = -1, the routine calculates the optimal size of *t* for optimum performance and returns this value in *t*(1).

If *tsize* = -2, the routine calculates then minimum size required for *t* and returns this value in *t*(1).

lwork

INTEGER. The size of the array *work*. If *lwork* = -1 or *lwork* = -2, then the routine performs a workspace query. The routine only calculates the sizes of the *t* and *work* arrays and returns these values as the first entries of the *t* and *work* arrays, without issuing any error message related to *t* or *work* by xerbla.

If *lwork* = -1, the routine calculates the optimal size of *work* for optimum performance and returns this value in *work*(1).

If *lwork* = -2, the routine calculates the minimum size required for *work* and returns this value in *work*(1).

Output Parameters

a

REAL for sgeqr

DOUBLE PRECISION for dgeqr

COMPLEX for cgeqr

COMPLEX*16 for zgeqr

On exit, the elements on and above the diagonal of the array contain the (min(*m*,*n*))-by-*n* upper trapezoidal matrix *R* (*R* is upper triangular if *m*≥*n*); the elements below the diagonal represent *Q*.

t

REAL for sgelq

DOUBLE PRECISION for dgelq

COMPLEX for cgelq

COMPLEX*16 for zgelq

Array, size (max(5,*tsize*)).

If *info* = 0, *t*(1) returns the optimal value for *tsize*. You can specify that it return the minimum required value for *tsize* instead - see the *tsize* description for details. The remaining entries of *t* contains part of the data structure used to represent *Q*. To apply or construct Q, you need to retain *a* and *t* and pass them to other routines.

work

REAL for sgelq

DOUBLE PRECISION for dgelq

COMPLEX for cgelq

COMPLEX*16 for zgelq

Array, size (max(1,*lwork*)).

If *info* = 0, *work*(1) contains the optimal value for *lwork*. You can specify that it return the minimum required value for *lwork* instead - see the *lwork* description for details.

info

INTEGER.

info = 0 indicates a successful exit.

info < 0: if *info* = -*i*, the *i*-th argument had an illegal value.

See Also

?gemqr Multiples a matrix *C* by a real orthogonal or complex unitary matrix *Q*, as computed by ?geqr, with best performance for tall and skinny matrices.

?geqrfp
Computes the QR factorization of a general m-by-n matrix with non-negative diagonal elements.

Syntax

```
call sgeqrfp(m, n, a, lda, tau, work, lwork, info)
call dgeqrfp(m, n, a, lda, tau, work, lwork, info)
call cgeqrfp(m, n, a, lda, tau, work, lwork, info)
call zgeqrfp(m, n, a, lda, tau, work, lwork, info)
```

Description

The routine forms the *QR* factorization of a general *m*-by-*n* matrix *A* (see Orthogonal Factorizations). No pivoting is performed. The diagonal entries of *R* are real and nonnegative.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of min(*m*, *n*) *elementary reflectors*. Routines are provided to work with *Q* in this representation.

NOTE
This routine supports the Progress Routine feature. See Progress Function for details.

Input Parameters

m	INTEGER. The number of rows in the matrix *A* (*m*≥ 0).
n	INTEGER. The number of columns in *A* (*n*≥ 0).
a, *work*	REAL for sgeqrfp DOUBLE PRECISION for dgeqrfp COMPLEX for cgeqrfp DOUBLE COMPLEX for zgeqrfp. Arrays: *a*(*lda*,*) contains the matrix *A*. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The leading dimension of *a*; at least max(1, *m*).
lwork	INTEGER. The size of the *work* array (*lwork*≥*n*).

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See Application Notes for the suggested value of *lwork*.

Output Parameters

a

Overwritten by the factorization data as follows:

The elements on and above the diagonal of the array contain the min(*m*,*n*)-by-*n* upper trapezoidal matrix *R* (*R* is upper triangular if *m*≥*n*); the elements below the diagonal, with the array *tau*, present the orthogonal matrix *Q* as a product of min(*m*,*n*) elementary reflectors (see Orthogonal Factorizations).

The diagonal elements of the matrix *R* are real and non-negative.

tau

REAL for sgeqrfp

DOUBLE PRECISION for dgeqrfp

COMPLEX for cgeqrfp

DOUBLE COMPLEX for zgeqrfp.

Array, size at least max (1, min(*m*, *n*)). Contains scalars that define elementary reflectors for the matrix *Q*in its decomposition in a product of elementary reflectors (see Orthogonal Factorizations).

work(1)

If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info

INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine *geqrfp* interface are the following:

a

Holds the matrix *A* of size (*m*,*n*).

tau

Holds the vector of length min(*m*,*n*)

Application Notes

For better performance, try using *lwork* = *n***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (`work(1)`) for subsequent runs.

If you set `lwork = -1`, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed factorization is the exact factorization of a matrix $A + E$, where

$||E||_2 = O(\varepsilon)||A||_2$.

The approximate number of floating-point operations for real flavors is

$(4/3)n^3$	if $m = n$,
$(2/3)n^2(3m-n)$	if $m > n$,
$(2/3)m^2(3n-m)$	if $m < n$.

The number of operations for complex flavors is 4 times greater.

To solve a set of least squares problems minimizing $||A*x - b||_2$ for all columns b of a given matrix B, you can call the following:

`?geqrfp` (this routine)	to factorize $A = QR$;
ormqr	to compute $C = Q^T*B$ (for real matrices);
unmqr	to compute $C = Q^H*B$ (for complex matrices);
trsm (a BLAS routine)	to solve $R*X = C$.

(The columns of the computed X are the least squares solution vectors x.)

To compute the elements of Q explicitly, call

orgqr	(for real matrices)
ungqr	(for complex matrices).

`mkl_progress`

Matrix Storage Schemes

?geqrt
Computes a blocked QR factorization of a general real or complex matrix using the compact WY representation of Q.

Syntax

```
call sgeqrt(m, n, nb, a, lda, t, ldt, work, info)
call dgeqrt(m, n, nb, a, lda, t, ldt, work, info)
call cgeqrt(m, n, nb, a, lda, t, ldt, work, info)
call zgeqrt(m, n, nb, a, lda, t, ldt, work, info)
```

```
call geqrt(a, t, nb[, info])
```

Include Files

- mkl.fi, lapack.f90

Description

The strictly lower triangular matrix *V* contains the elementary reflectors *H*(*i*) in the *i*th column below the diagonal. For example, if m=5 and n=3, the matrix *V* is

$$V = \begin{bmatrix} 1 & & \\ v_1 & 1 & \\ v_1 & v_2 & 1 \\ v_1 & v_2 & v_3 \\ v_1 & v_2 & v_3 \end{bmatrix}$$

where v_i represents one of the vectors that define *H*(*i*). The vectors are returned in the lower triangular part of array a.

NOTE
The 1s along the diagonal of *V* are not stored in `a`.

Let `k = min(m,n)`. The number of blocks is `b = ceiling(k/nb)`, where each block is of order `nb` except for the last block, which is of order `ib = k - (b-1)*nb`. For each of the *b* blocks, a upper triangular block reflector factor is computed: `t1, t2, ..., tb`. The `nb`-by-`nb` (and *ib*-by-*ib* for the last block) *t*s are stored in the `nb`-by-`n` array `t` as

`t = (t1t2 ... tb)`.

Input Parameters

`m`	`INTEGER`. The number of rows in the matrix *A* (`m` ≥ 0).
`n`	`INTEGER`. The number of columns in *A* (`n` ≥ 0).
`nb`	`INTEGER`. The block size to be used in the blocked QR (min(`m`, `n`) ≥ `nb` ≥ 1).

`a`, `work`	`REAL` for `sgeqrt`
	`DOUBLE PRECISION` for `dgeqrt`
	`COMPLEX` for `cgeqrt`
	`COMPLEX*16` for `zgeqrt`.
	Arrays: `a`DIMENSION (`lda`, `n`) contains the `m`-by-`n` matrix *A*.
	`work`DIMENSION (`nb`, `n`) is a workspace array.

`lda`	`INTEGER`. The leading dimension of `a`; at least max(1, `m`).
`ldt`	`INTEGER`. The leading dimension of `t`; at least `nb`.

Output Parameters

`a`	Overwritten by the factorization data as follows: The elements on and above the diagonal of the array contain the min(`m`,`n`)-by-*n* upper trapezoidal matrix *R* (*R* is upper triangular if `m`≥`n`); the elements below the diagonal, with the array `t`, present the orthogonal matrix *Q* as a product of min(`m`,`n`) elementary reflectors (see Orthogonal Factorizations).

`t`	`REAL` for `sgeqrt`
	`DOUBLE PRECISION` for `dgeqrt`
	`COMPLEX` for `cgeqrt`
	`COMPLEX*16` for `zgeqrt`.
	Array, `DIMENSION` (`ldt`, min(`m`, `n`)).
	The upper triangular block reflector's factors stored as a sequence of upper triangular blocks.

`info`	`INTEGER`. If `info` = 0, the execution is successful. If `info` < 0 and `info` = -*i*, the *i*th argument had an illegal value.

?gemqrt

Multiplies a general matrix by the orthogonal/unitary matrix Q of the QR factorization formed by `?geqrt`.

Syntax

```
call sgemqrt(side, trans, m, n, k, nb, v, ldv, t, ldt, c, ldc, work, info)
call dgemqrt(side, trans, m, n, k, nb, v, ldv, t, ldt, c, ldc, work, info)
call cgemqrt(side, trans, m, n, k, nb, v, ldv, t, ldt, c, ldc, work, info)
call zgemqrt(side, trans, m, n, k, nb, v, ldv, t, ldt, c, ldc, work, info)
call gemqrt( v, t, c, k, nb[, trans][, side][, info])
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The `?gemqrt` routine overwrites the general real or complex *m*-by-*n* matrix*C* with

	side ='L'	*side* ='R'
trans = 'N':	*Q***C*	*C***Q*
trans = 'T':	Q^T**C*	*C**Q^T
trans = 'C':	Q^H**C*	*C**Q^H

where *Q* is a real orthogonal (complex unitary) matrix defined as the product of *k* elementary reflectors

Q = *H*(1) *H*(2)... *H*(*k*) = *I* - *V***T**V^T for real flavors, and

Q = *H*(1) *H*(2)... *H*(*k*) = *I* - *V***T**V^H for complex flavors,

generated using the compact WY representation as returned by geqrt. *Q* is of order *m* if *side* = 'L' and of order *n* if *side* = 'R'.

Input Parameters

side — CHARACTER

='L': apply *Q*, Q^T, or Q^H from the left.

='R': apply *Q*, Q^T, or Q^H from the right.

trans — CHARACTER

='N', no transpose, apply *Q*.

='T', transpose, apply Q^T.

='C', transpose, apply Q^H.

m — INTEGER. The number of rows in the matrix *C*, (*m* ≥ 0).

n — INTEGER. The number of columns in the matrix *C*, (*n* ≥ 0).

k — INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. Constraints:

If *side* = 'L', *m* ≥ *k*≥0

If *side* = 'R', *n* ≥ *k*≥0.

nb INTEGER.

The block size used for the storage of *t*, *k* ≥ *nb* ≥ 1. This must be the same value of *nb* used to generate *t* in geqrt.

v REAL for sgemqrt

DOUBLE PRECISION for dgemqrt

COMPLEX for cgemqrt

COMPLEX*16 for zgemqrt.

Array, DIMENSION (*ldv*, *k*).

The *i*th column must contain the vector which defines the elementary reflector *H*(*i*), for *i* = 1,2,...,*k*, as returned by geqrt in the first *k* columns of its array argument *a*.

ldv INTEGER. The leading dimension of the array *v*.

if *side* = 'L', *ldv* must be at least max(1,*m*);

if *side* = 'R', *ldv* must be at least max(1,*n*).

t REAL for sgemqrt

DOUBLE PRECISION for dgemqrt

COMPLEX for cgemqrt

COMPLEX*16 for zgemqrt.

Array, DIMENSION (*ldt*, *k*).

The upper triangular factors of the block reflectors as returned by geqrt.

ldt INTEGER. The leading dimension of the array *t*. *ldt* must be at least *nb*.

c REAL for sgemqrt

DOUBLE PRECISION for dgemqrt

COMPLEX for cgemqrt

COMPLEX*16 for zgemqrt.

The *m*-by-*n* matrix *C*.

ldc INTEGER. The leadi*n*ng dimension of the array *c*. *ldc* must be at least max(1, *m*).

work REAL for sgemqrt

DOUBLE PRECISION for dgemqrt

COMPLEX for cgemqrt

COMPLEX*16 for zgemqrt.

Workspace array.

If *side* = 'L' DIMENSION *n***nb*.

If *side* = 'R' DIMENSION *m***nb*.

Output Parameters

c	Overwritten by the product $Q*C$, $C*Q$, Q^T*C, $C*Q^T$, Q^H*C, or $C*Q^H$ as specified by *side* and *trans*.
info	INTEGER. = 0: the execution is successful. < 0: if *info* = -*i*, the *i*th argument had an illegal value.

?geqpf
Computes the QR factorization of a general m-by-n matrix with pivoting.

Syntax

```
call sgeqpf(m, n, a, lda, jpvt, tau, work, info)
call dgeqpf(m, n, a, lda, jpvt, tau, work, info)
call cgeqpf(m, n, a, lda, jpvt, tau, work, rwork, info)
call zgeqpf(m, n, a, lda, jpvt, tau, work, rwork, info)
call geqpf(a, jpvt [,tau] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine is deprecated and has been replaced by routine geqp3.

The routine ?geqpf forms the *QR* factorization of a general *m*-by-*n* matrix *A* with column pivoting: *A*P = Q*R* (see Orthogonal Factorizations). Here *P* denotes an *n*-by-*n* permutation matrix.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of min(*m*, *n*) *elementary reflectors*. Routines are provided to work with *Q* in this representation.

Input Parameters

m	INTEGER. The number of rows in the matrix *A* (*m*≥ 0).
n	INTEGER. The number of columns in *A* (*n*≥ 0).
a, *work*	REAL for sgeqpf DOUBLE PRECISION for dgeqpf COMPLEX for cgeqpf DOUBLE COMPLEX for zgeqpf. Arrays: *a* (*lda*,*) contains the matrix *A*. The second dimension of *a* must be at least max(1, *n*). *work* (*lwork*) is a workspace array. The size of the *work* array must be at least max(1, 3*n*) for real flavors and at least max(1, *n*) for complex flavors.
lda	INTEGER. The leading dimension of *a*; at least max(1, *m*).

jpvt INTEGER. Array, size at least max(1, *n*).

On entry, if *jpvt*(*i*) > 0, the *i*-th column of *A* is moved to the beginning of *A***P* before the computation, and fixed in place during the computation.

If *jpvt*(*i*) = 0, the *i*th column of *A* is a free column (that is, it may be interchanged during the computation with any other free column).

rwork REAL for cgeqpf

DOUBLE PRECISION for zgeqpf.

A workspace array, DIMENSION at least max(1, 2**n*).

Output Parameters

a Overwritten by the factorization data as follows:

The elements on and above the diagonal of the array contain the min(*m*,*n*)-by-*n* upper trapezoidal matrix *R* (*R* is upper triangular if *m*≥*n*); the elements below the diagonal, with the array *tau*, present the orthogonal matrix *Q* as a product of min(*m*,*n*) elementary reflectors (see Orthogonal Factorizations).

tau REAL for sgeqpf

DOUBLE PRECISION for dgeqpf

COMPLEX for cgeqpf

DOUBLE COMPLEX for zgeqpf.

Array, size at least max (1, min(*m*, *n*)). Contains additional information on the matrix *Q*.

jpvt Overwritten by details of the permutation matrix *P* in the factorization *A***P* = *Q***R*. More precisely, the columns of *A***P* are the columns of *A* in the following order:

jpvt(1), *jpvt*(2), ..., *jpvt*(*n*).

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine geqpf interface are the following:

a Holds the matrix *A* of size (*m*,*n*).

jpvt Holds the vector of length *n*.

tau Holds the vector of length min(*m*,*n*)

Application Notes

The computed factorization is the exact factorization of a matrix *A* + *E*, where

$||E||_2 = O(\varepsilon)||A||_2$.

The approximate number of floating-point operations for real flavors is

$(4/3)n^3$	if $m = n$,
$(2/3)n^2(3m-n)$	if $m > n$,
$(2/3)m^2(3n-m)$	if $m < n$.

The number of operations for complex flavors is 4 times greater.

To solve a set of least squares problems minimizing $||A*x - b||_2$ for all columns b of a given matrix B, you can call the following:

?geqpf (this routine)	to factorize $A*P = Q*R$;
ormqr	to compute $C = Q^T*B$ (for real matrices);
unmqr	to compute $C = Q^H*B$ (for complex matrices);
trsm (a BLAS routine)	to solve $R*X = C$.

(The columns of the computed X are the permuted least squares solution vectors x; the output array *jpvt* specifies the permutation order.)

To compute the elements of Q explicitly, call

orgqr	(for real matrices)
ungqr	(for complex matrices).

?geqp3

Computes the QR factorization of a general m-by-n matrix with column pivoting using level 3 BLAS.

Syntax

```
call sgeqp3(m, n, a, lda, jpvt, tau, work, lwork, info)
call dgeqp3(m, n, a, lda, jpvt, tau, work, lwork, info)
call cgeqp3(m, n, a, lda, jpvt, tau, work, lwork, rwork, info)
call zgeqp3(m, n, a, lda, jpvt, tau, work, lwork, rwork, info)
call geqp3(a, jpvt [,tau] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine forms the *QR* factorization of a general *m*-by-*n* matrix *A* with column pivoting: $A*P = Q*R$ (see Orthogonal Factorizations) using Level 3 BLAS. Here *P* denotes an *n*-by-*n* permutation matrix. Use this routine instead of geqpf for better performance.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of min(*m*, *n*) *elementary reflectors*. Routines are provided to work with *Q* in this representation.

Input Parameters

m	INTEGER. The number of rows in the matrix *A* (*m*≥ 0).
n	INTEGER. The number of columns in *A* (*n*≥ 0).
a, *work*	REAL for sgeqp3 DOUBLE PRECISION for dgeqp3 COMPLEX for cgeqp3 DOUBLE COMPLEX for zgeqp3. Arrays: *a* (*lda*,*) contains the matrix *A*. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The leading dimension of *a*; at least max(1, *m*).
lwork	INTEGER. The size of the *work* array; must be at least max(1, 3*n+1) for real flavors, and at least max(1, *n*+1) for complex flavors. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* below for details.
jpvt	INTEGER. Array, size at least max(1, *n*). On entry, if *jpvt*(*i*)≠ 0, the *i*-th column of *A* is moved to the beginning of *AP* before the computation, and fixed in place during the computation. If *jpvt*(*i*) = 0, the *i*-th column of *A* is a free column (that is, it may be interchanged during the computation with any other free column).
rwork	REAL for cgeqp3 DOUBLE PRECISION for zgeqp3. A workspace array, size at least max(1, 2**n*). Used in complex flavors only.

Output Parameters

a	Overwritten by the factorization data as follows: The elements on and above the diagonal of the array contain the min(*m*,*n*)-by-*n* upper trapezoidal matrix *R* (*R* is upper triangular if *m*≥*n*); the elements below the diagonal, with the array *tau*, present the orthogonal matrix *Q* as a product of min(*m*,*n*) elementary reflectors (see Orthogonal Factorizations).
tau	REAL for sgeqp3 DOUBLE PRECISION for dgeqp3 COMPLEX for cgeqp3 DOUBLE COMPLEX for zgeqp3.

	Array, size at least max (1, min(*m*, *n*)). Contains scalar factors of the elementary reflectors for the matrix *Q*.
jpvt	Overwritten by details of the permutation matrix *P* in the factorization *A*P = Q*R*. More precisely, the columns of *AP* are the columns of *A* in the following order: *jpvt*(1), *jpvt*(2), ..., *jpvt*(*n*).
info	INTEGER. If *info = 0*, the execution is successful. If *info = -i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine geqp3 interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
jpvt	Holds the vector of length *n*.
tau	Holds the vector of length min(*m*,*n*)

Application Notes

To solve a set of least squares problems minimizing $||A*x - b||_2$ for all columns *b* of a given matrix *B*, you can call the following:

?geqp3 (this routine)	to factorize *A*P = Q*R*;
ormqr	to compute $C = Q^T*B$ (for real matrices);
unmqr	to compute $C = Q^H*B$ (for complex matrices);
trsm (a BLAS routine)	to solve *R*X = C*.

(The columns of the computed *X* are the permuted least squares solution vectors *x*; the output array *jpvt* specifies the permutation order.)

To compute the elements of *Q* explicitly, call

orgqr	(for real matrices)
ungqr	(for complex matrices).

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork = -1*.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork = -1*, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?orgqr
Generates the real orthogonal matrix Q of the QR factorization formed by `?geqrf`.

Syntax

```
call sorgqr(m, n, k, a, lda, tau, work, lwork, info)
call dorgqr(m, n, k, a, lda, tau, work, lwork, info)
call orgqr(a, tau [,info])
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine generates the whole or part of *m*-by-*m* orthogonal matrix *Q* of the *QR* factorization formed by the routine `?geqrf` or geqpf. Use this routine after a call to `sgeqrf`/`dgeqrf` or `sgeqpf`/`dgeqpf`.

Usually *Q* is determined from the *QR* factorization of an *m* by *p* matrix *A* with $m \geq p$. To compute the whole matrix *Q*, use:

```
call?orgqr(m, m, p, a, lda, tau, work, lwork, info)
```

To compute the leading *p* columns of *Q* (which form an orthonormal basis in the space spanned by the columns of *A*):

```
call?orgqr(m, p, p, a, lda, work, lwork, info)
```

To compute the matrix Q^k of the *QR* factorization of leading *k* columns of the matrix *A*:

```
call?orgqr(m, m, k, a, lda, tau, work, lwork, info)
```

To compute the leading *k* columns of Q^k (which form an orthonormal basis in the space spanned by leading *k* columns of the matrix *A*):

```
call?orgqr(m, k, k, a, lda, tau, work, lwork, info)
```

Input Parameters

m	`INTEGER`. The order of the orthogonal matrix *Q* ($m \geq 0$).
n	`INTEGER`. The number of columns of *Q* to be computed ($0 \leq n \leq m$).
k	`INTEGER`. The number of elementary reflectors whose product defines the matrix *Q* ($0 \leq k \leq n$).

a, *tau*, *work*	`REAL` for `sorgqr`
	`DOUBLE PRECISION` for `dorgqr`
	Arrays:
	a(*lda*,*) and *tau*(*) are the arrays returned by `sgeqrf` / `dgeqrf` or `sgeqpf` / `dgeqpf`.

The second dimension of *a* must be at least max(1, *n*).

The size of *tau* must be at least max(1, *k*).

work is a workspace array, its dimension `max(1, lwork)`.

lda — `INTEGER`. The leading dimension of *a*; at least max(1, *m*).

lwork — `INTEGER`. The size of the *work* array (*lwork*≥*n*).

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a — Overwritten by *n* leading columns of the *m*-by-*m* orthogonal matrix *Q*.

work(1) — If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info — `INTEGER`.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `orgqr` interface are the following:

a — Holds the matrix *A* of size (*m*,*n*).

tau — Holds the vector of length (*k*)

Application Notes

For better performance, try using *lwork* = *n***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed *Q* differs from an exactly orthogonal matrix by a matrix *E* such that

$||E||_2 = O(\varepsilon)||A||_2$ where ε is the machine precision.

The total number of floating-point operations is approximately $4*m*n*k - 2*(m + n)*k^2 + (4/3)*k^3$.

If $n = k$, the number is approximately $(2/3)*n^2*(3m - n)$.

The complex counterpart of this routine is ungqr.

?ormqr
Multiplies a real matrix by the orthogonal matrix Q of the QR factorization formed by ?geqrf *or* ?geqpf.

Syntax

```
call sormqr(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call dormqr(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call ormqr(a, tau, c [,side] [,trans] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine multiplies a real matrix *C* by *Q* or Q^T, where *Q* is the orthogonal matrix *Q* of the *QR* factorization formed by the routine ?geqrf or ?geqpf.

Depending on the parameters *side*left_right and trans, the routine can form one of the matrix products $Q*C$, Q^T*C, $C*Q$, or $C*Q^T$ (overwriting the result on *C*).

Input Parameters

side	CHARACTER*1. Must be either 'L' or 'R'. If *side*='L', *Q* or Q^T is applied to *C* from the left. If *side*='R', *Q* or Q^T is applied to *C* from the right.
trans	CHARACTER*1. Must be either 'N' or 'T'. If *trans*='N', the routine multiplies *C* by *Q*. If *trans*='T', the routine multiplies *C* by Q^T.
m	INTEGER. The number of rows in the matrix *C* ($m \geq 0$).
n	INTEGER. The number of columns in *C* ($n \geq 0$).
k	INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. Constraints: $0 \leq k \leq m$ if *side*='L'; $0 \leq k \leq n$ if *side*='R'.
a, *tau*, *c*, *work*	REAL for sgeqrf DOUBLE PRECISION for dgeqrf. Arrays:

a(*lda*,*) and *tau*(*) are the arrays returned by `sgeqrf` / `dgeqrf` or `sgeqpf` / `dgeqpf`.

The second dimension of *a* must be at least max(1, *k*).

The size of *tau* must be at least max(1, *k*).

c(*ldc*,*) contains the matrix *C*.

The second dimension of *c* must be at least max(1, *n*)

work is a workspace array, its dimension `max(1, lwork)`.

lda — `INTEGER`. The leading dimension of *a*. Constraints:

if `side = 'L'`, *lda* ≥ `max(1, m)` ;

if `side = 'R'`, *lda* ≥ `max(1, n)`.

ldc — `INTEGER`. The leading dimension of *c*. Constraint:

ldc ≥ max(1, *m*).

lwork — `INTEGER`. The size of the *work* array. Constraints:

lwork ≥ `max(1, n)` if `side = 'L'`;

lwork ≥ `max(1, m)` if `side = 'R'`.

If `lwork = -1`, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

c — Overwritten by the product $Q*C$, Q^T*C, $C*Q$, or $C*Q^T$ (as specified by *side* and *trans*).

work(1) — If `info = 0`, on exit `work(1)` contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info — `INTEGER`.

If `info = 0`, the execution is successful.

If `info = -i`, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `ormqr` interface are the following:

a — Holds the matrix *A* of size (*r*,*k*).

`r = m` if `side = 'L'`.

`r = n` if `side = 'R'`.

tau — Holds the vector of length (*k*).

c	Holds the matrix *C* of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
trans	Must be 'N' or 'T'. The default value is 'N'.

Application Notes

For better performance, try using *lwork = n*blocksize* (if *side = 'L'*) or *lwork = m*blocksize* (if *side = 'R'*) where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork = -1*.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work(1)*) for subsequent runs.

If you set *lwork = -1*, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The complex counterpart of this routine is unmqr.

?gemqr
Multiples a matrix C by a real orthogonal or complex unitary matrix Q, as computed by ?geqr, with best performance for tall and skinny matrices.

```
call sgemqr(side, trans, m, n, k, a, lda, t, tsize, c, ldc, work, lwork, info)
call dgemqr(side, trans, m, n, k, a, lda, t, tsize, c, ldc, work, lwork, info)
call cgemqr(side, trans, m, n, k, a, lda, t, tsize, c, ldc, work, lwork, info)
call zgemqr(side, trans, m, n, k, a, lda, t, tsize, c, ldc, work, lwork, info)
```

Description

The ?gemqr routine multiplies an *m*-by-*n* matrix *C* by Op(*Q*), where matrix *Q* is the factor from the LQ factorization of matrix *A* formed by ?geqr, and

Op(*Q*) = *Q*, or

Op(*Q*) = Q^T, or

Op(*Q*) = Q^H.

NOTE
You must use ?geqr for LQ factorization before calling ?gemqr. ?gemqr is not compatible with QR factorization routines other than ?geqr.

For real flavors, *C* is real and *Q* is real orthogonal.

For complex flavors, *C* is complex and *Q* is complex unitary.

If matrix *A* is tall and skinny, a highly scalable algorithm is used to avoid communication overhead. Otherwise, ?ormqr or ?unmqr is used.

Input Parameters

side
CHARACTER*1.
If *side* = 'L': apply Op(*Q*) from the left.
If *side* = 'R'': apply Op(*Q*) from the right.

trans
CHARACTER*1.
If *trans* = 'N': No transpose, Op(*Q*) = *Q*.
If *trans* = 'T': Transpose, Op(*Q*) = Q^T.
If *trans* = 'C': Conjugate transpose, Op(*Q*) = Q^H.

m
INTEGER. The number of rows of the matrix *A*. *m*≥ 0.

n
INTEGER. The number of columns of the matrix *C*. *m*≥*n*≥ 0.

k
INTEGER. The number of elementary reflectors whose product defines the matrix Q.
If *side* = 'L', *m*≥*k*≥ 0.
if *side* = 'R', *n*≥*k*≥ 0.

a
REAL for sgemqr
DOUBLE PRECISION for dgemqr
COMPLEX for cgemqr
COMPLEX*16 for zgemqr
Array, size (*lda*,*k*).
Part of the data structure to represent *Q* as returned by ?geqr.

lda
INTEGER. The leading dimension of the array *a*.
If *side* = 'L', *lda*≥max(1,*m*).
If *side* = 'R', *lda*≥max(1,*n*).

t
REAL for sgemlq
DOUBLE PRECISION for dgemlq
COMPLEX for cgemlq
COMPLEX*16 for zgemlq
Array, size (max(5,*tsize*)). Part of the data structure to represent *Q* as returned by ?geqr.

tsize
INTEGER. The size of the array *t*. *tsize*≥ 5.

c
REAL for sgemqr
DOUBLE PRECISION for dgemqr
COMPLEX for cgemqr
COMPLEX*16 for zgemqr
Array of size (*ldc*,*n*). On entry, contains the *m*-by-*n* matrix *C*.

ldc	INTEGER. The leading dimension of the array *c*. *ldc*≥max(1,*m*).
lwork	INTEGER. The size of the array *work*. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array and returns this value as *work*(1); no error message related to *lwork* is issued by xerbla.

Output Parameters

c	On exit, *c* is overwritten by Op(*Q*)***C* or *C**Op(*Q*).
work	REAL for sgemlq DOUBLE PRECISION for dgemlq COMPLEX for cgemlq COMPLEX*16 for zgemlq Workspace array of size (max(1,*lwork*)).
info	INTEGER. *info* = 0 indicates a successful exit. *info* < 0: if *info* = -*i*, the *i*-th argument had an illegal value.

?ungqr
Generates the complex unitary matrix Q of the QR factorization formed by ?geqrf.

Syntax

```
call cungqr(m, n, k, a, lda, tau, work, lwork, info)
call zungqr(m, n, k, a, lda, tau, work, lwork, info)
call ungqr(a, tau [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine generates the whole or part of *m*-by-*m* unitary matrix *Q* of the *QR* factorization formed by the routines ?geqrf or geqpf. Use this routine after a call to cgeqrf/zgeqrf or cgeqpf/zgeqpf.

Usually *Q* is determined from the *QR* factorization of an *m* by *p* matrix *A* with *m*≥*p*. To compute the whole matrix *Q*, use:

```
call?ungqr(m, m, p, a, lda, tau, work, lwork, info)
```

To compute the leading *p* columns of *Q* (which form an orthonormal basis in the space spanned by the columns of *A*):

```
call?ungqr(m, p, p, a, lda, tau, work, lwork, info)
```

To compute the matrix Q^k of the *QR* factorization of the leading *k* columns of the matrix *A*:

```
call?ungqr(m, m, k, a, lda, tau, work, lwork, info)
```

To compute the leading *k* columns of Q^k (which form an orthonormal basis in the space spanned by the leading *k* columns of the matrix *A*):

```
call?ungqr(m, k, k, a, lda, tau, work, lwork, info)
```

Input Parameters

m	INTEGER. The order of the unitary matrix *Q* (*m*≥ 0).
n	INTEGER. The number of columns of *Q* to be computed (0 ≤*n*≤*m*).
k	INTEGER. The number of elementary reflectors whose product defines the matrix *Q* (0 ≤*k*≤*n*).
a, *tau*, *work*	COMPLEX for cungqr DOUBLE COMPLEX for zungqr Arrays: *a*(*lda*,*) and *tau*(*) are the arrays returned by cgeqrf/zgeqrf or cgeqpf/zgeqpf. The second dimension of *a* must be at least max(1, *n*). The size of *tau* must be at least max(1, *k*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The leading dimension of *a*; at least max(1, *m*).
lwork	INTEGER. The size of the *work* array (*lwork*≥*n*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a	
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine ungqr interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).

tau Holds the vector of length (*k*).

Application Notes

For better performance, try using *lwork* =*n*blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed *Q* differs from an exactly unitary matrix by a matrix *E* such that $||E||_2 = O(\varepsilon)*||A||_2$, where ε is the machine precision.

The total number of floating-point operations is approximately $16*m*n*k - 8*(m + n)*k2 + (16/3)*k^3$.

If $n = k$, the number is approximately $(8/3)*n^2*(3m - n)$.

The real counterpart of this routine is orgqr.

?unmqr

Multiplies a complex matrix by the unitary matrix Q of the QR factorization formed by ?geqrf.

Syntax

```
call cunmqr(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call zunmqr(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call unmqr(a, tau, c [,side] [,trans] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine multiplies a rectangular complex matrix *C* by *Q* or Q^H, where *Q* is the unitary matrix *Q* of the *QR* factorization formed by the routines ?geqrf or geqpf.

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products *Q*C*, Q^H*C*, *C*Q*, or *C*Q^H (overwriting the result on *C*).

Input Parameters

side CHARACTER*1. Must be either 'L' or 'R'.

If *side* = 'L', *Q* or Q^H is applied to *C* from the left.

If *side* = 'R', *Q* or Q^H is applied to *C* from the right.

trans — CHARACTER*1. Must be either 'N' or 'C'.

If *trans* = 'N', the routine multiplies *C* by *Q*.

If *trans* = 'C', the routine multiplies *C* by Q^H.

m — INTEGER. The number of rows in the matrix *C* (*m* ≥ 0).

n — INTEGER. The number of columns in *C* (*n* ≥ 0).

k — INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. Constraints:

0 ≤ *k* ≤ *m* if *side* = 'L';

0 ≤ *k* ≤ *n* if *side* = 'R'.

a, *c*, *tau*, *work* — COMPLEX for cgeqrf

DOUBLE COMPLEX for zgeqrf.

Arrays:

a(*lda*,*) and *tau*(*) are the arrays returned by cgeqrf / zgeqrf or cgeqpf / zgeqpf.

The second dimension of *a* must be at least max(1, *k*).

The size of *tau* must be at least max(1, *k*).

c(*ldc*,*) contains the *m*-by-*n* matrix *C*.

The second dimension of *c* must be at least max(1, *n*)

work is a workspace array, its dimension max(1, *lwork*).

lda — INTEGER. The leading dimension of *a*. Constraints:

lda ≥ max(1, *m*) if *side* = 'L';

lda ≥ max(1, *n*) if *side* = 'R'.

ldc — INTEGER. The leading dimension of *c*. Constraint:

ldc ≥ max(1, *m*) .

lwork — INTEGER. The size of the *work* array. Constraints:

lwork ≥ max(1, *n*) if *side* = 'L';

lwork ≥ max(1, *m*) if *side* = 'R'.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application notes* for the suggested value of *lwork*.

Output Parameters

c — Overwritten by the product $Q*C$, Q^H*C, $C*Q$, or $C*Q^H$ (as specified by *side* and *trans*).

work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine unmqr interface are the following:

a	Holds the matrix *A* of size (*r*,*k*). *r* = *m* if *side* = 'L'. *r* = *n* if *side* = 'R'.
tau	Holds the vector of length (*k*).
c	Holds the matrix *C* of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
trans	Must be 'N' or 'C'. The default value is 'N'.

Application Notes

For better performance, try using *lwork* = *n***blocksize* (if *side* = 'L') or *lwork* = *m***blocksize* (if *side* = 'R') where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The real counterpart of this routine is ormqr.

?gelqf
Computes the LQ factorization of a general m-by-n matrix.

Syntax

```
call sgelqf(m, n, a, lda, tau, work, lwork, info)
call dgelqf(m, n, a, lda, tau, work, lwork, info)
call cgelqf(m, n, a, lda, tau, work, lwork, info)
```

```
call zgelqf(m, n, a, lda, tau, work, lwork, info)
call gelqf(a [, tau] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine forms the *LQ* factorization of a general *m*-by-*n* matrix *A* (see Orthogonal Factorizations). No pivoting is performed.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of min(*m*, *n*) *elementary reflectors*. Routines are provided to work with *Q* in this representation.

NOTE
This routine supports the Progress Routine feature. See Progress Function for details.

Input Parameters

m	INTEGER. The number of rows in the matrix *A* (*m*≥ 0).
n	INTEGER. The number of columns in *A* (*n*≥ 0).
a, *work*	REAL for sgelqf DOUBLE PRECISION for dgelqf COMPLEX for cgelqf DOUBLE COMPLEX for zgelqf. Arrays: Array *a*(*lda*,*) contains the matrix *A*. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The leading dimension of *a*; at least max(1, *m*).
lwork	INTEGER. The size of the *work* array; at least max(1, *m*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a	Overwritten by the factorization data as follows: The elements on and below the diagonal of the array contain the *m*-by-min(*m*,*n*) lower trapezoidal matrix *L* (*L* is lower triangular if *m*≤*n*); the elements above the diagonal, with the array *tau*, represent the orthogonal matrix *Q* as a product of elementary reflectors.

tau	REAL for sgelqf DOUBLE PRECISION for dgelqf COMPLEX for cgelqf DOUBLE COMPLEX for zgelqf. Array, size at least max(1, min(*m*, *n*)). Contains scalars that define elementary reflectors for the matrix *Q* (see Orthogonal Factorizations).
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine gelqf interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
tau	Holds the vector of length min(*m*,*n*).

Application Notes

For better performance, try using *lwork* =*m***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed factorization is the exact factorization of a matrix $A + E$, where

$||E||_2 = O(\varepsilon) \ ||A||_2$.

The approximate number of floating-point operations for real flavors is

$(4/3)n^3$	if $m = n$,
$(2/3)n^2(3m-n)$	if $m > n$,
$(2/3)m^2(3n-m)$	if $m < n$.

The number of operations for complex flavors is 4 times greater.

To find the minimum-norm solution of an underdetermined least squares problem minimizing $||A*x - b||_2$ for all columns *b* of a given matrix *B*, you can call the following:

?gelqf (this routine)	to factorize $A = L*Q$;
trsm (a BLAS routine)	to solve $L*Y = B$ for *Y*;
ormlq	to compute $X = (Q_1)^T*Y$ (for real matrices);
unmlq	to compute $X = (Q_1)^H*Y$ (for complex matrices).

(The columns of the computed *X* are the minimum-norm solution vectors *x*. Here *A* is an *m*-by-*n* matrix with $m < n$; Q_1 denotes the first *m* columns of *Q*).

To compute the elements of *Q* explicitly, call

orglq	(for real matrices)
unglq	(for complex matrices).

mkl_progress

Matrix Storage Schemes

?gelq
Computes an LQ factorization of a general matrix.

```
call sgelq(m, n, a, lda, t, tsize, work, lwork, info)
call dgelq(m, n, a, lda, t, tsize, work, lwork, info)
call cgelq(m, n, a, lda, t, tsize, work, lwork, info)
call zgelq(m, n, a, lda, t, tsize, work, lwork, info)
```

Description

The ?gelq routines computes an LQ factorization of an *m*-by-*n* matrix *A*. If the matrix is short and wide (*n* is substantially larger than *m*), a highly scalable algorithm is used to avoid communication overhead.

NOTE
The internal format of the elementary reflectors generated by ?gelq is only compatible with the ?gemlq routine and not any other LQ routines.

NOTE
An optimized version of ?gelq is not available.

Input Parameters

m	INTEGER. The number of rows of the matrix *A*. $m \geq 0$.
n	INTEGER. The number of columns of the matrix *A*. $n \geq 0$.
a	REAL for sgelq

DOUBLE PRECISION for dgelq

COMPLEX for cgelq

COMPLEX*16 for zgelq

Array, size (*lda*, *n*). Contains the *m*-by-*n* matrix *A*.

lda INTEGER. The leading dimension of the array *a*. *lda*≥max(1, *m*).

tsize INTEGER. If *tsize*≥ 5, the size of the array *t*. If *tsize* = -1 or *tsize* = -2, then the routine performs a workspace query. The routine calculates the sizes required for the *t* and *work* arrays and returns these values as the first entries of the *t* and *work* arrays, without issuing any error message related to *t* or *work* by xerbla.

If *tsize* = -1, the routine calculates the optimal size of *t* for optimum performance and returns this value in *t*(1).

If *tsize* = -2, the routine calculates then minimum size required for *t* and returns this value in *t*(1).

lwork INTEGER. The size of the array *work*. If *lwork* = -1 or *lwork* = -2, then the routine performs a workspace query. The routine only calculates the sizes of the *t* and *work* arrays and returns these values as the first entries of the *t* and *work* arrays, without issuing any error message related to *t* or *work* by xerbla.

If *lwork* = -1, the routine calculates the optimal size of *work* for optimum performance and returns this value in *work*(1).

If *lwork* = -2, the routine calculates the minimum size required for *work* and returns this value in *work*(1).

Output Parameters

a REAL for sgelq

DOUBLE PRECISION for dgelq

COMPLEX for cgelq

COMPLEX*16 for zgelq

The elements on and below the diagonal of the array contain the lower trapezoidal matrix *L* (*L* is lower triangular if *m*≤*n*). The elements above the diagonal are used to store part of the internal data structure representing *Q*.

t REAL for sgelq

DOUBLE PRECISION for dgelq

COMPLEX for cgelq

COMPLEX*16 for zgelq

Array, size (max(5,*tsize*)).

If *info* = 0, *t*(1) returns the optimal value for *tsize*. You can specify that it return the minimum required value for *tsize* instead - see the *tsize* description for details. The remaining entries of *t* contains part of the data structure used to represent *Q*. To apply or construct Q, you need to retain *a* and *t* and pass them to other routines.

work

REAL for sgelq

DOUBLE PRECISION for dgelq

COMPLEX for cgelq

COMPLEX*16 for zgelq

Array, size (max(1,*lwork*)).

If *info* = 0, *work*(1) contains the optimal value for *lwork*. You can specify that it return the minimum required value for *lwork* instead - see the *lwork* description for details.

info

INTEGER.

info = 0 indicates a successful exit.

info < 0: if *info* = -*i*, the *i*-th argument had an illegal value.

See Also

?gemlq Multiples a matrix *C* by a real orthogonal or complex unitary matrix *Q*, as computed by ?gelq.

?gelqt

?gelqt *computes a blocked LQ factorization of a real or complex m-by-n matrix A using the compact WY representation of Q.*

```
call sgelqt(m, n, mb, a, lda, t, ldt, work, info)
call dgelqt(m, n, mb, a, lda, t, ldt, work, info)
call cgelqt(m, n, mb, a, lda, t, ldt, work, info)
call zgelqt(m, n, mb, a, lda, t, ldt, work, info)
```

Description

?gelqt computes a blocked LQ factorization of a real or complex *m*-by-*n* matrix *A* using the compact WY representation of *Q*.

The matrix *V* stores the elementary reflectors *H*(*i*) in the *i*-th row above the diagonal. For example, if *m*=5 and *n*=3, the matrix *V* is

$$V = \begin{pmatrix} 1 & v_1 & v_1 & v_1 & v_1 \\ & 1 & v_2 & v_2 & v_2 \\ & & 1 & v_3 & v_3 \end{pmatrix}$$

where the v_is represent the vectors which define *H*(*i*), which are returned in the array *a*. The 1 elements along the diagonal of *V* are not stored in *a*. Let *k* = min(*m*,*n*). The number of blocks is *b* = ceiling(*k*/*mb*), where each block is of order *mb* except for the last block, which is of order *ib* = *k* - (*b*-1)**mb*. For each of the *b* blocks, a upper triangular block reflector factor is computed: *T1*, *T2*, ..., *TB*. The *mb*-by-*mb* (and *ib*-by-*ib* for the last block) *T*'s are stored in the *mb*-by-*k* matrix *T* as

T = (*T1T2* ... *TB*).

Input Parameters

m	INTEGER. The number of rows of the matrix *A*. *m*≥ 0.
n	INTEGER. The number of columns of the matrix *A*. *n*≥ 0.
mb	INTEGER. The block size to be used in the blocked QR. min(*m*, *n*) ≥*mb*≥ 1.
a	REAL for sgelqt DOUBLE PRECISION for dgelqt COMPLEX for cgelqt COMPLEX*16 for zgelqt Array of size (*lda*,*n*). On entry, the *m*-by-*n* matrix *A*.
lda	INTEGER. The leading dimension of the array *a*. *lda*≥ max(1,*m*).
ldt	INTEGER. The leading dimension of the array *t*. *ldt*≥*mb*.

Output Parameters

a	On exit, the elements on and below the diagonal of the array contain the *m*-by-min(*m*, *n*) lower trapezoidal matrix *L* (*L* is lower triangular if *m*≤*n*); the elements above the diagonal are the rows of *V*.
t	REAL for sgelqt DOUBLE PRECISION for dgelqt COMPLEX for cgelqt COMPLEX*16 for zgelqt Array of size (*ldt*, min(*m*, *n*)). The upper triangular block reflectors stored in compact form as a sequence of upper triangular blocks. See Description for further details.
work	REAL for sgelqt DOUBLE PRECISION for dgelqt COMPLEX for cgelqt COMPLEX*16 for zgelqt Array of size (*mb***n*).
info	INTEGER. *info* = 0: successful exit. *info* < 0: if *info* = -*i*, the *i*-th argument had an illegal value.

?gemlqt

Multiplies a general matrix by the orthogonal/unitary matrix Q of the LQ factorization formed by ?gelqt.

```
call sgemlqt(side, trans, m, n, k, mb, v, ldv, t, ldt, c, ldc, work, info)
call dgemlqt(side, trans, m, n, k, mb, v, ldv, t, ldt, c, ldc, work, info)
call cgemlqt(side, trans, m, n, k, mb, v, ldv, t, ldt, c, ldc, work, info)
```

```
call zgemlqt(side, trans, m, n, k, mb, v, ldv, t, ldt, c, ldc, work, info)
```

Description

?gemlqt overwrites the general real *m*-by-*n* matrix *C* with

	side = 'L'	*side* = 'R'
trans = 'N'	*Q***C*	*C***Q*
trans = 'T'	Q^T**C*	*C**Q^T
trans = 'C'	Q^H**C*	*C**Q^H

where *Q* is a real or complex orthogonal matrix defined as the product of *k* elementary reflectors:

Q = *H*(*k*) *H*(*k* - 1) . . . *H*(1) = *I* - *VTV*^{T} for real flavors

or

Q = *H*(*k*)^H*H*(*k* - 1)^H . . . *H*(1)^H = *I* - *VTV*^{H} for complex flavors

generated using the compact WY representation as returned by ?gelqt.

Q is of order *m* if *side* = 'L' and of order *n* if *side* = 'R'.

Input Parameters

side
CHARACTER*1.
If *side*= 'L': apply op(*Q*) from the left;
if *side*= 'R': apply op(*Q*) from the right.

trans
CHARACTER*1.
If *trans* = 'N': No transpose, op(*Q*) = *Q*;
if *trans* = 'T': Transpose, op(*Q*) = Q^T;
if *trans*= 'C': Transpose, op(*Q*) = Q^H.

m
INTEGER. The number of rows of the matrix *C*. *m*≥ 0.

n
INTEGER. The number of columns of the matrix *C*. *n*≥ 0.

k
INTEGER. The number of elementary reflectors whose product defines the matrix *Q*.
If *side* = 'L', *m*≥*k*≥ 0;
if *side* = 'R', *n*≥*k*≥ 0.

mb
INTEGER. The block size used for the storage of *T*. *k*≥*mb*≥ 1. This must be the same value of *mb* used to generate *T* in ?gelqt.

v
REAL for sgemlqt
DOUBLE PRECISION for dgemlqt
COMPLEX for cgemlqt
COMPLEX*16 for zgemlqt

	Array of size (*ldv*,*m*) if *side* = 'L' or (*ldv*,*n*) if *side* = 'R'. The *i*-th row must contain the vector which defines the elementary reflector *H*(*i*), for *i* = 1,2,...,*k*, as returned by ?gelqt in the first *k* rows of its array argument *a*.
ldv	INTEGER. The leading dimension of the array *v*. *ldv*≥ max(1,*k*).
t	REAL for sgemlqt DOUBLE PRECISION for dgemlqt COMPLEX for cgemlqt COMPLEX*16 for zgemlqt Array of size (*ldt*,*k*). The upper triangular factors of the block reflectors as returned by ?gelqt, stored as a *mb*-by-*k* matrix.
ldt	INTEGER. The leading dimension of the array *t*. *ldt*≥*mb*.
c	REAL for sgemlqt DOUBLE PRECISION for dgemlqt COMPLEX for cgemlqt COMPLEX*16 for zgemlqt Array of size (*ldc*,*n*). On entry, the *m*-by-*n* matrix *C*.
ldc	INTEGER. The leading dimension of the array *c*. *ldc*≥ max(1,*m*).

Output Parameters

c	On exit, *c* is overwritten by op(*Q*)**C* or *C**op(*Q*).
work	REAL for sgemlqt DOUBLE PRECISION for dgemlqt COMPLEX for cgemlqt COMPLEX*16 for zgemlqt Array. The size of *work* is *n***mb* if *side* = 'L', or *m***mb* if *side* = 'R'.
info	*info* = 0: successful exit. *info* < 0: if *info* = -*i*, the *i*-th argument had an illegal value.

?orglq
Generates the real orthogonal matrix Q of the LQ factorization formed by ?gelqf*.*

Syntax

```
call sorglq(m, n, k, a, lda, tau, work, lwork, info)
call dorglq(m, n, k, a, lda, tau, work, lwork, info)
call orglq(a, tau [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine generates the whole or part of *n*-by-*n* orthogonal matrix *Q* of the *LQ* factorization formed by the routines gelqf. Use this routine after a call to sgelqf/dgelqf.

Usually *Q* is determined from the *LQ* factorization of an *p*-by-*n* matrix *A* with $n \geq p$. To compute the whole matrix *Q*, use:

```
call ?orglq(n, n, p, a, lda, tau, work, lwork, info)
```

To compute the leading *p* rows of *Q*, which form an orthonormal basis in the space spanned by the rows of *A*, use:

```
call ?orglq(p, n, p, a, lda, tau, work, lwork, info)
```

To compute the matrix Q^k of the *LQ* factorization of the leading *k* rows of *A*, use:

```
call ?orglq(n, n, k, a, lda, tau, work, lwork, info)
```

To compute the leading *k* rows of Q^k, which form an orthonormal basis in the space spanned by the leading *k* rows of *A*, use:

```
call ?orgqr(k, n, k, a, lda, tau, work, lwork, info)
```

Input Parameters

m

INTEGER. The number of rows of *Q* to be computed

($0 \leq m \leq n$).

n

INTEGER. The order of the orthogonal matrix *Q* ($n \geq m$).

k

INTEGER. The number of elementary reflectors whose product defines the matrix *Q* ($0 \leq k \leq m$).

a, *tau*, *work*

REAL for sorglq

DOUBLE PRECISION for dorglq

Arrays: *a*(*lda*,*) and *tau*(*) are the arrays returned by sgelqf/dgelqf.

The second dimension of *a* must be at least max(1, *n*).

The size of *tau* must be at least max(1, *k*).

work is a workspace array, its dimension max(1, *lwork*).

lda

INTEGER. The leading dimension of *a*; at least max(1, *m*).

lwork

INTEGER. The size of the *work* array; at least max(1, *m*).

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a	Overwritten by *m* leading rows of the *n*-by-*n* orthogonal matrix *Q*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine orglq interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
tau	Holds the vector of length (*k*).

Application Notes

For better performance, try using *lwork* =*m***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed *Q* differs from an exactly orthogonal matrix by a matrix *E* such that $||E||_2 = O(\varepsilon)*||A||_2$, where ε is the machine precision.

The total number of floating-point operations is approximately $4*m*n*k - 2*(m + n)*k^2 + (4/3)*k^3$.

If $m = k$, the number is approximately $(2/3)*m^2*(3n - m)$.

The complex counterpart of this routine is unglq.

?ormlq

Multiplies a real matrix by the orthogonal matrix Q of the LQ factorization formed by ?gelqf.

Syntax

```
call sormlq(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call dormlq(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call ormlq(a, tau, c [,side] [,trans] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine multiplies a real *m*-by-*n* matrix *C* by *Q* or Q^T, where *Q* is the orthogonal matrix *Q* of the *LQ* factorization formed by the routine gelqf.

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products $Q*C$, Q^T*C, $C*Q$, or $C*Q^T$ (overwriting the result on *C*).

Input Parameters

side	CHARACTER*1. Must be either 'L' or 'R'. If *side* = 'L', *Q* or Q^T is applied to *C* from the left. If *side* = 'R', *Q* or Q^T is applied to *C* from the right.
trans	CHARACTER*1. Must be either 'N' or 'T'. If *trans* = 'N', the routine multiplies *C* by *Q*. If *trans* = 'T', the routine multiplies *C* by Q^T.
m	INTEGER. The number of rows in the matrix *C* ($m \geq 0$).
n	INTEGER. The number of columns in *C* ($n \geq 0$).
k	INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. Constraints: $0 \leq k \leq m$ if *side* = 'L'; $0 \leq k \leq n$ if *side* = 'R'.
a, *c*, *tau*, *work*	REAL for sormlq DOUBLE PRECISION for dormlq. Arrays: *a*(*lda*,*) and *tau*(*) are arrays returned by ?gelqf. The second dimension of *a* must be: at least max(1, *m*) if *side* = 'L'; at least max(1, *n*) if *side* = 'R'. The dimension of *tau* must be at least max(1, *k*). *c*(*ldc*,*) contains the *m*-by-*n* matrix *C*. The second dimension of *c* must be at least max(1, *n*) *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The leading dimension of *a*; *lda* ≥ max(1, *k*).
ldc	INTEGER. The leading dimension of *c*; *ldc* ≥ max(1, *m*).
lwork	INTEGER. The size of the *work* array. Constraints:

lwork ≥ max(1, *n*) if *side* = 'L';

lwork ≥ max(1, *m*) if *side* = 'R'.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

c — Overwritten by the product $Q*C$, Q^T*C, $C*Q$, or $C*Q^T$ (as specified by *side* and *trans*).

work(1) — If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine ormlq interface are the following:

a — Holds the matrix *A* of size (*k*,*m*).

tau — Holds the vector of length (*k*).

c — Holds the matrix *C* of size (*m*,*n*).

side — Must be 'L' or 'R'. The default value is 'L'.

trans — Must be 'N' or 'T'. The default value is 'N'.

Application Notes

For better performance, try using *lwork* = *n***blocksize* (if *side* = 'L') or *lwork* = *m***blocksize* (if *side* = 'R') where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork*= -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork*= -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The complex counterpart of this routine is unmlq.

?gemlq
Multiples a matrix C by a real orthogonal or complex unitary matrix Q, as computed by ?gelq*.*

```
call sgemlq(side, trans, m, n, k, a, lda, t, tsize, c, ldc, work, lwork, info)
call dgemlq(side, trans, m, n, k, a, lda, t, tsize, c, ldc, work, lwork, info)
call cgemlq(side, trans, m, n, k, a, lda, t, tsize, c, ldc, work, lwork, info)
call zgemlq(side, trans, m, n, k, a, lda, t, tsize, c, ldc, work, lwork, info)
```

Description

The ?gemlq routine multiplies an *m*-by-*n* matrix *C* by Op(*Q*), where matrix *Q* is the factor from the LQ factorization of matrix *A* formed by ?gelq, and

Op(*Q*) = *Q*, or

Op(*Q*) = Q^T, or

Op(*Q*) = Q^H.

NOTE
You must use ?gelq for LQ factorization before calling ?gemlq. ?gemlq is not compatible with LQ factorization routines other than ?gelq.

For real flavors, *C* is real and *Q* is real orthogonal.

For complex flavors, *C* is complex and *Q* is complex unitary.

If matrix *A* is short and wide, a highly scalable algorithm is used to avoid communication overhead. Otherwise, ?ormlq or ?unmlq is used.

NOTE
An optimized version of ?gemlq is not available.

Input Parameters

side
CHARACTER*1.
If *side* = 'L': apply Op(*Q*) from the left.
If *side* = 'R': apply Op(*Q*) from the right.

trans
CHARACTER*1.
If *trans* = 'N': No transpose, Op(*Q*) = *Q*.
If *trans* = 'T': Transpose, Op(*Q*) = Q^T.
If *trans* = 'C': Conjugate transpose, Op(*Q*) = Q^H.

m
INTEGER. The number of rows of the matrix *A*. $m \geq 0$.

n
INTEGER. The number of columns of the matrix *C*. $n \geq 0$.

k	INTEGER. The number of elementary reflectors whose product defines the matrix Q. If *side* = 'L', $m \geq k \geq 0$. if *side* = 'R', $n \geq k \geq 0$.
a	REAL for sgemlq DOUBLE PRECISION for dgemlq COMPLEX for cgemlq COMPLEX*16 for zgemlq Array of size (*lda*,*m*) if *side* = 'L', or (*lda*,*n*) if *side* = 'R'. Part of the data structure to represent *Q* as returned by ?gelq.
lda	INTEGER . The leading dimension of the array *a*. $lda \geq \max(1,k)$.
t	REAL for sgemlq DOUBLE PRECISION for dgemlq COMPLEX for cgemlq COMPLEX*16 for zgemlq Array, size (max(5,*tsize*)). Part of the data structure to represent *Q* as returned by ?gelq.
tsize	INTEGER. The size of the array *t*. $tsize \geq 5$.
c	REAL for sgemlq DOUBLE PRECISION for dgemlq COMPLEX for cgemlq COMPLEX*16 for zgemlq Array, size (*ldc*,*n*). On entry, *a* contains the *m*-by-*n* matrix *C*.
ldc	INTEGER. The leading dimension of the array *c*. $ldc \geq \max(1,m)$.
lwork	INTEGER. The size of the array *work*. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array and returns this value as *work*(1); no error message related to *lwork* is issued by xerbla.

Output Parameters

c	On exit, *c* is overwritten by Op(*Q*)***C* or *C**Op(*Q*).
work	REAL for sgemlq DOUBLE PRECISION for dgemlq COMPLEX for cgemlq COMPLEX*16 for zgemlq Workspace array of size (max(1,*lwork*)).

info	INTEGER. *info* = 0 indicates a successful exit. *info* < 0: if *info* = -*i*, the *i*-th argument had an illegal value.

?unglq

Generates the complex unitary matrix Q of the LQ factorization formed by ?gelqf.

Syntax

```
call cunglq(m, n, k, a, lda, tau, work, lwork, info)
call zunglq(m, n, k, a, lda, tau, work, lwork, info)
call unglq(a, tau [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine generates the whole or part of *n*-by-*n* unitary matrix *Q* of the *LQ* factorization formed by the routines gelqf. Use this routine after a call to cgelqf/zgelqf.

Usually *Q* is determined from the *LQ* factorization of an *p*-by-*n* matrix *A* with $n < p$. To compute the whole matrix *Q*, use:

```
call ?unglq(n, n, p, a, lda, tau, work, lwork, info)
```

To compute the leading *p* rows of *Q*, which form an orthonormal basis in the space spanned by the rows of *A*, use:

```
call ?unglq(p, n, p, a, lda, tau, work, lwork, info)
```

To compute the matrix Q^k of the *LQ* factorization of the leading *k* rows of *A*, use:

```
call ?unglq(n, n, k, a, lda, tau, work, lwork, info)
```

To compute the leading *k* rows of Q^k, which form an orthonormal basis in the space spanned by the leading *k* rows of *A*, use:

```
call ?ungqr(k, n, k, a, lda, tau, work, lwork, info)
```

Input Parameters

m	INTEGER. The number of rows of *Q* to be computed ($0 \le m \le n$).
n	INTEGER. The order of the unitary matrix *Q* ($n \ge m$).
k	INTEGER. The number of elementary reflectors whose product defines the matrix *Q* ($0 \le k \le m$).
a, *tau*, *work*	COMPLEX for cunglq DOUBLE COMPLEX for zunglq Arrays: *a*(*lda*,*) and *tau*(*) are the arrays returned by cgelqf/zgelqf. The second dimension of *a* must be at least max(1, *n*).

The dimension of *tau* must be at least max(1, *k*).

work is a workspace array, its dimension `max(1, lwork)`.

lda — `INTEGER`. The leading dimension of *a*; at least max(1, *m*).

lwork — `INTEGER`. The size of the *work* array; at least max(1, *m*).

If `lwork = -1`, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a — Overwritten by *m* leading rows of the *n*-by-*n* unitary matrix *Q*.

work(1) — If `info = 0`, on exit `work(1)` contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info — `INTEGER`.

If `info = 0`, the execution is successful.

If `info = -i`, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `unglq` interface are the following:

a — Holds the matrix *A* of size (*m*,*n*).

tau — Holds the vector of length (*k*).

Application Notes

For better performance, try using `lwork = m*blocksize`, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set `lwork = -1`.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (`work(1)`) for subsequent runs.

If `lwork = -1`, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed *Q* differs from an exactly unitary matrix by a matrix *E* such that $||E||_2 = O(\varepsilon)*||A||_2$, where ε is the machine precision.

The total number of floating-point operations is approximately $16*m*n*k - 8*(m + n)*k^2 + (16/3)*k^3$.

If $m = k$, the number is approximately $(8/3)*m^2*(3n - m)$.

The real counterpart of this routine is orglq.

?unmlq

Multiplies a complex matrix by the unitary matrix Q of the LQ factorization formed by ?gelqf.

Syntax

```
call cunmlq(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call zunmlq(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call unmlq(a, tau, c [,side] [,trans] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine multiplies a real *m*-by-*n* matrix *C* by *Q* or Q^H, where *Q* is the unitary matrix *Q* of the *LQ* factorization formed by the routine gelqf.

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products *Q***C*, Q^H**C*, *C***Q*, or *C**Q^H (overwriting the result on *C*).

Input Parameters

side

CHARACTER*1. Must be either 'L' or 'R'.

If *side* = 'L', *Q* or Q^H is applied to *C* from the left.

If *side* = 'R', *Q* or Q^H is applied to *C* from the right.

trans

CHARACTER*1. Must be either 'N' or 'C'.

If *trans* = 'N', the routine multiplies *C* by *Q*.

If *trans* = 'C', the routine multiplies *C* by Q^H.

m

INTEGER. The number of rows in the matrix *C* ($m \geq 0$).

n

INTEGER. The number of columns in *C* ($n \geq 0$).

k

INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. Constraints:

$0 \leq k \leq m$ if *side* = 'L';

$0 \leq k \leq n$ if *side* = 'R'.

a, *c*, *tau*, *work*

COMPLEX for cunmlq

DOUBLE COMPLEX for zunmlq.

Arrays:

a(*lda*,*) and *tau*(*) are arrays returned by ?gelqf.

The second dimension of *a* must be:

at least max(1, *m*) if *side* = 'L';

at least max(1, *n*) if *side* = 'R'.

The size of *tau* must be at least max(1, *k*).

c(*ldc*,*) contains the *m*-by-*n* matrix *C*.

The second dimension of *c* must be at least max(1, *n*)

work is a workspace array, its dimension max(1, *lwork*).

lda INTEGER. The leading dimension of *a*; *lda*≥ max(1, *k*).

ldc INTEGER. The leading dimension of *c*; *ldc*≥ max(1, *m*).

lwork INTEGER. The size of the *work* array. Constraints:

lwork≥ max(1, *n*) if *side* = 'L';

lwork≥ max(1, *m*) if *side* = 'R'.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

c Overwritten by the product $Q*C$, Q^H*C, $C*Q$, or $C*Q^H$ (as specified by *side* and *trans*).

work(1) If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine unmlq interface are the following:

a Holds the matrix *A* of size (*k*,*m*).

tau Holds the vector of length (*k*).

c Holds the matrix *C* of size (*m*,*n*).

side Must be 'L' or 'R'. The default value is 'L'.

trans Must be 'N' or 'C'. The default value is 'N'.

Application Notes

For better performance, try using `lwork = n*blocksize` (if `side = 'L'`) or `lwork = m*blocksize` (if `side = 'R'`) where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set `lwork = -1`.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (`work(1)`) for subsequent runs.

If `lwork = -1`, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The real counterpart of this routine is ormlq.

?geqlf

Computes the QL factorization of a general m-by-n matrix.

Syntax

```
call sgeqlf(m, n, a, lda, tau, work, lwork, info)
call dgeqlf(m, n, a, lda, tau, work, lwork, info)
call cgeqlf(m, n, a, lda, tau, work, lwork, info)
call zgeqlf(m, n, a, lda, tau, work, lwork, info)
call geqlf(a [, tau] [,info])
```

Include Files

- `mkl.fi, lapack.f90`

Description

The routine forms the *QL* factorization of a general *m*-by-*n* matrix *A* (see Orthogonal Factorizations). No pivoting is performed.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of min(*m*, *n*) *elementary reflectors*. Routines are provided to work with *Q* in this representation.

NOTE
This routine supports the Progress Routine feature. See Progress Function for details.

Input Parameters

`m`	`INTEGER`. The number of rows in the matrix *A* (`m≥ 0`).
`n`	`INTEGER`. The number of columns in *A* (`n≥ 0`).

a, *work*

REAL for sgeqlf

DOUBLE PRECISION for dgeqlf

COMPLEX for cgeqlf

DOUBLE COMPLEX for zgeqlf.

Arrays:

Array *a*(*lda*,*) contains the matrix *A*.

The second dimension of *a* must be at least max(1, *n*).

work is a workspace array, its dimension max(1, *lwork*).

lda

INTEGER. The leading dimension of *a*; at least max(1, *m*).

lwork

INTEGER. The size of the *work* array; at least max(1, *n*).

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a

Overwritten on exit by the factorization data as follows:

if $m \geq n$, the lower triangle of the subarray *a*(*m*-*n*+1:*m*, 1:*n*) contains the *n*-by-*n* lower triangular matrix *L*; if $m \leq n$, the elements on and below the (*n*-*m*)-th superdiagonal contain the *m*-by-*n* lower trapezoidal matrix *L*; in both cases, the remaining elements, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors.

tau

REAL for sgeqlf

DOUBLE PRECISION for dgeqlf

COMPLEX for cgeqlf

DOUBLE COMPLEX for zgeqlf.

Array, size at least max(1, min(*m*, *n*)). Contains scalar factors of the elementary reflectors for the matrix *Q* (see Orthogonal Factorizations).

work(1)

If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance.

info

INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine geqlf interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
tau	Holds the vector of length min(*m*,*n*).

Application Notes

For better performance, try using *lwork =n*blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

Related routines include:

orgql	to generate matrix Q (for real matrices);
ungql	to generate matrix Q (for complex matrices);
ormql	to apply matrix Q (for real matrices);
unmql	to apply matrix Q (for complex matrices).

See Also

mkl_progress

Matrix Storage Schemes

?orgql
Generates the real matrix Q of the QL factorization formed by ?geqlf.

Syntax

```
call sorgql(m, n, k, a, lda, tau, work, lwork, info)
call dorgql(m, n, k, a, lda, tau, work, lwork, info)
call orgql(a, tau [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine generates an *m*-by-*n* real matrix *Q* with orthonormal columns, which is defined as the last *n* columns of a product of *k* elementary reflectors *H*(*i*) of order *m*: *Q = H*(*k*) **...* H*(2)**H*(1) as returned by the routines geqlf. Use this routine after a call to sgeqlf/dgeqlf.

Input Parameters

m	INTEGER. The number of rows of the matrix *Q* (*m* ≥ 0).
n	INTEGER. The number of columns of the matrix *Q* (*m* ≥ *n* ≥ 0).
k	INTEGER. The number of elementary reflectors whose product defines the matrix *Q* (*n* ≥ *k* ≥ 0).
a, *tau*, *work*	REAL for sorgql DOUBLE PRECISION for dorgql Arrays: *a*(*lda*,*), *tau*(*). On entry, the (*n* - *k* + *i*)th column of *a* must *contain the vector which* defines the elementary reflector *H*(*i*), for *i* = 1,2,...,*k*, as returned by sgeqlf/dgeqlf in the last *k* columns of its array argument *a*; *tau*(*i*) must contain the scalar factor of the elementary reflector *H*(*i*), as returned by sgeqlf/dgeqlf; The second dimension of *a* must be at least max(1, *n*). The size of *tau* must be at least max(1, *k*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The leading dimension of *a*; at least max(1, *m*).
lwork	INTEGER. The size of the *work* array; at least max(1, *n*). If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a	Overwritten by the last *n* columns of the *m*-by-*m* orthogonal matrix *Q*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = −*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine orgql interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
tau	Holds the vector of length (*k*).

Application Notes

For better performance, try using `lwork =n*blocksize`, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set `lwork = -1`.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (`work(1)`) for subsequent runs.

If you set `lwork = -1`, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The complex counterpart of this routine is ungql.

?ungql

Generates the complex matrix Q of the QL factorization formed by `?geqlf`*.*

Syntax

```
call cungql(m, n, k, a, lda, tau, work, lwork, info)
call zungql(m, n, k, a, lda, tau, work, lwork, info)
call ungql(a, tau [,info])
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine generates an *m*-by-*n* complex matrix *Q* with orthonormal columns, which is defined as the last *n* columns of a product of *k* elementary reflectors `H(i)` of order *m*: `Q = H(k) *...* H(2)*H(1)` as returned by the routines geqlf/geqlf . Use this routine after a call to `cgeqlf`/`zgeqlf`.

Input Parameters

`m`	`INTEGER`. The number of rows of the matrix *Q* (`m≥0`).
`n`	`INTEGER`. The number of columns of the matrix *Q* (`m≥n≥0`).
`k`	`INTEGER`. The number of elementary reflectors whose product defines the matrix *Q* (`n≥k≥0`).

`a`, `tau`, `work`	`COMPLEX` for `cungql`
	`DOUBLE COMPLEX` for `zungql`
	Arrays: *a*(*lda*,*), *tau*(*), *work*(*lwork*).
	On entry, the (*n* - *k* + *i*)th column of *a* must contain the vector which defines the elementary reflector *H*(*i*), for i = 1,2,...,*k*, as returned by `cgeqlf`/`zgeqlf` in the last *k* columns of its array argument *a*;

tau(*i*) must contain the scalar factor of the elementary reflector *H*(*i*), as returned by `cgeqlf`/`zgeqlf`;

The second dimension of *a* must be at least max(1, *n*).

The size of *tau* must be at least max(1, *k*).

work is a workspace array, its dimension `max(1, lwork)`.

lda — `INTEGER`. The leading dimension of *a*; at least max(1, *m*).

lwork — `INTEGER`. The size of the *work* array; at least max(1, *n*).

If `lwork = -1`, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a — Overwritten by the last *n* columns of the `m`-by-`m` unitary matrix *Q*.

work(1) — If `info = 0`, on exit `work(1)` contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info — `INTEGER`.

If `info = 0`, the execution is successful.

If `info = -i`, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `ungql` interface are the following:

a — Holds the matrix *A* of size (*m*,*n*).

tau — Holds the vector of length (*k*).

Application Notes

For better performance, try using `lwork =n*blocksize`, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set `lwork = -1`.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (`work(1)`) for subsequent runs.

If `lwork = -1`, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The real counterpart of this routine is orgql.

?ormql

Multiplies a real matrix by the orthogonal matrix Q of the QL factorization formed by `?geqlf`.

Syntax

```
call sormql(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call dormql(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call ormql(a, tau, c [,side] [,trans] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine multiplies a real *m*-by-*n* matrix *C* by *Q* or Q^T, where *Q* is the orthogonal matrix *Q* of the *QL* factorization formed by the routine geqlf.

Depending on the parameters *side* and *trans*, the routine ormql can form one of the matrix products $Q*C$, Q^T*C, $C*Q$, or $C*Q^T$ (overwriting the result over *C*).

Input Parameters

side	CHARACTER*1. Must be either 'L' or 'R'. If *side* = 'L', *Q* or Q^T is applied to *C* from the left. If *side* = 'R', *Q* or Q^T is applied to *C* from the right.
trans	CHARACTER*1. Must be either 'N' or 'T'. If *trans* = 'N', the routine multiplies *C* by *Q*. If *trans* = 'T', the routine multiplies *C* by Q^T.
m	INTEGER. The number of rows in the matrix *C* ($m \geq 0$).
n	INTEGER. The number of columns in *C* ($n \geq 0$).
k	INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. Constraints: $0 \leq k \leq m$ if *side* = 'L'; $0 \leq k \leq n$ if *side* = 'R'.
a, *tau*, *c*, *work*	REAL for sormql DOUBLE PRECISION for dormql. Arrays: *a*(*lda*,*), *tau*(*), *c*(*ldc*,*). On entry, the *i*th column of *a* must contain the vector which defines the elementary reflector H_i, for i = 1,2,...,*k*, as returned by sgeqlf/dgeqlf in the last *k* columns of its array argument *a*. The second dimension of *a* must be at least max(1, *k*).

tau(*i*) must contain the scalar factor of the elementary reflector H_i, as returned by `sgeqlf`/`dgeqlf`.

The size of *tau* must be at least max(1, *k*).

c(*ldc*,*) contains the *m*-by-*n* matrix *C*.

The second dimension of *c* must be at least max(1, *n*)

work is a workspace array, its dimension `max(1, lwork)`.

lda — `INTEGER`. The leading dimension of *a*;

if `side = 'L'`, *lda* ≥ `max(1, m)` ;

if `side = 'R'`, *lda* ≥ `max(1, n)`.

ldc — `INTEGER`. The leading dimension of *c*; *ldc* ≥ `max(1, m)`.

lwork — `INTEGER`. The size of the *work* array. Constraints:

lwork ≥ `max(1, n)` if `side = 'L'`;

lwork ≥ `max(1, m)` if `side = 'R'`.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

c — Overwritten by the product $Q*C$, Q^T*C, $C*Q$, or $C*Q^T$ (as specified by *side* and *trans*).

work(1) — If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info — `INTEGER`.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `ormql` interface are the following:

a — Holds the matrix *A* of size (*r*,*k*).

r = *m* if `side = 'L'`.

r = *n* if `side = 'R'`.

tau — Holds the vector of length (*k*).

c — Holds the matrix *C* of size (*m*,*n*).

side	Must be 'L' or 'R'. The default value is 'L'.
trans	Must be 'N' or 'T'. The default value is 'N'.

Application Notes

For better performance, try using *lwork = n*blocksize* (if *side = 'L'*) or *lwork = m*blocksize* (if *side = 'R'*) where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork = -1*.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work(1)*) for subsequent runs.

If you set *lwork = -1*, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The complex counterpart of this routine is unmql.

?unmql

Multiplies a complex matrix by the unitary matrix Q of the QL factorization formed by ?geqlf.

Syntax

```
call cunmql(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call zunmql(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call unmql(a, tau, c [,side] [,trans] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine multiplies a complex *m*-by-*n* matrix *C* by *Q* or Q^H, where *Q* is the unitary matrix *Q* of the *QL* factorization formed by the routine geqlf.

Depending on the parameters *side* and *trans*, the routine unmql can form one of the matrix products *Q*C*, Q^H**C*, *C*Q*, or *C**Q^H (overwriting the result over *C*).

Input Parameters

side	CHARACTER*1. Must be either 'L' or 'R'. If *side = 'L'*, *Q* or Q^H is applied to *C* from the left. If *side = 'R'*, *Q* or Q^H is applied to *C* from the right.
trans	CHARACTER*1. Must be either 'N' or 'C'. If *trans = 'N'*, the routine multiplies *C* by *Q*.

If *trans* = 'C', the routine multiplies *C* by Q^H.

m — INTEGER. The number of rows in the matrix *C* (*m* ≥ 0).

n — INTEGER. The number of columns in *C* (*n* ≥ 0).

k — INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. Constraints:

0 ≤ *k* ≤ *m* if *side* = 'L';

0 ≤ *k* ≤ *n* if *side* = 'R'.

a, *tau*, *c*, *work* — COMPLEX for cunmql

DOUBLE COMPLEX for zunmql.

Arrays: *a*(*lda*,*), *tau*(*), *c*(*ldc*,*), *work*(*lwork*).

On entry, the *i*-th column of *a* must contain the vector which defines the elementary reflector *H*(*i*), for i = 1,2,...,*k*, as returned by cgeqlf/zgeqlf in the last *k* columns of its array argument *a*.

The second dimension of *a* must be at least max(1, *k*).

tau(*i*) must contain the scalar factor of the elementary reflector *H*(*i*), as returned by cgeqlf/zgeqlf.

The size of *tau* must be at least max(1, *k*).

c(*ldc*,*) contains the *m*-by-*n* matrix *C*.

The second dimension of *c* must be at least max(1, *n*)

work is a workspace array, its dimension max(1, *lwork*).

lda — INTEGER. The leading dimension of *a*; *lda* ≥ max(1, *n*).

ldc — INTEGER. The leading dimension of *c*; *ldc* ≥ max(1, *m*).

lwork — INTEGER. The size of the *work* array. Constraints:

lwork ≥ max(1, *n*) if *side* = 'L';

lwork ≥ max(1, *m*) if *side* = 'R'.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

c — Overwritten by the product *Q***C*, Q^H**C*, *C***Q*, or *C**Q^H (as specified by *side* and *trans*).

work(1) — If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = *-i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `unmql` interface are the following:

a	Holds the matrix *A* of size (*r*,*k*). *r* = *m* if *side* = 'L'. *r* = *n* if *side* = 'R'.
tau	Holds the vector of length (*k*).
c	Holds the matrix *C* of size (*m*,*n*).
side	Must be 'L' or 'L'. The default value is 'L'.
trans	Must be 'N' or 'C'. The default value is 'N'.

Application Notes

For better performance, try using *lwork* = *n*blocksize* (if *side* = 'L') or *lwork* = *m*blocksize* (if *side* = 'R') where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The real counterpart of this routine is ormql.

?gerqf
Computes the RQ factorization of a general m-by-n matrix.

Syntax

```
call sgerqf(m, n, a, lda, tau, work, lwork, info)
call dgerqf(m, n, a, lda, tau, work, lwork, info)
call cgerqf(m, n, a, lda, tau, work, lwork, info)
call zgerqf(m, n, a, lda, tau, work, lwork, info)
call gerqf(a [, tau] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine forms the *RQ* factorization of a general *m*-by-*n* matrix *A*(see Orthogonal Factorizations). No pivoting is performed.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of min(*m*, *n*) *elementary reflectors*. Routines are provided to work with *Q* in this representation.

NOTE
This routine supports the Progress Routine feature. See Progress Function for details.

Input Parameters

m	INTEGER. The number of rows in the matrix *A* (*m*≥ 0).
n	INTEGER. The number of columns in *A* (*n*≥ 0).
a, *work*	REAL for sgerqf DOUBLE PRECISION for dgerqf COMPLEX for cgerqf DOUBLE COMPLEX for zgerqf. Arrays: Array *a*(*lda*,*) contains the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The leading dimension of *a*; at least max(1, *m*).
lwork	INTEGER. The size of the *work* array; *lwork*≥ max(1, *m*). If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

a	Overwritten on exit by the factorization data as follows: if *m*≤*n*, the upper triangle of the subarray *a*(1:*m*, *n*-*m*+1:*n*) contains the *m*-by-*m* upper triangular matrix *R*; if *m*≥*n*, the elements on and above the (*m*-*n*)th subdiagonal contain the *m*-by-*n* upper trapezoidal matrix *R*;

	in both cases, the remaining elements, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of min(*m*,*n*) elementary reflectors.

tau	`REAL` for `sgerqf`
	`DOUBLE PRECISION` for `dgerqf`
	`COMPLEX` for `cgerqf`
	`DOUBLE COMPLEX` for `zgerqf`.
	Array, size at least max (1, min(*m*, *n*)). (See Orthogonal Factorizations.)
	Contains scalar factors of the elementary reflectors for the matrix *Q*.

work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	`INTEGER`. If *info* = 0, the execution is successful. If *info* = –*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `gerqf` interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
tau	Holds the vector of length min(*m*,*n*).

Application Notes

For better performance, try using *lwork* =*m***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = –1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = –1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The real counterpart of this routine is orgrq.

?ormrq
Multiplies a real matrix by the orthogonal matrix Q of the RQ factorization formed by `?gerqf`*.*

Syntax

```
call sormrq(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call dormrq(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call ormrq(a, tau, c [,side] [,trans] [,info])
```

Include Files

- `mkl.fi, lapack.f90`

Description

The routine multiplies a real *m*-by-*n* matrix *C* by *Q* or Q^T, where *Q* is the real orthogonal matrix defined as a product of *k* elementary reflectors H_i : $Q = H_1 H_2 \ldots H_k$ as returned by the *RQ* factorization routine gerqf.

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products $Q*C$, Q^T*C, $C*Q$, or $C*Q^T$ (overwriting the result over *C*).

Input Parameters

side
CHARACTER*1. Must be either 'L' or 'R'.
If *side* = 'L', *Q* or Q^T is applied to *C* from the left.
If *side* = 'R', *Q* or Q^T is applied to *C* from the right.

trans
CHARACTER*1. Must be either 'N' or 'T'.
If *trans* = 'N', the routine multiplies *C* by *Q*.
If *trans* = 'T', the routine multiplies *C* by Q^T.

m
INTEGER. The number of rows in the matrix *C* (*m* ≥ 0).

n
INTEGER. The number of columns in *C* (*n* ≥ 0).

k
INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. Constraints:
0 ≤ *k* ≤ *m*, if *side* = 'L';
0 ≤ *k* ≤ *n*, if *side* = 'R'.

a, *tau*, *c*, *work*
REAL for sormrq
DOUBLE PRECISION for dormrq.
Arrays: *a*(*lda*,*), *tau*(*), *c*(*ldc*,*).
On entry, the *i*th row of *a* must contain the vector which defines the elementary reflector H_i, for i = 1,2,...,*k*, as returned by sgerqf/dgerqf in the last *k* rows of its array argument *a*.
The second dimension of *a* must be at least max(1, *m*) if *side* = 'L', and at least max(1, *n*) if *side* = 'R'.
tau(i) must contain the scalar factor of the elementary reflector H_i, as returned by sgerqf/dgerqf.
The size of *tau* must be at least max(1, *k*).
c(*ldc*,*) contains the *m*-by-*n* matrix *C*.
The second dimension of *c* must be at least max(1, *n*)
work is a workspace array, its dimension max(1, *lwork*).

lda
INTEGER. The leading dimension of *a*; *lda* ≥ max(1, *k*).

ldc
INTEGER. The leading dimension of *c*; *ldc* ≥ max(1, *m*).

lwork
INTEGER. The size of the *work* array. Constraints:
lwork ≥ max(1, *n*) if *side* = 'L';
lwork ≥ max(1, *m*) if *side* = 'R'.
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.
See *Application Notes* for the suggested value of *lwork*.

Output Parameters

c	Overwritten by the product $Q*C$, Q^T*C, $C*Q$, or $C*Q^T$ (as specified by *side* and *trans*).
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine ormrq interface are the following:

a	Holds the matrix *A* of size (*k*,*m*).
tau	Holds the vector of length (*k*).
c	Holds the matrix *C* of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
trans	Must be 'N' or 'T'. The default value is 'N'.

Application Notes

For better performance, try using *lwork* = *n***blocksize* (if *side* = 'L') or *lwork* = *m***blocksize* (if *side* = 'R') where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The complex counterpart of this routine is unmrq.

?unmrq
Multiplies a complex matrix by the unitary matrix Q of the RQ factorization formed by ?gerqf.

Syntax

```
call cunmrq(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
```

```
call zunmrq(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call unmrq(a, tau, c [,side] [,trans] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine multiplies a complex *m*-by-*n* matrix *C* by *Q* or Q^H, where *Q* is the complex unitary matrix defined as a product of *k* elementary reflectors *H(i)* of order *n*: *Q = H(1)^H* H(2)^H*...*H(k)^H*as returned by the *RQ* factorization routine gerqf .

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products *Q*C*, Q^H**C*, *C*Q*, or *C**Q^H (overwriting the result over *C*).

Input Parameters

side — CHARACTER*1. Must be either 'L' or 'R'.

If *side* = 'L', *Q* or Q^H is applied to *C* from the left.

If *side* = 'R', *Q* or Q^H is applied to *C* from the right.

trans — CHARACTER*1. Must be either 'N' or 'C'.

If *trans* = 'N', the routine multiplies *C* by *Q*.

If *trans* = 'C', the routine multiplies *C* by Q^H.

m — INTEGER. The number of rows in the matrix *C* (*m*≥ 0).

n — INTEGER. The number of columns in *C* (*n*≥ 0).

k — INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. Constraints:

0 ≤*k*≤*m*, if *side* = 'L';

0 ≤*k*≤*n*, if *side* = 'R'.

a, *tau*, *c*, *work* — COMPLEX for cunmrq

DOUBLE COMPLEX for zunmrq.

Arrays: *a*(*lda*,*), *tau*(*), *c*(*ldc*,*), *work*(*lwork*).

On entry, the *i*th row of *a* must contain the vector which defines the elementary reflector *H*(*i*), for i = 1,2,...,*k*, as returned by cgerqf/zgerqf in the last *k* rows of its array argument *a*.

The second dimension of *a* must be at least max(1, *m*) if *side* = 'L', and at least max(1, *n*) if *side* = 'R'.

tau(i) must contain the scalar factor of the elementary reflector *H*(*i*), as returned by cgerqf/zgerqf.

The size of *tau* must be at least max(1, *k*).

c(*ldc*,*) contains the *m*-by-*n* matrix *C*.

The second dimension of *c* must be at least max(1, *n*)

work is a workspace array, its dimension `max(1, lwork)`.

`lda` `INTEGER`. The leading dimension of *a*; *lda*≥ max(1, *k*) .

`ldc` `INTEGER`. The leading dimension of *c*; *ldc*≥ max(1, *m*).

`lwork` `INTEGER`. The size of the *work* array. Constraints:

lwork≥ `max(1, n)` if `side = 'L'`;

lwork≥ `max(1, m)` if `side = 'R'`.

If `lwork = -1`, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

`c` Overwritten by the product $Q*C$, Q^H*C, $C*Q$, or $C*Q^H$ (as specified by *side* and *trans*).

`work(1)` If `info = 0`, on exit `work(1)` contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

`info` `INTEGER`.

If `info = 0`, the execution is successful.

If `info = -i`, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `unmrq` interface are the following:

`a` Holds the matrix *A* of size (*k*,*m*).

`tau` Holds the vector of length (*k*).

`c` Holds the matrix *C* of size (*m*,*n*).

`side` Must be `'L'` or `'R'`. The default value is `'L'`.

`trans` Must be `'N'` or `'C'`. The default value is `'N'`.

Application Notes

For better performance, try using `lwork = n*blocksize` (if `side = 'L'`) or `lwork = m*blocksize` (if `side = 'R'`) where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set `lwork = -1`.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (`work(1)`) for subsequent runs.

If `lwork = -1`, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The real counterpart of this routine is ormrq.

?tzrzf
Reduces the upper trapezoidal matrix A to upper triangular form.

Syntax

```
call stzrzf(m, n, a, lda, tau, work, lwork, info)
call dtzrzf(m, n, a, lda, tau, work, lwork, info)
call ctzrzf(m, n, a, lda, tau, work, lwork, info)
call ztzrzf(m, n, a, lda, tau, work, lwork, info)
call tzrzf(a [, tau] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine reduces the *m*-by-*n* ($m \le n$) real/complex upper trapezoidal matrix *A* to upper triangular form by means of orthogonal/unitary transformations. The upper trapezoidal matrix $A = [A1\ A2] = [A_{1:m,\ 1:m},\ A_{1:m,\ m+1:n}]$ is factored as

$A = [R0]*Z$,

where *Z* is an *n*-by-*n* orthogonal/unitary matrix, *R* is an *m*-by-*m* upper triangular matrix, and *0* is the *m*-by-(*n*-*m*) zero matrix.

See larz that applies an elementary reflector returned by `?tzrzf` to a general matrix.

The `?tzrzf` routine replaces the deprecated `?tzrqf` routine.

Input Parameters

m	INTEGER. The number of rows in the matrix *A* ($m \ge 0$).
n	INTEGER. The number of columns in *A* ($n \ge m$).
a, *work*	REAL for stzrzf DOUBLE PRECISION for dtzrzf COMPLEX for ctzrzf DOUBLE COMPLEX for ztzrzf. Arrays: *a*(*lda*,*) , *work*(*lwork*) .

The leading *m*-by-*n* upper trapezoidal part of the array *a* contains the matrix *A* to be factorized.

The second dimension of *a* must be at least max(1, *n*).

work is a workspace array, its dimension `max(1, lwork)`.

lda — `INTEGER`. The leading dimension of *a*; at least max(1, *m*).

lwork — `INTEGER`. The size of the *work* array;

lwork≥ `max(1, m)`.

If *lwork* = −1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a — Overwritten on exit by the factorization data as follows:

the leading *m*-by-*m* upper triangular part of *a* contains the upper triangular matrix *R*, and elements *m* +1 to *n* of the first *m* rows of *a*, with the array *tau*, represent the orthogonal matrix *Z* as a product of *m* elementary reflectors.

tau — `REAL` for `stzrzf`

`DOUBLE PRECISION` for `dtzrzf`

`COMPLEX` for `ctzrzf`

`DOUBLE COMPLEX` for `ztzrzf`.

Array, size at least max (1, *m*). Contains scalar factors of the elementary reflectors for the matrix *Z*.

work(1) — If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info — `INTEGER`.

If *info* = 0, the execution is successful.

If *info* = −*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `tzrzf` interface are the following:

a — Holds the matrix *A* of size (*m*,*n*).

tau — Holds the vector of length (*m*).

Application Notes

The factorization is obtained by Householder's method. The *k*-th transformation matrix, *Z*(*k*), which is used to introduce zeros into the (*m* - *k* + 1)-th row of *A*, is given in the form

$$Z(k) = \begin{bmatrix} I & 0 \\ 0 & T(k) \end{bmatrix}$$

where for real flavors

$$T(k) = I - tau * u(k) * u(k)^T, \quad u(k) = \begin{bmatrix} 1 \\ 0 \\ z(k) \end{bmatrix}$$

and for complex flavors

$$T(k) = I - tau * u(k) * u(k)^H, \quad u(k) = \begin{bmatrix} 1 \\ 0 \\ z(k) \end{bmatrix}$$

tau is a scalar and *z*(*k*) is an *l*-element vector. *tau* and *z*(*k*) are chosen to annihilate the elements of the *k*-th row of *A*2.

The scalar *tau* is returned in the *k*-th element of *tau* and the vector *u*(*k*) in the *k*-th row of *A*, such that the elements of *z*(*k*) are stored in `a(k, m+1), ..., a(k, n)`.

The elements of *R* are returned in the upper triangular part of *A*.

The matrix *Z* is given by

`Z = Z(1)*Z(2)*...*Z(m).`

For better performance, try using `lwork =m*blocksize`, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set `lwork = -1`.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (`work(1)`) for subsequent runs.

If `lwork = -1`, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

Related routines include:

ormrz	to apply matrix Q (for real matrices)
unmrz	to apply matrix Q (for complex matrices).

?ormrz
Multiplies a real matrix by the orthogonal matrix defined from the factorization formed by `?tzrzf`.

Syntax

```
call sormrz(side, trans, m, n, k, l, a, lda, tau, c, ldc, work, lwork, info)
call dormrz(side, trans, m, n, k, l, a, lda, tau, c, ldc, work, lwork, info)
call ormrz(a, tau, c, l [, side] [,trans] [,info])
```

Include Files

- `mkl.fi, lapack.f90`

Description

The `?ormrz` routine multiplies a real *m*-by-*n* matrix *C* by *Q* or Q^T, where *Q* is the real orthogonal matrix defined as a product of *k* elementary reflectors `H(i)` of order *n*: `Q = H(1)* H(2)*...*H(k)` as returned by the factorization routine tzrzf .

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products `Q*C`, Q^T`*C`, `C*Q`, or `C*`Q^T (overwriting the result over *C*).

The matrix *Q* is of order *m* if `side = 'L'` and of order *n* if `side = 'R'`.

The `?ormrz` routine replaces the deprecated `?latzm` routine.

Input Parameters

side	`CHARACTER*1`. Must be either `'L'` or `'R'`. If `side = 'L'`, *Q* or Q^T is applied to *C* from the left. If `side = 'R'`, *Q* or Q^T is applied to *C* from the right.
trans	`CHARACTER*1`. Must be either `'N'` or `'T'`.

If *trans* = 'N', the routine multiplies *C* by *Q*.

If *trans* = 'T', the routine multiplies *C* by Q^T.

m — INTEGER. The number of rows in the matrix *C* (*m* ≥ 0).

n — INTEGER. The number of columns in *C* (*n* ≥ 0).

k — INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. Constraints:

0 ≤ *k* ≤ *m*, if *side* = 'L';

0 ≤ *k* ≤ *n*, if *side* = 'R'.

l — INTEGER.

The number of columns of the matrix *A* containing the meaningful part of the Householder reflectors. Constraints:

0 ≤ *l* ≤ *m*, if *side* = 'L';

0 ≤ *l* ≤ *n*, if *side* = 'R'.

a, *tau*, *c*, *work* — REAL for sormrz

DOUBLE PRECISION for dormrz.

Arrays: *a*(*lda*,*), *tau*(*), *c*(*ldc*,*).

On entry, the *i*th row of *a* must contain the vector which defines the elementary reflector *H*(*i*), for i = 1,2,...,*k*, as returned by stzrzf/dtzrzf in the last *k* rows of its array argument *a*.

The second dimension of *a* must be at least max(1, *m*) if *side* = 'L', and at least max(1, *n*) if *side* = 'R'.

tau(i) must contain the scalar factor of the elementary reflector *H*(*i*), as returned by stzrzf/dtzrzf.

The size of *tau* must be at least max(1, *k*).

c(*ldc*,*) contains the *m*-by-*n* matrix *C*.

The second dimension of *c* must be at least max(1, *n*)

work is a workspace array, its dimension max(1, *lwork*).

lda — INTEGER. The leading dimension of *a*; *lda* ≥ max(1, *k*) .

ldc — INTEGER. The leading dimension of *c*; *ldc* ≥ max(1, *m*).

lwork — INTEGER. The size of the *work* array. Constraints:

lwork ≥ max(1, *n*) if *side* = 'L';

lwork ≥ max(1, *m*) if *side* = 'R'.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

c	Overwritten by the product $Q*C$, Q^T*C, $C*Q$, or $C*Q^T$ (as specified by *side* and *trans*).
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine ormrz interface are the following:

a	Holds the matrix *A* of size (*k*,*m*).
tau	Holds the vector of length (*k*).
c	Holds the matrix *C* of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
trans	Must be 'N' or 'T'. The default value is 'N'.

Application Notes

For better performance, try using *lwork* = *n***blocksize* (if *side* = 'L') or *lwork* = *m***blocksize* (if *side* = 'R') where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The complex counterpart of this routine is unmrz.

?unmrz
Multiplies a complex matrix by the unitary matrix defined from the factorization formed by ?tzrzf.

Syntax

```
call cunmrz(side, trans, m, n, k, l, a, lda, tau, c, ldc, work, lwork, info)
```

```
call zunmrz(side, trans, m, n, k, l, a, lda, tau, c, ldc, work, lwork, info)
call unmrz(a, tau, c, l [,side] [,trans] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine multiplies a complex *m*-by-*n* matrix *C* by *Q* or Q^H, where *Q* is the unitary matrix defined as a product of *k* elementary reflectors `H(i)`:

`Q = H(1)^H* H(2)^H*...*H(k)^H` as returned by the factorization routine tzrzf.

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products *Q***C*, Q^H**C*, *C***Q*, or *C**Q^H (overwriting the result over *C*).

The matrix *Q* is of order *m* if `side = 'L'` and of order *n* if `side = 'R'`.

Input Parameters

side
: CHARACTER*1. Must be either 'L' or 'R'.
If `side = 'L'`, *Q* or Q^H is applied to *C* from the left.
If `side = 'R'`, *Q* or Q^H is applied to *C* from the right.

trans
: CHARACTER*1. Must be either 'N' or 'C'.
If `trans = 'N'`, the routine multiplies *C* by *Q*.
If `trans = 'C'`, the routine multiplies *C* by Q^H.

m
: INTEGER. The number of rows in the matrix *C* (*m*≥ 0).

n
: INTEGER. The number of columns in *C* (*n*≥ 0).

k
: INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. Constraints:
0 ≤*k*≤*m*, if `side = 'L'`;
0 ≤*k*≤*n*, if `side = 'R'`.

l
: INTEGER.
The number of columns of the matrix *A* containing the meaningful part of the Householder reflectors. Constraints:
0 ≤*l*≤*m*, if `side = 'L'`;
0 ≤*l*≤*n*, if `side = 'R'`.

a, *tau*, *c*, *work*
: COMPLEX for cunmrz
DOUBLE COMPLEX for zunmrz.
Arrays: *a*(*lda*,*), *tau*(*), *c*(*ldc*,*), *work*(*lwork*).
On entry, the *i*th row of *a* must contain the vector which defines the elementary reflector `H(i)`, for i = 1,2,...,*k*, as returned by ctzrzf/ztzrzf in the last *k* rows of its array argument *a*.

The second dimension of *a* must be at least max(1, *m*) if `side = 'L'`, and at least max(1, *n*) if `side = 'R'`.

tau(i) must contain the scalar factor of the elementary reflector `H(i)`, as returned by `ctzrzf`/`ztzrzf`.

The size of *tau* must be at least max(1, *k*).

c(*ldc*,*) contains the *m*-by-*n* matrix *C*.

The second dimension of *c* must be at least max(1, *n*)

work is a workspace array, its dimension `max(1, lwork)`.

`lda` INTEGER. The leading dimension of *a*; `lda` ≥ `max(1, k)`.

`ldc` INTEGER. The leading dimension of *c*; `ldc` ≥ `max(1, m)`.

`lwork` INTEGER. The size of the *work* array. Constraints:

`lwork` ≥ `max(1, n)` if `side = 'L'`;

`lwork` ≥ `max(1, m)` if `side = 'R'`.

If `lwork = -1`, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

`c` Overwritten by the product $Q*C$, Q^H*C, $C*Q$, or $C*Q^H$ (as specified by *side* and *trans*).

`work(1)` If `info = 0`, on exit `work(1)` contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

`info` INTEGER.

If `info = 0`, the execution is successful.

If `info = -i`, the *i*th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `unmrz` interface are the following:

`a` Holds the matrix *A* of size (*k*,*m*).

`tau` Holds the vector of length (*k*).

`c` Holds the matrix *C* of size (*m*,*n*).

`side` Must be `'L'` or `'R'`. The default value is `'L'`.

`trans` Must be `'N'` or `'C'`. The default value is `'N'`.

Application Notes

For better performance, try using `lwork = n*blocksize` (if `side = 'L'`) or `lwork = m*blocksize` (if `side = 'R'`) where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set `lwork = -1`.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (`work(1)`) for subsequent runs.

If `lwork = -1`, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The real counterpart of this routine is ormrz.

?ggqrf

Computes the generalized QR factorization of two matrices.

Syntax

```
call sggqrf(n, m, p, a, lda, taua, b, ldb, taub, work, lwork, info)
call dggqrf(n, m, p, a, lda, taua, b, ldb, taub, work, lwork, info)
call cggqrf(n, m, p, a, lda, taua, b, ldb, taub, work, lwork, info)
call zggqrf(n, m, p, a, lda, taua, b, ldb, taub, work, lwork, info)
call ggqrf(a, b [,taua] [,taub] [,info])
```

Include Files

- `mkl.fi, lapack.f90`

Description

The routine forms the generalized *QR* factorization of an *n*-by-*m* matrix *A* and an *n*-by-*p* matrix *B* as `A = Q*R, B = Q*T*Z`, where *Q* is an *n*-by-*n* orthogonal/unitary matrix, *Z* is a *p*-by-*p* orthogonal/unitary matrix, and *R* and *T* assume one of the forms:

$$R = \begin{array}{c} \\ m \\ n-m \end{array} \begin{array}{c} m \\ \begin{pmatrix} R_{11} \\ 0 \end{pmatrix} \end{array}, \quad \text{if } n \geq m$$

or

$$R = \begin{array}{c} \\ n \end{array} \begin{array}{c} \begin{array}{cc} n & m-n \end{array} \\ \begin{pmatrix} R_{11} & R_{12} \end{pmatrix} \end{array}, \quad \text{if } n < m$$

where R_{11} is upper triangular, and

$$T = \begin{array}{c} \\ n \end{array} \begin{array}{c} \begin{array}{cc} p-n & n \end{array} \\ \begin{pmatrix} 0 & T_{12} \end{pmatrix} \end{array}, \quad \text{if } n \leq p,$$

$$T = \begin{array}{c} \\ n \\ p-n \end{array} \begin{array}{c} \begin{array}{c} p \end{array} \\ \begin{pmatrix} T_{11} \\ T_{21} \end{pmatrix} \end{array}, \quad \text{if } n > p,$$

where T_{12} or T_{21} is a p-by-p upper triangular matrix.

In particular, if B is square and nonsingular, the GQR factorization of A and B implicitly gives the QR factorization of $B^{-1}A$ as:

$B^{-1}*A = Z^{T}*(T^{-1}*R)$ (for real flavors) or $B^{-1}*A = Z^{H}*(T^{-1}*R)$ (for complex flavors).

Input Parameters

n	INTEGER. The number of rows of the matrices *A* and *B* (*n*≥ 0).
m	INTEGER. The number of columns in *A* (*m*≥ 0).
p	INTEGER. The number of columns in *B* (*p*≥ 0).
a, *b*, *work*	REAL for sggqrf DOUBLE PRECISION for dggqrf COMPLEX for cggqrf DOUBLE COMPLEX for zggqrf. Arrays: *a*(*lda*,*) contains the matrix *A*. The second dimension of *a* must be at least max(1, *m*). *b*(*ldb*,*) contains the matrix *B*. The second dimension of *b* must be at least max(1, *p*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The leading dimension of *a*; at least max(1, *n*).

ldb — INTEGER. The leading dimension of *b*; at least max(1, *n*).

lwork — INTEGER. The size of the *work* array; must be at least max(1, *n*, *m*, *p*).

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a, *b* — Overwritten by the factorization data as follows:

on exit, the elements on and above the diagonal of the array *a* contain the min(*n*,*m*)-by-*m* upper trapezoidal matrix *R* (*R* is upper triangular if $n \geq m$);the elements below the diagonal, with the array *taua*, represent the orthogonal/unitary matrix *Q* as a product of min(*n*,*m*) elementary reflectors ;

if $n \leq p$, the upper triangle of the subarray *b*(1:*n*, *p*-*n*+1:*p*) contains the *n*-by-*n* upper triangular matrix *T*;

if *n* > *p*, the elements on and above the (*n*-*p*)th subdiagonal contain the *n*-by-*p* upper trapezoidal matrix *T*; the remaining elements, with the array *taub*, represent the orthogonal/unitary matrix *Z* as a product of elementary reflectors.

taua, *taub* — REAL for sggqrf

DOUBLE PRECISION for dggqrf

COMPLEX for cggqrf

DOUBLE COMPLEX for zggqrf.

Arrays, size at least max (1, min(*n*, *m*)) for *taua* and at least max (1, min(*n*, *p*)) for *taub*. The array *taua* contains the scalar factors of the elementary reflectors which represent the orthogonal/unitary matrix *Q*.

The array *taub* contains the scalar factors of the elementary reflectors which represent the orthogonal/unitary matrix *Z*.

work(1) — If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine ggqrf interface are the following:

a — Holds the matrix *A* of size (*n*,*m*).

b — Holds the matrix *B* of size (*n*,*p*).

taua	Holds the vector of length min(*n,m*).
taub	Holds the vector of length min(*n,p*).

Application Notes

The matrix *Q* is represented as a product of elementary reflectors

Q = *H*(1)*H*(2)...*H*(*k*), where *k* = min(n,m).

Each *H*(i) has the form

$H(i) = I - \tau_a * v * v^T$ for real flavors, or

$H(i) = I - \tau_a * v * v^H$ for complex flavors,

where τ_a is a real/complex scalar, and *v* is a real/complex vector with $v_j = 0$ for $1 \le j \le i - 1$, $v_i = 1$.

On exit, for$i + 1 \le j \le n$, v_j is stored in *a*(i+1:*n*, i) and τ_a is stored in *taua*(*i*)

The matrix *Z* is represented as a product of elementary reflectors

Z = *H*(1)*H*(2)...*H*(*k*), where *k* = min(n,p).

Each *H*(i) has the form

$H(i) = I - \tau_b * v * v^T$ for real flavors, or

$H(i) = I - \tau_b * v * v^H$ for complex flavors,

where τ_b is a real/complex scalar, and *v* is a real/complex vector with $v_{p-k+1} = 1$, $v_j = 0$ for $p - k + 1 \le j \le p - 1$, .

On exit, for $1 \le j \le p - k + i - 1$, v_j is stored in *b*(n-k+i, 1:p-k+i-1) and τ_b is stored in *taub*(*i*).

For better performance, try using *lwork*≥ max(*n*,*m*, *p*)*max(*nb1*,*nb2*,*nb3*), where *nb1* is the optimal blocksize for the *QR* factorization of an *n*-by-*m* matrix, *nb2* is the optimal blocksize for the *RQ* factorization of an *n*-by-*p* matrix, and *nb3* is the optimal blocksize for a call of ormqr/unmqr.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?ggrqf
Computes the generalized RQ factorization of two matrices.

Syntax

```
call sggrqf (m, p, n, a, lda, taua, b, ldb, taub, work, lwork, info)
call dggrqf (m, p, n, a, lda, taua, b, ldb, taub, work, lwork, info)
call cggrqf (m, p, n, a, lda, taua, b, ldb, taub, work, lwork, info)
call zggrqf (m, p, n, a, lda, taua, b, ldb, taub, work, lwork, info)
```

```
call ggrqf(a, b [,taua] [,taub] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine forms the generalized *RQ* factorization of an *m*-by-*n* matrix *A* and an *p*-by-*n* matrix *B* as `A = R*Q`, `B = Z*T*Q`, where *Q* is an *n*-by-*n* orthogonal/unitary matrix, *Z* is a *p*-by-*p* orthogonal/unitary matrix, and *R* and *T* assume one of the forms:

$$R = \begin{array}{c} \\ m \end{array} \begin{array}{c} \begin{array}{cc} n-m & m \end{array} \\ \begin{pmatrix} 0 & R_{12} \end{pmatrix} \end{array}, \quad \text{if } m \le n,$$

or

$$R = \begin{array}{c} \\ m-n \\ n \end{array} \begin{array}{c} n \\ \begin{pmatrix} R_{11} \\ R_{21} \end{pmatrix} \end{array}, \quad \text{if } m > n,$$

where R_{11} or R_{21} is upper triangular, and

$$T = \begin{array}{c} \\ n \\ p-n \end{array} \begin{array}{c} n \\ \begin{pmatrix} T_{11} \\ 0 \end{pmatrix} \end{array}, \quad \text{if } p \ge n,$$

or

$$T = \begin{array}{c} \\ p \end{array} \begin{array}{c} \begin{array}{cc} p & n-p \end{array} \\ \begin{pmatrix} T_{11} & T_{12} \end{pmatrix} \end{array}, \quad \text{if } p < n,$$

where T_{11} is upper triangular.

In particular, if *B* is square and nonsingular, the *GRQ* factorization of *A* and *B* implicitly gives the *RQ* factorization of $A*B^{-1}$ as:

$A*B^{-1} = (R*T^{-1})*Z^{T}$ (for real flavors) or $A*B^{-1} = (R*T^{-1})*Z^{H}$ (for complex flavors).

Input Parameters

m	INTEGER. The number of rows of the matrix *A* (*m*≥ 0).
p	INTEGER. The number of rows in *B* (*p*≥ 0).
n	INTEGER. The number of columns of the matrices *A* and *B* (*n*≥ 0).
a, *b*, *work*	REAL for sggrqf DOUBLE PRECISION for dggrqf COMPLEX for cggrqf DOUBLE COMPLEX for zggrqf. Arrays: *a*(*lda*,*) contains the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) contains the *p*-by-*n* matrix *B*. The second dimension of *b* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The leading dimension of *a*; at least max(1, *m*).
ldb	INTEGER. The leading dimension of *b*; at least max(1, *p*).
lwork	INTEGER. The size of the *work* array; must be at least max(1, *n*, *m*, *p*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a, *b*	Overwritten by the factorization data as follows: on exit, if *m*≤*n*, the upper triangle of the subarray *a*(1:*m*, *n*-*m*+1:*n*) contains the *m*-by-*m* upper triangular matrix *R*; if *m* > *n*, the elements on and above the (*m*-*n*)th subdiagonal contain the *m*-by-*n* upper trapezoidal matrix *R*; the remaining elements, with the array *taua*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors. The elements on and above the diagonal of the array *b* contain the min(*p*,*n*)-by-*n* upper trapezoidal matrix *T* (*T* is upper triangular if *p*≥*n*); the elements below the diagonal, with the array *taub*, represent the orthogonal/unitary matrix *Z* as a product of elementary reflectors.
taua, *taub*	REAL for sggrqf DOUBLE PRECISION for dggrqf COMPLEX for cggrqf

DOUBLE COMPLEX for zggrqf.

Arrays, size at least max (1, min(*m*, *n*)) for *taua* and at least max (1, min(*p*, *n*)) for *taub*.

The array *taua* contains the scalar factors of the elementary reflectors which represent the orthogonal/unitary matrix *Q*.

The array *taub* contains the scalar factors of the elementary reflectors which represent the orthogonal/unitary matrix *Z*.

work(1) — If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine ggrqf interface are the following:

a — Holds the matrix *A* of size (*m*,*n*).

b — Holds the matrix *A* of size (*p*,*n*).

taua — Holds the vector of length min(*m*,*n*).

taub — Holds the vector of length min(*p*,*n*).

Application Notes

The matrix *Q* is represented as a product of elementary reflectors

Q = *H*(1)*H*(2)...*H*(*k*), where *k* = min(m,n).

Each *H*(i) has the form

H(i) = *I* - *taua***v***v*^{T} for real flavors, or

H(i) = *I* - *taua***v***v*^{H} for complex flavors,

where *taua* is a real/complex scalar, and *v* is a real/complex vector with $v_{n-k+i} = 1$, $v_{n-k+i+1:n} = 0$.

On exit, $v_{1:n-k+i-1}$ is stored in *a*(m-k+i,1:n-k+i-1) and *taua* is stored in *taua*(*i*).

The matrix *Z* is represented as a product of elementary reflectors

Z = *H*(1)*H*(2)...*H*(*k*), where *k* = min(p,n).

Each *H*(i) has the form

H(i) = *I* - *taub***v***v*^{T} for real flavors, or

H(i) = *I* - *taub***v***v*^{H} for complex flavors,

where *taub* is a real/complex scalar, and *v* is a real/complex vector with $v_{1:i-1} = 0$, $v_i = 1$.

On exit, $v_{i+1:p}$ is stored in *b*(i+1:p, i) and *taub* is stored in *taub*(*i*).

For better performance, try using

lwork≥ max(*n*,*m*, *p*)*max(*nb1*,*nb2*,*nb3*),

where *nb1* is the optimal blocksize for the *RQ* factorization of an *m*-by-*n* matrix, *nb2* is the optimal blocksize for the *QR* factorization of an *p*-by-*n* matrix, and *nb3* is the optimal blocksize for a call of ?ormrq/?unmrq.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork*= -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork*= -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?tpqrt
Computes a blocked QR factorization of a real or complex "triangular-pentagonal" matrix, which is composed of a triangular block and a pentagonal block, using the compact WY representation for Q.

Syntax

```
call stpqrt(m, n, l, nb, a, lda, b, ldb, t, ldt, work, info)
call dtpqrt(m, n, l, nb, a, lda, b, ldb, t, ldt, work, info)
call ctpqrt(m, n, l, nb, a, lda, b, ldb, t, ldt, work, info)
call ztpqrt(m, n, l, nb, a, lda, b, ldb, t, ldt, work, info)
call tpqrt(a, b, t, nb[, info])
```

Include Files

- mkl.fi, lapack.f90

Description

The input matrix *C* is an (*n*+*m*)-by-*n* matrix

$$C = \begin{bmatrix} A \\ B \end{bmatrix} \begin{matrix} \leftarrow n \times n \text{ upper triangular} \\ \leftarrow m \times n \text{ pentagonal} \end{matrix}$$

where *A* is an *n*-by-*n* upper triangular matrix, and *B* is an *m*-by-*n* pentagonal matrix consisting of an (*m*-*l*)-by-*n* rectangular matrix *B1* on top of an *l*-by-*n* upper trapezoidal matrix *B2*:

$$B = \begin{bmatrix} B1 \\ B2 \end{bmatrix} \begin{matrix} \leftarrow (m-l)\times n \text{ rectangular} \\ \leftarrow l \times n \text{ upper trapezoidal} \end{matrix}$$

The upper trapezoidal matrix *B2* consists of the first `l` rows of an `n`-by-`n` upper triangular matrix, where 0 ≤ `l` ≤ min(`m`,`n`). If `l`=0, *B* is an `m`-by-`n` rectangular matrix. If `m`=`l`=`n`, *B* is upper triangular. The elementary reflectors *H(i)* are stored in the *i*th column below the diagonal in the (`n`+`m`)-by-`n` input matrix *C*. The structure of vectors defining the elementary reflectors is illustrated by:

$$\begin{bmatrix} I \\ V \end{bmatrix} \begin{matrix} \leftarrow n \times n \text{ identity} \\ \leftarrow m \times n \text{ pentagonal} \end{matrix}$$

The elements of the unit matrix *I* are not stored. Thus, *V* contains all of the necessary information, and is returned in array `b`.

NOTE
Note that *V* has the same form as *B*:

$$V = \begin{bmatrix} V1 \\ V2 \end{bmatrix} \begin{matrix} \leftarrow (m-l)\times n \text{ rectangular} \\ \leftarrow l \times n \text{ upper trapezoidal} \end{matrix}$$

The columns of *V* represent the vectors which define the *H(i)*s.

The number of blocks is *k* = ceiling(`n`/`nb`), where each block is of order `nb` except for the last block, which is of order *ib* = `n` - (*k*-1)*`nb`. For each of the *k* blocks, an upper triangular block reflector factor is computed: *T1*, *T2*, ..., *Tk*. The `nb`-by-`nb` (*ib*-by-*ib* for the last block) *Ti*s are stored in the `nb`-by-`n` array `t` as

`t = [T1T2 ... Tk]` .

Input Parameters

`m` — `INTEGER`. The total number of rows in the matrix *B* (`m` ≥ 0).

`n` — `INTEGER`. The number of columns in *B* and the order of the triangular matrix *A* (`n` ≥ 0).

`l` — `INTEGER`. The number of rows of the upper trapezoidal part of *B* (min(`m`, `n`) ≥ `l` ≥ 0).

nb	INTEGER. The block size to use in the blocked *QR* factorization ($n \geq nb \geq 1$).
a, *b*, *work*	REAL for stpqrt DOUBLE PRECISION for dtpqrt COMPLEX for ctpqrt COMPLEX*16 for ztpqrt. Arrays: *a* size (*lda*, *n*) contains the *n*-by-*n* upper triangular matrix *A*. *b* size (*ldb*, *n*), the pentagonal *m*-by-*n* matrix *B*. The first (*m*-*l*) rows contain the rectangular *B1* matrix, and the next *l* rows contain the upper trapezoidal *B2* matrix. *work* size (*nb*, *n*) is a workspace array.
lda	INTEGER. The leading dimension of *a*; at least max(1, *n*).
ldb	INTEGER. The leading dimension of *b*; at least max(1, *m*).
ldt	INTEGER. The leading dimension of *t*; at least *nb*.

Output Parameters

a	The elements on and above the diagonal of the array contain the upper triangular matrix *R*.
b	The pentagonal matrix *V*.
t	REAL for stpqrt DOUBLE PRECISION for dtpqrt COMPLEX for ctpqrt COMPLEX*16 for ztpqrt. Array, size (*ldt*, *n*). The upper triangular block reflectors stored in compact form as a sequence of upper triangular blocks.
info	INTEGER. If *info* = 0, the execution is successful. If *info* < 0 and *info* = -*i*, the *i*th argument had an illegal value.

?tpmqrt

Applies a real or complex orthogonal matrix obtained from a "triangular-pentagonal" complex block reflector to a general real or complex matrix, which consists of two blocks.

Syntax

```
call stpmqrt(side, trans, m, n, k, l, nb, v, ldv, t, ldt, a, lda, b, ldb, work, info)
call dtpmqrt(side, trans, m, n, k, l, nb, v, ldv, t, ldt, a, lda, b, ldb, work, info)
call ctpmqrt(side, trans, m, n, k, l, nb, v, ldv, t, ldt, a, lda, b, ldb, work, info)
```

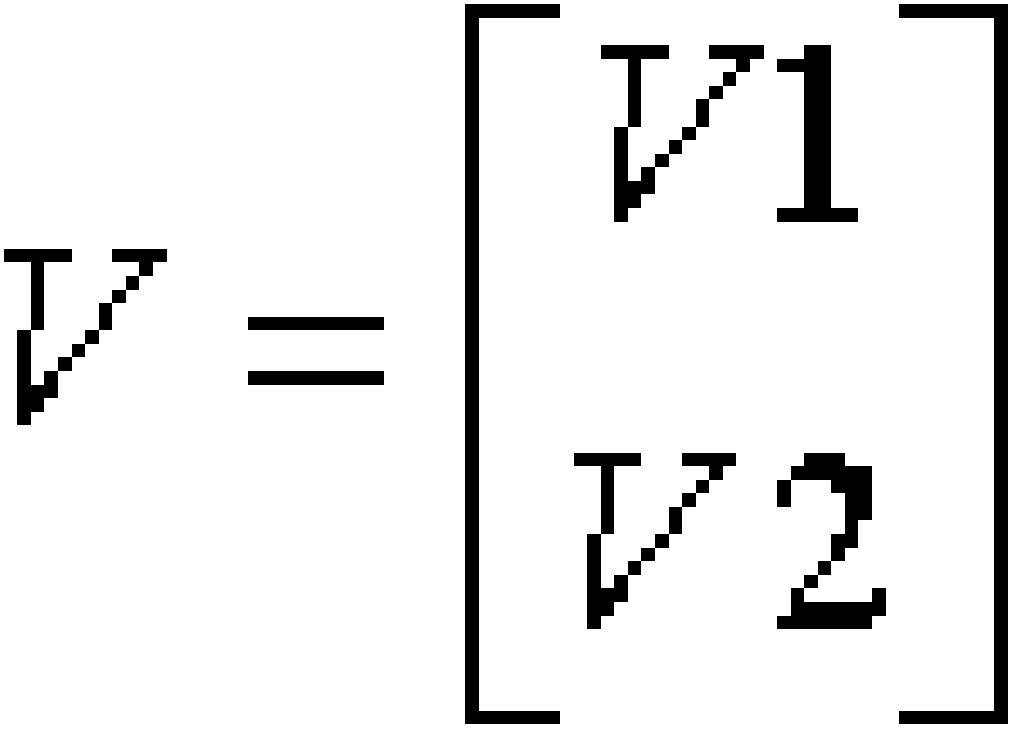
```
call ztpmqrt(side, trans, m, n, k, l, nb, v, ldv, t, ldt, a, lda, b, ldb, work, info)
call tpmqrt( v, t, a, b, k, nb[, trans][, side][, info])
```

Include Files

- mkl.fi, lapack.f90

Description

The columns of the pentagonal matrix *V* contain the elementary reflectors *H*(1), *H*(2), ..., *H*(*k*); *V* is composed of a rectangular block *V1* and a trapezoidal block *V2*:

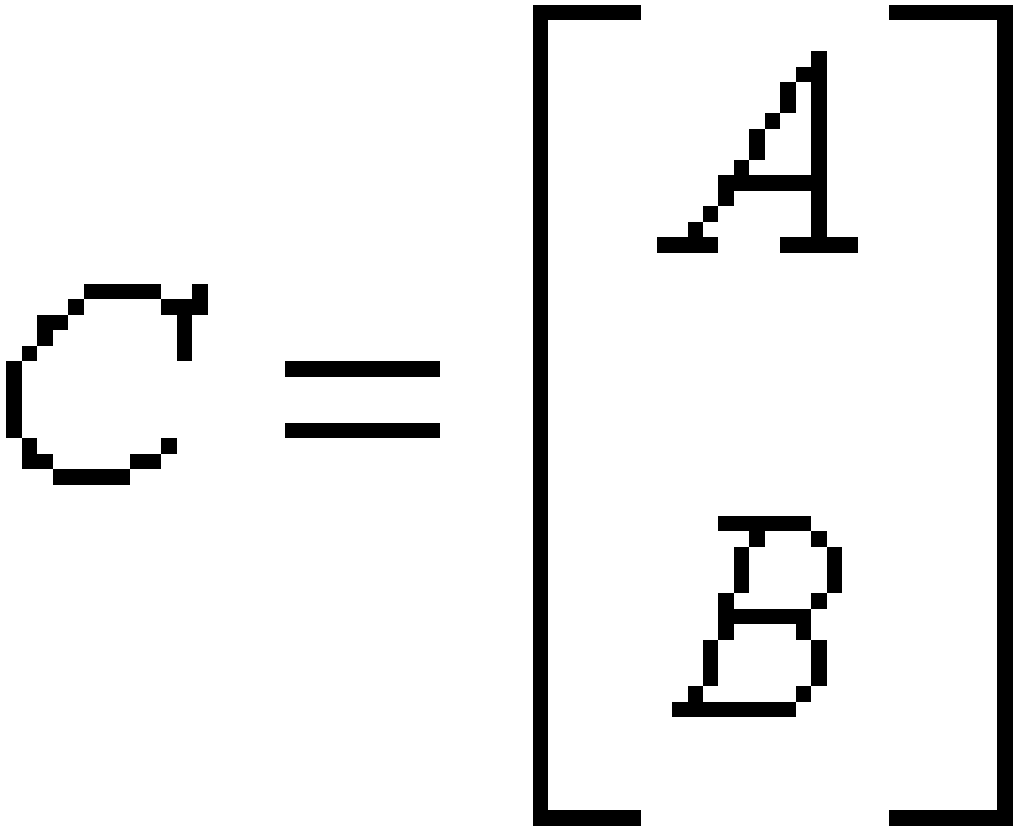


The size of the trapezoidal block *V2* is determined by the parameter *l*, where 0 ≤ *l* ≤ *k*. *V2* is upper trapezoidal, consisting of the first *l* rows of a *k*-by-*k* upper triangular matrix.

If *l*=*k*, *V2* is upper triangular;

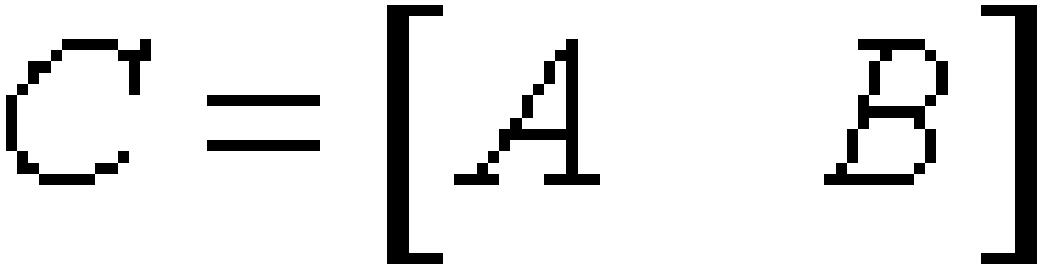
If *l*=0, there is no trapezoidal block, so *V* = *V1* is rectangular.

If *side* = 'L':



where *A* is *k*-by-*n*, *B* is *m*-by-*n* and *V* is *m*-by-*k*.

If *side* = 'R':



where *A* is *m*-by-*k*, *B* is *m*-by-*n* and *V* is *n*-by-*k*.

The real/complex orthogonal matrix *Q* is formed from *V* and *T*.

If *trans*='N' and *side*='L', *c* contains *Q* * *C* on exit.

If *trans*='T' and *side*='L', *C* contains Q^T * *C* on exit.

If *trans*='C' and *side*='L', *C* contains Q^H * *C* on exit.

If *trans*='N' and *side*='R', *C* contains *C* * *Q* on exit.

If *trans*='T' and *side*='R', *C* contains *C* * Q^T on exit.

If *trans*='C' and *side*='R', *C* contains $C * Q^H$ on exit.

Input Parameters

side CHARACTER*1

='L': apply Q, Q^T, or Q^H from the left.

='R': apply Q, Q^T, or Q^H from the right.

trans CHARACTER*1

='N', no transpose, apply Q.

='T', transpose, apply Q^T.

='C', transpose, apply Q^H.

m INTEGER. The number of rows in the matrix B, $(m \geq 0)$.

n INTEGER. The number of columns in the matrix B, $(n \geq 0)$.

k INTEGER. The number of elementary reflectors whose product defines the matrix Q, $(k \geq 0)$.

l INTEGER. The order of the trapezoidal part of V ($k \geq l \geq 0$).

nb INTEGER.

The block size used for the storage of *t*, $k \geq nb \geq 1$. This must be the same value of *nb* used to generate *t* in tpqrt.

v REAL for stpmqrt

DOUBLE PRECISION for dtpmqrt

COMPLEX for ctpmqrt

COMPLEX*16 for ztpmqrt.

Size (*ldv*, *k*)

The *i*th column must contain the vector which defines the elementary reflector $H(i)$, for $i = 1,2,...,k$, as returned by tpqrt in array argument *b*.

ldv INTEGER. The leading dimension of the array *v*.

If *side* = 'L', *ldv* must be at least max(1,*m*);

If *side* = 'R', *ldv* must be at least max(1,*n*).

t REAL for stpmqrt

DOUBLE PRECISION for dtpmqrt

COMPLEX for ctpmqrt

COMPLEX*16 for ztpmqrt.

Array, size (*ldt*, *k*).

The upper triangular factors of the block reflectors as returned by tpqrt, stored as an *nb*-by-*k* matrix.

ldt INTEGER. The leading dimension of the array *t*. *ldt* must be at least *nb*.

a
REAL for stpmqrt
DOUBLE PRECISION for dtpmqrt
COMPLEX for ctpmqrt
COMPLEX*16 for ztpmqrt.
If *side* = 'L', size (*lda*, *n*).
If *side* = 'R', size (*lda*, *k*).
The *k*-by-*n* or *m*-by-*k* matrix *A*.

lda
INTEGER. The leading dimension of the array *a*.
If *side* = 'L', *lda* must be at least max(1,*k*).
If *side* = 'R', *lda* must be at least max(1,*m*).

b
REAL for stpmqrt
DOUBLE PRECISION for dtpmqrt
COMPLEX for ctpmqrt
COMPLEX*16 for ztpmqrt.
Size (*ldb*, *n*).
The *m*-by-*n* matrix *B*.

ldb
INTEGER. The leading dimension of the array *b*. *ldb* must be at least max(1,*m*).

work
REAL for stpmqrt
DOUBLE PRECISION for dtpmqrt
COMPLEX for ctpmqrt
COMPLEX*16 for ztpmqrt.
Workspace array. If *side* = 'L' DIMENSION *n***nb*. If *side* = 'R' DIMENSION *m***nb*.

Output Parameters

a
Overwritten by the corresponding block of the product $Q*C$, $C*Q$, Q^T*C, $C*Q^T$, Q^H*C, or $C*Q^H$.

b
Overwritten by the corresponding block of the product $Q*C$, $C*Q$, Q^T*C, $C*Q^T$, Q^H*C, or $C*Q^H$.

info
(global) INTEGER.
= 0: the execution is successful.
< 0: if *info* = -*i*, the *i*th argument had an illegal value.

?tplqt
Computes a blocked LQ factorization of a complex "triangular-pentagonal" matrix composed of a triangular block A and pentagonal block B, using the compact WY representation for Q.

```
call stplqt(m, n, l, mb, a, lda, b, ldb, t, ldt, work, info)
call dtplqt(m, n, l, mb, a, lda, b, ldb, t, ldt, work, info)
call ctplqt(m, n, l, mb, a, lda, b, ldb, t, ldt, work, info)
call ztplqt(m, n, l, mb, a, lda, b, ldb, t, ldt, work, info)
```

Description

?tplqt computes a blocked LQ factorization of a real or complex "triangular-pentagonal" matrix *C*, which is composed of a triangular block *A* and pentagonal block *B*, using the compact WY representation for *Q*.

The input matrix *C* is an *m*-by-(*m*+*n*) matrix:

C = [*A*] [*B*]

where *A* is a lower triangular *m*-by-*m* matrix, and *B* is an *m*-by-*n* pentagonal matrix consisting of an *m*-by-(*n*-*l*) rectangular matrix *B1* to the left of an *m*-by-*l* lower trapezoidal matrix *B2*:

[*B*] = [*B1*] [*B2*]

[*B1*] <- *m*-by-(*n*-*l*) rectangular

[*B2*] <- *m*-by-*l* lower trapezoidal.

The lower trapezoidal matrix *B2* consists of the first *l* columns of an *m*-by-*m* lower triangular matrix, where 0 ≤*l*≤ min(*m*,*n*). If *l*=0, *b* is rectangular *m*-by-*n*; if *m*=*l*=*n*, *b* is lower triangular.

The matrix *W* stores the elementary reflectors *H*(*i*) in the *i*-th row above the diagonal (of *A*) in the *m*-by-(*m* +*n*) input matrix *C*:

[*C*] = [*A*] [*B*]

[*A*] <- lower triangular *m*-by-*m*

[*B*] <- *m*-by-*n* pentagonal

so that *W* can be represented as

[*W*] = [*I*] [*V*]

[*I*] <- *m*-by-*m* identity matrix

[*V*] <- *m*-by-*n*, same form as *B*.

Thus, all of information needed for *W* is contained on exit in the array *b*, called *V* in the preceding. Note that *V* has the same form as *B*; that is,

[*V*] = [*V1*] [*V2*]

[*V1*] <- *m*-by-(*n*-*l*) rectangular

[*V2*] <- *m*-by-*l* lower trapezoidal.

The rows of *V* represent the vectors which define the *H*(*i*) elementary reflectors .

The number of blocks is *B* = ceiling(*m*/*mb*), where each block is of order *mb* except for the last block, which is of order *ib* = *m* - (*m* - 1)**mb*. For each of the *B* blocks, a upper triangular block reflector factor is computed:

T1, *T2*, ..., *TB*.

The *mb*-by-*mb* (and *ib*-by-*ib* for the last block) *Ti*s are stored in the *mb*-by-*n* array *t* as

T = [*T1T2* ... *TB*].

Input Parameters

m	INTEGER. The number of rows of the matrix *B*, and the order of the triangular matrix *A*. *m*≥ 0.
n	INTEGER. The number of columns of the matrix *B*. *n*≥ 0.
l	INTEGER. The number of rows of the lower trapezoidal part of *B*. min(*m*, *n*) ≥*l*≥ 0.
mb	INTEGER. The block size to be used in the blocked QR. *m*≥*mb*≥ 1.
a	REAL for stplqt DOUBLE PRECISION for dtplqt COMPLEX for ctplqt COMPLEX*16 for ztplqt Array of size (*lda*,*m*). On entry, the lower triangular *m*-by-*m* matrix *A*.
lda	INTEGER. The leading dimension of the array *a*. *lda*≥ max(1,*m*).
b	REAL for stplqt DOUBLE PRECISION for dtplqt COMPLEX for ctplqt COMPLEX*16 for ztplqt Array of size (*ldb*,*n*). On entry, the pentagonal *m*-by-*n* matrix *B*. The first *n*-*l* columns are rectangular, and the last *l* columns are lower trapezoidal.
ldb	INTEGER. The leading dimension of the array *b*. *ldb*≥ max(1,*m*).
ldt	INTEGER. The leading dimension of the array *t*. *ldt*≥*mb*.

Output Parameters

a	On exit, the elements on and below the diagonal of the array contain the lower triangular matrix *L*.
b	On exit, *b* contains the pentagonal matrix *V*.
t	REAL for stplqt DOUBLE PRECISION for dtplqt COMPLEX for ctplqt COMPLEX*16 for ztplqt Array of size (*ldt*,*n*). The lower triangular block reflectors stored in compact form as a sequence of upper triangular blocks.
work	REAL for stplqt DOUBLE PRECISION for dtplqt COMPLEX for ctplqt

	COMPLEX*16 for ztplqt Array of size (*mb***m*).
info	INTEGER. *info* = 0: successful exit. *info* < 0: if *info* = -*i*, the *i*-th argument had an illegal value.

?tpmlqt

Applies an orthogonal matrix obtained from a "triangular-pentagonal" block reflector to a general matrix.

```
call stpmlqt(side, trans, m, n, k, l, mb, v, ldv, t, ldt, a, lda, b, ldb, work, info)
call dtpmlqt(side, trans, m, n, k, l, mb, v, ldv, t, ldt, a, lda, b, ldb, work, info)
call ctpmlqt(side, trans, m, n, k, l, mb, v, ldv, t, ldt, a, lda, b, ldb, work, info)
call ztpmlqt(side, trans, m, n, k, l, mb, v, ldv, t, ldt, a, lda, b, ldb, work, info)
```

Description

?tpmlqt applies an orthogonal matrix *Q* obtained from a "triangular-pentagonal" block reflector *H* to a general matrix *C*, which consists of two blocks *A* and *B*.

The columns of the pentagonal matrix *V* contain the elementary reflectors *H*(1), *H*(2), ..., *H*(*k*); *V* is composed of a rectangular block *V1* and a trapezoidal block *V2*:

V = [*V1*] [*V2*].

The size of the trapezoidal block *V2* is determined by the parameter *l*, where 0 ≤*l*≤*k*; *V2* is lower trapezoidal, consisting of the first *l* rows of a *k*-by-*k* upper triangular matrix. If *l*=*k*, *V2* is lower triangular; if *l*=0, there is no trapezoidal block, hence *V* = *V1* is rectangular.

If *side* = 'L':

C = [*A*] [*B*]

where *A* is *k*-by-*n*, *B* is *m*-by-*n*, and *C* is *k*-by-*m*.

If *side* = 'R':

C = [*AB*]

where *A* is *m*-by-*k*, *B* is *m*-by-*n*, and *C* is *k*-by-*n*.

The real orthogonal matrix *Q* is formed from *V* and *T*.

If *trans*='N' and *side*='L', *C* is on exit replaced with *Q* * *C*.

C is on exit replaced with

	side = 'L'	*side* = 'R'
trans = 'N'	*Q***C*	*C***Q*
trans = 'T'	Q^T**C*	*C**Q^T
trans = 'C'	Q^H**C*	*C**Q^H

Input Parameters

side CHARACTER*1.

= 'L': apply op(Q) from the left;

= 'R': apply op(Q) from the right.

trans CHARACTER*1.

= 'N': No transpose, op(Q) = Q;

= 'T': Transpose, op(Q) = Q^T;

= 'C': Transpose, op(Q) = Q^H.

m INTEGER. The number of rows of the matrix B. $m \geq 0$.

n INTEGER. The number of columns of the matrix B. $n \geq 0$.

k INTEGER. The number of elementary reflectors whose product defines the matrix Q.

l INTEGER. The order of the trapezoidal part of V. $k \geq l \geq 0$.

mb INTEGER. The block size used for the storage of T. $k \geq mb \geq 1$. This must be the same value of *mb* used to generate T in ?tplqt.

v REAL for stpmlqt

DOUBLE PRECISION for dtpmlqt

COMPLEX for ctpmlqt

COMPLEX*16 for ztpmlqt

Array of size (*lda*,*k*). The i-th row must contain the vector which defines the elementary reflector $H(i)$, for $i = 1,2,...,k$, as returned by ?tplqt in *b*.

ldv INTEGER. The leading dimension of the array *v*. If *side* = 'L', $ldv \geq \max(1, m)$; if *side* = 'R', $ldv \geq \max(1, n)$.

t REAL for stpmlqt

DOUBLE PRECISION for dtpmlqt

COMPLEX for ctpmlqt

COMPLEX*16 for ztpmlqt

Array of size (*ldt*,*k*). The upper triangular factors of the block reflectors as returned by ?tplqt, stored as a *mb*-by-*k* matrix.

ldt INTEGER. The leading dimension of the array *t*. $ldt \geq mb$.

a REAL for stpmlqt

DOUBLE PRECISION for dtpmlqt

COMPLEX for ctpmlqt

COMPLEX*16 for ztpmlqt

Array of size (*lda*,*n*) if *side* = 'L', or size (*lda*,*k*) if *side* = 'R'.

On entry, the *k*-by-*n* or *m*-by-*k* matrix A.

lda	INTEGER. The leading dimension of the array *a*. If *side* = 'L', LDC ≥ max(1, *k*); if *side* = 'R', LDC ≥ max(1, *m*).
b	REAL for stpmlqt DOUBLE PRECISION for dtpmlqt COMPLEX for ctpmlqt COMPLEX*16 for ztpmlqt Array of size (*ldb*, *n*). On entry, the *m*-by-*n* matrix *B*.
ldb	INTEGER. The leading dimension of the array *b*. *ldb*≥ max(1, *m*).

Output Parameters

a	On exit, *a* is overwritten by the corresponding block of op(*Q*)**C* or *C**op(*Q*) See Description.
b	REAL for stpmlqt DOUBLE PRECISION for dtpmlqt COMPLEX for ctpmlqt COMPLEX*16 for ztpmlqt On exit, *b* is overwritten by the corresponding block of op(*Q*)**C* or *C**op(*Q*) See Description.
work	REAL for stpmlqt DOUBLE PRECISION for dtpmlqt COMPLEX for ctpmlqt COMPLEX*16 for ztpmlqt Array. The size of *work* is *n***mb* if *side* = 'L', or *m***mb* if *side* = 'R'.
info	INTEGER. *info* = 0: successful exit. *info* < 0: if *info* = -*i*, the *i*-th argument had an illegal value.

Singular Value Decomposition: LAPACK Computational Routines

This topic describes LAPACK routines for computing the *singular value decomposition* (SVD) of a general *m*-by-*n* matrix *A*:

$A = U\Sigma V^H$.

In this decomposition, *U* and *V* are unitary (for complex *A*) or orthogonal (for real *A*); Σ is an *m*-by-*n* diagonal matrix with real diagonal elements σ_i:

$\sigma_1 \geq \sigma_2 \geq \ldots \geq \sigma_{\min(m, n)} \geq 0$.

The diagonal elements σ_i are *singular values* of *A*. The first $\min(m, n)$ columns of the matrices *U* and *V* are, respectively, *left* and *right singular vectors* of *A*. The singular values and singular vectors satisfy

$Av_i = \sigma_i u_i$ and $A^H u_i = \sigma_i v_i$

where u_i and v_i are the *i*-th columns of *U* and *V*, respectively.

To find the SVD of a general matrix *A*, call the LAPACK routine `?gebrd` or `?gbbrd` for reducing *A* to a bidiagonal matrix *B* by a unitary (orthogonal) transformation: $A = QBP^H$. Then call `?bdsqr`, which forms the SVD of a bidiagonal matrix: $B = U_1 \Sigma V_1^H$.

Thus, the sought-for SVD of *A* is given by $A = U \Sigma V^H = (QU_1) \Sigma (V_1^H P^H)$.

Table "Computational Routines for Singular Value Decomposition (SVD)" lists LAPACK routines (FORTRAN 77 interface) that perform singular value decomposition of matrices. The corresponding routine names in the Fortran 95 interface are the same except that the first character is removed.

Computational Routines for Singular Value Decomposition (SVD)

Operation	Real matrices	Complex matrices
Reduce *A* to a bidiagonal matrix *B*: $A = QBP^H$ (full storage)	?gebrd	?gebrd
Reduce *A* to a bidiagonal matrix *B*: $A = QBP^H$ (band storage)	?gbbrd	?gbbrd
Generate the orthogonal (unitary) matrix *Q* or P	?orgbr	?ungbr
Apply the orthogonal (unitary) matrix *Q* or P	?ormbr	?unmbr
Form singular value decomposition of the bidiagonal matrix *B*: $B = U \Sigma V^H$	?bdsqr ?bdsdc	?bdsqr

Decision Tree: Singular Value Decomposition

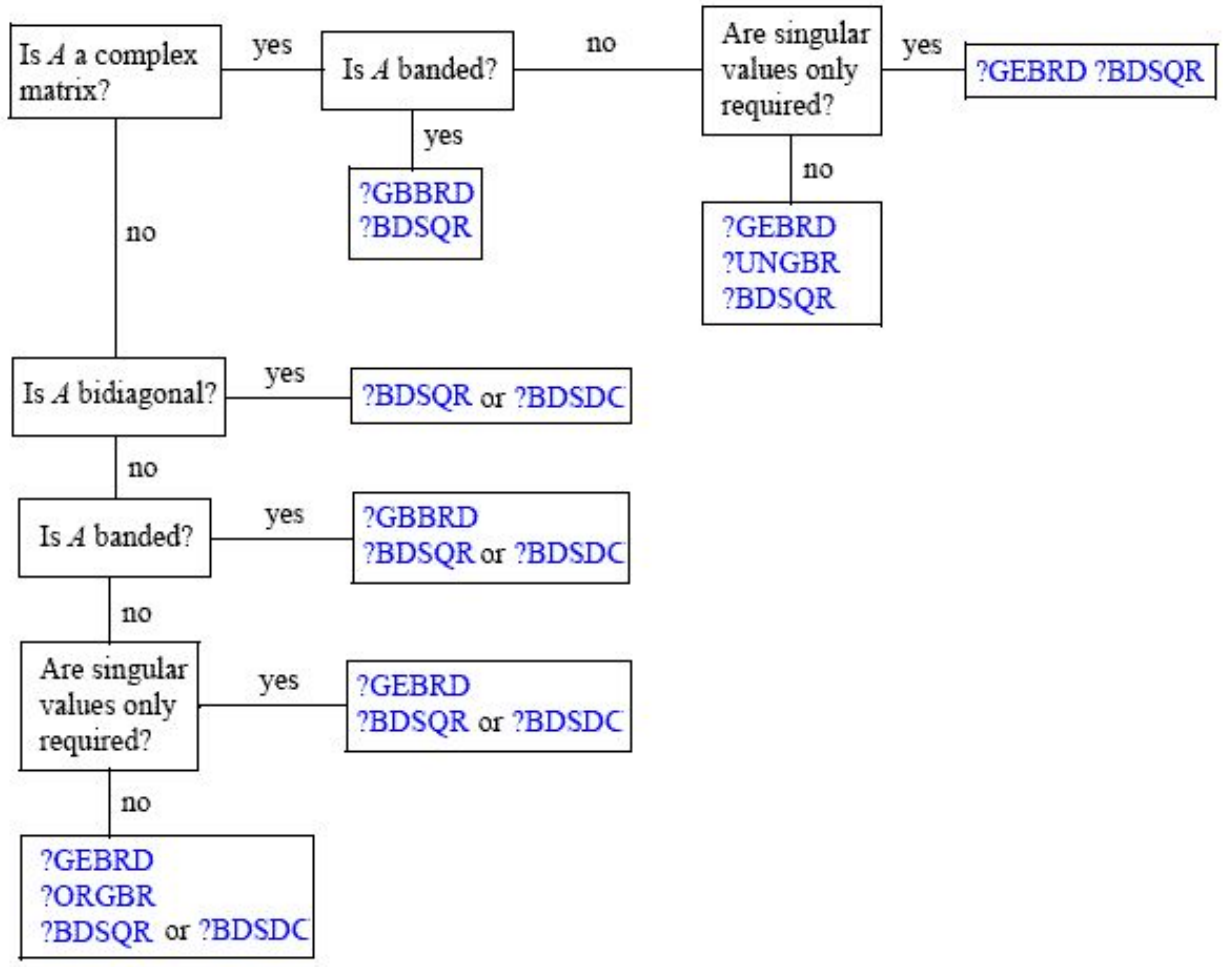


Figure "Decision Tree: Singular Value Decomposition" presents a decision tree that helps you choose the right sequence of routines for SVD, depending on whether you need singular values only or singular vectors as well, whether *A* is real or complex, and so on.

You can use the SVD to find a minimum-norm solution to a (possibly) rank-deficient least squares problem of minimizing $||Ax - b||^2$. The effective rank *k* of the matrix *A* can be determined as the number of singular values which exceed a suitable threshold. The minimum-norm solution is

$$x = V_k(\Sigma_k)^{-1}c$$

where Σ_k is the leading *k*-by-*k* submatrix of Σ, the matrix V_k consists of the first *k* columns of $V = PV_1$, and the vector *c* consists of the first *k* elements of $U^Hb = U_1{}^HQ^Hb$.

?gebrd
Reduces a general matrix to bidiagonal form.

Syntax

```
call sgebrd(m, n, a, lda, d, e, tauq, taup, work, lwork, info)
call dgebrd(m, n, a, lda, d, e, tauq, taup, work, lwork, info)
call cgebrd(m, n, a, lda, d, e, tauq, taup, work, lwork, info)
call zgebrd(m, n, a, lda, d, e, tauq, taup, work, lwork, info)
```

```
call gebrd(a [, d] [,e] [,tauq] [,taup] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine reduces a general *m*-by-*n* matrix *A* to a bidiagonal matrix *B* by an orthogonal (unitary) transformation.

If $m \geq n$, the reduction is given by $A = QBP^H = \begin{pmatrix} B_1 \\ 0 \end{pmatrix} P^H = Q_1 B_1 P_H$,

where B_1 is an *n*-by-*n* upper diagonal matrix, *Q* and *P* are orthogonal or, for a complex *A*, unitary matrices; Q_1 consists of the first *n* columns of *Q*.

If $m < n$, the reduction is given by

$A = Q*B*P^H = Q*(B_1 0)*P^H = Q_1*B_1*P_1{}^H$,

where B_1 is an *m*-by-*m* lower diagonal matrix, *Q* and *P* are orthogonal or, for a complex *A*, unitary matrices; P_1 consists of the first *m* columns of *P*.

The routine does not form the matrices *Q* and *P* explicitly, but represents them as products of elementary reflectors. Routines are provided to work with the matrices *Q* and *P* in this representation:

If the matrix *A* is real,

- to compute *Q* and *P* explicitly, call orgbr.
- to multiply a general matrix by *Q* or *P*, call ormbr.

If the matrix *A* is complex,

- to compute *Q* and *P* explicitly, call ungbr.
- to multiply a general matrix by *Q* or *P*, call unmbr.

Input Parameters

m	INTEGER. The number of rows in the matrix *A* ($m \geq 0$).
n	INTEGER. The number of columns in *A* ($n \geq 0$).
a, *work*	REAL for sgebrd DOUBLE PRECISION for dgebrd COMPLEX for cgebrd DOUBLE COMPLEX for zgebrd. Arrays: *a*(*lda*,*) contains the matrix *A*. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The leading dimension of *a*; at least max(1, *m*).
lwork	INTEGER. The dimension of *work*; at least max(1, *m*, *n*).

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a

If *m*≥*n*, the diagonal and first super-diagonal of *a* are overwritten by the upper bidiagonal matrix *B*. The elements below the diagonal, with the array *tauq*, represent the orthogonal matrix *Q* as a product of elementary reflectors, and the elements above the first superdiagonal, with the array *taup*, represent the orthogonal matrix *P* as a product of elementary reflectors.

If *m* < *n*, the diagonal and first sub-diagonal of *a* are overwritten by the lower bidiagonal matrix *B*. The elements below the first subdiagonal, with the array *tauq*, represent the orthogonal matrix *Q* as a product of elementary reflectors, and the elements above the diagonal, with the array *taup*, represent the orthogonal matrix *P* as a product of elementary reflectors.

d

REAL for single-precision flavors

DOUBLE PRECISION for double-precision flavors.

Array, size at least max(1, min(*m*, *n*)).

Contains the diagonal elements of *B*.

e

REAL for single-precision flavors

DOUBLE PRECISION for double-precision flavors.

Array, size at least max(1, min(*m*, *n*) - 1). Contains the off-diagonal elements of *B*.

tauq, *taup*

REAL for sgebrd

DOUBLE PRECISION for dgebrd

COMPLEX for cgebrd

DOUBLE COMPLEX for zgebrd.

Arrays, size at least max (1, min(*m*, *n*)). The scalar factors of the elementary reflectors which represent the orthogonal or unitary matrices *P* and *Q*.

work(1)

If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info

INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `gebrd` interface are the following:

`a`	Holds the matrix *A* of size (*m*,*n*).
`d`	Holds the vector of length min(*m*,*n*).
`e`	Holds the vector of length min(*m*,*n*)-1.
`tauq`	Holds the vector of length min(*m*,*n*).
`taup`	Holds the vector of length min(*m*,*n*).

Application Notes

For better performance, try using `lwork = (m + n)*blocksize`, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set `lwork = -1`.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (`work(1)`) for subsequent runs.

If you set `lwork = -1`, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrices *Q*, *B*, and *P* satisfy $QBP^H = A + E$, where $||E||_2 = c(n)\varepsilon ||A||_2$, $c(n)$ is a modestly increasing function of *n*, and ε is the machine precision.

The approximate number of floating-point operations for real flavors is

$(4/3)*n^2*(3*m - n)$ for $m \geq n$,

$(4/3)*m^2*(3*n - m)$ for $m < n$.

The number of operations for complex flavors is four times greater.

If *n* is much less than *m*, it can be more efficient to first form the *QR* factorization of *A* by calling geqrf and then reduce the factor *R* to bidiagonal form. This requires approximately $2*n^2*(m + n)$ floating-point operations.

If *m* is much less than *n*, it can be more efficient to first form the *LQ* factorization of *A* by calling gelqf and then reduce the factor *L* to bidiagonal form. This requires approximately $2*m^2*(m + n)$ floating-point operations.

?gbbrd

Reduces a general band matrix to bidiagonal form.

Syntax

```
call sgbbrd(vect, m, n, ncc, kl, ku, ab, ldab, d, e, q, ldq, pt, ldpt, c, ldc, work, info)
```

```
call dgbbrd(vect, m, n, ncc, kl, ku, ab, ldab, d, e, q, ldq, pt, ldpt, c, ldc, work,
info)
```

```
call cgbbrd(vect, m, n, ncc, kl, ku, ab, ldab, d, e, q, ldq, pt, ldpt, c, ldc, work,
rwork, info)
```

```
call zgbbrd(vect, m, n, ncc, kl, ku, ab, ldab, d, e, q, ldq, pt, ldpt, c, ldc, work,
rwork, info)
```

```
call gbbrd(ab [, c] [,d] [,e] [,q] [,pt] [,kl] [,m] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine reduces an *m*-by-*n* band matrix *A* to upper bidiagonal matrix *B*: $A = Q*B*P^H$. Here the matrices *Q* and *P* are orthogonal (for real *A*) or unitary (for complex *A*). They are determined as products of Givens rotation matrices, and may be formed explicitly by the routine if required. The routine can also update a matrix *C* as follows: $C = Q^H*C$.

Input Parameters

vect	CHARACTER*1. Must be 'N' or 'Q' or 'P' or 'B'. If *vect* = 'N', neither *Q* nor P^H is generated. If *vect* = 'Q', the routine generates the matrix *Q*. If *vect* = 'P', the routine generates the matrix P^H. If *vect* = 'B', the routine generates both *Q* and P^H.
m	INTEGER. The number of rows in the matrix *A* ($m \geq 0$).
n	INTEGER. The number of columns in *A* ($n \geq 0$).
ncc	INTEGER. The number of columns in *C* ($ncc \geq 0$).
kl	INTEGER. The number of sub-diagonals within the band of *A* ($kl \geq 0$).
ku	INTEGER. The number of super-diagonals within the band of *A* ($ku \geq 0$).
ab, *c*, *work*	REAL for sgbbrd DOUBLE PRECISION for dgbbrd COMPLEX for cgbbrd DOUBLE COMPLEX for zgbbrd. Arrays: *ab*(*ldab*,*) contains the matrix *A* in band storage (see Matrix Storage Schemes). The second dimension of *a* must be at least max(1, *n*). *c*(*ldc*,*) contains an *m*-by-*ncc* matrix *C*. If *ncc* = 0, the array *c* is not referenced. The second dimension of *c* must be at least max(1, *ncc*). *work*(*) is a workspace array.

The dimension of *work* must be at least 2*max(*m*, *n*) for real flavors, or max(*m*, *n*) for complex flavors.

ldab INTEGER. The leading dimension of the array *ab* (*ldab*≥*kl* + *ku* + 1).

ldq INTEGER. The leading dimension of the output array *q*.

ldq≥ max(1, *m*) if *vect* = 'Q' or 'B', *ldq*≥ 1 otherwise.

ldpt INTEGER. The leading dimension of the output array *pt*.

ldpt≥ max(1, *n*) if *vect* = 'P' or 'B', *ldpt*≥ 1 otherwise.

ldc INTEGER. The leading dimension of the array *c*.

ldc≥ max(1, *m*) if *ncc* > 0; *ldc*≥ 1 if *ncc* = 0.

rwork REAL for cgbbrd DOUBLE PRECISION for zgbbrd.

A workspace array, size at least max(*m*, *n*).

Output Parameters

ab Overwritten by values generated during the reduction.

d REAL for single-precision flavors

DOUBLE PRECISION for double-precision flavors.

Array, size at least max(1, min(*m*, *n*)). Contains the diagonal elements of the matrix *B*.

e REAL for single-precision flavors

DOUBLE PRECISION for double-precision flavors.

Array, size at least max(1, min(*m*, *n*) – 1).

Contains the off-diagonal elements of *B*.

q, *pt* REAL for sgebrd

DOUBLE PRECISION for dgebrd

COMPLEX for cgebrd

DOUBLE COMPLEX for zgebrd.

Arrays:

q(*ldq*,*) contains the output *m*-by-*m* matrix *Q*.

The second dimension of *q* must be at least max(1, *m*).

p(*ldpt*,*) contains the output *n*-by-*n* matrix P^T.

The second dimension of *pt* must be at least max(1, *n*).

c Overwritten by the product $Q^H * C$.

c is not referenced if *ncc* = 0.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine gbbrd interface are the following:

ab	Holds the array *A* of size (*kl*+*ku*+1,*n*).
c	Holds the matrix *C* of size (*m*,*ncc*).
d	Holds the vector with the number of elements min(*m*,*n*).
e	Holds the vector with the number fo elements min(*m*,*n*)-1.
q	Holds the matrix *Q* of size (*m*,*m*).
pt	Holds the matrix *PT* of size (*n*,*n*).
m	If omitted, assumed *m* = *n*.
kl	If omitted, assumed *kl* = *ku*.
ku	Restored as *ku* = *lda*-*kl*-1.
vect	Restored based on the presence of arguments *q* and pt as follows: *vect* = 'B', if both *q* and *pt* are present, *vect* = 'Q', if *q* is present and *pt* omitted, *vect* = 'P', if *q* is omitted and *pt* present, *vect* = 'N', if both *q* and *pt* are omitted.

Application Notes

The computed matrices *Q*, *B*, and *P* satisfy $Q*B*P^H = A + E$, where $||E||_2 = c(n)\varepsilon ||A||_2$, $c(n)$ is a modestly increasing function of *n*, and ε is the machine precision.

If *m* = *n*, the total number of floating-point operations for real flavors is approximately the sum of:

$6*n^2*(kl + ku)$ if *vect* = 'N' and *ncc* = 0,

$3*n^2*ncc*(kl + ku - 1)/(kl + ku)$ if *C* is updated, and

$3*n^3*(kl + ku - 1)/(kl + ku)$ if either *Q* or P^H is generated (double this if both).

To estimate the number of operations for complex flavors, use the same formulas with the coefficients 20 and 10 (instead of 6 and 3).

?orgbr
Generates the real orthogonal matrix Q or P^T determined by ?gebrd.

Syntax

```
call sorgbr(vect, m, n, k, a, lda, tau, work, lwork, info)
call dorgbr(vect, m, n, k, a, lda, tau, work, lwork, info)
call orgbr(a, tau [,vect] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine generates the whole or part of the orthogonal matrices Q and P^T formed by the routines gebrd. Use this routine after a call to sgebrd/dgebrd. All valid combinations of arguments are described in *Input parameters*. In most cases you need the following:

To compute the whole m-by-m matrix Q:

```
call ?orgbr('Q', m, m, n, a ... )
```

(note that the array *a* must have at least *m* columns).

To form the n leading columns of Q if $m > n$:

```
call ?orgbr('Q', m, n, n, a ... )
```

To compute the whole n-by-n matrix P^T:

```
call ?orgbr('P', n, n, m, a ... )
```

(note that the array *a* must have at least *n* rows).

To form the m leading rows of P^T if $m < n$:

```
call ?orgbr('P', m, n, m, a ... )
```

Input Parameters

vect

CHARACTER*1. Must be 'Q' or 'P'.

If *vect* = 'Q', the routine generates the matrix Q.

If *vect* = 'P', the routine generates the matrix P^T.

m, n

INTEGER. The number of rows (m) and columns (n) in the matrix Q or P^T to be returned ($m \geq 0$, $n \geq 0$).

If *vect* = 'Q', $m \geq n \geq \min(m, k)$.

If *vect* = 'P', $n \geq m \geq \min(n, k)$.

k

If *vect* = 'Q', the number of columns in the original m-by-k matrix reduced by gebrd.

If *vect* = 'P', the number of rows in the original k-by-n matrix reduced by gebrd.

a

REAL for sorgbr

DOUBLE PRECISION for dorgbr

The vectors which define the elementary reflectors, as returned by gebrd.

lda

INTEGER. The leading dimension of the array *a*. $lda \geq \max(1, m)$.

tau

REAL for sorgbr

DOUBLE PRECISION for dorgbr

Array, size `min (m,k) if vect = 'Q'`, `min (n,k) if vect = 'P'`. Scalar factor of the elementary reflector $H(i)$ or $G(i)$, which determines Q and P^T as returned by `gebrd` in the array *tauq* or *taup*.

work

`REAL` for `sorgbr`

`DOUBLE PRECISION` for `dorgbr`

Workspace array, size `max(1, lwork)`.

lwork

`INTEGER`. Dimension of the array *work*. See *Application Notes* for the suggested value of *lwork*.

If `lwork = -1` then the routine performs a workspace query and calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

Output Parameters

a

Overwritten by the orthogonal matrix Q or P^T (or the leading rows or columns thereof) as specified by *vect*, *m*, and *n*.

work(1)

If `info = 0`, on exit `work(1)` contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info

`INTEGER`.

If `info = 0`, the execution is successful.

If `info = -i`, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `orgbr` interface are the following:

a

Holds the matrix A of size (m,n).

tau

Holds the vector of length min(m,k) where

`k = m`, if `vect = 'P'`,

`k = n`, if `vect = 'Q'`.

vect

Must be `'Q'` or `'P'`. The default value is `'Q'`.

Application Notes

For better performance, try using `lwork = min(m,n)*blocksize`, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the blocked algorithm.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set `lwork = -1`.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (`work(1)`) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix *Q* differs from an exactly orthogonal matrix by a matrix *E* such that $||E||_2 = O(\varepsilon)$.

The approximate numbers of floating-point operations for the cases listed in *Description* are as follows:

To form the whole of *Q*:

$(4/3)*n*(3m^2 - 3m*n + n^2)$ if $m > n$;

$(4/3)*m^3$ if $m \le n$.

To form the *n* leading columns of *Q* when $m > n$:

$(2/3)*n^2*(3m - n)$ if $m > n$.

To form the whole of P^T:

$(4/3)*n^3$ if $m \ge n$;

$(4/3)*m*(3n^2 - 3m*n + m^2)$ if $m < n$.

To form the *m* leading columns of P^T when $m < n$:

$(2/3)*n^2*(3m - n)$ if $m > n$.

The complex counterpart of this routine is ungbr.

?ormbr
Multiplies an arbitrary real matrix by the real orthogonal matrix Q or P^T determined by ?gebrd.

Syntax

```
call sormbr(vect, side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call dormbr(vect, side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call ormbr(a, tau, c [,vect] [,side] [,trans] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

Given an arbitrary real matrix *C*, this routine forms one of the matrix products $Q*C$, Q^T*C, $C*Q$, $C*Q^T$, $P*C$, P^T*C, $C*P$, $C*P^T$, where *Q* and *P* are orthogonal matrices computed by a call to gebrd. The routine overwrites the product on *C*.

Input Parameters

In the descriptions below, *r* denotes the order of *Q* or P^T:

If *side* = 'L', *r* = *m*; if *side* = 'R', *r* = *n*.

vect CHARACTER*1. Must be 'Q' or 'P'.
If *vect* = 'Q', then *Q* or Q^T is applied to *C*.

If *vect* = 'P', then P or P_T is applied to C.

side — CHARACTER*1. Must be 'L' or 'R'.

If *side* = 'L', multipliers are applied to C from the left.

If *side* = 'R', they are applied to C from the right.

trans — CHARACTER*1. Must be 'N' or 'T'.

If *trans* = 'N', then Q or P is applied to C.

If *trans* = 'T', then Q^T or P^T is applied to C.

m — INTEGER. The number of rows in C.

n — INTEGER. The number of columns in C.

k — INTEGER. One of the dimensions of A in ?gebrd:

If *vect* = 'Q', the number of columns in A;

If *vect* = 'P', the number of rows in A.

Constraints: $m \geq 0$, $n \geq 0$, $k \geq 0$.

a, *c*, *work* — REAL for sormbr

DOUBLE PRECISION for dormbr.

Arrays:

a(*lda*,*) is the array *a* as returned by ?gebrd.

Its second dimension must be at least max(1, min(*r*,*k*)) for *vect* = 'Q', or max(1, *r*)) for *vect* = 'P'.

c(*ldc*,*) holds the matrix C.

Its second dimension must be at least max(1, *n*).

work is a workspace array, its dimension max(1, *lwork*).

lda — INTEGER. The leading dimension of *a*. Constraints:

lda ≥ max(1, *r*) if *vect* = 'Q';

lda ≥ max(1, min(*r*,*k*)) if *vect* = 'P'.

ldc — INTEGER. The leading dimension of *c*; *ldc* ≥ max(1, *m*) .

tau — REAL for sormbr

DOUBLE PRECISION for dormbr.

Array, size at least max (1, min(*r*, *k*)).

For *vect* = 'Q', the array *tauq* as returned by ?gebrd. For *vect* = 'P', the array *taup* as returned by ?gebrd.

lwork — INTEGER. The size of the *work* array. Constraints:

lwork ≥ max(1, *n*) if *side* = 'L';

lwork ≥ max(1, *m*) if *side* = 'R'.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

c — Overwritten by the product $Q*C$, Q^T*C, $C*Q$, $C*Q,^T$, $P*C$, P^T*C, $C*P$, or $C*P^T$, as specified by *vect*, *side*, and *trans*.

work(1) — If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine ormbr interface are the following:

a — Holds the matrix *A* of size (*r*,min*(nq,k)*) where

r = *nq*, if *vect* = 'Q',

r = min(*nq*,*k*), if *vect* = 'P',

nq = *m*, if *side* = 'L',

nq = *n*, if *side* = 'R',

k = *m*, if *vect* = 'P',

k = *n*, if *vect* = 'Q'.

tau — Holds the vector of length min(*nq*,*k*).

c — Holds the matrix *C* of size (*m*,*n*).

vect — Must be 'Q' or 'P'. The default value is 'Q'.

side — Must be 'L' or 'R'. The default value is 'L'.

trans — Must be 'N' or 'T'. The default value is 'N'.

Application Notes

For better performance, try using

lwork = *n***blocksize* for *side* = 'L', or

lwork = *m***blocksize* for *side* = 'R',

where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set `lwork = -1`.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (`work(1)`) for subsequent runs.

If you set `lwork = -1`, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed product differs from the exact product by a matrix E such that $||E||_2 = O(\varepsilon)*||C||_2$.

The total number of floating-point operations is approximately

$2*n*k(2*m - k)$ if `side = 'L'` and $m \geq k$;

$2*m*k(2*n - k)$ if `side = 'R'` and $n \geq k$;

$2*m^2*n$ if `side = 'L'` and $m < k$;

$2*n^2*m$ if `side = 'R'` and $n < k$.

The complex counterpart of this routine is unmbr.

?ungbr
Generates the complex unitary matrix Q or P^H determined by `?gebrd`.

Syntax

```
call cungbr(vect, m, n, k, a, lda, tau, work, lwork, info)
call zungbr(vect, m, n, k, a, lda, tau, work, lwork, info)
call ungbr(a, tau [,vect] [,info])
```

Include Files

- `mkl.fi`, `lapack.f90`

Description

The routine generates the whole or part of the unitary matrices Q and P^H formed by the routines gebrd. Use this routine after a call to `cgebrd`/`zgebrd`. All valid combinations of arguments are described in *Input Parameters*; in most cases you need the following:

To compute the whole m-by-m matrix Q, use:

```
call ?ungbr('Q', m, m, n, a ... )
```

(note that the array*a* must have at least m columns).

To form the n leading columns of Q if $m > n$, use:

```
call ?ungbr('Q', m, n, n, a ... )
```

To compute the whole n-by-n matrix P^H, use:

```
call ?ungbr('P', n, n, m, a ... )
```

(note that the array *a* must have at least n rows).

To form the *m* leading rows of P^H if $m < n$, use:

```
call ?ungbr('P', m, n, m, a ... )
```

Input Parameters

vect — CHARACTER*1. Must be 'Q' or 'P'.

If *vect* = 'Q', the routine generates the matrix *Q*.

If *vect* = 'P', the routine generates the matrix P^H.

m — INTEGER. The number of required rows of *Q* or P^H.

n — INTEGER. The number of required columns of *Q* or P^H.

k — INTEGER. One of the dimensions of *A* in ?gebrd:

If *vect* = 'Q', the number of columns in *A*;

If *vect* = 'P', the number of rows in *A*.

Constraints: $m \geq 0$, $n \geq 0$, $k \geq 0$.

For *vect* = 'Q': $k \leq n \leq m$ if $m > k$, or $m = n$ if $m \leq k$.

For *vect* = 'P': $k \leq m \leq n$ if $n > k$, or $m = n$ if $n \leq k$.

a, *work* — COMPLEX for cungbr

DOUBLE COMPLEX for zungbr.

Arrays:

a(*lda*,*) is the array *a* as returned by ?gebrd.

The second dimension of *a* must be at least max(1, *n*).

work is a workspace array, its dimension max(1, *lwork*).

lda — INTEGER. The leading dimension of *a*; at least max(1, *m*).

tau — COMPLEX for cungbr

DOUBLE COMPLEX for zungbr.

For *vect* = 'Q', the array *tauq* as returned by ?gebrd. For *vect* = 'P', the array *taup* as returned by ?gebrd.

The dimension of *tau* must be at least max(1, min(*m*, *k*)) for *vect* = 'Q', or max(1, min(*m*, *k*)) for *vect* = 'P'.

lwork — INTEGER. The size of the *work* array.

Constraint: *lwork* < max(1, min(*m*, *n*)).

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a	Overwritten by the orthogonal matrix Q or P^T (or the leading rows or columns thereof) as specified by *vect*, *m*, and *n*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine ungbr interface are the following:

a	Holds the matrix A of size (m,n).
tau	Holds the vector of length min(m,k) where $k = m$, if *vect* = 'P', $k = n$, if *vect* = 'Q'.
vect	Must be 'Q' or 'P'. The default value is 'Q'.

Application Notes

For better performance, try using *lwork* = min(*m*,*n*)***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix Q differs from an exactly orthogonal matrix by a matrix E such that $||E||_2 = O(\varepsilon)$.

The approximate numbers of possible floating-point operations are listed below:

To compute the whole matrix Q:

$(16/3)n(3m^2 - 3m*n + n^2)$ if $m > n$;

$(16/3)m^3$ if $m \le n$.

To form the n leading columns of Q when $m > n$:

$(8/3)n^2(3m - n^2)$.

To compute the whole matrix P^H:

(16/3)n^3 if $m \geq n$;

(16/3)$m(3n^2 - 3m*n + m^2)$ if $m < n$.

To form the m leading columns of P^H when $m < n$:

(8/3)$n^2(3m - n^2)$ if $m > n$.

The real counterpart of this routine is orgbr.

?unmbr

Multiplies an arbitrary complex matrix by the unitary matrix Q or P determined by ?gebrd.

Syntax

```
call cunmbr(vect, side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call zunmbr(vect, side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call unmbr(a, tau, c [,vect] [,side] [,trans] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

Given an arbitrary complex matrix C, this routine forms one of the matrix products $Q*C$, Q^H*C, $C*Q$, $C*Q^H$, $P*C$, P^H*C, $C*P$, or $C*P^H$, where Q and P are unitary matrices computed by a call to gebrd/gebrd. The routine overwrites the product on C.

Input Parameters

In the descriptions below, r denotes the order of Q or P^H:

If *side* = 'L', $r = m$; if *side* = 'R', $r = n$.

vect
CHARACTER*1. Must be 'Q' or 'P'.
If *vect* = 'Q', then Q or Q^H is applied to C.
If *vect* = 'P', then P or P^H is applied to C.

side
CHARACTER*1. Must be 'L' or 'R'.
If *side* = 'L', multipliers are applied to C from the left.
If *side* = 'R', they are applied to C from the right.

trans
CHARACTER*1. Must be 'N' or 'C'.
If *trans* = 'N', then Q or P is applied to C.
If *trans* = 'C', then Q^H or P^H is applied to C.

m
INTEGER. The number of rows in C.

n
INTEGER. The number of columns in C.

k
INTEGER. One of the dimensions of A in ?gebrd:
If *vect* = 'Q', the number of columns in A;

If *vect* = 'P', the number of rows in *A*.

Constraints: *m*≥ 0, *n*≥ 0, *k*≥ 0.

a, *c*, *work*

COMPLEX for cunmbr

DOUBLE COMPLEX for zunmbr.

Arrays:

a(*lda*,*) is the array *a* as returned by ?gebrd.

Its second dimension must be at least max(1, min(*r*,*k*)) for *vect* = 'Q', or max(1, *r*)) for *vect* = 'P'.

c(*ldc*,*) holds the matrix *C*.

Its second dimension must be at least max(1, *n*).

work is a workspace array, its dimension max(1, *lwork*).

lda

INTEGER. The leading dimension of *a*. Constraints:

lda≥ max(1, *r*) if *vect* = 'Q';

lda≥ max(1, min(*r*,*k*)) if *vect* = 'P'.

ldc

INTEGER. The leading dimension of *c*; *ldc*≥ max(1, *m*).

tau

COMPLEX for cunmbr

DOUBLE COMPLEX for zunmbr.

Array, size at least max (1, min(*r*, *k*)).

For *vect* = 'Q', the array *tauq* as returned by ?gebrd. For *vect* = 'P', the array *taup* as returned by ?gebrd.

lwork

INTEGER. The size of the *work* array.

lwork≥ max(1, *n*) if *side* = 'L';

lwork≥ max(1, *m*) if *side* = 'R'.

lwork≥ 1 if *n*=0 or *m*=0.

For optimum performance *lwork* ≥ max(1,*n***nb*) if *side* = 'L', and *lwork* ≥ max(1,*m***nb*) if *side* = 'R', where *nb* is the optimal blocksize. (*nb* = 0 if *m* = 0 or *n* = 0.)

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

c

Overwritten by the product *Q***C*, Q^H**C*, *C***Q*, *C**Q^H, *P***C*, P^H**C*, *C***P*, or *C**P^H, as specified by *vect*, *side*, and *trans*.

work(1)

If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine unmbr interface are the following:

a	Holds the matrix *A* of size (*r*,min*(nq,k)*) where *r* = *nq*, if *vect* = 'Q', *r* = min(*nq*,*k*), if *vect* = 'P', *nq* = *m*, if *side* = 'L', *nq* = *n*, if *side* = 'R', *k* = *m*, if *vect* = 'P', *k* = *n*, if *vect* = 'Q'.
tau	Holds the vector of length min(*nq,k*).
c	Holds the matrix *C* of size (*m,n*).
vect	Must be 'Q' or 'P'. The default value is 'Q'.
side	Must be 'L' or 'R'. The default value is 'L'.
trans	Must be 'N' or 'C'. The default value is 'N'.

Application Notes

For better performance, use

lwork = *n***blocksize* for *side* = 'L', or

lwork = *m***blocksize* for *side* = 'R',

where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed product differs from the exact product by a matrix *E* such that $||E||_2 = O(\varepsilon)*||C||_2$.

The total number of floating-point operations is approximately

`8*n*k(2*m - k)` if `side = 'L'` and $m \geq k$;

`8*m*k(2*n - k)` if `side = 'R'` and $n \geq k$;

$8*m^2*n$ if `side = 'L'` and $m < k$;

$8*n^2*m$ if `side = 'R'` and $n < k$.

The real counterpart of this routine is ormbr.

?bdsqr

Computes the singular value decomposition of a general matrix that has been reduced to bidiagonal form.

Syntax

```
call sbdsqr(uplo, n, ncvt, nru, ncc, d, e, vt, ldvt, u, ldu, c, ldc, work, info)
call dbdsqr(uplo, n, ncvt, nru, ncc, d, e, vt, ldvt, u, ldu, c, ldc, work, info)
call cbdsqr(uplo, n, ncvt, nru, ncc, d, e, vt, ldvt, u, ldu, c, ldc, rwork, info)
call zbdsqr(uplo, n, ncvt, nru, ncc, d, e, vt, ldvt, u, ldu, c, ldc, rwork, info)
call rbdsqr(d, e [,vt] [,u] [,c] [,uplo] [,info])
call bdsqr(d, e [,vt] [,u] [,c] [,uplo] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes the singular values and, optionally, the right and/or left singular vectors from the Singular Value Decomposition (SVD) of a real *n*-by-*n* (upper or lower) bidiagonal matrix *B* using the implicit zero-shift *QR* algorithm. The SVD of *B* has the form $B = Q*S*P^H$ where *S* is the diagonal matrix of singular values, *Q* is an orthogonal matrix of left singular vectors, and *P* is an orthogonal matrix of right singular vectors. If left singular vectors are requested, this subroutine actually returns *U* **Q* instead of *Q*, and, if right singular vectors are requested, this subroutine returns P^H **VT* instead of P^H, for given real/complex input matrices *U* and *VT*. When *U* and *VT* are the orthogonal/unitary matrices that reduce a general matrix *A* to bidiagonal form: `A = U*B*VT`, as computed by `?gebrd`, then

$A = (U*Q)*S*(P^H*VT)$

is the SVD of *A*. Optionally, the subroutine may also compute Q^H **C* for a given real/complex input matrix *C*.

See also lasq1, lasq2, lasq3, lasq4, lasq5, lasq6 used by this routine.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. If `uplo = 'U'`, *B* is an upper bidiagonal matrix. If `uplo = 'L'`, *B* is a lower bidiagonal matrix.
n	INTEGER. The order of the matrix *B* ($n \geq 0$).
ncvt	INTEGER. The number of columns of the matrix *VT*, that is, the number of right singular vectors ($ncvt \geq 0$).

Set *ncvt* = 0 if no right singular vectors are required.

nru — INTEGER. The number of rows in *U*, that is, the number of left singular vectors (*nru*≥ 0).

Set *nru* = 0 if no left singular vectors are required.

ncc — INTEGER. The number of columns in the matrix *C* used for computing the product Q^H*C (*ncc*≥ 0). Set *ncc* = 0 if no matrix *C* is supplied.

d, *e* — REAL for single-precision flavors

DOUBLE PRECISION for double-precision flavors.

Arrays:

d(*) contains the diagonal elements of *B*.

The size of *d* must be at least max(1, *n*).

e(*) contains the (*n*–1) off-diagonal elements of *B*.

The size of *e* must be at least max(1, *n* – 1).

work — REAL for sbdsqr

DOUBLE PRECISION for dbdsqr.

work(*) is a workspace array.

The size of *work* must be at least max(1, 4**n*).

rwork — REAL for cbdsqr

DOUBLE PRECISION for zbdsqr.

rwork(*) is a workspace array.

The size of *rwork* must be at least max(1, 4**n*).

vt, *u*, *c* — REAL for sbdsqr

DOUBLE PRECISION for dbdsqr

COMPLEX for cbdsqr

DOUBLE COMPLEX for zbdsqr.

Arrays:

vt(*ldvt*,*) contains an *n*-by-*ncvt* matrix *VT*.

The second dimension of *vt* must be at least max(1, *ncvt*).

vt is not referenced if *ncvt* = 0.

u(*ldu*,*) contains an *nru* by *n* matrix *U*.

The second dimension of *u* must be at least max(1, *n*).

u is not referenced if *nru* = 0.

c(*ldc*,*) contains the *n*-by-*ncc* matrix *C* for computing the product Q^H*C.

The second dimension of *c* must be at least max(1, *ncc*). The array is not referenced if *ncc* = 0.

ldvt — INTEGER. The leading dimension of *vt*. Constraints:

ldvt ≥ max(1, *n*) if *ncvt* > 0;

ldvt ≥ 1 if *ncvt* = 0.

ldu INTEGER. The leading dimension of *u*. Constraint:

ldu ≥ max(1, *nru*) .

ldc INTEGER. The leading dimension of *c*. Constraints:

ldc ≥ max(1, *n*) if *ncc* > 0; *ldc* ≥ 1 otherwise.

Output Parameters

d On exit, if *info* = 0, overwritten by the singular values in decreasing order (see *info*).

e On exit, if *info* = 0, *e* is destroyed. See also *info* below.

c Overwritten by the product Q^H*C*.

vt On exit, this array is overwritten by P^H *VT*. Not referenced if *ncvt* = 0.

u On exit, this array is overwritten by *U* *Q. Not referenced if *nru* = 0.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* > 0,

If *ncvt* = *nru* = *ncc* = 0,

- *info* = 1, a split was marked by a positive value in *e*
- *info* = 2, the current block of *z* not diagonalized after 100**n* iterations (in the inner `while` loop)
- *info* = 3, termination criterion of the outer `while` loop is not met (the program created more than *n* unreduced blocks).

In all other cases when *ncvt*, *nru*, or *ncc* > 0, the algorithm did not converge; *d* and *e* contain the elements of a bidiagonal matrix that is orthogonally similar to the input matrix *B*; if *info* = *i*, *i* elements of *e* have not converged to zero.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `bdsqr` interface are the following:

d Holds the vector of length (*n*).

e Holds the vector of length (*n*).

vt Holds the matrix *VT* of size (*n*, *ncvt*).

u Holds the matrix *U* of size (*nru*,*n*).

c	Holds the matrix *C* of size (*n*,*ncc*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
ncvt	If argument *vt* is present, then *ncvt* is equal to the number of columns in matrix *VT*; otherwise, *ncvt* is set to zero.
nru	If argument *u* is present, then *nru* is equal to the number of rows in matrix *U*; otherwise, *nru* is set to zero.
ncc	If argument *c* is present, then *ncc* is equal to the number of columns in matrix *C*; otherwise, *ncc* is set to zero.

Note that two variants of Fortran 95 interface for bdsqr routine are needed because of an ambiguous choice between real and complex cases appear when *vt*, *u*, and *c* are omitted. Thus, the name rbdsqr is used in real cases (single or double precision), and the name bdsqr is used in complex cases (single or double precision).

Application Notes

Each singular value and singular vector is computed to high relative accuracy. However, the reduction to bidiagonal form (prior to calling the routine) may decrease the relative accuracy in the small singular values of the original matrix if its singular values vary widely in magnitude.

If s_i is an exact singular value of *B*, and s_i is the corresponding computed value, then

$|s_i - \sigma_i| \leq p(m,n) * \varepsilon * \sigma_i$

where $p(m, n)$ is a modestly increasing function of *m* and *n*, and ε is the machine precision.

If only singular values are computed, they are computed more accurately than when some singular vectors are also computed (that is, the function $p(m, n)$ is smaller).

If u_i is the corresponding exact left singular vector of *B*, and w_i is the corresponding computed left singular vector, then the angle $\theta(u_i, w_i)$ between them is bounded as follows:

$\theta(u_i, w_i) \leq p(m,n) * \varepsilon / \min_{i \neq j}(|\sigma i - \sigma j| / |\sigma_i + \sigma j|)$.

Here $\min_{i \neq j}(|\sigma_i - \sigma_j| / |\sigma_i + \sigma_j|)$ is the *relative gap* between σ_i and the other singular values. A similar error bound holds for the right singular vectors.

The total number of real floating-point operations is roughly proportional to n^2 if only the singular values are computed. About $6n^2 * nru$ additional operations ($12n^2 * nru$ for complex flavors) are required to compute the left singular vectors and about $6n^2 * ncvt$ operations ($12n^2 * ncvt$ for complex flavors) to compute the right singular vectors.

?bdsdc

Computes the singular value decomposition of a real bidiagonal matrix using a divide and conquer method.

Syntax

```
call sbdsdc(uplo, compq, n, d, e, u, ldu, vt, ldvt, q, iq, work, iwork, info)
call dbdsdc(uplo, compq, n, d, e, u, ldu, vt, ldvt, q, iq, work, iwork, info)
call bdsdc(d, e [,u] [,vt] [,q] [,iq] [,uplo] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes the Singular Value Decomposition (SVD) of a real *n*-by-*n* (upper or lower) bidiagonal matrix *B*: $B = U*\Sigma*V^T$, using a divide and conquer method, where Σ is a diagonal matrix with non-negative diagonal elements (the singular values of *B*), and *U* and *V* are orthogonal matrices of left and right singular vectors, respectively. ?bdsdc can be used to compute all singular values, and optionally, singular vectors or singular vectors in compact form.

This rotuine
uses ?lasd0, ?lasd1, ?lasd2, ?lasd3, ?lasd4, ?lasd5, ?lasd6, ?lasd7, ?lasd8, ?lasd9, ?lasda, ?lasdq, ?lasdt.

Input Parameters

uplo

CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', *B* is an upper bidiagonal matrix.

If *uplo* = 'L', *B* is a lower bidiagonal matrix.

compq

CHARACTER*1. Must be 'N', 'P', or 'I'.

If *compq* = 'N', compute singular values only.

If *compq* = 'P', compute singular values and compute singular vectors in compact form.

If *compq* = 'I', compute singular values and singular vectors.

n

INTEGER. The order of the matrix *B* ($n \geq 0$).

d, *e*, *work*

REAL for sbdsdc

DOUBLE PRECISION for dbdsdc.

Arrays:

d(*) contains the *n* diagonal elements of the bidiagonal matrix *B*. The size of *d* must be at least max(1, *n*).

e(*) contains the off-diagonal elements of the bidiagonal matrix *B*. The size of *e* must be at least max(1, *n*).

work(*) is a workspace array.

The dimension of *work* must be at least:

max(1, 4**n*), if *compq* = 'N' or *compq* = 'P';

max(1, $3*n^2+4*n$), if *compq* = 'I'.

ldu

INTEGER. The leading dimension of the output array *u*; *ldu*≥ 1.

If singular vectors are desired, then *ldu*≥ max(1, *n*).

ldvt

INTEGER. The leading dimension of the output array *vt*; *ldvt*≥ 1.

If singular vectors are desired, then *ldvt*≥ max(1, *n*).

iwork

INTEGER. Workspace array, dimension at least max(1, 8**n*).

Output Parameters

d

If *info* = 0, overwritten by the singular values of *B*.

e	On exit, *e* is overwritten.
u, *vt*, *q*	REAL for sbdsdc DOUBLE PRECISION for dbdsdc. Arrays: *u*(*ldu*,**), *vt*(*ldvt*,**), *q*(*). If *compq* = 'I', then on exit *u* contains the left singular vectors of the bidiagonal matrix *B*, unless *info*≠ 0 (*seeinfo*). For other values of *compq*, *u* is not referenced. The second dimension of *u* must be at least max(1,*n*). if *compq* = 'I', then on exit vt^T contains the right singular vectors of the bidiagonal matrix *B*, unless *info*≠ 0 (*seeinfo*). For other values of *compq*, *vt* is not referenced. The second dimension of *vt* must be at least max(1,*n*). If *compq* = 'P', then on exit, if *info* = 0, *q* and *iq* contain the left and right singular vectors in a compact form. Specifically, *q* contains all the REAL (for sbdsdc) or DOUBLE PRECISION (for dbdsdc) data for singular vectors. For other values of *compq*, *q* is not referenced.
iq	INTEGER. Array: *iq*(*). If *compq* = 'P', then on exit, if *info* = 0, *q* and *iq* contain the left and right singular vectors in a compact form. Specifically, *iq* contains all the INTEGER data for singular vectors. For other values of *compq*, *iq* is not referenced.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the algorithm failed to compute a singular value. The update process of divide and conquer failed.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine bdsdc interface are the following:

d	Holds the vector of length *n*.
e	Holds the vector of length *n*.
u	Holds the matrix *U* of size (*n*,*n*).
vt	Holds the matrix *VT* of size (*n*,*n*).
q	Holds the vector of length (*ldq*), where *ldq*≥ *n**(11 + 2**smlsiz* + 8**int*(*log_2*(*n*/(*smlsiz* + 1)))) and *smlsiz* is returned by *ilaenv* and is equal to the maximum size of the subproblems at the bottom of the computation tree (usually about 25).

compq Restored based on the presence of arguments *u*, *vt*, *q*, and *iq* as follows:

compq = 'N', if none of *u*, *vt*, *q*, and *iq* are present,

compq = 'I', if both *u* and *vt* are present. Arguments *u* and *vt* must either be both present or both omitted,

compq = 'P', if both *q* and *iq* are present. Arguments *q* and *iq* must either be both present or both omitted.

Note that there will be an error condition if all of *u*, *vt*, *q*, and *iq* arguments are present simultaneously.

Symmetric Eigenvalue Problems: LAPACK Computational Routines

Symmetric eigenvalue problems are posed as follows: given an *n*-by-*n* real symmetric or complex Hermitian matrix *A*, find the *eigenvalues* λ and the corresponding *eigenvectors z* that satisfy the equation

$Az = \lambda z$ (or, equivalently, $z^H A = \lambda z^H$).

In such eigenvalue problems, all *n* eigenvalues are real not only for real symmetric but also for complex Hermitian matrices *A*, and there exists an orthonormal system of *n* eigenvectors. If *A* is a symmetric or Hermitian positive-definite matrix, all eigenvalues are positive.

To solve a symmetric eigenvalue problem with LAPACK, you usually need to reduce the matrix to tridiagonal form and then solve the eigenvalue problem with the tridiagonal matrix obtained. LAPACK includes routines for reducing the matrix to a tridiagonal form by an orthogonal (or unitary) similarity transformation $A = QTQ^H$ as well as for solving tridiagonal symmetric eigenvalue problems. These routines (for FORTRAN 77 interface) are listed in Table "Computational Routines for Solving Symmetric Eigenvalue Problems". The corresponding routine names in the Fortran 95 interface are without the first symbol.

There are different routines for symmetric eigenvalue problems, depending on whether you need all eigenvectors or only some of them or eigenvalues only, whether the matrix *A* is positive-definite or not, and so on.

These routines are based on three primary algorithms for computing eigenvalues and eigenvectors of symmetric problems: the divide and conquer algorithm, the QR algorithm, and bisection followed by inverse iteration. The divide and conquer algorithm is generally more efficient and is recommended for computing all eigenvalues and eigenvectors. Furthermore, to solve an eigenvalue problem using the divide and conquer algorithm, you need to call only one routine. In general, more than one routine has to be called if the QR algorithm or bisection followed by inverse iteration is used.

The decision tree in Figure "Decision Tree: Real Symmetric Eigenvalue Problems" will help you choose the right routine or sequence of routines for eigenvalue problems with real symmetric matrices. Figure "Decision Tree: Complex Hermitian Eigenvalue Problems" presents a similar decision tree for complex Hermitian matrices.

?sytrd
Reduces a real symmetric matrix to tridiagonal form.

Syntax

```
call ssytrd(uplo, n, a, lda, d, e, tau, work, lwork, info)
call dsytrd(uplo, n, a, lda, d, e, tau, work, lwork, info)
call sytrd(a, tau [,uplo] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine reduces a real symmetric matrix *A* to symmetric tridiagonal form *T* by an orthogonal similarity transformation: $A = Q*T*Q^T$. The orthogonal matrix *Q* is not formed explicitly but is represented as a product of *n*-1 elementary reflectors. Routines are provided for working with *Q* in this representation (see *Application Notes* below).

Input Parameters

uplo

CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', *a* stores the upper triangular part of *A*.

If *uplo* = 'L', *a* stores the lower triangular part of *A*.

n

INTEGER. The order of the matrix *A* ($n \geq 0$).

a, *work*

REAL for ssytrd

DOUBLE PRECISION for dsytrd.

a(*lda*,*) is an array containing either upper or lower triangular part of the matrix *A*, as specified by *uplo*. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *A* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *A* is not referenced.

The second dimension of *a* must be at least max(1, *n*).

work is a workspace array, its dimension max(1, *lwork*).

lda

INTEGER. The leading dimension of *a*; at least max(1, *n*).

lwork

INTEGER. The size of the *work* array ($lwork \geq n$).

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a

On exit,

if *uplo* = 'U', the diagonal and first superdiagonal of *A* are overwritten by the corresponding elements of the tridiagonal matrix *T*, and the elements above the first superdiagonal, with the array *tau*, represent the orthogonal matrix *Q* as a product of elementary reflectors;

if *uplo* = 'L', the diagonal and first subdiagonal of *A* are overwritten by the corresponding elements of the tridiagonal matrix *T*, and the elements below the first subdiagonal, with the array *tau*, represent the orthogonal matrix *Q* as a product of elementary reflectors.

d, *e*, *tau*

REAL for ssytrd

DOUBLE PRECISION for dsytrd.

Arrays:

d(*) contains the diagonal elements of the matrix *T*.

The size of *d* must be at least max(1, *n*).

e(*) contains the off-diagonal elements of *T*.

The size of *e* must be at least max(1, *n*-1).

tau(*) stores (*n*-1) scalars that define elementary reflectors in decomposition of the orthogonal matrix *Q* in a product of *n*-1 elementary reflectors. *tau*(*n*) is used as workspace.

The size of *tau* must be at least max(1, *n*).

work(1) — If *info*=0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine sytrd interface are the following:

a — Holds the matrix *A* of size (*n*,*n*).

tau — Holds the vector of length (*n*-1).

uplo — Must be 'U' or 'L'. The default value is 'U'.

Note that diagonal (*d*) and off-diagonal (*e*) elements of the matrix *T* are omitted because they are kept in the matrix *A* on exit.

Application Notes

For better performance, try using *lwork* =*n***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix *T* is exactly similar to a matrix $A+E$, where $||E||_2 = c(n)*\varepsilon*||A||_2$, $c(n)$ is a modestly increasing function of *n*, and ε is the machine precision.

The approximate number of floating-point operations is $(4/3)n^3$.

After calling this routine, you can call the following:

orgtr — to form the computed matrix *Q* explicitly

ormtr to multiply a real matrix by *Q*.

The complex counterpart of this routine is ?hetrd.

?syrdb

Reduces a real symmetric matrix to tridiagonal form with Successive Bandwidth Reduction approach.

Syntax

```
call ssyrdb(jobz, uplo, n, kd, a, lda, d, e, tau, z, ldz, work, lwork, info)
call dsyrdb(jobz, uplo, n, kd, a, lda, d, e, tau, z, ldz, work, lwork, info)
```

Include Files

- mkl.fi

Description

The routine reduces a real symmetric matrix *A* to symmetric tridiagonal form *T* by an orthogonal similarity transformation: $A = Q*T*Q^T$ and optionally multiplies matrix *Z* by *Q*, or simply forms *Q*.

This routine reduces a full symmetric matrix *A* to the banded symmetric matrix *B*, and then to the tridiagonal symmetric matrix *T* with a Successive Bandwidth Reduction approach after C. Bischof's works (see for instance, [Bischof00]). ?syrdb is functionally close to ?sytrd routine but the tridiagonal form may differ from those obtained by ?sytrd. Unlike ?sytrd, the orthogonal matrix *Q* cannot be restored from the details of matrix *A* on exit.

Input Parameters

jobz

CHARACTER*1. Must be 'N' or 'V'.

If *jobz* = 'N', then only *A* is reduced to *T*.

If *jobz* = 'V', then *A* is reduced to *T* and *A* contains *Q* on exit.

If *jobz* = 'U', then *A* is reduced to *T* and *Z* contains *Z*Q* on exit.

uplo

CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', *a* stores the upper triangular part of *A*.

If *uplo* = 'L', *a* stores the lower triangular part of *A*.

n

INTEGER. The order of the matrix *A* ($n \geq 0$).

kd

INTEGER. The bandwidth of the banded matrix *B* ($kd \geq 1$, $kd \leq n-1$).

a,*z*, *work*

REAL for ssyrdb.

DOUBLE PRECISION for dsyrdb.

a(*lda*,*) is an array containing either upper or lower triangular part of the matrix *A*, as specified by *uplo*.

The second dimension of *a* must be at least max(1, *n*).

z(*ldz*,*), the second dimension of *z* must be at least max(1, *n*).

If *jobz* = 'U', then the matrix *z* is multiplied by *Q*.

If *jobz* = 'N' or 'V', then *z* is not referenced.

work(*lwork*) is a workspace array.

lda — INTEGER. The leading dimension of *a*; at least max(1, *n*).

ldz — INTEGER. The leading dimension of *z*; at least max(1, *n*). Not referenced if *jobz* = 'N'

lwork — INTEGER. The size of the *work* array (*lwork*≥ (2*kd*+1)*n*+*kd*).

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a

If *jobz* = 'V', then overwritten by *Q* matrix.

If *jobz* = 'N' or 'U', then overwritten by the banded matrix *B* and details of the orthogonal matrix Q_B to reduce *A* to *B* as specified by *uplo*.

z

On exit,

if *jobz* = 'U', then the matrix *z* is overwritten by *Z***Q*.

If *jobz* = 'N' or 'V', then *z* is not referenced.

d, *e*, *tau* — DOUBLE PRECISION.

Arrays:

d(*) contains the diagonal elements of the matrix *T*.

The dimension of *d* must be at least max(1, *n*).

e(*) contains the off-diagonal elements of *T*.

The dimension of *e* must be at least max(1, *n*-1).

tau(*) stores further details of the orthogonal matrix *Q*.

The dimension of *tau* must be at least max(1, *n*-*kd*-1).

work(1) — If *info*=0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

Application Notes

For better performance, try using *lwork* = *n**(3**kd*+3).

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

For better performance, try using *kd* equal to 40 if n ≤ 2000 and 64 otherwise.

Try using ?syrdb instead of ?sytrd on large matrices obtaining only eigenvalues - when no eigenvectors are needed, especially in multi-threaded environment. ?syrdb becomes faster beginning approximately with n = 1000, and much faster at larger matrices with a better scalability than ?sytrd.

Avoid applying ?syrdb for computing eigenvectors due to the two-step reduction, that is, the number of operations needed to apply orthogonal transformations to *Z* is doubled compared to the traditional one-step reduction. In that case it is better to apply ?sytrd and ?ormtr/?orgtr to obtain tridiagonal form along with the orthogonal transformation matrix *Q*.

?herdb
Reduces a complex Hermitian matrix to tridiagonal form with Successive Bandwidth Reduction approach.

Syntax

```
call cherdb(jobz, uplo, n, kd, a, lda, d, e, tau, z, ldz, work, lwork, info)
call zherdb(jobz, uplo, n, kd, a, lda, d, e, tau, z, ldz, work, lwork, info)
```

Include Files

- mkl.fi

Description

The routine reduces a complex Hermitian matrix *A* to symmetric tridiagonal form *T* by a unitary similarity transformation: $A = Q*T*Q^T$ and optionally multiplies matrix *Z* by *Q*, or simply forms *Q*.

This routine reduces a full symmetric matrix *A* to the banded symmetric matrix *B*, and then to the tridiagonal symmetric matrix *T* with a Successive Bandwidth Reduction approach after C. Bischof's works (see for instance, [Bischof00]). ?herdb is functionally close to ?hetrd routine but the tridiagonal form may differ from those obtained by ?hetrd. Unlike ?hetrd, the orthogonal matrix *Q* cannot be restored from the details of matrix *A* on exit.

Input Parameters

jobz

CHARACTER*1. Must be 'N' or 'V'.

If *jobz* = 'N', then only *A* is reduced to *T*.

If *jobz* = 'V', then *A* is reduced to *T* and *A* contains *Q* on exit.

If *jobz* = 'U', then *A* is reduced to *T* and *Z* contains *Z*Q* on exit.

uplo

CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', *a* stores the upper triangular part of *A*.

If *uplo* = 'L', *a* stores the lower triangular part of *A*.

n — INTEGER. The order of the matrix *A* (*n* ≥ 0).

kd — INTEGER. The bandwidth of the banded matrix *B* (*kd* ≥ 1, *kd* ≤ *n*-1).

a, *z*, *work* — COMPLEX for cherdb.

DOUBLE COMPLEX for zherdb.

a(*lda*,*) is an array containing either upper or lower triangular part of the matrix *A*, as specified by *uplo*.

The second dimension of *a* must be at least max(1, *n*).

z(*ldz*,*), the second dimension of *z* must be at least max(1, *n*).

If *jobz* = 'U', then the matrix *z* is multiplied by *Q*.

If *jobz* = 'N' or 'V', then *z* is not referenced.

work(*lwork*) is a workspace array.

lda — INTEGER. The leading dimension of *a*; at least max(1, *n*).

ldz — INTEGER. The leading dimension of *z*; at least max(1, *n*). Not referenced if *jobz* = 'N'

lwork — INTEGER. The size of the *work* array (*lwork* ≥ (2*kd*+1)*n*+*kd*).

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a

If *jobz* = 'V', then overwritten by *Q* matrix.

If *jobz* = 'N' or 'U', then overwritten by the banded matrix *B* and details of the unitary matrix Q_B to reduce *A* to *B* as specified by *uplo*.

z

On exit,

if *jobz* = 'U', then the matrix *z* is overwritten by *Z*Q* .

If *jobz* = 'N' or 'V', then *z* is not referenced.

d, *e* — REAL for cherdb.

DOUBLE PRECISION for zherdb.

Arrays:

d(*) contains the diagonal elements of the matrix *T*.

The dimension of *d* must be at least max(1, *n*).

e(*) contains the off-diagonal elements of *T*.

The dimension of *e* must be at least max(1, *n*-1).

tau(*) stores further details of the orthogonal matrix *Q*.

	The dimension of *tau* must be at least max(1, *n-kd*-1).
tau	COMPLEX for cherdb. DOUBLE COMPLEX for zherdb. Array, size at least max(1, *n*-1) Stores further details of the unitary matrix Q_B. The dimension of *tau* must be at least max(1, *n-kd*-1).
work(1)	If *info*=0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Application Notes

For better performance, try using *lwork* = *n**(3**kd*+3).

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

For better performance, try using *kd* equal to 40 if n ≤ 2000 and 64 otherwise.

Try using ?herdb instead of ?hetrd on large matrices obtaining only eigenvalues - when no eigenvectors are needed, especially in multi-threaded environment. ?herdb becomes faster beginning approximately with n = 1000, and much faster at larger matrices with a better scalability than ?hetrd.

Avoid applying ?herdb for computing eigenvectors due to the two-step reduction, that is, the number of operations needed to apply orthogonal transformations to *Z* is doubled compared to the traditional one-step reduction. In that case it is better to apply ?hetrd and ?unmtr/?ungtr to obtain tridiagonal form along with the unitary transformation matrix *Q*.

?orgtr
Generates the real orthogonal matrix Q determined by ?sytrd*.*

Syntax

```
call sorgtr(uplo, n, a, lda, tau, work, lwork, info)
call dorgtr(uplo, n, a, lda, tau, work, lwork, info)
call orgtr(a, tau [,uplo] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine explicitly generates the *n*-by-*n* orthogonal matrix *Q* formed by `?sytrd` when reducing a real symmetric matrix *A* to tridiagonal form: $A = Q*T*Q^T$. Use this routine after a call to `?sytrd`.

Input Parameters

uplo
: `CHARACTER*1`. Must be `'U'` or `'L'`.

  Use the same *uplo* as supplied to `?sytrd`.

n
: `INTEGER`. The order of the matrix *Q* ($n \geq 0$).

a, *tau*, *work*
: `REAL` for `sorgtr`

  `DOUBLE PRECISION` for `dorgtr`.

  Arrays:

  a(*lda*,*) is the array *a* as returned by `?sytrd`.

  The second dimension of *a* must be at least max(1, *n*).

  tau(*) is the array *tau* as returned by `?sytrd`.

  The size of *tau* must be at least max(1, *n*-1).

  work is a workspace array, its dimension `max(1, lwork)`.

lda
: `INTEGER`. The leading dimension of *a*; at least max(1, *n*).

lwork
: `INTEGER`. The size of the *work* array ($lwork \geq n$).

  If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

  See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a
: Overwritten by the orthogonal matrix *Q*.

work(1)
: If $info = 0$, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info
: `INTEGER`.

  If $info = 0$, the execution is successful.

  If $info = -i$, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `orgtr` interface are the following:

a
: Holds the matrix *A* of size (*n*,*n*).

tau	Holds the vector of length (*n*-1).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For better performance, try using *lwork* = (*n*–1)***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix *Q* differs from an exactly orthogonal matrix by a matrix *E* such that $||E||_2 = O(\varepsilon)$, where ε is the machine precision.

The approximate number of floating-point operations is $(4/3)n^3$.

The complex counterpart of this routine is ungtr.

?ormtr
Multiplies a real matrix by the real orthogonal matrix Q determined by ?sytrd*.*

Syntax

```
call sormtr(side, uplo, trans, m, n, a, lda, tau, c, ldc, work, lwork, info)
call dormtr(side, uplo, trans, m, n, a, lda, tau, c, ldc, work, lwork, info)
call ormtr(a, tau, c [,side] [,uplo] [,trans] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine multiplies a real matrix *C* by *Q* or Q^T, where *Q* is the orthogonal matrix *Q* formed by sytrd when reducing a real symmetric matrix *A* to tridiagonal form: *A* = *Q***T***Q*^{T}. Use this routine after a call to ?sytrd.

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products *Q***C*, Q^T**C*, *C***Q*, or *C***Q*^{T} (overwriting the result on *C*).

Input Parameters

In the descriptions below, *r* denotes the order of *Q*:

If *side* = 'L', *r* = *m*; if *side* = 'R', *r* = *n*.

side	CHARACTER*1. Must be either 'L' or 'R'.

If *side* = 'L', Q or Q^T is applied to C from the left.

If *side* = 'R', Q or Q^T is applied to C from the right.

uplo — CHARACTER*1. Must be 'U' or 'L'.

Use the same *uplo* as supplied to ?sytrd.

trans — CHARACTER*1. Must be either 'N' or 'T'.

If *trans* = 'N', the routine multiplies C by Q.

If *trans* = 'T', the routine multiplies C by Q^T.

m — INTEGER. The number of rows in the matrix C ($m \geq 0$).

n — INTEGER. The number of columns in C ($n \geq 0$).

a, *c*, *tau*, *work* — REAL for sormtr

DOUBLE PRECISION for dormtr

a(*lda*,*) and *tau* are the arrays returned by ?sytrd.

The second dimension of *a* must be at least max(1, *r*).

The size of *tau* must be at least max(1, *r*-1).

c(*ldc*,*) contains the matrix C.

The second dimension of *c* must be at least max(1, *n*)

work is a workspace array, its dimension max(1, *lwork*).

lda — INTEGER. The leading dimension of *a*; $lda \geq \max(1, r)$.

ldc — INTEGER. The leading dimension of *c*; $ldc \geq \max(1, m)$.

lwork — INTEGER. The size of the *work* array. Constraints:

$lwork \geq \max(1, n)$ if *side* = 'L';

$lwork \geq \max(1, m)$ if *side* = 'R'.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

c — Overwritten by the product $Q*C$, Q^T*C, $C*Q$, or $C*Q^T$ (as specified by *side* and *trans*).

work(1) — If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `ormtr` interface are the following:

a	Holds the matrix *A* of size (*r*,*r*). *r* = *m* if *side* = 'L'. *r* = *n* if *side* = 'R'.
tau	Holds the vector of length (*r*-1).
c	Holds the matrix *C* of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N' or 'T'. The default value is 'N'.

Application Notes

For better performance, try using *lwork* = *n*blocksize* for *side* = 'L', or *lwork* = *m*blocksize* for *side* = 'R', where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed product differs from the exact product by a matrix *E* such that $||E||_2 = O(\varepsilon)*||C||_2$.

The total number of floating-point operations is approximately $2*m^2*n$, if *side* = 'L', or $2*n^2*m$, if *side* = 'R'.

The complex counterpart of this routine is unmtr.

?hetrd
Reduces a complex Hermitian matrix to tridiagonal form.

Syntax

```
call chetrd(uplo, n, a, lda, d, e, tau, work, lwork, info)
call zhetrd(uplo, n, a, lda, d, e, tau, work, lwork, info)
call hetrd(a, tau [,uplo] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine reduces a complex Hermitian matrix *A* to symmetric tridiagonal form *T* by a unitary similarity transformation: $A = Q*T*Q^H$. The unitary matrix *Q* is not formed explicitly but is represented as a product of *n*-1 elementary reflectors. Routines are provided to work with *Q* in this representation. (They are described later in this topic.)

Input Parameters

uplo

CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', *a* stores the upper triangular part of *A*.

If *uplo* = 'L', *a* stores the lower triangular part of *A*.

n

INTEGER. The order of the matrix *A* ($n \geq 0$).

a, *work*

COMPLEX for chetrd

DOUBLE COMPLEX for zhetrd.

a(*lda*,*) is an array containing either upper or lower triangular part of the matrix *A*, as specified by *uplo*. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *A* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *A* is not referenced.

The second dimension of *a* must be at least max(1, *n*).

work is a workspace array, its dimension max(1, *lwork*).

lda

INTEGER. The leading dimension of *a*; at least max(1, *n*).

lwork

INTEGER. The size of the *work* array ($lwork \geq n$).

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a

On exit,

if *uplo* = 'U', the diagonal and first superdiagonal of *A* are overwritten by the corresponding elements of the tridiagonal matrix *T*, and the elements above the first superdiagonal, with the array *tau*, represent the orthogonal matrix *Q* as a product of elementary reflectors;

if *uplo* = 'L', the diagonal and first subdiagonal of *A* are overwritten by the corresponding elements of the tridiagonal matrix *T*, and the elements below the first subdiagonal, with the array *tau*, represent the orthogonal matrix *Q* as a product of elementary reflectors.

d, *e*	`REAL` for `chetrd` `DOUBLE PRECISION` for `zhetrd`. Arrays: *d*(*) contains the diagonal elements of the matrix *T*. The dimension of *d* must be at least max(1, *n*). *e*(*) contains the off-diagonal elements of *T*. The dimension of *e* must be at least max(1, *n*-1).
tau	`COMPLEX` for `chetrd``DOUBLE COMPLEX` for `zhetrd`. Array, size at least max(1, *n*-1). Stores (*n*-1) scalars that define elementary reflectors in decomposition of the unitary matrix *Q* in a product of *n*-1 elementary reflectors.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	`INTEGER`. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `hetrd` interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
tau	Holds the vector of length (*n*-1).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Note that diagonal (*d*) and off-diagonal (*e*) elements of the matrix *T* are omitted because they are kept in the matrix *A* on exit.

Application Notes

For better performance, try using *lwork* =*n***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix *T* is exactly similar to a matrix *A* + *E*, where $||E||_2 = c(n)*\varepsilon*||A||_2$, $c(n)$ is a modestly increasing function of *n*, and ε is the machine precision.

The approximate number of floating-point operations is $(16/3)n^3$.

After calling this routine, you can call the following:

ungtr	to form the computed matrix *Q* explicitly
unmtr	to multiply a complex matrix by *Q*.

The real counterpart of this routine is ?sytrd.

?ungtr
Generates the complex unitary matrix Q determined by ?hetrd*.*

Syntax

```
call cungtr(uplo, n, a, lda, tau, work, lwork, info)
call zungtr(uplo, n, a, lda, tau, work, lwork, info)
call ungtr(a, tau [,uplo] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine explicitly generates the *n*-by-*n* unitary matrix *Q* formed by ?hetrd when reducing a complex Hermitian matrix *A* to tridiagonal form: $A = Q*T*Q^H$. Use this routine after a call to ?hetrd.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Use the same *uplo* as supplied to ?hetrd.
n	INTEGER. The order of the matrix *Q* ($n \geq 0$).
a, *tau*, *work*	COMPLEX for cungtr DOUBLE COMPLEX for zungtr. Arrays: *a*(*lda*,*) is the array *a* as returned by ?hetrd. The second dimension of *a* must be at least max(1, *n*). *tau*(*) is the array *tau* as returned by ?hetrd. The dimension of *tau* must be at least max(1, *n*-1). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The leading dimension of *a*; at least max(1, *n*).
lwork	INTEGER. The size of the *work* array ($lwork \geq n$).

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a — Overwritten by the unitary matrix *Q*.

work(1) — If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine ungtr interface are the following:

a — Holds the matrix *A* of size (*n*,*n*).

tau — Holds the vector of length (*n*-1).

uplo — Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For better performance, try using *lwork* = (*n*-1)**blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix *Q* differs from an exactly unitary matrix by a matrix *E* such that $||E||_2 = O(\varepsilon)$, where ε is the machine precision.

The approximate number of floating-point operations is $(16/3)n^3$.

The real counterpart of this routine is orgtr.

?unmtr
Multiplies a complex matrix by the complex unitary matrix Q determined by `?hetrd`.

Syntax

```
call cunmtr(side, uplo, trans, m, n, a, lda, tau, c, ldc, work, lwork, info)
call zunmtr(side, uplo, trans, m, n, a, lda, tau, c, ldc, work, lwork, info)
call unmtr(a, tau, c [,side] [,uplo] [,trans] [,info])
```

Include Files

- `mkl.fi, lapack.f90`

Description

The routine multiplies a complex matrix C by Q or Q^H, where Q is the unitary matrix Q formed by `?hetrd` when reducing a complex Hermitian matrix A to tridiagonal form: $A = Q*T*Q^H$. Use this routine after a call to `?hetrd`.

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products $Q*C$, Q^H*C, $C*Q$, or $C*Q^H$ (overwriting the result on C).

Input Parameters

In the descriptions below, r denotes the order of Q:

If *side* = 'L', $r = m$; if *side* = 'R', $r = n$.

side
`CHARACTER*1`. Must be either 'L' or 'R'.
If *side* = 'L', Q or Q^H is applied to C from the left.
If *side* = 'R', Q or Q^H is applied to C from the right.

uplo
`CHARACTER*1`. Must be 'U' or 'L'.
Use the same *uplo* as supplied to `?hetrd`.

trans
`CHARACTER*1`. Must be either 'N' or 'T'.
If *trans* = 'N', the routine multiplies C by Q.
If *trans* = 'C', the routine multiplies C by Q^H.

m
`INTEGER`. The number of rows in the matrix C ($m \geq 0$).

n
`INTEGER`. The number of columns in C ($n \geq 0$).

a, *c*, *tau*, *work*
`COMPLEX` for `cunmtr`
`DOUBLE COMPLEX` for `zunmtr`.
a(*lda*,*) and *tau* are the arrays returned by `?hetrd`.
The second dimension of *a* must be at least max(1, r).
The dimension of *tau* must be at least max(1, r-1).
c(*ldc*,*) contains the matrix C.
The second dimension of *c* must be at least max(1, n)

work is a workspace array, its dimension `max(1, lwork)`.

`lda` — `INTEGER`. The leading dimension of *a*; `lda` ≥ `max(1, r)`.

`ldc` — `INTEGER`. The leading dimension of *c*; `ldc` ≥ `max(1, n)` .

`lwork` — `INTEGER`. The size of the *work* array. Constraints:

`lwork` ≥ `max(1, n)` if `side = 'L'`;

`lwork` ≥ `max(1, m)` if `side = 'R'`.

If `lwork = -1`, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

`c` — Overwritten by the product $Q*C$, Q^H*C, $C*Q$, or $C*Q^H$ (as specified by *side* and `trans`).

`work(1)` — If `info = 0`, on exit `work(1)` contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

`info` — `INTEGER`.

If `info = 0`, the execution is successful.

If `info = -i`, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `unmtr` interface are the following:

`a` — Holds the matrix *A* of size (*r*,*r*).

`r = m` if `side = 'L'`.

`r = n` if `side = 'R'`.

`tau` — Holds the vector of length (*r*-1).

`c` — Holds the matrix *C* of size (*m*,*n*).

`side` — Must be `'L'` or `'R'`. The default value is `'L'`.

`uplo` — Must be `'U'` or `'L'`. The default value is `'U'`.

`trans` — Must be `'N'` or `'C'`. The default value is `'N'`.

Application Notes

For better performance, try using `lwork = n*blocksize` (for `side = 'L'`) or `lwork = m*blocksize` (for `side = 'R'`) where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set `lwork = -1`.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (`work(1)`) for subsequent runs.

If `lwork = -1`, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed product differs from the exact product by a matrix *E* such that $||E||_2 = O(\varepsilon)*||C||_2$, where ε is the machine precision.

The total number of floating-point operations is approximately $8*m^2*n$ if `side = 'L'` or $8*n^2*m$ if `side = 'R'`.

The real counterpart of this routine is ormtr.

?orm22/?unm22
Multiplies a general matrix by an orthogonal/unitary matrix with a 2x2 structure.

Syntax

```
call sorm22 (side, trans, m, n, n1, n2, q, ldq, c, ldc, work, lwork, info )
call dorm22 (side, trans, m, n, n1, n2, q, ldq, c, ldc, work, lwork, info )
call cunm22(side, trans, m, n, n1, n2, q, ldq, c, ldc, work, lwork, info)
call zunm22(side, trans, m, n, n1, n2, q, ldq, c, ldc, work, lwork, info)
```

Include Files

- `mkl.fi`

Description

`?orm22/?unm22` overwrites the general real/complex *m*-by-*n* matrix *C* with

	`side` = 'L'	`side` = 'R'
`trans` = 'N'	*Q* * *C*	*C* * *Q*
`trans` = 'T' applies to `sorm22` and `dorm22` only	Q^T * *C*	*C* * Q^T
`trans` = 'C' applies to `cunm22` and `zunm22` only	Q^H * *C*	*C* * Q^H

where *Q* is a real orthogonal/complex unitary matrix of order *nq*, with *nq* = *m* if `side` = 'L' and *nq* = *n* if `side` = 'R'.

The orthogonal/unitary matrix *Q* processes a 2-by-2 block structure:

$$Q = \begin{pmatrix} Q11 & Q12 \\ Q21 & Q22 \end{pmatrix}$$

where *Q12* is an *n1*-by-*n1* lower triangular matrix and *Q21* is an *n2*-by-*n2* upper triangular matrix.

Input Parameters

side
CHARACTER*1. = 'L': apply *Q*, Q^T, or Q^H from the left;
= 'R': apply *Q*, Q^T, or Q^H from the right.

trans
CHARACTER*1. = 'N': apply *Q* (no transpose);
= 'T': apply Q^T (transpose) - `sorm22` and `dorm22` only;
= 'C': apply Q^H (conjugate transpose) - `cunm22` and `zunm22` only.

m
INTEGER. The number of rows of the matrix *C*.
m≥ 0.

n
INTEGER. The number of columns of the matrix *C*.
n≥ 0.

n1
INTEGER. The dimension of *Q12*.
n1≥ 0.
The following requirement must be satisfied: *n1* + *n2* = *m* if *side* = 'L' and *n1* + *n2* = *n* if *side* = 'R'.

n2
INTEGER. The dimension of *Q21*.
n2≥ 0.
The following requirement must be satisfied: *n1* + *n2* = *m* if *side* = 'L' and *n1* + *n2* = *n* if *side* = 'R'.

q
`REAL` for `sorm22`
`DOUBLE PRECISION` for `dorm22`
`COMPLEX` for `cunm22`
`DOUBLE COMPLEX` for `zunm22`
Array, size (*ldq*,*m*) if *side* = 'L' and (*ldq*,*n*) if *side* = 'R'.

ldq
INTEGER. The leading dimension of the array *q*.
ldq≥ max(1,*m*) if *side* = 'L';
ldq≥ max(1,*n*) if *side* = 'R'.

c
`REAL` for `sorm22`
`DOUBLE PRECISION` for `dorm22`
`COMPLEX` for `cunm22`
`DOUBLE COMPLEX` for `zunm22`
Array, size (*ldc*,*n*)
On entry, the *m*-by-*n* matrix *C*.

ldc
INTEGER. The leading dimension of the array *c*.
ldc≥ max(1,*m*).

lwork INTEGER. The dimension of the array *work*.

If *side* = 'L', *lwork*≥ max(1,*n*);

if *side* = 'R', *lwork*≥ max(1,*m*).

For optimum performance *lwork*≥*m**n.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

Output Parameters

c On exit, *c* is overwritten by the product:

*Q***C*,

Q^T**C*,

Q^H * *C*,

*C**Q^T,

C * Q^H, or

*C**Q.

work REAL for sorm22

DOUBLE PRECISION for dorm22

COMPLEX for cunm22

DOUBLE COMPLEX for zunm22

Array, size (max(1,*lwork*))

On exit, if *info* = 0, *work*(1) returns the optimal *lwork*.

info INTEGER. = 0: successful exit.

< 0: if *info* = -*i*, the *i*-th argument had an illegal value.

?sptrd
Reduces a real symmetric matrix to tridiagonal form using packed storage.

Syntax

```
call ssptrd(uplo, n, ap, d, e, tau, info)
call dsptrd(uplo, n, ap, d, e, tau, info)
call sptrd(ap, tau [,uplo] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine reduces a packed real symmetric matrix *A* to symmetric tridiagonal form *T* by an orthogonal similarity transformation: $A = Q*T*Q^T$. The orthogonal matrix *Q* is not formed explicitly but is represented as a product of *n*-1 elementary reflectors. Routines are provided for working with *Q* in this representation. See *Application Notes* below for details.

Input Parameters

uplo — CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', *ap* stores the packed upper triangle of *A*.

If *uplo* = 'L', *ap* stores the packed lower triangle of *A*.

n — INTEGER. The order of the matrix *A* ($n \geq 0$).

ap — REAL for ssptrd

DOUBLE PRECISION for dsptrd.

Array, size at least max(1, *n*(*n*+1)/2). Contains either upper or lower triangle of *A* (as specified by *uplo*) in the packed form described in Matrix Storage Schemes.

Output Parameters

ap — Overwritten by the tridiagonal matrix *T* and details of the orthogonal matrix *Q*, as specified by *uplo*.

d, *e*, *tau* — REAL for ssptrd

DOUBLE PRECISION for dsptrd.

Arrays:

d(*) contains the diagonal elements of the matrix *T*.

The dimension of *d* must be at least max(1, *n*).

e(*) contains the off-diagonal elements of *T*.

The dimension of *e* must be at least max(1, *n*-1).

tau(*) Stores (*n*-1) scalars that define elementary reflectors in decomposition of the matrix *Q* in a product of *n*-1 reflectors.

The dimension of *tau* must be at least max(1, *n*-1).

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine sptrd interface are the following:

ap — Holds the array *A* of size (*n**(*n*+1)/2).

tau — Holds the vector with the number of elements *n*-1.

uplo	Must be 'U' or 'L'. The default value is 'U'.

Note that diagonal (*d*) and off-diagonal (*e*) elements of the matrix *T* are omitted because they are kept in the matrix *A* on exit.

Application Notes

The matrix *Q* is represented as a product of *n*-1 *elementary reflectors*, as follows :

- If *uplo* = 'U', $Q = H(n-1) \ldots H(2)H(1)$

  Each *H*(i) has the form

  $H(i) = I - tau*v*v^T$

  where *tau* is a real scalar and *v* is a real vector with $v(i+1:n) = 0$ and $v(i) = 1$.

  On exit, *tau* is stored in *tau*(i), and $v(1:i-1)$ is stored in *AP*, overwriting $A(1:i-1, i+1)$.
- If *uplo* = 'L', $Q = H(1)H(2) \ldots H(n-1)$

  Each *H*(i) has the form

  $H(i) = I - tau*v*v^T$

  where *tau* is a real scalar and *v* is a real vector with $v(1:i) = 0$ and $v(i+1) = 1$.

  On exit, *tau* is stored in *tau*(i), and $v(i+2:n)$ is stored in *AP*, overwriting $A(i+2:n, i)$.

The computed matrix *T* is exactly similar to a matrix $A+E$, where $||E||_2 = c(n)*\varepsilon*||A||_2$, $c(n)$ is a modestly increasing function of *n*, and ε is the machine precision. The approximate number of floating-point operations is $(4/3)n^3$.

After calling this routine, you can call the following:

opgtr	to form the computed matrix *Q* explicitly
opmtr	to multiply a real matrix by *Q*.

The complex counterpart of this routine is hptrd.

?opgtr
Generates the real orthogonal matrix Q determined by ?sptrd*.*

Syntax

```
call sopgtr(uplo, n, ap, tau, q, ldq, work, info)
call dopgtr(uplo, n, ap, tau, q, ldq, work, info)
call opgtr(ap, tau, q [,uplo] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine explicitly generates the *n*-by-*n* orthogonal matrix *Q* formed by sptrd when reducing a packed real symmetric matrix *A* to tridiagonal form: $A = Q*T*Q^T$. Use this routine after a call to ?sptrd.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Use the same *uplo* as supplied to ?sptrd.
n	INTEGER. The order of the matrix *Q* ($n \geq 0$).
ap, *tau*	REAL for sopgtr DOUBLE PRECISION for dopgtr. Arrays *ap* and *tau*, as returned by ?sptrd. The size of *ap* must be at least max(1, $n(n+1)/2$). The size of *tau* must be at least max(1, $n-1$).
ldq	INTEGER. The leading dimension of the output array *q*; at least max(1, *n*).
work	REAL for sopgtr DOUBLE PRECISION for dopgtr. Workspace array, size at least max(1, $n-1$).

Output Parameters

q	REAL for sopgtr DOUBLE PRECISION for dopgtr. Array, size (*ldq*,*) . Contains the computed matrix *Q*. The second dimension of *q* must be at least max(1, *n*).
info	INTEGER. If $info = 0$, the execution is successful. If $info = -i$, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine opgtr interface are the following:

ap	Holds the array *A* of size (*n*(n+1)/2*).
tau	Holds the vector with the number of elements *n* - 1.
q	Holds the matrix *Q* of size (*n*,*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed matrix *Q* differs from an exactly orthogonal matrix by a matrix *E* such that $||E||_2 = O(\varepsilon)$, where ε is the machine precision.

The approximate number of floating-point operations is $(4/3)n^3$.

The complex counterpart of this routine is upgtr.

?opmtr

Multiplies a real matrix by the real orthogonal matrix Q determined by ?sptrd.

Syntax

```
call sopmtr(side, uplo, trans, m, n, ap, tau, c, ldc, work, info)
call dopmtr(side, uplo, trans, m, n, ap, tau, c, ldc, work, info)
call opmtr(ap, tau, c [,side] [,uplo] [,trans] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine multiplies a real matrix C by Q or Q^T, where Q is the orthogonal matrix Q formed by sptrd when reducing a packed real symmetric matrix A to tridiagonal form: $A = Q*T*Q^T$. Use this routine after a call to ?sptrd.

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products $Q*C$, Q^T*C, $C*Q$, or $C*Q^T$ (overwriting the result on C).

Input Parameters

In the descriptions below, r denotes the order of Q:

If side = 'L', $r = m$; if side = 'R', $r = n$.

side
CHARACTER*1. Must be either 'L' or 'R'.
If side = 'L', Q or Q^T is applied to C from the left.
If side = 'R', Q or Q^T is applied to C from the right.

uplo
CHARACTER*1. Must be 'U' or 'L'.
Use the same *uplo* as supplied to ?sptrd.

trans
CHARACTER*1. Must be either 'N' or 'T'.
If trans = 'N', the routine multiplies C by Q.
If trans = 'T', the routine multiplies C by Q^T.

m
INTEGER. The number of rows in the matrix C ($m \geq 0$).

n
INTEGER. The number of columns in C ($n \geq 0$).

ap, *tau*, *c*, *work*
REAL for sopmtr
DOUBLE PRECISION for dopmtr.
ap and *tau* are the arrays returned by ?sptrd.
The dimension of *ap* must be at least max(1, $r(r+1)/2$).
The dimension of *tau* must be at least max(1, r-1).
c(*ldc*,*) contains the matrix C.

The second dimension of *c* must be at least max(1, *n*)

work(*) is a workspace array.

The dimension of *work* must be at least

max(1, *n*) if *side* = 'L';

max(1, *m*) if *side* = 'R'.

ldc INTEGER. The leading dimension of *c*; *ldc*≥ max(1, *n*) .

Output Parameters

c Overwritten by the product $Q*C$, Q^T*C, $C*Q$, or $C*Q^T$ (as specified by *side* and *trans*).

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine opmtr interface are the following:

ap Holds the array *A* of size (*r**(r+1)/2), where

r = *m* if *side* = 'L'.

r = *n* if *side* = 'R'.

tau Holds the vector with the number of elements *r* - 1.

c Holds the matrix *C* of size (*m*,*n*).

side Must be 'L' or 'R'. The default value is 'L'.

uplo Must be 'U' or 'L'. The default value is 'U'.

trans Must be 'N', 'C', or 'T'. The default value is 'N'.

Application Notes

The computed product differs from the exact product by a matrix *E* such that $||E||_2 = O(\varepsilon) ||C||_2$, where ε is the machine precision.

The total number of floating-point operations is approximately $2*m^2*n$ if *side* = 'L', or $2*n^2*m$ if *side* = 'R'.

The complex counterpart of this routine is upmtr.

?hptrd

Reduces a complex Hermitian matrix to tridiagonal form using packed storage.

Syntax

```
call chptrd(uplo, n, ap, d, e, tau, info)
call zhptrd(uplo, n, ap, d, e, tau, info)
call hptrd(ap, tau [,uplo] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine reduces a packed complex Hermitian matrix *A* to symmetric tridiagonal form *T* by a unitary similarity transformation: $A = Q*T*Q^H$. The unitary matrix *Q* is not formed explicitly but is represented as a product of *n*-1 elementary reflectors. Routines are provided for working with *Q* in this representation (see *Application Notes* below).

Input Parameters

uplo

CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', *ap* stores the packed upper triangle of *A*.

If *uplo* = 'L', *ap* stores the packed lower triangle of *A*.

n

INTEGER. The order of the matrix *A* ($n \geq 0$).

ap

COMPLEX for chptrd

DOUBLE COMPLEX for zhptrd.

Array, size at least max(1, *n*(*n*+1)/2). Contains either upper or lower triangle of *A* (as specified by *uplo*) in the packed form described in "Matrix Storage Schemes.

Output Parameters

ap

Overwritten by the tridiagonal matrix *T* and details of the unitary matrix *Q*, as specified by *uplo*.

d, *e*

REAL for chptrd

DOUBLE PRECISION for zhptrd.

Arrays:

d(*) contains the diagonal elements of the matrix *T*.

The size of *d* must be at least max(1, *n*).

e(*) contains the off-diagonal elements of *T*.

The size of *e* must be at least max(1, *n*-1).

tau

COMPLEX for chptrd

DOUBLE COMPLEX for zhptrd.

Array, size at least max(1, *n*-1). Stores (n-1) scalars that define elementary reflectors in decomposition of the unitary matrix *Q* in a product of reflectors.

info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine hptrd interface are the following:

ap	Holds the array *A* of size (*n*(n+1)/2*).
tau	Holds the vector with the number of elements *n* - 1.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Note that diagonal (*d*) and off-diagonal (*e*) elements of the matrix *T* are omitted because they are kept in the matrix *A* on exit.

Application Notes

The computed matrix *T* is exactly similar to a matrix *A* + *E*, where $||E||_2 = c(n)*\varepsilon*||A||_2$, $c(n)$ is a modestly increasing function of *n*, and ε is the machine precision.

The approximate number of floating-point operations is $(16/3)n^3$.

After calling this routine, you can call the following:

upgtr	to form the computed matrix *Q* explicitly
upmtr	to multiply a complex matrix by *Q*.

The real counterpart of this routine is sptrd.

?upgtr
Generates the complex unitary matrix Q determined by ?hptrd*.*

Syntax

```
call cupgtr(uplo, n, ap, tau, q, ldq, work, info)
call zupgtr(uplo, n, ap, tau, q, ldq, work, info)
call upgtr(ap, tau, q [,uplo] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine explicitly generates the *n*-by-*n* unitary matrix *Q* formed by hptrd when reducing a packed complex Hermitian matrix *A* to tridiagonal form: $A = Q*T*Q^H$. Use this routine after a call to ?hptrd.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Use the same *uplo* as supplied to ?hptrd.
n	INTEGER. The order of the matrix *Q* ($n \geq 0$).
ap, *tau*	COMPLEX for cupgtr DOUBLE COMPLEX for zupgtr. Arrays *ap* and *tau*, as returned by ?hptrd. The dimension of *ap* must be at least max(1, $n(n+1)/2$). The dimension of *tau* must be at least max(1, $n-1$).
ldq	INTEGER. The leading dimension of the output array *q*; at least max(1, *n*).
work	COMPLEX for cupgtr DOUBLE COMPLEX for zupgtr. Workspace array, size at least max(1, $n-1$).

Output Parameters

q	COMPLEX for cupgtr DOUBLE COMPLEX for zupgtr. Array, size (*ldq*,*) . Contains the computed matrix *Q*. The second dimension of *q* must be at least max(1, *n*).
info	INTEGER. If $info = 0$, the execution is successful. If $info = -i$, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine upgtr interface are the following:

ap	Holds the array *A* of size (*n*(n+1)/2*).
tau	Holds the vector with the number of elements *n* - 1.
q	Holds the matrix *Q* of size (*n*,*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed matrix *Q* differs from an exactly orthogonal matrix by a matrix *E* such that $||E||_2 = O(\varepsilon)$, where ε is the machine precision.

The approximate number of floating-point operations is `(16/3)n3`.

The real counterpart of this routine is opgtr.

?upmtr

Multiplies a complex matrix by the unitary matrix Q determined by `?hptrd`.

Syntax

```
call cupmtr(side, uplo, trans, m, n, ap, tau, c, ldc, work, info)
call zupmtr(side, uplo, trans, m, n, ap, tau, c, ldc, work, info)
call upmtr(ap, tau, c [,side] [,uplo] [,trans] [,info])
```

Include Files

- `mkl.fi, lapack.f90`

Description

The routine multiplies a complex matrix C by Q or Q^H, where Q is the unitary matrix formed by hptrd when reducing a packed complex Hermitian matrix A to tridiagonal form: $A = Q*T*Q^H$. Use this routine after a call to `?hptrd`.

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products $Q*C$, Q^H*C, $C*Q$, or $C*Q^H$ (overwriting the result on C).

Input Parameters

In the descriptions below, r denotes the order of Q:

If `side = 'L'`, $r = m$; if `side = 'R'`, $r = n$.

side	`CHARACTER*1`. Must be either `'L'` or `'R'`. If `side = 'L'`, Q or Q^H is applied to C from the left. If `side = 'R'`, Q or Q^H is applied to C from the right.
uplo	`CHARACTER*1`. Must be `'U'` or `'L'`. Use the same *uplo* as supplied to `?hptrd`.
trans	`CHARACTER*1`. Must be either `'N'` or `'T'`. If `trans = 'N'`, the routine multiplies C by Q. If `trans = 'T'`, the routine multiplies C by Q^H.
m	`INTEGER`. The number of rows in the matrix C ($m \geq 0$).
n	`INTEGER`. The number of columns in C ($n \geq 0$).
ap, *tau*, *c*,	`COMPLEX` for `cupmtr` `DOUBLE COMPLEX` for `zupmtr`. *ap* and *tau* are the arrays returned by `?hptrd`. The size of *ap* must be at least max(1, $r(r+1)/2$). The size of *tau* must be at least max(1, $r-1$).

c(*ldc*,*) contains the matrix *C*.

The second dimension of *c* must be at least max(1, *n*)

work(*) is a workspace array.

The dimension of *work* must be at least

max(1, *n*) if `side = 'L'`;

max(1, *m*) if `side = 'R'`.

`ldc` INTEGER. The leading dimension of *c*; `ldc` ≥ `max(1, m)` .

Output Parameters

`c` Overwritten by the product *Q***C*, Q^H**C*, *C***Q*, or *C**Q^H (as specified by *side* and *trans*).

`info` INTEGER.

If `info = 0`, the execution is successful.

If `info = -i`, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `upmtr` interface are the following:

`ap` Holds the array *A* of size (*r**(*r*+1)/2), where

`r = m` if `side = 'L'`.

`r = n` if `side = 'R'`.

`tau` Holds the vector with the number of elements *n* - 1.

`c` Holds the matrix *C* of size (*m*,*n*).

`side` Must be `'L'` or `'R'`. The default value is `'L'`.

`uplo` Must be `'U'` or `'L'`.The default value is `'U'`.

`trans` Must be `'N'` or `'C'`. The default value is `'N'`.

Application Notes

The computed product differs from the exact product by a matrix *E* such that $||E||_2 = O(\varepsilon)*||C||_2$, where ε is the machine precision.

The total number of floating-point operations is approximately $8*m^2*n$ if `side = 'L'` or $8*n^2*m$ if `side = 'R'`.

The real counterpart of this routine is opmtr.

?sbtrd
Reduces a real symmetric band matrix to tridiagonal form.

Syntax

```
call ssbtrd(vect, uplo, n, kd, ab, ldab, d, e, q, ldq, work, info)
call dsbtrd(vect, uplo, n, kd, ab, ldab, d, e, q, ldq, work, info)
call sbtrd(ab[, q] [,vect] [,uplo] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine reduces a real symmetric band matrix *A* to symmetric tridiagonal form *T* by an orthogonal similarity transformation: $A = Q*T*Q^T$. The orthogonal matrix *Q* is determined as a product of Givens rotations.

If required, the routine can also form the matrix *Q* explicitly.

Input Parameters

vect

CHARACTER*1. Must be 'V', 'N', or 'U'.

If *vect* = 'V', the routine returns the explicit matrix *Q*.

If *vect* = 'N', the routine does not return *Q*.

If *vect* = 'U', the routine updates matrix *X* by forming *X***Q*.

uplo

CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', *ab* stores the upper triangular part of *A*.

If *uplo* = 'L', *ab* stores the lower triangular part of *A*.

n

INTEGER. The order of the matrix *A* ($n \geq 0$).

kd

INTEGER. The number of super- or sub-diagonals in *A*

($kd \geq 0$).

ab, *q*, *work*

REAL for ssbtrd

DOUBLE PRECISION for dsbtrd.

ab(*ldab*,*) is an array containing either upper or lower triangular part of the matrix *A* (as specified by *uplo*) in band storage format.

The second dimension of *ab* must be at least max(1, *n*).

q(*ldq*,*) is an array.

If *vect* = 'U', the *q* array must contain an *n*-by-*n* matrix *X*.

If *vect* = 'N' or 'V', the *q* parameter need not be set.

The second dimension of *q* must be at least max(1, *n*).

work(*) is a workspace array.

The dimension of *work* must be at least max(1, *n*).

ldab

INTEGER. The leading dimension of *ab*; at least *kd*+1 .

ldq INTEGER. The leading dimension of *q*. Constraints:

ldq ≥ max(1, *n*) if *vect* = 'V' or 'U';

ldq ≥ 1 if *vect* = 'N'.

Output Parameters

ab On exit, the diagonal elements of the array *ab* are overwritten by the diagonal elements of the tridiagonal matrix *T*. If *kd* > 0, the elements on the first superdiagonal (if *uplo* = 'U') or the first subdiagonal (if *uplo* = 'L') are ovewritten by the off-diagonal elements of *T*. The rest of *ab* is overwritten by values generated during the reduction.

d, *e*, *q* REAL for ssbtrd

DOUBLE PRECISION for dsbtrd.

Arrays:

d(*) contains the diagonal elements of the matrix *T*.

The size of *d* must be at least max(1, *n*).

e(*) contains the off-diagonal elements of *T*.

The size of *e* must be at least max(1, *n*-1).

q(*ldq*,*) is not referenced if *vect* = 'N'.

If *vect* = 'V', *q* contains the *n*-by-*n* matrix *Q*.

If *vect* = 'U', *q* contains the product *X** *Q*.

The second dimension of *q* must be:

at least max(1, *n*) if *vect* = 'V';

at least 1 if *vect* = 'N'.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine sbtrd interface are the following:

ab Holds the array *A* of size (*kd*+1,*n*).

q Holds the matrix *Q* of size (*n*,*n*).

uplo Must be 'U' or 'L'. The default value is 'U'.

vect If omitted, this argument is restored based on the presence of argument *q* as follows: *vect* = 'V', if *q* is present, *vect* = 'N', if *q* is omitted.

If present, *vect* must be equal to 'V' or 'U' and the argument *q* must also be present. Note that there will be an error condition if *vect* is present and *q* omitted.

Note that diagonal (*d*) and off-diagonal (*e*) elements of the matrix *T* are omitted because they are kept in the matrix *A* on exit.

Application Notes

The computed matrix *T* is exactly similar to a matrix *A*+*E*, where $||E||_2 = c(n)*\varepsilon*||A||_2$, $c(n)$ is a modestly increasing function of *n*, and ε is the machine precision. The computed matrix *Q* differs from an exactly orthogonal matrix by a matrix *E* such that $||E||_2 = O(\varepsilon)$.

The total number of floating-point operations is approximately $6n^2*kd$ if *vect* = 'N', with $3n^3*(kd-1)/kd$ additional operations if *vect* = 'V'.

The complex counterpart of this routine is hbtrd.

?hbtrd
Reduces a complex Hermitian band matrix to tridiagonal form.

Syntax

```
call chbtrd(vect, uplo, n, kd, ab, ldab, d, e, q, ldq, work, info)
call zhbtrd(vect, uplo, n, kd, ab, ldab, d, e, q, ldq, work, info)
call hbtrd(ab [, q] [,vect] [,uplo] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine reduces a complex Hermitian band matrix *A* to symmetric tridiagonal form *T* by a unitary similarity transformation: $A = Q*T*Q^H$. The unitary matrix *Q* is determined as a product of Givens rotations.

If required, the routine can also form the matrix *Q* explicitly.

Input Parameters

vect — CHARACTER*1. Must be 'V', 'N', or 'U'.
If *vect* = 'V', the routine returns the explicit matrix *Q*.
If *vect* = 'N', the routine does not return *Q*.
If *vect* = 'U', the routine updates matrix *X* by forming *Q***X*.

uplo — CHARACTER*1. Must be 'U' or 'L'.
If *uplo* = 'U', *ab* stores the upper triangular part of *A*.
If *uplo* = 'L', *ab* stores the lower triangular part of *A*.

n — INTEGER. The order of the matrix *A* ($n \geq 0$).

kd — INTEGER. The number of super- or sub-diagonals in *A*

($kd \geq 0$).

ab, *work*

COMPLEX for chbtrd

DOUBLE COMPLEX for zhbtrd.

ab(*ldab*,*) is an array containing either upper or lower triangular part of the matrix *A* (as specified by *uplo*) in band storage format.

The second dimension of *ab* must be at least max(1, *n*).

work(*) is a workspace array.

The dimension of *work* must be at least max(1, *n*).

q

COMPLEX for chbtrd

DOUBLE COMPLEX for zhbtrd.

q(*ldq*,*) is an array.

If *vect* = 'U', the *q* array must contain an *n*-by-*n* matrix *X*.

If *vect* = 'N' or 'V', the *q* parameter need not be set.'

ldab

INTEGER. The leading dimension of *ab*; at least *kd*+1.

ldq

INTEGER. The leading dimension of *q*. Constraints:

ldq ≥ max(1, *n*) if *vect* = 'V' or 'U';

ldq ≥ 1 if *vect* = 'N'.

Output Parameters

ab

On exit, the diagonal elements of the array *ab* are overwritten by the diagonal elements of the tridiagonal matrix *T*. If *kd* > 0, the elements on the first superdiagonal (if *uplo* = 'U') or the first subdiagonal (if *uplo* = 'L') are ovewritten by the off-diagonal elements of *T*. The rest of *ab* is overwritten by values generated during the reduction.

d, *e*

REAL for chbtrd

DOUBLE PRECISION for zhbtrd.

Arrays:

d(*) contains the diagonal elements of the matrix *T*.

The dimension of *d* must be at least max(1, *n*).

e(*) contains the off-diagonal elements of *T*.

The dimension of *e* must be at least max(1, *n*-1).

q

If *vect* = 'N', *q* is not referenced.

If *vect* = 'V', *q* contains the *n*-by-*n* matrix *Q*.

If *vect* = 'U', *q* contains the product *X** *Q*.

The second dimension of *q* must be:

at least max(1, *n*) if *vect* = 'V';

at least 1 if *vect* = 'N'.

info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine hbtrd interface are the following:

ab	Holds the array *A* of size (*kd*+1,*n*).
q	Holds the matrix *Q* of size (*n*,*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
vect	If omitted, this argument is restored based on the presence of argument *q* as follows: *vect* = 'V', if *q* is present, *vect* = 'N', if *q* is omitted. If present, *vect* must be equal to 'V' or 'U' and the argument *q* must also be present. Note that there will be an error condition if *vect* is present and *q* omitted.

Note that diagonal (*d*) and off-diagonal (*e*) elements of the matrix *T* are omitted because they are kept in the matrix *A* on exit.

Application Notes

The computed matrix *T* is exactly similar to a matrix *A* + *E*, where $||E||_2 = c(n)*\varepsilon*||A||_2$, *c*(*n*) is a modestly increasing function of *n*, and ε is the machine precision. The computed matrix *Q* differs from an exactly unitary matrix by a matrix *E* such that $||E||_2 = O(\varepsilon)$.

The total number of floating-point operations is approximately $20n^2*kd$ if *vect* = 'N', with $10n^3*(kd-1)/kd$ additional operations if *vect* = 'V'.

The real counterpart of this routine is sbtrd.

?sterf

Computes all eigenvalues of a real symmetric tridiagonal matrix using QR algorithm.

Syntax

```
call ssterf(n, d, e, info)
call dsterf(n, d, e, info)
call sterf(d, e [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes all the eigenvalues of a real symmetric tridiagonal matrix *T* (which can be obtained by reducing a symmetric or Hermitian matrix to tridiagonal form). The routine uses a square-root-free variant of the *QR* algorithm.

If you need not only the eigenvalues but also the eigenvectors, call steqr.

Input Parameters

n	INTEGER. The order of the matrix *T* ($n \geq 0$).
d, *e*	REAL for ssterf DOUBLE PRECISION for dsterf. Arrays: *d*(*) contains the diagonal elements of *T*. The dimension of *d* must be at least max(1, *n*). *e*(*) contains the off-diagonal elements of *T*. The dimension of *e* must be at least max(1, *n*-1).

Output Parameters

d	The *n* eigenvalues in ascending order, unless *info* > 0. See also *info*.
e	On exit, the array is overwritten; see *info*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = *i*, the algorithm failed to find all the eigenvalues after 30*n* iterations: *i* off-diagonal elements have not converged to zero. On exit, *d* and *e* contain, respectively, the diagonal and off-diagonal elements of a tridiagonal matrix orthogonally similar to *T*. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine sterf interface are the following:

d	Holds the vector of length *n*.
e	Holds the vector of length (*n*-1).

Application Notes

The computed eigenvalues and eigenvectors are exact for a matrix $T+E$ such that $||E||_2 = O(\varepsilon)*||T||_2$, where ε is the machine precision.

If λ_i is an exact eigenvalue, and m_i is the corresponding computed value, then

$|\mu i - \lambda i| \leq c(n)*\varepsilon*||T||_2$

where $c(n)$ is a modestly increasing function of n.

The total number of floating-point operations depends on how rapidly the algorithm converges. Typically, it is about $14n^2$.

?steqr

Computes all eigenvalues and eigenvectors of a symmetric or Hermitian matrix reduced to tridiagonal form (QR algorithm).

Syntax

```
call ssteqr(compz, n, d, e, z, ldz, work, info)
call dsteqr(compz, n, d, e, z, ldz, work, info)
call csteqr(compz, n, d, e, z, ldz, work, info)
call zsteqr(compz, n, d, e, z, ldz, work, info)
call rsteqr(d, e [,z] [,compz] [,info])
call steqr(d, e [,z] [,compz] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes all the eigenvalues and (optionally) all the eigenvectors of a real symmetric tridiagonal matrix T. In other words, the routine can compute the spectral factorization: $T = Z*\Lambda*Z^T$. Here Λ is a diagonal matrix whose diagonal elements are the eigenvalues λ_i; Z is an orthogonal matrix whose columns are eigenvectors. Thus,

$T*z_i = \lambda_i*z_i$ for $i = 1, 2, \ldots, n$.

The routine normalizes the eigenvectors so that $||z_i||_2 = 1$.

You can also use the routine for computing the eigenvalues and eigenvectors of an arbitrary real symmetric (or complex Hermitian) matrix A reduced to tridiagonal form T: $A = Q*T*Q^H$. In this case, the spectral factorization is as follows: $A = Q*T*Q^H = (Q*Z)*\Lambda*(Q*Z)^H$. Before calling ?steqr, you must reduce A to tridiagonal form and generate the explicit matrix Q by calling the following routines:

	for real matrices:	for complex matrices:
full storage	?sytrd, ?orgtr	?hetrd, ?ungtr
packed storage	?sptrd, ?opgtr	?hptrd, ?upgtr
band storage	?sbtrd(*vect*='V')	?hbtrd(*vect*='V')

If you need eigenvalues only, it's more efficient to call sterf. If T is positive-definite, pteqr can compute small eigenvalues more accurately than ?steqr.

To solve the problem by a single call, use one of the divide and conquer routines stevd, syevd, spevd, or sbevd for real symmetric matrices or heevd, hpevd, or hbevd for complex Hermitian matrices.

Input Parameters

compz

CHARACTER*1. Must be 'N' or 'I' or 'V'.

If *compz* = 'N', the routine computes eigenvalues only.

If *compz* = 'I', the routine computes the eigenvalues and eigenvectors of the tridiagonal matrix *T*.

If *compz* = 'V', the routine computes the eigenvalues and eigenvectors of the original symmetric matrix. On entry, *z* must contain the orthogonal matrix used to reduce the original matrix to tridiagonal form.

n

INTEGER. The order of the matrix *T* (*n*≥ 0).

d, *e*, *work*

REAL for single-precision flavors

DOUBLE PRECISION for double-precision flavors.

Arrays:

d(*) contains the diagonal elements of *T*.

The size of *d* must be at least max(1, *n*).

e(*) contains the off-diagonal elements of *T*.

The size of *e* must be at least max(1, *n*-1).

work(*) is a workspace array.

The size of *work* must be:

at least 1 if *compz* = 'N';

at least max(1, 2**n*-2) if *compz* = 'V' or 'I'.

z

REAL for ssteqr

DOUBLE PRECISION for dsteqr

COMPLEX for csteqr

DOUBLE COMPLEX for zsteqr.

Array, size (*ldz*, *).

If *compz* = 'N' or 'I', *z* need not be set.

If *vect* = 'V', *z* must contain the orthogonal matrix used in the reduction to tridiagonal form.

The second dimension of *z* must be:

at least 1 if *compz* = 'N';

at least max(1, *n*) if *compz* = 'V' or 'I'.

work (*lwork*) is a workspace array.

ldz

INTEGER. The leading dimension of *z*. Constraints:

ldz≥ 1 if *compz* = 'N';

ldz≥ max(1, *n*) if *compz* = 'V' or 'I'.

Output Parameters

d	The *n* eigenvalues in ascending order, unless *info* > 0. See also *info*.
e	On exit, the array is overwritten; see *info*.
z	If *info* = 0, contains the *n*-by-*n* matrix the columns of which are orthonormal eigenvectors (the *i*-th column corresponds to the *i*-th eigenvalue).
info	INTEGER. If *info* = 0, the execution is successful. If *info* = *i*, the algorithm failed to find all the eigenvalues after 30*n* iterations: *i* off-diagonal elements have not converged to zero. On exit, *d* and *e* contain, respectively, the diagonal and off-diagonal elements of a tridiagonal matrix orthogonally similar to *T*. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine steqr interface are the following:

d	Holds the vector of length *n*.
e	Holds the vector of length (*n*-1).
z	Holds the matrix *Z* of size (*n*,*n*).
compz	If omitted, this argument is restored based on the presence of argument *z* as follows: *compz* = 'I', if *z* is present, *compz* = 'N', if *z* is omitted. If present, *compz* must be equal to 'I' or 'V' and the argument *z* must also be present. Note that there will be an error condition if *compz* is present and *z* omitted. Note that two variants of Fortran 95 interface for steqr routine are needed because of an ambiguous choice between real and complex cases appear when *z* is omitted. Thus, the name rsteqr is used in real cases (single or double precision), and the name steqr is used in complex cases (single or double precision).

Application Notes

The computed eigenvalues and eigenvectors are exact for a matrix $T+E$ such that $||E||_2 = O(\varepsilon)*||T||_2$, where ε is the machine precision.

If λ_i is an exact eigenvalue, and μ_i is the corresponding computed value, then

$|\mu_i - \lambda_i| \leq c(n)*\varepsilon*||T||_2$

where $c(n)$ is a modestly increasing function of n.

If z_i is the corresponding exact eigenvector, and w_i is the corresponding computed vector, then the angle $\theta(z_i, w_i)$ between them is bounded as follows:

$\theta(z_i, w_i) \leq c(n)*\varepsilon*||T||_2 / \min_{i \neq j}|\lambda_i - \lambda_j|$.

The total number of floating-point operations depends on how rapidly the algorithm converges. Typically, it is about

$24n^2$ if *compz* = 'N';

$7n^3$ (for complex flavors, $14n^3$) if *compz* = 'V' or 'I'.

?stemr

Computes selected eigenvalues and eigenvectors of a real symmetric tridiagonal matrix.

Syntax

```
call sstemr(jobz, range, n, d, e, vl, vu, il, iu, m, w, z, ldz, nzc, isuppz, tryrac,
work, lwork, iwork, liwork, info)
```

```
call dstemr(jobz, range, n, d, e, vl, vu, il, iu, m, w, z, ldz, nzc, isuppz, tryrac,
work, lwork, iwork, liwork, info)
```

```
call cstemr(jobz, range, n, d, e, vl, vu, il, iu, m, w, z, ldz, nzc, isuppz, tryrac,
work, lwork, iwork, liwork, info)
```

```
call zstemr(jobz, range, n, d, e, vl, vu, il, iu, m, w, z, ldz, nzc, isuppz, tryrac,
work, lwork, iwork, liwork, info)
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes selected eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix *T*. Any such unreduced matrix has a well defined set of pairwise different real eigenvalues, the corresponding real eigenvectors are pairwise orthogonal.

The spectrum may be computed either completely or partially by specifying either an interval (vl,vu] or a range of indices il:iu for the desired eigenvalues.

Depending on the number of desired eigenvalues, these are computed either by bisection or the *dqds* algorithm. Numerically orthogonal eigenvectors are computed by the use of various suitable $L*D*L^T$ factorizations near clusters of close eigenvalues (referred to as RRRs, Relatively Robust Representations). An informal sketch of the algorithm follows.

For each unreduced block (submatrix) of *T*,

a. Compute $T - sigma*I = L*D*L^T$, so that *L* and *D* define all the wanted eigenvalues to high relative accuracy. This means that small relative changes in the entries of *L* and *D* cause only small relative changes in the eigenvalues and eigenvectors. The standard (unfactored) representation of the tridiagonal matrix *T* does not have this property in general.

b. Compute the eigenvalues to suitable accuracy. If the eigenvectors are desired, the algorithm attains full accuracy of the computed eigenvalues only right before the corresponding vectors have to be computed, see steps c and d.

c. For each cluster of close eigenvalues, select a new shift close to the cluster, find a new factorization, and refine the shifted eigenvalues to suitable accuracy.

d. For each eigenvalue with a large enough relative separation compute the corresponding eigenvector by forming a rank revealing twisted factorization. Go back to step c for any clusters that remain.

Normal execution of `?stemr` may create NaNs and infinities and may abort due to a floating point exception in environments that do not handle NaNs and infinities in the IEEE standard default manner.

For more details, see: [Dhillon04], [Dhillon04-02], [Dhillon97]

Input Parameters

jobz

`CHARACTER*1`. Must be `'N'` or `'V'`.

If *jobz* = `'N'`, then only eigenvalues are computed.

If *jobz* = `'V'`, then eigenvalues and eigenvectors are computed.

range

`CHARACTER*1`. Must be `'A'` or `'V'` or `'I'`.

If *range* = `'A'`, the routine computes all eigenvalues.

If *range* = `'V'`, the routine computes all eigenvalues in the half-open interval: `(vl, vu]`.

If *range* = `'I'`, the routine computes eigenvalues with indices *il* to *iu*.

n

`INTEGER`. The order of the matrix *T* (*n*≥0).

d

`REAL` for single precision flavors

`DOUBLE PRECISION` for double precision flavors.

Array, size (*n*).

Contains *n* diagonal elements of the tridiagonal matrix *T*.

e

`REAL` for single precision flavors

`DOUBLE PRECISION` for double precision flavors.

Array, size *n*.

Contains `(n-1)` off-diagonal elements of the tridiagonal matrix *T* in elements `1` to *n*–`1` of *e*. *e*`(n)` need not be set on input, but is used internally as workspace.

vl, *vu*

`REAL` for single precision flavors

`DOUBLE PRECISION` for double precision flavors.

If *range* = `'V'`, the lower and upper bounds of the interval to be searched for eigenvalues. Constraint: *vl*<*vu*.

If *range* = `'A'` or `'I'`, *vl* and *vu* are not referenced.

il, *iu*

`INTEGER`.

If *range* = `'I'`, the indices in ascending order of the smallest and largest eigenvalues to be returned.

Constraint: `1`≤*il*≤*iu*≤*n*, if *n*>`0`.

If *range* = `'A'` or `'V'`, *il* and *iu* are not referenced.

ldz

`INTEGER`. The leading dimension of the output array *z*.

if *jobz* = `'V'`, then *ldz* ≥ `max(1, n)` ;

ldz ≥ 1 otherwise.

nzc INTEGER. The number of eigenvectors to be held in the array *z*.

If *range* = 'A', then *nzc*≥max(1, *n*);

If *range* = 'V', then *nzc* is greater than or equal to the number of eigenvalues in the half-open interval: (*vl*, *vu*].

If *range* = 'I', then *nzc*≥*iu*-*il*+1.

If *nzc* = -1, then a workspace query is assumed; the routine calculates the number of columns of the array *z* that are needed to hold the eigenvectors.

This value is returned as the first entry of the array *z*, and no error message related to *nzc* is issued by the routine xerbla.

tryrac LOGICAL.

If *tryrac*= .TRUE. is true, it indicates that the code should check whether the tridiagonal matrix defines its eigenvalues to high relative accuracy. If so, the code uses relative-accuracy preserving algorithms that might be (a bit) slower depending on the matrix. If the matrix does not define its eigenvalues to high relative accuracy, the code can uses possibly faster algorithms.

If *tryrac*= .FALSE. is not true, the code is not required to guarantee relatively accurate eigenvalues and can use the fastest possible techniques.

work REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Workspace array, size (*lwork*).

lwork INTEGER.

The dimension of the array *work*,

lwork ≥ max(1, 18*n).

If *lwork*=-1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

iwork INTEGER.

Workspace array, size (*liwork*).

liwork INTEGER.

The dimension of the array *iwork*.

lwork≥max(1, 10*n) if the eigenvectors are desired, and *lwork*≥max(1, 8*n) if only the eigenvalues are to be computed.

If *liwork*=-1, then a workspace query is assumed; the routine only calculates the optimal size of the *iwork* array, returns this value as the first entry of the *iwork* array, and no error message related to *liwork* is issued by xerbla.

Output Parameters

d

On exit, the array *d* is overwritten.

e

On exit, the array *e* is overwritten.

m

INTEGER.

The total number of eigenvalues found, $0 \le m \le n$.

If *range* = 'A', then $m=n$, and if *range* = 'I', then $m=iu-il+1$.

w

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size (*n*).

The first *m* elements contain the selected eigenvalues in ascending order.

z

REAL for sstemr

DOUBLE PRECISION for dstemr

COMPLEX for cstemr

DOUBLE COMPLEX for zstemr.

Array *z*(*ldz*,*), the second dimension of *z* must be at least max(1, *m*).

If *jobz* = 'V', and *info* = 0, then the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *T* corresponding to the selected eigenvalues, with the i-th column of *z* holding the eigenvector associated with *w*(i).

If *jobz* = 'N', then *z* is not referenced.

Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z* ; if *range* = 'V', the exact value of *m* is not known in advance and can be computed with a workspace query by setting *nzc*=-1, see description of the parameter *nzc*.

isuppz

INTEGER.

Array, size (2*max(1, *m*)).

The support of the eigenvectors in *z*, that is the indices indicating the nonzero elements in *z*. The i-th computed eigenvector is nonzero only in elements *isuppz*(2*i-1) through *isuppz*(2*i). This is relevant in the case when the matrix is split. *isuppz* is only accessed when *jobz* = 'V' and *n*>0.

tryrac

On exit, TRUE. *tryrac* is set to .FALSE. if the matrix does not define its eigenvalues to high relative accuracy.

work(1)

On exit, if *info* = 0, then *work*(1) returns the optimal (and minimal) size of *lwork*.

iwork(1)

On exit, if *info* = 0, then *iwork*(1) returns the optimal size of *liwork*.

info

INTEGER.

If = 0, the execution is successful.

If *info* = -i, the i-th parameter had an illegal value.

If *info* = 1, internal error in ?larre occurred,

if *info* = 2, internal error in ?larrv occurred.

?stedc

Computes all eigenvalues and eigenvectors of a symmetric tridiagonal matrix using the divide and conquer method.

Syntax

```
call sstedc(compz, n, d, e, z, ldz, work, lwork, iwork, liwork, info)
call dstedc(compz, n, d, e, z, ldz, work, lwork, iwork, liwork, info)
call cstedc(compz, n, d, e, z, ldz, work, lwork, rwork, lrwork, iwork, liwork, info)
call zstedc(compz, n, d, e, z, ldz, work, lwork, rwork, lrwork, iwork, liwork, info)
call rstedc(d, e [,z] [,compz] [,info])
call stedc(d, e [,z] [,compz] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes all the eigenvalues and (optionally) all the eigenvectors of a symmetric tridiagonal matrix using the divide and conquer method. The eigenvectors of a full or band real symmetric or complex Hermitian matrix can also be found if sytrd/hetrd or sptrd/hptrd or sbtrd/hbtrd has been used to reduce this matrix to tridiagonal form.

See also laed0, laed1, laed2, laed3, laed4, laed5, laed6, laed7, laed8, laed9, and laeda used by this function.

Input Parameters

compz

CHARACTER*1. Must be 'N' or 'I' or 'V'.

If *compz* = 'N', the routine computes eigenvalues only.

If *compz* = 'I', the routine computes the eigenvalues and eigenvectors of the tridiagonal matrix.

If *compz* = 'V', the routine computes the eigenvalues and eigenvectors of original symmetric/Hermitian matrix. On entry, the array *z* must contain the orthogonal/unitary matrix used to reduce the original matrix to tridiagonal form.

n

INTEGER. The order of the symmetric tridiagonal matrix ($n \geq 0$).

d, *e*, *rwork*

REAL for single-precision flavors

DOUBLE PRECISION for double-precision flavors.

Arrays:

d(*) contains the diagonal elements of the tridiagonal matrix.

The dimension of *d* must be at least max(1, *n*).

e(*) contains the subdiagonal elements of the tridiagonal matrix.

The dimension of *e* must be at least max(1, *n*-1).

rwork is a workspace array, its dimension `max(1, lrwork)`.

z, *work*

`REAL` for `sstedc`

`DOUBLE PRECISION` for `dstedc`

`COMPLEX` for `cstedc`

`DOUBLE COMPLEX` for `zstedc`.

Arrays: *z*(*ldz*, *), *work*(*).

If `compz = 'V'`, then, on entry, *z* must contain the orthogonal/unitary matrix used to reduce the original matrix to tridiagonal form.

The second dimension of *z* must be at least max(1, *n*).

work is a workspace array, its dimension `max(1, lwork)`.

ldz

`INTEGER`. The leading dimension of *z*. Constraints:

ldz≥ 1 if `compz = 'N'`;

ldz≥ max(1, *n*) if `compz = 'V'` or `'I'`.

lwork

`INTEGER`. The dimension of the array *work*.

For real functions `sstedc` and `dstedc`:

- If `compz = 'N'`or $n \le 1$, *lwork* must be at least 1.
- If `compz = 'V'` and $n > 1$, *lwork* must be at least $1 + 3*n + 2*n*\log_2(n) + 4*n^2$, where $\log_2(n)$ is the smallest integer *k* such that $2^k \ge n$.
- If `compz = 'I'` and $n > 1$ then *lwork* must be at least $1 + 4*n + n^2$

  Note that for `compz = 'I'` or `'V'` and if *n* is less than or equal to the minimum divide size, usually 25, then *lwork* need only be `max(1, 2*(n-1))`.

For complex functions `cstedc` and `zstedc`:

- If `compz = 'N'`or `'I'`, or $n \le 1$, *lwork* must be at least 1.
- If `compz = 'V'` and $n > 1$, *lwork* must be at least n^2.

  Note that for `compz = 'V'`, and if *n* is less than or equal to the minimum divide size, usually 25, then *lwork* need only be 1.

If `lwork = -1`, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for the required value of *lwork*.

lrwork

`INTEGER`. The dimension of the array *rwork* (used for complex flavors only).

If `compz = 'N'`, or $n \le 1$, *lrwork* must be at least 1.

If *compz* = 'V' and *n* > 1, *lrwork* must be at least (1 + 3**n* + 2**n**$\log_2(n)$ + 4**n*^{2}), where $\log_2(n)$ is the smallest integer *k* such that $2^k \geq n$.

If *compz* = 'I' and *n* > 1, *lrwork* must be at least (1 + 4**n* + 2**n*^{2}).

Note that for *compz* = 'V'or 'I', and if *n* is less than or equal to the minimum divide size, usually 25, then *lrwork* need only be max(1, 2*(*n*-1)).

If *lrwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for the required value of *lrwork*.

iwork INTEGER. Workspace array, its dimension max(1, *liwork*).

liwork INTEGER. The dimension of the array *iwork*.

If *compz* = 'N', or *n* ≤ 1, *liwork* must be at least 1.

If *compz* = 'V' and *n* > 1, *liwork* must be at least (6 + 6**n* + 5**n**$\log_2(n)$), where $\log_2(n)$ is the smallest integer *k* such that $2^k \geq n$.

If *compz* = 'I' and *n* > 1, *liwork* must be at least (3 + 5**n*).

Note that for *compz* = 'V'or 'I', and if *n* is less than or equal to the minimum divide size, usually 25, then *liwork* need only be 1.

If *liwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for the required value of *liwork*.

Output Parameters

d The *n* eigenvalues in ascending order, unless *info* ≠ 0.

See also *info*.

e On exit, the array is overwritten; see *info*.

z If *info* = 0, then if *compz* = 'V', *z* contains the orthonormal eigenvectors of the original symmetric/Hermitian matrix, and if *compz* = 'I', *z* contains the orthonormal eigenvectors of the symmetric tridiagonal matrix. If *compz* = 'N', *z* is not referenced.

work(1) On exit, if *info* = 0, then *work(1)* returns the optimal *lwork*.

rwork(1) On exit, if *info* = 0, then *rwork(1)* returns the optimal *lrwork* (for complex flavors only).

iwork(1) On exit, if *info* = 0, then *iwork(1)* returns the optimal *liwork*.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, the algorithm failed to compute an eigenvalue while working on the submatrix lying in rows and columns *i*/(*n*+1) through mod(*i*, *n*+1).

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `stedc` interface are the following:

d	Holds the vector of length *n*.
e	Holds the vector of length (*n*-1).
z	Holds the matrix *Z* of size (*n*,*n*).
compz	If omitted, this argument is restored based on the presence of argument *z* as follows: *compz* = 'I', if *z* is present, *compz* = 'N', if *z* is omitted. If present, *compz* must be equal to 'I' or 'V' and the argument *z* must also be present. Note that there will be an error condition if *compz* is present and *z* omitted.

Note that two variants of Fortran 95 interface for `stedc` routine are needed because of an ambiguous choice between real and complex cases appear when *z* and *work* are omitted. Thus, the name `rstedc` is used in real cases (single or double precision), and the name `stedc` is used in complex cases (single or double precision).

Application Notes

The required size of workspace arrays must be as follows.

For `sstedc/dstedc`:

If *compz* = 'N' or $n \le 1$ then *lwork* must be at least 1.

If *compz* = 'V' and $n > 1$ then *lwork* must be at least $(1 + 3n + 2n \cdot \log_2 n + 4n^2)$, where $\log_2(n)$ = smallest integer k such that $2^k \ge n$.

If *compz* = 'I' and $n > 1$ then *lwork* must be at least $(1 + 4n + n^2)$.

If *compz* = 'N' or $n \le 1$ then *liwork* must be at least 1.

If *compz* = 'V' and $n > 1$ then *liwork* must be at least $(6 + 6n + 5n \cdot \log_2 n)$.

If *compz* = 'I' and $n > 1$ then *liwork* must be at least $(3 + 5n)$.

For `cstedc/zstedc`:

If *compz* = 'N' or 'I', or $n \le 1$, *lwork* must be at least 1.

If *compz* = 'V' and $n > 1$, *lwork* must be at least n^2.

If *compz* = 'N' or $n \le 1$, *lrwork* must be at least 1.

If *compz* = 'V' and $n > 1$, *lrwork* must be at least $(1 + 3n + 2n \cdot \log_2 n + 4n^2)$, where $\log_2(n)$ = smallest integer k such that $2^k \ge n$.

If *compz* = 'I' and $n > 1$, *lrwork* must be at least$(1 + 4n + 2n^2)$.

The required value of *liwork* for complex flavors is the same as for real flavors.

If *lwork* (or *liwork* or *lrwork*, if supplied) is equal to -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*). This operation is called a workspace query.

Note that if *lwork* (*liwork*, *lrwork*) is less than the minimal required value and is not equal to -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?stegr

Computes selected eigenvalues and eigenvectors of a real symmetric tridiagonal matrix.

Syntax

```
call sstegr(jobz, range, n, d, e, vl, vu, il, iu, abstol, m, w, z, ldz, isuppz, work, lwork, iwork, liwork, info)
call dstegr(jobz, range, n, d, e, vl, vu, il, iu, abstol, m, w, z, ldz, isuppz, work, lwork, iwork, liwork, info)
call cstegr(jobz, range, n, d, e, vl, vu, il, iu, abstol, m, w, z, ldz, isuppz, work, lwork, iwork, liwork, info)
call zstegr(jobz, range, n, d, e, vl, vu, il, iu, abstol, m, w, z, ldz, isuppz, work, lwork, iwork, liwork, info)
call rstegr(d, e, w [,z] [,vl] [,vu] [,il] [,iu] [,m] [,isuppz] [,abstol] [,info])
call stegr(d, e, w [,z] [,vl] [,vu] [,il] [,iu] [,m] [,isuppz] [,abstol] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes selected eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix *T*.

The spectrum may be computed either completely or partially by specifying either an interval `(vl,vu]` or a range of indices `il:iu` for the desired eigenvalues.

`?stegr` is a compatibility wrapper around the improved stemr routine. See its description for further details.

Note that the *abstol* parameter no longer provides any benefit and hence is no longer used.

See also auxiliary lasq2lasq5, lasq6, used by this routine.

Input Parameters

jobz — CHARACTER*1. Must be 'N' or 'V'.

If *job* = 'N', then only eigenvalues are computed.

If *job* = 'V', then eigenvalues and eigenvectors are computed.

range — CHARACTER*1. Must be 'A' or 'V' or 'I'.

If *range* = 'A', the routine computes all eigenvalues.

If *range* = 'V', the routine computes eigenvalues *w*(*i*) in the half-open interval:

	vl<*w*(*i*)≤*vu*.
	If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.
n	INTEGER. The order of the matrix *T* (*n*≥ 0).
d, *e*, *work*	REAL for single precision flavors
	DOUBLE PRECISION for double precision flavors.
	Arrays:
	d(*) contains the diagonal elements of *T*.
	The dimension of *d* must be at least max(1, *n*).
	e(*) contains the subdiagonal elements of *T* in elements 1 to *n*-1; *e*(*n*) need not be set on input, but it is used as a workspace.
	The dimension of *e* must be at least max(1, *n*).
	work(*lwork*) is a workspace array.
vl, *vu*	REAL for single precision flavors
	DOUBLE PRECISION for double precision flavors.
	If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.
	Constraint: *vl*< *vu*.
	If *range* = 'A' or 'I', *vl* and *vu* are not referenced.
il, *iu*	INTEGER.
	If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.
	Constraint: 1 ≤*il*≤*iu*≤*n*, if *n* > 0.
	If *range* = 'A' or 'V', *il* and *iu* are not referenced.
abstol	REAL for single precision flavors
	DOUBLE PRECISION for double precision flavors.
	Unused. Was the absolute error tolerance for the eigenvalues/eigenvectors in previous versions.
ldz	INTEGER. The leading dimension of the output array *z*. Constraints:
	ldz≥ 1 if *jobz* = 'N';
	ldz≥ max(1, *n*) if *jobz* = 'V'.
lwork	INTEGER.
	The dimension of the array *work*,
	lwork≥max(1, 18**n*) if *jobz* = 'V', and
	lwork≥max(1, 12**n*) if *jobz* = 'N'.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* below for details.

iwork INTEGER.

Workspace array, size (*liwork*).

liwork INTEGER.

The dimension of the array *iwork*, *liwork* ≥ max(1, 10*n*) if the eigenvectors are desired, and *liwork* ≥ max(1, 8*n*) if only the eigenvalues are to be computed..

If *liwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *iwork* array, returns this value as the first entry of the *iwork* array, and no error message related to *liwork* is issued by xerbla. See *Application Notes* below for details.

Output Parameters

d, *e* On exit, *d* and *e* are overwritten.

m INTEGER. The total number of eigenvalues found,

$0 \le m \le n$.

If *range* = 'A', *m* = *n*, and if *range* = 'I', *m* = *iu*-*il*+1.

w REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.

Array, size at least max(1, *n*).

The selected eigenvalues in ascending order, stored in *w*(1) to *w*(*m*).

z REAL for sstegr

DOUBLE PRECISION for dstegr

COMPLEX for cstegr

DOUBLE COMPLEX for zstegr.

Array *z*(*ldz*, *), the second dimension of *z* must be at least max(1, *m*).

If *jobz* = 'V', and if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *T* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*).

If *jobz* = 'N', then *z* is not referenced.

Note: if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used. Using *n* = *m* is always safe.

isuppz INTEGER.

Array, size at least (2*max(1, *m*)).

	The support of the eigenvectors in *z*, that is the indices indicating the nonzero elements in *z*. The *i*-th computed eigenvector is nonzero only in elements *isuppz*(2*i*-1) through *isuppz*(2*i*). This is relevant in the case when the matrix is split. *isuppz* is only accessed when *jobz* = 'V', and *n* > 0.
work(1)	On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.
iwork(1)	On exit, if *info* = 0, then *iwork(1)* returns the required minimal size of *liwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = 1*x*, internal error in ?larre occurred, If *info* = 2*x*, internal error in ?larrv occurred. Here the digit *x* = abs(*iinfo*) < 10, where *iinfo* is the non-zero error code returned by ?larre or ?larrv, respectively.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine stegr interface are the following:

d	Holds the vector of length *n*.
e	Holds the vector of length *n*.
w	Holds the vector of length *n*.
z	Holds the matrix *Z* of size (*n*,*m*).
isuppz	Holds the vector of length (2**m*).
vl	Default value for this argument is *vl* = - HUGE (*vl*) where HUGE(*a*) means the largest machine number of the same precision as argument *a*.
vu	Default value for this argument is *vu* = HUGE (*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this argument is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present,

range = 'I', if one of or both *il* and *iu* are present,

range = 'A', if none of *vl*, *vu*, *il*, *iu* is present,

Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Note that two variants of Fortran 95 interface for `stegr` routine are needed because of an ambiguous choice between real and complex cases appear when *z* is omitted. Thus, the name `rstegr` is used in real cases (single or double precision), and the name `stegr` is used in complex cases (single or double precision).

Application Notes

`?stegr` works only on machines which follow IEEE-754 floating-point standard in their handling of infinities and `NaN`s. Normal execution of `?stegr` may create `NaN`s and infinities and hence may abort due to a floating point exception in environments which do not conform to the IEEE-754 standard.

If it is not clear how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run, or set *lwork* = -1 (*liwork* = -1).

If *lwork* (or *liwork*) has any of admissible sizes, which is no less than the minimal value described, then the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If *lwork* = -1 (*liwork* = -1), then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if *lwork* (*liwork*) is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?pteqr

Computes all eigenvalues and (optionally) all eigenvectors of a real symmetric positive-definite tridiagonal matrix.

Syntax

```
call spteqr(compz, n, d, e, z, ldz, work, info)
call dpteqr(compz, n, d, e, z, ldz, work, info)
call cpteqr(compz, n, d, e, z, ldz, work, info)
call zpteqr(compz, n, d, e, z, ldz, work, info)
call rpteqr(d, e [,z] [,compz] [,info])
call pteqr(d, e [,z] [,compz] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes all the eigenvalues and (optionally) all the eigenvectors of a real symmetric positive-definite tridiagonal matrix *T*. In other words, the routine can compute the spectral factorization: $T = Z*\Lambda*Z^T$.

Here Λ is a diagonal matrix whose diagonal elements are the eigenvalues λ_i; Z is an orthogonal matrix whose columns are eigenvectors. Thus,

$T*z_i = \lambda_i*z_i$ for $i = 1, 2, \ldots, n$.

(The routine normalizes the eigenvectors so that $||z_i||_2 = 1$.)

You can also use the routine for computing the eigenvalues and eigenvectors of real symmetric (or complex Hermitian) positive-definite matrices A reduced to tridiagonal form T: $A = Q*T*Q^H$. In this case, the spectral factorization is as follows: $A = Q*T*Q^H = (QZ)*\Lambda*(QZ)^H$. Before calling ?pteqr, you must reduce A to tridiagonal form and generate the explicit matrix Q by calling the following routines:

	for real matrices:	for complex matrices:
full storage	?sytrd, ?orgtr	?hetrd, ?ungtr
packed storage	?sptrd, ?opgtr	?hptrd, ?upgtr
band storage	?sbtrd(*vect*='V')	?hbtrd(*vect*='V')

The routine first factorizes T as $L*D*L^H$ where L is a unit lower bidiagonal matrix, and D is a diagonal matrix. Then it forms the bidiagonal matrix $B = L*D^{1/2}$ and calls ?bdsqr to compute the singular values of B, which are the square roots of the eigenvalues of T.

Input Parameters

compz

CHARACTER*1. Must be 'N' or 'I' or 'V'.

If *compz* = 'N', the routine computes eigenvalues only.

If *compz* = 'I', the routine computes the eigenvalues and eigenvectors of the tridiagonal matrix T.

If *compz* = 'V', the routine computes the eigenvalues and eigenvectors of A (and the array *z* must contain the matrix Q on entry).

n

INTEGER. The order of the matrix T ($n \geq 0$).

d, *e*, *work*

REAL for single-precision flavors

DOUBLE PRECISION for double-precision flavors.

Arrays:

d(*) contains the diagonal elements of T.

The size of *d* must be at least max(1, *n*).

e(*) contains the off-diagonal elements of T.

The size of *e* must be at least max(1, *n*-1).

work(*) is a workspace array.

The dimension of *work* must be:

at least 1 if *compz* = 'N';

at least max(1, 4**n*-4) if *compz* = 'V' or 'I'.

z

REAL for spteqr

DOUBLE PRECISION for dpteqr

COMPLEX for cpteqr

DOUBLE COMPLEX for zpteqr.

Array, size (*ldz*,*)

If *compz* = 'N' or 'I', *z* need not be set.

If *compz* = 'V', *z* must contain the orthogonal matrix used in the reduction to tridiagonal form..

The second dimension of *z* must be:

at least 1 if *compz* = 'N';

at least max(1, *n*) if *compz* = 'V' or 'I'.

ldz — INTEGER. The leading dimension of *z*. Constraints:

ldz≥ 1 if *compz* = 'N';

ldz≥ max(1, *n*) if *compz* = 'V' or 'I'.

Output Parameters

d — The *n* eigenvalues in descending order, unless *info* > 0.

See also *info*.

e — On exit, the array is overwritten.

z — If *info* = 0, contains an *n*-by*n* matrix the columns of which are orthonormal eigenvectors. (The *i*-th column corresponds to the *i*-th eigenvalue.)

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = *i*, the leading minor of order *i* (and hence *T* itself) is not positive-definite.

If *info* = *n* + *i*, the algorithm for computing singular values failed to converge; *i* off-diagonal elements have not converged to zero.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine pteqr interface are the following:

d — Holds the vector of length *n*.

e — Holds the vector of length (*n*-1).

z — Holds the matrix *Z* of size (*n*,*n*).

compz — If omitted, this argument is restored based on the presence of argument *z* as follows:

compz = 'I', if *z* is present,

compz = 'N', if *z* is omitted.

If present, *compz* must be equal to 'I' or 'V' and the argument *z* must also be present. Note that there will be an error condition if *compz* is present and *z* omitted.

Note that two variants of Fortran 95 interface for pteqr routine are needed because of an ambiguous choice between real and complex cases appear when *z* is omitted. Thus, the name rpteqr is used in real cases (single or double precision), and the name pteqr is used in complex cases (single or double precision).

Application Notes

If λ_i is an exact eigenvalue, and μ_i is the corresponding computed value, then

$|\mu_i - \lambda_i| \leq c(n)*\varepsilon*K*\lambda_i$

where $c(n)$ is a modestly increasing function of n, ε is the machine precision, and $K = ||DTD||_2 * ||(DTD)^{-1}||_2$, D is diagonal with $d_{ii} = t_{ii}^{-1/2}$.

If z_i is the corresponding exact eigenvector, and w_i is the corresponding computed vector, then the angle $\theta(z_i, w_i)$ between them is bounded as follows:

$\theta(u_i, w_i) \leq c(n)\varepsilon K / \min_{i \neq j}(|\lambda_i - \lambda_j|/|\lambda_i + \lambda_j|)$.

Here $\min_{i \neq j}(|\lambda_i - \lambda_j|/|\lambda_i + \lambda_j|)$ is the *relative gap* between λ_i and the other eigenvalues.

The total number of floating-point operations depends on how rapidly the algorithm converges.

Typically, it is about

$30n^2$ if *compz* = 'N';

$6n^3$ (for complex flavors, $12n^3$) if *compz* = 'V' or 'I'.

?stebz

Computes selected eigenvalues of a real symmetric tridiagonal matrix by bisection.

Syntax

call sstebz (*range*, *order*, *n*, *vl*, *vu*, *il*, *iu*, *abstol*, *d*, *e*, *m*, *nsplit*, *w*, *iblock*, *isplit*, *work*, *iwork*, *info*)

call dstebz (*range*, *order*, *n*, *vl*, *vu*, *il*, *iu*, *abstol*, *d*, *e*, *m*, *nsplit*, *w*, *iblock*, *isplit*, *work*, *iwork*, *info*)

call stebz(*d*, *e*, *m*, *nsplit*, *w*, *iblock*, *isplit* [, *order*] [,*vl*] [,*vu*] [,*il*] [,*iu*] [,*abstol*] [,*info*])

Include Files

- mkl.fi, lapack.f90

Description

The routine computes some (or all) of the eigenvalues of a real symmetric tridiagonal matrix *T* by bisection. The routine searches for zero or negligible off-diagonal elements to see if *T* splits into block-diagonal form $T = \mathrm{diag}(T_1, T_2, \ldots)$. Then it performs bisection on each of the blocks T_i and returns the block index of each computed eigenvalue, so that a subsequent call to stein can also take advantage of the block structure.

See also laebz.

Input Parameters

range

CHARACTER*1. Must be 'A' or 'V' or 'I'.

If *range* = 'A', the routine computes all eigenvalues.

If *range* = 'V', the routine computes eigenvalues $w(i)$ in the half-open interval: $vl < w(i) \le vu$.

If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.

order

CHARACTER*1. Must be 'B' or 'E'.

If *order* = 'B', the eigenvalues are to be ordered from smallest to largest within each split-off block.

If *order* = 'E', the eigenvalues for the entire matrix are to be ordered from smallest to largest.

n

INTEGER. The order of the matrix *T* ($n \ge 0$).

vl, *vu*

REAL for sstebz

DOUBLE PRECISION for dstebz.

If *range* = 'V', the routine computes eigenvalues $w(i)$ in the half-open interval:

$vl < w(i)) \le vu$.

If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, *iu*

INTEGER. Constraint: $1 \le il \le iu \le n$.

If *range* = 'I', the routine computes eigenvalues $w(i)$ such that $il \le i \le iu$ (assuming that the eigenvalues $w(i)$ are in ascending order).

If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol

REAL for sstebz

DOUBLE PRECISION for dstebz.

The absolute tolerance to which each eigenvalue is required. An eigenvalue (or cluster) is considered to have converged if it lies in an interval of width *abstol*.

If $abstol \le 0.0$, then the tolerance is taken as eps*|*T*|, where eps is the machine precision, and |*T*| is the 1-norm of the matrix *T*.

d, *e*, *work*

REAL for sstebz

DOUBLE PRECISION for dstebz.

Arrays:

d(*) contains the diagonal elements of *T*.

The size of *d* must be at least max(1, *n*).

e(*) contains the off-diagonal elements of *T*.

The size of *e* must be at least max(1, *n*-1).

work(*) is a workspace array.

The dimension of *work* must be at least max(1, 4*n*).

iwork — INTEGER. Workspace.

Array, size at least max(1, 3*n*).

Output Parameters

m — INTEGER. The actual number of eigenvalues found.

nsplit — INTEGER. The number of diagonal blocks detected in *T*.

w — REAL for sstebz

DOUBLE PRECISION for dstebz.

Array, size at least max(1, *n*). The computed eigenvalues, stored in *w*(1) to *w*(*m*).

iblock, *isplit* — INTEGER.

Arrays, size at least max(1, *n*).

A positive value *iblock*(*i*) is the block number of the eigenvalue stored in *w*(*i*) (see also *info*).

The leading *nsplit* elements of *isplit* contain points at which *T* splits into blocks T_i as follows: the block T_1 contains rows/columns 1 to *isplit*(1); the block T_2 contains rows/columns *isplit*(1)+1 to *isplit*(2), and so on.

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = 1, for *range* = 'A' or 'V', the algorithm failed to compute some of the required eigenvalues to the desired accuracy; *iblock*(*i*)<0 indicates that the eigenvalue stored in *w*(*i*) failed to converge.

If *info* = 2, for *range* = 'I', the algorithm failed to compute some of the required eigenvalues. Try calling the routine again with *range* = 'A'.

If *info* = 3:

for *range* = 'A' or 'V', same as *info* = 1;

for *range* = 'I', same as *info* = 2.

If *info* = 4, no eigenvalues have been computed. The floating-point arithmetic on the computer is not behaving as expected.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine stebz interface are the following:

d — Holds the vector of length *n*.

e	Holds the vector of length (*n*-1).
w	Holds the vector of length *n*.
iblock	Holds the vector of length *n*.
isplit	Holds the vector of length *n*.
order	Must be 'B' or 'E'. The default value is 'B'.
vl	Default value for this argument is *vl* = - HUGE (*vl*) where HUGE(*a*) means the largest machine number of the same precision as argument *a*.
vu	Default value for this argument is *vu* = HUGE (*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this argument is *abstol* = 0.0_WP.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

The eigenvalues of *T* are computed to high relative accuracy which means that if they vary widely in magnitude, then any small eigenvalues will be computed more accurately than, for example, with the standard *QR* method. However, the reduction to tridiagonal form (prior to calling the routine) may exclude the possibility of obtaining high relative accuracy in the small eigenvalues of the original matrix if its eigenvalues vary widely in magnitude.

?stein

Computes the eigenvectors corresponding to specified eigenvalues of a real symmetric tridiagonal matrix.

Syntax

```
call sstein(n, d, e, m, w, iblock, isplit, z, ldz, work, iwork, ifailv, info)
call dstein(n, d, e, m, w, iblock, isplit, z, ldz, work, iwork, ifailv, info)
call cstein(n, d, e, m, w, iblock, isplit, z, ldz, work, iwork, ifailv, info)
call zstein(n, d, e, m, w, iblock, isplit, z, ldz, work, iwork, ifailv, info)
call stein(d, e, w, iblock, isplit, z [,ifailv] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes the eigenvectors of a real symmetric tridiagonal matrix *T* corresponding to specified eigenvalues, by inverse iteration. It is designed to be used in particular after the specified eigenvalues have been computed by `?stebz` with `order = 'B'`, but may also be used when the eigenvalues have been computed by other routines.

If you use this routine after `?stebz`, it can take advantage of the block structure by performing inverse iteration on each block T_i separately, which is more efficient than using the whole matrix *T*.

If *T* has been formed by reduction of a full symmetric or Hermitian matrix *A* to tridiagonal form, you can transform eigenvectors of *T* to eigenvectors of *A* by calling `?ormtr` or `?opmtr` (for real flavors) or by calling `?unmtr` or `?upmtr` (for complex flavors).

Input Parameters

n

`INTEGER`. The order of the matrix *T* (*n*≥ 0).

m

`INTEGER`. The number of eigenvectors to be returned.

d, *e*, *w*

`REAL` for single-precision flavors

`DOUBLE PRECISION` for double-precision flavors.

Arrays:

d(*) contains the diagonal elements of *T*.

The size of *d* must be at least max(1, *n*).

e(*) contains the sub-diagonal elements of *T* stored in elements 1 to *n*-1

The size of *e* must be at least max(1, *n*-1).

w(*) contains the eigenvalues of *T*, stored in `w(1)` to `w(m)` (as returned by stebz). Eigenvalues of T_1 must be supplied first, in non-decreasing order; then those of T_2, again in non-decreasing order, and so on. Constraint:

if *iblock*(*i*) = *iblock*(*i*+1), *w*(*i*) ≤*w*(*i*+1).

The size of *w* must be at least max(1, *n*).

iblock, *isplit*

`INTEGER`.

Arrays, size at least max(1, *n*). The arrays *iblock* and *isplit*, as returned by `?stebz` with `order = 'B'`.

If you did not call `?stebz` with `order = 'B'`, set all elements of *iblock* to 1, and *isplit*(1) to *n*.)

ldz

`INTEGER`. The leading dimension of the output array *z*; *ldz*≥ max(1, *n*).

work

`REAL` for single-precision flavors

`DOUBLE PRECISION` for double-precision flavors.

Workspace array, size at least max(1, 5*n*).

iwork

`INTEGER`.

Workspace array, size at least max(1, *n*).

Output Parameters

z

`REAL` for `sstein`

`DOUBLE PRECISION` for `dstein`

COMPLEX for cstein

DOUBLE COMPLEX for zstein.

Array, size (*ldz*, *).

If *info* = 0, *z* contains an *n*-by-*n* matrix the columns of which are orthonormal eigenvectors. (The *i*-th column corresponds to the *i*th eigenvalue.)

ifailv INTEGER.

Array, size at least max(1, *m*).

If *info* = *i* > 0, the first *i* elements of *ifailv* contain the indices of any eigenvectors that failed to converge.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = *i*, then *i* eigenvectors (as indicated by the parameter *ifailv*) each failed to converge in 5 iterations. The current iterates are stored in the corresponding columns of the array *z*.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine stein interface are the following:

d Holds the vector of length *n*.

e Holds the vector of length *n*.

w Holds the vector of length *n*.

iblock Holds the vector of length *n*.

isplit Holds the vector of length *n*.

z Holds the matrix *Z* of size (*n*,*m*).

ifailv Holds the vector of length (*m*).

Application Notes

Each computed eigenvector z_i is an exact eigenvector of a matrix $T+E_i$, where $||E_i||_2 = O(\varepsilon)*||T||_2$. However, a set of eigenvectors computed by this routine may not be orthogonal to so high a degree of accuracy as those computed by ?steqr.

?disna

Computes the reciprocal condition numbers for the eigenvectors of a symmetric/ Hermitian matrix or for the left or right singular vectors of a general matrix.

Syntax

```
call sdisna(job, m, n, d, sep, info)
```

```
call ddisna(job, m, n, d, sep, info)
call disna(d, sep [,job] [,minmn] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine computes the reciprocal condition numbers for the eigenvectors of a real symmetric or complex Hermitian matrix or for the left or right singular vectors of a general *m*-by-*n* matrix.

The reciprocal condition number is the 'gap' between the corresponding eigenvalue or singular value and the nearest other one.

The bound on the error, measured by angle in radians, in the *i*-th computed vector is given by

`?lamch('E')*(anorm/sep(i))`

where *anorm* = $||A||_2$ = max(|d(j)|). *sep*(*i*) is not allowed to be smaller than `slamch('E')*anorm` in order to limit the size of the error bound.

`?disna` may also be used to compute error bounds for eigenvectors of the generalized symmetric definite eigenproblem.

Input Parameters

job

CHARACTER*1. Must be 'E','L', or 'R'. Specifies for which problem the reciprocal condition numbers should be computed:

job = 'E': for the eigenvectors of a symmetric/Hermitian matrix;

job = 'L': for the left singular vectors of a general matrix;

job = 'R': for the right singular vectors of a general matrix.

m

INTEGER. The number of rows of the matrix ($m \geq 0$).

n

INTEGER.

If *job* = 'L', or 'R', the number of columns of the matrix ($n \geq 0$). Ignored if *job* = 'E'.

d

REAL for sdisna

DOUBLE PRECISION for ddisna.

Array, dimension at least max(1,*m*) if *job* = 'E', and at least max(1, min(*m*,*n*)) if *job* = 'L' or 'R'.

This array must contain the eigenvalues (if *job* = 'E') or singular values (if *job* = 'L' or 'R') of the matrix, in either increasing or decreasing order.

If singular values, they must be non-negative.

Output Parameters

sep

REAL for sdisna

DOUBLE PRECISION for ddisna.

Array, dimension at least max(1,*m*) if *job* = 'E', and at least max(1, min(*m*,*n*)) if *job* = 'L' or 'R'. The reciprocal condition numbers of the vectors.

info INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine disna interface are the following:

d Holds the vector of length min(*m*,*n*).

sep Holds the vector of length min(*m*,*n*).

job Must be 'E', 'L', or 'R'. The default value is 'E'.

minmn Indicates which of the values *m* or *n* is smaller. Must be either 'M' or 'N', the default is 'M'.

If *job* = 'E', this argument is superfluous, If *job* = 'L' or 'R', this argument is used by the routine.

Generalized Symmetric-Definite Eigenvalue Problems: LAPACK Computational Routines

Generalized symmetric-definite eigenvalue problems are as follows: find the eigenvalues λ and the corresponding eigenvectors *z* that satisfy one of these equations:

$Az = \lambda Bz$, $ABz = \lambda z$, or $BAz = \lambda z$,

where *A* is an *n*-by-*n* symmetric or Hermitian matrix, and *B* is an *n*-by-*n* symmetric positive-definite or Hermitian positive-definite matrix.

In these problems, there exist *n* real eigenvectors corresponding to real eigenvalues (even for complex Hermitian matrices *A* and *B*).

Routines described in this topic allow you to reduce the above generalized problems to standard symmetric eigenvalue problem $Cy = \lambda y$, which you can solve by calling LAPACK routines described earlier in this chapter (see Symmetric Eigenvalue Problems).

Different routines allow the matrices to be stored either conventionally or in packed storage. Prior to reduction, the positive-definite matrix *B* must first be factorized using either potrf or pptrf.

The reduction routine for the banded matrices *A* and *B* uses a split Cholesky factorization for which a specific routine pbstf is provided. This refinement halves the amount of work required to form matrix *C*.

Table "Computational Routines for Reducing Generalized Eigenproblems to Standard Problems" lists LAPACK routines that can be used to solve generalized symmetric-definite eigenvalue problems. The corresponding routine names in the Fortran 95 interface are without the first symbol.

Computational Routines for Reducing Generalized Eigenproblems to Standard Problems

Matrix type	Reduce to standard problems (full storage)	Reduce to standard problems (packed storage)	Reduce to standard problems (band matrices)	Factorize band matrix
real symmetric matrices	sygst	spgst	sbgst	pbstf
complex Hermitian matrices	hegst	hpgst	hbgst	pbstf

?sygst
Reduces a real symmetric-definite generalized eigenvalue problem to the standard form.

Syntax

```
call ssygst(itype, uplo, n, a, lda, b, ldb, info)
call dsygst(itype, uplo, n, a, lda, b, ldb, info)
call sygst(a, b [,itype] [,uplo] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine reduces real symmetric-definite generalized eigenproblems

$A*z = \lambda*B*z$, $A*B*z = \lambda*z$, or $B*A*z = \lambda*z$

to the standard form $C*y = \lambda*y$. Here A is a real symmetric matrix, and B is a real symmetric positive-definite matrix. Before calling this routine, call ?potrf to compute the Cholesky factorization: $B = U^T*U$ or $B = L*L^T$.

Input Parameters

itype

INTEGER. Must be 1 or 2 or 3.

If $itype = 1$, the generalized eigenproblem is $A*z = lambda*B*z$

for $uplo$ = 'U': $C = inv(U^T)*A*inv(U)$, $z = inv(U)*y$;

for $uplo$ = 'L': $C = inv(L)*A*inv(L^T)$, $z = inv(L^T)*y$.

If $itype = 2$, the generalized eigenproblem is $A*B*z = lambda*z$

for $uplo$ = 'U': $C = U*A*U^T$, $z = inv(U)*y$;

for $uplo$ = 'L': $C = L^T*A*L$, $z = inv(L^T)*y$.

If $itype = 3$, the generalized eigenproblem is $B*A*z = lambda*z$

for $uplo$ = 'U': $C = U*A*U^T$, $z = U^T*y$;

for $uplo$ = 'L': $C = L^T*A*L$, $z = L*y$.

uplo

CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', the array *a* stores the upper triangle of *A*; you must supply *B* in the factored form $B = U^T*U$.

If *uplo* = 'L', the array *a* stores the lower triangle of *A*; you must supply *B* in the factored form $B = L*L^T$.

n — INTEGER. The order of the matrices *A* and *B* ($n \geq 0$).

a, *b* — REAL for ssygst

DOUBLE PRECISION for dsygst.

Arrays:

a(*lda*,*) contains the upper or lower triangle of *A*.

The second dimension of *a* must be at least max(1, *n*).

b(*ldb*,*) contains the Cholesky-factored matrix *B*:

$B = U^T*U$ or $B = L*L^T$ (as returned by ?potrf).

The second dimension of *b* must be at least max(1, *n*).

lda — INTEGER. The leading dimension of *a*; at least max(1, *n*).

ldb — INTEGER. The leading dimension of *b*; at least max(1, *n*).

Output Parameters

a — The upper or lower triangle of *A* is overwritten by the upper or lower triangle of *C*, as specified by the arguments *itype* and *uplo*.

info — INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine sygst interface are the following:

a — Holds the matrix *A* of size (*n*,*n*).

b — Holds the matrix *B* of size (*n*,*n*).

itype — Must be 1, 2, or 3. The default value is 1.

uplo — Must be 'U' or 'L'. The default value is 'U'.

Application Notes

Forming the reduced matrix *C* is a stable procedure. However, it involves implicit multiplication by inv(*B*) (if *itype* = 1) or *B* (if *itype* = 2 or 3). When the routine is used as a step in the computation of eigenvalues and eigenvectors of the original problem, there may be a significant loss of accuracy if *B* is ill-conditioned with respect to inversion.

The approximate number of floating-point operations is n^3.

?hegst
Reduces a complex Hermitian positive-definite generalized eigenvalue problem to the standard form.

Syntax

```
call chegst(itype, uplo, n, a, lda, b, ldb, info)
call zhegst(itype, uplo, n, a, lda, b, ldb, info)
call hegst(a, b [,itype] [,uplo] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine reduces a complex Hermitian positive-definite generalized eigenvalue problem to standard form.

itype	**Problem**	**Result**
1	$A*x = \lambda*B*x$	*A* overwritten by $\mathrm{inv}(U^H)*A*\mathrm{inv}(U)$ or $\mathrm{inv}(L)*A*\mathrm{inv}(L^H)$
2	$A*B*x = \lambda*x$	*A* overwritten by $U*A*U^H$ or L^H*A*L
3	$B*A*x = \lambda*x$	

Before calling this routine, you must call ?potrf to compute the Cholesky factorization: $B = U^H*U$ or $B = L*L^H$.

Input Parameters

itype

INTEGER. Must be 1 or 2 or 3.

If *itype* = 1, the generalized eigenproblem is *A*z = lambda*B*z*

for *uplo* = 'U': $C = (U^H)^{-1}*A*U^{-1}$;

for *uplo* = 'L': $C = L^{-1}*A*(L^H)^{-1}$.

If *itype* = 2, the generalized eigenproblem is *A*B*z = lambda*z*

for *uplo* = 'U': $C = U*A*U^H$;

for *uplo* = 'L': $C = L^H*A*L$.

If *itype* = 3, the generalized eigenproblem is *B*A*z = lambda*z*

for *uplo* = 'U': $C = U*A*U^H$;

for *uplo* = 'L': $C = L^H*A*L$.

uplo

CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', the array *a* stores the upper triangle of *A*; you must supply *B* in the factored form $B = U^H*U$.

If *uplo* = 'L', the array *a* stores the lower triangle of *A*; you must supply *B* in the factored form $B = L*L^H$.

n

INTEGER. The order of the matrices *A* and *B* ($n \geq 0$).

a, *b*	`COMPLEX` for `chegst` `DOUBLE COMPLEX` for `zhegst`. Arrays: *a*(*lda*,*) contains the upper or lower triangle of *A*. The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) contains the Cholesky-factored matrix *B*: $B = U^H*U$ or $B = L*L^H$ (as returned by `?potrf`). The second dimension of *b* must be at least max(1, *n*).
lda	`INTEGER`. The leading dimension of *a*; at least max(1, *n*).
ldb	`INTEGER`. The leading dimension of *b*; at least max(1, *n*).

Output Parameters

a	The upper or lower triangle of *A* is overwritten by the upper or lower triangle of *C*, as specified by the arguments *itype* and *uplo*.
info	`INTEGER`. If *info* = 0, the execution is successful. If *info* = −*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `hegst` interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
b	Holds the matrix *B* of size (*n*,*n*).
itype	Must be 1, 2, or 3. The default value is 1.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

Forming the reduced matrix *C* is a stable procedure. However, it involves implicit multiplication by B^{-1} (if *itype* = 1) or *B* (if *itype* = 2 or 3). When the routine is used as a step in the computation of eigenvalues and eigenvectors of the original problem, there may be a significant loss of accuracy if *B* is ill-conditioned with respect to inversion.

The approximate number of floating-point operations is n^3.

?spgst

Reduces a real symmetric-definite generalized eigenvalue problem to the standard form using packed storage.

Syntax

```
call sspgst(itype, uplo, n, ap, bp, info)
```

```
call dspgst(itype, uplo, n, ap, bp, info)
call spgst(ap, bp [,itype] [,uplo] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine reduces real symmetric-definite generalized eigenproblems

$A*x = \lambda*B*x$, $A*B*x = \lambda*x$, or $B*A*x = \lambda*x$

to the standard form $C*y = \lambda*y$, using packed matrix storage. Here A is a real symmetric matrix, and B is a real symmetric positive-definite matrix. Before calling this routine, call ?pptrf to compute the Cholesky factorization: $B = U^T*U$ or $B = L*L^T$.

Input Parameters

itype

INTEGER. Must be 1 or 2 or 3.

If *itype* = 1, the generalized eigenproblem is $A*z = lambda*B*z$

for *uplo* = 'U': $C = \text{inv}(U^T)*A*\text{inv}(U)$, $z = \text{inv}(U)*y$;

for *uplo* = 'L': $C = \text{inv}(L)*A*\text{inv}(L^T)$, $z = \text{inv}(L^T)*y$.

If *itype* = 2, the generalized eigenproblem is $A*B*z = lambda*z$

for *uplo* = 'U': $C = U*A*U^T$, $z = \text{inv}(U)*y$;

for *uplo* = 'L': $C = L^T*A*L$, $z = \text{inv}(L^T)*y$.

If *itype* = 3, the generalized eigenproblem is $B*A*z = lambda*z$

for *uplo* = 'U': $C = U*A*U^T$, $z = U^T*y$;

for *uplo* = 'L': $C = L^T*A*L$, $z = L*y$.

uplo

CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', *ap* stores the packed upper triangle of *A*;

you must supply *B* in the factored form $B = U^T*U$.

If *uplo* = 'L', *ap* stores the packed lower triangle of *A*;

you must supply *B* in the factored form $B = L*L^T$.

n

INTEGER. The order of the matrices *A* and *B* ($n \geq 0$).

ap, *bp*

REAL for sspgst

DOUBLE PRECISION for dspgst.

Arrays:

ap(*) contains the packed upper or lower triangle of *A*.

The dimension of *ap* must be at least max(1, *n**(*n*+1)/2).

bp(*) contains the packed Cholesky factor of *B* (as returned by ?pptrf with the same *uplo* value).

The dimension of *bp* must be at least max(1, *n**(*n*+1)/2).

Output Parameters

ap	The upper or lower triangle of *A* is overwritten by the upper or lower triangle of *C*, as specified by the arguments *itype* and *uplo*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine spgst interface are the following:

ap	Holds the array *A* of size (*n**(*n*+1)/2).

itype	Must be 1, 2, or 3. The default value is 1.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

Forming the reduced matrix *C* is a stable procedure. However, it involves implicit multiplication by inv(*B*) (if *itype* = 1) or *B* (if *itype* = 2 or 3). When the routine is used as a step in the computation of eigenvalues and eigenvectors of the original problem, there may be a significant loss of accuracy if *B* is ill-conditioned with respect to inversion.

The approximate number of floating-point operations is n^3.

?hpgst

Reduces a generalized eigenvalue problem with a Hermitian matrix to a standard eigenvalue problem using packed storage.

Syntax

```
call chpgst(itype, uplo, n, ap, bp, info)
call zhpgst(itype, uplo, n, ap, bp, info)
call hpgst(ap, bp [,itype] [,uplo] [,info])
```

Include Files

- mkl.fi, lapack.f90

Description

The routine reduces generalized eigenproblems with Hermitian matrices

*A***z* = λ**B***z*, *A***B***z* = λ**z*, or *B***A***z* = λ**z*.

to standard eigenproblems $C*y = \lambda*y$, using packed matrix storage. Here A is a complex Hermitian matrix, and B is a complex Hermitian positive-definite matrix. Before calling this routine, you must call ?pptrf to compute the Cholesky factorization: $B = U^H*U$ or $B = L*L^H$.

Input Parameters

itype

INTEGER. Must be 1 or 2 or 3.

If *itype* = 1, the generalized eigenproblem is $A*z = lambda*B*z$

for *uplo* = 'U': $C = \text{inv}(U^H)*A*\text{inv}(U)$, $z = \text{inv}(U)*y$;

for *uplo* = 'L': $C = \text{inv}(L)*A*\text{inv}(L^H)$, $z = \text{inv}(L^H)*y$.

If *itype* = 2, the generalized eigenproblem is $A*B*z = lambda*z$

for *uplo* = 'U': $C = U*A*U^H$, $z = \text{inv}(U)*y$;

for *uplo* = 'L': $C = L^H*A*L$, $z = \text{inv}(L^H)*y$.

If *itype* = 3, the generalized eigenproblem is $B*A*z = lambda*z$

for *uplo* = 'U': $C = U*A*U^H$, $z = U^H*y$;

for *uplo* = 'L': $C = L^H*A*L$, $z = L*y$.

uplo

CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', *ap* stores the packed upper triangle of *A*; you must supply *B* in the factored form $B = U^H*U$.

If *uplo* = 'L', *ap* stores the packed lower triangle of *A*; you must supply *B* in the factored form $B = L*L^H$.

n

INTEGER. The order of the matrices *A* and *B* ($n \geq 0$).

ap, *bp*

COMPLEX for chpgstDOUBLE COMPLEX for zhpgst.

Arrays:

ap(*) contains the packed upper or lower triangle of *A*.

The dimension of *a* must be at least max(1, *n**(*n*+1)/2).

bp(*) contains the packed Cholesky factor of *B* (as returned by ?pptrf with the same *uplo* value).

The dimension of *b* must be at least max(1, *n**(*n*+1)/2).

Output Parameters

ap

The upper or lower triangle of *A* is overwritten by the upper or lower triangle of *C*, as specified by the arguments *itype* and *uplo*.

info

INTEGER.

If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

LAPACK 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see LAPACK 95 Interface Conventions.

Specific details for the routine `hpgst` interface are the following:

ap	Holds the array *A* of size (*n*(n+1)/2*).
bp	Holds the array *B* of size (*n*(n+1)/2*).
itype	Must be 1, 2, or 3. The default value is 1.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

Forming the reduced matrix *C* is a stable procedure. However, it involves implicit multiplication by inv(*B*) (if *itype* = 1) or *B* (if *itype* = 2 or 3). When the routine is used as a step in the computation of eigenvalues and eigenvectors of the original problem, there may be a significant loss of accuracy if *B* is ill-conditioned with respect to inversion.

The approximate number of floating-point operations is n^3.

?sbgst

Reduces a real symmetric-definite generalized eigenproblem for banded matrices to the standard form using the factorization performed by `?pbstf`.

Syntax

```
call ssbgst(vect, uplo, n, ka, kb, ab, ldab, bb, ldbb, x, ldx, work, info)
call dsbgst(vect, uplo, n, ka, kb, ab, ldab, bb, ldbb, x, ldx, work, info)
call sbgst(ab, bb [,x] [,uplo] [,info])
```

Include Files

- `mkl.fi, lapack.f90`

Description

To reduce the real symmetric-definite generalized eigenproblem $A*z = \lambda*B*z$ to the standard form $C*y=\lambda*y$, where *A*, *B* and *C* are banded, this routine must be preceded by a call to pbstf, which computes the split Cholesky factorization of the positive-definite matrix *B*: $B=S^T*S$. The split Cholesky factorization, compared with the ordinary Cholesky factorization, allows the work to be approximately halved.

This routine overwrites *A* with $C = X^T*A*X$, where $X = \text{inv}(S)*Q$ and *Q* is an orthogonal matrix chosen (implicitly) to preserve the bandwidth of *A*. The routine also has an option to allow the accumulation of *X*, and then, if *z* is an eigenvector of *C*, $X*z$ is an eigenvector of the original system.

Input Parameters

vect	`CHARACTER*1`. Must be `'N'` or `'V'`. If *vect* = `'N'`, then matrix *X* is not returned; If *vect* = `'V'`, then matrix *X* is returned.
uplo	`CHARACTER*1`. Must be `'U'` or `'L'`. If *uplo* = `'U'`, *ab* stores the upper triangular part of *A*. If *uplo* = `'L'`, *ab* stores the lower triangular part of *A*.

n INTEGER. The order of the matrices *A* and *B* (*n*≥ 0).

ka INTEGER. The number of super- or sub-diagonals in *A* (*ka*≥ 0).
